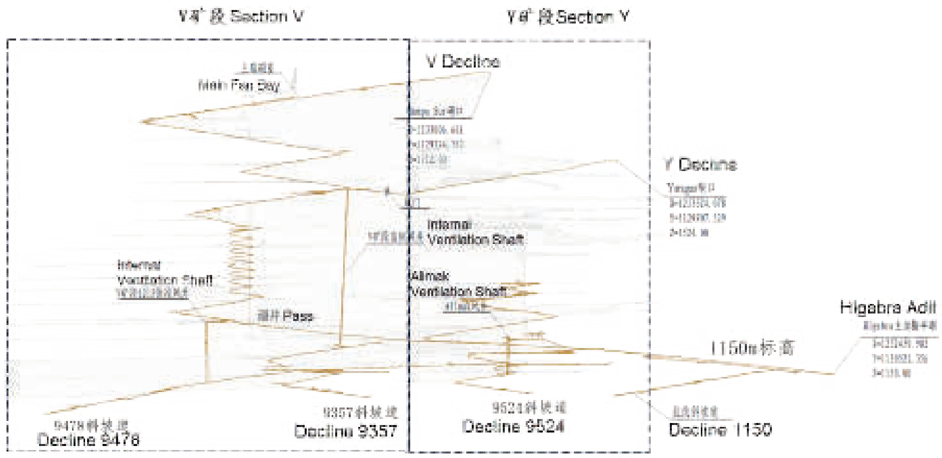
- The tunnels above 1,150 m ASL for the Yaragua, excluding the Yaragua Decline, have been sealed due to issues caused by the illegal mining activities. Below the 1,150 m ASL, a decline is set to access the mining block 9524. The decline 9524 has been connected with the Higabra Adit and Decline 1150 at 1150 m ASL and 1030 m ASL, respectively. The ore from the mining

block 9524 is transported to the surface crusher via the Decline 9524, Decline 1150 or Higabra Adit. The producing stopes are mainly located between levels 1,016 m ASL and 1,140 m ASL. The fresh air is drawn into a working face via the Higabra Adit, Decline 1150. After flushing through the working face, the exhausted air is drawn out via the ventilation upcasts in Veta Sur and the Veta Sur Decline. The groundwater inflows are temporarily collected into the water dam at 1,090 m ASL, then pumped to surface via water pipes installed in ramps and the Higabra Adit.

- The tunnels above 1,315 m ASL for the Veta Sur, excluding the Veta Sur Decline and Yaragua, have been sealed. Below the 1,150 m ASL, two declines were constructed to access mining blocks 9357 and 9478. The two declines connected with the Higabra Adit at 1,120 m ASL. The Decline 9357 was also connected to the Decline 1150 at 1,000 m ASL. The ore from a mining block is transported to the surface crusher via the declines, Decline 1150 or Higabra Adit. The producing stopes are mainly between levels 1,000 m ASL and 1,315 m ASL. The air flowing route is same as that of Yaragua. The groundwater inflows are temporarily collected into the water dam at 1,200 m ASL, then pumped to surface via the Higabra Adit.

The mining methods practiced is the SLOS method, with delayed backfilling. The method will be continually used for the extraction of ore. The nominally mining capacity will be expanded to 1,650 ktpa from the start of year 2028, by developing third ramp and expanding back-filling system, as proposed by the mine.

Figure 9-1: Schematic View of Existing Development System



Sources: *FS 2025*

9.2 Hydrogeology

The topography is very variable, with widely occurring steep valleys and shallow dipping peaks in the mine area. The highest elevation is 2,200 m ASL. The lowest elevation is 600 m ASL, in the Cauca gully.

The temperature varies between 17 °C and 26 °C. The annual precipitation is about 1,050 mm to 1,450 mm, averaging at 1,690 mm. The maximum 24 hours precipitation is between 80 mm and 150 mm per day ("**mm/d**").

There are two major catchments in the mine area, namely the Quebrada La Mina (about 5.8 km^2) and the Quebrada Bermejal (about 12.3 km^2). The waterflows of these two catchments assembled in the Quebrada La Tesorero (about 18.3 km^2), then flow to the Cauca River.

Water pressure tests were performed in wells in the Higabra valley by the Tierra Group International ("**TGI**") in June 2017. The tests indicated the groundwater flows in north and north-east directions with an average hydraulic gradient of 0.4 at an average flow rate of about 20 litres per second ("**L/s**"). The flowing directions are controlled by hydraulic gradient and fracture direction.

Four hydrogeological units are interpreted, namely aquifer of strongly permeable aquifer of alluvial, moderately-strongly permeable aquifer of fractured rock, moderately-weakly permeable aquifer of cataclasite and weakly permeable aquifer of Cretaceous sediment. The aquifers are mainly charged with rainfall via fractures.

The alluvial aquifer is 60 m thick at most with a variable permeability relating to the aquifer's thickness. Permeability of underlying fissure aquifer of bedrock is related to the lithology.

To estimate groundwater inflows to underground workings during mining, Montgomery & Associates constructed a numerical groundwater flow model calibrated with available hydrogeologic data. The modelling area was separated to two sections at the Level 1,176 m ASL. Groundwater flow estimates are shown in Table 9-2.

Table 9-2: Groundwater Inflow Estimates (m^3/d)

Section	Normal	Maximum	Remarks
above Level 1,176 m ASL	9,850	14,256	1,728 m^3/d after 10 years mining.
below Level 1,176 m ASL	8,640	10,368	5,184 m^3/d after 10 years mining.

Sources: *FS 2025*

9.3 Geotechnical Conditions

Many uniaxial compressive strength (the "**UCS**") tests were conducted by the CGL Colombia in 2014. Testing results are shown in Table 10-3.

Table 9-3: Geotechnical Properties of Intact Rock

Rock	Hoek-Brown Coefficient	Tensile Strength (MPa)	Compressive Strength (MPa)	Young's Modulus	Poisson's Ratio
Andesite	11	16	104	28.6	0.23
Breccia	23	17	97	/	/
Volcanic Breccia	13	10	98	32.1	0.19
Conglomerate	10	23	113	64.3	0.32
Diorite	17	13	164	/	/
Volcanic Sedimentary Rock	9	19	98	/	/

Sources: *FS 2025*

Five structural-geomechanically domains were delineated, as described below:

- Diatreme Fault Zone Domain consists of two 50 m apart sub-parallel faults, containing many thrust zones. Rock quality is poor. Most of the core are too strongly fractured to carry out tests. The average compressive strength is about 50 mega Pascals ("**MPa**") based on a few suitable samples.
- Diatreme Hanging Wall Domain: Rock quality is fair. The average compressive strength is 98 MPa derived from 17 UCS tests.
- Diatreme Footwall Domain: Rock quality is good. The average compressive strength is 90 MPa derived from the 24 UCS tests.
- West Fault Zone Domain: Rock quality is poor, like the Diatreme Fault Zone Domain. No laboratory test samples were obtained to date.
- Tonusco Fault Zone Domain: Rock quality is poor, like the Diatreme Fault Zone Domain. No laboratory test samples were obtained to date.

Historically, landslides and slope collapses have been observed in the Higabra valley. These incidents could occur again and bring risks to the mine's road, power transmission lines and facilities.

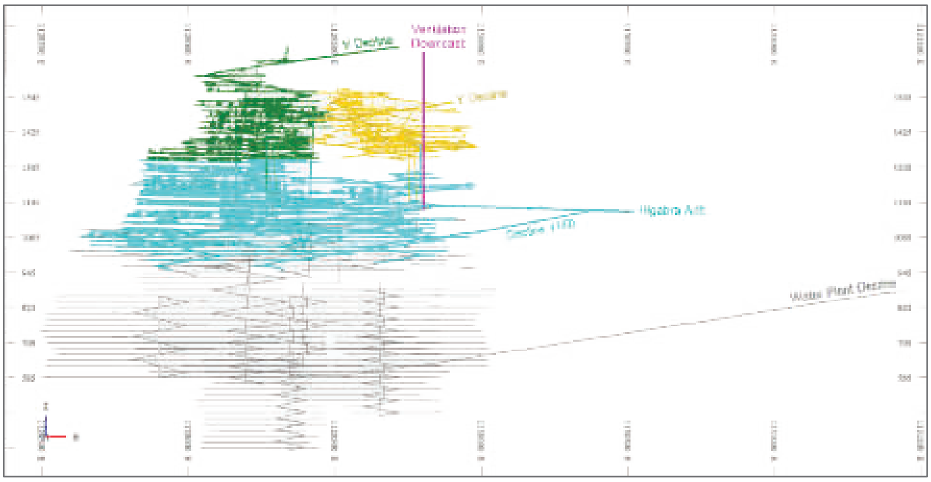
The peak acceleration is 0.20 gravity.

9.4 Development System

The purpose of development system is to provide access from surface to the mineralised zone to extract ore and waste, as well as to provide ways for transport of rocks, ventilation, drainage, and so on. Usually, a development system consists of tunnels and bays for running and installation of equipment.

The development system mainly includes the Higabra Adit, the Veta Sur Decline, the Yaragua Decline, the Decline 1150, the Central Ventilation Downcast, passes, the Water Plant Decline, the internal central ventilation downcast, Internal Veta Sur and Yaragua ramps, several internal ventilation shafts, the hauling levels down to the 345 m ASL in 40 m spacing interval, and the crosscuts connecting the internal ramps and the hauling ways. Each level is usually subdivided into two 15m to 20 m high sublevels. The longitudinal view of development system is shown in Figure 9-2.

Figure 9-2: Longitudinal View of Development System



Sources: CGL Colombia

Notes: #2 adit, which is at level 1614, is not shown in the figure.

Each mining section is furtherly subdivided into five subzones to carry out simultaneously mining operations. The subzones are the old group of levels between 1,380 m ASL and 1,105 m ASL, the first group of levels between 1,105 m ASL and 925 m ASL, the second group of levels between 925 m ASL and 745 m ASL, the third group of levels between 745 m ASL and 565 m ASL, and the fourth group of levels below the 565 m ASL. Extraction of Mineral Resources starts from the bottom sublevel, advancing upward at 15 m to 20 m per sublevel.

The ore from stopes at levels between 925 m ASL and 595 m ASL is transferred directly to the ore pass connecting with the draw point at level 565 m ASL with a LHD, then loaded into 40 t truck to be transported to the surface via the Water Plant Decline.

The ore from stopes at levels above 925 m ASL and below 595 m ASL is loaded to 20 t or 30 t trucks with a LHD at the draw point, then transported to surface crusher via the haulage way, internal ramps and the Water Plant Decline.

9.5 Mining Methodology

CGL Colombia has practised several mining methods previously, and concluded that the SLOS with delayed backfilling is the appropriate mining method to extract ore. SLOS is used for mining mineral deposits with steep dip where the footwall inclination exceeds the angle of repose, stable rock in both hanging wall and footwall, competent ore and host rock, and regular ore boundaries. SLOS recovers the ore in large open stopes, which are normally backfilled to enable recovery of pillars.

Stopes are laid along the strike direction of orebodies. The sublevel stope is 40 m long, 20 m high, and no less than 1.8 m wide. There is neither bottom nor crown pillar.

Stope development includes loading crosscuts, a cut slot, an undercut and drilling headings. Loading crosscuts are driven from the level haulage to the undercut in 10 m interval.

Downward vertically long holes are drilled with DL210 jumbo rig in a drilling heading. The blasthole has a diameter of 72 mm, length of 11 m and overburden of 0.85 m to 1.0 m. Powder ammonium nitrate/ fuel oil (the "**ANFO**") explosives are charged into the blastholes, utilising a specialist trackless vehicle. A non-electric detonator is applied to initiate the blast at a 4 or 5 row blasthole interval. Blasted ore falls to the undercut by gravity and is loaded with remote LHD loader in the loading crosscuts. The mining rate is about 300 tpd for a stope.

Fresh air flows to headings and crosscuts via internal ramps and level haulage ways, while the exhausted air flows to the upper ventilation level via ventilation raise.

Mined out stopes, after completing of barrier walls, are backfilled with pastes via filling tubes located in the upper level ventilation level. Ratios of cement and sand are 1:10 and 1:13 for backfills at both top and bottom layers and those in the middle, respectively.

This mining method has been utilised for several years onsite. SRK was informed that this method would be continually used in future.

9.6 Mining Equipment

In SRKs opinion, there is sufficient mining equipment in place to support mining operations. The list of primary mining equipment is shown in Table 9-4.

Table 9-4: Primary Mining Equipment

Equipment	Mode	CGL Colombia's Quantity	Contractor's Quantity	Total
Drilling Jumbo	DL210	5		5
Drilling Jumbo	Simba 1254	3		3

9.7 Mining Services

9.7.1 Backfilling

The backfill demand is estimated to be 1,540 m^3/d (or 115.5 m^3/h). The existing paste plant is located near to the ramp's portal in Veta Sur. A filling pump has been installed in the paste plant, which has a filling capacity of 130 m^3/h and a maximum pumping pressure of 10 MPa.

Tailings are transported to the paste plant with two cable ropeways (175 t/h capacity) and dumped to the tailings bin embedded in the ground. Tailings are loaded to a belt conveyor via vibrator of YXZG5, then dumped to the mixing hopper. Normal Portland cement is transported to the paste plant with mixer and dumped into the cement bin. The cement is loaded to the mixing hopper via a twin-screw feeder. Tailings and cement are mixed with water in stirrers to produce 75% density backfill, which consists of 0.495 m^3/m^3 tailings, 0.015 m^3/m^3 cement and 0.490 m^3/m^3 water.

Backfill paste is pumped to voids via tubes laid in ramps and the underground downcast. Stowing gradient is 1.6-8.3.

9.7.2 Ventilation

The fresh air enters mine via the Central Ventilation Downcast, Higabra Adit, Decline 1150 and Water Plant Decline, then distributed to each stope via internal ramps, haulage ways and crosscuts. After cleaning workfaces, the exhaust air in Veta Sur is drawn out of mine via internal ventilation shaft, internal ramps and Veta Sur Decline. The exhaust air in Yaragua, it is drawn out of mine via internal ventilation shaft and Yaragua Decline. The fresh air demand is about 455 cubic meters per second ("**m^3/s**").

Three main fans are installed in Veta Sur to draw out of exhausted air. The fans are located at the Fan Bay in Veta Sur Decline, the Fan Bay 1215 and the Fan Bay in Central Ventilation Downcast. Just one main fan is installed at the portal of Yaragua Decline to draw out of exhausted air in the Yaragua. The fan's location and properties are shown in Table 9-5.

Table 9-5: Main Fan's Location and Properties

Item	Unit	Easy Period	Difficult Period
Main Fan at the Fan Bay in Veta Sur Decline			
Air demand	m^3/s	322	322
Air resistance	Pascal ("**Pa**")	4,318	4,672
Efficiency	%	85	82

Sources: *FS 2025*

Local fans are used for ventilation at the drawpoint, drilling workface, explosive charging workface, stopes, and developing tunnels.

9.7.3 Mine Drainage and Dewatering

Permanent water dams are set at levels 925 m ASL, 745 m ASL, 565 m ASL and 425 m ASL. The groundwater inflow to the water dam is pumped to the upper water dam one by one, till to the surface. The pumping capacity of each water dam is normally 8,640 cubic metres per day ("**m^3/d**"), maximised about 10,368 m^3/d. There is additional 600 m^3/d wastewater should be pumped out of mine.

Before the completion of the Water Plant Decline, the groundwater inflow above the level 925 m ASL flows to the water dam at level 925 m ASL by gravity, while the groundwater inflow between the levels 925 m ASL and 745 m ASL flows to the water dam at level 745 m ASL by gravity, then is pumped up to the water dam at 925 m ASL. The inflows in the water dam at 925 m ASL is finally pumped up to the surface sedimentation pool at 1,150 m ASL.

After completion of Water Plant Decline, the groundwater inflow above the level 565 m ASL flows to the water dam at level 565 m ASL by gravity, while the groundwater below the level 565m ASL flows to the water basins in lower levels by gravity, then is pumped up to the water dam at 565 m ASL. The inflows in the water dam at 565 m ASL is finally pumped up to the surface sedimentation pool. The seamless steel pipe is 325 mm in external diameter by 7.5 mm in wall thickness.

Properties of water pumps are summarised in Table 9-6.

Table 9-6: Water Pump Properties

Item	Unit	Water Dam 925	Water Dam 745	Water Dam 565	Water Dam 425
Water Pump		MD450-90×3(P)	MD500-40×5(P)	MD500-40×9(P)	MD500-40×5(P)
Flow Rate	m^3/h	450	500	500	500
Water Head	m	225	200	350	200
Electric Motor	kW	560×3	400×3	710×3	400×3

Sources: *FS 2025*

9.7.4 Water Supply

Water demand is about 1,945 m^3/d for the underground mining and surface backfill plant. Fire extinguish water demand is about 72 m^3/h.

All the required water is sourced from the recycled groundwater inflow. Water is supplied from the surface elevated tank with a supply pressure of between 0.4-0.7 MPa and enters into the mine via seamless steel pipe of Φ140×9 mm in Higabra Adit and internal ramps.

9.7.5 Compressed Air

The maximum demand of compressed air is about 79.9 m^3/min.

Three fixed screw compressors are installed to supply the mining operations with compressed air. Each compressor has a flow rate of 43 m^3/min and a discharge pressure of 0.7 MPa. Compressed air is distributed to underground levels via seamless steel pipe of Φ219×6mm installed in Higabra Adit and internal ramps.

9.8 Mine Production Plan

9.8.1 Operating Schedule and Production Capacity

The Buritica Project has been and will be operated on 12 hours per shift, 2 shifts per day and 330 days per year. Both the nominal mining capacity and processing throughput are now 4,000 tpd ore, or 1,320 ktpa. CGL Colombia are planning to expand the mining capacity and processing throughput to 5,000 tpd or 1,650 ktpa from the start of year 2028.

9.8.2 Production Plan and LoM

The production schedule is shown in Table 9-7, based on SRK's modelling. The life of mine ("**LoM**") is about fifteen years, including a three-years ramp up period to expand mining capacity from the current 1,320 ktpa to 1,650 ktpa, a nine-years full-production period and a three-years ramp-down period.

Table 9-7: Production Schedule

Item	Unit	2025	2026	2027	2028	2029	2030	2031	2032

Sources: SRK

Notes:

[1] All the mined materials are fed to the Buritica Plant.

9.8.3 Production Expansion Options

CGL Colombia planned to expand the mining capacity and processing throughput to 5,000 tpd or 1,650 ktpa from the start of year 2028, by developing a third ramp and expanding the back-filling system, while a detailed plan is still in preparation.

10 Processing and Metallurgical Assessment

10.1 Processing and Metallurgical Test Work

10.1.1 Test Work to Support the Processing Plant Design

The test work is to assess the ore beneficiability, develop the process flowsheet and the plant design criteria. These studies have been carried out by different qualified laboratories between 2011 and 2015, as shown in Table 10-1.

Table 10-1: Summary of Test Work Completed in Phase I

Sources: JDS FS NI43-101 Report (20 March 2016)

The completed metallurgical tests were appropriate to develop metallurgical flowsheet and plant design criteria. JDS Energy & Mining Inc carried out a feasibility study for the Buritica Project and designed the Buritica Plant in 2016 based on the test results. The Buritica Plant was built adopting the derived flowsheet of "gravity-cyanidation" to extract gold and silver, producing gold doré bullion, with designed recoveries of 95% for gold and 59% for silver. The Buritica Plant started construction in November 2017 and commissioning trial production in April 2020. The overall recoveries in the second half year of 2020 are 90% for gold and 50% for silver which were lower than the designed recoveries. The designed capacity of the Buritica Plant is 3,000 tpd of ore and included the flowing operation circuits:

- Primary crushing
- Semi autogenous mill + ball mill + pebble crusher ("**SABC**")
- Gravity separation
- Pre-leach thickening and agitation cyanide leaching
- Conter current decantation ("**CCD**")
- Merrill Crowe zinc precipitation
- Smelting
- Tailings cyanide detoxification
- Tailings dewatering

- Tailings stacking into the TSF

Although the production process of "gravity – cyanidation" can effectively recover gold, it has the following disadvantages: "

- Silver recovery rate is low, only 40% ~ 50%;
- Copper and zinc are not recovered;
- Quantitative copper is leached out in the process of cyanidation resulting high copper content in the pregnant leach solution ("**PLS**") and high sodium cyanide consumption, high zinc powder consumption, and low grade of gold doré bullion;
- The quantity of cyanide tailings is high consuming a quantity of cyanide deconstruction regents.

10.1.2 Test Work to Support the Plant Upgrading and Expansion

Phase II test work is to upgrade the process plant for comprehensively recovering copper, zinc and pyrite (hereafter referred to as sulphur) and raising the recoveries of gold and silver. These tests were carried out by Xiamen Zijin Technology of Mining and Metallurgy Ltd, which comprised of the following:

- *Experimental research report on optimisation technology development of processing and metallurgy of Buritica Gold Mine, Colombia*, November 2020.
- *Research report on basic mineralogy and gold occurrence state of a gold mine in Colombia*, October 2019.
- *Research report on processing and metallurgical technology development of Buritica gold mine, Colombia*, August 2019.

Composite Sample

Based on the mineralogical studies and metallurgical tests of different grade composites from Ore Sections Veta Sur and Yaragua conducted in 2019, a total of 139 processing testing and grade verification samples from Ore Sections Veta Sur and Yaragua were blended into 5 working face composite samples respectively, according to the gold grade, gold-sulphur ratio, and elevation, resulting in a total of 10 working face composite samples. According to the gold grades of the working face composite samples, the Section Vata Sur composite (VS Composite) and the Section Yaragua composite (YR Composite) were prepared with gold grades of 7 to 8 g/t, respectively. The Master Composite was then prepared by blending the ore section composites at a ratio of Veta Sur:Yaragua = 6:4.

The following tests were conducted:

- Head assay and multi-element chemical analysis
- Process mineralogy research
- Comminution test
- Verification test of the existing process flowsheet (gravity separation - cyanidation)
- Whole ore cyanidation ("**WOCN**") test
- Bulk sulphide flotation test

- Slurry sedimentation performance test
- Process flowsheet test

Head Assay

The head assay results are shown in Table 10-2.

Table 10-2: Head Assay Results

Element	Unit	Veta Sur Composite	Yaragua Composite	Master Composite
Au1	g/t	6.26	9.5	7.71

Mineralogy

In the master composite, gold minerals are primarily composed of electrum, with a minor presence of petzite. At a grinding fineness of 80% minus 145 μm (P_{80} = 145 μm), gold mainly exists as exposed gold (accounts for 83.1%), including the liberated gold (71%) and the locked gold (12.1%). The liberated gold has a particle size ranging from 0 to 700 μm, and the coarse gold (>100 μm) accounts for 65.7%, making it suitable for preferential recovery via gravity separation. The micro-fine gold (<40 μm) constitutes 11.9% of the liberated gold, which is more amenable to flotation recovery. The locked gold contains sub-optimally locked particles (40–100 μm) that require further fine grinding for liberation. Additionally, sulphide-encapsulated gold accounts for 16%, predominantly as ultra-fine particles (<20 μm), which can be recovered along with sulphides.

The master composite sample contains abundant silver-bearing minerals, with tetrahedrite being the predominant carrier, accounting for 65.7% of the total silver in the RoM. Silver content in tetrahedrite varies significantly across different particles, ranging from 0.5% to 20%, with an average silver content of about 7.57%. In the copper concentrate, tetrahedrite is enriched by approximately 128 times compared to RoM, with a silver recovery rate of 73%, demonstrating that tetrahedrite can be effectively recovered through flotation.

The independent silver minerals include: the Au-Ag compounds, mainly electrum, representing 3.49% of the total silver content in the ore; the silver tellurides, including sylvanite and hessite, accounting for 2.76% of the total silver content in the ore; and the silver sulphides, mainly acanthite, comprising 2.88% of the total silver content in the ore. The total silver content in independent silver minerals collectively constitutes 9.13% of the total silver content in the ore, which can be recovered through gravity separation and flotation methods. Furthermore, in the Buritica deposit, a portion of silver occurs as invisible silver distributed within sulphides such as pyrite, chalcopyrite, sphalerite, and galena. This portion accounts for 20.19% of the total silver content in the ore.

Overall, multiple silver minerals are contained in the Buritica deposit, distributed in a scattered manner. The tetrahedrite, the main silver-bearing mineral, is difficult to achieve thorough leaching in cyanide solution, and the invisible silver within the sulphide minerals is also unrecoverable through cyanide leaching, which poses constraints on silver recovery. Nonetheless, silver can be further recovered through flotation.

Gravity and Cyanidation Tests

Standard three-stage grinding and gravity separation tests were conducted on the master composite of Ore Sections Veta Sur and Yaragua. The gravity separation test equipment used was a centrifugal concentrator, Knelson Concentrator ("**KC**"), and the KC concentrates from each stage were subjected to washing for cleaning. The results are shown in Table 10-3. The concentrate grade was 440.8 g/t, with a gold recovery rate of 59.7%, suggesting the existence of nugget gold in the ore, which can be recovered by gravity separation.

Table 10-3: Gravity Separation Test Result

Stage	Grind Size	Mass Pull (%)	Concentrate Grade (g/t)		Recovery (%)	
			Au	Ag	Au	Ag
1st Stage	P_{100}=380μ	0.17	1,607.6	714.6	35.2	2.9
2nd Stage	P_{80}=125μ	0.41	302.6	230.4	16.3	2.3
3rd Stage	P_{80}=94μ	0.45	136.8	175.0	8.2	1.9
Total Concentrate		1.02	440.8	284.4	59.7	7.0

Sources: CGL Colombia

Whole ore cyanidation tests were conducted on RoM and gravity tailings from Veta Sur composite, Yaragua composite and Master composite. The test results are presented in Table 10-4.

When the grinding fineness (P_{80}) of the Master composite was reduced from 145 μm to 38 μm, the gold grade in the cyanide tailings decreased from 1.08 g/t to 0.72 g/t, while the gold leaching rate increased from 85.3% to 89.8%. Meanwhile, the silver leaching rate increased from 45.3% to 55.9%, indicating that fine grinding can enhance gold and silver leaching rates. At the same time, the copper leaching rate also rose from 12.8% to 25.6%, and the copper concentration in the pregnant leach solution increased from 20-fold to 43-fold the gold concentration. Copper leaching not only consumes substantial amounts of sodium cyanide and zinc powder but also leads to a reduction in the gold content of the final product, the doré bullion.

Table 10-4: Whole Ore Cyanidation Test Results

Sample	Grind Size	Feed Grade (g/t)		Residue Grade (g/t)		Extraction (%)		Consumption (kg/t)

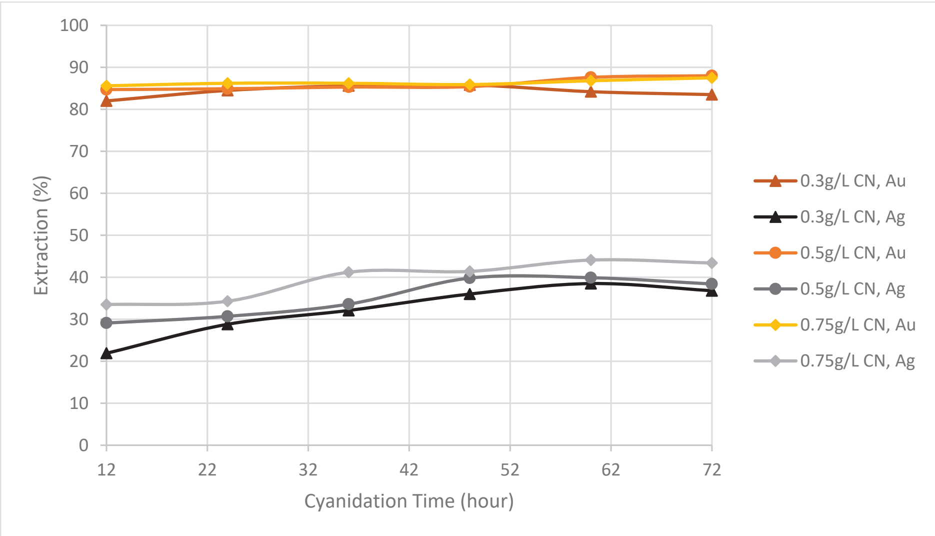
Sources: CGL Colombia

The comprehensive recovery rate of the Master composite, by gravity separation followed by cyanidation of the tailings, was Au 91.2% and Ag 49.4%. The gravity tailings were leached under three different sodium cyanide concentrations, and the leaching curves, as shown in Figure 10-1, demonstrate that the Buritica ore is suitable for leaching under low sodium cyanide concentrations.

Figure 10-1: Extraction Vs Cyanidation Time for Gravity Tails of Master Composite



Sources: CGL Colombia

Gravity - Flotation - Cyanidation - Flotation Tests

The bulk sulphide flotation test was carried out on the gravity tailings which have a grinding fineness of P_{80}=145 μm. The results showed that the gravity separation - bulk sulphide flotation - flotation tailings discarding process can achieve gravity separation concentrate + flotation concentrate yield of 23.5%, gold recovery rate of 98%~99%, and silver recovery rate of 96%~99%. The copper, lead and zinc grade in the flotation tailings were lower than the detection limit, and full recovery was basically realised.

In order to provide a technical basis for the upgrade of the Buritica Plant, the following three flowsheets were tested in detail:

- Flowsheet 1: Gravity separation - copper preferential flotation from gravity separation tailings – zinc and pyrite (sulphur, S) flotation - zinc sulphur flotation concentrate regrinding & cyanidation - zinc flotation from cyanide residue.
- Flowsheet 2: Gravity separation - bulk sulphide flotation of gravity separation tailings - copper/ zinc sulphur separation flotation of bulk sulphite concentrate - zinc sulphur concentrate regrinding & cyanidation - zinc flotation from cyanide residue.
- Flowsheet 3: Gravity separation - bulk sulphide flotation of gravity separation tailings - bulk sulphide flotation concentrate regrinding & gravity reseparation - gravity reseparation tailings cyanidation – copper and zinc flotation from cyanide residue.

Compared with the existing "gravity separation - cyanidation" process, the gold recovery rate of Flowsheet 1 remains basically unchanged, and the silver recovery rate increases by 20%~25%. About half of the copper is recovered in the form of copper concentrate with marketable quality. It significantly reduces the amount of copper in the cyanidation system and reduces the consumption of sodium cyanide. Most of the zinc can be effectively recovered, improving the Mineral Resource utilisation rate. The yield of flotation tailings is about 65%, which can be directly discarded. It reduces the processing capacity of cyanide residue and saves cyanide breaking costs.

Compared with Flowsheet 1, the gold recovery rate of Flowsheet 2 is basically the same, and the recovery rate of silver is higher, which is 30%~35% higher than the existing "gravity separation - cyanidation" process. However, for the copper-lead concentrate produced by bulk sulphide flotation from gravity separation tailings, it is difficult to separate copper and zinc.

Compared with the existing "gravity separation - cyanidation" process, Flowsheet 3 has no obvious improvement in silver recovery and reduction of copper leaching rate by cyanidation. But zinc can be effectively recovered.

After comprehensive analysis of the features of the three flowsheets, Flowsheet 1 is recommended as for the plant transformation, as shown in Figure 10-2. The flowsheet of "Gravity separation - copper preferential flotation from gravity separation tailings – zinc sulphur flotation from copper flotation tailings – zinc sulphur flotation concentrate regrinding & cyanidation - zinc flotation from cyanide residue" is adopted as the final technical upgrade process. The test results of this process are shown in Table 10-5.

Gravity separation: The concentrate yield is 0.01%. The grades of gold, silver and lead are all high, which are 34,267g/t gold, 9,342g/t silver, and 63.1% lead, with a recovery rate of 43.87% gold, 2.15% silver, and 5.72% lead, respectively.

Copper preferential flotation from gravity separation tailings: The copper concentrate has a yield of 0.25%, with 390 g/t gold, 8,592 g/t silver, and 21.08% copper. The recovery rates are 12.96% gold, 49.01% silver, and 51.02% copper, respectively. The grades of gold, silver and copper are high in the copper concentrate. But a lot of zinc is also contained.

Zinc-sulphur concentrate cyanidation: The operating leaching rates are gold 72.5% and silver 47.8%. The leaching rates as to the RoM are gold 29.1% and silver 20.5%.

Zinc flotation from cyanide residue: The yield of zinc concentrate is 0.72%. The grades of gold, silver and zinc are high, which are 12.18 g/t gold, 402.1 g/t silver and zinc 65.13%, with a recovery rate of gold 1.16%, silver 6.58% and zinc 77.7%.

The comprehensive recovery rate is 87.1% gold, 78.2% silver, 51.0% copper and 77.7% zinc. Since the flotation test is not a full-closed circuit, the metal grade in the copper middling's and zinc-sulphur middling's is relatively high. There is still the possibility of further recovery. At the same time, the zinc flotation tailings may also be further floated to produce sulphur gold concentrate.

Table 10-5: Gravity-Cu Flotation- Zn/S Flotation-Zn/S Concentrate Regrind-Cyanidation-Zn Flotation from Cyanide Residue

Product	Mass Yield	Grade (*g/t, %)					Recovery (%)

10.1.3 Test Work to Optimise the Plant Operations

After the completion of the plant technical transformation tests, the 4,000 tpd technical transformation project was initiated in December 2020 in accordance with the recommended process. The Buritica Project was completed by the end of 2021, and trial operation was conducted. In March 2022, it achieved full production capacity and standards, comprehensively recovering gold, silver, copper. The products were gold doré bullion, copper gold mixed concentrate, but the zinc flotation is not yet put into operation because of the current lower zinc grade of the RoM. In order to optimise the plant operations after the transformation, frequent metallurgical test work were carried out, such as the feasibility of sulphur flotation of zinc flotation tailings, discarding the low-grade pebbles from the comminution circuit to improve the grinding efficiency, regrind the gravity concentrate to improve the grade.

10.2 Processing Plant

10.2.1 Overview

Buritica Plant is located in Higabra Valley on the east side of the main haulage adit. The plant began production in April 2020. A process of "gravity separation + whole ore cyanidation" was adopted for gold and silver extraction to produce gold doré bullion. In order to recover the associated copper and zinc, increase the recovery of silver, and improve the plant capacity while reduce the cyanidation consumption, Zijin Xiamen complied a *Feasibility Study on Mining, Processing and Metallurgical Technical Innovation Project of Colombia Buritica Gold Mine* in July 2020. In December 2020, 4,000 tpd technical transformation project was started, and finished in the end of 2021. After the technological upgrading and capacity expansion campaign, the Buritica Plant capacity is expanded from 3,000 tpd to 4,000 tpd, and the flowsheet comprised of crushing, grinding, gravity separation, copper flotation, zinc and pyrite (sulphur) flotation, zinc and pyrite bulk concentrate cyanidation, gold smelting, tailings management. The final products are gold doré bullion, copper-gold concentrate.

The updated plant was put into operation in January 2022. The production results proved the assumptions were successful. The mass yield of zinc-pyrite concentrate is about 30%, greatly decrease the quantity of cyanidation feed. The overall recovery rates of gold and silver have both increased compared to original gravity – cyanidation process. A full view of the Buritica Plant is shown in Figure 10-3.

Figure 10-3: Full View of the Buritica Plant

10.2.2 Processing Flowsheet

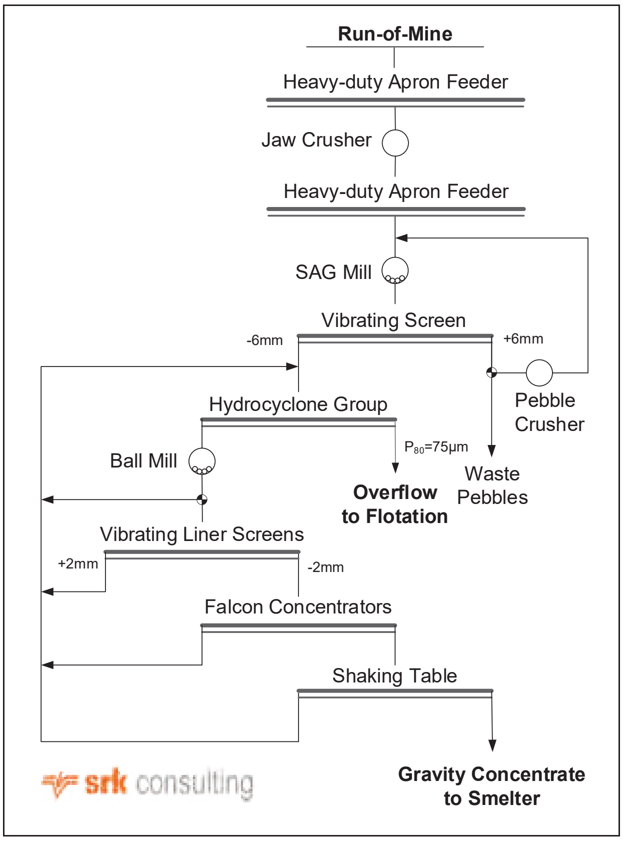
Crushing, Grinding and Gravity Separation Process

The flowsheet is shown in Figure 10-4. The comminution process is composed of "primary jaw crusher + semi-autogenous mill + ball mill + pebble cone crusher", which is called SABC process. Three centrifugal concentrators (Falcon concentrator) are installed in the ball milling-classification circuit to recover the liberated gold. The final product of the comminution process has a fineness of P_{80}=75 μm, which is much finer than the designed P_{80}=130 μm.

The ball mill discharge is pumped into the slurry distribution box and evenly distributed to three series of gravity separation circuits. Each gravity separation circuit includes a linear vibrating screen to remove coarse materials. The undersize material of the screen enters a Falcon concentrator to recover liberated gold. The Falcon concentrates are further cleaned by a shaking table before entering the smelter.

The oversize product and gravity tailings enter the hydrocyclone feed pump box and pumped to a hydrocyclone cluster, forming a closed-circuit of milling and classification.

Figure 10-4: Crushing, Grinding and Gravity Separation Process



Sources: SRK

Flotation and Dewatering Processes

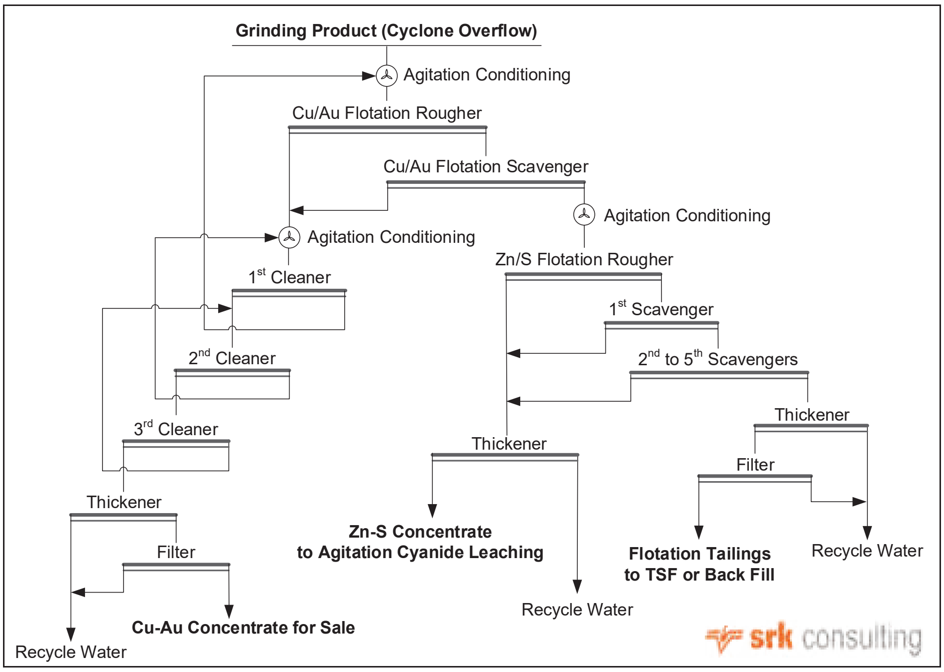
The processes are as Figure 10-5, including copper and gold flotation circuit, zinc and pyrite(S) flotation circuit and three dewatering circuits for copper-gold concentrate, zinc-pyrite concentrate and flotation tailings, respectively.

Copper and gold flotation circuit is a "1 roughing and 1 scavenging and 3 cleaning process", producing copper and gold mixed concentrate. The concentrate is thickened and filtered and packaged for sale.

Zinc and pyrite flotation circuit is a "1 roughing and 5 scavenging process", producing zinc and pyrite bulk concentrate. The concentrate is thickened and then pumped to agitation cyanide leaching circuit.

The flotation tailings is thickened and filtered for dewatering. The dewatered tailings are transported by belt conveyor to a tailings storage tent, where it is loaded onto vehicles to transport to the TSF or forwarding station to transported to backfill plant by cable cars.

Figure 10-5: Flotation Process



Sources: SRK

Cyanidation of Zinc and Pyrite Bulk Concentrate

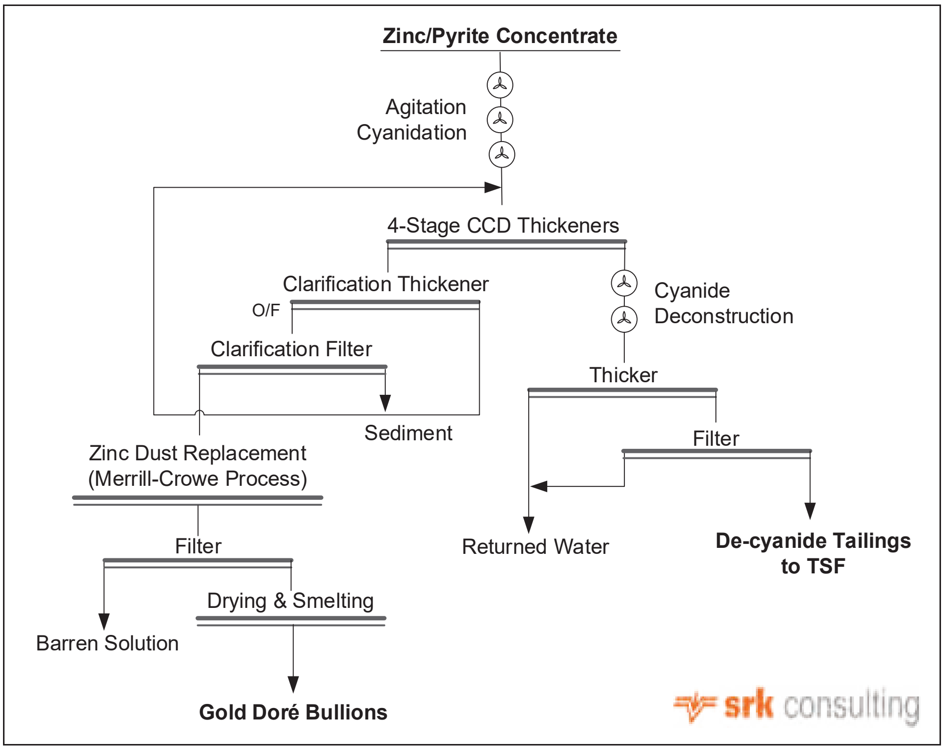
The process is as Figure 10-6. The zinc and pyrite bulk concentrate is thickened and then pumped into agitation cyanide leaching tanks. The cyanide leaching circuit comprises 5 agitation tanks with each working volume of 2,758 m^3 for 3,000 tpd ore retention time 48 hours. As the feed material is zinc and sulphur concentrate after technological transformation, the feed volume is greatly reduced to approximate 1,200 tpd, only 3 of the 5 tanks are used and the retention time is about 70 hours. The leachable pulp enters CCD circuit of 4 thickeners for solid-liquid separation. The overflow of the first CCD thickener is PLS, is clarified in a clarification thickener and then pumped to the Merrill Crowe circuit for gold precipitation by zinc powder replacement. The gold precipitate sludge is then pumped to the filter press and the filter cake is sent to gold room for smelting.

The underflow of the fourth CCD thickener is detoxicated in 2 agitation tanks with addition of lime milk and sodium metabisulfite, and air injection (SO_2/ air method). The cyanide deconstructed residue is thickened and filtered for dewatering. The dewatered residue is transported to TSF by trucks.

Smelting

The gold precipitate from Merrill Crowe process and gravity concentrate are dried in one of the two electric dry ovens. The dried gold precipitate and concentrate are smelted in one of the two intermediate frequency furnaces separately, and casted into moulds. The slag is transported to the ore grinding circuit for leaching again, the gold doré bullion is sampled, weighted and stored for sale.

Figure 10-6: Agitation Cyanide Leaching and Merrill Crowe Process



10.2.3 Processing Facilities and Equipment

The Buritica Plant consists of RoM stockpile, primary crushing facility, coarse ore stockpile, SABC grinding facility, flotation facility, agitation leaching facility, CCD washing facility, Merrill Crowe zinc replacement facility, concentrates dehydration facility, tailings dehydration facility, gold smelting facility, laboratory, mechanical repair shop.

The main processing equipment of Buritica Plant is listed in Table 10-6. Figure 10-7 shows some of main equipment and facilities.

Table 10-6: Main Processing Equipment

10.2.4 Historical Production Performance and Capacity Expanding Plan

The historical production performances after technological transformation and expansion are listed in Table 10-7. Compared with the recoveries of the original "gravity separation + cyanidation" process, the overall recovery of gold is roughly the same, and the overall recovery of silver is increased from 50% to 73%. Copper concentrate has low copper grade and high gold grade, sold as gold concentrate with copper and silver are priced.

Sources: CGL Colombia

Based on the monthly production data from January 2022 to March 2025, the grade (Au, Ag & Cu) - recovery curve plotted is shown in Figure 10-8. The recovery of gold was relatively stable, with a minimum of 84.4%, a maximum of 93.6%, and an average of 90.2%. The recovery rates of silver and copper fluctuate greatly. The lowest recovery of silver is 23.7%, the highest is 82.0%, and the average is 70.7%. The lowest copper recovery was 27.5%, the highest was 70.8%, and the average was 50.2%.

- CGL Colombia plans to expand the processing capacity from current 4,000 tpd up to 5,000 tpd by debottleneck of grinding circuit as both the flotation circuit and agitation cyanide leaching circuit has enough capacity. The debottleneck measures are: Discard low grade pebbles from semi-autogenous grinding ("**SAG**") mill discharge. The current pebbles returned to the SAG mill is about 500 tpd.
- Decrease the grind fineness from current P_{80}=75μm to P_{70}=75μm, increasing the ball mill throughput, and
- Pre-discard waste rock before grinding as a supplementary measure. A pre-discarding circuit has been built between primary crusher and SAG mill, which comprises a vibrating washing screen and a smart sorting system of Beijing Honesort Company. The industrial test is on-going.

Figure 10-8: Relationship Between Feed Grade and Recovery

10.3 Tailing Storage Facility

The TSF is located in the Higabra Valley. Its construction extends along the alluvial landform of the valley, where the Bermejal stream flows, between 850 and 1,150 m ASL, with an average gradient of 14%. The dam is bounded to the east by the Bermejal canal, to the west by the Occidental canal, to the north by the industrial wastewater treatment plant ("WTP"), and to the south by the Buritica Plant. Figure 10-9 shows the TSF.

The TSF is designed by Robertson GeoConsultants Inc. in July 2017. The designed total storage capacity is 6.05 million cubic meters ("**Mm^3**") of material, including filtered tailings, waste rocks from mining and plant rejection. The dry density is assumed as 1.7 t/m^3. The impoundment site consists of a compacted tailings core, a reinforced dam, and a backfill dam that border the entire perimeter of the impoundment. It is waterproofed with a double high density polyethylene ("**HDPE**") geomembrane and has a drainage system for managing contact and non-contact water. It also includes a gabion closure and vegetation cover to control erosion and expose the stored material.

The tailings stacking process in the TSF is carried out from north to south, with layer-by-layer accumulation, compaction and superimposition. The slope of each layer's surface from north to south is no less than 5.0%. During the operation of the TSF, SRK Consulting Colombia S.A.S. has a resident representative on site responsible for on-site inspection and acceptance.

Part of the flotation tailings is used for underground backfilling, while the remaining portion is stacked in the TSF. All cyanide tailings are stacked in the TSF. As of 25 February 2025, the total accumulated material stored in the TSF amounts to 3.77 Mm^3, of which 2.26 Mm^3 consists of compacted tailings and 1.51 Mm^3 consists of mining waste rock. The TSF roughly divided into five sections (cell 1 to cell 5) from north to south along the valley. Presently, the cell 1 and cell 2 are full, with rehabilitation completed of cell 1. The tailings and waste rocks are being stockpiled in the other three cells; 3, 4 and 5.

SRK Consulting Colombia S.A.S completed an expansion feasibility study in 2023 and expansion design of the TSF in August 2024. This expansion has been requested following the update of the mining plan issued by CGL Colombia, which requires a significant increase in the production of waste rock and tailings. The expansion involves extending the existing storage facility westward, horizontally resting one of the two sides of the operational TSF against the western slopes of the Bermejal Creek valley. The TSF will be transformed from its current flat terrain type to a hillside type. The total capacity of the TSF will raise from original 6.05 Mm^3 to 11.25 Mm^3.

The designs propose the management of tailings, waste rock, and water necessary to achieve a stable landform in the short, medium, and long term. This requires the filtration, transportation, and mechanical compaction of tailings, following strict quality controls, continuous monitoring, and constant oversight.

11 Workforce Assessment

11.1 Workforce Numbers

There are 1,470 people employed on the mine, with 65 people from China. Table 11-1 gives details about the workforces.

Table 11-1: Workforce of the Buritica Project

Centre	Staff. Personnel		Operator Personnel		Total	
	CN	Local	CN	Local	CN	Local

11.2 Assessment of Workforce

SRK is opined that the workforce and its composition are reasonable.

12 Project Infrastructure

12.1 Road Access

The mine was located 72 km northwest of Medellin City, Antioquia Province. It can be easily accessed from either Medellin City via the paved No. 62 road or the ports in Cartagena City via the highway network.

12.2 Power Supply

The power supplier has been and will still be the Empresas Públicas de Medellín (the "**EPM**"). There is no power supply contract in place now. Power consumption and costs in 2020 are shown in Table 12-1. The latest data and information are not available to SRK due to the confidential considerations of Zijin Gold International.

Table 12-1: Power Consumptions and Costs

Item	Unit	Jan.-Nov. 2020	Remarks
Consumption	kWh	46,069,052	January to November total.
Annual Cost	USD	4,438,237	January to November total.
Fixed cost [1]	USD	140,964	Bay rental from January to November. Main line maintenance from September to November.
Variable cost	USD	4,297,273	January to November total.
Unit Cost	/	/	
Fixed cost [1]	USD per month	15,301	
Variable cost	USD/kWh	0.095	

Sources: CGL Colombia

Future power load and demand are shown in Table 12-2. The primary electric equipment includes water pumps (3*355 kW) in the water dam at the Level 1,176 m ASL, fans (2*710 kW) at the portal of ventilation adit at the Level 1,435 m ASL, fans (2*280 kW) at the portal of the west upcast at the Level 1,707 m ASL, compressed air system (4*220 kW), emergency lighting, etc. The total rated power for the primary electric equipment is 3,925 kW, with an active power of 2,250 kW.

Table 12-2: Power Load and Demand

Item	Unit	Total	Users

General facilities and infrastructures		MWh	1,534	

Sources: *FS 2025*

There is an existing general substation of 110/ 33.2 kV near to the continuous CCD facility. Two transformers of 25 MVA and 110/ 13.2 kV have been installed with power supplied from the Chorodó Substation along a 32 km long overhead power transmission line. Additionally, six high-voltage switch cabinets will be installed.

Emergency power is supplied with two diesel generators of 2,000 kW near to the general substation. An additional standby diesel generator rated at 2,000 kW will be installed.

12.3 Water Supply

Water demand is shown in Table 12-3.

Table 12-3: Water Demand (m^3/d)

Item	Mining	Processing	Living	Others	Total
Domestic	-	85	100		185
Fresh	-	1,648	-	60	1,708

Sources: FS 2025

Water sources are described below:

- Groundwater inflow has been and will be supplied to underground working faces and surface backfill paste plant. Groundwater inflow is pumped up to the existing elevated tank on surface via pumps installed in the water dam at the Level 1,176 m ASL.
- Three wells are located southwest of the Buritica Plant, each with a pump to supply process water and domestic water. Each water pump has a flow rate of 120 m^3/h, a waterhead of 90 m and a power requirement of 45 kW. A 0.3 km long Diameter Nominal ("**DN**") 250 steel pipeline has been installed on site to connect the wells and the water tank in the Buritica Plant. The existing facilities can meet the water requirement of enlarged production capacity.

Process water supplies are described below:

- There is an existing water tank of 500 m^3 (Dimension is 12m*12m*4.5m (L*B*H)) on surface (1,735 m ASL) for mining operations. Additionally, a 0.5 km long steel pipeline of DN125 will be installed parallel to the existing DN100 pipe to support the enlarged underground water demand of fresh process water and fire distinguishing water.

- There is an existing water tank of 1,000 m^3 (Dimension is 12.5 m*10.9m (Φ*H)) near to the process plant on surface (1,150 m ASL). Water has been distributed to users in the Buritica Plant via an existing 1.0 km long steel pipe of DN300. The existing facilities can meet the water requirement of enlarged production capacity.

Domestic water supply is described below:

- There is an existing water tank of 150 m^3 (Dimension is 6.1 m*5.7 m (Φ*H)) near to the process plant on surface (1,150 m ASL). Processed water is distributed to users in the Buritica Plant via an existing 1.0 km long polyethylene pipe of 160 mm external diameter (De160). The existing facilities can meet the water requirement of enlarged production capacity.

Fire distinguish water supply is described below:

- There is an existing water tank of 1,000m^3 near to the process plant on surface (1,150 m ASL). The fire distinguishing facilities include an electric pump, a stabilised pressure pump, a diesel pump, 3.0 km long DN250 steel pipe and several fire hydrants. The existing facilities can meet the water requirement of fire distinguish.

There is no water supply contract in place now.

12.4 Consumables Supply

General consumables are supplied via Medellin City.

Steel balls and reagents/ chemicals related to the Buritica Plant, are imported from other countries.

Cement and lime are supplied locally.

Fuel is supplied by Servicauca at an average price of USD0.6/ L from January to November in 2020, with no contract in place now. Fuel will be supplied locally. It was estimated that 2,572 tpa of diesel is needed to support mine hauling, mainly used for LHDs and trucks.

12.5 Maintenance Facilities

The mine relies on the Medellin City to maintain its facilities and equipment.

12.6 Communication

The mine relies on local operators of mobile communication and wireless internet networks as the communication suppliers.

13 Environmental Studies, Permitting, Social or Community Impact, and Occupational Health and Safety

13.1 Environmental, Social, and Occupational Health and Safety Review Objective

The objective of this review is to identify and verify the existing and potential Environmental, Social, as well as Occupational Health and Safety ("**OHS**") liabilities and risks and assess any associated proposed remediation measures for the Buritica Project. At the time of this Report, the Buritica Project is on a commercial operation.

13.2 Environmental and Social Review Process, Scope and Standards

The process for the verification of the environmental compliance and conformance for the Buritica Project comprised a review and inspection of the Buritica Project's environmental management performance against:

- Colombian national environmental regulatory requirements; and
- Equator Principles (World Bank/International Finance Corporation ("**IFC**") environmental and social standards and guidelines) and internationally recognised environmental management practices.

13.3 Status of Environmental Approvals and Permits

The following laws are adopted in Colombia to protect the environment and to provide sustainable nature resource management:

- *National Mining Code;*
- *Environmental Law;*
- *Law on Air Protection;*
- *Law on Water Body Protection;*
- *Law on Noise Emission;*
- *Law on Solid Waste and Hazardous Waste Management;*
- *Law on Ecological Environment Protection; and*
- *Law on Forest Biodiversity and Ecosystem Protection.*

In Colombia, any projects and activities that may severely affect natural resources require environmental authorisation in the form of an environmental licence. In the case of mining, an environmental licence must be granted either by the National Environmental Licence Agency ("**ANLA**") or by a Regional Environmental Authority.

CGL Colombia has obtained the following major environmental licences from ANLA, in regard to the construction and operation of the Buritica Project:

- Environmental licence modification for the existing tailings storage facility expansion for the Buritica Project (Resolution No. 1633 of 2024), ANLA, 1 August 2024;
- Environmental licence modification for mining and processing capacity upgrade from 3,000 tpd to 4,000 tpd for the Buritica Project (Resolution No. 0411 of 2022), ANLA, 18 February 2022; and
- Environmental licence for integrating all former environmental permits for the Buritica Project (Resolution No. 1443 of 2016), ANLA, 30 November 2016.

Please note that the significant environmental and social impacts by the Buritica Project are associated with the mining, and processing activities. The environmental and social review identified the most significant current and potential environmental and social management and legislative compliance liabilities that relate to operation and further development of the Buritica Project and defined gaps in operational management as relates to industry best practices. The following sections identify the environmental and social aspects that have been addressed in the various environmental licences, environmental and social management plans, and other related documents, as well as those environmental and social aspects that have not been addressed.

13.4 Environmental Aspects

13.4.1 Site Ecological Assessment

The Buritica Project is situated in mountainous terrain of the Cordillera Central to the west of the north-flowing Cauca River, characterised by steep-sided valleys and subdued peaks. The landform and topography in the Buritica Project's mining area is commonly changed by mining, waste rock dumps, TSFs, haul roads, office buildings and dormitories, and other ancillary facilities. The development of the Buritica Project may also result in impacts to or loss of flora and fauna habitat. If effective measures are not taken to manage and rehabilitate the disturbed areas, the surrounding land can become polluted and the land utilisation function will be changed, causing an increase in water loss and soil erosion. As part of CGL Colombia assessment, they should determine the extent and significance of any potential impacts to flora and fauna habitat.

Forestry surveys to identify species of concern have been conducted. The Buritica Project area vegetation cover is mainly comprised of a mosaic of coffee, pastures, and natural spaces, riparian forest, and other grasslands. The FS 2025 report also states the mining operation may have little impact on the ecological environment if the appropriate preventive measures are taken. The environmental licences and the FS 2025 report contain proposed measures for controlling and monitoring soil erosion and minimising loss of flora and fauna habitat. These proposed measures include water and soil conservation, geological hazard protection and ecological restoration. CGL Colombia states that a species conservation monitoring plan has been implemented.

SRK recommends conducting baseline assessments along with predictions of potential impacts to floral and faunal communities in the surrounding area of influence to fully understand the Buritica Project's potential ecological environmental risk. In addition, SRK recommends an operational land disturbance and rehabilitation registry be developed for recording to allow for effective rehabilitation planning to reduce the impact to the ecological environment.

13.4.2 Waste Rock and Tailings Management

The FS 2025 report states that most of the waste rock mined will be used as construction material. During the current operational stage, some waste rock is dumped into the dry stack TFS, and the rest is disposed of in the Waste Rock Dump ("**WRD**") area in a valley. It is noted that waste rock runoff and/ or seepage flows could have acidic hydrogen ion concentration ("**pH**") and/ or non-compliant sulphate and iron concentrations, due to the pyrite and pyrrhotite contained in the waste rock. In addition, acid drainage can release naturally contained heavy metals in the surrounding environment, and it can cause heavy metal pollution to the soil, surface water body, and groundwater. SRK recommends that a comprehensive waste rock characterisation program is required to fully define the risk for waste rock acid generation and to provide the basis for any required management of potentially acid forming material. Encapsulation of any potential acid forming material should be considered if the acid rock drainage is expected to impact the environment.

Tailings generated from the Buritica Plant contain cyanide, which has been destroyed in the Buritica Plant before being sent to a backfill paste facility. According to CGL Colombia, 40% tailings are utilised as backfill, in the mined-out underground workings and the rest tailings are sent to the dry stack TSF. Another backfill paste facility is under construction during SRK's site visit in May 2025, and it will be put into operation in 2026. Therefore, more tailings are expected to be utilised for backfill paste and less will be stored in the TSF in the future. The tailings are dried by a filtered vacuum facility. The TSF has been divided into five cells to contain all waste material over the Buritica Project life, including dried tailings and waste rock supplemented with local alluvial materials. The TSF has been underlain by a composite geosynthetic clay layer ("**GCL**") sandwiched between two textured (double-textured or micro-spiked) HDPE geomembranes. In addition, a series of French drains were installed beneath the facility to eliminate pore pressure buildup in the alluvium beneath the TSF liners on the bottom. The TSF is constructed, operated, and reclaimed in phases as mining proceeds, and currently the cell 1 and cell 2 have reached design capacity are in the process of progress rehabilitation. Cell 3 and cell 4 have almost reached the full storage capacity, and the cell 5 is on operation. The TSF expansion has been approved, and the construction will commence soon. It should be note that the tailings may potentially release acid drainage to pollute the environment.

13.4.3 Water Management

The climate of Buritica Project area is tropical, tempered by the altitude, with relatively stable temperatures ranging from 16 to 27°C. Rains are frequent for much of the year, although there is a relatively dry season from December to February. The annual average rainfall is around 1,690 mm. There are two major drainage basins in the Buritica Project area, Quebrada La Mina and Quebrada Bermejal. All streams combine to form Quebrada La Tesorero, which discharges to the Cauca River eventually. The potential negative impacts of the Buritica Project to the Cauca River and ground water are due to the indiscriminate discharge of untreated mine water and domestic wastewater. In addition, the mining activities may lead to the change of the groundwater table.

According to the reports 2025, the Buritica Plant has a sedimentation tank system to treat and recycle wastewater within the plant, in which overflow from the weirs of the tank is returned to the processing process, and the thickened tailings on the bottom are pumped to the tailing backfill paste facility. Therefore, this water recycling system can save a significant amount of water for the Buritica Project. An industry wastewater treatment plant has been built, and it can treat mine water, wastewater from underground mining, and processing water from the plant. It is noted that 2,000 m^3 brine water with elevated chlorine ion concentration is generated daily from deep aquifer lower than 700 m ASL, and 5,000 m^3 rainwater infiltrating into the underground workings is also collected separately. The rainwater does not contain high chlorine concentration but with high suspended solid, it is treated by a simple flocculation treatment on the surface. A membrane treatment system has been used to treat the brine water and contact water from the TSF. Constituents removed from the brine water are processed through a crystalliser to produce solid products such as calcium and magnesium residue and sodium chloride and sodium sulphate crystals, which are disposed of into the TSF. All treated water is discharged back to the river. SRK notes that all domestic wastewater on site is treated biologically and the treated wastewater is used for site irrigation. A wastewater monitoring plan is implemented to monitor the compliance of any wastewater discharged into the environment.

CGL Colombia has construction of an effective stormwater management system to divert run-off from undisturbed areas around disturbed areas. Runoff that contacts ore materials is collected in a sediment settling pond and outflow water is directed to the water treatment plant. In addition, some prevention measures, such as surface hardening, second containment facility and accident pool, are implemented to mitigate the water pollution risks.

Overall, SRK opines that the water management for the Buritica Project are generally in line with recognised Colombian industry practices.

13.4.4 Dust and Gas Emissions

The fugitive dust emission sources for the Buritica Project are mainly from underground blasting, mining, crushing, loading, waste rock storage and handling, and movement of vehicles and mobile equipment. SRK recommends the Buritica Project adopt the following dust and gas management measures:

- Water sprinkling for underground drilling, underground blasting, waste rock stockpile and industrial site;
- Haul road maintenance and watering;
- Speed limitation to the vehicles; and
- Conduct greening on site.

SRK also recommends including ambient air quality monitoring as part of a site environmental monitoring program.

13.4.5 Noise Emissions

The main sources of noise emissions for the Buritica Project are underground blasting, underground rock drills, crushing, loaders, pumps, mobile equipment, air compressors, and other noise-making equipment and machinery. SRK recommends the Buritica Project implement the following noise management measures:

- Use of low-noise equipment;
- Enclosures for noisy equipment;
- Setup the speed limit for vehicles;
- Optimisation of the layout; and

- Install muffler on equipment.

SRK also recommends including ambient noise monitoring as part of a site environmental monitoring program.

13.4.6 Hazardous Materials Management

Hazardous materials used during Buritica Project operations are cyanide, reagents, explosives, and a range of hydrocarbons. The Buritica Project's environmental management plan includes an assessment or measures for storage and handling of these materials. Dedicated storage areas for reagents, cyanide, and explosives are constructed on site.

The Buritica Project needs to further develop procedures for hazardous materials management (hydrocarbons, reagents, cyanide, and explosives) and implement these procedures along with appropriate storage facilities and conditions to comply with Colombian national regulations and best industry practices. SRK recommends that all hazardous material storage and handling facilities for the Buritica Project be constructed with secondary containment (i.e., lined and bunded areas) and in accordance with Colombian national environmental requirements and recognised international industry practices.

13.4.7 Site Closure Planning and Rehabilitation

A mine closure plan is required by Decree 1076 of 2015 in Colombia, and CGL Colombia will prepare a mine closure study to the environmental authority with following objectives, before closure commences:

- Identification of site environmental impacts at the time of closure;
- Demolition plan;
- Drawings and plans showing the location of infrastructure for closure;
- All obligations to be fulfilled and work to be completed; and
- The closure plan costs including pending compliance items.

When the Buritica Project begins its dismantling and abandonment phase, the owner must submit a mine closure plan to the competent environmental authority, at least three (3) months in advance. CGL Colombia must post an insurance bond to cover the costs for the closure period, and for three years following closure completion. It is noted that Buritica Project is still on the operating stage, and therefore a mine closure plan is not required.

In June 2023, CGL Colombia submitted a conceptual closure plan as part of TSF expansion environmental licence modification application, which was approved in 2024. This plan includes; four TSF components on site, underground mine workings, dry stack tailing and waste rock storage facility, water treatment plant, and ancillary facilities. Underground mine entrances will be sealed to prevent unauthorised access. The dry stack TSF will be constructed in sequential cells as a series of expansions, and reclamation will be implemented concurrently with operations. Therefore, most of reclamation activities costs will be spent during the operating period. Continued operation of a reduced-capacity wastewater treatment plant is planned to treat remaining mine water flows and dry stack TSF run-off during post site closure. Geochemical studies have been carried out and include kinetic testing and seepage studies for the dry stack TSF estimated flows and water chemistry. It is noted that both tailing and waste material may have long-term acid drainage generation potential, and therefore seepage water will be collected, treated and monitored during closure and post-closure. SRK notes that the above proposed approach to the site rehabilitation is generally in line with the relevant recognised Colombian industry practices.

13.5 Social Aspects

The Buritica Project is located in the Higabra valley, 72 km northwest of Medellin city, the capital of Antioquia province. Overall, the landform of this area is characterised by steep mountains and valleys. The primary land use for the general surrounding area of the Buritica Project site is agricultural with a number of other mining activities. The major agricultural products include coffee, corns, and beans. The local economy mainly relies on agriculture, mining industry, and tourism. A total of 32 communities live in this area, eight of which are directly impacted by the Buritica Project. The nearest three communities have 850 residents, 195 families.

CGL Colombia states they had received no official notices of public complaints in relation to the activities of the Buritica Project and that they maintained a positive relationship with the local communities. SRK notes that the positive effects to the surrounding local communities are mainly direct employment of local contractors and use of local suppliers and service providers where practical. According to CGL Colombia, a total of 1,127 locals are currently hired by CGL Colombia, mostly are underground mining workers, processing workers or logistics staff for supporting departments. During SRK's site visit in May 2025, a female ore hand-pick team was noted, and most of them are single mothers from the surrounding communities. In addition, CGL Colombia put efforts on the social development measures amongst local communities including water and electricity supplies, school buildings, the development of local infrastructure, and provides building materials to help on dilapidated house rehabilitation for locals. CGL Colombia also provides assistance to grow small family businesses on coffee beans, honey and beeswax. It is noted that CGL Colombia invests multimillion USD every year to improve local economy. Therefore, the Buritica Project is fully supported by the local residents.

Some of the Buritica Project site has been illegal occupied by the criminal organisation named Clan del Golfo or Gulf Clan recently. Starting in late 2022, illegal artisanal miners organised by Gulf Clan primarily operate in parts of the underground mining area within concession area above 1,200 m ASL. It is hard to estimate exactly how many people get involved in the illegal activities, but the number could be very high. They operate the underground mining and sell the ores to others illegally. In order to proactively protect the Buritica Project site from the attacks by the criminal group, CGL Colombia has prepared and activated an emergency response plan for this matter, which included urgent rescue efforts, medical attention for the injured, and aftermath management. SRK notes that one 100 m minimum thick protection zone has been formed by backfill tailings between 1,200 m ASL and 1,100 m ASL, and this zone grows as the backfilling progresses. The Buritica Project site is protected daily by armed security guards and local police forces, and additional military forces nearby can be deployed to the site immediately if needed.

SRK opines that in order to mitigate the risks of illegal mining area occupation and potential armed attacks, a multi-faceted approach is needed, including strengthening legal frameworks, enhancing security measures, promoting community engagement, and addressing the root causes of illegal mining.

13.6 Occupational Health and Safety

SRK has sighted the OHS management system and procedures, which provide the following summary in respect to the proposed OHS management measures for the Buritica Project:

- On-site security guard service;
- OHS administration;
- Establishment of an emergency response plan;
- Regular OHS training for relevant employees;
- Safety and hazard signage;
- Dust/ gases monitoring and control within the workplace;
- Distribution of Personal Protective Equipment ("**PPE**") to all relevant employees;
- Fire prevention and firefighting;
- Lightning strike prevention;
- Mining, crushing, blasting and explosives handling;
- Traffic management;
- Sanitary provision;
- Power provision; and
- Labour and supervision.

In addition, SRK was provided with OHS records, and Table 13-1 summarises the historical OHS incident records for the past four years. One fatality occurred on 27 December 2022 during underground mining when a drilling worker mistakenly disconnected his fall protection equipment and attempted to manually remove a jammed rock beyond his reach and then fell 20 m and died. Reports analysing the cause of injuries, and identifying measures to prevent a recurrence were provided to SRK.

Table 13-1: Historical OHS Incident Records

Year	Minor	Serious	Fatality
2021	5	1	-
2022	8	2	1
2023	11	1	-
2024	8	-	-

Sources: CGL Colombia

SRK opines that CGL Colombia shall put more efforts to train the employees and provide more frequent safety inspection in regard to the PPE for the employees. It is noted that continuous retraining, real-time monitoring, and safety audits to address risks like ground collapses and equipment failures including full-face mask and fall protection equipment are needed for this mine site.

13.7 Evaluation of Environmental and Social Risks

The sources of inherent environmental and social risk are project activities that may result in potential environmental and social impacts. The environmental and social risks for the Buritica Project are:

- Impacts to the local ecological system due to significant land disturbance;
- Heavy metal pollution from the waste rock dumps and TSFs;
- Social concerns; and
- OHS training and inspection concerns.

The above risks are categorised as moderate/ tolerable risks (i.e., requiring risk management measures). It is SRK's opinion that these risks for the Buritica Project can be generally managed if CGL Colombia put efforts to solve the issues.

14 Capital Expenditures and Operating Expenses

14.1 Capital Expenditures

Historically Capex refers to those invested into the Buritica Project have been provided by CGL Colombia. SRK has summarised the Capex in Table 14-1. As of 31 December 2024, the net assets of the Buritica Project are totalling at about USD844.52 million.

Table 14-1: The Net Value of Capex Invested into the Buritica Project (USD in Million)

Item	Net Value
Fixed assets	673.95
Engineering fees in construction	7.74
Intangible assets	162.83
Total	**844.52**

Sources: CGL Colombia

CGL Colombia also provided SRK with the sustaining Capex for the following five years. Table 14-2 lists the Capex invested (Sunk Capex) and to be invested into the Buritica Project. The sustaining Capex includes the fund for increasing the production to 5,000 tpd from current 4,000 tpd, which is consisted of USD10 million for the development of third ramp of 2,000 m, and USD7.31 million for the expansion of backfill paste facility, and will be investing USD12.31 million and USD5 million in 2026 and 2027, respectively.

Table 14-2: Sunk Capex and Sustaining Capex (USD Million) (from *FS 2025*, and Mine)

Item	2024	2025	2026	2027	2028	2029
Capex invested	844.52*	-	-	-	-	-
Sustaining Capex	-	47.89	23.27	13.45	9.52	8.81
Expansion Capex			12.31	5		

Sources: FS 2025 and CGL Colombia
Notes: The net value of the assets of the Buritica Project

14.2 Operating Expenses

The Buritica Project is an operating mine with mining and processing/smelter production. SRK was provided with the Opex records for years from 2022 to 2024. Table 14-3 summarises the Opex for various activities/ elements for the period 2022 to 2024.

Table 14-3: SRK's Summary of Historical Data (2022 to 2024)

Item	Unit	2022	2023	2024
Cash cost-mining	$	88,610,737	104,869,522	126,840,215
Cash cost- processing	$	47,489,656	41,644,873	38,393,587
Cash cost- sales	$	8,051,046	10,436,264	2,470,926
Cash cost- on site admin	$	24,736,434	25,677,377	25,963,452

The cash operating costs in different production centres in 2022, 2023 and 2024 are given in Table 14-4.

Table 14-4: The Cash Operating Costs from 2022 to 2024 of the Project (USD)

Cost Centre	Unit	2022	2023	2024
Mining cost	USD	88,610,737	104,869,522	126,840,215
Processing cost	USD	47,489,656	41,644,873	38,393,587
Others	USD	72,597,307	77,358,216	79,900,581
Cash operating cost	USD	208,697,701	223,872,611	245,134,382

For the Opex of future production, the FS 2025 proposed the Opex as listed in Table 14-5.

Table 14-5: Opex Proposed in *FS 2025*

Category	Unit	Amount
Mining	USD/t	83.65
Processing	USD/t	25.69
Support Services	USD/t	17.37
G & A	USD/t	17.97
Total	USD/t	144.68

Sources: FS 2025

CGL Colombia also estimated the Opex from 2025 to 2029, as listed in Table 14-6.

Table 14-6: Opex for 2025-2029 by the Mine Management

Category	Unit	2025	2026	2027	2028	2029

15 Economic Analysis

15.1 Metal Prices

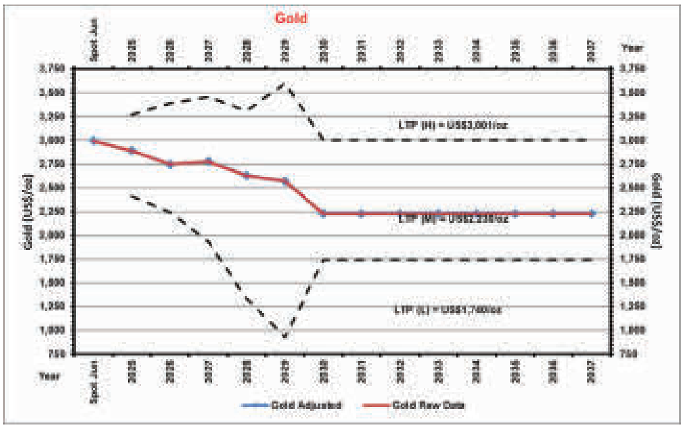
The economical viable products from the Buritica Project include gold, silver, and copper.

The historical gold price trend is shown in Figure 15-1. The gold price forecast, as predicted by Consensus Market Forecast ("**CMF**") is shown in Figure 15-2.

Figure 15-1: Gold Price Trend in History

Sources: goldprice.org

Figure 15-2: Gold Price Forecast



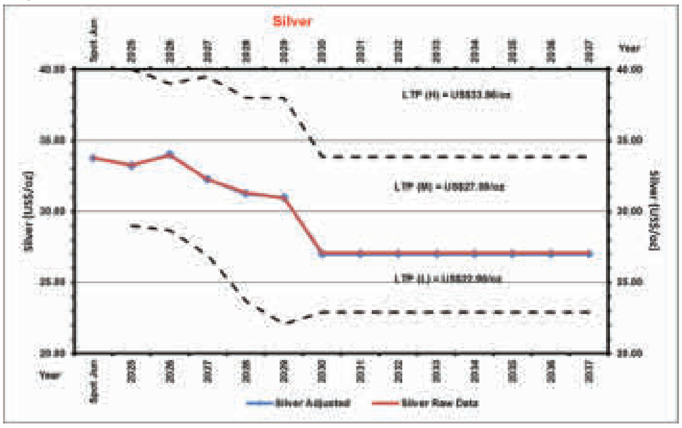
Sources: CMF on 17 March 2025

The historical silver price trend is shown in Figure 15-3, and the silver price forecast, as predicted by CMF is shown in Figure 15-4.

Figure 15-3: Silver Price Trend in History

Sources: silverprice.org

Figure 15-4: Silver Price Forecast



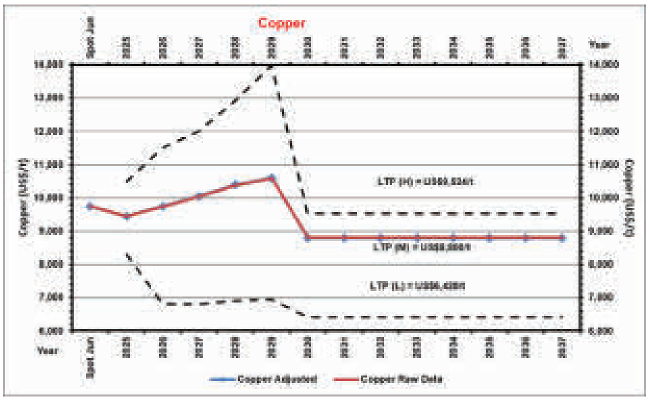
Sources: CMF on 17 March 2025

The historical copper price trend is shown in Figure 15-5, and the copper price forecast, as predicted by CMF is shown in Figure 15-6.

Figure 15-5: Copper Price Trend in History

Sources: https://tradingeconomics.com/commodity/copper

Figure 15-6: Copper Price Forecast



Sources: CMF on 17 March 2025

Table 15-1 summaries the predicted prices of gold, silver, and copper for the next five-years, and then flat-line beyond 2030, which is a consensus market forecast, considering various forecasts made by other professional institutions. SRK was also provided with forecasts in Table 15-2 (detailed in Appendix B), which sourced from the Zijin Gold International.

At the Effective Date, Zijin Gold International suggested that the long-term gold forecast of CMF was rounded to the second significant figure to estimate Ore Reserves, while the price forecasts of Zijin Gold International were used for economic analysis post year 2024. Comparison between gold prices in Table 15-1 and Table 15-2 indicates that the long-term forecast of Zijin Gold Internation is about 2.0% higher than that of CMF, and that Zijin Gold International's forecasts are generally near to those of CMF's at the middle level. SRK accepted the suggestions due to similar forecasts of gold prices, while the other metals' forecasts of CMF were utilised by SRK to carry out economic analysis post year 2024.

Table 15-1: Forecasted Metal Prices by SRK in the 2nd Quarter of 2025

Metal	Unit	2025	2026	2027	2028	2029	2030 and After
Gold	USD/oz	2,890	2,750	2,780	2,630	2,570	2,230
Gold	USD/g	92.92	88.41	89.38	84.56	82.63	71.70
Silver	USD/oz	33.25	34.00	32.25	31.25	31.00	27.00
Silver	USD/g	1.07	1.09	1.04	1.00	1.00	0.87

Notes: Gold price in real US$.

15.2 Sales Contracts

Sale contracts are not available to SRK to date. The payable rates available now are shown in Table 15-3.

Table 15-3: Payable Rates

Commodity	Payable Rate (%)
Gold in Gold Concentrates	97.00
Silver in Gold Concentrates	95.00
Copper in Gold Concentrates	78.00
Silver in Silver Ingot	99.30
Gold in Alloyed Gold	99.92

Sources: CGL Colombia

15.3 Tax Obligations

According to the data provide from CGL Colombia, SRK has summarised the taxes and other fees in Table 15-4.

Table 15-4: Main Taxes Obligations in Colombia

Item	Unit	Amount	Remarks
Income Tax	%	35	On taxable income
Resource Tax (gold and silver)	%	3.2	On total revenues from the metals
Resource Tax (Cu)	%	5.0	On total revenues from the metals
Other Taxes and Fees	USD'000/a	15,650	
Value-added Tax	%	19	No VAT on exporting products; VAT credit on some Opex

Sources: CGL Colombia

15.4 Technical and Economic Analysis

It should be emphasised that the economic analysis presented in this section is based purely on the results of the technical review provided in previous sections and some key assumptions. It is provided for Ore Reserve estimation purposes as required by the *JORC Code* guidelines.

15.4.1 Principal Assumptions

As discussed in previous sections, various technical and economic parameters have been reviewed. The discount cash flow ("**DCF**") model has been used in the economic analysis of the Buritica Project and the following simplifications and assumptions are made:

- The production rates are as planned on a yearly basis and ore quality are evenly distributed over a production year (average grades were used).
- The final products will be gold ingots/ doré bars, silver ingots and copper concentrate.
- USD is used as the currency and inflation is not considered in the model (real-term model).
- Unit cash costs are also considered constants over a year; and the cash costs do not include depreciation and amortisation.
- Product prices are based on the CMF forecasts for gold, silver, and copper.
- Previous capital investment (Sunk Capex) and newly investments (Sustaining Capex) have been considered as capital costs.
- The net value of the Sunk Capex will be considered for depreciation and amortisation; and the Sustaining Capex be fully depreciated and amortised.
- The Capex will be depreciated and/ or amortised evenly over a 15-year period, and
- Discount rate of 8% will be used in base case, and the weighted average cost of capital ("**WACC**") assumptions are given in Table 15-5.

Table 15-5: Discount Rate Calculation (WACC Method)

Item	Unit	Value	Remarks
Risk Free Rate	%	4.0	Treasury bonds rate
Market Risk Premium	%	6.0	
Beta of the Investment	/	1.5	
Cost of Equity	%	13.0	
Debt Margin	%	5.0	Policy rate
Cost of Debt	%	9.0	
CIT	%	30.0	
Post-tax Cost of Debt	%	6.3	
Target Debt Equity Ratio	%	30.0	
WACC in Nominal Terms	%	11.0	
Inflation Rate	%	3.0	
WACC in Real Terms	%	7.8	

Sources: SRK

15.4.2 Summary of the Cashflow Projection

For the economic analysis of the Buritica Project, SRK adopted a DCF analysis based on the production schedules, previous assumptions and parameters as discussed in previous sections. Detailed cashflow projection has been given in Table 15-6.

Table 15-6: Detailed Cashflow Projection of the Buritica Project

Category	Unit	Total	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039

15.4.3 Results of the Discount Cashflow Projection of the Buritica Project Analysis

Table 15-7 presents the net present value ("NPV") for the Buritica Project as calculated using SRK's DCF analysis. SRK estimated the NPV in a range of USD 2.75 billion (at 10% discount rate) to USD 3.43 billion (at 6% discount rate), with a base case of USD 3.06 billion using a discount rate of 8%.

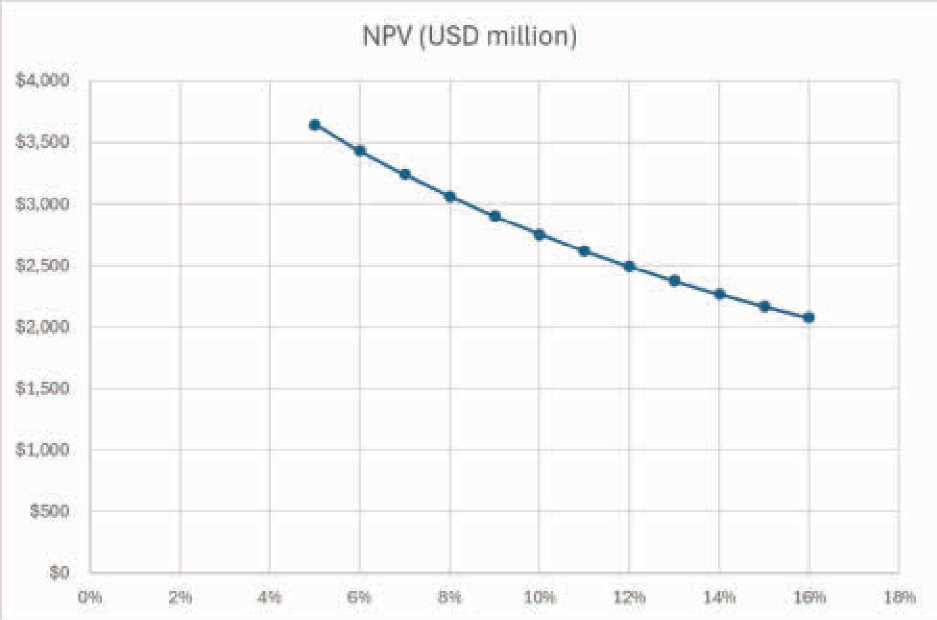
Figure 15-7 shows the NPV varies with the discount rate.

Table 15-7: NPV Projections

Item	Upper Case	Base Case	Lower Case
Discount Rate	6%	**8%**	10%
NPV (USD billion)	3.43	**3.06**	2.75

Sources: SRK

Figure 15-7: NPV Vs Discount Rate



Sources: SRK

15.5 Sensitivity Analysis

SRK applied a single factor method for the sensitivity analysis. Many parameters can affect the Buritica Project's NPV. To simplify the calculations, and the commodity prices, Opex, and Capex were selected as the essential variable factors on cash flow. The effects of these essential factors on the NPV were analysed within a ±30% range. The results are shown in Table 15-8 and Figure 15-8.

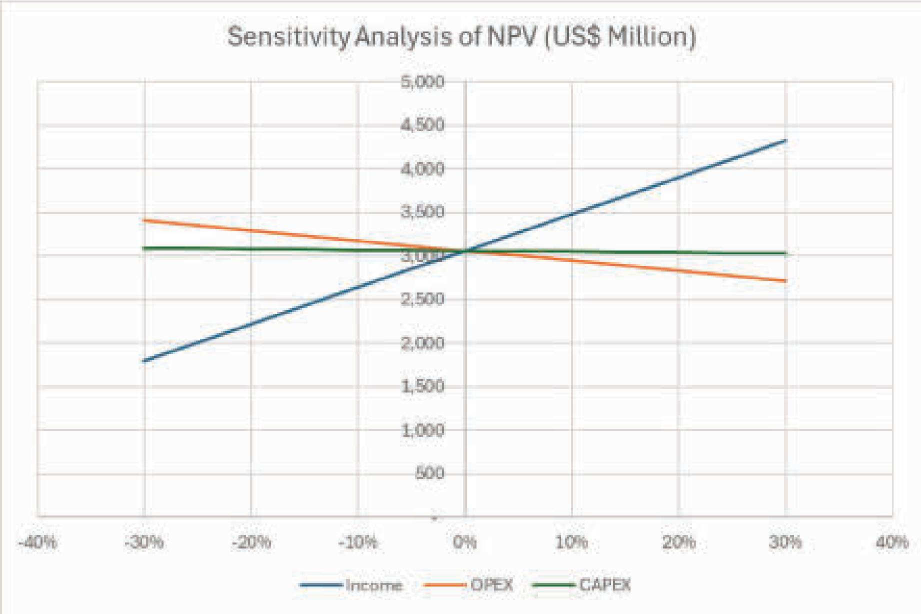
Table 15-8: Sensitivity Study of NPV (at 8% Discount Rate, in USD million)

Changes	Price	Opex	Capex
30%	4,323	2,718	3,030
25%	4,112	2,775	3,035
20%	3,902	2,832	3,040
15%	3,692	2,889	3,045
10%	3,481	2,946	3,050
5%	3,271	3,004	3,056
0%	3,061	3,061	3,061
-5%	2,850	3,118	3,066
-10%	2,640	3,175	3,071
-15%	2,430	3,232	3,076
-20%	2,219	3,289	3,081

-25%	2,009	3,347	3,086
-30%	1,799	3,404	3,091

Sources: SRK

Figure 15-8: Univariate Sensitivity Analysis of NPV (8% Discount)



Sources: SRK

As shown in Table 15-8 and Figure 15-8, changes in Opex have smaller effect on the Buritica Project's NPV than that of changes in the commodity prices, while the changes of Capex have less effect on NPV.

The analysis shows that the Buritica Project is economically viable, and the Ore Reserves statement can satisfy with the requirements of *JORC Code* guidelines.

16 Risk Assessment

SRK completed a risk assessment of the specific risks identified for the Buritica Project in relation to their likelihood of occurrence within the LoM and consequence in accordance with the *Listing Rules* of HKEX.

In general, the risk of a project decreases from exploration, through development, to the production stage. The Buritica Project is a production project.

SRK considered various technical aspects which may affect the feasibility and future cash flow of the Buritica Project. SRK's final risk assessment is presented in Table 16-1.

Table 16-1: Risk Assessment for Buritica Gold-Silver Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Unlikely	Major	Medium
Unexpected Groundwater Ingress	Unlikely	Moderate	Low
Significant Unexpected Geological Faulting	Possible	Moderate	Medium
Ore Reserve and Mining			
Lack of Significant Ore Reserves	Unlikely	Minor	Low
Significant Geological Structures	Possible	Moderate	Medium
Production Shortfalls	Possible	Moderate	Medium
Unexpected Groundwater ingress	Possible	Minor	Low
Excessive Surface Subsidence	Possible	Minor	Low
Poor Mine Plan	Unlikely	Minor	Low
Ore Production Capacity is Optimistic	Unlikely	Minor	Low
Processing and Metallurgy			
Process Adaptability	Possible	Minor	Low
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Unlikely	Moderate	Low
Low Plant Reliability	Unlikely	Moderate	Low
Environmental and Social			
Impact on the local ecological system due to the significant land disturbance	Possible	Moderate	Medium
Heavy metal pollution from the waste rock dumps and TSFs	Possible	Moderate	Medium
Social concerns	Possible	Moderate	Medium
OHS training and inspection concerns	Unlikely	Moderate	Low
Capital and Operating Costs			
Project Timing Delay	Unlikely	Moderate	Low
Capital Cost Increases	Unlikely	Moderate	Low
Capital Costs- Ongoing	Unlikely	Moderate	Low
Operating Cost Underestimated	Possible	Moderate	Medium

Sources: SRK

In the risk assessment, various risk issues have been assessed for Likelihood, Consequence, and Overall Rating. SRK has used a matrix as described below.

The Likelihood of a risk is considered within a certain time frame, e.g., five years, as:

- Likely: will probably occur;
- Possible: may occur; or
- Unlikely: unlikely to occur.

The Consequence of a risk is classified as:

- Major: the factor poses an immediate danger to the Buritica Project that, if uncorrected, will have a material effect on the Buritica Project cash flow and performance and could lead to a project failure
- Moderate: the factor, if uncorrected, will have a significant effect on the Buritica Project cash flow and performance; or
- Minor: the factor, if uncorrected, will have little or no effect on the Buritica Project cash flow and performance

The overall risk assessment combines the Likelihood and Consequence of a risk and be classified as Low (unlikely and possible minor risks, and unlikely moderate risk), Medium (likely minor, possible moderate, and unlikely major risks) and High (likely moderate and major risks, and possible major risks).

17 Conclusions and Recommendations

17.1 Conclusions

17.1.1 Exploration and Mineral Resources

Based on current sampling, mineralisation in Buritica Project is fault-controlled, vein-like, 0.5–1.0 m thick, consisting of altered rocks and quartz veinlets with high pyrite and base metal sulphides, and clear vein borders. The host fault structure is stable along strike and dip. Tunnel mapping indicates the vein is wavy, swelling, pinching, reappearing, branching, and rejoining along both directions. Au grades locally increase in the hanging wall and footwall due to small veinlets.

As of December 2024, a total of 3,772 diamond drillholes for a combined drilling meter of 782,103.5 m, 25,081 channel samplings for a total length of 82,345.3 m and 13 geotechnical sampling for a total length of 4,243.8 m were conducted on a sampling grid 20 and 50 m along both strike and dip directions. In SRK's opinion, the documented procedures and primary data may still be, in general, acceptable by the industry practice even though some deficiencies were recognised, and SRK therefore believes that the current primary database is acceptable for the purpose of Mineral Resource estimation, and reliable to support Ore Reserve conversion in the Report.

Current defined Au-Ag mineralisation distributes ranging between -145 and 1,598 m ASL, with elevation difference of 1,743 m vertically, and exploration potential open along the dip extension, demonstrating enough space to find more Au-Ag resources, and to upgrade current Inferred Mineral Resource into Indicated and/ or Measured Mineral Resource as well. Metallurgical tests indicate that additional Mineral Resources of Zn, Cu, etc. may be recoverable. SRK believes that the Buritica Project is economic viable, and economic potential is encouraging.

However, coarse gold nugget effect found by assessment of QC data is prominent and nugget effect will cause impaction against the precision of Mineral Resource estimate. In SRK's opinion, the risks to the Buritica Project due to the geology, and exploration procedures are low, but the Mineral Resource are medium.

As of 31 December 2024 and at a cut-off grade of 2.0 g/t AuEq, the Buritica Project is estimated to contain 10.1 Mt of Measured Mineral Resources with an average grade of 7.7 g/t Au and 23.4 g/t Ag, 19.2 Mt of Indicated Mineral Resources with an average grade of 7.1 g/t Au and 24.7 g/t Ag, and 21.0 Mt of Inferred Mineral Resources with an average grade of 7.1 g/t Au and 20.6 g/t Ag.

17.1.2 Mining Operation

The Buritica Mine is currently in production hence all the main mining infrastructure is in place. It's unlikely that the future operations will have material risks.

The Ore Reserves can support a fifteen-years life of mine, including a three-years ramp up period, a nine-years full-production period and a three-years ramp-down period, based on SRK's mining model.

17.1.3 Infrastructure, Market Studies and Contracts

Project infrastructure has been developed and maintained well over its operation life and these facilities can serve the operation well in the future.

Sale records and contracts have been reviewed by SRK. Historically, a marketing channel has been built and is well maintained by the Mine. It can be reasonably expected that there will be no material market risk related to the selling of gold.

17.1.4 Mineral Processing

The current production capacity of the Buritica Plant is 4,000 tpd. The SABC process is adopted for crushing and grinding, and a gravity separation system is added to the grinding circuit to recover liberated gold grains. The grinding products adopt a preferential flotation process to recover copper and other sulphide minerals, resulting in copper-gold concentrate, zinc-pyrite concentrate and flotation tailings. Copper-gold concentrate is sold directly. Part of the flotation tailings is used for mining backfill, and the remaining part is dehydrated and stored in TSF. The zinc-pyrite concentrate undergoes the agitation cyanidation – Merrill Crowe zinc precipitation process to extract gold and silver. After the cyanide destruction, the cyanidation residue dehydrated and stored in TSF.

The existing process is reasonable and well-suited to the characteristics of the ore being processed. It has improved the recovery rates of gold and silver while also recovering copper. The tonnage of cyanide leaching material is only 30% of the RoM, significantly lowering the consumption of sodium cyanide and cyanide destruction reagents. Due to the low grade of zinc in RoM, it is not possible to produce marketable/ economic zinc concentrate. Therefore, the Buritica Plant no longer recovers zinc, despite having constructed a zinc flotation system for cyanide tailings.

17.1.5 Environmental and Social Issues

The sources of inherent environmental and social risk are project activities that may result in potential environmental and social impacts. The environmental and social risks for the Buritica Project are:

- Impacts to the local ecological system due to significant land disturbance;
- Heavy metal pollution from the waste rock dumps and TSFs;
- Social concerns; and
- OHS training and inspection concerns.

Environmental and social risks identified are categorised as moderate/ tolerable risks (i.e., requiring risk management measures). It is SRK's opinion that these risks for the Buritica Project can be generally managed if CGL Colombia put efforts to solve the issues.

17.1.6 Mine Economy

Previous Capex invested into the Buritica Project has established the facilities of an operation of annual capacity of about 1,320 ktpa ore for mining, ore processing and smelter to produce saleable concentrates enriching gold silver and copper, and ingots of gold and silver. For a life of mine of about 15 years, considering sustaining Capex the Buritica Project will have a NPV of about USD 3.06

billion at 8% discount rate predicted by using the DCF method. The overall average cash Opex is USD 162.5/t ore, or USD 81.7.9/oz gold. The AISC is USD 840.9/oz gold.

17.2 Recommendations

17.2.1 Exploration and Mineral Resources

In consideration of vein-like mineralisation and mineralisation characteristics of the Buritica Project, it is recommended to apply a drilling program for controlling host fault structure and use tunnels to define Indicated and Measured Mineral Resources, and accordingly Probable and Proved Ore Reserves.

Nugget effect is significant, causing negative impaction against assaying precession and the Mineral Resource categorisation. It is recommended to conduct trial sample preparation procedural to solve the problem of observed nugget effects.

Besides Au and Ag, other elements such as Zn, Cu, Pb, and S may become associated Mineral Resources. It is recommended to have a systematic assaying on all associated elements, and to update the current Mineral Resource estimate.

SRK considers the capping methods are reasonable and aligned with industry practices. However, extreme high-grade values should be carefully monitored during grade interpolation to prevent local artificial high-grade blocks.

17.2.2 Ore Reserves

CGL Colombia plans to expand the mining capacity and processing throughput to 5,000 tpd or 1,650 ktpa from the start of year 2028. Currently there is no plan or study in place to be reviewed by SRK. SRK opine a mine plan at least at the level of preliminary feasibility study to support the Ore Reserve estimate should be carried out.

17.2.3 Mineral Processing

SRK opines, that adding Falcon Concentrators to process the entire ball mill discharge and cyclone overflow, aiming to maximise the recovery rate of gold through gravity separation would be effective.

As the grinding fineness has a significant impact on grinding costs and processing capacity, it is recommended to conduct grinding fineness tests based on the existing process to explore the possibility of coarsening the grinding fineness.

To study the process structure of gravity separation-flotation and evaluate the feasibility of eliminating cyanide leaching.

Closure

This report, Competent Person's Report of the Buritica Gold-Silver Project in Antioquia, Colombia, was prepared by

Dr Anshun Xu
Corporate Consultant

and reviewed by

Pengfei Xiao
Principal Consultant

All data used as source material plus the text, tables, figures, and attachments of this document have been reviewed and prepared in accordance with generally accepted professional engineering and environmental practices.

Secretaría de Minas

CONTRATO DE CONCESIÓN MINERA PARA LA EXPLOTACIÓN DE UN YACIMIENTO DE METALES PRECIOSOS, MINERALES DE COBRE, MINERALES DE PLOMO, MINERALES DE ZINC Y SUS CONCENTRADOS No. 7495 CELEBRADO ENTRE EL GOBERNADOR DEL DEPARTAMENTO DE ANTIOQUIA Y LA SOCIEDAD CONTINENTAL GOLD LTD. "CG DE COLOMBIA".

Entre los suscritos, **LUIS ALFREDO RAMOS BOTERO**, Gobernador del Departamento de Antioquia, según Acta de Posesión del 01 de enero de 2008, identificado con cédula de ciudadanía No. 8.250.911, debidamente facultado para la celebración de este contrato de conformidad con las Resoluciones números 18-1552 del 22 de noviembre de 2004, 18-1847 del [illegible] de diciembre de 2006, 18-0919 del 21 de junio de 2007, 18-0933 del 23 de junio de 2008, 18-2386 del 18 de diciembre de 2009 y 18-2402 del 14 de Diciembre de 2010, del Ministerio de Minas y Energía, en adelante llamado **EL CONCEDENTE** de una parte, y la Sociedad **CG DE COLOMBIA**, sucursal en Colombia de la Sociedad **CONTINENTAL GOLD LTD.**, con Nit. 900.166.097-7, representada legalmente por el señor **EDUARDO OTOYA ROJAS**, identificado con la cédula de ciudadanía No. 80.416.253, quien en adelante será llamado **EL CONCESIONARIO**, acuerdan celebrar un Contrato de Concesión Minera, con base en la facultad otorgada a **EL CONCEDENTE** en el artículo 317 del Código de Minas – Ley 685 de 2001, modificado por la Ley 1382 del 09 de febrero de 2010 y por las Resoluciones aludidas anteriormente, mediante las cuales les delegaron las funciones al Señor Gobernador del Departamento de Antioquia, el cual se regirá por las siguientes cláusulas: **CLÁUSULA PRIMERA.- Objeto.** El presente contrato tiene por objeto la realización por parte de **EL CONCESIONARIO** de un proyecto de exploración técnica y explotación económica de un yacimiento de **METALES PRECIOSOS, MINERALES DE COBRE, MINERALES DE PLOMO, MINERALES DE ZINC Y SUS CONCENTRADOS**, en el área total descrita en la cláusula segunda de este contrato, así como los que se hallaren asociados o en liga íntima o resultaren como subproductos de la explotación. **EL CONCESIONARIO** tendrá la libre disponibilidad de los minerales objeto del contrato de concesión que llegue a extraer en cumplimiento del

Programa de Trabajos y Obras Unificado aprobado por **EL CONCEDENTE**, mediante Acto Administrativo radicado con el número 011497 del 07 de Abril de 2011. Los minerales in situ son del Estado Colombiano, y una vez extraídos, serán de propiedad de **EL CONCESIONARIO**. **PARÁGRAFO.- Adición al Objeto de la Concesión.** Cuando por los trabajos de explotación se encontraren minerales distintos de los que son objeto del presente contrato y que no se encontraren en las circunstancias señaladas en el Artículo 61 del Código de Minas, **EL CONCESIONARIO** podrá solicitar que su concesión se extienda a dichos minerales [illegible] que la suscripción de un acta adicional que se anotará en el Registro Minero Nacional. Esta adición no modificará ni extenderá los plazos establecidos en el contrato original y, si a ello hubiere lugar, **EL CONCESIONARIO**, solicitará la correspondiente ampliación o modificación de la Licencia Ambiental que cubra los títulos y minerales objeto de la adición, en el caso de que los impactos ambientales de estos, sean diferentes de los impactos de la explotación original. **CLÁUSULA SEGUNDA.- Área del contrato.** El área objeto del presente contrato está comprendida por la siguiente alinderación, definida por las siguientes coordenadas planas de Gauss:

Appendix C *JORC Code* Table 1

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	*JORC Code* explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Sampling including drill core sampling and channel sampling, geologists will perform geological logging, then mark the sample intervals before sampling to ensure appropriate sampling. • Mainly used tape meters for measurement. • Based on geologists' observation. • Sampling is based mainly on the sample mark made by geologists, trying to take unbiased samples, however, nugget effects observed during core split duplicate samples.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• All surface and underground drilling guided by technical protocols were contracted to the third party for the operation, and conducted by diamond core equipment, with mainly HQ size core, some holes of which were reduced to BQ. All drill holes collars were surveyed by a total-station of Leica FlexLine TS09plus made in Switzerland, and downhole surveys utilised Reflex EZ-Trac, Reflex Gyro, or ACTIII instruments. Core recovery was satisfying with more than 90% boreholes with core recovery of not less than 92%.

Criteria	*JORC Code* explanation	Commentary
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Core length was measured against the core run to assess the core recovery. • Short runs to reduce drilling time was applied to maximise sample recovery. • Core recovery in broken/ fault zones are normally lower, however, still higher than 90% in genera.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Core and channel samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Photos were taken during logging. • All intervals were logged.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Core were sawn in half for sample and the other half stored. • No such samples. • Sample preparation in Buritica Project is considered at industry good practice. • Core duplicates, coarse duplicates and pulp duplicates have been applied to maximise representativity of samples. • Duplicates results were monitored by QA/QC geologists, and QA/QC reports were prepared bi-monthly. • Sample size is always the larger the better, the core samples and channel are appropriate to the grain size of the material being sampled.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The assaying and laboratory procedures is at industrial good practice. • No such tools been used. • Standards, blanks and duplicates have demonstrated good accuracy and precision, as well as good contamination management.

Criteria	*JORC Code* explanation	Commentary
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• SRK geologists verified the ore bodies and ore grades during the site visit. • No twinned holes been used. • Database and monthly reports, and data management are at industry good practice.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Survey information is good enough to support Mineral Resource estimation. • Projections of Magna Sirgas, Colombia West Zone • Survey equipment is well operated and calibrated by professional surveyors.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Drill data spacing is variable within each vein but CGL Colombia aims for an intercept pattern of between 20 and 50 m along both strike and dip directions. • Data spacing and distribution is sufficient to establish the degree of geological and grade continuity. • Sample compositing has been applied to equal lengths for constant sample volume, in keeping with industry theories of sample support.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Boreholes and channels were designed considering the possible structures and mineralisation. • No such bias has been observed.
Sample security	• *The measures taken to ensure sample security.*	• Samples were marked and sealed after sampling. then shipped to laboratory by dedicated staff.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• SRK geologists have observed and discussed with the on-site geologists, and satisfied with the sampling techniques and the data.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	*JORC Code* explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• The Buritica Project includes one mining concession (7495) with an area of 1,920.0314 hectares. The validity period of the mining rights is until 19 March 2043. • In addition, it has other approvals and permits including work plans, water use permits, and land access permits, etc.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Several surface mapping and sampling surveys have been conducted by different companies during the 1990s including Gran Colombia Resources Ltd ("GCR"). • Since 2007, CGI focuses on widespread surface exploration, drilling and tunnelling. • In March 2020, Zijin Mining made the acquisition of the Continental Gold Ltd. Then, CGL Colombia fully takes over the Buritica Project, and keeps on conducting infill drilling programs in 2020.

Criteria	*JORC Code* explanation	Commentary
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The northern Andean Cordillera in Colombia was uplifted by the subduction of multiple oceanic plates, with major accretionary events forming volcanic-magmatic belts during the Jurassic, Cretaceous, and Tertiary periods. The Buritica Project lies within the Miocene-age Middle Cauca Belt, known for hosting numerous polymetallic porphyry and epithermal deposits. The region's geology is dominated by the Cretaceous Barroso Formation, consisting of pillow basalts, andesitic pyroclastics, dolerites, and mudstone layers. The area is intruded by Cretaceous Santa Fe Batholith tonalites and the Buritica Intrusive Complex (BIC), with radiometric dating (U/Pb) indicating an age of 7.7±0.1 Ma. • The Buritica Project hosts two major Au-Ag vein systems: the Yaragua and the Veta Sur. Yaragua trends ENE (75°–80°), is nearly vertical, and measures 1,350 m in length, 1,660 m in depth, and 220 m in width, with 24 high-value mineralised veins (HVMs) commonly 0.5–1.0 m wide. Veta Sur strikes NE (40°–50°), is also steeply vertical, spans 1,300 m in length, 1,600 m in depth, and 300 m in width, with 28 HVMs showing similar geometry to Yaragua. In addition to vein-style mineralisation, 4 low-grade pillar-like mineralised systems (BMZs) have been defined. These BMZs are hosted vertically within Yaragua and Veta Sur and are irregular in shape, with diameters of 100–150 m and vertical extents of 300–600 m. • Recent geological observations and drilling data from CGL Colombia suggest the Buritica deposit is a low to intermediate sulfidation epithermal vein type Au-Ag system, while retaining some characteristics of porphyry gold deposits. Gold mineralisation in low-grade pillar-like systems (BMZs) is associated with areas of increased veinlet density or disseminated mineralisation, sharing similarities with high-value vein (HVM) mineralisation. BMZ shells are spatially related to the orientation of epithermal vein systems that crosscut the porphyry system.

Criteria	*JORC Code* explanation	Commentary
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Diamond core drilling equipment was utilised, primarily producing HQ-NQ size cores, with some drill holes reduced to BQ size. • Drill hole collars were surveyed using a Leica FlexLine TS09plus total station, manufactured in Switzerland. • Downhole surveys employed Reflex Gyro and Dip Core instruments. • Core recovery rates were highly satisfactory, with over 90% of boreholes achieving core recovery of no less than 92%.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Exploration data is reported as the average sample grade. Top cutting was used report the exploration results. • The mineralisation is controlled by fault structure, and appears vein-like, commonly 0.5 to 1.0 m wide with high Au and Ag grade. The undiluted vein models were subsequently diluted to an MHW of 1.0 m for final resource reporting. • AuEq = Au g/t + Ag g/t × 0.010086.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Mineralisation intercept lengths were reported. • Drill dip varies by location within the deposit.

Criteria	*JORC Code* explanation	Commentary
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Appropriate maps and typical sections were reported in this Report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Reporting was fully representative of the data collected at this stage.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• No additional information was provided.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Further drilling program is recommended.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	*JORC Code* explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Digitalised Mineral Resource databases were provided to SRK, and SRK conducted crossing-checking against logging data and typical interpretation. All relevant data was imported to Leapfrog™ software, and validation routines were run to confirm validity of all data. • Checks for holes without samples. • Checks for duplicate samples. • Checks and adjusts the missing or wrong intervals.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• Dr Anshun (Anson) Xu and Mr Huaixiang (Hubert) Li from SRK team visited the Buritica Project from 15 May and 20 May 2025.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Mineralised veins were manually constructed using economic composites and natural boundaries, with a minimum horizontal width (MHW) of 0.2 m for vein continuity. • CGL Colombia combined lithological logs and assay data to define the boundaries of BMZ grade shell models.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• Yaragua vein system trending ENE 75 to 80°, presents almost vertically, 1,470 m long, 1,860 m deep and 220 m wide. • Veta Sur vein system trending NE 40 to 50°, demonstrates vertically, 1,370 m long, 1,710 m deep and 300 m wide. • BMZs appear vertically in an irregular pillar-like shape each, with diameters of 100 to 150 m, and 300 to 600 m vertically, 493 m to 1,761 m ASL associated to intense phyllite alteration.

Criteria	*JORC Code* explanation	Commentary
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	• Mineral Resource estimation was undertaken in Datamine™ software with the following key assumptions and parameters. • Ordinary Kriging interpolation has been applied for the estimation of Au and Ag. • Extreme grade values were managed by upper grade capping. • Veta Sur and Yaragua 1 m composites, BMZ 4 m composites. • The estimates were predominantly undertaken using hard domain boundaries and a series of elliptical search passes orientated in the plane of mineralisation. These search orientations and sizes were supported by variogram analysis. • Exploratory data analysis, variography and search neighbourhood optimisation for each domain was performed. • Octant searches were used. • No assumptions were made regarding recovery of by-products. • No assumptions were made about modelling of selective mining units. • A parent block size of 10 m easting (X) by 10 m northing (Y) by 10 m vertically (Z) was used, with sub-cells of 1 m easting (X) by dynamic option northing (Y) with minimum 0.1 m by 1 m vertically (Z). • SRK has validated both block models by swath plot and visual inspection, indicating that the models were validated.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• The tonnages are estimated on a dry basis.

Criteria	*JORC Code* explanation	Commentary
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The Mineral Resources are reported at a cut-off grade of 2.0 g/t AuEq (AuEq = Au g/t + Ag g/t × 0.010086, based on metal prices of 2700 USD/oz Au and 35 USD/oz Ag and recovery rates of 87.63% Au and 68.18% Ag) considering an underground extraction. Cut-off grades are based on an Au metal price of USD 2,700/oz and USD 35/oz Ag, and one troy ounce is equal to 31.1035 gram.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• Active underground mining operation.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• SRK adopted a method that combines the actual products and metal recoveries of the Buritica Plant with metallurgical test results to predict future mineral metallurgical recoveries.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• This is an operational mine site, and waste rock and tailings have been disposed of in tailings storage facility. Please refer to the section 13.

Criteria	*JORC Code explanation*	Commentary
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• As of December 2024, a total of 13,034 core samples were collected for measures of the specific gravity ("SG") using a conventional density – immersion method, operated by CGL Colombia geological technicians in the core shed on site. The samples were randomly selected and externally re-measured by ALS Colombia on a monthly base. • Veta Sur and Yaragua veins, SG 3.10, BMZ SG 2.95 and Halos SG 2.80.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• Veta Sur and Yaragua Blocks estimated within 15 m of at least 3 drill or channel samples from minimum 7 composites used for grade estimation (first search volume) clustered mainly in tunnelling space can be classified as Measured Mineral Resources. Blocks estimated within 40 or 60 m for master veins of at least 2 drill or channel samples from minimum 4 composites used for grade estimation (second search volume) can be classified as Indicated Mineral Resources. Blocks estimated within 150 m of at least 1 drill or channel samples from minimum 1 composite used for grade estimation (third search volume) can be classified as Inferred Mineral Resources. • BMZ Measured Mineral Resource: 30 m drill spacing and be estimated using information from 3 drillholes, and a minimum 8 composites used; generally, with P_{90} for KV=0.38. Indicated Mineral Resource: 60 m drill spacing and be estimated using information from 2 drillholes, and a minimum 6 composites used; generally, with P_{90} for KV=0.40. Inferred Mineral Resource: 120 m drill spacing and be estimated using information from 1 drillhole, and a minimum 2 composites used; generally, with P_{90} for KV=0.45.

Criteria	*JORC Code* explanation	Commentary
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• The input data, including geological mapping and drillhole data are comprehensive in their coverage of the mineralisation. • The Mineral Resource estimate appropriately reflects the view of the Competent Person.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the *JORC Code*. • The statement relates to global volumetric estimates.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	*JORC Code* explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• The Measured Resources and Indicated Resources estimated have been considered for Ore Reserve conversion. • The latest MRM was completed by CGL Colombia, then was reviewed and accepted by SRK in April 2025. The MRM is a local estimate of gold and silver minerals for the mineralised zones and surrounding wall rocks.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• A site visit was conducted between 15 May and 20 May 2025. • SRK communicated all modification factors with technicians.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• See "8.1 Technical Studies" • After the review of the 2025 feasibility study, SRK noted that it mainly summarised the operating status but with little sustaining designs to the existing operations. There is no further mine plan in place to modify the mining capacity, mining method, development system, ventilation, dewatering and drainage.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• See "8.2 Cut-off Grade"

Criteria	*JORC Code* explanation	Commentary
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• Mining method is demonstrated in "9 Mining Methods". • The mine is a producing underground mine. Therefore, it is not applicable to consider the factors related to an open pit property. • The mining dilution and recovery factors are shown in Figure 8-2 and "8.5 Mining Loss and Dilution". • The minimum mining width is 4.2 m. • The Inferred Mineral Resource and wall rocks were treated as waste materials with a zero grade. • The tonnage of Inferred Mineral Resources account for no more than 2.0% of total tonnage of mineable materials in Table 8-3. These Inferred Mineral Resources must be mined during the ore extraction process. They cannot be selectively excluded from the Ore Reserves.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.* • *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• The production indicators of the Buritica Plant after technological transformation serve as the basis for forecasting the output of various products and metal recovery rates. The forecast results are used for Mineral Resource and Ore Reserve estimation and preliminary economic analysis. • The recoverable precious metals are gold and silver. They are in the products of doré bullion and copper concentrate. The copper product is copper concentrate. • There are no payable by-product metals, nor are there any deleterious elements that would result in price penalties.
Environmen-tal	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• See "13 Environmental Studies, Permitting, Social or Community Impact, and Occupational Health and Safety"

Criteria	*JORC Code* explanation	Commentary
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• See "12 Project Infrastructure"
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• See "14 Capital Expenditures and Operating Expenses"
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• See "15.1 Metal Prices"
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• The Buritica Project is a production mine, and its main products are gold and silver. The mine has established dependable buyers of the products. The annual gold production will be less than or around 10 tonnes, which will not affect the gold prices in the market.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• See "15 Economic Analysis"
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• See "13.5 Social Aspects"

Criteria	*JORC Code* explanation	Commentary
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• See "16 Risk Assessment".
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• See "8.6 Ore Reserve Classification".
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• This report has been peer reviewed by another Competent Person.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• See "16 Risk Assessment". • See "8.3 Ore Reserve Model".

Appendix D Compliance with Chapter 18

Chapter 18				Sections in SRK's Report
18.01	**DEFINITIONS AND INTERPRETATION**			**Not applicable.**
18.02-18.04	**CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES**			
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.			
18.03	A Mineral Company must:—			
	(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—		3
		(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or	
			Note: 'control over a majority' means an interest greater than 50%.	
		(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which gives it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
	(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—		7.13
		(a)	Indicated Resources; or	
		(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
	(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—		14.2
		(a)	workforce employment;	
		(b)	consumables;	
		(c)	fuel, electricity, water and other services;	
		(d)	on and off-site administration;	
		(e)	environmental protection and monitoring;	
		(f)	transportation of workforce;	
		(g)	product marketing and transport;	
		(h)	non-income taxes, royalties and other governmental charges; and	
		(i)	contingency allowances;	
		Note:	*A Mineral Company must:* *• set out the components of cash operating costs separately by category;* *• explain the reason for any departure from the list of items to be included under cash operating costs; and* *• discuss any material cost items that should be highlighted to investors.*	

Chapter 18				Sections in SRK's Report
	(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—		14.2
		(a)	general, administrative and operating costs;	
		(b)	property holding costs; and	
		(c)	the cost of any proposed exploration and/or development; and	
		Note:	*Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.*	
	(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has sufficient available working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.		14.2
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.			Not applicable
	Note: A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.			
18.05-18.08	**CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS**			
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—			
	(1)	a Competent Person's Report;		Whole report
	(2)	a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;		2.4
	(3)	the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;		3.1
	(4)	a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;		3.1
	(5)	disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and		16

Chapter 18				Sections in SRK's Report
	(6)	if relevant and material to the Mineral Company's business operations, information on the following:—		13
		(a)	project risks arising from environmental, social, and health and safety issues;	
		(b)	any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	
		(c)	compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	
		(d)	sufficient funding plans for remediation, rehabilitation and closure and removal of facilities in a sustainable manner;	
		(e)	environmental liabilities of its projects or properties;	
		(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	
		(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	
		(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	
18.06-18.08	***Additional disclosure requirements that apply to certain new applicant Mineral Companies***			
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.			14.2, 15.4.2
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.			Not applicable.
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.			
18.09-18.13	**RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS**			**Not applicable.**
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—			
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;		
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;		
		Note: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.		

Chapter 18			Sections in SRK's Report
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and	
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.	
	Note: Material liabilities that remain with the issuer on a disposal must also be discussed.		
18.10-18.11	***Requirements that apply to listed issuers***		
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.		
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.		
18.12-18.13	***Requirements that apply to Mineral Companies and listed issuers***		
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.		
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.		
18.14-18.17	**CONTINUING OBLIGATIONS**		**Not applicable.**
18.14	***Disclosure in reports***		
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.		
18.15-18.17	***Publication of Resources and Reserves***		
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.		
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.		
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18.		
	Note: Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.		

Chapter 18			Sections in SRK's Report
18.18-18.27	**STATEMENTS ON RESOURCES AND/OR RESERVES**		
18.18	***Presentation of data***		
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.		7.13, 8.7
18.19	***Basis of evidence***		
18.19	All statements referring to Resources and/or Reserves:—		
	(1)	in any new applicant listing document or circular relating to a Relevant Notifiable Transaction must be substantiated in a Competent Person's Report which must form part of the document; and	Whole report
	(2)	in all other cases, must at least be substantiated by the issuer's internal experts.	Not applicable.
18.20	***Petroleum Competent Persons' Reports***		**Not applicable.**
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.		
18.21-18.22	***Competent Person***		
18.21	A Competent Person must:—		2.7
	(1)	have a minimum of five years' experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	
	(2)	be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	
	(3)	take overall responsibility for the Competent Person's Report.	
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—		2.11
	(1)	have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2)	not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3)	in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4)	in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	

Chapter 18			Sections in SRK's Report
18.23	***Additional requirements of Competent Evaluators***		**Not applicable.**
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—		
	(1)	have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2)	have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3)	hold all necessary licences.	
	Note:	*A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.*	
18.24	***Scope of Competent Persons' Reports and Valuation Reports***		
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—		2.2
	(1)	be addressed to the Mineral Company or listed issuer;	2.1
	(2)	have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	2.4
	(3)	set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	2.2
18.25-18.26	***Disclaimers and Indemnities***		
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.		2.3
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.		2.9
18.27	***Obligations of sponsor***		**Not applicable.**
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.		

				Sections in SRK's Report
	Chapter 18			
18.28-18.34	**REPORTING STANDARD**			
18.28-18.30	***Mineral reporting standard***			
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.			
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—			
	(1)	under:		
		(a)	the JORC Code;	1, 2.2
		(b)	NI 43-101; or	
		(c)	the SAMREC Code,	
		as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		Not applicable.
	Note:	*The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.*		
18.30	A Mineral Company must ensure that:—			
	(1)	any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;		8.1
	(2)	estimates of mineral Reserves and mineral Resources are disclosed separately;		7.13, 8.7
	(3)	Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;		8.4, 15
	(4)	for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—		
		(a)	the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	15.1
		(b)	if a contract for future prices of mineral Reserves exists, the contract price is used; and	Not applicable.
	(5)	for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.		15.5
18.31-18.33	***Petroleum reporting standard***			**Not applicable.**
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.			

Chapter 18			Sections in SRK's Report
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—		
	(1)	under PRMS as modified by this Chapter; or	
	(2)	under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	Note: A Reporting Standard applied to specific assets must be used consistently.		
18.33	A Mineral Company must ensure that:—		
	(1)	where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;	
	(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
	(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	8; 9
	(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	
		Note: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.	
	(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
		Note: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.	
	(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
	(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	

Chapter 18			Sections in SRK's Report
18.34	***Mineral or Petroleum Asset Valuation Reports***		**Not applicable.**
18.34	A Mineral Company must ensure that:—		
	(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
	(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
	(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
	(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

Appendix E Chapter 2.6 of the Guide for New Listing Applicants

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	7.13, 8.2, 8.4, 7.5, 9.5, 15.1
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	Not applicable.
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	Not applicable.
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	4.1
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	8
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	15.4
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/ oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	Not applicable.
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	16

Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

Term / Abbreviation	Meaning / Definition
%	percent
°	degree, angle of inclination
°C	degrees of temperature
3D	Three-dimensional
AGM INC	Aurora Gold Mine Incorporated (奥罗拉有限责任公司)
AN/FO	Ammonium nitrate / fuel oil
ARD	Acid rock drainage
asl	above sea level
Au	the element symbol of gold
AusIMM	Australasian Institute of Mining and Metallurgy
Capex	capital expenditure(s)
CIL	carbon-in-leach, a continuous agitation cyanide leaching process with active carbon in the leaching tanks to adsorb resolved gold
CIP	Carbon-in-pulp, similar with CIL, there is pre-leaching operation before carbon adsorption. Most of the time, the two processes are not distinguished in expressions
CIT	corporate income tax
cm	centimetres
COG	cut-off grade
Company or Zijin Gold International	Zijin Gold International Company Limited(紫金黄金国际有限公司)
CPR	Competent Person's Report
DCF	discounted cash flow
E	East
EIA	Environmental Impact Assessment
EPMP	Environmental Protection and Management Plan
FAusIMM	Fellow of the Australasian Institute of Mining and Metallurgy
Exploration Results	Data and information generated by mineral exploration programs that might be of use to investors, but which do not form part of a declaration of Mineral Resources or Ore Reserves
Exploration Target	A statement or estimate of the exploration potential of a mineral deposit in a defined geological setting where the statement or estimate, quoted as a range of tonnes and a range of grade (or quality), relates to mineralisation for which there has been insufficient exploration to estimate a Mineral Resources
FS or Feasibility Study	A Feasibility Study is a comprehensive technical and economic study of the selected development option for a mineral project that includes appropriately detailed assessments of applicable Modifying Factors together with any other relevant operational factors and detailed financial analysis that are necessary to demonstrate at the time of reporting that extraction is reasonably justified (economically mineable). The results of the study may reasonably serve as the basis for a final decision by a proponent or financial institution to proceed with, or finance, the development of the project. The confidence level of the study will be higher than that of a Pre-Feasibility Study
FY	financial year
G&A	general and administration
g	gram
g/cm^3	gram(s) per cubic centimetre
g/t	gram per tonne
ha	hectare(s)

Term / Abbreviation	Meaning / Definition
HKEx	Hong Kong Exchanges and Clearing Ltd
Indicated Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit
Inferred Mineral Resource	That part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
JORC Code	2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves prepared by the Joint Ore Reserves Committee of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
JORC Committee	Joint Ore Reserves Committee
K	the element symbol of potassium
kg	kilogram, equivalent to 1,000 grams
km	kilometres, equivalent to 1,000 metres
km^2	square kilometres
kt	thousand tonnes
ktpa	thousand tonnes per annum
kV	kilovolts, equivalent to 1,000 volts
kVA	kilovolt ampers
kW	kilowatt, equivalent to 1,000 watts
kWh	kilowatt hours
L	litres
Li	the element symbol of lithium
LHD	load-haul-dump
L/s	litres per second
LoM	life-of-mine
M	million
m	metres
m^2	square metre
m^3	cubic metre
Mm^3	million cubic metres
MAusIMM	Member of the Australasian Institute of Mining and Metallurgy
m asl	metres above sea level
m/s	metres per second
Measured Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit.
Mineral Resource	A concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.
ML	megalitres (million metres); Mining Licence
mg	milligram
mm	millimetre(s)
MRE	Mineral Resource estimate
Mt	million tonnes

Term / Abbreviation	Meaning / Definition
Mtpa	million tonnes per annum
MW	megawatts
MWh	megawatts hours
NPV	net present values
NSR	net smelter return
OK	Ordinary Kriging
Opex	operating expenditure(s)/cost(s)
Ore Reserve	The economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified
ORM	Ore Reserves Model
PFS	A Preliminary Feasibility Study (Pre-Feasibility Study) is a comprehensive study of a range of options for the technical and economic viability of a mineral project that has advanced to a stage where a preferred mining method, in the case of underground mining, or the pit configuration, in the case of an open pit, is established and an effective method of mineral processing is determined. It includes a financial analysis based on reasonable assumptions on the Modifying Factors and the evaluation of any other relevant factors which are sufficient for a Competent Person, acting reasonably, to determine if all or part of the Mineral Resources may be converted to an Ore Reserve at the time of reporting. A Pre-Feasibility Study is at a lower confidence level than a Feasibility Study
PPE	Personal protective equipment
ppm	parts per million, equivalent to gram(s) per tonne (g/t)
Probable Ore Reserve	the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve
Proved Ore Reserve	the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors
QA/QC	quality assurance/quality control
RC	reverse circulation
ROM	run-of-mine
RPEEE	reasonable prospects for eventual economic extraction
S	South, also the element symbol of sulphur
SG	specific gravity
SRK	SRK Consulting China Ltd
Stock Exchange	The Stock Exchange of Hong Kong Ltd, a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("HKEx")
t	tonnes
t/d or tpd	tonnes per day
t/m^3	tonnes per cubic metre
TSF	tailings storage facilities
US$	United States dollar
VALMIN Code	2015 edition of the Australasian Code for the Public Reporting of Technical Assessments and Valuations of Mineral Assets.
WRD	waste rock dump
VAT	value-added tax

Executive Summary

Introduction

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Limited ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of the Aurora Gold Project ("**Aurora Project**" or the "**Project**") which is located in Georgetown, Guyana and operated by AGM INC ("**AGM**"), a subsidiary company of Zijin Gold International. Zijin Gold International is wholly-owned by Zijin Mining Group Company Ltd. ("Zijin Mining").

It is SRK's understanding that the independent technical assessment on the Project is required to be included in a Competent Person's Report ("**CPR**", or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Company on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEx**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on the Stock Exchange including the *Chapter 18* requirements and other relevant regulations of the Stock Exchange and HKEx.

Summary of Principal Objectives

The principal objective of this Report is to provide Zijin Gold International and potential equity investors and future shareholders of the Company with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserves, mining methodologies, processing and metallurgical technologies, environmental and social aspects, and etc of the Project based on all available technical data. It is understood that the aim of this Report will be used by the Company for the proposed listing on the Stock Exchange and HKEx.

Outline of Work Programme

The work program for this project consisted of:

- review of dataset and resource models provided by AGM INC and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection.
- a site visit in June 2025, to the Aurora Project, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.
- review of all available documents, including operating licenses and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating expenses ("**Opex**"), etc.

- discussion with AGM INC and Zijin Gold International management and technical personnel, as well as the professionals of Xiamen Zijin Engineering Design Co., Ltd ("**Xiamen Zijin**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Aurora Project.
- preparation of a draft report in accordance with the JORC Code and the requirements of the *Chapter 18* on the Stock Exchange and other regulations of the HKEx (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- submission of the draft to Zijin Gold International and AGM and the related third party for comments and finalise the draft based on the feedback.

Results

Overall

The Aurora Gold Mine project is an advanced stage gold exploration project, located in Guyana. It is situated approximately 170 km west of Georgetown, the capital, and 130 km west-northwest of Bartica, where the Cuyuni, Mazaruni, and Essequibo Rivers meet. AGM Inc. ("AGM") holds the rights to the project, having acquired full ownership through a series of transactions culminating in the acquisition by Zijin in August 2020.

Operational Licences and Permits

AGM, a fully-owned subsidiary of GGI, holds complete ownership of the Mine, which spans an area of 5,802 hectares. In August 2020, GGI was acquired by Zijin. Back on 18 November 2011, AGM obtained a Mining Licence (ML/G1), granting them the authority to construct and manage the Mine. Two Environmental Permits for the project were issued by the Guyana EPA pursuant to the Environmental Protection Act and the Environmental Protection (Authorizations) Regulations. A number of operational licences/permits have been issued to Aurora Gold Mine. AGM has informed SRK that it has already obtained the necessary licences and permits required for the mine operations.

Geology and Mineralogy

The Project lies within the Paleoproterozoic Guiana Shield's greenstone belt, which comprises metamorphosed volcanic and sedimentary rocks. The area features the Barama and Cuyuni Groups, with significant deformation and chemical weathering forming a laterite-saprolite profile.

The Aurora Gold Mine is in a high-strain zone near a granitic batholith, with stratigraphy dominated by metasedimentary and metavolcanic rocks intruded by late stage felsic to mafic suites. The Rory's Knoll diorite and Mad Kiss quartz-feldspar porphyry are key gold-hosting lithologies due to the brittle deformation imparted on these lithologies.

Gold occurs in four main mineralization zones: Rory's Knoll, East Walcott/ Walcott Hill, Mad Kiss, and Aleck Hill. Mineralization is associated with quartz veining and pyrite, often localized in fold hinges and high-strain zones. Structural controls include foliation, fold interference patterns, and extensional veining.

- Rory's Knoll (RK): The primary deposit is hosted in a highly altered diorite pipe, with mineralization extending over 2 km below surface, associated with quartz veins and disseminated pyrite.

- East Walcott/ Walcott Hill: Mineralization occurs in fold closures and foliated diorites, extending to a depth between of 420m and 650 m.
- Mad Kiss (MK): Hosted in a foliated quartz-feldspar porphyry dike, with mineralization extending to a depth of up to 700 m. High-strain corridors control geometry.
- Aleck Hill (AH)/ North Aleck Hill (NAH): Veining is localized in high-strain zones within mafic volcanics and sediments. The area features braided veins and stockworks, with distinct "pink" quartz alteration.

Two main alteration styles are identified: and both styles are characterized by primarily chlorite, epidote, magnetite and traces of interstitial and veined calcite in the distal zones. Of them, the style 1 alteration consists of pervasive sericite and Fe-carbonate with small component of quartz, and the type 2 alteration is composed of magnetite and calcite with less amount of Fe-carbonate.

All the deposits display an association of gold mineralization with quartz veining and pyrite, locally as much as 10%. Coarse visible gold occurs in quartz-bearing veins and in pyrite-rich fractures.

Mineralization within the volcanoclastic rocks is preferentially developed in fold hinges as silicified, stockwork, and brecciated concentrations of veins exploiting the local, low pressure, extensional environment. Quartz veins typically display crustiform and comb textures; and have been observed in en-echelon sets.

Within foliation dominant fold limbs, gold veining is characterized by narrow, two to twenty-five centimeters, and rarely up to a few meters in width, ribbon line veins that are discontinuous along strike. These veins form anastomosing arrays along a strike of 290° to 305° and dip steeply to the northeast at 70° to 85°.

Alteration is zoned, from distal to proximal to the hydrothermal fluid source. Alteration typically includes silicification, albitization, and pyritization.

The gold mineralization at the Mine exhibits features analogous to mesothermal or "orogenic" gold deposits typified by Archean deposits of the Abitibi region, Canada. Features characteristic of the gold mineralization at the Mine include:

- A strong spatial association to large scale shear zones;
- Relative late timing during active compressional deformation;
- Formed during greenschist metamorphic conditions;
- Association with a propylitic-phyllic alteration assemblages; and
- Principally hosted in quartz-ankerite-pyrite veining.

Whereas the previous interpretation suggested shear-related control, no evidence of strike-slip displacement has been identified in mapping mine exposures. The shear model implied reasonable strike continuity of foliation parallel veins in the volcanoclastic lithologies. Exposures from mining has demonstrated limited strike continuity in the order of five to ten meters of individual veins. It is believed that the mineralization continuity is controlled by the intersection lineation between the earlier foliation and the later, dominant penetrative foliation.

Mineral Resource Estimation

GGI's exploration efforts span over two decades, marked by progressive drilling campaigns and geological studies. It began in 1998 with the acquisition of a 100% property.

Early drilling before 2002 was conducted by previous operators, including 131 boreholes (19,128 m), providing foundational geological data. Between 2002 and 2012, GGI drilled 1,624 boreholes (411,088 m), transitioning to targeted diamond drilling in 2010 to refine gold mineralization models and resource classification. After a hiatus from 2013 to 2016, GGI resumed exploration in 2017, drilling 88 boreholes (12,801 m) and integrating advanced tools including the Reflex EZ-Mark and ACT-III systems for accurate structural logging.

From 2019 to 2020, GGI focused on resource definition, drilling 51 boreholes (14,088 m) across key deposits and initiating reverse circulation (RC) drilling programs.

Recent exploration activities from 2021 to March 2024 included 146 drill holes (128 diamond drilling (DD) holes totalling 27,603 m and 18 RC holes totalling 3,545 m) and 115 trenches (18,563 m) across Aleck Hill, Powis Hill, and Batholith. Current efforts emphasize detailed geological investigations and supplementary surface data acquisition, with exploration ongoing.

No quality assurance and quality control (QA/QC) program was in place prior to 2004. Drill holes dated prior to 2004 are not included in the current resource estimation. To ensure the reliability and trustworthiness of exploration data, comprehensive quality control measures are implemented throughout the exploration process of Aurora Gold Mine from 2004, including inserting the certified reference materials ("CRMs"), blank samples (Blanks), field duplicates and check samples from 2004 to 2007 and in 2010.

The core samples were collected, logged, and processed by trained personnel using standardized protocols, maintaining the integrity of the data throughout the exploration process.

There is no quality expectation for quarter core duplicates and results are within the expected range for the deposit type. The quarter core duplicates are sufficient for the project, and reproducibility for the deposit type has been established, although quarter core duplicates are not mandatory for quality control.

The QA/QC program as designed and the assay results in the database are suitable for Mineral Resource estimation.

SRK team including geologists, mining engineer and processing engineer, visited the Aurora Project in June 2025 and conducted the following verification procedures. SRK has inspected the RK and AH open pits and a number of mining stopes underground at the AK and MK satellite deposits which show the exposure of the mineralized bodies at the AGM. SRK also checked five sealed boreholes, visited the drill core shed and inspected mineralized cores from two boreholes with comparison of original logs. Based on the exploration database available and the site observations, SRK selected a total of 114 representative samples, including 41 RC pulp duplicates and 73 quarter core samples from 53 boreholes as independent verification samples.

Based on SRK's site visit, review of the previous and ongoing exploration datasets, communication with the AGM's technical personnel and consideration of the mineralization characteristics of the Aurora gold deposit, SRK is satisfied with the quality and result of the sample preparation and assay conducted by related analytical laboratories. The analytical procedures are consistent with generally accepted industry practices and the primary sample results are therefore suitably reliable for use in Mineral Resource estimation.

The Mineral Resource estimation work for Rory's Knoll, East Walcott, Mad Kiss South, Walcott Hill, and Mad Kiss West was completed by SLR Consulting ("SLR") in 2021. And There are non-material changes (no material changes on wireframing/ interpretation assumptions and no additional sample data acquired since 2021, Mr Pengfei Xiao (FAusIMM, MAIG), and Ms Yanfang Zhao (MAusIMM), who are Principal Geologists from SRK have reviewed the database, estimation methodologies and models used to prepare the Mineral Resource estimation using Leapfrog and Surpac software. Mr Pengfei Xiao and Ms Yanfang Zhao, as the Competent Persons for the Mineral Resource estimates were satisfied that they comply generally with reasonable industry practice.

For Mad Kiss, Aleck Hill underground, North Aleck Hill, and Aleck Hill Open Pit Area, SRK has updated the domains with additional data that is acquired from drilling programme completed since the previous update. The modelling and MRE update used Leapfrog Geo and Edge. The estimates are based on information of drilling samples and underground channel samples available up to March 2024. SRK is not aware of any material changes in exploration data that could impact the MRE update reported herein since 31 March 2024, and SRK believes that the current drilling information is sufficiently reliable to interpret with confidence the mineralized zone boundaries for the Aurora Project and that the assay data are sufficiently reliable to support a reasonable MRE dated 31 December 2024.

The Mineral Resources were reported with constraints including a cut-off grade calculated assuming a long-term gold price of United States Dollars (USD or US$) 2,700 per troy ounces (oz), i.e. US$2,700/oz; Of Which the open pit Mineral Resources were determined from a conceptual pit, designed using Whittle software. The input parameters were summarized by SRK according to the reviewed data provided by AGM.

As of 31 December 2024, the Aurora Mine, at a cut-off grade of 0.3 g/t Au for all deposits to open pit (OP) mining, 1.0 g/t Au for RK and 0.8 g/t Au respectively for satellite deposits to underground (UG) mining, the Mineral Resources were summarized in Table ES-1.

Table ES-1: Mineral Resource Statement for Aurora Project, as of 31 December 2024

Mine	Category	Tonnes (Mt)	Grade (g/t Au)	Contained Metal (t Au)	Contained Metal (000 oz Au)
OP	Measured	2.1	2.80	5.89	189
	Indicated	2.7	2.25	6.08	196
	Measured + Indicated	4.8	2.49	11.97	385
	Inferred	0.5	1.64	0.82	26
	Sub Total	5.3	2.41	12.79	411
UG	Measured				
	Indicated	37.6	2.68	100.64	3,235
	Measured + Indicated	37.6	2.68	100.64	3,235
	Inferred	36.4	2.07	75.13	2,413
	Sub Total	73.9	2.38	175.56	5,641
OP+UG	**Measured**	**2.1**	**2.80**	**5.89**	**189**
	Indicated	**40.3**	**2.65**	**106.72**	**3,431**
	Measured + Indicated	**42.4**	**2.65**	**112.61**	**3,620**
	Inferred	**36.9**	**2.06**	**75.95**	**2,439**
	Total	**79.2**	**2.38**	**188.35**	**6,052**

Note:

1. The Mineral Resources results are used solely for the purpose of testing the "reasonable prospects for eventual economic extraction" by open pit mining and underground mining and do not represent an attempt to estimate Ore Reserves.

2. Mt – million tonnes.
3. All figures are rounded to reflect the relative accuracy of the estimate. The significant differences are due to rounding.
4. Current surface stockpile was not included.
5. The information in this Report which relates to Mineral Resource is based on information compiled by Ms Yanfang Zhao and reviewed by Mr Pengfei Xiao; and Dr Yiefei Jia peer reviewed the Mineral Resource estimates and this Report; all of who are full time geological consultants of SRK Consulting. Ms Yanfang Zhao is a Member of the Australasian Institute of Mining and Metallurgy (the "AusIMM") and Mr Pengfei Xiao is a Fellow of the AusIMM and a Member of the Australian Institute of Geoscientists (the "AIG"); and Dr Yiefei Jia is a Charter Professional and Fellow of the AusIMM. Ms Zhao, Mr Xiao and Dr Yiefei Jia have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration. To the qualification, experience and activity Ms Yanfang Zhao, Mr Pengfei Xiao and Dr Yiefei Jia are undertaking to qualify as Competent Persons as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources, and Ore Reserves". Ms Yanfang Zhao, Mr Pengfei Xiao and Dr Yiefei Jia consent to the reporting of this information in the form and context in which it appears.

Exploration Potential

There is potential to supplement the current Mineral Resources with exploration beneath the East Walcott, Mad Kiss, and Aleck Hill satellite deposits. Zijin plans to drill these targets from surface. More efficient drilling will be facilitated from underground as the ramp to access the Rory's Knoll underground deposit advances.

Mining and Ore Reserves

SRK has estimated the Ore Reserves for the Rory's Knoll open pit and the underground deposits at Aleck Hill, Mad Kiss, and Rory's Knoll in accordance with the guidelines outlined in the JORC Code. These Ore Reserve estimates are supported by Modifying Factors derived from technical studies and ongoing operational records, which are considered to meet the confidence level of a Pre-Feasibility Study.

Key factors applied in the estimation process include design scope, pit optimization, pit design, mining losses, and dilution. Additional factors, such as processing capabilities, market conditions, environmental considerations, legal and political constraints, and other elements that may influence the quantity and classification of the Ore Reserves, were also taken into account.

The portions of Measured and Indicated Mineral Resources within the designed open pits and underground stopes, inclusive of diluting materials and allowances for losses, have been classified as Proved Ore Reserves and Probable Ore Reserves, respectively. The Ore Reserve statement is shown in Table ES-2.

Table ES-2: Ore Reserves Statement for the Aurora Gold Mine, as of 31 December 2024

Category	Tonnes (kt)	Grade (g/t Au)	Contained Au Metal (kg)	Contained Au Metal (t)
Open Pit				
Proved	2,163	2.52	5,458	5.458
Probable	2,867	1.98	5,679	5.679
Sub-total	5,030	2.21	11,138	11.138
Underground				
Proved	-	-	-	
Probable	27,574	2.22	61,336	61.336

Category	Tonnes (kt)	Grade (g/t Au)	Contained Au Metal (kg)	Contained Au Metal (t)
Sub-total	27,574	2.22	61,336	61.336

Source: SRK

Note:

[1] The information in this report which relates to Ore Reserve is based on information compiled by Ms Shan Chuang and Mr Falong Hu, who are full-time employees of SRK Consulting China Ltd. Ms Chuang is a Member of AusIMM and Mr Falong Hu is a Fellow of AusIMM. Both Ms Chuang and Mr Falong Hu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms Shan Chuang and Mr Falong Hu consent to the reporting of this information in the form and context in which it appears.

[2] Number was rounded to the second significant digit to reflect the uncertainties in estimate.

[3] Total may not add due to rounding discrepancies

[4] For Rory's Knoll pit, the mining dilution (waste rock and inferred Mineral Resources) rate is 5%. Mining loss rate is 18%.

[5] For Rory's Knoll deposit, the mining dilution (waste rock and inferred Mineral Resources) rate is 20%. Mining loss rate is 10%.

[6] For Aleck Hill and Mad Kiss deposit, the mining dilution (waste rock and inferred Mineral Resources) rate is 28%. Mining loss rate is 10%.

[7] The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources

Mining Assessment

The Aurora Gold Mine ("AGM") includes both open-pit and underground mining operations.

Open-pit Operations

Rory's Knoll is the primary open pit, with an estimated remaining life of approximately 5–6 years. The Aleck Hill pit is expected to be depleted by October 2024, while the Mad Kiss and North Aleck Hill pits have already been fully mined, with the latter backfilled. The open-pit operations are designed as a conventional truck-and-shovel system managed by contractors. The bench height is 10 meters, with double benching extending to 20 meters where applicable. Haul roads are designed with a maximum gradient of 10%, featuring double-lane roads 14 meters wide and single-lane roads 10 meters wide, providing efficient access to the pit bottom.

Underground Operations

Underground mining at Rory's Knoll is scheduled to commence between mid to late 2026, with Phase 1 planned from 2027 to 2032 and Phase 2 extending to 2036. Underground operations at Aleck Hill began in 2024 and are expected to conclude by 2027, while Mad Kiss started in 2023 and is anticipated to finish by 2026. Early mining operations focus on Aleck Hill and Mad Kiss due to their relatively shallow depths, enabling faster access and initial ore extraction. Rory's Knoll underground development will proceed in two phases.

Rory's Knoll employs a modified sub-level stoping method with tailings paste backfill to achieve a production rate of 10,000 tonnes per day (tpd). The design incorporates 60-meter level intervals and a 40-meter crown pillar to maintain geotechnical stability. Stopes measure 50m x 15m x 60m and are oriented northeast-southwest. A bottom-up mining sequence is implemented to support production targets and minimize geotechnical risks. Primary stopes are backfilled immediately after extraction to ensure ground stability and facilitate the safe mining of secondary stopes. Ore is transported using 25-ton trucks over a 0.5-kilometre distance to the main ore pass, while waste rock is hauled 1.5 kilometres to designated backfill zones.

Aleck Hill and Mad Kiss utilize sub-level open stoping without backfill, leveraging favourable rock properties and geometric conditions. Sill and rib pillars are used to optimize ore recovery and maintain ground control. Gravity is utilized to assist ore movement, reducing reliance on mechanical equipment, with blasted rock falling into drawpoints or being extracted by load-haul-dump (LHD) equipment. The mine layout includes a footwall drift parallel to the orebody, with crosscuts constructed perpendicular to the drift to support efficient ore extraction. Ore from Aleck Hill and Mad Kiss is transported using 20-ton trucks over a 1.2-kilometre distance to adit portals, while waste rock is hauled 1.0 kilometre to either backfill zones or external dumps.

For deeper mining operations below -240 meter reduced level (mRL), ore is transported via declines to Rory's Knoll, where it is processed between -320 mRL and -800 mRL through the #1 ore pass for primary crushing. The crushed ore is then hoisted to the surface via a skip shaft.

Processing and Metallurgy

Aurora gold mine (AGM) gold ore contains low sulphide minerals of pyrite, chalcopyrite, sphalerite and molybdenite. Gold is amenable to cyanidation process. Cyanidation tests achieved high gold extraction rate, and gravity separation helps to avoid the loss of coarse-grained gold. The AGM processing plant employs gravity – carbon in pulp (CIP) process, historical performances confirmed the process is suitable for the ore characteristic. The plant was optimised and debottlenecked in 2024, with the designed throughput raise from 7,500tpd to 10,000tpd (2.48 to 3.30 Mtpa equivalent). The gold produced in 2022, 2023 and 2024 were about 2.82t, 2.97t and 4.06t, respectively. The plant historical performance is as in Table ES-3.

Table ES-3: AGM Processing Plant Historical Performance

Description	Unit	2022	2023	2024
Milled tonnage	kt	2,489	2,660	2,712
Average feed grade	g/t	1.24	1.23	1.61
Feed gold metal	kg	3,095	3,281	4,367
Gold lost in Tailings	kg	263	293	309
Tailings grade	g/t	0.11	0.12	0.11
Gold recovery	%	91.06	90.51	92.93
Gold in doré	t	2.82	2.97	4.06
Gold in doré	kg	2,819	2,970	4,058
Gold in doré	oz	90,620	95,475	130,456

Overall, the project had processed ores of 2.49 Mt averaging 1.24 g/t Au, 2.66 Mt averaging 1.23 g/t Au, and 2.71 Mt averaging 1.61 g/t Au in 2022, 2023, and 2024 respectively; and produced 2,819 kg, 2,970 kg, and 4,058 kg gold, achieving recoveries of 91.06%, 90.51%, and 92.93% in 2022, 2023, and 2024.

Workforce Assessment

The project outsources open-pit mining operations, with 683 personnel required for other activities, including 632 production workers and 51 management and service staff. Open-pit and underground mining operations share management and service personnel. Production workers follow a continuous working system (330 days/year, 3 shifts/day, 8 hours/shift), while other roles operate intermittently based on demand. The organizational structure includes the Ministry of Mines and two key workshops: the Mining Workshop for production and the Support Workshop for auxiliary services. Staffing and scheduling are periodically adjusted to align with production requirements and operational conditions.

Project Infrastructure

The Aurora Gold Mine is remote in forest region, and is accessible by air, road, and barge. The site includes essential infrastructure such as a 1,200-meter (m) airstrip, a 170-km access road, and the Buckhall Port Facility, which support logistical needs. It is self-sufficient, generating power on-site with diesel generators and maintaining communication through satellite systems. The facilities include residential accommodations, transportation infrastructure, utilities, and waste management systems. The infrastructure of the project also comprises a processing facility, maintenance buildings, and a tailings management area, supporting the operation's functionality in this remote location.

Environmental and Social Impacts

Two Environmental Permits for the project were issued by the Guyana EPA pursuant to the Environmental Protection Act and the Environmental Protection (Authorizations) Regulations. The renewed Environmental Permit (Reference Number 20090114-GGIOO) was issued by the Guyana EPA on 30 May 2023 and is valid until 31 January 2028. A varied Environmental Permit (Reference Number 20090114-GGIOO (B)) was issued on 14 July 2021 and is valid until 30 June 2026.

Since 2006, the project has undergone several environmental baseline studies, conducted by various third parties. Additionally, multiple environmental and social impact assessments have been carried out for the Aurora Gold Mine, with some of the assessments following the IFC Performance Standards. The most recent environmental assessment, completed by GSEC in 2020, focused on underground mining.

The project holds necessary environmental-related permits to carry out the proposed work on the property. The environmental and social impact assessments for the project also cover the mine's main production facilities. SRK is unaware of any significant factors or risks that could impact the mine's operation.

Capital Expenditures and Operating Costs

Capital Expenditure(s)

The Capex for the AGM over its LoM is estimated at USD 439 million. The largest portion of this expenditure is allocated to contingency, amounting to USD173 million, which serves as sustaining Capex due to the absence of specific sustaining data. This represents 5% of the initial development costs. These initial development costs include investments in underground mine infrastructure (USD 128 million), Rory's Knoll Phase II Construction (USD 138 million), the technical upgrade and renovation of the mineral processing plant (USD 0 million), farm construction (USD 0 million), and the expansion of magazines (USD 0.15 million). Mine closure costs are projected at USD 7.22 million and is allocated evenly over the LoM.

The summary of Capex is presented in Table ES-4.

Table ES-4: Summary of Capex for AGM

Item	Unit	LoM Total
Underground mine infrastructure	USD Million	128
Expansion of Magazines	USD Million	0.15
Mineral Processing Plant Technical Upgrade and Renovation	USD Million	–
Farm construction	USD Million	–
Rory's Knoll Phase II Construction	USD Million	138
Mine Closure	USD Million	7.22
Contingency	USD Million	173
Total	**USD Million**	**439**

Source: AGM and Zijin 2024, summarized by SRK

Operating Costs

The Opex are shown in Table ES-5. it provides a summary of the unit costs in years 2022 to 2024. SRK considers the historical three-year weighted average cost to be reasonable and uses it for future economic evaluations. For future underground mining at Rory's Knoll, the weighted average cost from Aleck Hill and Mad Kiss will be applied, along with the additional backfill costs, and is estimated to be USD 52.65 per tonne.

Table ES-5: Summary of Opex Historical & Forecasted for AGM

Item	Unit	2022	2023	2024
Cash cost-mining	US$	51,545,634	67,476,575	84,105,342
Cash cost- processing	US$	34,056,363	35,842,161	39,916,508
Cash cost- sales	US$	512,689	479,324	634,040
Cash cost- on site admin	US$	28,040,535	27,354,591	26,616,615
Changes of inventory (materials, producing and produced products)	US$	-7,120,903	-6,090,621	-21,938,782
C1 cost	**US$**	**107,034,318**	**125,062,029**	**129,333,724**
Business taxation and surcharges	US$	12,407,159	15,072,247	25,145,564

Item	Unit	2022	2023	2024
C2 cost	**US$**	119,441,477	140,134,277	154,479,288
Depreciation and amortization of OPEX	US$	14,338,797	19,114,732	22,129,326
Depreciation and amortization of on site admin	US$	1,169,501	1,531,795	3,702,796
C3 cost	**US$**	134,949,775	160,780,804	180,311,409
Cost of production exploration	US$	1,936,727	1,026,635	911,198
Sustaining Capex	US$	35,824,918	25,004,444	50,189,828
Annual AISC	**US$**	157,203,122	166,165,355	205,580,314
Gold sales	**oz**	89,110	97,035	130,809
Unit AISC	**US$/oz**	1,764	1,712	1,572

Source: AGM

Based on the LoM schedule and cost estimates, the all-in sustaining cost (AISC) for the Project is shown in Table ES-6.

Table ES-6: All-in Sustaining Forecasts

Item	Unit	Total	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037

Sources: SRK

Economic Analysis

The net present values ("NPVs") at different discount rates were estimated by SRK through DCF model, presented in Table ES-7.

Table ES-7: Estimated NPVs at Different Discount Rate

Discount Rate	5%	6%	7%	8%	9%	10%	11%	12%	13%	14%	15%
NPV	1,264	1,209	1,157	1,109	1,064	1,023	984	948	914	883	853

SRK conducted a single-factor sensitivity analysis for the Project to determine which factors most significantly impact its economics when considered independently. The analysis focused on metal prices, CAPEX, and OPEX, each tested within a ±30% range.

The changes in prices have the greatest impact on the Project's NPV, while OPEX and CAPEX have less effects.

To clarify the effects of prices on the Project's NPV, SRK estimated that the break-even price (NPV=0, at 10% discount rate) is around a change of -42% from the base scenario prices used in the model. In other words, the price drops to about 58% of the forecasting price, the Project NPV will become negative.

Risk Assessment

SRK completed a risk assessment of the risks identified for the Aurora Project in relation to their likelihood of occurrence and consequence.

SRK considers various technical aspects which may affect the feasibility and future cash flow of each operating mine and conducts risk assessments for the Aurora Project based on similar techno-economic conditions among the different deposits or mines, which have been summarized in Table ES-8.

Table ES-8: Risk Assessment for Aurora Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Unlikely	Major	Medium
Unexpected Groundwater Ingress	Possible	Moderate	Medium
Significant Unexpected Geological Faulting	Possible	Moderate	Medium
Mining			
Significant Production Shortfalls (LoM)	Unlikely	Major	High
Pumping System Adequacy	Unlikely	Moderate	Low
Excessive Surface Subsidence	Unlikely	Moderate	Low
Poor Underground Condition	Possible	Moderate	Medium
Poor Mine Plan	Possible	Moderate	Medium
Poor Road Transportation/Safety	Possible	Minor	Low
Ore Processing and Metallurgy			
Process Adaptability	Unlikely	Moderate	Low
Lower Throughput	Possible	Moderate	Medium
Lower Recovery	Unlikely	Moderate	Low
Low Plant Reliability	Unlikely	Minor	Low
Environmental and Social			
Lack of Relevant Environmental Permit	Unlikely	Moderate	Low
Impact on Flora and Fauna	Possible	Minor	Low
Water Contamination	Possible	Moderate	Medium
Hazardous Materials Management	Unlikely	Moderate	Low
Social Aspects	Unlikely	Moderate	Low
Capital and Operating Costs			
Project Timing Delay	Possible	Moderate	Medium
Capital Cost Increases	Possible	Minor	Low
Capital Costs- Ongoing	Possible	Minor	Low
Operating Cost Underestimated	Possible	Minor	Low

Recommendations

Geology and Resource

The mineralization at Aurora is confined within a greenstone belt of the Paleoproterozoic Guiana Shield in a series of folded metasedimentary, metavolcanics, and intrusive rocks. Gold mineralization fits an orogenic model, similar to many of the other gold deposits found within the Guiana Shield.

The drilling, sampling, sample preparation, analyses, security, and data verification meet industry standards and are appropriate for Mineral Resource estimation.

SRK recommended continuing the collection of accurate production tonnages and grades by mine area, including estimated tonnages mined based on open-pit surveys of each blast. These data should be reviewed against the resource models before subsequent updates, as they are valuable for resource classification and the evaluation of outlier strategies.

Environmental and Social Impacts

SRK recommends obtain all necessary environmental permits/approvals for the construction and production phase of underground mine. Those individual environmental and social management plans should be regularly updated, with conceptual plans revised to align more closely with actual production practices. It is also recommended to strengthen surface water and groundwater monitoring in the project area, particularly in the upstream and downstream regions of the TSF.

The cyanide purchase, transportation, handling/storage, use, equipment decommissioning, operation safety, emergency response, training, etc. should comply with the practical principles and standards of the International Cyanide Management Code. The MRCP should be updated regularly, with annual reviews to evaluate reclamation progress and record the activities completed in the previous year.

1 Introduction and Scope of Report

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Limited ("Zijin Gold International" or the "**Company**"), the parent company of AGM INC ("AGM") to undertake an independent assessment of all relevant technical aspects of the Aurora Gold Project ("**Aurora Project**" or the "**Project**") which is located in Georgetown, Guyana.

It is SRK's understanding that the independent technical assessment on the Project is required to be included in a Competent Person's Report ("**CPR**", or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Company on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEx**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on the Stock Exchange including the *Chapter 18* requirements and other relevant regulations of the Stock Exchange and HKEx.

The ownership of the Project has transitioned through several entities over the past decades. The Solar Development Company ("Solar") originally held the rights in the late 1930s. In 1940, Cuyuni Goldfields Company ("Cuyuni") acquired the rights and initiated underground mining operations at Aleck Hill until 1948. In 1989, South American Goldfields Inc. ("SAGI") secured an Exclusive Exploration Permit for the area. Although SAGI did not directly engage in exploration, they entered into an agreement with Denison Mines Ltd. ("Denison"), which carried out a comprehensive exploration program between 1989 and 1992. Following Denison's withdrawal, SAGI sold the rights to Golden Star Resources Ltd. ("Golden Star") in 1992. However, Golden Star relinquished the rights within the same year.

During the mid-1990s, Mr. Alphonso acquired the property and later optioned it to Coeur d'Alene Mines Ltd., which conducted limited geochemical exploration. In 1998, Guyana Goldfields Ltd ("GGI") secured a 100% option on the property from Mr. Alphonso and later acquired full ownership under an amended agreement in 2004.

In August 2020, Zijin Mining Group acquired 100% interest in GGI through its 100%-owned subsidiaries, marking the most recent ownership transition. The direct ownership of the Project is AGM being 100% owned by GGI with 100% interest controlled by Zijin Mining Group. Zijin Gold International is wholly-owned by Zijin Mining Group Company Ltd. ("Zijin Mining").

2 Program Objectives and Work Program

2.1 Purpose of the Report

The purpose of this Report is to provide an independent technical assessment for inclusion in a prospectus to be issued by Zijin Gold International to support the proposed listing on the Stock Exchange and the HKEx. The SRK's report is proposed to provide an unbiased technical assessment of the risk and opportunities associated with the reviewed project.

2.2 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "**Valmin Code**"). The Valmin Code incorporates the JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all members of the Australasian Institute of Mining and Metallurgy ("**AusIMM**") and the Australian Institute of Geoscientists ("**AIG**").

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the JORC Code.

2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that the Client has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Client has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Client and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

2.4 Effective Date

The effective date for this CPR is deemed to be 31 May 2025 (the "Effective Date"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as of 31 December 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK. Rather than ordinary production, SRK is not aware of any material changes to the Mineral Resources and Ore Reserves post the statement.

2.5 Work Program

- review of dataset and resource models provided by AGM INC and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection.
- a site visit in June 2025, to the Aurora Project, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("TSF"), water source and power supply station, the office and living areas, and other infrastructure, etc.
- review of all available documents, including operating licenses and permits, geology reports and environmental impact assessment ("EIA") reports, mineral processing technology and mining methodologies, capital expenditures ("Capex") and operating costs ("Opex"), etc.
- discussion with AGM and Zijin Gold International management and technical personnel, as well as the professionals of Xiamen Zijin Engineering Design Co., Ltd ("Xiamen Zijin"), who conducted either the geology and exploration or the feasibility study ("FS") on the Aurora Project.
- preparation of a draft report in accordance with the JORC Code and the requirements of the *Chapter 18* on the Stock Exchange and other regulations of the HKEx (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- submission of the report to Zijin Gold International and AGM and the related third party for comments and finalise the report based on the feedback.

2.6 SRK Experience

The SRK Consulting Group ("SRK Consulting") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,800 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK China was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience in providing Independent Expert Reports to mining companies for successfully listing on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-1.

Table 2-1: SRK's Reports for Listing on the HKEx

Company	Year	Nature of Transaction
Yanzhou Coal Limited (listed in HKEx)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on the HKEx and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on the HKEx
Lingbao Gold Limited	2005	IPO Listing on the HKEx
Yue Da Holdings Limited (listed in HKEx)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on the HKEx
Sino Gold Mining Limited	2007	Dual Listing on the HKEx
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on the HKEx
Kiu Hung International Holding Limited	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Limited	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Limited	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Limited	2009	Acquisition of a molybdenum mining project in Shaanxi, China
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on the HKEx
Citic Dameng Holdings Limited	2010	IPO Listing on the HKEx
China Hanking Holdings Limited	2011	IPO Listing on the HKEx
China Daye Non-Ferrous Metal Mining Limited	2012	Very Substantial Acquisition on the HKEx
China Nonferrous Mining Corporation Limited	2012	IPO Listing on the HKEx
Hengshi Mining Investments Limited	2013	IPO Listing on the HKEx
Future Bright Mining Holdings Limited	2014	IPO Listing on the HKEx
King Stone Energy Group Limited	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte LTD	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Limited	2016	IPO Listing on the HKEx
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Limited	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Limited	2022	IPO Listing on the HKEx
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on HKEx
Chifeng Jilong Gold Mining Co., Ltd	2025	IPO Listing on HKEx

2.7 Project Team

The SRK project team and responsibilities are shown in Table 2-2.

Table 2-2: SRK Project Team

Consultant	Title	Discipline and Task
Pengfei Xiao	Principal Consultant (Geology)	Project Manager, Overall Responsibility
Yanfang (Bonnie) Zhao	Principal Consultant (Geology)	Geology, Mineral Resource Estimation
Falong Hu	Principal Consultant (Mining)	Mining and Ore Reserve Review
TzuHsuan (Shan) Chuang	Senior Consultant (Mining)	Mining Review and Economic Analysis
Lanliang Niu	Principal Consultant (Processing)	Processing and Metallurgical Review
Nan Xue	Principal Consultant (Environment)	Environment, Social, and Permitting
Donghao Luo	Consultant (Mining)	Assist in Mining Review
Yuting (Lori) Zhou	Project Coordinator and Consultant	Project Coordination and Translation
Yiefei Jia	Corporate Consultant (Geology)	Internal Peer Review and Quality Control

Pengfei Xiao, ***MSc, FAusIMM, MAIG,*** is the Managing Director of SRK China. He is a Principal Consultant (Geology) with a specialty in mineral exploration applying comprehensive geological and geophysical methods; and his expertise also includes resource modelling and estimation. He is familiar with both theory and practice in sampling, sample preparation and chemical analysis. As a consulting geoscientist, he has been active in mining projects including due diligence reviews, exploration design, data verification and resource estimation in China, Mongolia, Africa, America, Southeast and Central Asia. His experience relates precious metal (Au, Ag, PGE), base metal (Cu, Ni, Pb, Zn) and other metal deposits (Fe, Mn, V, Mo, Co), and also includes a few non-metal projects (phosphorite, potash, gypsum). In the past ten years he has been working in geology and resource assessment with SRK, and co-authored dozens of technical reports aiding clients in successful property transactions; and more than half of them are published in stock exchanges.

Yanfang Zhao (Bonnie), ***MEng, MAusIMM***; is a Principal Consultant at SRK China, she graduated in 2009 from the China University of Geosciences (Beijing)and has 14 years of experience geological modelling, mineral resource estimations, technical reporting, gap analysis and due diligence studies. As a consulting geoscientist, she has been active in over 70 mineral projects including due diligence reviews, exploration design, data verification, resource estimation and preparing Qualified Person Report in China, Mongolia, Indonesia, Cambodia, Malaysia, Serbia, Australia , Ecuador and many countries of Africa with minerals including Au, Ag, Cu, Fe, Pb, Zn, Mo, Co, Cr, bauxite and Coal. She is proficient in using mining software, including Surpac, Minex, Leapfrog, Arcgis, and AutoCAD etc.

Falong Hu, ***MBA, B.Eng, FAusIMM*****,** Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Chinese Certified Consulting Engineer (Investment), is a Principal Consultant (Mining). He obtained his Bachelor's degree in mining engineering from Central South University and Master of Business Administration (MBA) in China University of Geosciences (Beijing). Before joining SRK he worked as an on-site and head office mining engineer in 2 different international mining companies which were called Sino Gold Mining Limited (later merged with Eldorado Gold Corp.) and Silvercorp Metals Inc. He is familiar with underground and open pit mines' production systems and has been involved in mining engineering and development design, scheduling, long-hole blasting and production operation, rock mechanics, ventilation, back-fill; and cost accounting. After take part in

SRK, he accumulated extensive experience in ore reserve estimation, economic analysis, project valuation, mining assessment, scoping/pre-feasibility/feasibility studies and so on. Minerals include gold, silver, lead, zinc, copper, iron, bauxite, laterite-nickel, sylvine, phosphate and graphite, as well as quartzite, marble, bentonite and so on. He is a modeler on both technical and economic and also proficient in digital modeling by using Surpac, Whittle, Minesched, Datamine and AutoCAD.

TzuHsuan (Shan) Chuang, *M.Eng., MAusIMM*, is a Senior Consultant (Mining) at SRK China. She has experience in consulting and operation management. After graduating from Colorado School of Mines, she conducted scoping studies, pre-feasibility, feasibility studies, and project valuation in Zijin mining design company, with projects in China, Serbia, Tajikistan, Australia, Colombia, and Guyana. She then worked at Buritica underground gold mine of Continental Gold in Colombia, and was responsible for LoM plan, production operation, and grade control optimization. Her expertise includes pit optimization, mine design, and scheduling in metal mine, and is skilled in using Deswik, Whittle, Surpac, Minesched, and AutoCAD.

Donghao Luo, *BEng*, Consultant (Mining) at SRK China. He obtained his Bachelor's degree in mining engineering from Laurentian University. He has three years of experience in underground mining, having worked as a headquarters engineer at Silvercorp Metals Inc. His expertise includes production planning, production management, and the design of development and mining engineering projects.

Lanliang Niu, *B.Eng, MAusIMM*, is a Principal Mineral Processing Engineer, who graduated in 1987 from Beijing University of Science and Technology majoring in ore processing. He has worked on the industrial testing of gold leaching with low grade ores, managed or participated in processing and metallurgical testing for more than 10 precious and non-ferrous metals projects. With SRK, he has been responsible for the ore processing and metallurgical scope of work and involved in many key projects.

Nan Xue, *M.Sc, MAusIMM*, is a Principal Environmental Consultant with SRK Consulting China Ltd. He holds a master's degree in environmental sciences from Nankai University in Tianjin. He has four years' experience in environmental impact assessment, environmental planning, and environmental management. He has been involved in a number of large EIA projects and pollution source surveys for SINOPEC, as well as the environmental planning project funded by UNDP. He has particular expertise in construction project engineering analysis, pollution source calculations, and impact predictions. In recent years after he joined SRK, Nan Xue has been involved in a number of due diligence projects, such as the Fuguiniao Mining project in China.

Yuting Zhou (Lori), *BEng*, Consultant (Processing) / Project Coordinator of SRK China, Lori graduated from Central South University with a degree in Mineral Processing Engineering. She has worked in R&D of mineral processing, metallurgy, and environmental fields at a Kunming University of Science and Technology-affiliated company and local research institutes. She led a project to extract indium from slag produced by calcining ITO waste targets in a vacuum furnace, and obtained an authorized invention patent. She also participated in projects on dry stacking of titanium-iron tailings, recovery of fine-grained titanium-iron tailings, and industrial wastewater treatment. Since joining SRK, Lori has contributed to numerous projects, including due diligence of the Tolillar lithium brine project in Argentina, due diligence and risk assessment of seven lithium brine projects in Chile, lithium resource investigation projects in China, Qualified Person report for a rare earth project in Malaysia, and valuation of a lead-zinc project in Algeria. Lori is proficient in various office and drafting software and has extensive experience in data collection and organization, project management, project coordination, and implementation.

Yiefei Jia, *PhD, FAusIMM (CP Geo),* is a Corporate Consultant (Geology and Project Evaluation) with a specialty of exploration of mineral deposits. He has more than 25 years' experience in the field of exploration, development, and Mineral Resources estimate of precious metal (gold, silver, and PGE), non-ferrous metal (lithium, lead, zinc, copper, vanadium, titanium, cobalt and nickel), and black metal (iron and manganese) as well as non-metallic metal (potash, fluorite and graphite) and decorative stone (marble) ore deposits in different geological settings in Australia, Africa, China, and North and Central America. He also has over five years' experience in coal deposits exploration and due diligence in China, Indonesia and Mongolia. He has extensive experience in project management, exploration design and Mineral Resource assessment. In recent years, he, as Competent Person, has led and coordinated dozens of due diligence projects with technical reports either for fund raising or listing on overseas stock exchanges, such as the Stock Exchange of Hong Kong Limited.

2.8 Warranties

Zijin Gold International has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

2.9 Indemnities

As recommended by the VALMIN Code, Zijin Gold International has provided SRK with an indemnity under which SRK is to be compensated for any liability and/or any additional work or expenditure resulting from any additional work required:

- Which results from SRK's reliance on information provided by Zijin Gold International or to Zijin Gold International not providing material information; or
- Which relates to any consequential extension workload through queries, questions or public hearings arising from this Report.

2.10 Compliance Statement

The information in this report that relates to Mineral Resources is based on information compiled by Mr Pengfei Xiao, a Fellow of the Australasian Institute of Mining & Metallurgy ("FAusIMM", registration #307962) and a Member of Australian Institute of Geoscientists ("MAIG", registration #8610), and Ms Yanfang Zhao, a Member of the AusIMM ("MAusIMM"). Both are full-time employees of SRK. Mr Pengfei Xiao and Ms Yanfang Zhao have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code". Mr Pengfei Xiao and Ms Yanfang Zhao consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

The information in this report that relates to Ore Reserves is based on information compiled by Ms Shan Chuang, MAusIMM, and reviewed by Mr Falong Hu, FAusIMM. Both are full-time employees of SRK. Mr Falong Hu and Ms Shan Chuang have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code". Mr Falong Hu and Ms Shan Chuang consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

This Report is a Competent Person's Report in line with the Listing Rules of HKEx. As Mineral Resource and Ore Reserve reporting is a teamwork. Besides the Competent Persons aforementioned, other contributing Competent Persons with relevant areas of expertise are listed below, including

- Mr Lanliang Niu, MAusIMM, Principal Consultant (Processing); and
- Mr Nan Xue, MAusIMM, Principal Consultant (ESG)

Peer review and quality control of the Report were conducted by Dr. Yiefei Jia, FAusIMM, a Corporate Consultant (Geology) at SRK.

2.11 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Zijin Gold International or employees of Zijin Gold International or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

2.12 Consent

SRK consents to this Report being included, in full, in the Zijin Gold International prospectus, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

2.13 Forward Looking Statement

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

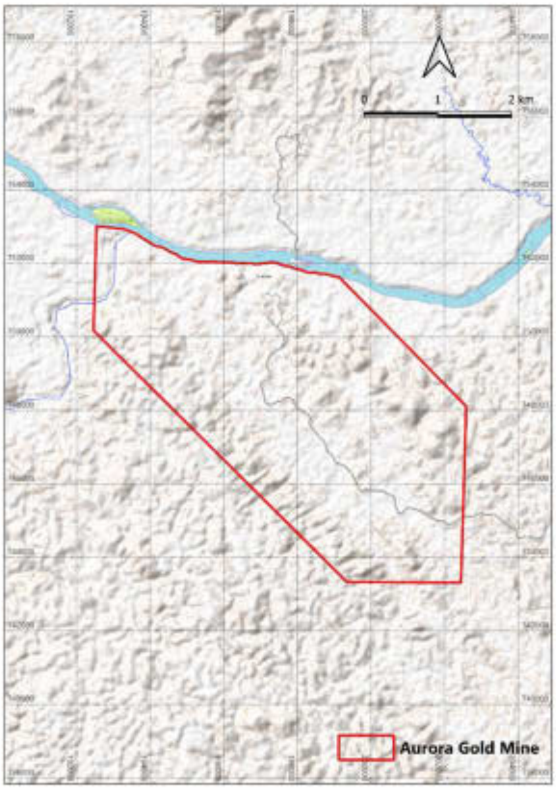
3 Operating Licenses and Permits

SRK relies on the information provided by Zijin Gold International and AGM INC, and SRK did not conduct a legal due diligence review of the Aurora Project since such work is outside the scope of SRK's technical review.

3.1 AGM INC Mining License

AGM, a fully-owned subsidiary of GGI, holds complete ownership of the Mine, which spans an area of 5,802 hectares. In August 2020, GGI was acquired by Zijin. Back on 18 November 2011, AGM obtained a Mining Licence (ML/G1), granting them the authority to construct and manage the Mine. The licence area extends roughly in a southeast-northwest direction, located to the south of the Cuyuni River (Figure 3-1). The northern boundary runs along the southern bank of the Cuyuni River, while the other borders are straight lines marked by six corner points, detailed in Table 3-1.

Figure 3-1: Mineral Tenure Map



Source: Aurora, 2025

Table 3-1: Corner Points of Mining Licence – Aurora Gold Mine

Corner Point ID	Latitude	Longitude
A	6°46'43"N	-59°46'55"W
B	6°48'16"N	-59°46'53"W
C	6°47'32"N	-59°43'18"W
D	6°45'38"N	-59°41'25"W
E	6°43'02"N	-59°41'29"W
F	6°43'02"N	-59°43'10"W

3.2 Operational Operating Permits

AGM INC In Guyana, environmental permits, also known as Environmental Authorisations, typically have a validity period of up to five years. This allows the Environmental Protection Agency (EPA) to monitor and assess the environmental impact of a project regularly. However, this can vary depending on the nature of the project and its environmental risks.

Permit holders are required to apply for renewal at least six months before the permit expires. If the project undergoes significant changes, the EPA must be notified during the renewal process to ensure continued compliance with environmental regulations.

Two Environmental Permits for the project were issued by the Guyana EPA pursuant to the Environmental Protection Act and the Environmental Protection (Authorizations) Regulations. The renewed Environmental Permit (Reference Number 20090114-GGIOO) was issued by the Guyana EPA on 30 May 2023 and is valid until 31 January 2028. A varied Environmental Permit (Reference Number 20090114-GGIOO (B)) was issued on 14 July 2021 and is valid until 30 June 2026.

A number of licences/permits have been issued to Aurora Gold Mine. AGM has informed SRK that it has already obtained the necessary licences and permits required for the mine operations. The licences/permits provided by AGM for this review are listed in Table 3-2.

Table 3-2: Aurora Gold Mine Issued Permits

Licences/Permits	No.	Issued by	Issue Date	Expiry Date
Approval Letter-Well Construction and Operation	/	Ministry of Agriculture	29-Sep-15	/
Approval Letter-Well Drill and Operation	/	Ministry of Agriculture	17-Sep-18	/
Export License	/	Ministry of Tourism, Industry and Commerce, Guyana Gold Board	25-Feb-25	24-Feb-26
Cyanide Permit Approval	/	Guyana Geology & Mines Commission	8-Apr-15	/

Licences/Permits	No.	Issued by	Issue Date	Expiry Date
Explosives Use Permit Approval	/	Ministry of Home Affairs Guyana Geology & Mines Commission	6-May-14	/
Operation Permit (Barging Facility and Ancillary Support Facilities)	20140722-GGIMC	Environmental Protection Agency	15-Jan-20	31-Dec-24
Aerodrome Licence	71/2016	Guyana Civil Aviation Authority	1-Oct-24	30-Sep-25
Existing Well Approval	/	Ministry of Agriculture	6-Feb-24	/
Buckhall Port Facility - Lease Land	A-24199	Guyana Lands and Surveys Commission	8-Feb-13	2-Oct-61
Buckhall Port Facility Extension - Lease Land	A-24847	Guyana Lands and Surveys Commission	15-Apr-14	15-Aug-63
Main Tapir West - Lease Land	A-24499	Guyana Lands and Surveys Commission	17-Sep-13	19-Aug-63
Main Tapir East - Lease Land	A-24572	Guyana Lands and Surveys Commission	30-Oct-13	19-Aug-63

The Operation Permit (Barging Facility and Ancillary Support Facilities) was expired and is currently in the process of being updated. The Aerodrome Licence is scheduled to be updated in the coming months.

4 Regional Description

4.1 Property Location

The Aurora Mine is located in the northwest of Guyana, South America; it is situated in a remote area, about 170 km west of Georgetown, the capital city of Guyana, and 130 km west-northwest of Bartica, a settlement where the Cuyuni, Mazaruni, and Essequibo Rivers meet. The central geographic coordinate of the property is positioned at latitude 6º45″ N and longitude 59º45″ W (Figure 4-1). The Mine lies near the Cuyuni River, with the nearest settlement approximately 50 km away.

The Mine includes the Buckhall Port Facility on the Essequibo River. One approximately 170 km road connects this port to the Aurora mine site, with a barge crossing at Tapir facilitating movement across the Cuyuni River. The Buckhall Port Facility and properties along the Cuyuni River are secured under leases for a period of 50 years until 2063. This region has been explored for minerals since the 1940s.

Figure 4-1: Location Map of Aurora Mine

Source: SRK

4.2 Accessibility

The Mine site can be accessed by air, road and barge. Guyana is served by two international airports: Cheddi Jagan International Airport, located about 40 km south of the nation's capital, Georgetown, and Ogle Airport, which lies just 10 km east of Georgetown. Cheddi Jagan is the primary international gateway, while Ogle Airport mainly handles domestic flights and limited international services, providing access to various parts of Guyana and adjacent countries.

The Mine has constructed a 1,200 m runway on the southern bank of the Cuyuni River, which is designed for helicopters and short-takeoff-and-landing aircraft. The Mine operates charter flights several times a week from Ogle Airport directly to the Mine site.

In addition to air access, the Mine can be reached via a road from the Buckhall Port Facility, a key logistics hub located on the west bank of the Essequibo River. The 170 km road to the Mine initially follows the north shore of the Cuyuni River, crossing the river at Tapir Crossing—about 26 km from the Mine—via a barge, and then continues to the Mine site. The majority of this road was originally constructed by Barama Company Limited for logging ("Barama"), with the final 26 km constructed by the Mine itself. Since Barama has exited the area, GGI has taken full responsibility for maintaining the road.

To reach the Buckhall Port Facility from Georgetown, you can either take a barge or drive 42 km west on a public highway to Parika, a town on the east bank of the Essequibo River. From Parika, the facility is accessible by boat or barge along the Essequibo River.

4.3 Local Resources and Infrastructure

The Mine is situated in a very remote and uninhabited region of Guyana. Georgetown, the nation's capital city with a population of around 240,000, is the nearest source for basic supplies. Equipment and supplies entering the Mine must first be cleared by customs in Georgetown, after which they are transported by barge to the Buckhall Port Facility and then by road to the site.

The Mine generates its own power on-site using diesel generators. Voice and data communications are currently maintained through satellite services. The site offers ample surface area to accommodate mining operations, processing facilities, tailings storage area, and waste disposal. Additionally, there is an adequate water supply to support the entire operation.

Situated in a region lacking any pre-existing infrastructure or services, AGM has developed comprehensive facilities to support its operations. These constructed amenities include:

- **Residential and Welfare Facilities:** Camp accommodations, dining halls, recreational areas, and health services ensure the well-being of personnel.
- **Transportation Infrastructure:** An airstrip with a passenger area facilitates air travel, while site access roads and a 170 km access road connect the Mine to the Buckhall Port Facility. Additionally, a river barge operates at the Tapir Crossing of the Cuyuni River.
- **Communication Systems:** Reliable communications and internet services are established to support operational needs.
- **Utilities and Waste Management:** A 16 MW diesel-powered generating plant provides electricity, complemented by a site-wide power distribution system. Solid waste is managed

through designated disposal areas and incinerators, and there are secure storage facilities for explosives. Fresh and mine water ponds cater to water requirements.

- **Operational Facilities:** Offices dedicated to mining, milling, and administrative functions, maintenance shops, and an assay laboratory support daily operations. A tailings management area is in place for environmental management.

Support Equipment: An extensive fleet of surface support equipment aids various operational tasks.

At the Buckhall River Port Facility, additional infrastructure includes:

- A dock and barge landing area.
- Residential camps and administrative offices.
- Workshops and fenced storage zones.
- Fuel storage tanks and maintenance shops.
- Equipment storage facilities.

Together, these facilities ensure that the Mine operates efficiently despite its remote location.

4.4 Climate

The Mine is located in the forested region of Guyana, which is situated in the equatorial trough zone, where the climate is influenced by the seasonal shifts of this trough and its shifting rain bands. Rain is a daily occurrence in this region, with the seasons defined mainly by changes in rainfall patterns. There are two distinct wet seasons, from April to August and from December to January, and two dry seasons, from February to April and from August to December. The forested area has an annual average rainfall of 2,124 centimetres ("mm"), with relatively high humidity, ranging between 65% and 100%. Temperatures throughout the year vary from 22 degrees Celsius ("°C") to 34°C, and the humid tropical climate is tempered by the northeastern trade winds.

Despite the persistent humidity and rainfall, exploration and mining operations can be carried out year-round in this region.

4.5 Physiography

Aurora is located southeast of the Cuyuni River, which sits at approximately 50 meters above sea level ("m asl"). The region features moderate relief and is covered with dense rainforest (Figure 4-2). In the Mine area, the hills reach elevations of up to 130 meters, and the low-lying areas become swampy during the rainy seasons.

Near the river, there are hills, and to the southeast of Aurora, a series of flat-topped hills rise about 200 m above the river level. To the southwest of Aurora, smaller hills reach approximately 40 m above the river level. These hills are composed of granitic rocks and clay-rich residual deposits, which are intersected by streams that flow into the Cuyuni River.

THIS DOCUMENT IS IN DRAFT FORM, INCOMPLETE AND SUBJECT TO CHANGE AND THAT THE INFORMATION MUST BE READ IN CONJUNCTION WITH THE SECTION HEADED "WARNING" ON THE COVER OF THIS DOCUMENT.

5 Geological Setting and Mineralisation

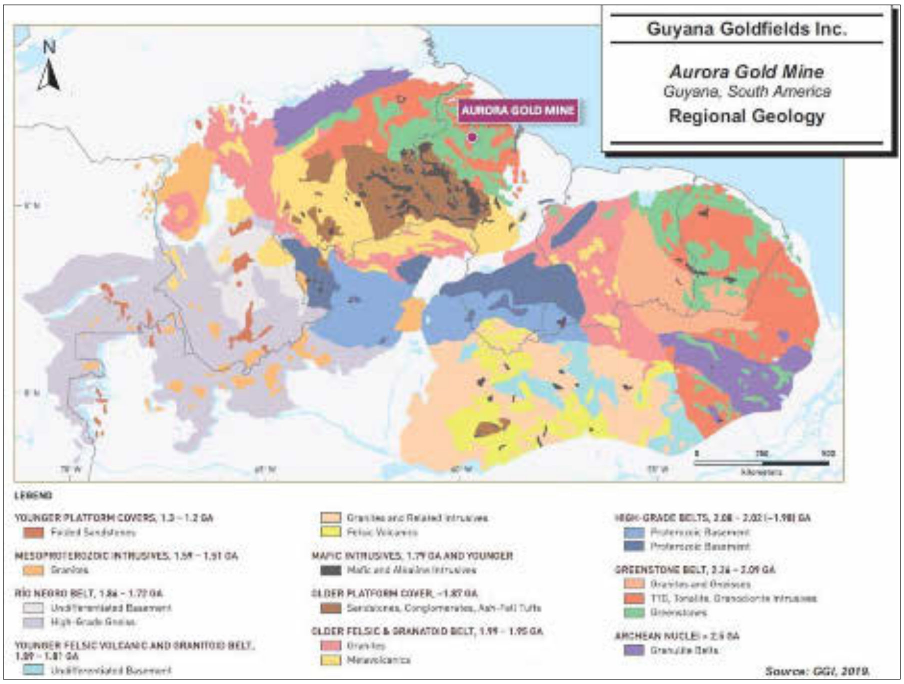
The contents of this section are mainly sourced from the NI 43-101 Technical Report by SLR in 2021.

5.1 Regional Geology

The Aurora project lies within a greenstone belt of the Paleoproterozoic Guiana Shield (Figure 5-1). The Guiana Shield represents the northern portion of the Amazon Craton, which is surrounded by Neoproterozoic orogenic belts. Most of the belt is comprised of rocks formed during the Transamazonian orogeny that have been deposited onto two Archean nuclei, the Venezuelan Imataca block to the west and the Amapa block to the east.

McConnell and Williams (1969) subdivided the central portion of the Guiana Shield into the Barama Group conformably overlain by the Mazaruni Group of rocks, both consisting of a pile of metasedimentary and metavolcanics rocks. The Mazaruni Group was further subdivided into the Cuyuni and Haimaraka Formations. The Cuyuni Formation consists of pebbly sandstones and intraformational conglomerates, intercalated with felsic to mafic volcanic rocks. The Haimaraka Formation is comprised of a sequence of turbiditic mudstones, pelites, and greywackes with lesser volcanic rocks. Most of the rocks of the Barama-Marzaruni Supergroup are metamorphosed to lower to middle greenschist facies, however, near the contacts with large granitic complexes, metamorphism increases to upper greenschist to lower amphibolite facies.

Figure 5-1: Regional Geology Setting of Aurora Gold Mine



Source: NI 43-101 Technical Report by SLR in 2021

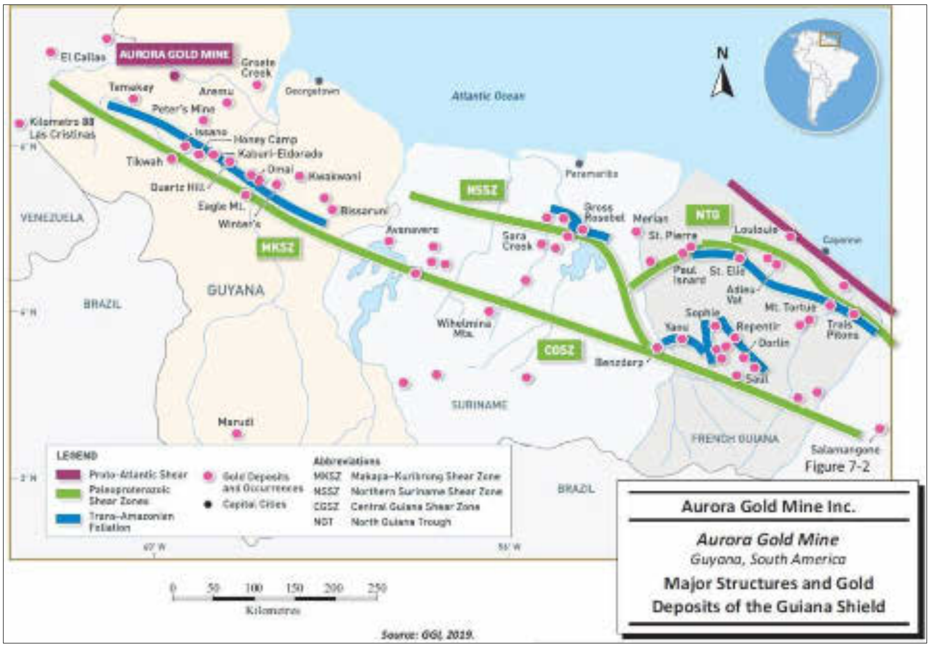
Structurally, the rocks in the shield have been subjected to compressional strain imparting a strong northwest-southeast fabric or penetrative cleavage. Large scale ductile shear zones are not common, although a series of major northwest trending faults have been identified including the North Guiana Trough (NGT) in French Guiana and the North Suriname Shear Zone (NSSZ) through north central Suriname. Voicu et al. (1999) suggested that the Central Guiana Shear Zone (CGSZ), identified by geophysical and satellite imagery, forms a major suture across the entire Guiana Shield. This kilometre wide west-northwest to east-southeast trending structure is known as the Makapa-Kuribrong shear zone (MKSZ) in northern Guyana.

A series of calc-alkaline to intermediate intrusive rocks ranging in composition from granite to granodiorites, diorite and adamelite, called the Transamazonian Granitoids, were emplaced between 2,250 Ma and 1,960 Ma (Gibbs and Barron, 1993). Intrusive rocks in the vicinity of the Mine consist of the Proterozoic-age Iroma–Aranka, Aurora, and Kartuni medium-grained granodiorite and diorite intrusions followed by late-stage basic sills and dikes.

The rocks in the Guiana Shield have been subject to chemical weathering reflecting prolonged exposure to a tropical climate. This has resulted in the formation of a laterite-saprolite profile that can be as deep as 100 m below surface. Chemical weathering results in the formation of stable secondary clay minerals along with iron, magnesium, and aluminium oxides due to the leaching of mobile, alkali elements. In the Aurora area, the depth of chemical weathering varies from 15 m to 75 m, depending on the underlying lithologies.

Figure 5-2 illustrates the major structures and gold deposits in the Guiana Shield.

Figure 5-2: Major Structures and Gold Deposits in the Guiana Shield



Source: NI 43-101 Technical Report by SLR in 2021

5.2 Property Geology

The Aurora Gold Mine is located within a high-strain zone developed along the northeast margin of a granitic batholith. The local stratigraphy comprises metasedimentary and metavolcanic supracrustal rocks metamorphosed to greenschist facies. The supracrustal units have been intruded by suites of phaneritic and sub-volcanic rocks which vary in composition from mafic to felsic phases. Importantly, gold mineralization in the Aurora deposit has been observed in almost all lithologies identified across the Golden Square Mile (GSM).

The Archean basement unit does not outcrop in the Mine area but has been mapped three kilometres to the west of the Mine. The lowermost mafic volcanics and metasediments constitute the Barama Group and is considered analogous to the West African Birimian sequences, while the late basin sediments constitute the Cuyuni Group, interpreted to be analogous to the West African Tarkwaian-type sediments.

Figure 5-3 illustrates the property geology, Figure 5-4 illustrates the stratigraphic units on the property.

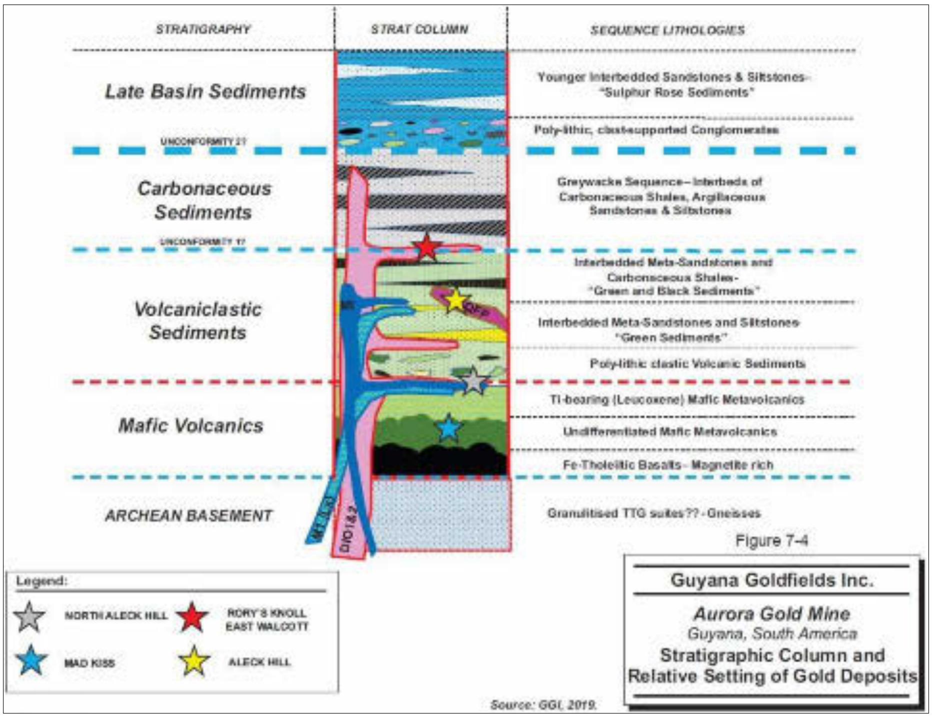
Figure 5-4: Stratigraphic Column of Aurora Gold Mine



Source: NI 43-101 Technical Report by SLR in 2021

5.3 Mineralization

Gold mineralization at Aurora is divided into four main mineralized zones; Rory's Knoll, East Walcott and Walcott Hill, Mad Kiss, Mad Kiss West and Mad Kiss South, and Aleck Hill and North Aleck Hill (Figure 5-5).

All the deposits display an association of gold mineralization with quartz veining and pyrite, locally as much as 10%. The auriferous veins developed relatively late in the deformational history and occur as brittle stockworks in more competent host rocks, e.g., Rory's Knoll diorite and lesser quartz-feldspar porphyry dikes, and as foliation parallel, ribbon-like veins that vary in width from a few centimetres to rarely up to one to two metres wide.

At least three major generations of veining have been observed:

- Early quartz carbonate veins which are typically foliation parallel and folded or truncated.
- Brittle extensional arrays and stockworks – quartz-pyrite +/- ankerite, associated with mineralization. Late-stage barren extensional quartz-calcite veins.

Coarse visible gold occurs in quartz-bearing veins and in pyrite-rich fractures. Gold-bearing structures have undergone minor post-formation strain. Vein selvages display sericite-iron carbonate hydrothermal alteration.

Harbort (2018) demonstrated that mineralization within the volcanoclastic rocks is preferentially developed in fold hinges as silicified, stockwork, and brecciated concentrations of veins exploiting the local, low pressure, extensional environment. In these cases, gold mineralization displays better continuity down the fold hinge plunge but is tightly constrained in the X-Y plane by the folded geometry. Quartz veins typically display crustiform and comb textures; and have been observed in en-echelon sets.

Within foliation dominant fold limbs, gold veining is characterized by narrow, two to twenty-five centimetres, and rarely up to a few metres in width, ribbon line veins that are discontinuous along strike. These veins form anastamosing arrays along a strike of 290° to 305° and dip steeply to the northeast at 70° to 85°.

Whereas the previous interpretation suggested shear related control, no evidence of strike-slip displacement has been identified in mapping mine exposures. The shear model implied reasonable strike continuity of foliation parallel veins in the volcanoclastic lithologies. Exposures from mining has demonstrated limited strike continuity in the order of five to ten metres of individual veins. It is believed that the mineralization continuity is controlled by the intersection lineation between the earlier D1 foliation and the later, dominant D2 penetrative foliation.

Source: SRK

Note: Zoom in to the major mineral deposits

Features displayed by the Aurora gold deposits that are typical of orogenic deposits include:

- Mineralization appears to be a late-stage event.

- Mineralization is structurally controlled.
- Both vein and, to a lesser extent, disseminated mineralization has been observed where higher grades are associated with stockworks and breccias.
- Veins typically consist of quartz, pyrite, and ankerite.
- Gold mineralization in association with pyrite; gold can occur as free grains.

Alteration is zoned, from distal to proximal to the hydrothermal fluid source. Alteration typically includes silicification, albitization, and pyritization.

5.4 Deposit Types

The information in this section is largely based on SRK, 2017.

The gold mineralization at the Mine exhibits features analogous to mesothermal or "orogenic" gold deposits typified by Archean deposits of the Abitibi region, Canada. Features characteristic of the gold mineralization at the Mine include:

- A strong spatial association to large scale shear zones;
- Relative late timing during active compressional deformation;
- Formed during greenschist metamorphic conditions;
- Association with a propylitic-phyllic alteration assemblages; and
- Principally hosted in quartz-ankerite-pyrite veining.

6 Exploration

6.1 Exploration History

The initial discovery of gold mineralization in the Mine area can be traced back to 1911. However, systematic exploration did not begin until the late 1930s. In 1938 and 1939, Solar Development Company, a subsidiary of Cominco Ltd., initiated exploration activities focused on the Mad Kiss, Aleck Hill, and Walcott Hill areas. This early exploration work included surface sampling and preliminary geological mapping, laying the foundation for future exploration efforts.

In 1940, Cuyuni Goldfields Company ("Cuyuni") acquired the rights to the Aleck Hill area and began underground mining operations.

In 1963, the Geological Survey of Guyana conducted a focused exploration program in the Haimaralli Falls area, located along the northwest border of the current Mine area.

In 1989, South American Goldfields Inc. ("South American") obtained an Exclusive Exploration Permit covering the area.

Between 1989 and 1992, Denison drilled a total of 56 surface diamond drill holes with an aggregate length of 10,204 m. Based on the data gathered, Denison prepared a mineral resource estimate encompassing gold mineralization at Aleck Hill, Aleck Hill South, Walcott Hill East, Mad Kiss, and Mad Kiss South areas. However, due to the lack of significant findings in their final drilling program, Denison terminated its participation in the Aurora area in 1992.

Details about legacy exploration programs are limited. Information given in this section is sourced from Cargill and Gow (2003) and Cargill (2005) and is summarized in Table 6-1.

Table 6-1: Summary of Historical Exploration Work Prior to 1998

Period	Company	Activity	Drilling	Underground Development
1911		Discovery of gold		
1934-1937		Numerous claims staked		
1938-1939	Solar	Exploration		
1940-1948	Cuyuni	Systematic development of claims, mining started in 1940	30 Surface (4,809 m) 26 UG (1,600 m)	To depth of approximately 75 m below surface at Aleck Hill Est. 2,260 -3,800 kg Au
1963	Denison Mines Ltd, Gold Star Resources Ltd.	Geochemical and geophysical surveys	19 Surface (2,515 m)

Period	Company	Activity	Drilling	Underground Development
Mid-1990s	Mr. Alphonso/Coeur d'Alene	Geochemical survey		

Source: NI 43-101 Technical Report by SLR in 2021

In 1998, GGI acquired a 100% option on the property from Mr. Alphonso, initiating a new phase of exploration. GGI has since undertaken extensive exploration activities, leading to the significant development of the Mine. These activities have included advanced geological mapping, geophysical surveys, extensive drilling programs, and the establishment of a detailed understanding of the area's mineralization potential. This ongoing exploration has been instrumental in defining the current resource base and guiding the development of the Mine.

6.2 Trenching and Tunnelling Exploration

From 2021 to March 2024, a total of 115 trenches (18,563 m) were conducted including in Haimaralli (11 trenches, 2,337 m), Powis Hill (13 trenches, 3,008 m), and Batholith (13 trenches, 1,782 m). These trenching efforts were aimed at providing supplementary surface data and supporting geological investigations in key project areas.

6.3 Drilling Exploration

6.3.1 Historical Drilling (Pre-2002)

Before GGI's involvement, the property was explored through drilling activities conducted by Cuyuni, the Geological Survey of Guyana, and Denison. Collectively, these entities drilled 131 core boreholes, with a total length of 19,128 m. Although this drilling provided valuable initial geological data, the detailed records, especially the core recovery rates and downhole surveys, are limited.

6.3.2 GGI Drilling (2002 – 2012)

After acquiring the property, GGI initiated an extensive drilling campaign. From 2002 to 31 May 2012, GGI drilled 1,624 boreholes, totalling 411,088 m. This program also included geotechnical and metallurgical boreholes, but from December 2010 onwards, diamond drilling completed mainly focused on infill drilling within existing auriferous zones and extending these zones both laterally and at depth. The primary goals of the drilling were to enhance the confidence in the continuity of gold mineralization, improve geological modelling, and upgrade resource classification.

Drill collars were surveyed by GGI personnel using a laser theodolite. This method provided a reliable means of positioning the drill holes relative to known control points.

Downhole surveys were carried out using Reflex EZ-Shot survey tools at nominal intervals ranging from 12 m to 50 m. These surveys were crucial for accurately determining the deviation of drill holes from their planned trajectories.

The drilling grid with 200-meter spacing was established to systematically evaluate the property. As the understanding of the mineralization improved, the grid spacing was reduced to 100 m, and eventually to 50 m, to provide greater detail and improve the resolution of the geological model. Despite these changes, a consistent grid pattern was maintained throughout this phase of drilling.

Before 2009, the drill core was transported to the exploration camp, where it was logged by geologists for various geological and geotechnical attributes, including lithology, alteration, mineralization, structural features, and rock quality designation ("RQD"). The core was digitally photographed, and then marked for sampling by geologists. Sample lengths generally ranged from 1.0 m to 3.0 m respecting lithological contacts. For the 2004 to 2009 programs, unweathered diamond drill ("DD") core was sawn on site.

From July 2009 to 2012, five geologists were assigned to the project to ensure orderly monitoring of the drilling program. One geologist was assigned to quality assurance and quality control ("QA/QC") and all core sampling was conducted under his supervision.

The core was placed in plastic core boxes at the drill rig holding three metres of HQ and/or NQ diameter sized core (6.35 cm and 4.76 cm diameter, respectively). Core boxes were then transported to the Aurora camp for logging and sampling. Drill core is stored on the property in plastic core boxes.

The core was photographed and RQD measured. Logging was carried out by GGI geology personnel recording lithology, alteration, mineralization, and structural features of the core. Once logging was completed, samples were selected based on geology, veining, and sulphide mineralization. Sample lengths range from 0.5 m to 3.0 m and respect lithological contacts. Both bedrock and saprolite core were sampled. Core recovery in fresh rock is very good, generally 95% to 100%, and recovery in saprolite ranges from 80% to 100%.

6.3.3 Drilling Hiatus (2013-2016)

No drilling activities were conducted on the property between 2013 and 2016. During this period, GGI focused on other operational and development priorities.

6.3.4 GGI Drilling (2017-2018)

Drilling resumed in 2017 and 2018, during which GGI completed 88 boreholes, totaling 12,801 m. This phase included not only the continuation of diamond drilling but also structural logging of oriented core, geological mapping of open pit exposures, and the relogging of approximately 50,000 m of historic core. These activities, combined with the analysis of blast hole and reverse circulation ("RC") grade control data, led to a revised geological interpretation.

Starting in 2017, GGI transitioned to using a differential global positioning system ("DGPS") for surveying drill collars, which provided more precise spatial data. All coordinates are in UTM Zone 21 North, PSAD56 datum. Drilling was carried out on the grid patterns established for the areas where practical. In cases where drill rigs were positioned in active mining areas to conduct resource definition drilling, several holes with varying azimuths were collared from one position due to restrictions on space availability. Drilling was designed to intersect the mineralization as close as possible to perpendicular. Many of the deeper holes intersected the mineralization at a shallower angle due to the impractical hole length required to intersect at a perpendicular angle.

In 2017 and 2018, all diamond drilling was oriented. In 2017, GGI implemented the Reflex EZ-Mark system for orienting diamond drill cores. This system uses ball levels and a physical pin impression of the core in-situ to indicate the bottom of the hole position, which is critical for accurate geological and structural logging. Orientation marks were initially made at the drill rig by contractor staff, while GGI personnel completed the bottom-of-hole lines at the core shack. Orientation lines grading and corresponding data confidence levels were evaluated and assigned using industry's best practices. Structural data were collected using protractors, beta-tape, and goniometers. In 2018, the Reflex ACT-III system was introduced, which utilizes a downhole accelerometer for capturing orientation data. Trained GGI geotechnicians marked the bottom-of-hole lines at the drill rig, and these were subsequently verified during logging. Structural data were collected using the Reflex IQ-Logger device by company geologists.

6.3.5 GGI Drilling (2019-2020)

In 2019, GGI drilled 51 boreholes totaling 14,088 m, concentrating efforts on specific areas:

- North Aleck Hill: 18 boreholes were drilled, including eight for resource definition (1,824 m), seven for stratigraphy definition (1,149 m), and three for sterilization (603 m).
- East Walcott: All 11 boreholes (totaling 4,679 m) were drilled for resource definition.
- Mad Kiss: 21 boreholes were drilled for resource definition (totaling 5,488 m), along with one framework-brownfields borehole (totaling 345 m).

In addition, an RC resource definition drilling program began in 2019 and continued in 2020. This program drilled 42 holes, totaling 3,351 m at the North Aleck Hill deposit. The RC program completed in February 2020. Later in November 2020, RC drilling resumed with a new program planned to drill 16,000 m, targeting Inferred Mineral Resources along the western edge of the Aleck Hill pit. By the end of 2020, 15 RC drill holes had been completed, totaling 3,067 m.

The Reflex ACT-III system continued to be used for downhole orientation, and structural data collection was performed using the Reflex IQ-Logger, with company geologists responsible for the accuracy and reliability of the data.

Table 6-2 summarizes the drilling at Aurora Gold Mine as of 31 December 2021.

Table 6-2: Summary of Historical Drilling of Aurora Gold Mine

Company	Year	Area	No. Drill Holes	Length (m)
Cuyuni	1940-1948	Aleck Hill, Mad Kiss	56	6,409
Geological Survey of Guyana	1963	Haimaralli Falls	19	2,515
Denison	1989-1991	Aleck Hill, North Aleck Hill and South, Mad Kiss, Mad Kiss South and West, Walcott Hill, Walcott Hill East	56	10,204

Company	Year	Area	No. Drill Holes	Length (m)
GGI	2002-2003	Aleck Hill, Mad Kiss, Felice	39	1,076
	2004-2006	Aleck Hill Bedrock and Saprolite, North Aleck Hill, Mad Kiss, Mad Kiss South, Walcott Hill, Walcott Hill East, Southeast Aurora, Rory's Knoll	144	31,941

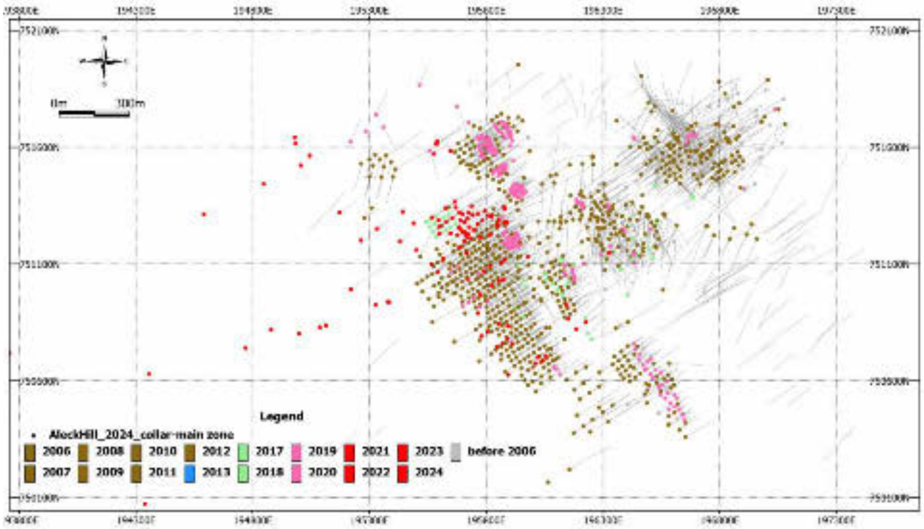
6.3.6 Zijin/AGM Drilling (2021-2024)

The exploration activities conducted from 2021 to 2024 were carried out by AGM across various project areas. As of 31 March 2024, A total of 146 drilling holes was completed, including 128 DD holes (totalling 27,603m) and 18 RC holes (totalling 3,545m) .The DD Drilling mainly conducted at the Aleck Hill Extension (62 holes, 17,598.91 m), AH-10 (29 holes, 2,452.21 m), and Powis Hill (13 holes, 3,025.97 m), while the RC drilling, limited to the Aleck Hill Extension, consisted of 18 holes totalling 3,545 m.

The drillholes location was shown in Figure 6-1.

Figure 6-1: Drillholes Location Map



Source: SRK

Note: Zoom in to the major mineral deposits

The collar positions were located using RTK(DGPS) and have been double-checked to ensure accurate positioning. The collar positions have been clearly flagged, displaying the hole number, azimuth, and hole inclination.

The core boxes were covered and safely stacked at the back of the pick-up vehicle before being transported to the core shed. Upon arrival at the core shed, the geological technician removed any excess drilling mud from the core and thoroughly cleaned both the core and the core boxes. The core boxes have been arranged based on depth and core box number, from top on the left to bottom on the right.

Drill core (Figure 6-2) was logged by geologists for various geological and geotechnical attributes, including lithology, alteration, mineralization, structural features, and RQD. The core was digitally photographed and then marked for sampling by geologists. Sample lengths generally ranged from 1.0 m to 3.0 m, respecting lithological contacts.

Figure 6-2: Drill Core

Source: 2024 SRK Site visit

6.4 Sampling, Sample Preparation and Analyses

6.4.1 Sampling

Before 2009, the core was laid out for digital photography and then marked for sampling by a geologist. Sample lengths range from 1.0 m to 3.0 m respecting lithological contacts.

From July 2009 to 2012, samples were selected based on geology, veining, and sulphide mineralization. Sample lengths range from 0.5 m to 3.0 m and respect lithological contacts. Both bedrock and saprolite core were sampled. Un-weathered samples were cut in half using a diamond saw and saprolite core was cut in half with a knife, with fragments of quartz vein material split in a Longyear core splitter or by diamond saw.

From 2017 to 2020, sample procedures were the same as those used in previous campaigns, with consistent procedures ensuring data integrity, except that the entire length of the drill holes were sampled. Sample lengths range from 0.3 m to 1.0 m and respect lithological contacts.

From 2021 to 2024, the sampling followed the procedure prepared by the exploration team of Zijin/AGM INC. Samples are taken at 1 m intervals, ensuring they do not cross geological or mineralization boundaries. A 5 m wide buffer zone was generally sampled before and after a mineralized zone at 1-meter intervals, and 2-3 m buffer were sampled for narrow mineralized zones. Both bedrock and saprolite core were sampled. Un-weathered samples were cut in half using a diamond saw and soil or saprolite core was sampled with a stainless-steel spatula.

6.4.2 Sample Preparation and Analyses

The sample preparation and analysis processes evolved over time, reflecting the improvements in laboratory facilities, analytical methodologies, and adherence to quality control standards.

From 2004 until July 2009, GGI relied on Loring Laboratories (Guyana) Ltd. ("Loring") for the preparation and analysis of drill core samples. Loring, a small independent commercial firm with two operations in Georgetown, Guyana, and Calgary, Alberta, was not accredited but operated independently of GGI. A 30-gram fire assay (FA) with atomic absorption spectroscopy (AA) was used to determine gold content. If the initial assay result exceeded 1,000 parts per billion (ppb), a new pulp was prepared, and the sample was reanalysed using a 30-gram FA with gravimetric finish (FAGrav).

In July 2009, GGI transitioned to using Acme Laboratories for sample preparation and analysis. The preparation facility was located in Georgetown, Guyana, and was ISO 9001:2000 accredited laboratory, ensuring standardized procedures and enhanced reliability in sample processing. The prepared pulps were shipped to Acme's analytical facility in Santiago, Chile, which also had ISO 9001:2000 accreditation. A 50 g FA/AAS was used for the gold assay. If results indicated gold concentrations greater than 3.0 grams per tonne (g/t Au), the sample was reanalysed using a 50 g FAGrav.

During the 2017 and part of the 2018 drilling programs, GGI began utilizing Bureau Veritas in Georgetown, Guyana, for sample preparation. Bureau Veritas, an independent laboratory, held ISO17025 certification for its Vancouver, Canada, facility, which provided assurance of high standards in sample processing. The prepared pulps were analysed for gold at Bureau Veritas's Vancouver facility. The analysis involved a 50 g FA/AAS. For samples with results greater than 3.0 g/t Au, a reanalysis using a 50 g FAGrav was conducted.

For part of the 2018 drilling programs, samples were shipped to the MSALABS in Georgetown, Guyana for sample preparation and analysis. The prepared pulps were analysed for gold at MSALABS's Georgetown facility using a 50 g FA/AAS. For samples with gold concentrations greater than 10 g/t Au, a reanalysis with a 50 g FAGrav was conducted.

MSALABS continued to handle sample preparation and analysis for the 2019 and 2020 drilling programs and some samples in 2022, with slight modifications to streamline the process and improve efficiency. The prepared pulps were analysed for gold at MSALABS in Georgetown, Guyana. The pulps were analysed for gold using a 50 g FA/AAS. When results were greater than 10 g/t Au, the pulp was analysed again using a gravimetric finish.

Following a care and maintenance period, AGM resumed drilling in November 2020 and established an on-site laboratory to handle the preparation and analysis of RC samples. This change eliminated the need for off-site shipping, improving the chain of custody and reducing turnaround times.

From 2021 to 2023, some samples from RC holes and trenches derived from different exploration activities were sent to AGM Assay Lab for analyses. The AGM Lab is an on-site lab without Certification.

Drill core samples are prepared using the following protocol:

- Drying: Samples were dried.
- Crushing: The entire sample was crushed to greater than 85% passing through a 2 mm sieve.

- Splitting: A 300 g portion was obtained using a linear splitting device attached to the crusher.
- Pulverizing: The 300 g sample was pulverized to greater than 85% passing through a 75-micron sieve.

The gold content was analysed using a 30 g FA/AAS. To verify the accuracy and precision of the on-site laboratory's results, 5% of the RC samples were sent to MSALABS in Georgetown, Guyana, for independent check assays.

From 2021 to 2024, some samples from different exploration activities were sent to ACTLABS GUYANA INC (Actlabs)for analyses. The Act Lab is accredited by ISO9001:2016. The prepared pulps were analysed for gold using a 50 g FA/AAS. For samples with gold concentrations greater than 5 g/t Au, a reanalysis with a 50 g FAGrav was conducted.

6.4.3 Specific Gravity Data

The bulk density assignments are used to convert volume to tonnage. In the 2021 NI 43-101 report, SLR performed a statistical analysis based on 342 density measurements received including 106 measurements (31%) taken from saprolite and 236 measurements (69%) of fresh rock). No additional density measurements have been added to the database since the 2021 Technical Report.

SRK received 67 density verification measurements collected by AMG from different areas and rock types, which were considered can been used to validate the density for Fresh Rock and support the density value used in resource estimation.

6.5 Quality Assurance and Quality Control Programs

No QC program was in place prior to 2004. Drill holes dated prior to 2004 are not included in the current resource estimation.

To ensure the reliability and trustworthiness of exploration data, the comprehensive quality control measures were implemented throughout the exploration process of Aurora Gold Mine from 2004.
A summary of QA/QC samples is provided in Table 6-3. The description and performance of the QC samples prior to 2021 have been documented in historical technical reports. In this instance, SRK primarily focused on the QAQC data from 2021 to March 2024.

Table 6-3: QA/QC Samples by Exploration Phase

Exploration Phase	Drill Holes Completed	Insertion Rate			
		Blank Material	CRMS	Quarter Core Duplicates	Check Assays
Loring (2004 to 2009)	624	1 in 20 samples	1 in 20 samples	1 in 30 samples	1,490 pulps by FA with AAS finish, any results over 1.0 g/t Au repeated using a gravimetric finish, 593 coarse Screen Fire Assays
Acme (2009 to 2012)	889	1 in 30 samples	1 in 20 samples	1 in 30 samples	No check assay results were provided.
Bureau Veritas (2017 to 2018)	79	1 in 30 samples	1 in 20 samples	Not available	

Exploration Phase	Drill Holes Completed	Insertion Rate			
		Blank Material	CRMS	Quarter Core Duplicates	Check Assays
MSALABS (2018)	32	1 in 30 samples	1 in 20 samples	1 in 30 samples	
MSALABS (2019-2020)	134	1 in 20 samples	1 in 20 samples	1 in 20 samples	
Act Lab (2021-March 2024)	146	1 in 20 samples	1 in 20 samples	1 in 30 samples	No check assay results were provided.

Source: The Exploration phase from 2004 to 2020 is summarized by SRK based on the information in NI 43-101 Technical Report by SLR in 2021 and the information of 2021-March 2024 summarized based on the data provided by AGM.

6.5.1 Certified reference standards

The monitoring of assay reliability of Aurora Mine included insertion of samples of CRMS， which were prepared by Ore Research and Exploration (ORE) located in Australia, CDN located in British-Columbia, Canada, and KLEN International of Wanneroo, Western Australia and with the prefix "OREAS", "CDN" and "K" correspondingly. The performance of CRMs from 2021 to 2024 is illustrated in Figure 6-3.

Figure 6-3: Performance of CRMs from 2021 to March 2024

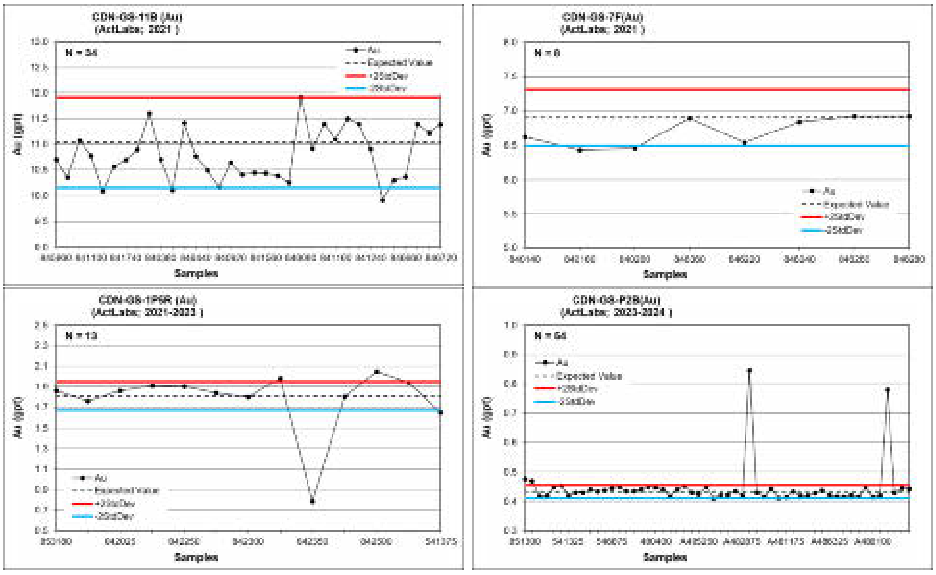


Figure 6-3: Performance of CRMs from 2021 to March 2024

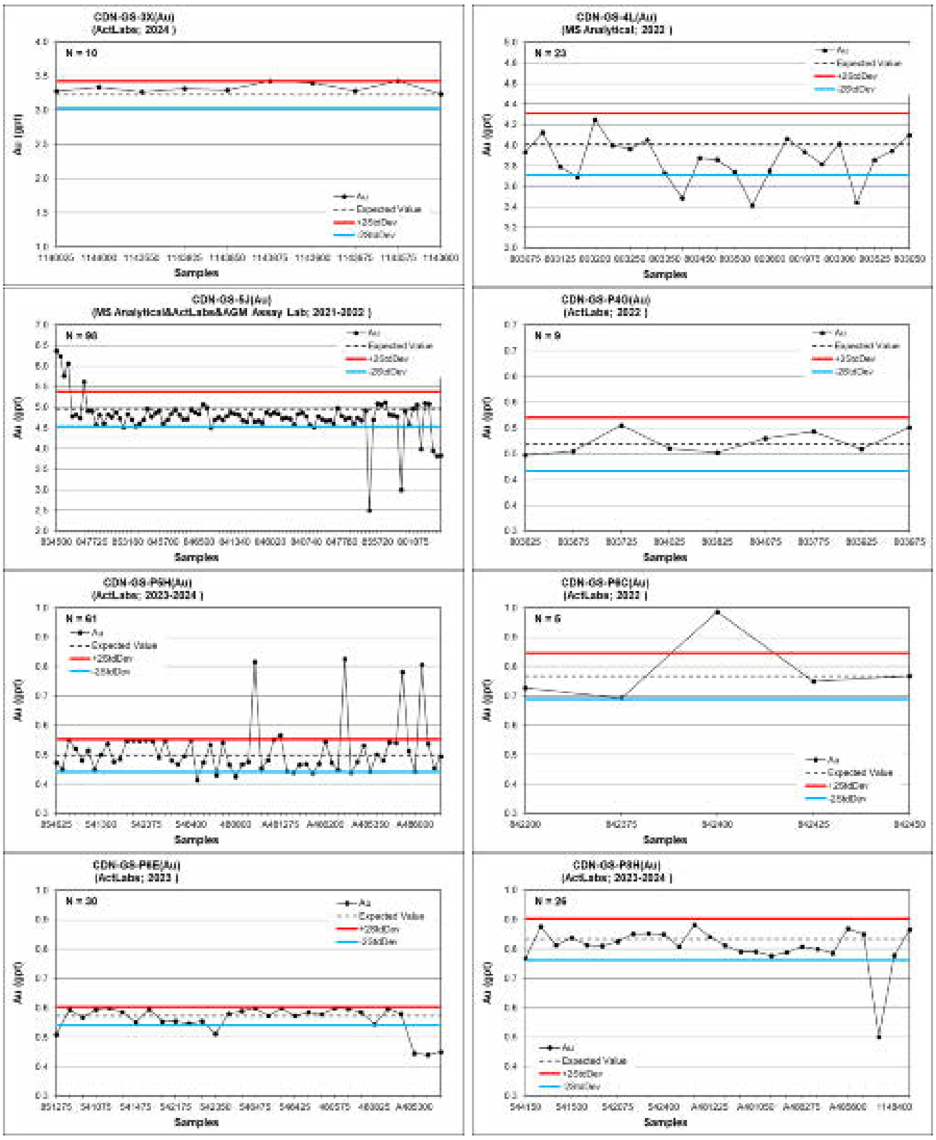

Figure 6-3: Performance of CRMs from 2021 to March 2024

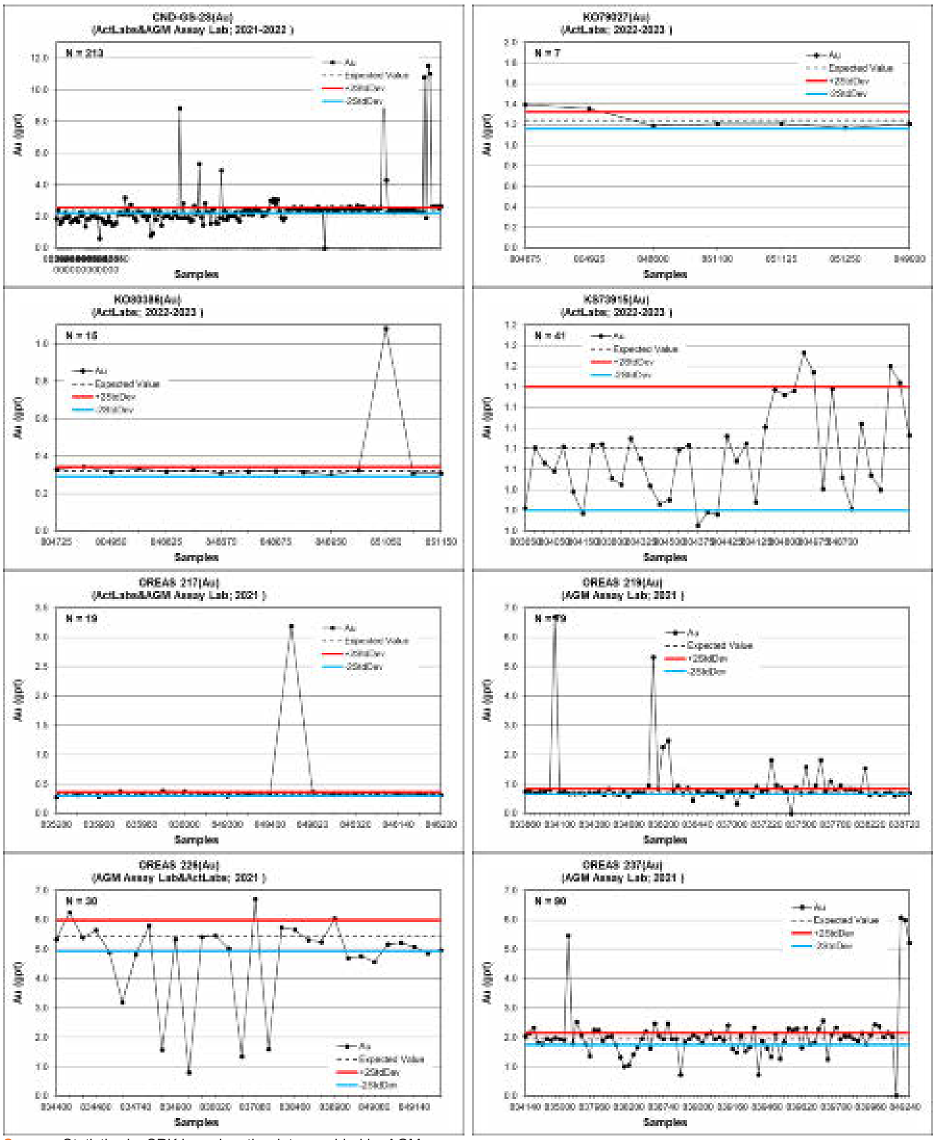
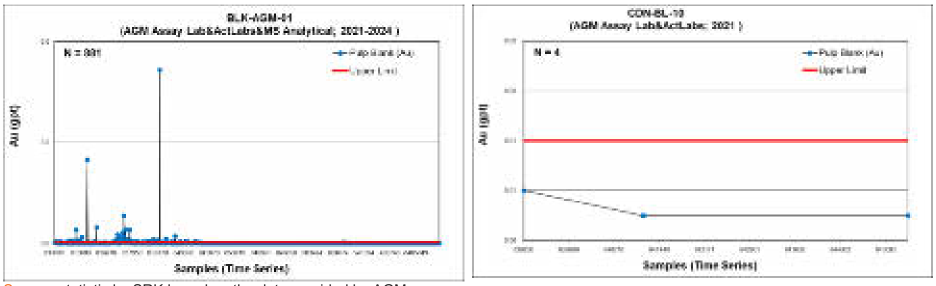


Source: Statistics by SRK based on the data provided by AGM
Note: Samples below 5 were not shown in the figures

6.5.2 Blank samples

Blank material was inserted in the sample stream to test for contamination in sample preparation during the analytical procedure (contaminated reagents or crucibles) or from sample solution carry-over during instrumental finish. GGI inserted coarse blanks from 2004 and inserted fine blanks from 2009. The source of the coarse blank was coarse crushed granite material obtained from a quarry near Georgetown, Guyana. The granite may contain background levels of the elements that are being monitored and therefore may not be totally barren. The fine blank material was obtained from CDN Resource Laboratories (CDN), and from 2021 BLK-AGM-01 was used. The performance of blanks from 2021 to 2024 is illustrated in Figure 6-4:.

Figure 6-4: Performance of Blanks from 2021 to March 2024



Source: statistic by SRK based on the data provided by AGM

6.5.3 Duplicate samples

Aurora's current QA/QC protocols include the insertion of field duplicates, with no coarse reject duplicates and pulp duplicates.

From 2004 to 2009, the insertion ratio for field duplicates was set at one quarter-core duplicate per 30 samples to determine the reproducibility of assays for one half vs one quarter of the core and to test for sampling bias. This practice was maintained consistently from 2009 to 2012.

No quarter core duplicates results were provided for the period of Bureau Veritas (2017-2018).

Field duplicates continued from the period of MSALABS (2018), and in the period from 2019 to 2020, the insertion ratio was adjusted to one duplicate per 20 samples. This change included both quarter-core and RC duplicates, reflecting a shift towards more frequent sampling to ensure robust quality control.

The variability of core duplicates, whether for half core or quarter core, is highly dependent on the distribution of the mineralization. The results are impacted by the nature of the sampling and the style of mineralization.

From 2020 to March 2024, the insertion ratio for field duplicates was set at one quarter-core duplicate per 30 samples to determine the reproducibility of assays for one half vs one quarter of the core and to test for sampling bias.

The performance of duplicates from 2021 to 2024 is illustrated in Figure 6-5.

Figure 6-5: Performance of Field Duplicates from 2021 to March 2024

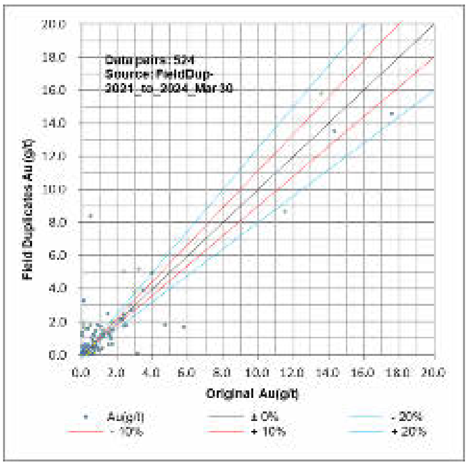


Table 6-4: Summary of the Field Duplicates from 2021 to March 2024

Project	Data Pairs Count	Relative Difference Au		
		<10%	10% - 20%	> 20%
AGM - Field Dup	524	236	1	287

6.5.4 Check (umpire) samples

Check assays consist of submitting pulps that were assayed by one laboratory to a different laboratory and re-analyzing them by using the same analytical procedures. This is done primarily to improve the assessment of bias in addition to the submission of reference materials and in-house control samples submitted to the original laboratory. Reference materials are also inserted with samples submitted to the secondary laboratory to evaluate if the secondary laboratory is potentially biased.

Between 2004 and 2007, a total of 1,490 pulps were submitted to ALS Minerals in Santiago, Chile. No reference materials were inserted in the check assay batches.

The pulps submitted for check assaying were analyzed for gold by FA with AA spectroscopy with any results over 1.0 g/t Au repeated using a gravimetric finish.

In February 2010, AMEC Americas Limited (AMEC) randomly selected 593 coarse reject samples from within a mineralized wireframe outlined using 0.4 g/t Au cut-off grade. The samples were submitted to Acme laboratories in Santiago for gold determination by screen fire assay. Sample preparation methodology consisted of crushing the entire sample to 95% passing two millimetres, taking a split of 500 g to 1,000 g and pulverizing to 95% passing 150 mesh. The pulverized material was dry sieved using a 150-mesh screen. The +150 mesh or coarse fraction was analyzed in its entirety by FAGrav. Two 50-gram splits of the -150 mesh or fine fraction were analyzed by FA with an AAS finish.

No check assay results were provided between 2021 and March 2024.

6.6 SRK Data Verification

SRK visited the AGM Project site between 21 and 27 September 2024 and conducted the following verification procedures:

Discussed with the company's geologists and engineers who were involved in the geological exploration campaign during 2021 and 2022.

Checked the current exploration drill site and previous (2021 and 2022) exploration borehole locations (AHD-352, AHD-345, AHD-346, AHD330 and AHD340A; Figure 6-6).

Visited the drill core shed and observed mineralized cores from two boreholes (VIP Holes: MKD-187 and RKD-87B; Figure 6-6).

Inspected two open pits (RK and AH) and a number of mining stopes underground at the AK and MK satellite deposits which show the exposure of the typical gold mineralization.

Reviewed the previous exploration dataset, selected SRK verification samples and checked the quarter drill core sampling processes.

Figure 6-6: Drill Hole Location (top) and Core Shed (bottom)

Source: SRK 2024 site visit

Based on the review of historical exploration datasets and on-site inspections, SRK selected a total of 114 verification samples from 53 boreholes as our verification samples; they include 41 pulp duplicates and 57 quarter drill core samples. The quarter core sampling processes were performed by the AGM geologists under the SRK guidance. All samples were sent to the MSALABS, based in Georgetown, Guyana for preparation and analysis. The MSALABS is an internationally recognized laboratory in key mining regions around the world.

The quarter drill core samples were prepared by the MSALABS following the standard protocol: dry samples, crush entire sample to 2mm, split 500 gram and pulverize to greater than 85% passing 75µm. The final prepared pulps were analysed for gold using a 50-gram fire assay with determination by atomic absorption spectroscopy ("AAS"). The details of SRK verification samples are presented in Table 6-5.

Table 6-5: Assays of Verification Samples

Sample No.	Sample Type	Original Sample ID	Au (g/t)		Sample No.	Sample Type	Original Sample ID	Au (g/t)

For the quality assurance and quality control ("QA/QC") purpose, each ten (10) analyses batch included seven (7) samples, one duplicate, one blank and one certified reference material ("CRM").

A total of 48 QA/QC samples were inserted, consisting of 16 CRMs, 16 blanks and 16 duplicates. The returned results for 16 sandstone samples as blanks are all below the gold detection limit of 0.005g/t, which indicates that no systematic contamination occurred during the sample preparation. Two types of certified standards, CDN-GS-P5H and CDN-GS-P8H, were purchased from CDN Resource Laboratories Ltd. The assay results of both CRMs fall within control limits with no indication of systematic assaying problems in the gold values (see Table 6-6).

Table 6-6: Performance of Certified Reference Materials

General Information	STANDARD 1	STANDARD 2

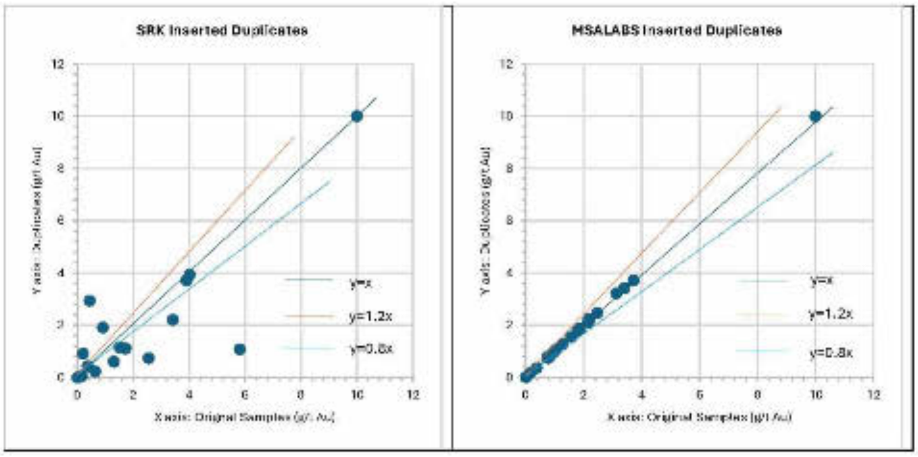
Standard Deviation	0.015	0.015

The returned results for SRK inserted 16 duplicates include 5 pulps and 11 quarter cores. The original assays of pulps and cores were from the AMG lab and ACTLABS, respectively. The comparison of assay results of the 16 duplicates against their original samples show that the relative differences between them are mostly outside 20% (see Figure 6-7 left). The likely reasons for the bad performance are: (1) the original analysis of the 5 pulps was conducted by AGM's own laboratory, which had poor reliability. In addition, the pulp was not well mixed and divided, resulting in large deviations. (2) For the 11 quarter core duplicates, it should be closely related to uneven gold mineralization.

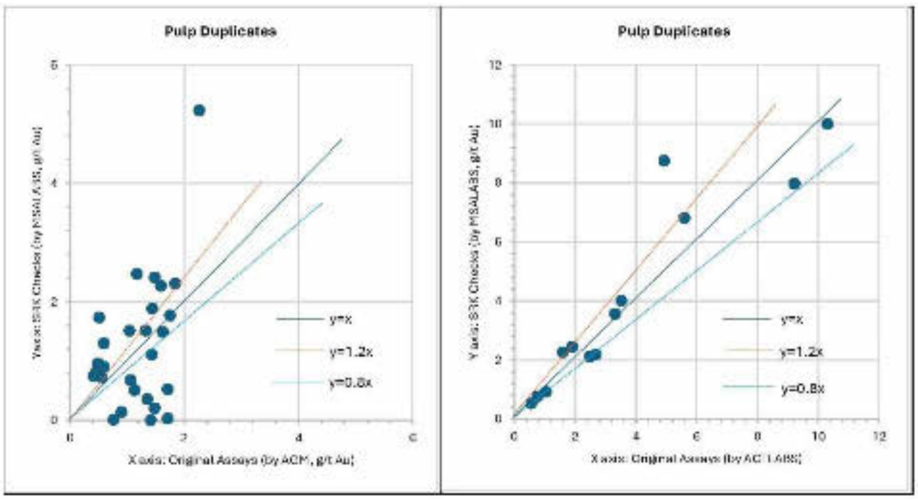
The MSALABS itself inserted twenty-two (22) duplicates as internal checks for quality control. The scatter plots are shown in Figure 6-7 (right). The results show a good correlation between the duplicates and their original counterparts, indicating the assays are considered acceptably repeatable.

Figure 6-7: Performance of SRK and MSALABS Inserted Duplicates



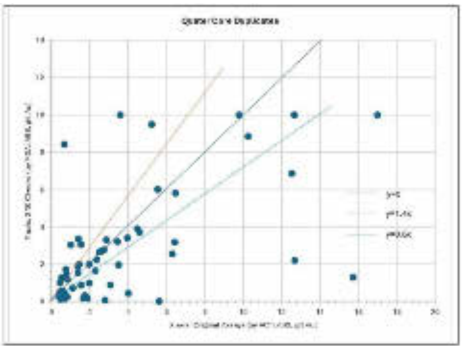
The performance of 41 pulp duplicates is illustrated in Figure 6-8. The outliers were defined with linear regression lines of +20% and -20% between the 41 pulps and their original assays. The original analytical results of these 41 pulps include 28 pulps analyzed by the AGM's own laboratory and 13 pulps assayed by the ACTLABS. The plots for the 28 pulps vs their original assays show most pairs are outside ±20% (see Figure 6-8 left), similarly, the likely reasons are the original analysis of the 28 pulps was conducted by AGM's own laboratory, which had poor reliability and also the pulp was not well mixed and divided, resulting in large deviations. While plots for the other 13 pulps vs their original results show all pairs are within ±20% (see Figure 6-8 right), indicating that the original assays by the ACTLABS are repeatable and are considered acceptable.

Figure 6-8: Performance of Pulp Duplicates



The performance of 73 quarter core duplicates is illustrated in Figure 6-9. The outliers were defined with linear regression lines of +40% and -40% between the 73 quarter cores and their original assays. The comparison of assay results of these quarter core duplicates against their original samples shows that the relative differences between them are more than half outside ±40%. The likely reasons for the bad performance are related to uneven gold mineralization.

Figure 6-9: Performance of Quarter Core Duplicates



Based on SRK's site visit, review of the previous and ongoing exploration datasets and the QA/QC program, communication with the AGM's technical personnel and consideration of the mineralization characteristics of the Aurora gold deposit, SRK is satisfied with the quality and result of the sample preparation and assay conducted by related analytical laboratories. The analytical procedures are consistent with generally accepted industry practices and the primary sample results are therefore suitably reliable for use in Mineral Resource estimation.

7 Mineral Resource Estimates

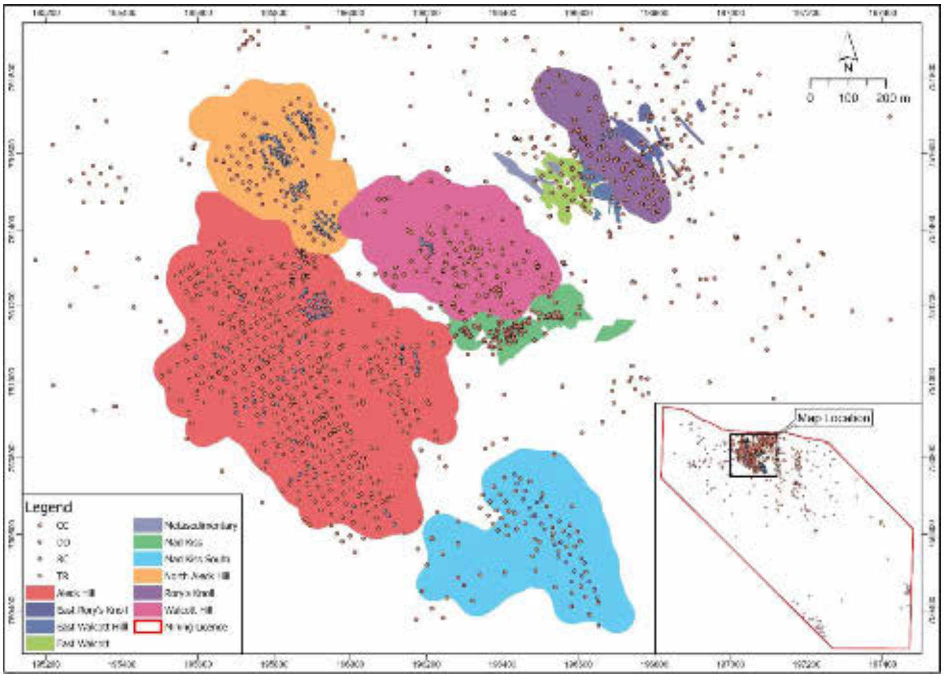
7.1 Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the AGM Project in accordance with the JORC Code (2012).

Gold mineralization at Aurora is divided into four main mineralized zones, Rory's Knoll, East Walcott and Walcott Hill, Mad Kiss, Mad Kiss West and Mad Kiss South, and Aleck Hill and North Aleck Hill.

The Mineral Resource estimate for this Technical Report, 31 December 2024, was based on multiple block models: 1) Rory's Knoll and East Walcott open pit and underground, 2) Mad Kiss underground, 3) Aleck Hill underground, and 4) Aleck Hill, North Aleck Hill, Mad Kiss South, Walcott Hill, and Mad Kiss West, collectively referred to as Aleck Hill Open Pit Area. The general areas are shown in Figure 7-1.

Figure 7-1: Block Models Plan View



Source: SRK

The Mineral Resource estimation work for Rory's Knoll, East Walcott, Mad Kiss South, Walcott Hill, and Mad Kiss West was completed by SLR in 2021. For those models with non-material changes (no material changes on wireframing/ interpretation assumptions and no additional sample data acquired since 2021, SRK have reviewed the database, estimation methodologies and models used to prepare the Mineral Resource estimate and were satisfied that they comply with reasonable industry practice.

For Mad Kiss, Aleck Hill underground, North Aleck Hill, and Aleck Hill Open Pit Area, SRK updated the domains with additional drilling completed since the previous update and updated the Mineral Resources estimation using Leapfrog EDGE software. The estimates are based on drilling samples and underground samples information available up to March 2024. SRK is not aware of any material changes in exploration data that could impact the MRE update reported herein since 31 March 2024, SRK believes the current drilling information is sufficiently reliable to interpret with confidence the boundaries for Aurora Project and that the assay data are sufficiently reliable to support Mineral Resource estimation dated 31 December 2024..

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Aurora Project at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

7.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Geological interpretation for estimation domain review/update;
- Data preparation (compositing and capping) and Variogram;
- Block model and grade interpolation review/update;
- Mining depletion;
- Mineral Resource classification review/update;
- Model validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("RPEEE") and selection of appropriate cut-off grades (COG); and
- Preparation of the Mineral Resource statement.

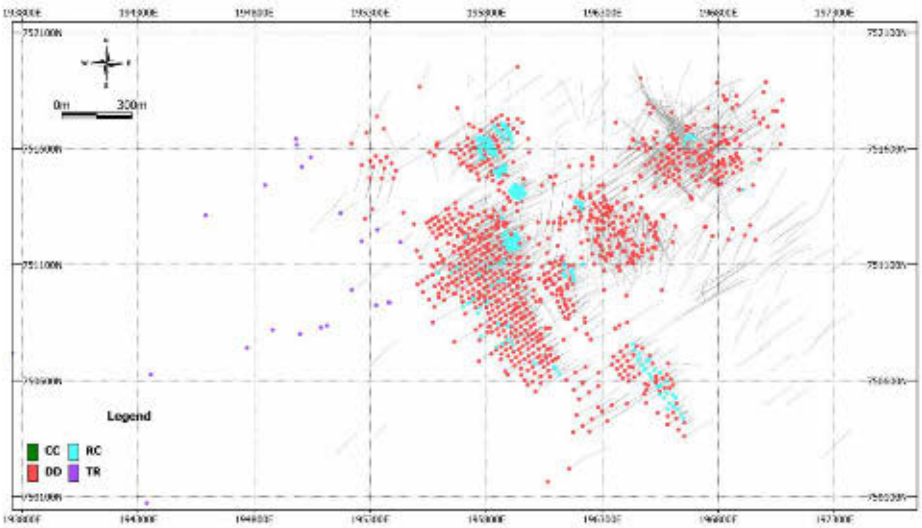
7.3 Resource Database

The data SRK received from Aurora Mine is a set of Leapfrog Model named ***Aurora Gold Mine.aproj updates*** which includes drilling data, composites, topography, grade shell, block model, pit shell and etc.

As of March 2024, there were 1,931 drillholes (77,366 samples/ 510,933 m), 115 trenches (8,565 samples) and 101 crosscuts (1,876 samples) in the database, of which trenches and the drillholes located outside of the resource area or not assayed were not considered for the Mineral Resource model.

Detailed information is shown in Table 7-1, and the drillhole and underground sample locations are shown in Figure 7-2

Figure 7-2: Drillholes and Underground Sampling Location



Source: SRK

Note: Zoom in to the major mineral deposits

Table 7-1: Resource Database Summary

Type	Holes Number	Depth(m)	Samples
DD holes	1,722	490,524	60,624
RC holes	209	20,409	16,742
Cross cut	101	1,932	1,876
Trenches	115	20,955	8,565

Source: Summaried by SRK from the Drillholes database of Leapfrog Models

Note：Trenches and the drillholes located outside of the resource area or not assayed were not considered for the Mineral Resource model.

7.4 Weathering Profiles

The rocks in the Guiana Shield have been subject to chemical weathering reflecting prolonged exposure to a tropical climate. This has resulted in the formation of a laterite-saprolite profile that can be as deep as 100 m below surface. Chemical weathering results in the formation of stable secondary clay minerals along with iron, magnesium, and aluminium oxides due to the leaching of mobile, alkali elements. In the Aurora area, the depth of chemical weathering varies from as little as 15 m to as much as 75 m, depending on the underlying lithologies.

The property-wide weathering profile surfaces were generated representing saprolite, transition, and fresh material using Leapfrog Geo from the logged oxidation state available in the drillhole database.

The saprolite layer ranges from 0 m to 65 m in Rory's Knoll and 0 m to 90 m at Aleck Hill. The transition layer is generally less than ten metres and was therefore assigned to the fresh category.

There is no apparent change in the gold grade distribution, or the gold-quartz relationship when saprolite statistics are compared to those in the fresh rock.

7.5 Domain Modelling

7.5.1 Rory's Knoll and East Walcott Deposits

The geological interpretation of Rory's Knoll and East Walcott Deposits comprises wireframes for mineralized domains, which were developed in Leapfrog Geo. Gold mineralization modelling was supported using gold grade shell wireframes influenced by structure.

Most of the gold mineralization occurs within the Rory's Knoll tonalite, which extends vertically 2,600, approximately 200 m along a trend of 315° west, and plunges steeply to the north-northwest.

East Walcott is hosted by mafic volcanoclastic sediments and is located approximately 60 m southwest of the main Rory's Knoll diorite pipe. There are numerous, steeply plunging mineralized shoots with subvertical extension textures and a down-plunge continuity of over five times their horizontal dimensions extending down to the 420 m below surface.

Outside of Rory's Knoll and East Walcott, the continuity of gold mineralization occurs within steeply dipping veins with limited horizontal continuity.

The updated understanding suggests that mineralization is controlled by fold hinges or occurs at the intersection of two sets of foliations that have a steep north-northwest plunge, similar to Rory's Knoll, and demonstrate good vertical continuity.

Rory's Knoll

The Rory's Knoll domain was modelled using a 0.4 g/t Au cut-off grade and the relogged lithology, where available. Where lithology was not available, grade was applied as a guide to determine the extent of the Rory's Knoll wireframe domain. The high-grade sub-domain or internal waste zones were not modelled.

East Walcott

East Walcott domain was interpreted where gold mineralization occurs in folded metasedimentary and metavolcanics rocks and was not snapped to assay and incorporated edge dilution.

Other Auriferous Domains

Outside of Rory's Knoll and East Walcott, but within this immediate area, gold mineralization was modelled using the dominant structural trends, grade shells generated at 0.4 g/t Au, and a nominal minimum thickness of four metres. The zones were separated into a northwest-trending metasedimentary ("Msed") structure that bounds the East Walcott, East Walcott Hill, and East Rory's Knoll domains. Where infill drilling showed reasonable continuity both horizontally and vertically, boundaries for individual zones were modelled using the vein modelling tool available in Leapfrog Geo software. Each auriferous zone was assigned a name and a rock code for statistical analysis, grade capping, variography, and grade interpolation.

Figure 7-3 shows the Rory's Knoll and East Walcott mineralization domains in three dimensions. The wireframe domain names and rock codes are summarized in Table 7-2.

Table 7-2: Wireframe Domain Codes and Groupings for Capping Analysis – Rory's Knoll and East Walcott

Zone	Wireframe Domain	Wireframe Capping Zone	Domain Code
Rory's Knoll	RK	RK	100
East Walcott	EW	EW	200

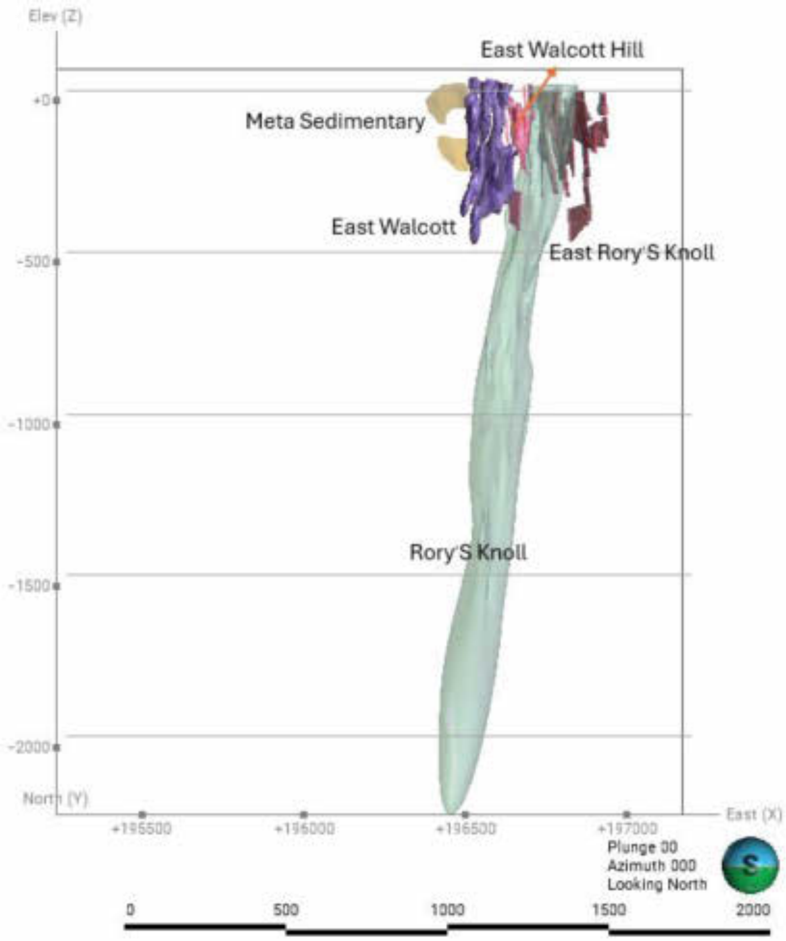
Figure 7-3: Rory's Knoll and East Walcott Mineralization Domains



Source: SRK

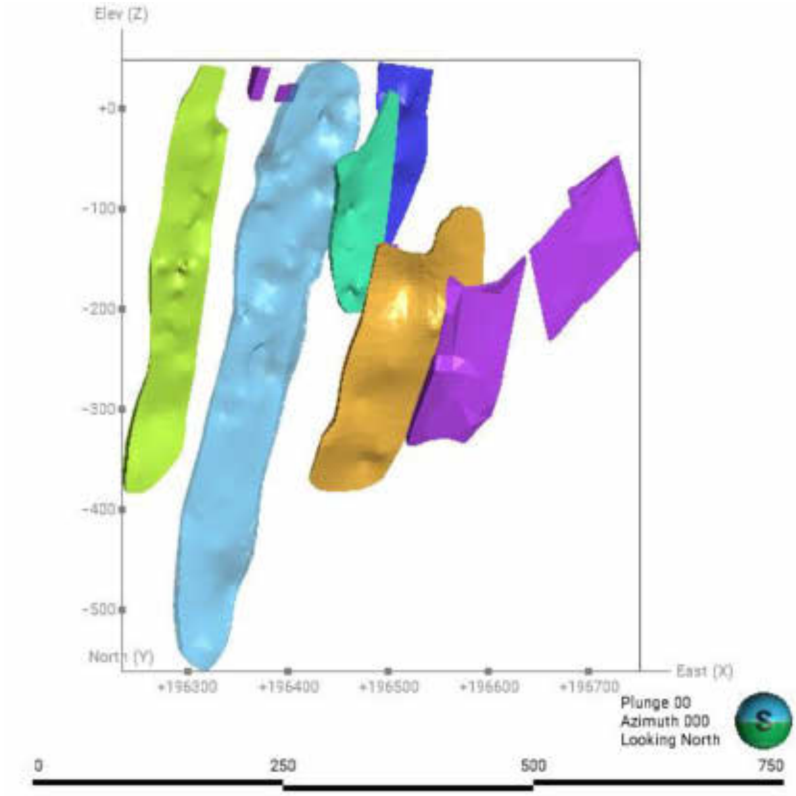
7.5.2 Mad Kiss Deposit

The Mad Kiss deposit is located between the Rory's Knoll and Aleck Hill deposits, approximately 500 m southwest of the Rory's Knoll deposit. The mineralization occurs as extensional and foliation parallel quartz-ankerite veining hosted by a foliated quartz-feldspar porphyry dike. The dike and related mineralization occur as distinct tabular zones trending 250° and dipping 70° north. The Mad Kiss zone is approximately 340 m long with a vertical extent of approximately 700 m.

In 2024, SRK used Leapfrog software to update the wireframes by new drilling and crosscut samples based on the 2019 wireframes done by SLR.

Figure 7-4 shows a 3D view of the Mad Kiss mineralization domains.

Figure 7-4: 3D View of the Mineralization Domains – Mad Kiss



Source: SRK

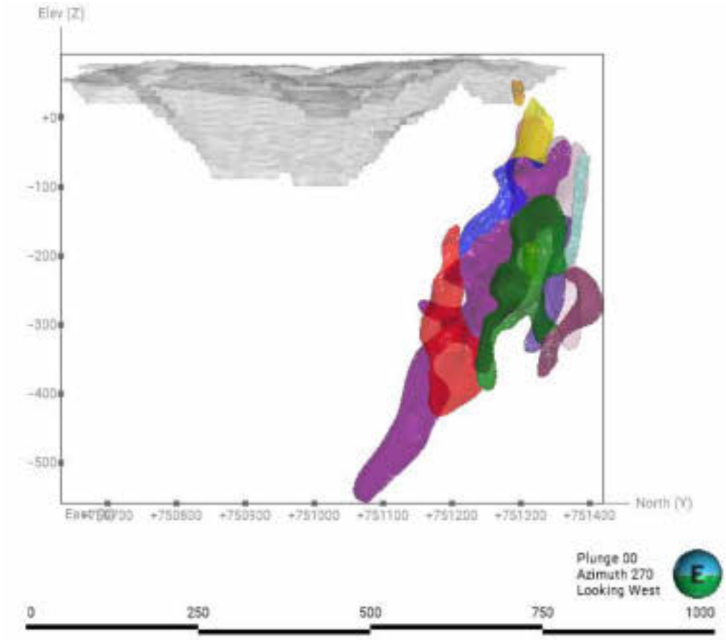
7.5.3 Aleck Hill Underground Deposit

The underground portion of the Aleck Hill (Aleck Hill underground) is located in the northeast corner of the Aleck Hill deposit. The gold mineralization is associated with discrete shear zones and occurs in four distinct sub-vertical quartz-carbonated veins striking approximately 150°. The Aleck Hill underground deposit is approximately 200 m long with a vertical extent of up to 600 m. The thickness of the zone is approximately 55 m, where the width of each domain varies between two metres and 16 m.

The Aleck Hill underground domains were modelled by AMG in 2023 using the dominant structural trends and a 1.0 g/t Au cut-off grade. And SRK updated the domains according to the new drillhole and the crosscut samples data in 2024.

Figure 7-5 shows a 3D view of the Aleck Hill Underground mineralization domains and the reserve pit design.

Figure 7-5: 3D View of the Mineralization Domains – Aleck Hill Underground



Source: SRK

7.5.4 Aleck Hill Open Pit Area

In the west and southwest of the Aurora Gold Mine area, the gold mineralization occurs in veins and along vein selvages. The veins are thin, on the centimetre scale, and predominantly quartz. They become more frequent near the hinge of folds. With the axial plane of the folds being sub-vertical, the swarms of gold rich quartz veins tend to produce steeply dipping rodlike structures, with their greatest continuity being along the near-vertical hinge line, their intermediate continuity being parallel to foliation in the horizontal direction, and their shortest continuity being perpendicular to foliation. These "ribbon vein" areas have been modelled using a methodology that differs from the wireframe-based methodology that is appropriate for Rory's Knoll East Walcott, Mad Kiss, and the underground portion of Aleck Hill.

Figure 7-6 shows the areas where gold grades have been estimated using this alternate approach: Aleck Hill, Walcott Hill, Mad Kiss West, Mad Kiss South, Aleck Hill, and North Aleck Hill. These areas are collectively referred to as Aleck Hill Open Pit Area.

The previous model interpretation where domains were based on quartz percentage, established the continuity of high grades along fold hinges. Additional trend analysis informed by both RC and DD drill holes shows greater intermediate continuity parallel to foliation than previously defined by the quartz domain approach. The high-grade gold mineralization in the Aleck Hill Open Pit area can still be characterized as being discontinuous and thin in areas causing some of the vertical hinge mineralization to be spatially limited compared to the DD hole spacing, however, assay results generally show good intermediate continuity parallel to foliation when more closely spaced RC drilling is included. The improved intermediate continuity is also shown in BH drilling at grades above 0.50 g/t Au. The BH grade contours delineate a complex structural network of gold vein mineralization. The BH drill holes also confirm the presence of discontinuous and in some places, thin mineralization.

This interpretation was used during trend analysis and 75 trend surfaces were constructed by SLR based on assay grades from diamond core, RC, and BH drilling across all six work areas in 2021.

In 2024, SRK added 8 trend surfaces according to the new drilling data. The trend surfaces are used to guide search ellipse orientations using dynamic anisotropy during both indicator probability and grade estimation. The current approach to domaining uses interpolated indicator probabilities from two metre composites within work areas for each deposit at a grade threshold of 0.50 g/t Au to define the domains.

Domain codes were assigned to each block based on high, medium, and low probability indicator thresholds. The indicator thresholds are as follows:

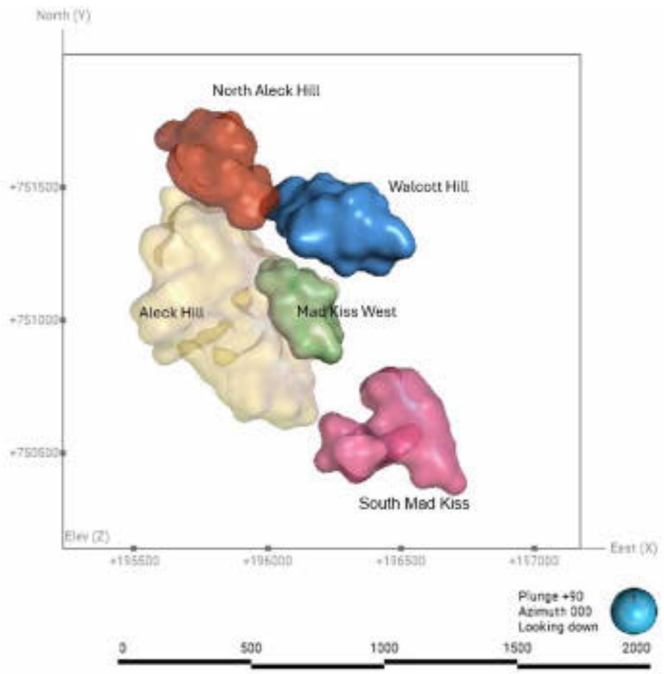
Domain 1 [Indicator Probability >= 0.70] – High Probability (High Grade)

Domain 2 [0.50=< Indicator Probability < 0.70] – Medium Probability (Medium Grade)

Domain 3 [0.30=< Indicator Probability < 0.50] – Low Probability (Low Grade)

Domain 4 [Indicator Probability < 0.30] – Waste

Figure 7-6: Five Work Areas of Ribbon-Vein Style Mineralization - Aleck Hill Open Pit



Source: SRK

The discontinuous and very thin character of the gold mineralization in the Aleck Hill Open Pit area required an alternative approach to domaining. A model updating with wireframes in the areas where drill hole spacing is sufficiently close to clearly delineate the fold hinge mineralization was recommended.

7.6 Bulk Density

The bulk density data was included in the Leapfrog Model package which contains data for density measurements of both saprolite and fresh rock. No additional density measurements have been added to the database since the 2021 report.

For the current Mineral Resource estimate, 342 density measurements were available, including106 measurements taken from saprolite and 236 measurements for fresh rock. SRK did not observe a correlation between mineralization and density measurements nor a significant relationship between lithology and density.

Density values used in the block model are listed in Table 7-3.

Table 7-3: Bulk Density Assignments

Material	Density Value (t/m3)
Saprolite	1.73
Fresh Rock	2.80
Waste Dump Material	2.00
Stockpile	2.00

Sources: NI 43-101 Technical Report by SLR in 2021

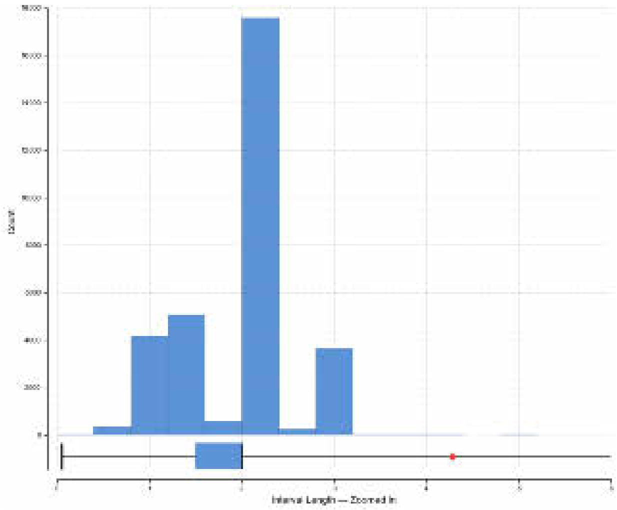
7.7 Compositing

7.7.1 Rory's Knoll and East Walcott Deposits

The assay lengths (excluding unsampled intervals) range from 0.02m to 5.63 m, with an average length of 1.77 m and median length of 2.00 m within mineralization wireframe domains. A composite length of 2.0 m was applied considering the width of mineralization. A histogram of the resource assays is shown in Figure 7-7.

Composites were created within the mineralization wireframe domains beginning at the upper contacts. The intersection thickness encountered by any given drill hole, however, is not an even multiple of the composite length. If the remaining length was greater than or equal to 0.50 m, the composite was accepted as part of the data set; if the remaining length was less than 0.50 m, the composite was not included. The elimination of the small composites did not affect the overall integrity of the composited database.

Figure 7-7: Resource Assay Length Histogram – Rory's Knoll and East Walcott

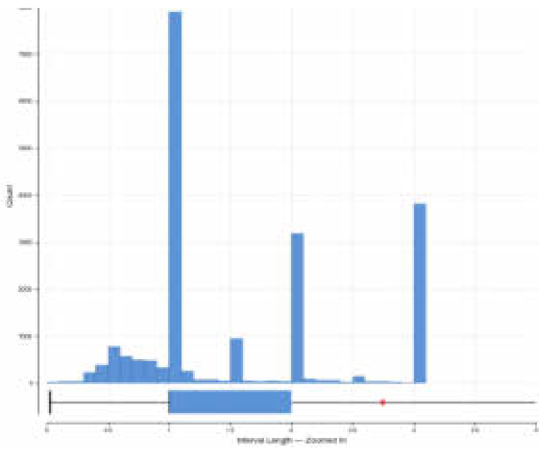


Source: SRK

7.7.2 Mad Kiss Deposit

Assay lengths (excluding unsampled intervals) range from 0.001 m to 3.3 m, with an average length of 1.13 m and median length of 2.00 m within mineralization wireframe domains, a composite length of 2.0 m was applied for the resource estimation. A histogram of the resource assays is shown in Figure 7-8.

Figure 7-8: Resource Assay Length Histogram – Mad kiss

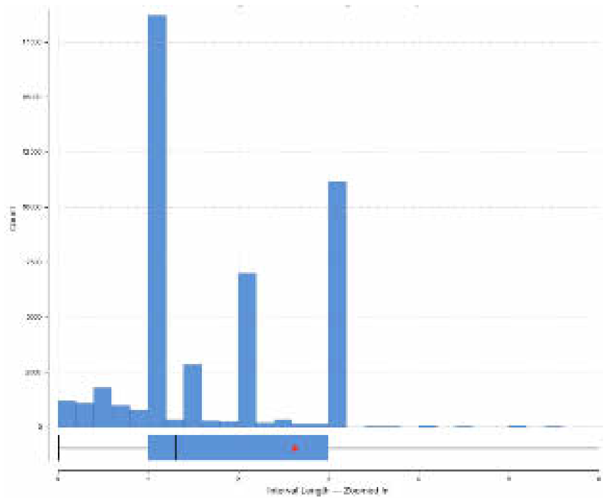


Source: SRK

7.7.3 Aleck Hill Underground Deposit

Assay lengths range from one metre to three metres, with an average length of 2.07 m and a median length of two metres within the mineralization wireframe domains. A composite length of 2.0 m was applied for the resource estimation. Composites were created within the mineralization wireframe domains beginning at the upper contact of the resource domains. If the remaining composite length was less than 0.50 m, the composite was added to the previous interval. A histogram of the resource assays is shown in Figure 7-9.

Figure 7-9: Resource Assay Length Histogram of Aleck Hill Underground Deposit

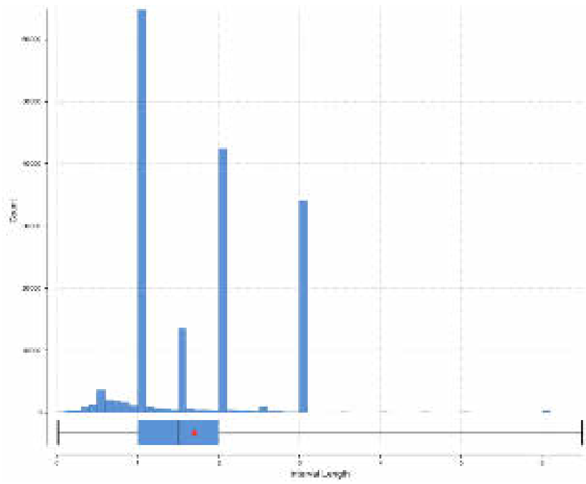


Source: Add sources

7.7.4 Aleck Hill Open Pit Area

Assay lengths range from 0.10 m to 6.5 m, with an average length of 1.70 m and a median length of 1.5 metres within the work areas. A composite length of 2.0 m was applied for the resource estimation. Composites were created within the work area wireframes beginning at the upper contacts. The intersection thickness encountered by any given drill hole, however, is not an even multiple of the composite length. If the remaining length was greater than or equal to one metre, the composite was accepted as part of the data set; if the remaining length was less than one metre, the remaining length was added to the previous composite. A histogram of the resource assays length is shown in Figure 7-10.

Figure 7-10: Resource Assay Length Histogram – Aleck Hill Open Pit Area



Source: SRK

7.8 Evaluation of Outliers

7.8.1 Rory's Knoll and East Walcott Deposits

Where the assay distribution is skewed positively or approaches lognormal, erratic high grade assay values can have a disproportionate effect on the average grade of a deposit. One method of treating these outliers in order to reduce their influence on the average grade is to cap them at a specific grade level.

The raw gold assay distributions in all the wireframes using a combination of histograms, probability plots, decile analyses, and cutting curves suggest that a 35 g/t Au capping value is appropriate for the Rory's Knoll domain, 25 g/t Au for the East Walcott, East Walcott Hill and East Rory's Knoll domains, and 10 g/t Au for the Metasedimentary Structural Zone domain, and high-grade composites were also restricted to a small spatial influence. The 5.0 g/t Au restriction threshold was based on variography, the gold grade histogram, and the observed extent of high-grade shoots in areas that are well supported by drilling. The parameters were iteratively adjusted along with the threshold grade to achieve the desired continuity. Histograms and probability plots shown from Figure 7-11 to Figure 7-13.

Using production data and related reconciliation work to adjust the capping level of the model, was recommended once sufficient reliable reconciliation and production data are available.

Aleck Hill Underground Deposit	10	138	0.28	4.74	2.98

Source: SRK

7.8.4 Aleck Hill Open Pit Area

Aleck Hill and Mad Kiss West

The composites from Domain blocks at the Aleck Hill-Mad Kiss West area have three different capping levels that correspond to the domain being estimated. The following example explains the process:

When estimating Domain 1 block grades which represents the high probability and/or the high-grade blocks, composites flagged as Domain 1 and 2 capped at a 30 g/t Au are used during estimation.

When estimating Domain 2 block grades which represents the medium probability and/or the medium-grade blocks, composites flagged as Domain 1, 2 and 3 capped at a 20 g/t Au are used during estimation.

When estimating Domain 3 block grades which represents the low probability and/or the low-grade blocks, composites flagged as Domain 2 and 3 capped at a 10 g/t Au are used during estimation.

High-grade composites were also restricted to a small spatial influence. A 10 g/t Au restriction threshold was applied for Domain 1 block and Domain 2 block and 5 g/t Au restriction threshold was applied for Domain 3 block based on variography, the gold grade histogram, and the observed extent of high-grade shoots in areas that are well supported by drilling.

The Histograms plots of the composites shown in Figure 7-16, Figure 7-17 and Figure 7-18.

North Aleck Hill

The composites from Domain blocks at the North Aleck Hill area have three different capping levels that correspond to the domain being estimated. The following example explains the process:

When estimating Domain 1 block grades which represents the high probability and/or the high-grade blocks, composites flagged as Domain 1 and 2 capped at a 16.5 g/t Au are used during estimation.

When estimating Domain 2 block grades which represents the medium probability and/or the medium-grade blocks, composites flagged as Domain 1, 2 and 3 capped at a 13.5 g/t Au are used during estimation.

When estimating Domain 3 block grades which represents the low probability and/or the low-grade blocks, composites flagged as Domain 2 and 3 capped at a 8.5 g/t Au are used during estimation.

And High-grade composites were also restricted to a small spatial influence based on variography.

Aleck Hill South and Mad Kiss South

The composites from Domain blocks at the Aleck Hill South and Mad Kiss South area have three different capping levels that correspond to the domain being estimated. The following example explains the process:

When estimating Domain 1 block grades which represents the high probability and/or the high-grade blocks, composites flagged as Domain 1 and 2 capped at a 9.0 g/t Au are used during estimation.

When estimating Domain 2 block grades which represents the medium probability and/or the medium-grade blocks, composites flagged as Domain 1, 2 and 3 capped at a 7.5 g/t Au are used during estimation.

When estimating Domain 3 block grades which represents the low probability and/or the low-grade blocks, composites flagged as Domain 2 and 3 capped at a 5.0 g/t Au are used during estimation.

And High-grade composites were also restricted to a small spatial influence based on variography.

Walcott Hill

The composites from Domain blocks at the Walcott Hill area have three different capping levels that correspond to the domain being estimated. The following example explains the process:

When estimating Domain 1 block grades which represents the high probability and/or the high-grade blocks, composites flagged as Domain 1 and 2 capped at a 6.5 g/t Au are used during estimation.

When estimating Domain 2 block grades which represents the medium probability and/or the medium-grade blocks, composites flagged as Domain 1 , 2 and 3 capped at a 5.0 g/t Au are used during estimation.

When estimating Domain 3 block grades which represents the low probability and/or the low-grade blocks, composites flagged as Domain 2 and 3 capped at a 3.0 g/t Au are used during estimation.

And High-grade composites were also restricted to a small spatial influence based on variography.

Source: Summarised by SRK based on the NI 43-101 Technical Report by SLR in 2021

The variography and prepared variograms using composited assays located within the Rory's Knoll and East Walcott mineralized domains. For all other domains in the Rory's Knoll East Walcott area, the density of drill hole information and the poddy nature of the gold grades and/or the small number of composite samples resulted in poor variogram model fits.

The nugget effect was established with the downhole variogram. For Rory's Knoll, the experimental variogram was oriented with the longest range in the down plunge direction, and the semi-major parallel to the strike of the mineralization. For East Walcott, the longest variogram range was oriented down the fold hinge, plunging steeply to the north-northwest, with the shortest range observed across strike, consistent with trends used for wireframe modelling. The semi-major range (sub-parallel to the fold limbs) was approximately equal to the downhole range and the shortest range was observed across strike, which was 60% of the range along strike. For all other domains, density of drill hole information and the discontinuous nature of the gold grades resulted in poor variogram model fits.

The gold variogram model results for the Rory's Knoll and East Walcott Deposits are presented in Figure 7-28 and Table 7-12.

7.9.3 Aleck Hill Open Pit Area

The estimation indicator variograms methodology used required separate instances of variography.

First, modelling prior to the interpolation of indicator probabilities within the work area.

Second, modelling gold variograms prior to the interpolation of gold values within the work area. Whereas modelling discrete veins would provide the opportunity for grade contouring and the ability to tailor the directional anisotropy of the mineralization on a vein-by-vein basis, the current estimation approach requires a fixed directional anisotropy be applied to all domains. The directional anisotropy used in the current estimation was selected to align with the observed continuity of high grades along what appear to be vertical (in the plane of mineralization) fold hinges.

The variograms for both indicator probabilities and gold using composited assays located within selected areas of well-defined mineralization was generated. The variogram ranges and anisotropy observed within the selected areas was applied to all domains. In some instances, these ranges were subject to adjustment based on professional experience.

Aleck Hill and Mad Kiss West

The 2m composites statistics for individual blocks and domains of Aleck Hill and Mad Kiss West are presented in Table 7-14.

7.10 Block Model and Grade Estimation

7.10.1 Rory's Knoll and East Walcott Deposits

The non-rotational model was constructed in Leapfrog EDGE for grade and tonnage estimation by SLR in 2021 and reviewed by SRK in 2024. A suitable sub- block interval and unit size was adopted to build a block model which was able to contain the mineralized zones. The bock size was set to be 5 m × 5 m × 5 m (East × North × Elevation). The sub-block size was set to be 2.5 m × 2.5 m × 2.5 m (East × North × Elevation). The block model used the same coordinate system as data collection. A summary of the block model specifications is presented in Table 7-23.

Table 7-23: Block Model Summary of Rory's Knoll and East Walcott Deposits

Description	Easting (X)	Northing (Y)	Elevation (Z)
Origin (m)	196318	751295	-2100
Block Size (m)	5	5	5
Sub-block Size (m)	2.5	2.5	2.5
Number of Parent Blocks	170	140	450
Boundary Size (m)	850	700	2250
Rotation	0°		

The block model attributes include mineralization domain codes, density domain codes, final block gold grades, ID3 and nearest neighbour (NN) gold grades for Rory's Knoll and East Walcott domains, density, and classification. The density factor applied was coded directly into each block based on the density model.

For Rory's Knoll and East Walcott, gold grades were interpolated using ordinary kriging (OK). Variography was used to determine the search ellipsoid orientation and dimensions. For all other domains, gold grades were interpolated using inverse distance cubed (ID3).

Grade search restrictions based on the geostatistical analysis and variography was applied to constrain high grade values and prevent unwanted smearing and artefacts in the third pass used for block grade interpolation in the Rory's Knoll domain. The 5.0 g/t Au restriction threshold was based on variography, the gold grade histogram, and the observed extent of high-grade shoots in areas that are well supported by drilling. The parameters were iteratively adjusted along with the threshold grade to achieve the desired continuity.

The Interpolation and search parameters used are summarized in Table 7-24 and Table 7-25.

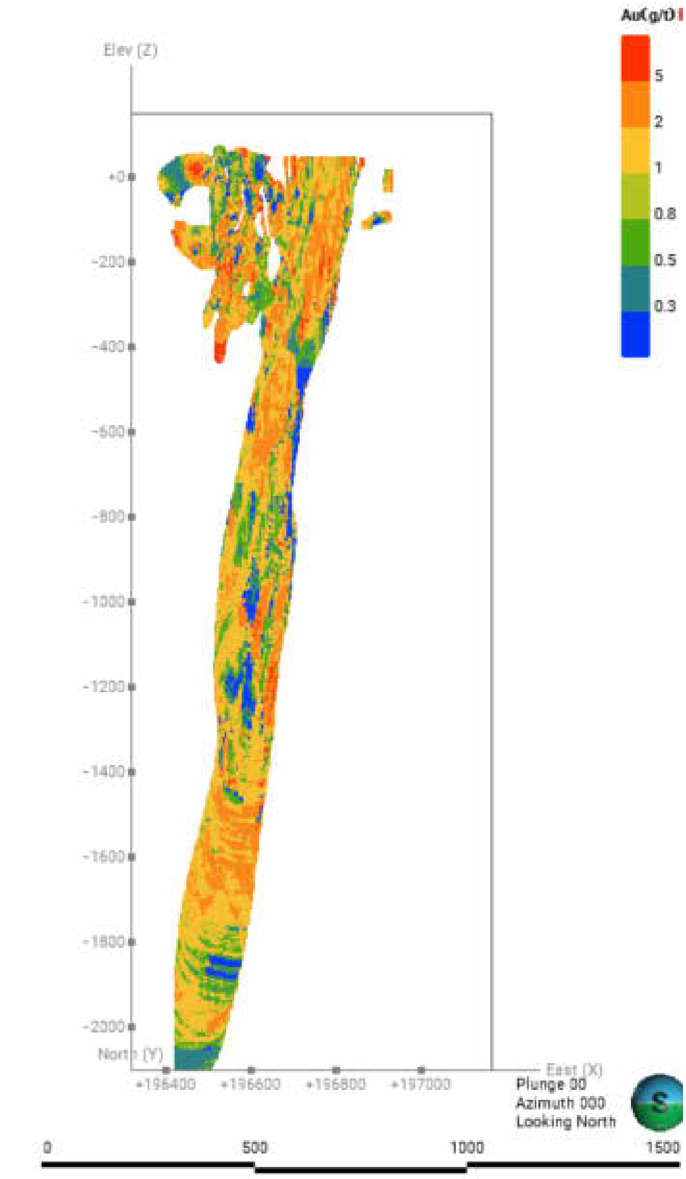
The Leapfrog EDGE block model was exported to a CSV file and imported into Surpac for final Mineral Resource compilation and reporting.

The Au gold distribution of the East Rory's Knoll and East Walcott Hill is presented in Figure 7-35.

Figure 7-35: Au Gold 3D Display of East Rory's Knoll and East Walcott Hill



7.10.2 Mad Kiss Deposit

The non-rotational model was constructed in Leapfrog EDGE for grade and tonnage estimation update by SRK in 2024. A suitable sub- block interval and unit size was adopted to build a block model which was able to contain the mineralized zones. The bock size was set to be 5 m × 5 m × 5 m (East × North × Elevation). The sub-block size was set to be 2.5 m × 2.5 m × 2.5 m (East × North × Elevation). The block model used the same coordinate system as data collection. A summary of the block model specifications is presented in Table 7-26.

Table 7-26: Block Model Summary of Mad Kiss

Description	Easting (X)	Northing (Y)	Elevation (Z)
Origin (m)	196093	750845	150
Block Size (m)	5	5	5
Sub-block Size (m)	2.5	2.5	2.5
Number of Parent Blocks	290	220	320
Boundary Size (m)	725	550	800
Rotation	0°		

The block model attributes include mineralization domain codes, density domain codes, final block gold grades, ID3 and NN gold grades, density, and classification. The density factor applied was coded directly into each block based on the density model.

The hanging wall and footwall of each domain was applied to guide the variable orientation search. Grades were interpolated by inverse distance cubic (ID3) with 3 passes.

For estimation within the saprolite wireframes, soft boundaries were applied between the fresh and oxidized domains limited to 25 m away from their boundary. No saprolite composites were used in estimation of the domain located within the non-oxidized material.

The Interpolation and search parameters used are summarized in Table 7-27. And the Au gold distribution of the Mad Kiss is presented in Figure 7-36.

Table 7-27: Search Parameters of Mad Kiss

Parameter	Pass 1	Pass 2	Pass 3
No. Composites (Min/Max)	5/12	4/12	2/12
Max. Composites per Drill Hole	2	2	-
Major (m) - Fresh/Saprolite	90/30	180/30	180/50
Semi-Major (m) - Fresh/Saprolite	20/50	40/50	60/70
Minor (m) - Fresh/Saprolite	5/10	5/15	10/30

7.10.3 Aleck Hill Underground Deposit

The non-rotational model was constructed in Leapfrog EDGE for grade and tonnage estimation update by SRK in 2024. A suitable sub- block interval and unit size was adopted to build a block model which was able to contain the mineralized zones. The bock size was set to be 5 m × 5 m × 5 m (East × North × Elevation). The sub-block size was set to be 2.5 m × 2.5 m × 2.5 m (East × North × Elevation). The block model used the same coordinate system as data collection. A summary of the block model specifications is presented in Table 7-28.

Table 7-28: Block Model Summary of Aleck Hill Underground Deposit

Description	Easting (X)	Northing (Y)	Elevation (Z)
Origin (m)	196093	750845	150
Block Size (m)	5	5	5
Sub-block Size (m)	2.5	2.5	2.5
Number of Parent Blocks	120	115	190
Boundary Size (m)	600	575	950
Rotation	0°		

The block model attributes include mineralization domain codes, density domain codes, final block gold grades, ID3 and Nearest Neighbour (NN) gold grades, density, and classification. The density factor applied was coded directly into each block based on the density model.

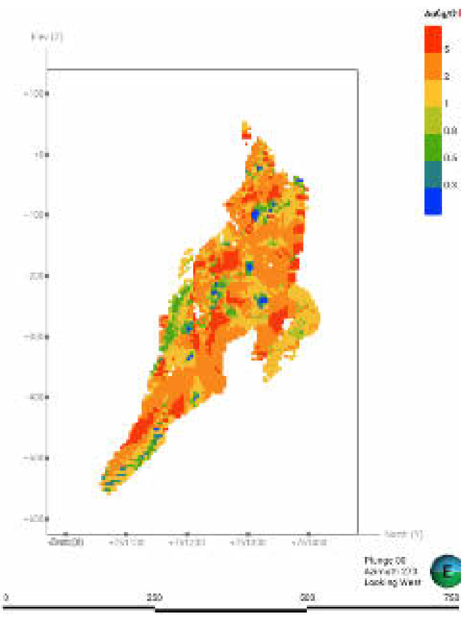
For Aleck Hill underground, gold grades were interpolated using ID3. The hanging wall and footwall of each domain was applied to guide the variable orientation search. Four estimation passes were used to populate the block model. The Interpolation and search parameters are summarized in Table 7-29.

Table 7-29: Search Parameters of Aleck Hill Underground

Parameter	Pass 1	Pass 2	Pass 3	Pass 4
No. Composites (Min/Max)	3/15	3/15	4/30	1/15
Major (m)	20	40	80	160
Semi-Major (m)	10	16	32	80
Minor (m)	4	8	16	30

The Au gold distribution of the Aleck Hill underground deposit is presented in Figure 7-37.

Figure 7-37: Au Gold 3D Display of Aleck Hill Underground Deposit



7.10.4 Aleck Hill Open Pit Area

The non-rotational model was constructed in Leapfrog EDGE for grade and tonnage estimation update by SRK in 2024. A suitable sub- block interval and unit size was adopted to build a block model which was able to contain the mineralized zones. The bock size was set to be 5 m × 5 m × 5 m (East × North × Elevation). The sub-block size was set to be 2.5 m × 2.5 m × 2.5 m (East × North × Elevation). The block model used the same coordinate system as data collection. A summary of the block model specifications is presented in Table 7-30.

Table 7-30: Block Model Summary of Aleck Hill Open Pit Area

Zone	Description	Easting (X)	Northing (Y)	Elevation (Z)
Aleck Hill and Mad Kiss West	Origin (m)	195478	750580	160
	Block Size (m)	5	5	5
	Sub Block Size (m)	2.5	2.5	2.5
	Number of Blocks	326	328	394
	Boundary Size (m)	815	820	985
	Rotation	0°		
North Aleck Hill	Origin (m)	195598	751310	160
	Block Size (m)	5	5	5
	Sub Block Size (m)	2.5	2.5	2.5
	Number of Blocks	184	198	210
	Boundary Size (m)	460	495	525

Mad Kiss South	Origin (m)	196138	750330	160
	Block Size (m)	5	5	5
	Sub Block Size (m)	2.5	2.5	2.5
	Number of Blocks	248	202	204
	Boundary Size (m)	620	505	510
	Rotation	0°		
Walcott Hill	Origin (m)	195958	750960	160
	Block Size (m)	5	5	5
	Sub Block Size (m)	2.5	2.5	2.5
	Number of Blocks	300	244	332
	Boundary Size (m)	750	610	830
	Rotation	0°		

The block model attributes include domain codes, OK and NN gold grades, density, and classification.

Both the indicator probabilities and gold grades were interpolated using OK. Variography and visual inspection of interpolated blocks was used to determine the search ellipsoid orientation and dimensions. The interpolation parameters for the estimated indicator blocks used to create estimation domains 1, 2, and 3 were visually compared to the mineralization defined by BH drilling to ensure that the domains were spatially representative of the along strike and across strike.

Grade search restrictions based on the geostatistical analysis and variography to constrain high grade values and prevent unwanted smearing and artefacts in the third pass used for block grade interpolation.

The interpolation and search parameters used are summarized in Table 7-31 and Table 7-32.

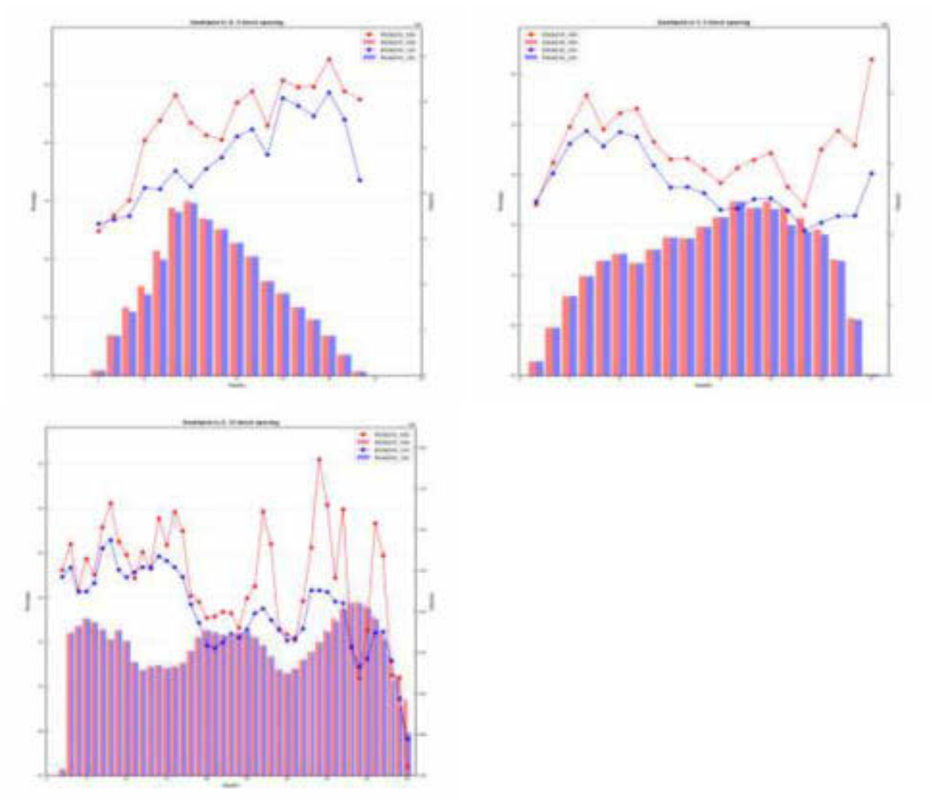
7.11 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the resource data used and of the estimation method applied. Other issues such as the relationship between the model-selectivity assumptions and mining practices are equally important when determining the appropriateness of the resource estimate.

7.11.1 Rory's Knoll and East Walcott Deposits

Figure 7-39 illustrates the gold trend plots and the block versus composite histograms for the combined Rory's Knoll and East Walcott domains. There is no significant bias between the resource block grades and the composited capped assay samples.

Figure 7-39: Swath Plots – Rory's Knoll and East Walcott Deposit

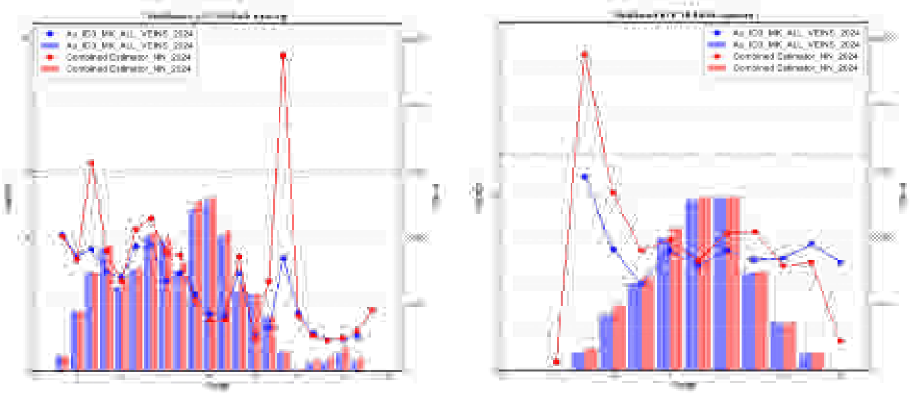


Source: SRK based on the model prepared by SLR in 2021

7.11.2 Mad Kiss Deposit

The swath plots show reasonably good correlation among the estimated ID3 block grades and the NN block grades where lower grades are observed. The swath plots are shown in Figure 7-40.

Figure 7-40: Swath Plots – Mad Kiss



Source: SRK

7.11.3 Aleck Hill Underground Deposit

The swath plots show reasonably good correlation among the estimated ID3 block grades and the NN block grades where lower grades are observed. The swath plots are shown in Figure 7-41.

Figure 7-41: Swath Plots – Aleck Hill Underground Deposit

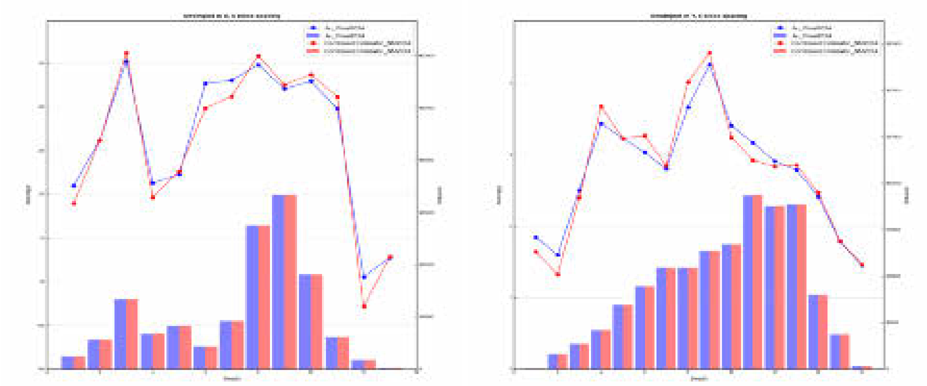


Figure 7-41: Swath Plots – Aleck Hill Underground Deposit

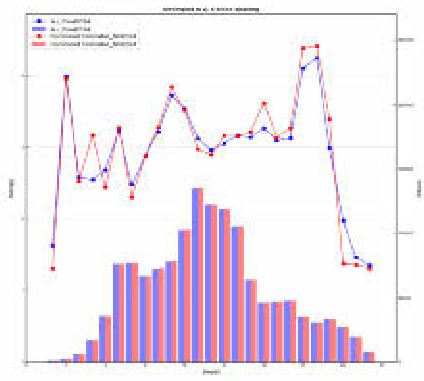

Source: SRK

7.11.4 Aleck Hill Open Pit Area

The swath plots show reasonably good correlation among the estimated OK block grades and the NN block grades where lower grades are observed. At higher grades, such as grades above 1.5 g/t Au at Aleck Hill and Mad Kiss West, the search restriction criteria applied during the OK estimate resulted in lower average grades than the NN estimate. Additionally, the search restriction criteria applied during the OK estimate have reduced the impact of isolated high grades where drill spacing is wide and estimation sample support is low. The swath plots are shown in Figure 7-42 to Figure 7-45.

7.12 Mineral Resource Classification

Mineral resource classification is typically a subjective concept, industry best practices suggest that resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating both concepts to delineate regular areas at similar resource classification.

SRK was satisfied with the classification criteria by SLR for Rory's Knoll and East Walcott Deposits, Mad Kiss Deposit and Aleck Hill Open Pit Area as considering the variogram ranges, drill hole spacing, and continuity of mineralization. For Aleck Hill Underground Deposit, some adjustment was taken considering the reconciliation and the continuity of mineralization.

7.12.1 Rory's Knoll and East Walcott Deposits

Blocks within the Rory's Knoll domain were classified as Measured, Indicated, and Inferred as following criteria：

Measured

Drill hole spacing less than 1/3 of the variogram range

Informed by at least three drill holes

Above -260 mRL

Indicated

Drill hole spacing less than 1/2 of the variogram range

Informed by at least two drill holes

Above -1,400 mRL

Inferred

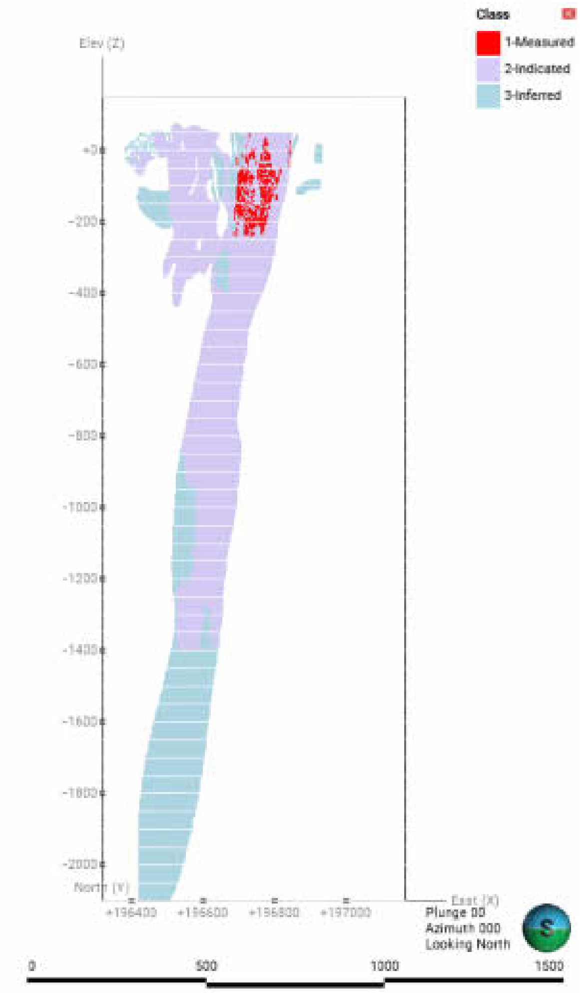
Non-Indicated interpolated blocks below -800 mRL

All interpolated blocks below -1,400 mRL

Within the East Rory's Knoll, East Walcott Hill, and Metasedimentary domains, blocks were assigned to the Indicated category when grade continuity could be established by drill hole spacing of 50 m or less, and the block was informed by at least two drill holes. All other blocks within these domains were assigned to the Inferred category.

Figure 7-46 illustrate classified blocks of Rory's Knoll and East Walcott Deposits in 3D.

Figure 7-46: 3D display Classification of Rory's Knoll and East Walcott Deposits



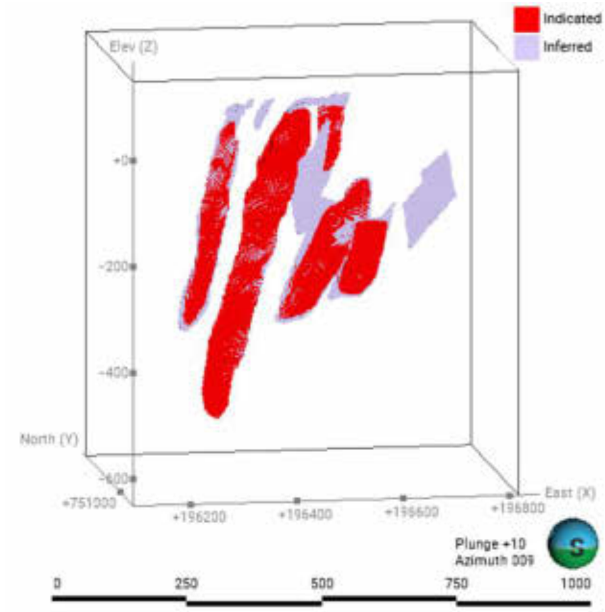
Source: SRK based on the resource model prepared by SLR in 2021

7.12.2 Mad Kiss Deposit

The Resource classification of Mad Kiss was considered that blocks populated during the first pass and informed by at least two drill holes as Indicated Mineral Resources. Additionally, the grade continuity and drill hole spacing of 50 m or less was used to refine the final classification. All other areas of the Mineral Resources were assigned to the Inferred category.

A 3D view of classified blocks is illustrated in Figure 7-47.

Figure 7-47: 3D Display Classification of Mad Kiss Deposit

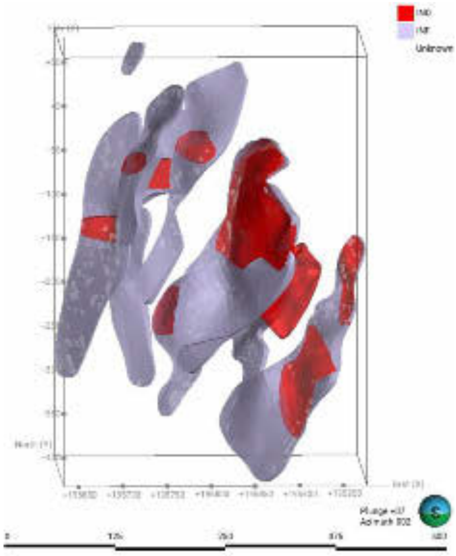


Source: SRK

7.12.3 Aleck Hill Underground Deposit

Blocks coded during the first search pass, drill spacing of approximately 50 m, and located above elevation of -470 m were assigned an Indicated classification. All other blocks were assigned an Inferred category. The 3D display of Aleck Hill underground Deposit is illustrated in Figure 7-48

Figure 7-48: 3D display Classification of Aleck Hill Underground Deposit



Source: SRK

7.12.4 Aleck Hill Open Pit Area

A range of criteria were used in determining an appropriate Mineral Resource classification including:

- Representativeness, quality, and positional accuracy of samples
- Geological continuity and reasonableness of the interpreted mineralized model
- Geostatistical spatial continuity and estimation quality
- Distance from digitized trend surfaces

The main factors typically used in Mineral Resource classification include drill hole spacing, data quality, and geological and grade continuity. Overall, grades are notably higher in the blocks classified as Indicated. Blocks classified as Indicated also show average distances to the informing samples and minimum block distances to the closest sample that are typically half of those observed in the blocks classified as Inferred.

The drill hole spacing is slightly different at each deposit within the Aleck Hill Open Pit Area. The higher-grade deposits with greater potential for economic extraction, such as Aleck Hill and North Aleck Hill, have generally seen tighter spaced drilling. Relatively poor reconciliation between the long-term resource model and the short-term grade control model were the main reason for increasing drilling density using in-pit grade control RC drilling at Aleck Hill, Mad Kiss West, and North Aleck Hill. Smaller areas within these deposits that were drilled as part of this program have a spacing of approximately 5 m to 15 m between holes. Outboard of these tighter spaced areas drilling is typically 30 m across strike by 20 m along strike with spacing typically increasing on the extremities the observed mineralization trends.

As shown by the variogram ranges, the ratio between the major and semi-major axes ranges from 2 to 2.6 across the various deposits of the Aleck Hill Open Pit Area. These areas are all considered to share the same mineralization style discussed earlier in the geological interpretation sub-section of this section. The major axis in this context is oriented down plunge while the semi-major axis is oriented along strike. The along strike distance at the total sill ranges from 25 m to 40 m at the various deposits of the Aleck Hill Open Pit area. The higher end of this range was chosen as the primary criteria for creating an indicated classification shape that uses a 25 m radius from composites flagged as Domain 1, 2, or 3 to assign blocks with the indicated classification at all Aleck Hill Open Pit deposits. The classification shapes take the anisotropy of the mineralization into consideration and are stretched in the down plunge direction. The Inferred classification shapes primarily use a 50 m radius from composites flagged as Domain 1, 2, or 3 to assign blocks with the Inferred classification at all Aleck Hill Open Pit deposits.

The section of Aleck Hill-Mad Kiss West and 3D view of North Aleck Hill, Aleck Hill South & Mad Kiss South and Walcott Hill are illustrated in Figure 7-49.

7.13 Mining Depletion

RK has been the primary focus of open-pit mining and is the largest open pit on the property, and the transition to underground mining is scheduled for mid to late 2026.

The AH open pit is nearing the end of its operations and AH Underground mining began in early 2024.

The MK open pit has already been mined out, and the MK Underground operations commenced in 2023.

The mining depletion cut-off date for the resource report is 31 December 2024.

7.14 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that the Aurora Project is amenable for open pit and underground mining. The assumptions made to determine the cutoffs for the Aurora Mine are shown in Table 7-33 and Table 7-34.

Table 7-33: RPEEE Assumptions for Open Pit Mining

Note:
1. The price refers to the long-term prediction published by Consensus Market Forecasts in December 2024

The Mineral Resource was estimated assuming a long-term gold price of US$2,700/oz. Open pit Mineral Resources were determined from a conceptual pit, designed using Whittle software, The input parameters was summarized by SRK according to the data provided by Aurora Gold Mine.

As of 31 December 2024, the Aurora Mine, at a cut-off grade of 0.3 g/t Au for all deposits to Open pit mining, 1.0 g/t Au for RK and 0.8 g/ for Satellites to underground mining, the Mineral Resources was summarized in Table 7-35, and details resource reports for each deposit are presented from Table 7-36 to Table 7-38.

7.15 Grade Sensitivity Analysis

The mineral resources of the Aurora Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, ore quantities and grade estimates at different cut-off grades are presented from Table 7-39 to

Table 7-42. The reader is cautioned that the figures presented in this table should not be mistaken for a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-50 to Figure 7-53 represent this sensitivity as grade-tonnage curves.

Table 7-39: Global Block Model Quantities and Grade Estimates, Rory's Knoll and East Walcott Deposits at Various cut-off Grades.

Cut-off grade (g/t)	Tonnes ≥ cut-off (millions)	Average grade ≥ cut-off (g/t)	Material Content (t)
0.2	91.1	1.88	171.45
0.3	87.2	1.95	170.48
0.4	83.8	2.02	169.27
0.5	80.2	2.09	167.65
0.6	76.9	2.16	165.85
0.7	73.7	2.22	163.76
0.8	70.4	2.29	161.29

7.16 Exploration Potential and Recommendations

There is potential to supplement the current Mineral Resources with exploration beneath the East Walcott, Mad Kiss, and Aleck Hill satellite deposits. Zijin plans to drill these targets from surface. More efficient drilling will be facilitated from underground as the ramp to access the Rory's Knoll underground deposit advances.

8 Ore Reserve Estimation

8.1 Technical Studies

SRK has received the following technical studies:

- Feasibility Study on Mining Engineering of Aurora Gold Mine in Guyana, conducted by Zijin (Xiamen) Engineering in April 2021 (hereafter referred to as Zijin 2021)
- NI 43-101 Technical Report on the Aurora Gold Mine, conducted by SLR in May 2021, (hereafter referred to as SLR 2021)
- Basic Design Report on the Aurora Gold Mine, conducted by Zijin (Xiamen) Engineering in Jun 2023 (hereafter referred to as Zijin 2023)
- Geotechnical Study on the Aurora Gold Mine (Aleck Hill and Mad Kiss), conducted by Zijin (Xiamen) Engineering in November 2024 (hereafter referred to as Zijin Geotech 2024.

8.2 Open Pit Ore Reserve Estimation

8.2.1 Open Pit Cut-off Grade

SRK estimated an economic cut-off grade to be applied to the resource block model for initiating the open pit mine planning process for the Aurora Gold Mine. The cut-off grade estimates were derived based on a gold price of US$2,200 per ounce and preliminary unit operating costs.

The marginal Cut-off Grade (COG) for gold in the Run-of-Mine feed has been calculated using the following formula.

$$A = \frac{C_p + C_g}{P * P_a * P_r * (1 - R_t)}$$

The parameters used in estimating the COG are detailed in the Table 8-1. The preferred COG value is rounded up to the nearest 0.1 for practical application.

Table 8-1: Open Pit Cut-off Grade Estimate

Item	Parameters	Units	SRK	Basis
P	Gold Price	US$/oz	2,200	CMF
Pa	Doré Gold Payable	%	99.9	SLR NI 43101 Report
Rt	Royalty	%	8	Client
Pr	Process Recovery	%	91.50	Three-year average
Cm	Mining Cost	US$/t mined	2.60	Three-year average
Cp	Processing Cost	US$/t feed	13.4	Three-year average
Cg	G&A Cost	US$/t feed	10.8	Three-year average
A	COG	g/t	0.41	

8.2.2 Modifying Factors

The following modifying factors are used to determine the Ore Reserves.

- Optimization: This includes the most economic pit shell.
- Pit design: The conversion between the optimal pit shell and the practical mine design.
- Dilution and Loss: Mining dilution is estimated at 18% and ore loss is estimated at 5% by Zijin 2023.

8.2.3 Ore Reserve Statement

SRK Consulting has estimated the open-pit Ore Reserves for the Rory's Knoll deposit in accordance with the guidelines outlined in the JORC Code. The Ore Reserve estimates are based on technical studies and operational records deemed to meet the standards of a Pre-Feasibility Study.

The economically mineable portions of Measured and Indicated Mineral Resources within the designed open pits and stopes have been classified as Proved and Probable Ore Reserves, respectively. These estimates include allowances for dilution and mining losses. The reference point for the Ore Reserve estimation is the stockpile preceding crusher feed, consistently applied in alignment with best practices under the JORC Code framework.

As of 31 December 2024, the Rory's Knoll deposit's open-pit Ore Reserves are estimated at 5,030 kt, with an average grade of 2.21 g/t Au, containing 11,138 kg of gold (Au).

As of 31 December 2024, the stockpile Ore Reserves are estimated at 1,436 kt, with an average grade of 0.73 g/t Au, containing 1,053 kg of gold (Au).

Table 8-2: Ore Reserve Statement for open pit at Rory's Knoll deposit as of 31 December 2024

Deposit	Tonnes (Mt)	Au Grade (g/t)	Contained Au Metal (kg)	Contained Au Metal (koz)
Proved Ore	2.16	2.52	5,458	175
Probable Ore	2.87	1.98	5,679	183
Total	**5.03**	**2.21**	**11,138**	**358**

Note:

1. The information in this report which relates to Ore Reserve is based on information compiled by Ms Shan Chuang and Mr Falong Hu, who are full-time employees of SRK Consulting China Ltd. Ms Chuang is a Member of AusIMM and Mr Falong Hu is a Fellow of AusIMM. Both Ms Chuang and Mr Falong Hu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms Shan Chuang and Mr Falong Hu consent to the reporting of this information in the form and context in which it appears.
2. Ore Reserves are constrained within an open pit design that uses the following assumptions: a gold price of US$2,200/oz; gold recoveries 91.5%; a reference mining cost of $2.6/ton mined in-situ; processing costs of $13.4ton ore processed; G&A costs of $10.8/ton ore processed; royalty of 8%; and pit overall slope angles ranging from 25–31° for saprolite and ranging from 40-46° for hard rock.
3. Ore Reserves are reported at a cut-off grade 0.41g/t.
4. Numbers have been rounded and may not sum precisely.

5. Mining dilution (waste rock and inferred Mineral Resources) rate is 5%. Mining loss rate is 18%.
6. The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

Table 8-3: Ore Reserves Estimate of the Mined Stockpile as of 31 December 2024

Deposit	Tonnes (Mt)	Au Grade (g/t)	Contained Au Metal (kg)	Contained Au Metal (koz)
Proved Ore				
Probable Ore	1.44	0.73	1,053	34
Total	**1.44**	**0.73**	**1,053**	**34**

Source: AGM

Note:

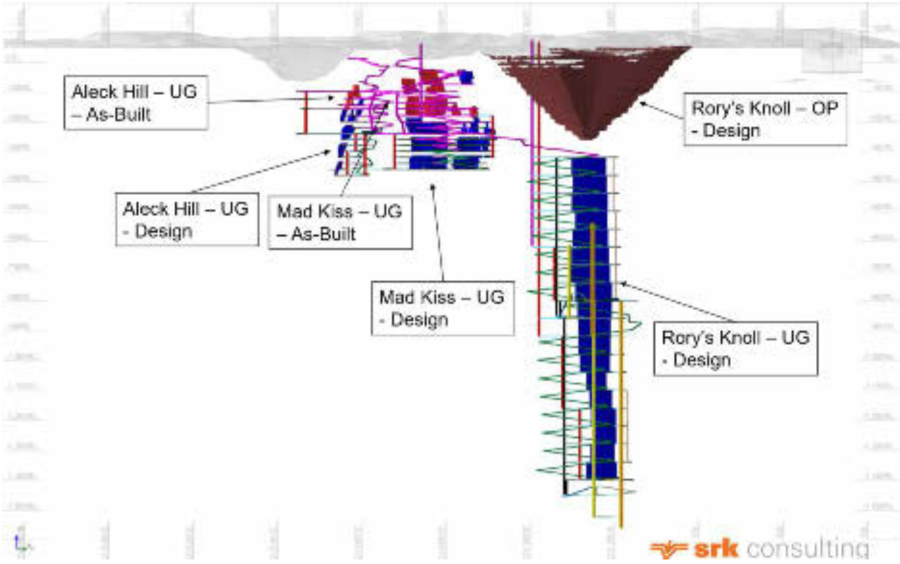
1. Ore Reserves are reported at the point of delivery to the processing plant, using the 2019 CIM Definition Standards, with an effective date of 31 December 2024.
2. The information in this report which relates to Ore Reserve is based on information compiled by Ms Shan Chuang and Mr Falong Hu, who are full-time employees of SRK Consulting China Ltd. Ms Chuang is a Member of AusIMM and Mr Falong Hu is a Fellow of AusIMM. Both Ms Chuang and Mr Falong Hu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms Shan Chuang and Mr Falong Hu consent to the reporting of this information in the form and context in which it appears.
3. The mined stockpile contains the mined ore for both UG and OP.
4. The information in this Report which relates to the Stockpile Ore Reserve is based on information provided by the Client.

8.3 Underground Ore Reserve Estimation

In terms of mining operations, all underground mine is designed to utilize mechanized rubber-tired equipment with decline accesses to reach the deposits. At Rory's Knoll, an additional vertical shaft will be constructed, extending down to the -840 mRL Additionally, winzes will be developed from this -800 mRL to -1550 mRL support mining activities. The mining method for Rory's Knoll is the Modified sub-level stoping mining method, which will be complemented using tailing paste fill to enhance stability and efficiency. The mining method for Aleck Hill and Mad Kiss is the Sub-level open stoping method with sill pillars and rib pillars.

Moreover, Rory's Knoll and Mad Kiss share an access portal, allowing for more streamlined and efficient access to their respective deposits. Similarly, Aleck Hill will utilize a shared ventilation shaft, further optimizing resource utilization and reducing operational costs.

Figure 8-1: Schematic View of Underground Deposits



Source: SRK

8.3.1 Underground Cut-off Grade

The cut-off grades for the Rory's Knoll, Aleck Hill, and Mad Kiss are presented in Table 8-4. Key considerations include:

- Price: The gold prices are dynamic and are derived from consensus market forecasts (CMF) provided by the Energy and Metals Consensus Forecast, published by Consensus Economics Inc., to which SRK subscribes annually.
- Cost: mining, processing, general/administrative (G&A) are based on average historical three-year cost. Rory's Knoll cost included cement backfill cost.

The marginal Cut-off Grade (COG) for gold in the Run-of-Mine feed has been calculated using the following formula.

$$A = \frac{C_p + C_g + C_m}{P * P_a * P_r * (1 - R_t)}$$

The parameters used in estimating the COG are detailed in the Table 8-4. The preferred COG value is rounded up to the nearest 0.1 for practical application.

Table 8-4: Underground Ore Reserves Cut-Off Grade

Item	Parameters	Unit	Rory's Knoll	Aleck Hill and Mad Kiss	By Product

8.3.2 Modifying Factors

Underground Stope Optimization

The Deswik Shape Optimizer™ ("SO") module was used on the Mineral Resource block model to generate mineable shapes. These shapes were subsequently used to refine and enhance the proposed design. Once the preliminary stopes were generated, an economic assessment was performed to eliminate any uneconomical ones, based on factors such as development and mining costs. The parameters used in the SO module are summarized in Table 8-5. Table 8-6 provides additional key design parameters.

Table 8-5: SO Parameters for Underground Mining

Parameters	Rory's Knoll		Aleck Hill and Mad Kiss	
	Units	Value	Units	Value
Default Density	g/t	2.8	g/t	2.8
COG	g/t	1.3	g/t	1.1

Underground Dilution and Extraction

Dilution

Stope dilution includes both planned and unplanned dilution. At Rory's Knoll, where the deposit is currently not in production, the dilution is derived from Zijin feasibility study (2023), indicating a total dilution of approximately 20%. The hanging wall and the footwall, both set at 0.1 meters, contribute to a planned dilution of 15%. The remaining 5% accounts for unplanned dilution.

In contrast, the Aleck Hill and Mad Kiss deposits are active production mines with a total dilution of roughly 28%. The hanging wall and the footwall both set at 0.3 meters, account for a planned dilution of 26%, with unplanned dilution at 2%.

Mining Loss

The estimated mining loss for Rory's Knoll, where the deposit is currently not in production, a total loss of 10% is derived from Zijin 2023. The total loss include planned ore loss and unplanned ore loss. For the Aleck Hill and Mad Kiss deposits, the ore loss is 10% based on production data. SRK is using the stope parameters derived from Zijin Geotech 2024 (2024), which is summarized in Table 8-7.

Table 8-7: Ore loss based on the depth and stope paramters

Mine	Level mRL	Length m	Width m	Sill Pillar m	Rib Pillar m	Ore Loss By Sill pillar and Rib pilla %	Stope Height m
Mad Kiss	>-240	<60	<15	6		0.10	60

8.3.3 Underground Ore Reserve Statement

SRK Consulting has estimated the underground Ore Reserves for the Rory's Knoll, Aleck Hill, and Mad Kiss deposits in accordance with the JORC Code guidelines. These Ore Reserve estimates are supported by technical studies and operational data, which are considered to meet the standards of a Pre-Feasibility Study.

The economically mineable portions of Measured and Indicated Mineral Resources within the designed underground stopes have been classified as Proved and Probable Ore Reserves, respectively, including allowances for mining dilution and losses. The reference point for the Ore Reserve estimation is the stockpile preceding crusher feed, in compliance with best practice under the JORC Code framework.

As of 31 December 2024, the underground Ore Reserves for the Aleck Hill deposit is estimated at 458 kt, with an average grade of 3.09 g/t Au, containing 1,414 kg of gold (Au).

As of 31 December 2024, the underground Ore Reserves for the Mad Kiss deposit is estimated at 6,74 kt, with an average grade of 2.56 g/t Au, containing 1,728 kg of gold (Au).

As of 31 December 2024, the underground Ore Reserves for the Rory's Knoll deposit is estimated at 26,442 kt, with an average grade of 2.20 g/t Au, containing 61,490 kg of gold (Au).

These reserves are all classified as Probable Ore Reserves, with a summary by deposit provided in Table 8-8.

Table 8-8: Ore Reserves Estimate of the underground deposit as of 31 December 2024

Deposit	Tonnes	Grade	Contained Au Metal	Contained Au Metal
	(Mt)	(g/t Au)	(kg)	(koz)
Aleck Hill				
Proved	-	-	-	-

Source: SRK

Note:

[1] The information in this report which relates to Ore Reserve is based on information compiled by Ms Shan Chuang and Mr Falong Hu, who are full-time employees of SRK Consulting China Ltd. Ms Chuang is a Member of AusIMM and Mr Falong Hu is a Fellow of AusIMM. Both Ms Chuang and Mr Falong Hu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms Shan Chuang and Mr Falong Hu consent to the reporting of this information in the form and context in which it appears.

[2] Ore Reserves are constrained with in an underground design that uses the following assumption: a gold price of US$2,200/oz; gold recoveries 91.5%; G&S costs of $10.8/ton ore processed; the stope dimension of Aleck Hill and Mad Kiss is 60m (heigh, 20m in sublevel) * 10m (length) * vein width (large than 2m), and dimension of Rory's Knoll is 60m (height) * 50m (length) * 15m (width)

[8] Underground Ore Reserves are estimated at a cut-off grade of 1.3 g/t Au for Rory's Knoll, 1.1 g/t Au for Mad Kiss and Aleck Hill.

[9] The ore reserves include by product ore, with a cut-off-grade of 0.41 g/t Au

[10] Mining Stope include the by producte ore from Cross cut

[11] The minable shapes optimization exclude the mineout area

[12] Numbers have been rounded and may not sum precisely.

[13] For Rory's Knoll deposit, the mining dilution (waste rock and inferred Mineral Resources) rate is 20%. Mining loss rate is 10%.

[14] For Aleck Hill and Mad Kiss deposit, the mining dilution (waste rock and inferred Mineral Resources) rate is 28%. Mining loss rate is 10%.

9 Mining and Ore Reserve Estimates

9.1 Mine Operating Status

The Aurora Gold Mine (AGM) was constructed by Guyana Goldfields Inc. (GGI) in 2014, with a designed processing capacity of 7,500 tonnes per day (tpd). Commercial production began on January 1, 2016. In August 2020, the ownership of AGM was transferred to Zijin, which subsequently initiated the development of an underground mining operation while continuing the open-pit operations. The underground mine commenced production in June 2022, complementing the existing open-pit activities. A summary of the historical production data is provided in Table 9-1 .

As of early 2025, the completion of a processing plant upgrade is expected to increase the processing capacity from 7,500 tpd to 10,000 tpd.

Table 9-1: Aurora Mine Historical Production

Mining Method	type	Unit	2021	2022	2023	2024

9.2 Open pit

9.2.1 Hydrogeology

The groundwater hydrology of Rory's Knoll, particularly its interaction with the nearby Cuyuni River, was extensively analyzed by Itasca Consulting Group, Inc. as part of the SLR (2021) study. In 2021, Itasca was commissioned to model groundwater flow and estimate inflow rates to support mine planning. The results confirmed no direct hydraulic connection between the Cuyuni River and the open pit, thereby validating the groundwater flow model. Itasca's recommendations included the installation of dewatering wells within the shear zone of the Rory's Knoll pit, the use of piezometers to monitor groundwater levels, the mapping of seepage areas, and the measurement of water volumes pumped from the pit.

9.2.2 Geotechnical Conditions

According to SLR (2021), the slope design for the Rory's Knoll pit is based on geotechnical analyses carried out by Call and Nicholas, Inc. (CNI) in 2018, 2019, and 2020, with subsequent revisions incorporated into the final design. The slope recommendations for the Rory's Knoll final pit are presented in Figure 9-1 and detailed in Table 9-2.

9.2.3 Mine Design and Planning

Pit Optimization

Block Model

The mine design and resource estimation within the pit design were based on mineral resource model (MRM) developed by SRK China, with an effective date of 31 May 2025. The model was provided in Surpac™ (.mdl) format.

Key parameters of the block model are outlined in Table 9-3 below. SRK converted the MRM to a Mining Block Model (MBM) in Block Geomodel (.gmdlb) format for mine planning purposes in Deswik™.

Table 9-3: Resource Block Model Parameters

Range	Min	Max
Easting	195,228	197,178
Northing	750,135	752,005
Elevation	-2,110	120

Optimization Inputs Parameters

The first step in transforming a Mineral Resource into a mineable open pit Ore Reserves involves the process of open pit optimization. At this stage, the physical, technical, and economic parameters are applied to the orebody to determine the optimal geometry for the open pit excavation. If the economic assessment of this optimal pit shell is positive, the resulting pit shell can be used as a reference for the subsequent pit design process.

SRK utilized the Whittle™ software for open pit optimization. In general terms, Whittle ™ adjusts the base input price by a range of revenue factors ("RF"), both above and below a base value of 1. For each RF, Whittle ™ generates a three-dimensional shape pit shell, that maximizes the value based on all input parameters and the adjusted price. Lower RF produce smaller shells, while higher RF result in larger shells. This approach creates a series of 'nested' shells, with each shell contained within the next larger one.

A summary of the pit optimization parameters is presented in Table 9-4.

Table 9-4: Pit Optimization Parameters

Optimization Parameter	Unit	SRK	Note
Revenue and selling costs

Pit Optimization Results

A series of nested pit shells were generated based on a range of RF on gold prices. Preliminary cash flows were estimated using a 10% discount rate and a nominal gold price of US$2,200/oz. The results of the pit optimization are detailed in Table 16 5.

Three optimization scenarios were automatically generated by WhittleTM software:

- Best case: Each of the pit shells is mined sequentially, one after the other.
- Worst case: The final pit is mined bench by bench.
- Specified case: This scenario is based on predefined pushback geometries.

In the specified case, the highest discounted cash flow was Pit shell 29 and was selected as the basis for pit design as it is close to the economic maximum. This shell has a total tonnage of 41,921 kt, including 5,098 kt of ROM.

A pit-by-pit graph of the Measured and Indicated Mineral Resource is shown in Table 9-5.

Table 9-5: Whittle Pit Optimization Results for Rory's Knoll pit

Pit Shell	Best Case (US$M)	Worst Case (US$M)	Specified Case (US$M)	Total (kt)	Ore (kt)	Waste (kt)	Strip Ratio (t/t)

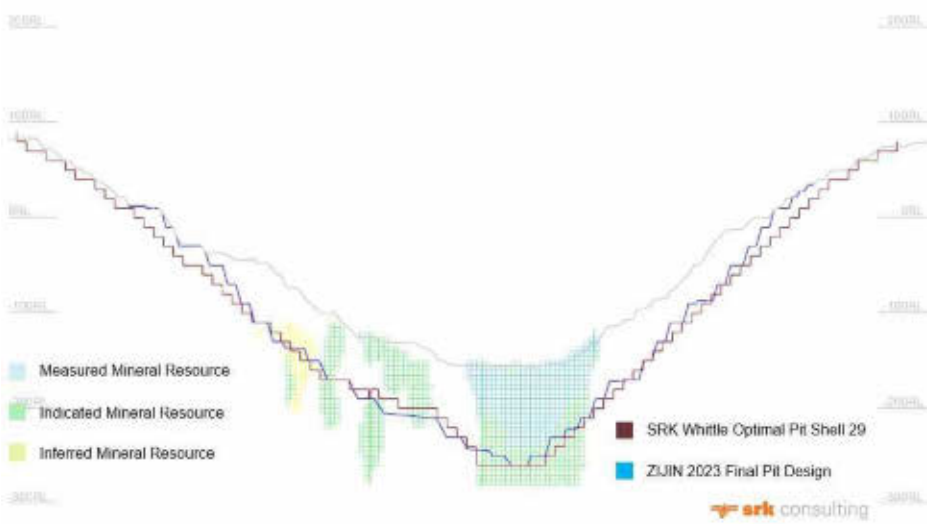
Mine Design

ZIJIN 2023 Final Pit Design versus SRK Whittle Pit Shell

SRK has compared the final pit design prepared by ZIJIN in 2023 with the Whittle optimal pit shell, as shown in Figure 9-3.

The ZIJIN 2023 final pit design closely correlates with SRK's optimal pit shell, influenced by the presence of a dyke in the northern section of Rory's Knoll. Furthermore, with underground operations planned to commence, the base level of the open pit has been limited to -260 meters relative level (mRL) to ensure the preservation of a crown pillar, necessary for the stability of the underground workings.

Figure 9-3: Comparison between SRK Whittle Pit Shell 23 and FS 2024 Final Pit Design



Source: Zijin 2023 and SRK

ZIJIN 2023 Pit Design

Based on ZIJIN 2023, the design ramp parameter is as follow:

- Ramp Grade: 9%
- Ramp Width (single lane): 10 m
- Ramp Width (double lane): 16 m

Single-lane ramps are implemented at the pit bottom when the benches begin to narrow, and mining rates are significantly reduced.

Figure 9-4 shows the final pit design and Table 9-6 shows the summary of pit design parameters.

Mining Methods

The mining operation is designed as a conventional truck-and-shovel system, operating continuously 24 hours per day, year-round, and organized into three shifts. The project will utilize a contractor-based approach to ensure access to specialized expertise and maximize operational efficiency.

Drilling will be conducted using the TAIYE-370 down-the-hole (DTH) drill, featuring a hole diameter of 165 mm. Blasting will employ a delayed non-electric initiation system and emulsion explosives. The bench height is designed at 10 meters, with double benching extending to 20 meters where applicable.

Material haulage will be carried out along properly designed haul roads, with gradients optimized for safe and efficient movement. Double-lane haul roads, with widths of 14 meters, will serve the main transportation pathways, while single-lane roads, 10 meters in width, will provide access to the pit bottom. The maximum road gradient is set at 9% to ensure safety and haulage efficiency.

Mining Equipment

Blasted material will be loaded into trucks using 5.2 m^3 hydraulic excavators and transported using haul trucks with a capacity of 65 tonnes. The Aurora Gold Mine (AGM) has compiled and provided a detailed list of primary and ancillary equipment, which is summarized in Table 16-7.

Table 9-7: Primary and Ancillary Equipment List

Waste Rock Dump Design

Two waste rock storage facilities (WRSFs) are located in proximity to the ultimate pit boundaries, as illustrated in Figure 9-5.

The East WRSF is situated approximately 1 km southeast of the Rory's Knoll open pit, with elevations ranging from 50 mRL to 118 mRL and a designed storage capacity of 37.4 million m^3. The West WRSF is positioned near the west side of the North Aleck Hill open pit and the northwest side of the Aleck Hill open pit, with elevations ranging from 50.00 mRL to 150.00 mRL and a designed storage capacity of 27.6 million m^3.

Figure 9-5: Waste Rock Storage Facilities

9.2.4 Mine Production Plan

The Life of Mine (LoM) production schedule for Rory's Knoll has been developed using Deswik software, based on the open pit design provided by Zijin. The Deswik software suite facilitates detailed production planning by aggregating the pit inventory according to stages, benches, and predefined grade bins, enabling the prioritization of early gold production to optimize economic returns.

The open-pit production plan for Rory's Knoll, as outlined in Table 16.24, has been designed by SRK Consulting in alignment with the Aurora Gold Mine (AGM) planning framework. A strategic crown pillar has been incorporated beneath the pit to ensure stability and eliminate the need for complex coordination between open-pit and underground mining operations. The open-pit production schedule is presented in calendar years, with mining operations scheduled to commence in January 2025.

Operating Schedule and Production Capacity

The schedule is organized on an annual basis, and the following key assumptions were applied during production planning:

- Only blocks classified as Measured and Indicated Mineral Resources with a gold grade above 0.41 g/t were considered and considered as ROM.
- Blocks classified as Inferred Mineral Resource or those with a gold grade below 0.41 g/t were designated as waste.
- A conceptual pushback was planned to guarantee an early supply of ROM.

- The maximum annual total material movement is capped at 15,000 ktpa.
- The vertical lag between mining phases is restricted to a maximum of 9 benches.

Production Plan and LoM

The results of the production scheduling are summarized in Table 9-8 and Figure 9-6. The LoM is estimated at 4 years, commencing in January 2025. The total ROM tonnage is 5,030 kt, with an average gold grade of 2.21%, yielding a contained gold metal total of 11,138 kg. The total waste material is estimated at 24,972 kt, resulting in an average stripping ratio of 4.96.

Table 9-8: Annual Mine Production Schedule for Rory's Knoll Pit

Item	Unit	LoM	2025	2026	2027
ROM	Mt	5.02	1.80	1.94	1.28
ROM Au Grade	g/t	2.22	1.97	2.25	2.52
ROM Au Metal	kg	11,151	3,534	4,380	3,238

9.3 Underground

9.3.1 Hydrogeology

For hydrogeology in this chapter, refer to Section 9.2.1.

9.3.2 Geotechnical Conditions

Aleck Hill and Mad Kiss

In late 2024, SRK received a geotechnical study conducted by the Zijin Research Institute, which focused on evaluating the dimensions of rib pillars and sill pillars for the Aleck Hill and Mad Kiss deposits. A summary of the study is provided below.

Rock Mass Quality

The geotechnical study included laboratory testing to determine the mechanical properties of the orebody and surrounding rock. The following tests were performed:

- Rock density test.
- Uniaxial compressive strength test (including compression deformation characteristics).
- Tensile strength test (using the splitting method).
- Shear strength test.

The results of the rock mechanics tests for Aleck Hill and Mad Kiss are presented in Table 9-9 and Table 9-10.

Table 9-9: Rock Mechanics Test Result (Aleck Hill)

Lithology	Unit Weight γ (t/m³)	Uniaxial Compressive Strength σc (MPa)	Tensile Strength σt (MPa)	Elastic Modulus E (GPa)	Poisson's Ratio μ	Cohesion c (MPa)	Internal Friction Angle ϕ (°)	Remarks

Rock Mass Quality Classification and Evaluation

The Zijin geotechnical study evaluated rock mass quality using three classification systems: RQD, RMR, and Q-system. The evaluation results are summarized as follows and are presented in the Table 9-11 and Table 9-12.

Aleck Hill

- Dominated by mafic volcanics with a massive rock structure.

- Strongly altered mafic volcanics are classified as Class II rock mass, characterized as moderately strong rock with good rock mass quality.
- The hanging wall and footwall mafic volcanics, as well as the mafic volcanic orebody, are also classified as Class II rock mass, characterized as strong rock with good rock mass quality.
- Mad Kiss
- Composed primarily of mafic volcanics and quartz-feldspar porphyry, with a massive rock structure.
- Strongly altered mafic volcanics and the hanging wall mafic volcanics are classified as Class II rock mass, characterized as moderately strong rock with good rock mass quality.
- The footwall mafic volcanics and quartz-feldspar porphyry (orebody) are classified as Class II rock mass, characterized as strong rock with good rock mass quality.

Table 9-11: Summary of Classification Results (Aleck Hill)

Classification Method	Item	Mafic Volcanic (Strongly Altered)	Mafic Volcanic (Upper Disk)	Mafic Volcanic (Lower Disk)	Mafic Volcanic (Ore Body)

Table 9-14: Stope Design Parameter (Aleck Hill)

	Orebody Thickness < 15m, Strike Length < 70m	Orebody Thickness < 15m, Strike Length > 70m	Orebody Thickness 15-40m
Block Height (m)	60	60	60
Stope Length (m)	<70	40-70	<40
Stope Width (m)	5, 10, 15	5, 10, 15	10, 15, 20
Sill Pillar Height (m)	4, 6, 8	4, 6, 8	6, 8, 11
Rib Pillar Width (m)	No	Yes	Focus on controlling the exposed area of the hanging wall.

	Orebody Thickness < 15m, Strike Length < 70m	Orebody Thickness < 15m, Strike Length > 70m	Orebody Thickness 15-40m
Notes	If strike length less than 40 m, no rib pillar, if the strike length between 40 to 70 m, operational Controls for Stope when third level stoping,	Control hanging wall and crown exposure areas by retaining low-grade zones or waste rock as inter-panel pillars to reduce unsupported spans.	Minimize tensile stress concentrations and mitigate potential instability risks associated with large exposed surfaces.

Source: Zijin Geotech Study (2024)

Numerical Simulation

The FLAC3D software was used to simulate the stope structure parameters. The orebodies of Aleck Hill and Mad Kiss have a maximum length of approximately 100m. The Mad Kiss orebodies are independent and spaced no less than 15m apart, while the Aleck Hill orebody is parallel and separated by at least 6m of rock. Through comprehensive analysis of displacement, stress, and plastic zones, the following conclusions were as below:

- Roof Thickness Parameters
  - After stope extraction, stress concentration is significant, especially with thin roofs, long stopes, or great mining depths. During mining at the -240m to -360m levels, roofs with a thickness of 6m will suffer instability and failure. For stopes with lengths of 40-80m, the roof thickness should not be less than 8m, and for stopes with lengths of 80-100m, the roof thickness should not be less than 10m. At the -360m to -480m levels, roofs with thicknesses of 6m and 8m will suffer instability and failure, and the roof thickness for stopes with lengths of 40-100m should not be less than 10m. Longer stopes require thicker roofs to effectively support the surrounding rock of the hanging and footwalls.
- Stope Length Parameters
  - As the length or mining depth of the stope increases, the tensile stress on the surrounding rock of the hanging and footwalls increases during stope extraction. At the -240m level, sporadic collapses occur in the surrounding rock of stopes with lengths of 40m. For stopes with lengths of 60-100m, small-area collapses are predicted in the surrounding rock of the hanging and footwalls. At the -300m level, stopes with lengths of 40-100m will experience increased tensile stress in the surrounding rock of the hanging and footwalls, potentially leading to large-area collapses, which is detrimental to stope stability and mining safety, especially for longer orebody lengths. To control the tensile stress and exposed area of the surrounding rock, the orebody is typically divided into stopes and pillars, using pillars to support the surrounding rock. Therefore, the following simulates and analyses the stability of stopes and pillars when the orebody length exceeds 80m at the middle levels.

Based on the above analysis, it is concluded that for orebodies at the -360m to -480m levels with lengths exceeding 80m, when divided into stopes and pillars, with stope lengths of 40m, to avoid overall failure and instability of the rib pillar and sill pillar, the rib pillar width and sill pillar height should not be less than 10m. For stope lengths of 50m, to ensure no overall failure and instability of the rib pillar and sill pillar, dimensions greater than 10m are required.

Geotechnical Results

To determine optimal stope geometry parameters for Aleck Hill and Mad Kiss, the geotechnical study recommend the following recommendations:

- Mad Kiss Stope (thickness<15m, length<100m):
  - Above -240m: Maintain stope length≤100m with sill pillar height≥6-8m.
  - Below -300m: Increase sill pillar height to 8-10m. Stopes exceeding 80m require 8m-wide rib pillars to prevent large-scale collapses.
  - Critical depth thresholds show 60m and 100m as pivotal length limits requiring progressive reinforcement measures.
- Aleck Hill Stope (variable thickness up to 20m):
  - Shallow zones (-240m): 70m maximum length with 6-8m sill pillar. Longer deposits require 8m-wide low-grade rib pillars.
  - Intermediate depth (-300~-360m): 10m sill pillar for 40-70m stopes.
  - Deep zones (-360~-480m): Increase the height of sill pillar to 10-12m.
  - Thick ore sections (>15m) mandate systematic low-grade rib pillar placement regardless of depth.

Rory's Knoll

Rock Mass Quality

The Zijin study in 2023 conducted the laboratory tests on the mechanical properties of the ore body and surrounding, which is summarized in Table 9-15.

Table 9-15: Rock Mechanics Test Result (Rory's Knoll)

Mine	Lithology	Average density (t/m3)	Number of uniaxial compression tests	Uniaxial compressive strength (Mpa)	Foliation uniaxial compressive strength (Mpa)	Young's modulus (Gpa)	Poisson's ratio	Average tensile strength (Mpa)
RK	Tonalite	2.85	7	150	70	74	0.21	10
	Sericite schist (shear zone)	2.8	24	105	35	31	0.34	7
	Mafic metamorphic volcanic rock	2.8	28	125	70	65	0.18	10
	Interbedded metamorphic sedimentary rock and mafic volcanic rock	2.75	21	110	45	66	0.27	12

Source: Zijin Study (2023)

Rock Mass Quality Classification and Evaluation

According to Table 9-16, all rock masses have RQD values ranging from 94% to 98%, indicating excellent rock mass integrity. The uniaxial compressive strength of the rock mass is significantly greater than the uniaxial compressive strength of the joints.

Table 9-16: Summary of Classification Results (Rory's Knoll)

Lithology	Average intact strength (MPa)	Average foliation uniaxial compressive strength (MPa)	RQD (%)	Q	RMR_{90}	Rock mass	MRMR	Joint spacing FF (m)
Metasedimentary rocks and interbedded mafic volcanic rocks	110	45	94	7.5～18.0	65～70	Good	69	1.4
Sericite schist (shear zone)	105	35	96	4.0～5.9	55～60	Fair	60	1.8
Tonalite diorite	150	70	98	7.5～18.0	70～75	Good	68	1.4
Mafic metamorphic volcanic rocks	125	70	97	7.5～18.0	65～70	Good	69	0.9

Source: Zijin Study (2023)

Geotechnical Results

The hydraulic radius is the ratio of the surface area of the exposed excavation face to its perimeter, reflecting the size and shape of the stope. It can be used to verify the rationality of stope parameters in the mining method design by comparing with the stable hydraulic radius and caving hydraulic radius determined through modified stability graph methods.

Rory's Knoll is using modified sub-level stoping mining method with tailings paste backfill. The stope has a sublevel height of 60 meters and is arranged perpendicular to the orebody strike. Based on the Zijin study in 2023, The stope width of 15 meters meets stability requirements.

Table 9-17: Stope Design Parameter (Rory's Knoll)

Location	Stope Width (m)	Stope Length (m)	Stope Height (m)	Design hydraulic radius (m)	Stable hydraulic radius (m)	Cavitation hydraulic radius (m)
Hanging Wall	15		60	6	12.7	15.8
Roof	15	50		5.77	5.9	7.2
Side Wall		50	60	13.6	9.9	12.6

Source: Zijin Study (2023)

9.3.3 Mine Design

The design parameter is based on the 2023 Zijin study, which has been summarized by SRK as follows:

- Rory's Knoll Deposit
  - Structural Geometry: Cylindrical steep-dipping orebody (dip ≈70 – 80°)
  - Diameter: 250 m
  - Vertical extent: >2,000 m below surface (current resource terminates at -2,000 mRL)
  - Depth: -320 ~ -2000 m
- Aleck Hill Deposit
  - Structural Geometry: Steeply dipping lenticular orebody with dip angle >60°
  - Strike length: 200 m
  - Width variability: 2.5–20 m (true thickness)
  - Vertical mining interval: 400 m (designed stopes)
  - Depth: -100 ~ - 480m
- Mad Kiss Deposit
  - Structural Geometry: Steeply dipping lenticular orebody (dip >70°)
  - Strike length: 300 m
  - Width variability: 3–21 m (true thickness)
  - Vertical mining interval: 450 m (designed stopes)
  - Depth: -30 ~ - 360m

The initial mining operations will focus on Aleck Hill and Mad Kiss due to their relatively shallow depths, facilitating early access and extraction. The development of Rory's Knoll will be conducted in two phases. Phase 1 will target the depth range from -320 m to -800 m Relative Level (RL), while Phase 2 will extend further to depths ranging from -800 m to -1400 m RL.

9.3.4 Mining Methods

Rory's Knoll

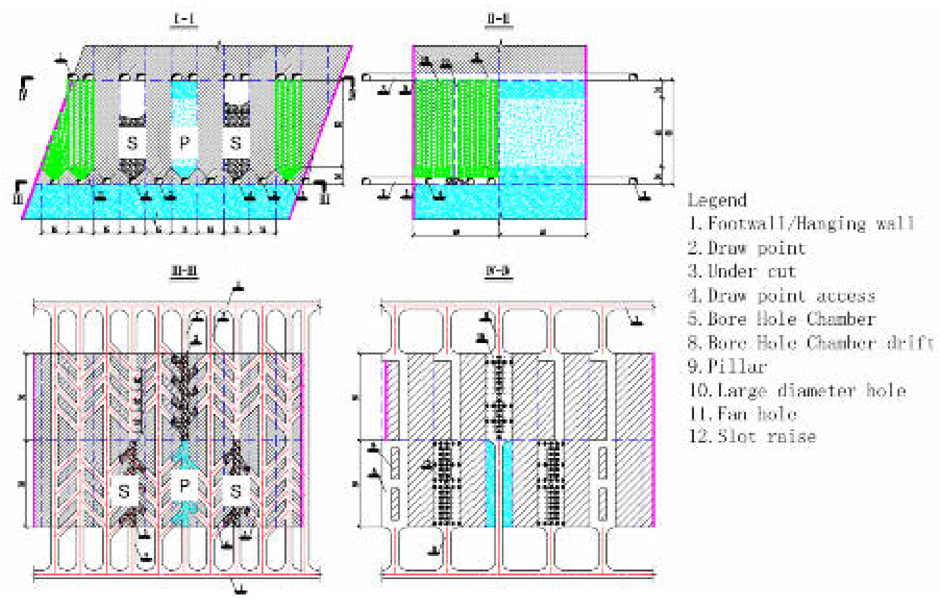
Rory's Knoll is planned to be mined using a modified sub-level stoping method with tailings paste backfill. This method has been chosen to achieve a target production rate of 10,000 tonnes per day (tpd), while minimizing ground disturbance and maintaining geotechnical stability. The design incorporates 60-meter level intervals to optimize extraction efficiency, with a 40-meter crown pillar planned for stability between the open pit and the underground operations.

Stopes are oriented in a northeast-southwest direction, with each stope designed to dimensions of 50 meters in length, 15 meters in width, and 60 meters in height. To achieve the target production rate, Phase 1 will involve the concurrent operation of multiple stopes across several levels. Mining will follow a bottom-up sequence to ensure safe extraction and to preserve overall ground stability.

Primary stopes are prioritized in areas of higher-grade ore, greater thickness, or more favorable geological conditions in order to maximize the extraction of high-value ore while establishing a stable foundation for subsequent mining activities. Upon completion of the extraction of primary stopes, backfilling is immediately undertaken to ensure ground stability, prevent wall collapse, and create a secure environment for mining secondary stopes. Mining in secondary stopes will only commence once the backfilling of adjacent primary stopes has been completed. This staggered sequence minimizes ground disturbance and reduces the risks of geotechnical hazards, such as rock bursts or roof falls.

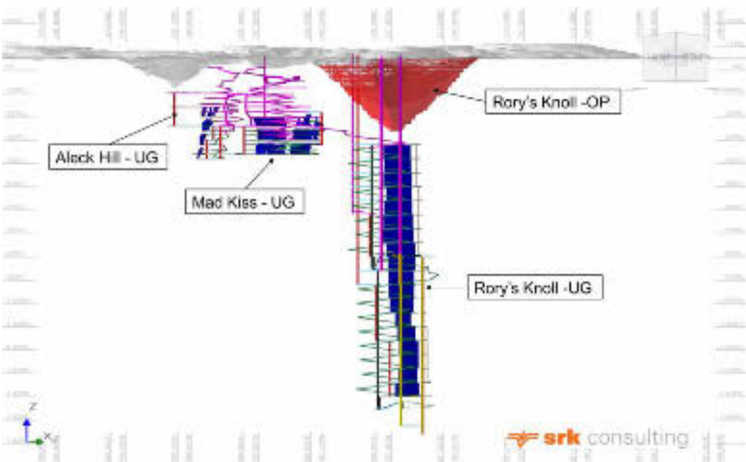
As shown in Figure 9-7 , the level development design includes hanging wall and footwall drifts excavated along the respective sides of the orebody. These drifts provide critical infrastructure for mining activities, including ventilation, material haulage, and personnel movement. Crosscuts are developed to connect the hanging wall and footwall drifts, forming the foundation for stope development. Stopes are extracted from the crosscuts towards the drifts, enabling efficient ore removal and material handling. The orientation of drifts and crosscuts is carefully aligned with the geometry of the orebody, minimizing waste development and maximizing operational efficiency. Isometric views of Rory's Knoll, illustrating the planned layout, are presented in Figure 9-8.

Figure 9-7: Schematic View of Rory's Knoll



Source: Zijin 2023

Figure 9-8: Isometric view of Rory's Knoll



Source: SRK

Aleck Hill and Mad Kiss

The Aleck Hill and Mad Kiss deposits exhibit favorable rock mass conditions and geometries that are well-suited for sublevel open stoping without backfill. To minimize mining costs while maintaining stope stability, these deposits have been designed to utilize open stoping with sill pillars and rib pillars. This approach capitalizes on the strong geotechnical characteristics of the rock mass, optimizing pillar dimensions to achieve an effective balance between ore recovery and ground control.

The design is based on the geotechnical study conducted by Zijin Geotech study 2024, which provided detailed rock mass conditions and stability requirements for pillar design. Table summarizes the key geotechnical parameters used to determine the optimal dimensions for stopes, sill pillars, and rib pillars.

- Geotechnical Characteristics
  - Average Rock Quality Designation (RQD): ~92%
  - Average Rock Mass Rating (RMR): ~76
  - Average Tunnelling Quality Index (Q'): ~23

Table 9-18: Dimensions of the Stope, Sill Pillar and Rib Pillar

Mine	Level (mRL)	Length (m)	Width (m)	Sill Pillar (m)	Rib Pillar (m)	Stope Height (m)
Mad Kiss	>-240	<60	<15	6		60
	>-240	60-100	<15	8		60
	-300 ~ (-360)	<60	<15	8		60
	-300 ~ (-360)	60-100	<15	10		60

	-300 ~ (-360)	<40	>15	10	8	60
	-300 ~ (-360)	40-70	>15	10	8	60

Source: Zijin Geotech 2024

The sublevel open stoping method is highly selective and productive, making it suitable for deposits with varying ore thicknesses and steeply dipping geometries. The steep dip of the deposits allows gravity to assist in ore movement, enhancing efficiency and reducing reliance on mechanical equipment. Blasted rock is designed to fall into supported drawpoints or be extracted using Load-Haul-Dump (LHD) equipment. The layout includes a footwall drift running parallel to the orebody, providing primary access for ore transport, ventilation, and personnel movement. Crosscuts are driven perpendicular to the orebody's strike, connecting the footwall drift to the stopes and facilitating efficient ore extraction in a transverse stoping configuration.

Isometric views of Mad Kiss and Aleck Hill are presented are shown in Figure 9-9 and Figure 9-11, respectively.

9.3.5 Development

Mine Access

Rory's Knoll

Phase 1: Initial Access Infrastructure

The initial access infrastructure for the underground mine consists of a dual-entry system, which includes a decline from the Mad Kiss deposit and the #1 vertical cage shaft extending from 64 mRL to -915 mRL. The decline is designed to accommodate bidirectional truck haulage, primary ventilation ducting, and utility corridors. The #1 cage shaft, together with the decline, serves as the primary intake for fresh air, with ventilation infrastructure designed to ensure sufficient airflow for diesel equipment dilution and thermal regulation in the deeper mining zones.

Vertical development includes critical levels at -320 mRL (the first production level) and -800 mRL (the terminal production level), with additional infrastructure such as a loading pocket located at -860 mRL and a sump at -915 mRL for dewatering and the placement of an emergency chamber. The shaft is configured with personnel hoisting systems (cages) to facilitate operational efficiency and safety.

Phase 2: Deep Zone Expansion

The deep zone expansion extends the Phase 1 infrastructure and includes the development of a secondary decline branching from the Phase 1 decline and the sinking of a #2 cage shaft with an internal diameter of 6.4 meters, extending from -800 mRL to -1500 mRL. Primary production horizons are established at -800 mRL (serving as the interface with Phase 1) and at -1400 mRL (the deepest planned production level), with a loading pocket located at -1450 mRL and a sump positioned at -1500 mRL for dewatering and operational support.

Ventilation capacity is improved through the #2 cage shaft and secondary decline, which provide a supplementary fresh air intake. Additional ventilation enhancements include auxiliary fans installed at -800 mRL to manage airflow in dead-end areas and lower mining horizons, ensuring adequate air circulation for equipment operation and personnel safety.

Aleck Hill and Mad Kiss

Two separate declines have been developed from the surface to Aleck Hill and Mad Kiss. These declines facilitate fresh air intake, personnel access, and material handling.

The dimensions of the underground development, as outlined in Table 9-19:

Table 9-19: Development Dimensions

TYPE	Dimensions W*H
Decline	4.5*4.2
Connection decline	4.5*4.2
Level access	4.5*4.2
Hanging wall drift	4.5*4.2
Footwall drift	4.5*4.2
Ventilation drift	4.5*4.2
Connection drift	4.5*4.2
Cross-cut	4.2*3.9
Exploration drift	4.5*4.2
Convery belt drift	4.0*3.9
Return air shaft	4.5m D

TYPE	Dimensions W*H
Ore pass	4.0m D
Skip shaft	5.4m D
Cage shaft	6.4m D
Backfill raise	2.5m D
Fresh air raise	4.5m D

9.3.6 Mining Service

Material Handling

Rory's Knoll

The underground haulage system employs a fleet of 25-ton trucks to transport ore and waste. Ore is hauled an average distance of 0.5 km from working faces to the main ore pass, while waste rock is transported 1.5 km to backfill zones.

- Main Shaft (Skip Shaft):
  - Phase 1 Main Shaft: hoists ore above -800 mRL via a dual-skip system with a capacity of 10,000 t/d.
  - Phase 2 Main Shaft: hoists ore between -800 mRL and -1,400 mRL with a capacity of 6,000 t/d.
- Auxiliary Shaft (Cage Shaft):
  - Phase 1 Auxiliary Shaft: access to 10 levels from -320 mRL to -860 mRL.
  - Phase 2 Auxiliary Shaft: access to 13 levels from -800 mRL to -1,510 mRL.
- Underground and Surface Conveyor Belt:
  - Underground: In Phase 1, Belt #1, with a capacity of 800 t/h, transports ore to the skip bin near the main shaft. In Phase 2, Belts #2 and #3, each with a capacity of 450 t/h, facilitate the transition between Phase 1 and Phase 2 operations.
  - Surface: Ore is discharged to surface bins and then transferred via Belt #1 and Belt #2 to the coarse ore stockpile.

Aleck Hill and Mad Kiss

Aleck Hill and Mad Kiss currently utilize 25-ton underground trucks for transporting ore and waste. Ore is hauled an average distance of 1.2 km from working faces to adit portals, while waste rock is transported approximately 1.0 km to backfill zones or waste dumps.

For operations below -240 mRL, ore is hauled via declines to Rory's Knoll at -320 mRL, where it is dumped into the ore pass for primary crushing. The crushed ore is then hoisted to the surface via the skip shaft.

Backfill

Rory's Knoll employs a modified sub-level stoping mining method with tailings paste backfill. Given the relatively high cement costs in the project area, optimizing cement consumption while maintaining backfill quality is a critical consideration. The backfill preparation plant is strategically located near the auxiliary shaft headframe at an elevation of +70m.

Mill tailings are pumped directly to the top of a deep cone thickener. After thickening, the tailings are transferred to mixing tanks where they are combined with cement to create a uniform paste. The paste is then distributed to the primary mining levels through a series of backfill raises: #1 backfill raise (+65m to -380m), #2 backfill raise (-380m to -560m), and #3 backfill raise (-560m to -800m).

For Phase 2, backfill material is transported to the secondary mining levels through #4 backfill raise (-800m to -1,100m) and #5 backfill raise (-1,100m to -1,340m). This backfill system ensures efficient material handling while meeting operational and geotechnical requirements for stope stability.

Power

The mining area is not connected to an external power grid, relying entirely on internal power generation for its operations. Currently, the milling facility is powered by a diesel power station consisting of eight 1,650 kW diesel generators operating in parallel. Additionally, the Aurora site has installed two solar photovoltaic (PV) systems: a 3 MW system completed in November 2022, dedicated to powering the camp, and a 20 MWh solar-battery storage system finalized in early 2025. The diesel power generators provide electricity at 13.8 kV with a frequency of 60 Hz and a power factor of 0.8. The 13.8 kV distribution system is housed indoors and features a single busbar configuration. Electricity from the diesel power station's 13.8 kV distribution room is transmitted via overhead lines and power cables to distribution rooms serving various facilities, including the open-pit mining operation, concentrator, smelter, and auxiliary facilities, ensuring a consistent power supply for production and living needs.

Underground operations have significantly higher power demands, with a peak load estimated at 30 MW. To meet this requirement, a new 10 kV diesel power station is planned for construction near Rory's Knoll to supply power to underground mining activities and related auxiliary facilities.

The newly installed backfill slurry pump house, located adjacent to the tailings thickener at the concentrator plant, will receive its power supply from the 0.48 kV busbar section of the nearby existing workshop distribution room. Additionally, the mine's existing dump truck maintenance workshop, which will continue to be utilized, will draw electricity from its existing power supply and distribution infrastructure.

Maintenance

The Aurora Gold Mine has already established accommodation camp facilities, a basic maintenance workshop, a fuel storage depot, and an expanded camp to meet the needs of mining production activities.

However, its remote location presents challenges, particularly in outsourcing mechanical equipment repairs. Most parts and components required for maintenance are sourced through external procurement and outsourcing.

Dewatering

Table 9-20 details the water inflow in the AGM.

Table 9-20: Water Inflow in AGM

	Rory's Knoll (m^3/d)	Aleck Hill and Mad Kiss (m^3/d)
Average	7,358	2,671
Max	11,037	4,006
Living and production recycle	2,500	400

Rory's Knoll:

The pump station in Rory's Knoll for main shaft and auxiliary shaft is summarized in below:

Main Shaft (Skip shaft):

- 800 mRL Pump Station:
  - 3 × MD580-100×10 multi-stage wear-resistant centrifugal pumps.
  - Single pump capacity: 580 m^3/h, head: 1,018 m, motor power: 2,800 kW.
  - Normal water inflow: 1 operational, 1 standby, 1 under maintenance; drainage completed in 17.0 hours.
  - Maximum water inflow: 2 pumps operating simultaneously; drainage completed in 11.67 hours.
  - Drainage pipeline: 2 × φ325×17 seamless steel pipes along the auxiliary shaft. Normal operation uses 1 pipe, with 1 standby. Flow velocity: 2.42 m/s.
- -1,400 mRL Pump Station:
  - 3 × MD580-100×7 multi-stage wear-resistant centrifugal pumps.
  - Single pump capacity: 580 m^3/h, head: 703 m, motor power: 1,800 kW.
  - Normal water inflow: 1 operational, 1 standby, 1 under maintenance; drainage completed in 17.0 hours.
  - Maximum water inflow: 2 pumps operating simultaneously; drainage completed in 11.67 hours.
  - Drainage pipeline: 2 × φ325×12 seamless steel pipes along the auxiliary shaft. Normal operation uses 1 pipe, with 1 standby. Flow velocity: 2.27 m/s.

Auxiliary Shaft (Cage shaft)

- 800 mRL Pump Station:
  - 1 × KL60-63×2 mining vertical pump to discharge water to the -800m main sump.
  - Capacity: 60 m^3/h, head: 125 m, motor power: 55 kW.

  - Drainage pipeline: 1 × φ108×4.0mm seamless steel pipe along the auxiliary shaft. Flow velocity: 2.12 m/s.

- -1,400 mRL Pump Station:
  - 1 × KL50-50×4 mining vertical pump to discharge water to the -1,400m main sump.
  - Capacity: 50 m³/h, head: 200 m, motor power: 90 kW.
  - Drainage pipeline: 1 × φ108×4.0mm seamless steel pipe along the blind auxiliary shaft. Flow velocity: 1.76 m/s.

Aleck Hill and Mad Kiss

The pump station in Aleck Hill and Mad Kiss is summarized in below:

- -240m Pump Station:
  - 3 × MD200-50×8 multi-stage wear-resistant centrifugal pumps.
  - Single pump capacity: 200 m³/h, head: 400 m, motor power: 355 kW.
  - Normal water inflow: 1 operational, 1 standby, 1 under maintenance; drainage completed in 15.36 hours.
  - Maximum water inflow: 2 pumps operating simultaneously; drainage completed in 11.02 hours.
  - Drainage pipeline: 2 × φ194×5.0mm seamless steel pipes along the return air shaft. Normal operation uses 1 pipe, with 1 standby. Flow velocity: 2.09 m/s.
- -480m Pump Station:
  - 3 × MD200-50×6 multi-stage wear-resistant centrifugal pumps.
  - Single pump capacity: 200 m³/h, head: 300 m, motor power: 280 kW.
  - Normal water inflow: 1 operational, 1 standby, 1 under maintenance; drainage completed in 15.36 hours.
  - Maximum water inflow: 2 pumps operating simultaneously; drainage completed in 11.02 hours.
  - Drainage pipeline: 2 × φ194×5.0mm seamless steel pipes along the return air shaft. Normal operation uses 1 pipe, with 1 standby. Flow velocity: 2.09 m/s.

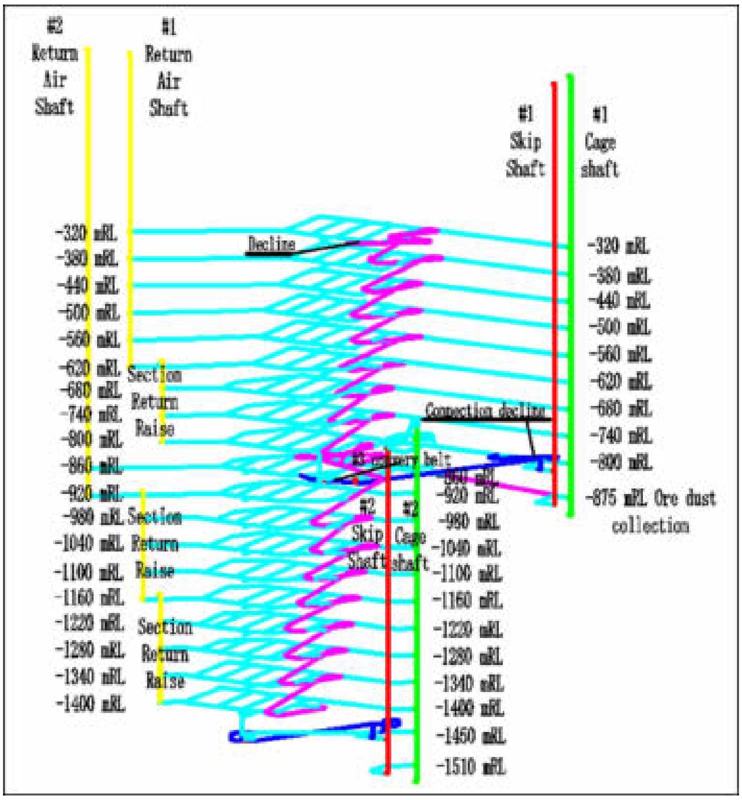
Ventilation

Rory's Knoll

Based on the orebody geometry and development layout, a single-wing diagonal ventilation system with mechanical exhaust ventilation is implemented. Exhaust fans are installed at the collar of the return air shaft to optimize airflow control and energy efficiency. Figure 9-12 presents the planned primary circuit for Rory's Knoll.

- Phase 1
  - Fresh Air Intake:
    - Delivered to underground levels via the #1 Main Shaft, #1 Auxiliary Shaft, and decline.
  - Contaminated Air Extraction:
    - Collected through return air raises to upper-level return airways.
    - Converged into the Main Return Airway.
    - Exhausted to the surface via the #1 Return Air Shaft.
- Phase 2
  - Fresh Air Intake:
    - Supplied through the #1 Main Shaft, #1 Auxiliary Shaft, #2 Main Shaft, #2 Auxiliary Shaft, and decline.
  - Contaminated Air Extraction:
    - Follows the same pathway as Phase 1.
    - Discharged via the #2 Return Air Shaft to accommodate expanded operations.

Figure 9-12: Rory's Knoll Ventilation Schematic



Source: Zijin 2023

Note: The levels are schematic; in actual construction, the interval between levels is 60m.

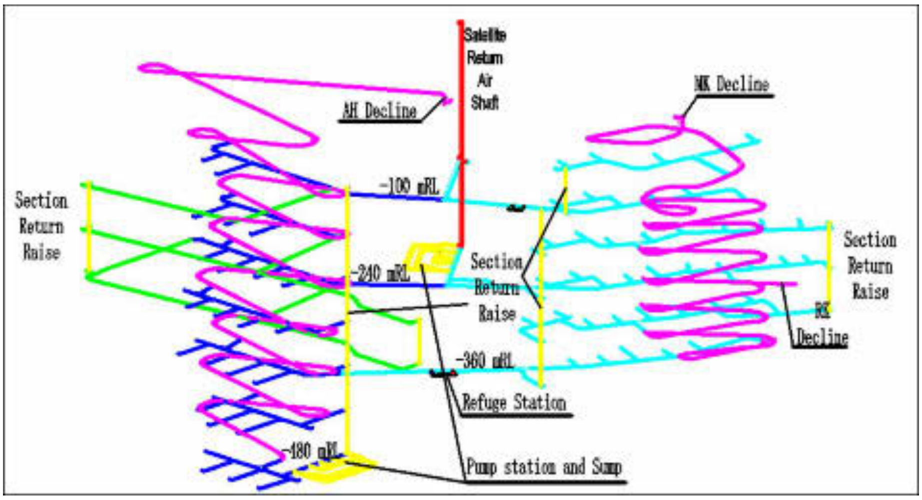
Aleck Hill and Mad Kiss

A diagonal ventilation system with mechanical exhaust ventilation is implemented, aligned with the orebody geometry and development layout. Both zones share a centralized satellite return air shaft, strategically positioned in the footwall between Aleck Hill and Mad Kiss, with exhaust fans installed at the raise collar. Figure 9-13 presents the planned primary circuit for Aleck Hill and Mad Kiss.

- Mad Kiss
  - Fresh Air Intake: Delivered to underground levels via the Mad Kiss decline.
  - Contaminated Air Extraction:
    - Collected through stope return air raises to the designated return level.
    - Directed through transfer raises to the Satellite Return Air Shaft.
    - Exhausted to the surface via mechanical ventilation.

- Aleck Hill
  - Fresh Air Intake: Supplied to the interconnected underground levels through the Aleck Hill decline.
  - Contaminated Air Extraction:
  a. Follows an identical pathway to Mad Kiss:
     i. Collected via stope return air raises.
     ii. Channelled through transfer raises to the Satellite Return Air Shaft.
  b. Consolidated exhaust airflow is discharged to the surface.

Figure 9-13: Aleck Hill and Mad Kiss Ventilation Schematic



Source: Zijin Study (2023)

Note: The levels are schematic; in actual construction, the interval between levels is 20m.

Mine Air Cooling

Mine air cooling was incorporated into the Feasibility Study in 2013, with design work completed by BBE Consulting (BBE) in 2012. However, there is no available data on virgin rock temperatures (VRT), nor has follow-up testing been conducted to validate the estimated temperatures. Given that mine air cooling represents a significant capital and operational expense, SRK recommends a thorough re-evaluation of cooling requirements as the decline advances.

This evaluation should include:

- Rock and Groundwater Temperature Monitoring: Regular assessment of in-situ rock and groundwater temperatures to refine cooling load estimates.
- Collecting rock temperature data as the shaft depth increases in Rory's Knoll.

- Heat Load Analysis: A detailed review of the mine air heat load, considering factors such as equipment heat emissions and ventilation efficiency.
- Alternative Cooling Strategies: Exploration of electric or battery-powered equipment to reduce heat generation, thereby minimizing cooling demands and associated costs.

9.3.8 Underground Development Schedule

Aleck Hill and Mad Kiss

The decline development continues within the existing declines, with level access construction initiated every 20 meters of vertical descent at designated sublevels. Once level access is completed, the sequential development process follows this order: footwall drift, then ventilation drift, and finally section return air raise (upward).

Crosscut construction begins only after the completion of these preceding activities at two adjacent sublevels. Mining operations are proceeded only after the crosscut is finished in both levels.

- Vertical Development
  Construction has been completed from the surface elevation (+64 mRL) to -241 mRL.
- Lateral Development
  - Aleck Hill Decline: Advanced to -240 mRL, with production level development completed to -240 mRL. Full completion of the decline is expected by 2026.
  - Mad Kiss Decline: Advanced to -294 mRL, with production level development completed to -280 mRL. Full completion of the decline is expected by 2025.

Rory's Knoll

Decline development continues within the existing declines, with level access constructed every 60 meters of vertical descent. To meet AGM production targets while maintaining future operational integrity, the prioritization of footwall drift development is as follows: -320 mRL, -380 mRL, -440 mRL, -560 mRL, -620 mRL, followed by -500 mRL, -740 mRL, -800 mRL, -860 mRL, -920 mRL, -980 mRL, -1100 mRL, -1120 mRL, and then the remaining sublevels.

Crosscut and stope operations necessitate the completion of the backfill raise breakthrough at the -440 mRL level. The construction of the conveyor belt system and the #2 shaft system will commence following the completion of activities at the -800 mRL level.

- Vertical Development
  - #1 Return Air Shaft: Construction has been completed from the surface elevation (+76 mRL) to -614 mRL, with operational readiness scheduled for mid-February 2026. Connecting drives are established at -314 mRL, -434 mRL, and -605 mRL.
  - #1 Skip Shaft: Planned for completion and equipping by December 2026, with a loading pocket at -800 mRL and a spill pocket at -860 mRL.
  - #1 Cage Shaft: Planned for completion and equipping by March 2026, with stations developed at 60 m intervals from -320 mRL to -800 mRL, including an additional station at -860 mRL.
  - #2 Return Air Shaft: Planned for completion and equipping by early 2026.
  - #2 Skip Shaft: Planned for completion and equipping by April 2029, with a loading pocket at -1400 mRL and a spill pocket at -1450 mRL.
  - #2 Cage Shaft: Planned for completion and equipping by September 2029, with stations developed at 60 m intervals from -800 mRL to -1400 mRL, including additional stations at -1450 mRL and -1520 mRL.
- Ore Pass System
  - #1 Ore Pass: Planned to complete by April 2028, commence after -860 mRL finalization.
  - #2 Ore Pass: Planned to complete by July 2029, commences after -1450 mRL finalization.
- Backfill plant is scheduled for commissioning by the end of March 2027, with #1 and #2 backfill raises to be completed prior to plant commissioning. Backfill raise construction triggers upon -320 mRL completion.
- Lateral Development
  - Decline progress has advanced from -240 mRL to -320 mRL.

The Table 9-22 shows the production rate in schedule.

Table 9-22: Production rate in Aurora Gold Mine

Type	Unit	Production rate
Modified sub-level stope in Rory's Knoll	t/d	1,200
Open Stope in Aleck Hill and Mad Kiss	t/d	400
Backfilling	m^3/d	2,400
Vertical development	m/d	3
Lateral development	m/d	4
Ramp	m/d	4
Backfill curing	d	30

Source: SRK

Note:

1. SRK applies a 5% factor for ramp development in Aleck Hill and Mad Kiss, and a 4% factor for Rory's Knoll. Based on standard rules of thumb, a passing bay is required every 150 meters.
2. For waste lateral development, SRK applies a 14% factor for Aleck Hill, 22% factor for Mad Kiss, and 7% factor for Rory's Knoll, based on the data from the Zijin 2023.
3. For ore lateral development, SRK applies a 96% factor for Aleck Hill, a 144% factor for Mad Kiss, and a 329% factor for Rory's Knoll. As the stopes differ from those in the Zijin 2023 Design, SRK has referenced the ore lateral development meter factors

9.3.9 Mine Production Plan

The Life of Mine ("LoM") production schedule for Aleck Hill, Mad Kiss and Rory's Knoll has been developed using Deswik software, based on the underground mining design provided by Zijin. The Deswik software suite facilitates detailed production planning by aggregating the pit inventory according to stages, benches, and predefined grade bins, enabling the prioritization of early gold production to optimize economic returns.

The underground production schedule, detailed in Table 16.25, includes contributions from the Aleck Hill, Mad Kiss, and Rory's Knoll deposits. Early in the schedule, priority is given to the Aleck Hill and Mad Kiss deposits to ensure a steady and reliable ore supply to the mill plant, optimizing operational continuity and efficiency.

Operating Schedule and Production Capacity

The schedule is organized on an annual basis, and the following key assumptions were applied during production planning:

- Only blocks classified as Measured and Indicated Mineral Resources, with an overall stope gold grade exceeding 1.3 g/t for the Rory's Knoll deposit and 1.1 g/t for the Aleck Hill and Mad Kiss deposits, were considered as ROM.
- Blocks classified as Inferred Mineral Resources or those located outside the defined stope areas were categorized as waste material.
- The maximum annual production rate is limited to 3,400 ktpa.
- The vertical separation between mining phases is restricted to a maximum of three levels.

Production Plan and LoM

10 Processing and Metallurgical Assessment

10.1 Processing and Metallurgical Test Work

Metallurgical test work in support of the Aurora Gold Mine were conducted over the period from 2006 to present, which may be divided into two phases.

Phase I is before the commissioning of the processing plant from 2006 to 2016 to develop the flowsheet and as the plant design criteria. series of metallurgical tests in Phase I were completed by qualified commercial laboratories and achieved consistent and as-expected results for the ore types. The completed metallurgical tests were appropriate to establish a conceptual processing route at a feasibility study level of accuracy for a non-refractory gold deposit. The test reports have a better structure and integrity and are sufficient to be used to develop the flowsheet and/or as design criteria. The operation data of the built AGM processing plant confirm that the results and indicators agree well with the completed metallurgical tests.

Phase II is after the commissioning the Processing Plant from 2017 to present to optimize the plant operation and to upgrade the processing plant. The post-commissioning special metallurgical tests followed the procedures appropriately and achieved reasonably good results. It is sufficient to provide technical supports to upgrade the processing plant.

The historical metallurgical tests include the followings:

- Comminution tests, includes JK drop weight, SMC test, Bond work index (BWi), abrasion index (Ai), autogenous work index (AWi), crushing work index (CWi), rod mill work index (RWi)
- Gravity tests, includes gravity recoverable gold test (GRG), batch test at different grind fineness, standard procedure gravity tests
- Cyanidation tests, includes whole ore cyanidation test (WOCN), carbon in leaching test (CIL), intensive cyanidation on gravity concentrate, cyanidation kinetics and carbon adsorption kinetics test
- Cyanide detoxification tests
- Settling, thickening and rheology tests

Key tests results are summarized in below tables:

Table 10-1: Gravity Test Results

Feed Size (F_{80} μm)	Head Calc. (Au g/t)	Recovery (Au %)	Concentrate (Au g/t)	Tailings (Au g/t)
138	1.53	32.0	246	1.04

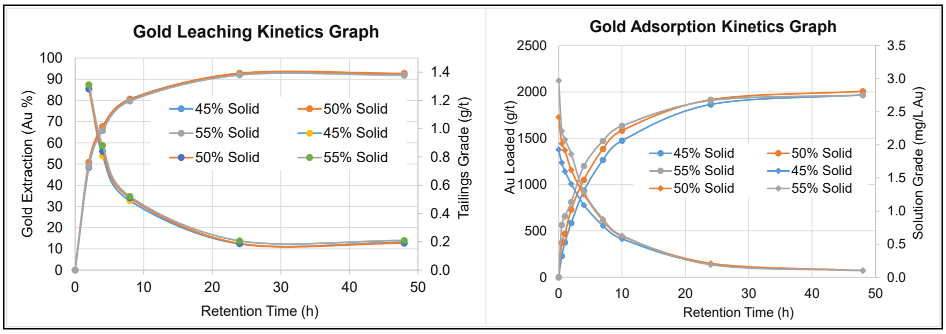
Kinetics tests on cyanide leaching and active adsorption at different pulp densities. The results are illustrated as Figure 10-1. It shows that the cyanidation will complete in 30 hours and gold adsorption will complete in 40 hours.

Figure 10-1: Kinetics Graphs of cyanidation and adsorption



10.2 Processing Plant

10.2.1 Overview

The Aurora Gold Mine (AGM) processing plant was commissioned in August 2015 and reached commercial production in January 2016. The original plant was designed to process 5,000 tpd (1.65 Mtpa) of mixed saprolite and fresh ore adopting the "gravity - carbon-in-pulp (CIP)" process. Plant expansion in 2018 and 2019 were successfully increasing the plant throughput to approximately 7,500 tpd (2.5 Mtpa) by the gravity and CIP process. The plant was put on care and maintenance in July of 2020 pending transfer of ownership. Zijin Mining Group owned AGM in August 2020 and resumed the plant operation in November 2020.

In August 2021, Zijin (Xiamen) Engineering Design Co., Ltd. compiled a *Feasibility Study Report on the Mining, Processing and Metallurgy Project of the Aurora Gold Mine in Guyana* in August 2021 and completed the *Technical Renovation Project Scheme Design for the First Phase Processing Plant of the Aurora Gold Mine in Guyana*" in May 2024. The technical transformation design still adopts the original "gravity-CIP" process, while optimizing equipment configuration and operating parameters to improve the gold recovery rate. Take measures to remove bottlenecks and increase the processing capacity to 10,000 tpd (3.3 Mtpa). The technological transformation project was completed by the end of 2024 without production suspension and put into production immediately. Figure 10-2 shows a panoramic view of the AGM Processing Plant.

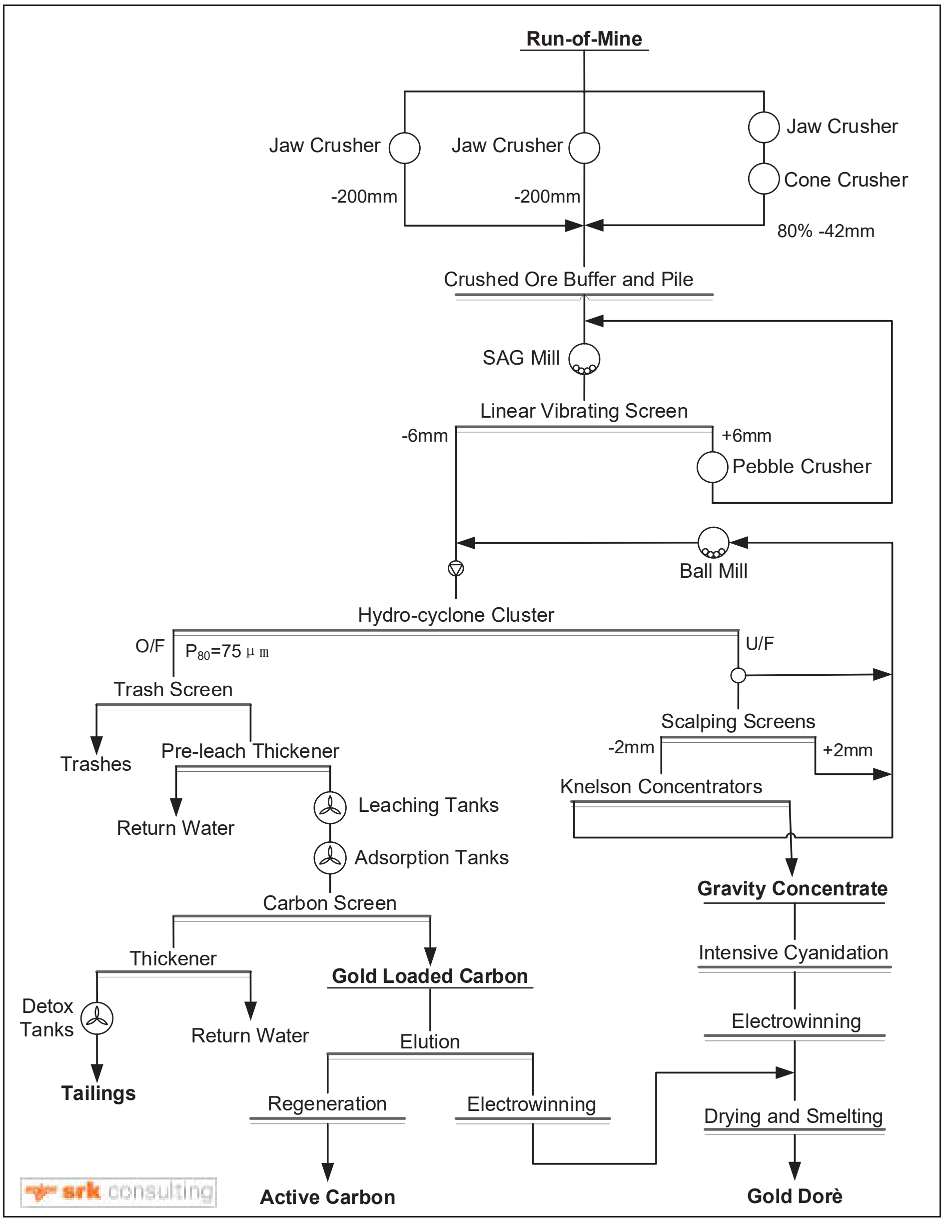
Figure 10-2: Panoramic Photo of AGM Processing Plant

10.2.2 Processing Flowsheet

The AGM Processing Plant adopts a CIP process to extract gold from fresh ore and saprolite ore. The final product is gold doré ingots. The process flowsheet comprises crushing, grinding, gravity separation, cyanide leaching, carbon adsorption, carbon elution and regeneration, gold smelting, cyanide destruction and tailings disposal. The plant has been upgraded and expanded to 10 ktpd in the end of 2024. The current flowsheet is simplified as Figure 10-3, briefly descripted as follows.

- Primary crushing: there are three primary crushing lines, adopt one or two stage open circuit
- Grinding: semi-autogenous mill + ball mill + pebble crusher (SABC)
- Gravity separation: Knelson concentrator in grinding circuit recover liberated gold grains
- Intensive cyanide leaching: Acacia reactor unit extract gold from gravity concentrates
- CIP process: cyanide leaching and carbon adsorption
- Elution: gold loaded carbon desorption and electrowinning
- Regeneration: barren carbon is restored its activity in a rotary kiln
- Smelting: gold sludge smelting and doré ingots casting
- Tailings detoxification and disposal: cyanide in tailings of CIP is decomposed by SO_2/Air process and deposited in the TSF

Figure 10-3: Simplified Metallurgical Diagram of AGM processing Plant



10.3 Processing Facilities and Main Equipment

The metallurgical facilities of the AGM processing plant consist of crushing workshop, crushed ore stockpile, grinding and gravity separation workshop, Acacia intensive leaching workshop, cyanide leaching and active carbon absorption workshop, elution – electrowinning workshop, cyanide deconstruction tanks, and belt gallery and transfer station.

The plant flowsheet is reasonable, developed from a series of metallurgical westworks, but there are certain equipment configuration issues existing in the plant which limits the throughput and gold recovery. To increase the gold recovery along with the throughput expansion, the following measures has been taken to debottleneck and optimize the operating parameters during 2024.

- Existing Metso C160 jaw crusher (Line #2) will be used, and the other two lines will be standby.
- One new ball mill with 5.8m in diameter and 9.8m of length replaces the existing MQY5064 ball mill, the existing ball mill is as a backup.
- Replaced cyclone feed pumps and piping to increase pumping capacity.
- Adding a new linear vibrating screen (scalping screen) and two new Knelson Concentrators to improve the GRG recovery and overall gold recovery.
- Recommissioning the pre-leach thickener.
- Adding a 3 sets of leaching tanks and increasing the stirring motor power (from 55kW to 75kW) to maintain the leaching time as the throughput increase.
- Adding a new tailings thickener, water storage tank, filter press and auxiliary facilities and equipment, improve the utilization rate of backwater, reduce the consumption of reagents, optimize the cyanide deconstruction process, and reduce the processing cost.
- Supplement and improve auxiliary facilities such as water supply and drainage, power supply and distribution.
- Modified inter-stage screens installed in adsorption tanks.
- Replaced trash screen and carbon recovery screens.
- Replaced tailings pumps and larger tailings pump box to increase tailings pumping capacity

The main process equipment after the 2024 upgraded is listed in Table 10-5. Equipment that was taken out of used in the 2024 upgrade is also listed in the table and marked as "OFU".

Table 10-5: Main Equipment of AGM Processing Plant

№	Equipment	Specification	Power (kW)	Number	Explanation

10.4 Production Performance

Table 10-6 lists the plant performances under Zijin operation. The average annual gold recovery ranges from 90.5% to 92.9%, lower than the anticipated 94%. The relationship of gold recovery – feed grade as per monthly data of 2024 is shown in Figure 10-4. The gold recovery has a natural positive correlation with the feed grade.

Table 10-6: Processing plant performance under Zijin operation before upgrading

Description	Unit	2022	2023	2024
Milled tonnage	kt	2,489	2,660	2,712
Average feed grade	g/t	1.24	1.23	1.61
Feed gold metal	kg	3,095	3,281	4,367
Gold lost in Tailings	kg	263	293	309
Tailings grade	g/t	0.11	0.12	0.11
Gold recovery	%	91.06	90.51	92.93
Gold in doré	t	2.82	2.97	4.06
Gold in doré	kg	2,819	2,970	4,058
Gold in doré	oz	90,620	95,475	130,456

10.5 Tailing Storage Facility

10.5.1 Storage Capacity Requirement

The tailings storage facility (TSF) of Aurora Gold Mine is planned to accommodate the storage of tailings generated over the mine's service life. According to the feasibility study completed in 2021 by Zijin (Xiamen) Engineering Co., Ltd, the total amount of tailings generated during the 25-year life-of-mine service period is 55.88 million tons (Mt). The total amount of tailings filled underground is 23.00 Mt. The total amount of tailings discharged into the TSF is 32.88 Mt. As of the study period, 7.10 Mt of tailings had already been stored, bringing the cumulative required storage to 39.98 Mt. To meet this requirement, the TSF's effective capacity was determined at 25.63 million cubic meters (Mm^3), with stacking density at 1.56 t/m^3.

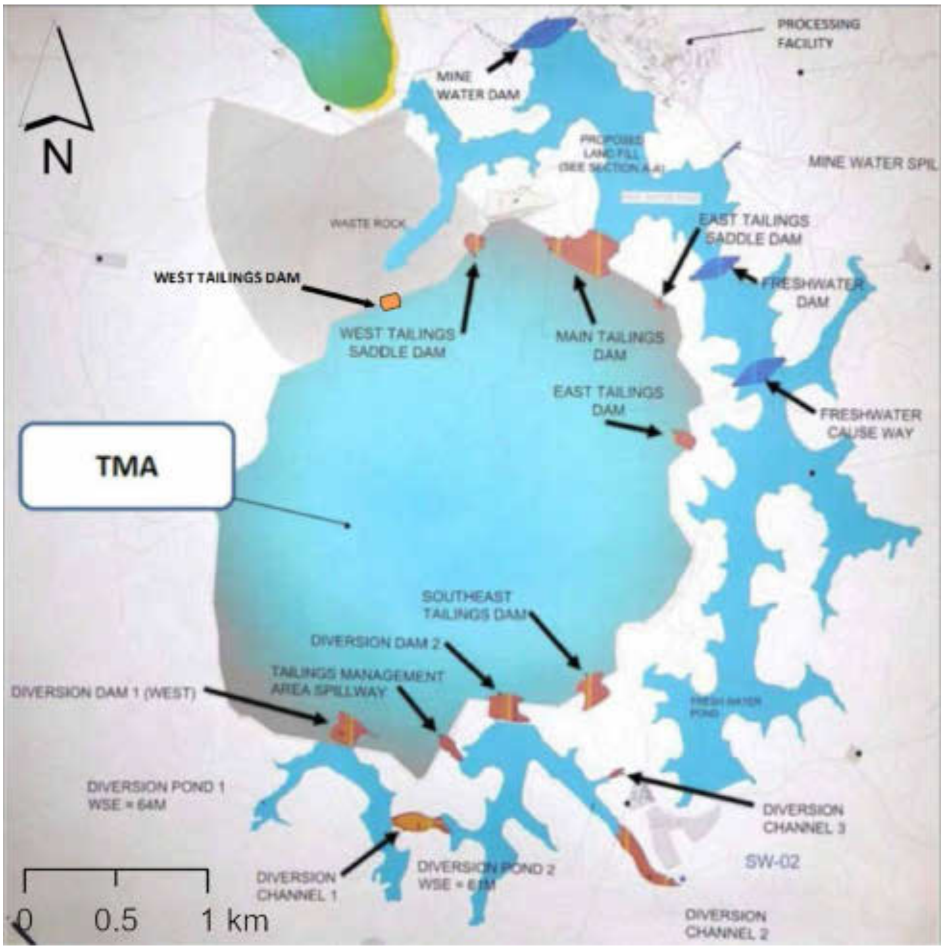
10.5.2 Current Situation and Construction Scheme

The TSF is located approximately 1 km southwest of the processing plant. It is approximately circular in shape and covers an area of around 240 ha. Tailings slurry is transported to the TSF via a 2-km pipeline and is discharged into the storage area. The TSF has been developed in phases to align with operational requirements and long-term resource management plans.

Phase I - Initial Construction. Designed by Tetra Tech in 2013, it is surrounded by a main dam and five saddle dams along with the surrounding mountains. The main dam of the phase I project has an elevation of 66.0 m and height of 16 m. Construction was completed from September 2014 to March 2015 and it was officially put into use in 2016.

Phase II- Raise of Dams. Tetra Tech prepared the design for the phase II heightening project of the tailings dams in 2018. Zijin (Xiamen) Engineering Design Co., Ltd. prepared the *Scheme Design for the Heightening Project of the Tailings Dam of the Aurora Gold Mine* in April 2022, supplementing the design for the phase II heightening project of Tetra Tech. The design of the phase II project adopts the downstream method to increase the top elevation of the main tailings dam (MTD), the eastern tailings dam (ETD), the western tailings saddle dam (WTSD), and the eastern tailings saddle dam (ETSD) to 71.0m. The southeastern tailings dam (SETD) and the DD-2 water retaining dam were raised. The top elevation of these two DAMS was increased to 70.0m by the downstream method, and the spillway of the accompanying tailings pond was renovated and designed. After the phase II heightening, the total capacity of the TSF reached 13.18 Mm ³.

Figure 10-5: Location of main structures and catchment areas of Aurora TSF



Phase III - Raise and Expansion. Zijin (Xiamen) Engineering Design Co., Ltd. compiled the *Feasibility Study on the Height-Increasing and Expansion Project of the Aurora Gold Mine Tailings Storage Facility* in August 2022, designed the phase III dam raise and expansion project. Upon completion of Phase III, the top elevation of the main dam was raised to 82 m, and the total storage capacity was projected to increase to approximately 34.5 Mm³. Meet the storage requirements of all tailings during the service life of the mine.

Figure 10-6 shows the main structures and catchment areas of the TSF.

Figure 10-6: Photo of TSF

Table 10-7 lists the figures of the main structures of the TSF. The tailings dams in the later phase will adopt downstream method to thicken and raise the dam bodies of the previous phase by using the mining waste rock and in-situ soil and rock materials.

Table 10-7: Dams Parameters of the TSF

Structures	Dam Parameters	Unit	Phase I	Phase II	Phase III
Main Tailings Dam (MTD)	Dam crest elevation	m	66	71	82
	Dam height	m	16	21	32
	Dam crest width	m	12	20	20
	Dam axis length	m	-	-	400
Eastern Tailings Dam (ETD)	Dam crest elevation	m	66	71	80
	Dam height	m	8	13	22
	Dam crest width	m	12	12	10
	Dam axis length	m	-	-	760
Eastern Tailings Saddle Dam (ETSD)	Dam crest elevation	m	66	71	80
	Dam height	m	2	7	16
	Dam crest width	m	12	12	10
	Dam axis length	m	-	-	543
Southeastern Tailings Dam (SETD)	Dam crest elevation	m	66	71	78
	Dam height	m	8	13	20
	Dam crest width	m	12	12	10
	Dam axis length	m	-	-	-
Western Tailings Saddle Dam (WTSD)	Dam crest elevation	m	66	71	82
	Dam height	m	8	13	24
	Dam crest width	m	12	12	10
	Dam axis length	m	-	-	215

Structures	Dam Parameters	Unit	Phase I	Phase II	Phase III
Western Tailings Dam (WTD)	Dam crest elevation	m	/	71	82
	Dam height	m	/	13	24
	Dam crest width	m	/	12	10
	Dam axis length	m	/	-	760
Western Tailings Dam -1 (WTD-1)	Dam crest elevation	m	/	/	82
	Dam height	m	/	/	14
	Dam crest width	m	/	/	10
	Dam axis length	m	/	/	480
Diversion Dam-2 (DD-2)	Dam crest elevation	m	65	70	78
	Dam height	m	7	12	20
	Dam crest width	m	12	10	10
	Dam axis length	m	-	-	-
Diversion Dam-1 (DD-1)	Dam crest elevation	m	65	70	78
	Dam height	m	5	10	18
	Dam crest width	m	12	10	10
	Dam axis length	m	-	-	540
Spillway-1	Initial bottom elevation	m	63	/	/
	Final bottom elevation	m	/	66	/
Spillway-2	Initial bottom elevation	m	/	/	68
	Final bottom elevation	m	/	/	71
Spillway-3	Initial bottom elevation	m	/	/	73
	Final bottom elevation	m	/	/	74

Note: "/" indicates that there is no such data at all; "-" indicates the absence of this data

10.5.3 Monitoring Facilities

Combination model of dynamic on-line monitoring system and the traditional artificial observation system. Video monitoring equipment was designed to be installed on the tailings and diversion dams, on the inlet of flood drainage system and where need to focus on monitoring site location. At present, two sets of groundwater pressure monitoring facilities have been buried in each of the main tailings dam and the DD-2 diversion dam, and displacement monitoring points have been arranged. After the dam body is raised, the layout of the monitoring points should be updated in time to facilitate the monitoring and control of the dam body. Key monitoring areas are the following:

- The displacement of the dams
- Seepage and water quality water
- Water level in the TSF

11 Workforce Assessment

11.1 Workforce Numbers

The open-pit mining operations for this project are outsourced, with management and service personnel shared with the underground mining operations. The labor quota has been determined based on the local mining production processes, organizational structure, design capacity, job positions, equipment levels, and other relevant factors.

Staffing for the project includes production personnel, management personnel, and service personnel, as outlined in the feasibility study for the Guyana Aurora Gold Mine Mining Engineering. The total workforce required for the project is 683 personnel (excluding outsourced workers), consisting of 632 production personnel and 51 management and service personnel.

Table 11-1: Summary of labour quota

No.	Department	Registered personnel		
		Production	Management and Service	Total
1	Minging workshop	554	17	571
2	Support workshop	78	7	85
3	Ministry of Mine		27	27
	Total	632	51	683
	Ratio	92.53%	7.47%	100%

11.2 Assessment of Workforce

The production workers in the mining workshop operate under a continuous working system, with 330 working days per year. The schedule comprises 3 shifts per day, 8 hours per shift, organized as four groups rotating across three daily shifts. Other personnel follow an intermittent working system depending on their roles and responsibilities.

The support workshop operates based on the principle of serving production needs. In general, it adopts a continuous working system to align with production requirements, while functional roles such as management and service personnel primarily work under an intermittent duty system. Specific scheduling and arrangements are adjusted as necessary to accommodate the operational demands and actual conditions of the mine.

The project employs a secondary management framework, structured around the Ministry of Mines and its associated workshops. This framework aims to facilitate organizational management, allocate human resources, and clarify the division of responsibilities and authority within the project site.

Under this organizational structure, the Ministry of Mines consists of functional departments such as Production and Operations, Finance, and Human Resources. These departments are tasked with supporting the mine's activities through administrative and operational functions.

At the operational level, the project incorporates two main workshops: the Mining Workshop, responsible for extraction and production activities, and the Support Workshop, which provides ancillary services to the production process. The arrangement and roles of personnel within these workshops may be adjusted periodically to accommodate changes in the mine's operational requirements and conditions.

12 Project Infrastructure

12.1 Access

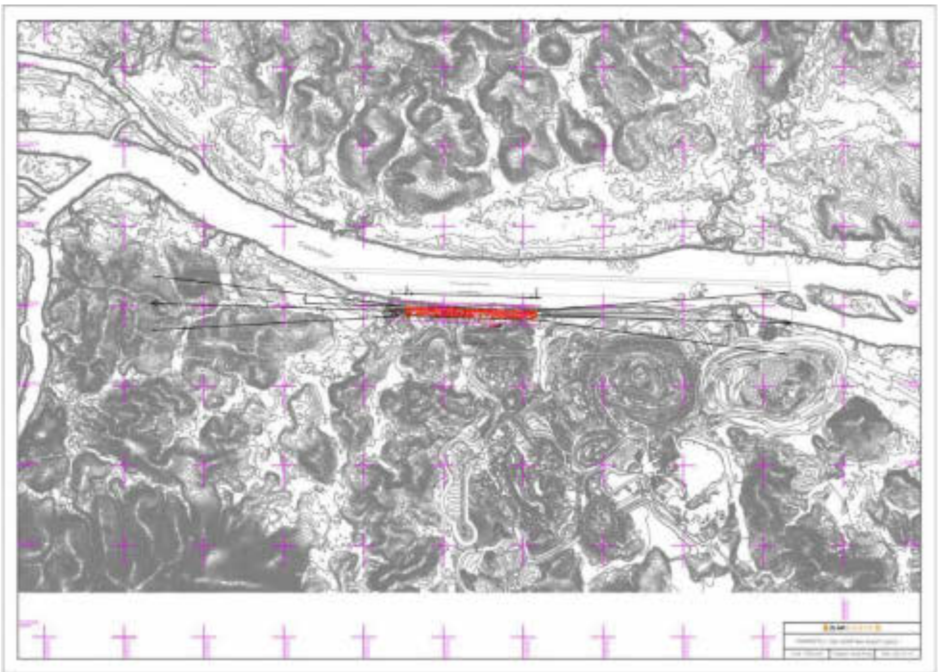
The Mine site can be accessed by air, road and barge. Guyana is served by two international airports: Cheddi Jagan International Airport, located about 40 km south of the nation's capital, Georgetown, and Ogle Airport, which lies just 10 km east of Georgetown. Cheddi Jagan is the primary international gateway, while Ogle Airport mainly handles domestic flights and limited international services, providing access to various parts of Guyana and adjacent countries.

The Mine has constructed a 1,200 m runway on the southern bank of the Cuyuni River, which is designed for helicopters and short-takeoff-and-landing aircraft. The Mine operates charter flights several times a week from Ogle Airport directly to the Mine site.

Due to recurrent flooding at the previous airport facility, a new airport has been constructed to the west of the original site, featuring a 935-meter runway with a GCAA-certified operational section of 761 meters. The runway became operational in June 2023, while the terminal building is scheduled for operational commencement in January 2025. All flight operations are restricted to daylight hours, with dedicated charter air services deployed to fulfill the mine's logistical requirements.

AGM New Airport Layout is shown in Figure 12-1.

Figure 12-1: AGM New Airport Layout



In addition to air access, the Mine can be reached via a road from the Buckhall Port Facility, a key logistics hub located on the west bank of the Essequibo River. The 170 km road to the Mine initially follows the north shore of the Cuyuni River, crossing the river at Tapir Crossing—about 26 km from the Mine—via a barge, and then continues to the Mine site. The majority of this road was originally constructed by Barama Company Limited for logging ("Barama"), with the final 26 km constructed by the Mine itself. Since Barama has exited the area, GGI has taken full responsibility for maintaining the road.

To reach the Buckhall Port Facility from Georgetown, you can either take a barge or drive 42 km west on a public highway to Parika, a town on the east bank of the Essequibo River. From Parika, the facility is accessible by boat or barge along the Essequibo River.

12.2 Power Supply

A power station located within the processing plant area integrates diesel generators with a supplementary photovoltaic power system. The station is equipped with 12 diesel generators, each rated at 2MW, and features a photovoltaic system designed for a capacity of 15MW/10MW. Expansion works are currently underway to increase the photovoltaic system's total installed capacity to 31.86MWp. The station delivers power at 13.8kV/60Hz.

12.3 Water Supply

Expanding to 10,000tpd capacity, the AGM processing plant needs 650 m3/h of water. The fresh water comes from the surface catchment water and underground water in the three open pit of the mining section. The water in the pits are pumped via pipe lines to the 750,000m3 pond on the north side of the mine, and after being clarified, it is pumped to the 1000m3 high-level pond in the processing plant through two pipes with a length of 1km, and then it flows through pipelines from the pond to each water point.

12.4 Workshops and Repair Facilities

12.4.1 Processing Workshops

The primary process facilities of the AGM processing plant consist of crushing workshop, crushed ore stock yard, grinding and gravity separation workshop, Acacia intensive leaching workshop, cyanide leaching and active carbon absorption workshop, elution – electrowinning workshop, cyanide deconstruction tanks, and belt gallery and transfer station.

12.4.2 Mobile Maintenance Building

The mobile equipment maintenance shop is designed to repair and maintain the mine fleet and other mobile equipment. It consists of four bays for heavy mobile equipment repairs and maintenance; two bays dedicated for heavy vehicle maintenance and two bays allocated for welding and other major repairs.

12.4.3 Fixed Plant Maintenance Facilities

Contained within the footprint of the processing plant are three separate maintenance structures. The Millwright Maintenance shop is a steel frame structure with spread footing foundation, metal clad walls. The shop is outfitted with all necessary tools and machines to address all maintenance activities. The Electrical / instrumentation shop is slab on grade with 40 ft sea containers around the perimeter for local storage and offices. The shop is outfitted with all necessary tooling to address all maintenance activities.

The Fabrication shop is a slab on grade with 40 ft sea containers around the perimeter for local storage, tool crib, and supplies. An extension to the shop was recently added consisting of slab on grade with steel frame structure with spread footing foundation and metal clad walls. The shop is outfitted with all necessary tooling to address all maintenance activities.

12.5 Buildings and Accommodation

12.5.1 Accommodation Camp

The permanent accommodation complex is located on a 10 ha elevated site approximately eight kilometres southeast of the mine complex. The accommodation complex includes 1,199 beds located in 20 dormitories with a total of 402 rooms.

The accommodation complex includes the following facilities:

- Kitchen, dining hall.
- Recreation, exercise, and entertainment facility.
- Cricket/soccer field.
- Infirmary equipped with:
  - trauma treatment facilities,
  - life support equipment,
  - waiting/reception area,
  - doctor's office,
  - treatment room/theatre,
  - two bed wards,
  - washroom facilities, and
  - ambulance parking
- Emergency power plant.

Administration, Human Resources, and Accounts Offices are located at the camp. Mines and Mill Administration Offices are located at the mines and mill areas.

12.5.2 Airstrip

The airstrip is 1,200 m long, 30 m wide with 90 m runway end safety areas at each end. The airstrip is located immediately adjacent to the Cuyuni River. The elevation of the airstrip and related access road are above the river flood level to permit continuous serviceability through the flood seasons. There is a waiting room for arriving and departing passengers. Flights are scheduled for daylight hours only. Charter air services are used to service the Mine's needs.

With the relocation of the river dike the airstrip will be moved to a new location near the camp. Approvals for the construction and the site clearing for an 860 m long runway have been completed. The facility is planned to be completed in 2021.

12.5.3 Solid Waste Disposal

Solid wastes are disposed of in an onsite lined landfill. Used tires will be shredded and placed in the landfill. Two incinerators are operated at the landfill site. One is dedicated to the incineration of waste oils accumulated from the maintenance of mobile and process equipment. The other is used for the incineration of general waste.

12.5.4 Site Security

The principal site entry point on the access road from the Tapir Crossing is manned by boat crews and security on dayshift. A security gatehouse and checkpoint is located on the access road adjacent to the man camp. A weighbridge is located adjacent to the gatehouse building to monitor incoming and outgoing vehicle loads. There is additional site security near the airstrip and roving patrols of the property are undertaken. The gold room has a security force and there is a Guyanese National Police detachment assigned to the explosives storage area.

12.5.5 Explosives Magazine

The explosives magazine was constructed and is operated in accordance with Guyanese law. A modular facility was used so it can be relocated during the LoM. The site is surrounded by a perimeter security fence with lights and there is round the clock Guyanese police presence at the magazine.

12.5.6 Communication and IT Systems

Satellite communication is the main communication system between the Mine and the outside world. The system includes voice/data/video, internet, and VPN services, including bi-directional links between the mine site, Georgetown and Toronto. A backup/emergency satellite system is available for redundancy. The backup/emergency system includes voice/data and internet access for a minimum number of users.

VHF/UHF radio communication is available within a 10 km radius from the processing plant. The phone system uses a voice over internet protocol with voice-messaging and e-mail. Satellite phones, installed at strategic areas, are provided for emergency communications. Satellite TV for entertainment and guest wireless data is available.

The IT system is connected throughout the site by a fiber optic network. The connection between IT devices and end-users provides high-throughput, secure, reliable, and redundant service for data and voice. The network system is connected to protocol independent multicasts (PIMS) and business networks through routers with firewalls and will provide remote access as required. The system has security and encryption to prevent unauthorized access.

12.5.7 Vehicle Fuelling Facility and Mine Equipment Ready Line

The vehicle fuelling facility and ready line is located adjacent to the open pit mine. The fuelling facility stores about 60,000 L of diesel. Smaller tanks hold a variety of oils and lubricants. The ready line is located adjacent to the fuelling facility and is well lit for 24 hour use.

13 Environmental Studies, Permitting, Social or Community Impact

13.1 Environmental, Permitting, and Social or Community Review Process, Scope, and Standards

The process for verifying the environmental permitting and licensing compliance and operational conformance for the Aurora Project comprised a review and inspection of the projects' environmental management performance against:

- Guyana national environmental regulatory requirements; and
- World Bank/International Finance Corporation (IFC) environmental standards and guidelines, and internationally recognised environmental management practices.

The methodology applied for this environmental review of the project consisted of a combination of documentation review, site visit and interviews with company technical representatives.

13.2 Environmental Legal Framework

In Guyana, the development of mining projects is subject to various environmental laws and regulations aimed at minimizing the ecological impact of such activities. Key laws and regulations include:

- Environmental Protection Act (1996): This is the primary legislation governing environmental protection in Guyana. It requires mining companies to conduct Environmental Impact Assessments (EIAs) before commencing any large-scale mining activities. The EIA process involves public consultations, and the final approval is granted by the Environmental Protection Agency (EPA).
- Mining Act (1989): This law regulates all aspects of mining in Guyana, including environmental management. It sets guidelines for land reclamation, pollution control, and waste management. The act ensures that mining operators follow environmental best practices.
- Forest Act (2009): For mining operations in forested areas, the Forest Act plays a significant role. It mandates sustainable forest management and prohibits unauthorized deforestation. Miners must obtain permission from the Guyana Forestry Commission (GFC) before disturbing forested lands.
- Water and Sewerage Act (2002): This legislation ensures that mining activities do not contaminate water sources. The act regulates the disposal of mining effluents into rivers and other water bodies, with strict penalties for non-compliance.
- Wildlife Conservation and Management Act (2016): To protect biodiversity, this act safeguards endangered species and their habitats from destruction caused by mining operations. Mining companies must ensure that their activities do not harm wildlife or protected ecosystems.
- Amerindian Act (2006): Since many mining activities occur in areas inhabited by indigenous communities, the Amerindian Act requires consultation with and consent from local Amerindian villages. Mining projects must respect the land rights of indigenous peoples and adhere to agreements made with these communities.

These laws are enforced by various regulatory agencies, including the Environmental Protection Agency (EPA), Guyana Geology and Mines Commission (GGMC), and Guyana Forestry Commission (GFC). Mining companies are required to follow environmental management plans and are subject to periodic inspections to ensure compliance with environmental standards.

13.3 Status of Environmental Studies

According to the description in the technical report prepared by SLR in 2021, a total of five Environmental and Social Impact Assessments (ESIAs) have been prepared for the project to date, as follows:

- The ESIA prepared in 2010 by Ground Structures Engineering Consultants (GSEC) facilitated the issuance of the Environmental Permit for the Aurora Mine by the Guyana EPA.
- A subsequent ESIA was completed in 2010 by ERM at the request of the IFC, a member of the Lenders' Group that financed the mine's construction.
- In 2013, Environ International Corporation (Environ, 2013a) updated the 2010 ERM ESIA at the IFC's request.
- An ESIA was prepared in 2015 by GSEC to update the 2010 GSEC ESIA, serving as a prerequisite for the renewal of the Environmental Permit. The relevant environmental permits were issued based on this ESIA.
- Another ESIA was compiled by GSEC to support the proposed underground mining operations, as required by the Construction Permit for the Underground Exploration Mine Decline. This ESIA was later revised and resubmitted in February 2020.

SRK has been provided the latest 2020 ESIA as part of this environmental review. The 2020 ESIA (GSEC, 2020) includes comprehensive baseline information, a detailed project description, an impact assessment, management and mitigation plans, reclamation and mine closure plan. International policies reviewed in relation to the preparation of this ESIA include the Protocol Concerning Pollution from Land-Based Sources and Activities (LBS), the Basel Convention, the Protocol Concerning Specially Protected Areas and Wildlife (SPAW), the Treaty on Cooperation for the Development of the Amazon Basin, and the UN Framework Convention on Climate Change (UNFCCC).

Before assessing the environmental and social impacts of the project, a baseline characterization of the environmental and social variables in the project areas was conducted. The biological baseline was developed based on the results of all biodiversity studies conducted at the project site, spanning from 2006 to the present. A literature review was also performed to supplement the biodiversity baseline, focusing on the area's biodiversity, and the findings from this review were incorporated into the biological baseline characterization. The most recent environmental baseline study was conducted in 2022 by a local environmental consulting firm. Such studies are planned to be conducted every two years.

In addition, the project has developed several individual environmental management plans, covering areas such as biodiversity, hazardous materials, reclamation and mine closure, surface water and groundwater monitoring, and waste management.

13.4 Flora and Fauna

Based on the ESIA, extensive biodiversity baseline studies were conducted in the Project Area of Influence (AOI) across wet and dry seasons in 2006, 2009, 2010, and 2011. These studies revealed that the Project is not located within a fully intact or undisturbed primary forest. Instead, it occupies a forested area with limited biodiversity, which has been significantly affected by decades of artisanal and small-scale mining (ASM), logging, hunting, and other human activities.

Floral assessments conducted from 2006 to 2011 identified and documented a wide range of plant species,, with the dominant families being Annonaceae, Lecythidaceae, Palmae, Guttiferae, and Burseraceae. The recorded plant species were classified according to the International Union for Conservation of Nature (IUCN) Red List. Among them, Coxipia enflexa and L. heteromorphais are categorized as Endangered, Eschweilera alata and Quiina indigofera are listed as Rare, and Couratari guianensis is considered Vulnerable. The majority of the species identified within the concession are widespread throughout their respective ranges within the Guiana Shield and Amazonia.

The faunal assessments from 2006 to 2011 documented a wide variety of species in the AOI, including mammal, bird, fish, herpetofauna, and macro invertebrates. All these species were also categorized by the IUCN Red List. Notably, the Vulnerable category includes species such as Myrmecophaga tridactyla, Patagioenas subvinacea, and Lachesis muta. Species listed as Near Threatened include Ateles paniscus, Harpia harpyja, and Amazona farinosa. Additionally, Leptodactylus lutzi and Pteronura brasiliensis are classified as Endangered. A specialized survey for giant otters (Pteronura brasiliensis) was completed along the Cuyuni River, including the Julian Ross Itabu Branch, and various tributaries in 2009, by international giant otter specialist Dr. Nicole Duplaix. No Otters or recent evidence of their presence was observed. Dr. Duplaix concluded that the habitat was not suitable given the high level of turbidity in the rivers (largely from ASM activity upstream of the study area) and that the two lone individual specimens sighted in multiple years of baseline field work were likely migrants passing through the area and not resident.

Based on the Biodiversity Management Plan (2023), the Guyana Shield Initiative (GSI) Priority Area No. 20 (Cuyuni) is located to the north of the Aurora concession and north of the Cuyuni River and traversed by the existing Barama Road. It is included for its importance for floristics, reptiles, and mammals; however, no specific information to substantiate this biogeographic distinctiveness is available in the GSI report. The other areas are remote from the Project AOI. In addition, no governmental or non-governmental organizations (NGOs) have identified any areas within the concession as conservation priorities. Conservation efforts in Guyana have generally been focused on larger, more intact forest landscapes in central and southern Guyana or in the Rupununi Savannas region. Likewise, the project AOI does not contain any established or proposed protected areas.

Based on the ESIA, a Biodiversity Monitoring and Evaluation Plan (BMEP) was developed to assess and monitor the potential effects of project operations on local wildlife in 2015. Biodiversity monitoring activities commenced shortly after the start of construction, with surveys conducted throughout 2015 to 2019. In addition, opportunistic sightings of species were recorded in 2015, 2016, 2018, and 2019 as part of the monitoring program. The first three years of monitoring (2015-2017) showed positive signs of biodiversity recovery, particularly in the abundance of several bird families and mammal species. While the biodiversity recovery was not in species numbers but in species abundance. In addition, few signs of declines in species numbers were observed with the Point Count and Camera Trap surveys. There were no signs of hunting activities observed during the period from 2016 to 2018.

Combined with the relatively stable abundance of game species in the Control Forest, these findings suggest that AGM's operations have not created a refugium effect for hunted species.

SRK conducted a review of the ESIA and the Biodiversity Management Plan (BMP) of AGM. These reports outline the main ecological impacts of the project during its construction, operational, and closure phases. The reports also propose a series of measures to mitigate these impacts on vegetation and wildlife. SRK has reviewed the proposed measures, such as minimizing the project footprint, progressively restoring habitats, and reducing noise generated by vehicles, equipment, and mining operations, and concluded that these measures are both reasonable and feasible and should effectively mitigate the ecological impacts of the project.

13.5 Water Management

The mine site area is drained by the Cuyuni River, which borders the site to the north, along with several associated tributaries, including Gold River located to the east of the site. With a length of approximately 750 km, the Cuyuni River extends in a general west-east direction from its headwaters in Venezuela to the Essequibo River in Guyana. The basin covers an area of approximately 53,500 square kilometres (km^2).

The AGM project camp's water supply mainly relies on two pumps to extract groundwater. Once the pumps draw the groundwater, it is injected into water pipes and treated with a chemical agent (bleach). The water is then pumped to the water treatment facility for pressurization, followed by five filtration processes, including three sand layer filters and two carbon layer filters. These filtration devices are replaced annually. After filtration, the water flows into a disinfection unit, where ultraviolet (UV) light is used for sterilization. Following disinfection, the water undergoes another round of chemical treatment. The treated water is then pumped to the mountaintop water pipes and supplied to the camp and kitchen through gravity. Besides, potable water is also harvested during the rainy season and raw water for potable use is collected in a series of lined reservoirs and storage tanks and treated in appropriately sized modular water treatment plants. Samples of drinking water are tested at the Government Analyst Department to ensure it conforms to drinking water standards.

The tailings and water management systems are integrated. Runoff water and tailings supernatant are collected in the TMA pond, from where a barge-mounted pump conveys the reclaimed water through a pipeline to the processing plant. Excess Tailings Management Area (TMA) water is discharged at the southeast corner of the facility through an overflow spillway to Diversion Pond 2 and then to a local receiving watercourse flowing northeasterly to the Cuyuni River. The TMA is equipped with an emergency spillway to prevent dam overtopping. The Fresh Water Pond (FWP) is located immediately east of the TMA. Overflow from the FWP discharges through a spillway into the Mine Water Pond (MWP). The MWP, located immediately south of the open pit mine, receives water from a 113 ha drainage basin, the 110 ha open pit mine drainage basin and groundwater inflow to the open pit mine. Discharges from the MWP flow through a set of 36" HDPE culverts to a tributary of the Cuyuni River. All water retention facilities are provided with adequate capacity to contain the design rainfall event and to eliminate the likelihood and frequency of spills that may impact on downstream waters and on groundwater quality. Based on the FS, water from the open pit and underground dewatering can meet the new water consumption for operations and firefighting requirements.

Aurora reports surface and groundwater quality monitoring on a quarterly basis to the EPA in compliance with permit conditions. Surface water monitoring includes discharge points and retention ponds within the operation, as well as rivers (up and downstream points). Monitoring boreholes are located up and downstream of potential pollution sources such as the landfill and tailings facility. Water quality data is compared to the IFC General and Mining Effluent Guidelines and IFC Guidelines for Waste Management Facilities where applicable, in addition to local guidelines from the General Environmental Guidelines in the Guyana National Bureau of Standards Interim Guidelines for Industrial Effluent Discharge into the Environment, 2002. These parameters were: pH, total dissolved solids (TDS), total suspended solids (TSS), turbidity, conductivity, organic compounds (phenol and oil and grease), major anions (Ca, Mg, Na, K), nutrients (total Kjeldahl nitrogen [TKN], total ammonia, phosphate, nitrate + nitrite), trace metals (Al, As, Cd, Co, Cr, Cu, Fe, Hg, Mn, Mo, Ni, Pb, Se, Sb, Zn).

From January to August 2024, monitoring data revealed that WAD Cyanide levels in the TMA spillway and slurry discharge fluctuated around the IFC Discharge Guideline limits. Instances where levels exceeded the recommended threshold were typically linked to increased calcium cyanide usage in gold extraction. Copper levels consistently surpassed the recommended limits for most monitoring months, largely due to the intensified use of copper sulfate in cyanide detoxification. However, the copper discharges from the tailing's spillway consistently stayed below the guideline. At the Aurora Drinking Water Treatment Plant, daily chlorine concentrations frequently exceeded the WHO guideline throughout the monitoring period. This increase was attributed to the manual addition of extra chlorine to compensate for the absence of functional UV lamps.

The potential negative impacts of the Aurora Project to surface water and ground water are due to the indiscriminate discharge of untreated production and domestic wastewater. In addition, the mining activities may lead to the change of the groundwater table. The main wastewater pollution sources of the project include mine dewatering water, processing wastewater, tailings and waste rock leachate, hazardous waste leachate, wastewater from maintenance workshop, contact water of industrial site, domestic sewage, etc. It should be noted that the mine drainage does not have a clear separation of clean and polluted water. However, during daily production, apart from vehicle washing and site cleaning in production areas (such as the processing plant and maintenance workshop), there is no additional wastewater discharge. However, the Aurora region experiences frequent rainfall and high instantaneous precipitation, leading to surface runoff. Based on the ESIA, wastewater from workshops and from drilling operations will be directed to oil-water separators. All water from the oil/water separators will be skimmed prior to discharge to surface water. Only water which attains EPA approved water quality standards will be discharged directly to the environment from the underground operations. Domestic sewage from the processing plant and operations and maintenance facility is collected from portable units and septic systems around the site by a certified waste contractor. The vacuum truck then empties the domestic sewage into the sewage treatment process facility where it is then treated. However, the original Sewage Treatment Plant (STP) effluent quality does not meet discharge standards. It is noted that the initial commitment to comply with International Finance Corporation (IFC) effluent quality limits is unrealistic and therefore the mine plans to amend the effluent discharge limits with the regulator.

The original Sewage Treatment Plant (STP) ceased operations in 2022. In the same year, AGM installed a new sewage treatment facility, which became fully operational in 2023. However, the initial treatment plant is currently still used as a storage facility to collect wastewater from the camp and offices before transferring it to the new treatment facility. All domestic wastewater are treated to meet local discharge standards, and then discharged into the forest behind the new treatment plant.

SRK recommends that quality monitoring be undertaken of the groundwater and surface water resources within the project area (including upstream and downstream of the project area), and also any site water discharges. This water quality monitoring should form part of a broader site environmental monitoring program. SRK also recommends the Company construct an effective drainage system to divert run-off from undisturbed areas around disturbed areas. In addition, some prevention measures, such as surface hardening, ground seepage control and second containment facility, are recommended to mitigate the water pollution risks.

13.6 Waste Rock and Tailings Management

Waste rock is dumped in the Waste Rock Dump (WRD), with a portion being utilized for road construction and reinforcing the dam structure of the Tailings Management Area (TMA). The WRD is situated to the east of the open pit and was originally designed to accommodate LoM waste. However, in 2019, subsidence was observed in the northeast corner of the WRD, where the foundation rests on a riverside swamp. As a result, AGM ceased dumping in the eastern section, leading to a decrease in the WRD's capacity. To address this, a new dump site has been established east of the processing plant. In December 2019, the Guyana Geology & Mines Commission (GGMC) conducted its annual environmental inspection at the site. A key concern highlighted was the Mine's failure to strip and stockpile topsoil for future rehabilitation, contrary to standard practices. According to the mine reclamation and closure plan, most of the waste rock will be backfilled after the closure of the pit and used as a photovoltaic site. The stripped topsoil is used for tailings dam construction and greening soil cover.

The tailings are deposited into the Tailings Management Area (TMA). The TMA is located approximately one kilometre southwest of the processing plant and has an elliptical shape, covering an area of 240 hectares. The tailings dam is constructed in phases to provide the necessary storage capacity for the tailings. The planned final crest elevation of the main tailings dam is 78.0 meters, with a maximum dam height of 28 meters, and the TMA will have a storage capacity of 22.14 million cubic meters of tailings. The supernatant from TMA is pumped from a barge-mounted pump through a two-kilometre pipeline back to the processing facility. In the beneficiation process, cyanide detoxification is carried out using the sulfur dioxide-air method to reduce the levels of Weak Acid Dissociable (WAD) cyanide in the tailings, ensuring safe disposal. Sodium metabisulfite (SMBS) supplies the sulfur dioxide, while copper sulfate acts as a catalyst for the reaction.

No geochemical characterization of waste rocks or acid rock drainage assessment has been sighted as part of this review. Acid rock drainage (ARD) refers to the acidic water that is created when sulphide minerals are exposed to air and water and, through a natural chemical reaction, produce sulphuric acid. ARD has the potential to introduce acidity and dissolved metals into water, which can be harmful to surface and groundwater. Based on static and kinetic geochemical testing conducted by Klohn Crippen Berger at the feasibility stage (Tetra Tech, 2013a), it has been determined that the tailings are unlikely to produce acid or release metals. Similarly, the 2020 Mine Reclamation and Closure Plan indicates that results from static and kinetic humidity cell testing show that acid rock drainage (ARD) is unlikely to occur in any waste rock, overburden, or saprolite stockpiles.

For detailed designs of WRDs and TMA, as well as information on waste rock and tailings discharge volumes, please refer to the preceding mining and processing chapters.

13.7 Air and Noise Emissions

Prior to the mine's development, industrial activity in the area was minimal, with air emissions primarily from natural vegetation decay and limited equipment use for dredging and artisanal mining. The 2020 ESIA assessed air pollution sources across the construction, operation, and closure phases, identifying dust and combustion emissions from activities such as land clearing, material handling, vehicle movement, stockpile wind erosion, and heavy equipment operation. Mitigation measures included minimizing material drop heights, limiting vehicle speeds, employing dust suppression techniques, and providing protective masks. Air quality monitoring includes parameters like PM_{10}, $PM_{2.5}$, CO, NO_x, SO_2, VOCs, etc. However, the monitoring program and data were not made available to SRK for review. The ESIA referenced international standards on greenhouse gas (GHG) emissions, such as IFC Performance Standard (PS) 3 and the UNFCCC, but it did not address the impacts or management of GHG emissions. During the site visit, SRK learned that the mine was proactive in GHG reduction and installed the solar panels on-site, which have reduced carbon emissions by 2,000 t with a 3-megawatt (MW) first-phase project, while the second phase is projected to generate 15 MW annually, cutting emissions by an additional 10,000 t. Monthly CO_2 emissions from January 2023 to August 2024 were calculated based on diesel consumption for production and residential use, but this method excluded indirect emissions from operations and transportation, and emissions from waste, materials, and food consumption. SRK recommends further research on energy consumption coefficients per unit output, comprehensive GHG emissions calculations, and a robust decarbonization strategy.

Noise generating sources are from heavy equipment and earthmoving machines operation, process equipment such as crushers and grinders, blasting operations associated with mining operations, maintenance operations in workshops and the process plant area, and diesel power generation plants, etc. Based on the hourly noise measurements conducted by AGM in 2015-2016, all noise measurements at the Mill are in compliance with Guyana's guidelines on noise emissions, since measurements were below the noise rage of 80-100 decibels. Primary noise receptors considered in the area will be individuals involved in operation activities. In addition to the earthen noise barriers created to minimize impacts on the housing area, additional mitigation measures include installation of sound suppression devices, employing best available work practices on-site, isolation of noise sources, use of personal protective equipment (PPE) etc. Blasting operations, which may cause vibrations and air blasts, will be managed by designing blasts with appropriate charge weights, powder factors, explosive types, delay periods, and geometric parameters. Although SRK has not reviewed the noise and vibration monitoring plan, it considers the air and noise pollution management measures proposed in the project's ESIA to be reasonable and feasible and recommends full implementation of these measures during operations.

13.8 Hazardous Substances Management

Hazardous materials have the characteristics of corrosive, reactive, explosive, toxic, flammable and potentially biologically infectious, which pose a potential risk to human and/or environmental health. The hazardous materials will be generated mainly by the project's construction, mining, and processing operations and include of hydrocarbons (i.e. fuels, waste oils, and lubricants) and oil containers, batteries, medical waste, etc. The leaks, spills or other types of accidental releases of hazardous materials may have negative impact on soils, surface water, and groundwater resources.

The main hazardous materials for the Aurora Project comprise the storage and handling of processing reagents, reagents containers, waste oil, waste oil drum, explosives, etc. The latest ESIA (GSEC, 2020) includes the management plans for explosives, cyanide and hazardous materials management. A separate hazardous materials and transportation management plan has been developed by the AGM in 2020. This standalone plan outlines the preparedness, prevention, response, and recovery measures to be taken in the event of a hazardous materials incident during transportation from Georgetown to the mining site. In addition, a hazardous materials management procedure was prepared in 2022 to manage the procurement, transportation, storage, and use of hazardous materials at the mine site.

During the 2024 site visit, the explosives storage magazine was examined. The area is monitored by closed-circuit television (CCTV) and guarded by local Guyanese police. Only licensed personnel are allowed access to the area, and the transportation of explosives must also be supervised by local police. A new explosives storage facility is currently under construction. All waste batteries generated by the project are stored at the on-site landfill. The Environmental Officer arranges for trucks to transport the used batteries back to Georgetown for recycling. Additionally, SRK has learned that all waste oil produced by the project is collected at this site. Of the waste oil, 90% is incinerated, while the remaining 10% is reused during blasting operations. Discarded oil drums are disposed of in the landfill. Currently, the landfill is nearing full capacity, necessitating a redesign and planning effort to ensure sufficient space for the disposal of waste generated on-site.

SRK recommends that the collected waste oil, oil drums and reagents be stored with secondary containment which is in line with the recognised international industry management practices. Due to the use of cyanide in the processing, SRK recommends that the cyanide purchase, transportation, handling/storage, use, equipment decommissioning, operation safety, emergency response, training, etc. should comply with the practical principles and standards of the International Cyanide Management Code.

13.9 Mine Closure and Rehabilitation

The site closure and rehabilitation planning process involves identifying stakeholders, consulting with them to establish closure criteria and post-operational land use, maintaining consultation records, setting rehabilitation objectives, defining site closure liabilities, creating management strategies and cost estimates, and establishing a financial process for closure. It also includes planning post-closure monitoring activities to ensure compliance with the rehabilitation objectives.

SRK has sighted a Mine Reclamation and Closure Plan (MRCP) for Aurora Gold Mine which was prepared by Proficiency Services in 2021. This MRCP is an update to the "Mine Reclamation and Closure Plan Update prepared by Rockstar International Corporation in August 2020. This "Mine Reclamation and Closure Plan Update December 2021" (herein referred to as the "Plan") is being submitted by AGM as a requirement of the permit issued by EPA (Guyana EPA 2017), the Aurora Mineral Agreement (GGMC 2011) and Aurora Mining Licence (GGMC, 2011). This plan outlines the regulatory framework and reclamation standards, biophysical settings, progressive and final reclamation activities, monitoring plan, adaptive management strategies, reclamation schedule and cost estimation.

Before mine development, the primary land uses in the area included small-scale gold mining, commercial forestry, and wildlife habitat. Agriculture was absent from the region, and baseline assessments indicated that the site had low agricultural potential. The primary goal of the reclamation program is to restore all areas disturbed by mining operations (excluding pit walls) to a land capability equal to or greater than what existed before mining, averaged across the property. In alignment with previous updates to the Reclamation and Closure Plan, wildlife habitat remains the designated primary end-use for the land. As outlined in the 2021 MRCP, progressive reclamation of certain areas began in recent years, with vegetation assessments conducted in 2017. This MRCP will undergo regular updates, with progressive reclamation plans, practices, and activities evaluated using the adaptive management techniques outlined in the Plan. Additionally, annual reviews will be conducted to assess progressive reclamation opportunities and document activities completed in the preceding year.

The MRCP summarizes the independently prepared cost estimates associated with decommissioning, reclamation, closure, and post-closure monitoring activities as described in the Life of Mine (LoM) plan using third-party contractors. Based on a site visit conducted in December 2021, the 2020 technical report prepared by RPA, design reports, studies, and other relevant information sources, the total estimated cost for reclamation and mine closure is 7,218,508 USD. According to mining regulations, the mining operation is required to post an environmental bond. This bond is held and not released until the mining company has completed the cleanup and closure activities in compliance with the specified requirements. As stated in the SLR technical report of 2021, AGM posted a cash Environmental Bond of $200,000 for the Aurora Mining Licence on November 18, 2011.

13.10 Social Considerations

The Aurora Gold Mine is located in Guyana, South America, approximately 170 km west of the capital city, Georgetown, and about 130 km northwest of Bartica, where the Essequibo and Cuyuni Rivers meet. Bartica serves as a regional transportation hub for accessing Guyana's northwestern interior. Exploration activities have been ongoing in the general area of the Aurora Gold Mine since the 1940s. The region in Guyana where the mine is located is largely uninhabited, with the nearest settlement approximately 50 km away.

Socio-economic assessments related to the Aurora Gold Mine have been carried out since at least 2010. According to the latest ESIA, there are no established or informal settlements within the boundaries of the Mine's Mining Licence or its designated environmental Area of Influence (AOI). Furthermore, the AOI does not include any officially recognized Amerindian lands or areas commonly used by Amerindian communities. The nearby population is predominantly composed of artisanal miners and a loosely organized community providing informal support services.

Two informal communities fall within the Mine's direct social Area of Influence (AOI): Aranka Mouth, a settlement focused on commerce with artisanal miners, located 16 km downstream on the Cuyuni River; and Buckhall, near AGM's logistics and export facility on the Essequibo River, where residents are involved in logging, artisanal mining, and small-scale commerce. The latest ESIA confirms that the Mine's environmental AOI does not overlap with any titled Amerindian lands or areas commonly used by Amerindians. The nearest Amerindian community is located approximately 50 km upstream along the Cuyuni River.

The 2020 ESIA states that Guyana Goldfields conducted a thorough evaluation of the project area, including Buckhall facilities and the access route to the mine, led by Guyanese archaeology expert Dr. Mark Plew in 2002. The assessment found no archaeological sites or areas of interest, though it noted the potential for incidental discoveries, such as pottery shards or stone artifacts of Amerindian origin. Dr. Plew concluded there is a low likelihood of significant archaeological finds. Since beginning operations in 2000, the Aurora Gold Mine has encountered no cultural or archaeological artifacts, and previous investigations support the conclusion that such resources are unlikely within the project area. No Archaeological studies were conducted for the underground mine development.

Since 2010, social risks and impacts have been identified and refined through the ESIA process and systematically managed throughout the Life of Mine (LoM). The latest ESIA highlights key risks, including potential population influx to the mine site and nearby communities like Buckhall, with associated health, security, and conflict risks; challenges related to artisanal mining; and socioeconomic impacts on the nation after the operations phase ends.

SRK has reviewed Social Responsibility System which was prepared by the AGM in October 2023. The document outlines the corporate standards of the Aurora Gold Mine, focusing on key areas such as employee rights, supplier and customer protection, environmental sustainability, and public welfare. It emphasizes compliance with laws, ethical practices, and community engagement. The system also mandates regular evaluations, transparency through reporting, and continuous improvement to ensure the company fulfills its social responsibilities effectively.

AGM has also developed the following conceptual plans to manage social risks, including:

- Community Development Plan - aims to create lasting positive impacts through education, healthcare, infrastructure, economic growth, and environmental stewardship, fostering sustainable growth, strong community ties, and improving local residents' well-being.
- Relocation and Settlement Plan - outlines a systematic approach to managing employee, family, and community relocations due to company operations. The plan ensures a smooth transition, minimizes disruptions, and supports all parties' well-being, covering logistics, housing, community integration, and support services.
- Stakeholder Development Plan - focuses on identifying, engaging, and managing relationships with relevant stakeholders, aiming to build positive, sustainable connections that benefit both business success and community well-being.

The SLR technical report (2021) states that community engagement was initiated during the preparation of the initial ESIAs in 2010 and continues proactively with communities and stakeholders potentially affected by the company's operations. AGM maintains close cooperation with local government authorities, elected officials, NGOs, and various communities to ensure transparency about its activities and to maximize benefits while minimizing negative community impacts.

14 Capital Expenditures and Operating Expenses

This section summarizes the Capital expenditures ("Capex") and Operating expenditures ("Opex"). The mine's capital and operating costs have been estimated by AGM as part of their 2024 Budget and Life of Mine (LoM) planning process. The estimates are based on actual costs incurred by AGM, as well as projected operating and capital expenditures for the LoM.

14.1 Capital Expenditures

The Capex for the AGM over its LoM is estimated at USD 439 million. The largest portion of this expenditure is allocated to contingency, amounting to USD173 million, which serves as sustaining Capex due to the absence of specific sustaining data. This represents 5% of the initial development costs. These initial development costs include investments in underground mine infrastructure (USD 128 million), Rory's Knoll Phase II Construction (USD 138 million), the technical upgrade and renovation of the mineral processing plant (USD 0 million), farm construction (USD 0 million), and the expansion of magazines (USD 0.15 million). Mine closure costs are projected at USD 7.22 million and is allocated evenly over the LoM.

The summary of Capex is presented in Table 14-1.

Table 14-1: Summary of Capex for AGM

Item	Unit	LoM Total
Underground mine infrastructure	USD Million	128
Expansion of Magazines	USD Million	0.15
Mineral Processing Plant Technical Upgrade and Renovation	USD Million	–
Farm construction	USD Million	–
Rory's Knoll Phase II Construction	USD Million	138
Mine Closure	USD Million	7.22
Contingency	USD Million	173
Total	**USD Million**	**439**

14.2 Operating Costs

The costs in years 2022 to 2024 are shown in Table 14-2 and Table 14-2. The operating costs are shown in Table 14-3.

Table 14-2: Summary of Expenses in Years 2022 to 2024

Item	Unit	2022	2023	2024
Cash cost-mining	US$	51,545,634	67,476,575	84,105,342
Cash cost- processing	US$	34,056,363	35,842,161	39,916,508

Sources: AGM

SRK considers the historical three-year weighted average cost to be reasonable and uses it for future economic evaluations. For future underground mining at Rory's Knoll, the weighted average cost from Aleck Hill and Mad Kiss will be applied, along with the additional backfill costs, and is estimated to be USD 52.65 per tonne. The Opex forecasts are shown in Table 14-4 over the life of mine.

Table 14-4: All-in Opex and Sustaining Forecasts

14.3 All-in Sustaining Costs

All-in sustaining costs (AISC) in the years 2022 to 2024 are summarized in Table 14-5. Based on the LoM schedule and cost estimates, the AISC for the Project is shown in Table 14-4.

Table 14-5: All-in Sustaining Costs in 2022 - 2024

Item	Unit	2022	2023	2024
Annual AISC	US$	157,203,122	166,165,355	205,580,314
Gold sales	oz	89,110	97,035	130,809
AISC	US$/oz	1,764	1,712	1,572

15 Economic Analysis

The economic analysis presented in this section is based purely on the results of the technical review provided above and some key assumptions and is provided for technical evaluation and Ore Reserves estimation purposes only. The economic analysis of AGM was conducted using conventional Discounted Cash Flow ("DCF") techniques. The Net Present Value ("NPV") was determined from the project's cash flow using a discount rate range of 5% to 15%. Additionally, a sensitivity analysis was performed to assess the impact of variations in capital cost, operating cost, and pricing.

15.1 Metal Prices

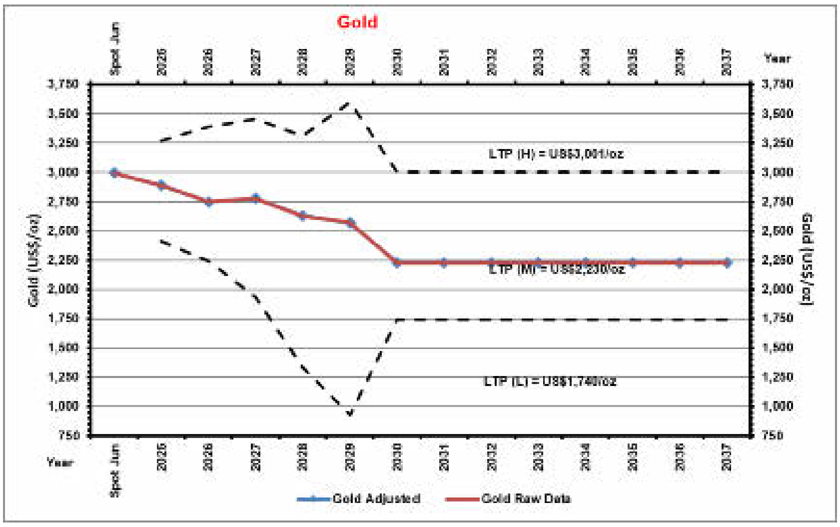
Valuable metallic elements for the project is gold.

The historical gold price trend is shown in Figure 15-1. The price forecast of Consensus Market Forecast ("CMF") is shown in Figure 15-2.

Figure 15-1: Gold Price Trend in History

Sources: goldprice.org

Figure 15-2: Gold Price Forecast



Sources: CMF on 17 March 2025

Table 15-1 lists the prediction on price of gold as used by SRK in the 2nd quarter of 2025, which is based on CMF predictions, considering various forecasts made by other professional institutions. Gold price predictions were updated by using latest data.

Table 15-1: Forecasted Metal Prices by SRK in the 2nd Quarter of 2025

Metal	Unit	2025	2026	2027	2028	2029	2030	Post-2030
Gold	US$/ oz	3,016	3,000	2,800	2,751	2,500	2,275	2,275
Gold	US$/ g	96.97	96.45	90.02	88.45	80.38	73.14	73.14

Source: Zijin Gold International

15.2 Depreciation, Tax and Royalties

The royalty on gold production is set at 8% of revenue.

The initial capital expenditure (Capex) and sustaining capital expenditure (Sustaining Capex) have been depreciated over the life of mine (LoM). The assumed depreciation follows a straight-line method over a period of 10 years.

15.3 Technical and Economic Analysis

15.3.1 Principal Assumptions

The cash flow estimate includes only the revenue, costs, taxes, and other factors directly associated with AGM. The assumptions are as follows:

- The ROM and finial products (gold doré) are based on the LoM schedule.

- The local currency is the Guyanese dollar; however, the financial report SRK has received is in US dollars, which is also used for the technical economic analysis.
- Annual gross revenue is calculated by applying the forecasted metal prices and metal payability to the annual recovered metal for each operating year.
- SRK does not consider future inflation or currency and cost fluctuations; the cost remains constant over the LoM.
- Financing is assumed to be on a 100% equity basis; no debt or related financing costs have been included in the technical economic analysis.
- Exploration Capex, which is aimed at discovering more Mineral Resources that is outside the Ore Reserves estimates, is not considered during this analysis.
- No salvage value has been included in the technical economic analysis.
- Working capital is not considered in the technical economic analysis since AGM is an operational mine.
- The reference date is 31 December 2024.
- Table 15-1 shows the gold price. These commodity prices are dynamic and are derived from consensus market forecasts provided by the Energy and Metals Consensus Forecast, published by Consensus Economics Inc., to which SRK subscribes annually.

15.3.2 Net Cash Flow

The projection for Project operation shows a positive economic prospect. The sensitivity of NPV against discount rate is presented in Figure 15-4. The annual cash flows are presented graphically in Figure 15-3 and in tabular form in Table 15-2 and Table 15-3.

15.3.3 Net Present Value Result

The net present values ("NPVs") at different discount rates were estimated by SRK through DCF model by using the assumptions outlined in the above Section 15.3.1, presented in Table 15-4.

Table 15-4: Estimated NPVs at Different Discount Rate

Discount Rate	5%	6%	7%	8%	9%	10%	11%	12%	13%	14%	15%
NPV	1,264	1,209	1,157	1,109	1,064	1,023	984	948	914	883	853

15.3.4 Sensitivity Analysis

SRK conducted a single-factor sensitivity analysis for the Project to determine which factors most significantly impact its economics when considered independently. The analysis focused on metal prices, CAPEX, and OPEX, each tested within a ±30% range. The results showed that the Project is most sensitive to changes in gold prices and least sensitive to capital costs. Results of the sensitivity tests are presented in Table 15-5 and Figure 15-5.

Table 15-5: Sensitivity Analysis Result (@10% Discount Rate)

Variance	OPEX	CAPEX	Price
	NPV @ 10% annual discount rate (US$ Millon)		
-30%	1,325	1,128	327
-25%	1,274	1,111	443
-20%	1,224	1,095	559
-15%	1,174	1,077	675
-10%	1,123	1,060	791

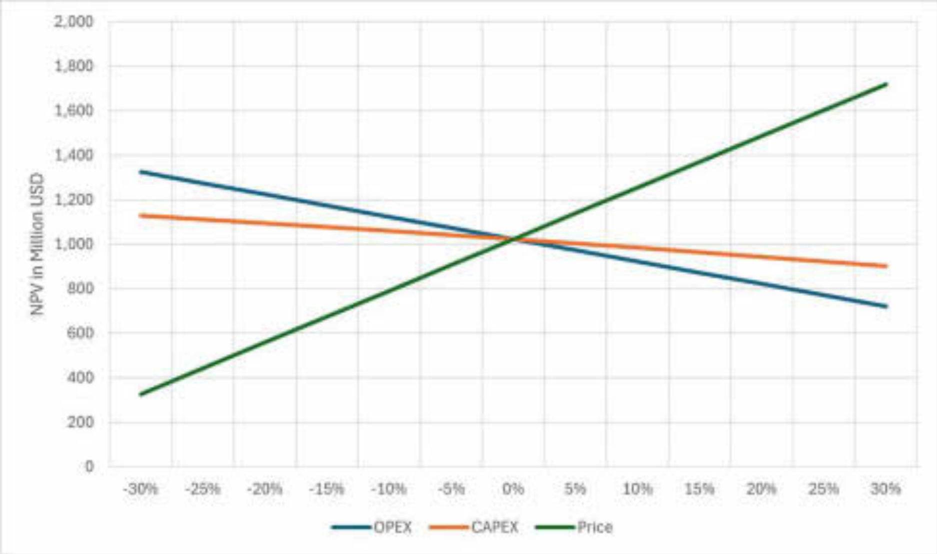
Source: SRK

THIS DOCUMENT IS IN DRAFT FORM, INCOMPLETE AND SUBJECT TO CHANGE AND THAT THE INFORMATION MUST BE READ IN CONJUNCTION WITH THE SECTION HEADED "WARNING" ON THE COVER OF THIS DOCUMENT.

Figure 15-5: Sensitivity Spider Chart (10% Discount Rate)



Source: SRK

It can be seen that the changes in prices have the greatest impact on the Project's NPV, while OPEX and CAPEX have smaller effects.

To clarify the effects of prices on the Project's NPV, SRK estimated that the break-even price (NPV=0, at 10% discount rate) is around a change of -42% from the base scenario prices used in the model. In other words, the price drops to about 58% of the forecasting price, the Project NPV will become negative.

16 Risk Assessment

SRK completed a risk assessment of the specific risks identified for the AGM Project in relation to their likelihood of occurrence within the LoM and consequence.

In general, the risk of a project decreases from exploration, through development, to the production stage. The AGM Project is an advanced project.

SRK considered various technical aspects which may affect the feasibility and future cash flow of the AGM Project. SRK's final Risk Assessment is presented in the following table.

Table 16-1: Risk Assessment for AGM Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Unlikely	Major	Medium
Unexpected Groundwater Ingress	Possible	Moderate	Medium
Significant Unexpected Geological Faulting	Possible	Moderate	Medium
Mining			
Significant Production Shortfalls (LoM)	Unlikely	Major	High
Pumping System Adequacy	Unlikely	Moderate	Low
Excessive Surface Subsidence	Unlikely	Moderate	Low
Poor Underground Condition	Possible	Moderate	Medium
Poor Mine Plan	Possible	Moderate	Medium
Poor Road Transportation/Safety	Possible	Minor	Low
Ore Processing and Metallurgy			
Process Adaptability	Unlikely	Moderate	Low
Lower Throughput	Possible	Moderate	Medium
Lower Recovery	Unlikely	Moderate	Low
Low Plant Reliability	Unlikely	Minor	Low
Environmental and Social			
Lack of Relevant Environmental Permit	Unlikely	Moderate	Low
Impact on Flora and Fauna	Possible	Minor	Low
Water Contamination	Possible	Moderate	Medium
Hazardous Materials Management	Unlikely	Moderate	Low
Social Aspects	Unlikely	Moderate	Low
Capital and Operating Costs			
Project Timing Delay	Possible	Moderate	Medium
Capital Cost Increases	Possible	Minor	Low
Capital Costs- Ongoing	Possible	Minor	Low
Operating Cost Underestimated	Possible	Minor	Low

17 Conclusions and Recommendations

17.1 Geology and Mineral Resources

- The mineralization at Aurora is confined within a greenstone belt of the Paleoproterozoic GuianaShield in a series of folded metasedimentary, metavolcanics, and intrusive rocks. The gold mineralization fits an orogenic model, similar to many of the other gold deposits found within the Guiana Shield.
- The drilling, sampling, sample preparation, analyses, security, and data verification consistent with generally accepted industry practices and the primary sample results are therefore suitably reliable for use in Mineral Resource estimation.
- Total Mineral Resource at the Aurora Project as of 31 December 2024, are:
  - Measured: 2.2 Mt grading 2.80 g/t Au, containing 189 koz of gold.
  - Indicated: 40.3 Mt grading 2.65 g/t Au, containing 3,431 koz of gold.
  - Inferred: 36.9 Mt grading 2.06 g/t Au, containing 2,439 koz of gold.

SRK recommended continuing the collection of accurate production tonnages and grades by mine area, including estimated tonnages mined based on open-pit surveys of each blast. These data should be reviewed against the resource models before subsequent updates, as they are valuable for resource classification and the evaluation of outlier strategies.

17.2 Mining and Ore Reserves

Ore Reserves have been estimated for one open-pit deposit and three underground deposits, with the majority of the reserves hosted in the Rory's Knoll deposit.

As of 31 December 2024, the total Ore Reserves at the mine are as follows:

- Proved: 2.16 Mt grading 2.52 g/t Au, containing 5,458 kg of gold.
- Probable: 31.88 Mt grading 2.14 g/t Au, containing 68,068 kg of gold.
- Proved and Probable: 34.04 Mt grading 2.16 g/t Au, containing 73,526 kg of gold.

Open-Pit Operations:

- Rory's Knoll is the sole designed open pit with a remaining life of approximately 5–6 years.
- The pit operates using a conventional truck-and-shovel method, managed by contractors.
- Bench height is designed at 10 meters, with double benching extending to 20 meters.
- Mined materials are transported along haul roads with a maximum gradient of 10%.
- Double-lane haul roads are designed to be 14 meters wide, while single-lane roads are 10 meters wide, ensuring efficient access to the pit bottom.
- Open-pit operations at North Aleck Hill have been completed, and the pit has been backfilled.

Underground Operations:

- Underground mining at Rory's Knoll is scheduled to commence in mid to late 2026, with Phase 1 planned from 2027 to 2032 and Phase 2 extending to 2036.
- Underground operations at Aleck Hill began in 2024 and are expected to conclude by 2027.
- Mad Kiss began underground mining in 2023 and is anticipated to continue until 2026.
- Initial underground mining targets Aleck Hill and Mad Kiss due to their relatively shallow depths, enabling early access and extraction.

- Rory's Knoll employs a modified sub-level stoping method with tailings paste backfill to maintain geotechnical stability and achieve a production rate of 10,000 tonnes per day (tpd).
- Aleck Hill and Mad Kiss utilize sub-level open stoping without backfill, leveraging favorable rock conditions and geometry supported by sill and rib pillars.

Recommendation:

- Monitor rock temperatures during shaft deepening operations to ensure safe working conditions.
- Design an effective cooling system for Rory's Knoll to accommodate deeper mining sections as operations progress.
- Prioritize ground control measures for open stoping operations at Aleck Hill and Mad Kiss to maintain stability and safety.
- Assess and monitor rock failure risks as mining advances to deeper levels.
- Regularly monitor sill pillars and barricade mined-out levels to mitigate airblast risks.
- Implement robust measures to manage pit wall stability and mitigate flood risks at the Rory's Knoll open pit due to its proximity to the river. This is critical to preventing significant water ingress in the event of dyke or slope failure.
- Apply geotechnical recommendations, including slope monitoring, installation of piezometers, and rock quality assessments, for underground excavations to ensure safety and efficiency.
- Continuously monitor water inflow rates as shaft deepening progresses to prevent water-related challenges.
- Ensure the location and design of #3 Shaft include provisions for future operational scalability.
- Conduct feasibility studies to evaluate the potential for expanding mining operations to greater depths.
- Maintain detailed production data, providing breakdowns from each deposit and distinct stopes to optimize reporting and operational decision-making.

17.3 Processing and Metallurgy

- The AGM ore is a low sulphide content gold ore, with sulphide minerals including pyrite, chalcopyrite, sphalerite, and molybdenite. However, due to the lack of detailed mineralogical studies, the content, occurrence, and potential recoverability of these minerals remain unclear. SRK recommends conducting a comprehensive mineralogical study to determine the occurrence of gold and major sulphide minerals, which will provide mineralogical guidance for the comprehensive utilization of sulphide minerals.
- SRK also suggests performing flotation tests to investigate the feasibility of using a flotation + cyanidation process to achieve comprehensive recovery of copper, zinc, and molybdenum, as well as to reduce the cost of gold extraction.
- Gold in the AGM ore is amenable to cyanidation, and the gold leaching rate increases with finer grinding when the grinding fineness is below 80% passing 75 microns. The processing plant currently employs a gravity separation-CIP process. Before the plant upgrade in 2024, the grinding fineness has not reached the design specification, resulting in lower gold recovery.
- The 2024 upgrade design includes a CIP process with 22 hours of leaching and 8 hours of carbon adsorption. However, based on adsorption kinetics test results, the time required for complete

adsorption is as long as 30 hours. SRK recommends testing the gold concentration in the adsorption tailings solution to analyze whether the gold loss in the tailings solution is within a reasonable range and to explore the possibility of improving the gold adsorption rate.

17.4 Environmental Studies, Permitting, Social or Community Impact

Two Environmental Permits for the project were issued by the Guyana EPA pursuant to the Environmental Protection Act and the Environmental Protection (Authorizations) Regulations. These permits were issued based on the ESIAs prepared by GSEC (2010 and 2021). Since 2010, the project has developed multiple Environmental and Social Impact Assessments (ESIAs) to meet the requirements of local regulatory authorities. Some of these ESIAs were also prepared with reference to international standards. The most recent ESIA was completed in 2020, and its scope of study included underground mining. The 2020 ESIA (GSEC, 2020) includes comprehensive baseline information, a detailed project description, an impact assessment, management and mitigation plans, reclamation and mine closure plan.

AGM has established a range of environmental and social management plans addressing key areas such as biodiversity, hazardous materials, mine reclamation and closure, water monitoring (both surface and groundwater), waste management, stakeholder engagement, resettlement, and community development. The biological baseline was developed based on the results of all biodiversity studies conducted at the project site, spanning from 2006 to the present. Biodiversity baseline studies conducted between 2006 and 2011 across wet and dry seasons revealed that the project area is not within a pristine primary forest but a degraded forest with limited biodiversity, impacted by decades of artisanal mining, logging, hunting, and other human activities.

During the beneficiation process, cyanide detoxification is performed using the sulfur dioxide-air method to lower the levels of Weak Acid Dissociable (WAD) cyanide in the tailings, ensuring their safe disposal. Static and kinetic geochemical testing conducted by Klohn Crippen Berger during the feasibility stage indicated that the tailings are unlikely to produce acid or release metals. Additionally, the 2020 Mine Reclamation and Closure Plan confirmed that humidity cell testing results suggest acid rock drainage (ARD) is unlikely to occur in any waste rock, overburden, or saprolite stockpiles.

SRK recommends obtain all necessary environmental permits/approvals for the construction and production phase of underground mine. Those individual environmental and social management plans should be regularly updated, with conceptual plans revised to align more closely with actual production practices. It is also recommended to strengthen surface water and groundwater monitoring in the project area, particularly in the upstream and downstream regions of the TSF.

The cyanide purchase, transportation, handling/storage, use, equipment decommissioning, operation safety, emergency response, training, etc. should comply with the practical principles and standards of the International Cyanide Management Code. The MRCP should be updated regularly, with annual reviews to evaluate reclamation progress and record the activities completed in the previous year.

Closure

This report, Competent Person's Report of Aurora Gold Project in Georgetown, Guyana, was prepared by

Appendix A Mining License

ANNEX "A"

BLOCK : G-1

DESCRIPTION OF BLOCK

Tract of state land located in the Cuyuni Mining District No. 4 as shown on Terra Surveys Topographic Map 17NE,NW,SE,SW, at scale 1: 50,000 with reference point 'X' located at the confluence of the Abuya River and the Cuyuni River with geographical co-ordinates of longitude **59°54'37"W** and latitude **6°46'46"N**.

Thence at true bearing of **90°**, for a distance of approximately **8 miles 1423 yards**, to point of commencement.

Point A, located at geographical coordinates of longitude **59°46'55"W** and latitude **6°46'43"N**, thence at true bearing of **360°**, for a distance of approximately **1 mile 1383 yards**, to **Point B**, located at geographical coordinates of longitude **59°46'53"W** and latitude **6°48'16"N**, thence down the right bank of the Cuyuni River, for a distance of approximately 4 miles **512 yards**, to **Point C**, located at geographical coordinates of longitude **59°43'18"W** and latitude **6°47'32"N**, thence at true bearing of **135°**, for a distance of approximately **3 miles 115 yards**, to **Point D**, located at geographical coordinates of longitude **59°41'25"W** and latitude **6°45'38"N**, thence at true bearing of **181°**, for a distance of approximately **2 miles 1754 yards**, to **Point E**, located at geographical coordinates of longitude **59°41'29"W** and latitude **6°43'2"N**, thence at true bearing of **270°**, for a distance of approximately **1 mile 1622 yards**, to **Point F**, located at geographical coordinates of longitude **59°43'10"W** and latitude **6°43'2"N**, thence at true bearing of **315°**, for a distance of approximately **6 miles 68 yards**, to the point of commencement at **Point A**.

Thus enclosing an area of approximately **14339 acres** , save and except all lands lawfully held or occupied.

Appendix B JORC Code Table 1

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Before 2009: Samples (1.0–3.0 m) taken from core respecting lithological contacts after marking by geologists. • 2009–2012: Samples (0.5–3.0 m) based on geology, veining, and sulphides. Bedrock cut with a diamond saw, saprolite with a knife; quartz veins split with a core splitter or saw. • 2017–2020: Entire drill holes sampled (0.3–1.0 m), following consistent prior procedures. • 2021–2024: Zijin/AGM sampling at 1 m intervals with 5 m or 2–3 m buffer zones around mineralized areas. Bedrock cut with a diamond saw; saprolite sampled with a spatula.

Criteria	JORC Code explanation	Commentary
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Historical Drilling (Pre-2002): Drill Type: Core drilling. • GGI Drilling (2002–2012): Drill Type: Diamond drilling. Core Diameter: HQ (6.35 cm) and NQ (4.76 cm). Core Handling: Unweathered cores sawn onsite; recovery ranged from 95–100% (fresh rock) and 80–100% (saprolite). • GGI Drilling (2017–2018): Drill Type: Diamond drilling (all oriented). Orientation Methods: Reflex EZ-Mark system (2017): Ball level and physical pin impression to mark the bottom-of-hole. Reflex ACT-III system (2018): Downhole accelerometer for orientation data. Structural Logging: Data collected using protractors, beta-tape, goniometers, and Reflex IQ-Logger. • GGI Drilling (2019–2020): Drill Types: Diamond drilling (oriented)，Reverse circulation (RC) drilling for resource definition. Orientation Methods: Reflex ACT-III system for downhole orientation and Reflex IQ-Logger for structural data. Core Handling: Core cleaned post-drilling; logged and digitally photographed. RC drilling uses face-sampling bits.

Criteria	JORC Code explanation	Commentary
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Recording and Assessing Recoveries: Core recoveries: Fresh rock 95–100%, saprolite 80–100%. Logged with geological attributes like RQD. • Maximizing Sample Recovery: Core cleaning, careful handling, and secure transport/storage. Sampling intervals aligned with lithological/mineralization boundaries. Oriented drilling (Reflex systems) ensured accurate data. • Sample Recovery and Bias: High recovery rates suggest minimal loss or bias. No explicit link between recovery and grade noted.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Core logged for lithology, alteration, mineralization, structural features, and RQD, supporting resource estimation, mining, and metallurgical studies. • Both qualitative (descriptions) and quantitative (RQD, structural data). Core digitally photographed. • All drill core logged; percentage of intersections not specified but appears comprehensive.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Core was cut using a diamond saw or split with a knife (saprolite) or splitter, with half-core typically taken for analysis. • Reverse circulation (RC) samples were split using a riffle splitter or a linear splitting device; samples were handled dry. • Duplicate samples were prepared during splitting (e.g., 1 in every 10 or 5%). • Sampling aligned with lithological and mineralization boundaries. • Field duplicates and preparation duplicates were used to ensure representivity. • On-site checks conducted to verify laboratory results (e.g., 5% RC samples sent to MSALABS). • Sample sizes (300–1,000 g portions) were deemed appropriate for the grain size of the material and gold mineralization style.

Criteria	JORC Code explanation	Commentary
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Gold assays primarily used Fire Assay (FA) with Atomic Absorption Spectroscopy (AAS) and Gravimetric Finish for higher-grade results. • Screen fire assay was also employed for coarse reject samples. • Methods are considered total techniques, providing reliable detection of gold content. • CRMs, blanks, field duplicates, and Check Assays was used, • Quarter-core duplicates showed variability dependent on mineralization style but were sufficient for the project.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Significant intersections were independently verified by alternative company personnel or external consultants
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Drill collars were located using laser theodolites (2002–2012) and DGPS/RTK systems (2017–2020), ensuring precise spatial positioning. • Downhole surveys were conducted using Reflex EZ-Shot and Reflex ACT-III tools at intervals of 12–50 m for reliable trajectory measurement. • All coordinates recorded in the UTM Zone 21 North (PSAD56 datum) grid system. • Topographic control was deemed adequate and accurate, providing sufficient detail for Mineral Resource estimation.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Data spacing and distribution were sufficient to establish geological and grade continuity, supporting Mineral Resource classifications. • No sample compositing was applied; samples were analyzed individually respecting lithological and mineralization boundaries.

Criteria	JORC Code explanation	Commentary
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Sampling consistently respected geological and mineralization boundaries, minimizing bias. • Drill holes were generally oriented perpendicular to key mineralized structures to ensure unbiased sampling, though deeper holes intersected structures at a shallower angle due to practical constraints. • No material sampling bias related to drilling orientation and key mineralized structures was reported.
Sample security	• *The measures taken to ensure sample security.*	• 2004–2012: Samples were sealed in rice sacks and transported in company-owned vehicles with submission forms. Logging and sampling areas were in secure, fenced compounds. • 2017–2020: Samples were sealed with cable ties, packed in rice bags, stored in locked sea containers, and transported with submission forms under security checks. Retained core stored on-site; pulp samples stored securely in Georgetown. • 2021–2024: Samples prepared, sealed, and stored on-site except for samples in umpire programs, which followed prior security protocols.

Criteria	JORC Code explanation	Commentary
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Before 2009, the core was laid out for digital photography and then marked for sampling by a geologist. Sample lengths range from 1.0 m to 3.0 m respecting lithological contacts. • From July 2009 to 2012, samples were selected based on geology, veining, and sulphide mineralization. Sample lengths range from 0.5 m to 3.0 m and respect lithological contacts. Both bedrock and saprolite core were sampled. Un-weathered samples were cut in half using a diamond saw and saprolite core was cut in half with a knife, with fragments of quartz vein material split in a Longyear core splitter or by diamond saw. • From 2017 to 2020, sample procedures were the same as those used in previous campaigns, with consistent procedures ensuring data integrity, except that the entire length of the drill holes were sampled. Sample lengths range from 0.3 m to 1.0 m and respect lithological contacts. • From 2021 to 2024, the sampling followed the procedure prepared by the exploration team of Zijin/AGM INC. Samples are taken at 1 m intervals, ensuring they do not cross geological or mineralization boundaries. A 5 m wide buffer zone was generally sampled before and after a mineralized zone at 1-meter intervals, and 2-3 m buffer were sampled for narrow mineralized zones. Both bedrock and saprolite core were sampled. Un-weathered samples were cut in half using a diamond saw and soil or saprolite core was sampled with a stainless-steel spatula. • No QC program was in place prior to 2004. Drill holes dated prior to 2004 are not included in the current resource estimation. • To ensure the reliability and trustworthiness of exploration data, the comprehensive quality control measures were implemented throughout the exploration process of Aurora Gold Mine from 2004.A summary of QA/QC samples is provided in Table 6-3. The description and performance of the QC samples prior to 2021 have been documented in historical technical reports. In this instance, SRK primarily focused on the QAQC data from 2021 to March 2024.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Mineral tenement is shown in Chapter 3.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Exploration included drilling by Cuyuni, Geological Survey of Guyana, Denison, GGI and Zijin AGM
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The gold mineralization at the Mine exhibits features analogous to mesothermal or "orogenic" gold deposits
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Easting and Northing: UTM Zone 21 North (PSAD56 datum) coordinates used for precise spatial references. • Elevation (RL): Elevation above sea level recorded for each drill hole collar but specific values not provided. • Dip and Azimuth: Holes were drilled generally perpendicular to mineralized structures; specific dip and azimuth values vary by hole. • Downhole Length and Interception Depth: Not fully tabulated but drill programs indicate variable depths designed to intersect mineralization as close to perpendicular as possible. • Hole Length: Drill hole lengths ranged widely, with some boreholes extending over 1,000 m for deeper exploration.

Criteria	JORC Code explanation	Commentary
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• To define the extension of mineralised domains, an appropriate cut-off was applied for different deposit. • A grade capping was used
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• The drill holes were generally oriented perpendicular to the mineralized structures to achieve representative sampling. • For deeper holes, mineralization was intersected at shallower angles due to practical limitations, but the geometry was understood.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Appropriate maps and sections were reported in this Report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Details of individual drill holes are not considered Material to the overall Mineral Resource estimate presented in this Report and are omitted.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Detailed logging of lithology, alteration, mineralization, structural features, and Rock Quality Designation (RQD) conducted throughout exploration. • Bulk density and Metallurgical test results were detailed in the report ,and can support resource evaluation. • RQD data collected to assess rock characteristics.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Supplementary exploration is underway in AH and MK area

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• SRK conducted spot checks of the database against historical exploration program tables and maps, and found no flaws in the data. • Visual checks of the different generations and types of sampling data against each other also ensure database integrity
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• SRK visited the AGM Project site between 21 and 27 September 2024
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• This dataset provides a good definition of the dimensions for resource estimation. • SRK has adequate confidence in the geological interpretation. The overall interpretation of the continuity, extent, and orientation of the mineralised domains, based on the various phases of exploration, has been confirmed by operation
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The dimensions of the mineralised domains are presented in section7.5

Criteria	JORC Code explanation	Commentary
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	• SLR was requested by AMG to complete a NI43-101 compliant Mineral Resource estimation for the Aurora project in 2021. • The Mineral Resource estimation work for Rory's Knoll, East Walcott, Mad Kiss South, Walcott Hill, and Mad Kiss West was completed by SLR in 2021. SRK have reviewed the database, estimation methodologies and models used to prepare the Mineral Resource estimate using Leapfrog and were satisfied that they comply with reasonable industry practice. For Mad Kiss, Aleck Hill underground, North Aleck Hill, and Aleck Hill Open Pit Area, SRK updated the domains with additional drilling completed since the previous update and updated the Mineral Resources estimation using Leapfrog EDGE software. • Three-dimensional (3D) block grade estimation approach was applied for the Mineral Resource estimation. • Details are in section 7
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• Tonnages are estimated on a dry basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• a cut-off grade of 0.3 g/t Au for all deposits to open pit (OP) mining, 1.0 g/t Au for RK and 0.8 g/t Au respectively for satellite deposits to underground (UG) mining • Details are in section 7.14

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• SRK considers that the Aurora Project is amenable for open pit and underground mining. • Details are in section 7.14
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• Metallurgical testing and production practices have confirmed that the gravity separation-cyanidation process is suitable for AGM ore, achieving gold recovery rates of 90% to 95%.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Waste rock is dumped in the Waste Rock Dump (WRD), with a portion being utilized for road construction and reinforcing the dam structure of the Tailings Management Area (TMA). The WRD is situated to the east of the open pit and was originally designed to accommodate LoM waste. A new dump site has been established east of the processing plant. • The tailings are deposited into the TMA. The TMA is located approximately one kilometre southwest of the processing plant and has an elliptical shape, covering an area of 240 hectares. Based on static and kinetic geochemical testing, it has been determined that the tailings are unlikely to produce acid or release metals.

Criteria	JORC Code explanation	Commentary
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• Bulk density and specific gravity measurements were performed during historical programs, • SRK did not observe a correlation between mineralization and density measurements nor a significant relationship between lithology and density • The average value of different rock type was used for mineral resource estimation
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. • Details in section 7.12
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• No external audits or reviews of the Mineral Resource estimate have been taken place. • SRK carried out an internal peer review on the Mineral Resource estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• The relative accuracy of the Mineral Resource estimate is reflected in the Mineral Resource classification categories applied. • The Mineral Resource Statement reflects the global estimates of in situ tonnes and grade

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• The Mineral Resource estimate was reviewed by SRK in-house geologist(s) which is the basis of Ore Reserve Estimate dated 31 December 2024 • Reported Mineral Resource is inclusive of potential Ore Reserve material.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• Mr. Pengfei Xiao and a team including geologist Ms. Yanfang Zhao; processing engineer Mr. Lanliang Niu; mining engineer Mr. Falong Hu , Donghao Luo and environmental scientist Mr. Nan Xue, conducted the site visit from 22 to 25 June 2025.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• This project is an operating mine with 1 processing plant, fed from 1 open pit with two underground mine. • The Feasibility Study/ technical study was updated by Zijin Xiamen in 2025. • SRK reviewed technical studies, as well as the current mining plan and actual operation data, and supportive studies, the level of accuracy of the Modifying Factors proposed in the studies and/ or modified by the Company, are considered by SRK to be akin to a pre-feasibility level study ("PFS"), which are suitable for the Ore Reserve Estimates.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Due to the different mineralization type and applied different processing methodology to Rory's Knoll Open pit mine; and Aleck Hill, Mad Kiss and Rory's Knoll underground mine, different inputs for the Cut-off grade (COG) estimates were employed. The details of Open pit cut-off grade in the chapter 8.2.1, and the details of underground cut-off grade in the chapter 8.3.1.

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• The open pit mining method is applied to Rory's Knoll mines. The open pit optimization, detail design, scheduling processes were considered during the mine plan. • The underground mining method is applied to Aleck Hill, Mad Kiss and Rory's Knoll mines. The stope shape optimization, stope design, mining method, scheduling processes were considered during the mine plan. • Zijin Xiamen optimized the open pit shell support the mine design review using Whittle program package. The optimized pit shell was generated using the Lerches-Grossman 3D or Psuedoflow algorithm. The open pit design was guided by optimization parameters and input criteria before being manually refined by engineers. The inputs parameters have been reviewed. • SRK optimized the underground stope shape by The Deswik Shape Optimizer™ ("SO") module. The stope shape was guided by optimization parameters and input criteria before being manually refined by engineers. The inputs parameters have been reviewed. • The slope parameters were provided during the previously studied and not updated this time, The last geotechnical study was conducted by SLR in 2021. The overall slope angle was in range of 25 to 46 degree in different open pit wall zones.

Criteria	JORC Code explanation	Commentary
		• The pillar parameters were provided by Zijin Research Institute in 2024.

Mine	Level (mRL)	Length (m)	Width (m)	Sill Pillar (m)	Rib Pillar (m)	Stope Height (m)
Mad Kiss	>-240	<60	<15	6		60
	>-240	60-100	<15	8		60
	-300 ~ (-360)	<60	<15	8		60
	-300 ~ (-360)	60-100	<15	10		60
	>-240	<60	>15	10	8	60
	>-240	60-100	>15	10	8	60
	-300 ~ (-360)	<60	>15	10	8	60
	-300 ~ (-360)	60-100	>15	10	8	60
Aleck Hill	>-240	<40	<15	6		60
	>-240	40-70	<15	8		60
	-300 ~ (-360)	<40	<15	8		60
	-300 ~ (-360)	40-70	<15	10		60
	-300 ~ (-360)	<40	<15	10		60
	-300 ~ (-360)	40-70	<15	12		60
	>-240	<40	>15	10	8	60
	>-240	40-70	>15	10	8	60
	-300 ~ (-360)	<40	>15	10	8	60
	-300 ~ (-360)	40-70	>15	10	8	60
	-300 ~ (-360)	<40	>15	10	8	60
	-300 ~ (-360)	40-70	>15	10	8	60

- Based on reviewing the operational practices, SRK has applied mining dilution factors of 5% for the Rory's Knoll open pit; 28% for the Aleck Hill and Mad Kiss underground mine, and 20% for the Rory's Knoll in the Ore Reserve estimates.
- Based on reviewing the operational practices, SRK has applied mining loss factors of 18% for the Rory's Knoll open pit; 10% for the Aleck Hill and Mad Kiss underground mine, and 10% for the Rory's Knoll in the Ore Reserve estimates.

Criteria	JORC Code explanation	Commentary
		• The minimum mining width is 8 meters for Rory's Knoll open pit, 1 meter for Aleck Hill and Mad kiss underground mine, and 5 meters for Rory's Knoll underground mine. • End of month survey ("EOM") of 31 December 2024 is the latest data source for the cut-off date. • Inferred Mineral Resources are excluded during open pit shell generated nor in the Ore Reserves conversion. • For the open pit area, Rory's Knoll open pit is operating, and various facilities are well developed. All necessary mining infrastructure, such as the explosive magazine, mine drainage, and waste rock dump, is fully established. All necessary infrastructure accounted for to support mining operations For the underground mine area, Aleck Hill and Mad Kiss underground mine are operating and Rory's Knoll underground mine is developing. For the Aleck Hill and Mad Kiss underground mine area. All necessary mining infrastructure, such as the material handling system, dewatering system, ventilation, maintenance workshop is fully established. For Rory's Knoll underground mine area, all the mining infrastructure is in developing.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.* • *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Metallurgical testing and production practices have confirmed that the gravity separation-cyanidation process is suitable for AGM ore, achieving gold recovery rates of 90% to 95%. • The gravity-CIP cyanidation process applied in the AGM processing plant is conventional, and the historical performance is stable. • The designed gold recovery is 92% for the plant upgrading. SRK considers this to be conservative and recommends aiming for a recovery rate of 94%.

Criteria	JORC Code explanation	Commentary
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Since 2006, the project has undergone several environmental baseline studies, conducted by various third parties. Additionally, multiple environmental and social impact assessments have been carried out for the Aurora Gold Mine, with some of the assessments following the IFC Performance Standards. The most recent environmental assessment, completed by GSEC in 2020, focused on underground mining. • Waste rock is dumped in the Waste Rock Dump (WRD), with a portion being utilized for road construction and reinforcing the dam structure of the Tailings Management Area (TMA). The TMA is located approximately one kilometre southwest of the processing plant and has an elliptical shape, covering an area of 240 hectares Based on static and kinetic geochemical testing, it has been determined that the tailings are unlikely to produce acid or release metals.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• See Chapter 12.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• See section 14.1 for the capital costs. • See section 14.2 for the operating costs.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• See section 15.1 for the prices. • See section 10.4 for the recovery rate. • Just United States dollar is utilised.

Criteria	JORC Code explanation	Commentary
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Mature channel for selling of products has been built and maintained well. • Price and volume are shown in Table 15-2 and Table 15-3.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• See section 15.3.1 for the assumptions.
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The region in Guyana where the mine is located is largely uninhabited, with the nearest settlement approximately 50 km away. • Community engagement was initiated during the preparation of the initial ESIAs in 2010 and continues proactively with communities and stakeholders potentially affected by the company's operations. • AGM maintains close cooperation with local government authorities, elected officials, NGOs, and various communities to ensure transparency about its activities and to maximize benefits while minimizing negative community impacts.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• See chapter 16 for the risks.

Criteria	JORC Code explanation	Commentary
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• See sections 8.2.3 and 8.3.3.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• This report has been peer reviewed by Dr Yiefei Jia, FAusIMM (CP Geo), a Corporate Consultant (Mining and Project Evaluation).
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• See chapter 16 for the risks.

Appendix C Compliance with *Chapter 18*

Chapter 18				Sections in SRK's Report
18.01	DEFINITIONS AND INTERPRETATION			
18.02-18.04	**CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES**			
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has			
	applied for listing must also satisfy the requirements of this Chapter.			
18.03	A Mineral Company must:—			
	(1)	establish to the Exchange's satisfaction that it has the right to participate actively in		3.1
		the exploration for and/or extraction of Natural Resources, either:—		
		(a)	through control over a majority (by value) of the assets in which it has invested	
			together with adequate rights over the exploration for and/or extraction of	
			Natural Resources; or	
			Note: 'control over a majority' means an interest greater than 50%.	
		(b)	through adequate rights (arising under arrangements acceptable to the	
			Exchange), which gives it sufficient influence in decisions over the exploration	
			for and/or extraction of the Natural Resources;	
	(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—		7.14
		(a)	Indicated Resources; or	
		(b)	Contingent Resources,	
			identifiable under a Reporting Standard and substantiated in a Competent Person's	
			Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
	(3)	if it has commenced production, provide an estimate of cash operating costs		14.2
		including the costs associated with:—		
		(a)	workforce employment;	
		(b)	consumables;	
		(c)	fuel, electricity, water and other services;	
		(d)	on and off-site administration;	
		(e)	environmental protection and monitoring;	
		(f)	transportation of workforce;	
		(g)	product marketing and transport;	
		(h)	non-income taxes, royalties and other governmental charges; and	
		(i)	contingency allowances;	
		Note :	*A Mineral Company must:*	
			• set out the components of cash operating costs separately by category;	

			• explain the reason for any departure from the list of items to be included under cash operating costs; and		
			• discuss any material cost items that should be highlighted to investors.		
	(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—			14.1
		(a)	general, administrative and operating costs;		
		(b)	property holding costs; and		
		(c)	the cost of any proposed exploration and/or development; and		
		Note:	Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.		
	(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has sufficient available working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.			14.1
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.				not applicable
	Note:	*A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.*			
18.05-18.08	CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS				
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—				
	(1)	a Competent Person's Report;			Whole report
	(2)	a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;			2.4
	(3)	the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;			3
	(4)	a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;			3
	(5)	disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and			16
	(6)	if relevant and material to the Mineral Company's business operations, information on the following:—			13
		(a)	project risks arising from environmental, social, and health and safety issues;		
		(b)	any non-governmental organisation impact on sustainability of mineral and/or exploration projects;		
		(c)	compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;		
		(d)	sufficient funding plans for remediation, rehabilitation and closure and removal of facilities in a sustainable manner;		
		(e)	environmental liabilities of its projects or properties;		

		(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	
		(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	
		(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	
18.06-18.08	*Additional disclosure requirements that apply to certain new applicant Mineral Companies*			
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.			14.2
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.			not applicable
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.			7.1
18.09-18.13	**RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION**			not applicable
	OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS			
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—			
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;		
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;		
		Note:	*The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.*	
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and		
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.		
	Note:	*Material liabilities that remain with the issuer on a disposal must also be discussed.*		
18.10-18.11	*Requirements that apply to listed issuers*			
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.			
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.			
18.12-18.13	*Requirements that apply to Mineral Companies and listed issuers*			
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.			

18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent		
	Evaluator for their material to be included in the form and context in which it appears in		
	a listing document or circular for the Relevant Notifiable Transaction, whether or not such		
	person or firm is retained by the listing applicant or the issuer.		
18.14-18.17	CONTINUING OBLIGATIONS		not applicable
18.14	*Disclosure in reports*		
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details		
	of its exploration, development and mining production activities and a summary of		
	expenditure incurred on these activities during the period under review. If there has been		
	no exploration, development or production activity, that fact must be stated.		
18.15-18.17	*Publication of Resources and Reserves*		
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an		
	update of those Resources and/or Reserves once a year in its annual report, in accordance		
	with the reporting standard under which they were previously disclosed or a Reporting		
	Standard.		
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual		
	report in accordance with the Reporting Standard under which they were previously		
	disclosed.		
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18.		
	Not e:	*Annual updates are not required to be supported by a Competent Person's Report*	
		and may take the form of a no material change statement.	
18.18-18.27	STATEMENTS ON RESOURCES AND/OR RESERVES		
18.18	*Presentation of data*		
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing		7.14; 8.2；8.3
	document, Competent Person's Report, Valuation Report or annual report, must be		
	presented in tables in a manner readily understandable to a non-technical person. All		
	assumptions must be clearly disclosed and statements should include an estimate of		
	volume, tonnage and grades.		
18.19	*Basis of evidence*		
18.19	All statements referring to Resources and/or Reserves:—		
	(1)	in any new applicant listing document or circular relating to a Relevant Notifiable	Whole report
		Transaction must be substantiated in a Competent Person's Report which must form part of the document; and	
	(2)	in all other cases, must at least be substantiated by the issuer's internal experts.	
18.20	*Petroleum Competent Persons' Reports*		not applicable
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or		
	extraction of Petroleum Resources and Reserves must include the information set out in		
	Appendix 25.		
18.21-18.22	*Competent Person*		
18.21	A Competent Person must:—		
	(1)	have a minimum of five years' experience relevant to the style of mineralization	2.10
		and type of deposit under consideration or to the type of Petroleum exploration,	
		reserve estimate (as appropriate), and to the activity which the Mineral Company is	
		undertaking;	
	(2)	be professionally qualified, and be a member in good standing of a relevant	2.10
		Recognised Professional Organisation, in a jurisdiction where, in the Exchange's	
		opinion, the statutory securities regulator has satisfactory arrangements (either by	
		way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the	
		Exchange) with the Commission for mutual assistance and exchange of information	
		for enforcing and securing compliance with the laws and regulations of that	
		jurisdiction and Hong Kong; and	
	(3)	take overall responsibility for the Competent Person's Report.	

18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—		2.11
	(1)	have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2)	not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3)	in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4)	in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
18.23	*Additional requirements of Competent Evaluators*		
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—		2.7
	(1)	have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2)	have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3)	hold all necessary licences.	
	Not e:	*A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.*	
18.24	*Scope of Competent Persons' Reports and Valuation Reports*		
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—		2.2
	(1)	be addressed to the Mineral Company or listed issuer;	2.1
	(2)	have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	2.4
	(3)	set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	2.2
18.25-18.26	*Disclaimers and Indemnities*		
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.		2.3
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.		2.9
18.27	*Obligations of sponsor*		not applicable
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.		not applicable
18.28-18.34	REPORTING STANDARD		
18.28-18.30	*Mineral reporting standard*		
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.		

18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—			
	(1)	under:		
		(a)	the JORC Code;	2.2
		(b)	NI 43-101; or	
		(c)	the SAMREC Code,	
		as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		not applicable
	Not e:	*The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.*		
18.30	A Mineral Company must ensure that:—			
	(1)	any estimates of Ore Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;		8; 9; 10; 11; 12; 13; 14
	(2)	estimates of Ore Reserves and mineral Resources are disclosed separately;		7.12; 7.14
	(3)	Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to Ore Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;		8
	(4)	for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—		15.1
		(a)	the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	
		(b)	if a contract for future prices of Ore Reserves exists, the contract price is used; and	
	(5)	for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.		15.2; 15.2.4
18.31-18.33	*Petroleum reporting standard*			not applicable
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.			
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—			
	(1)	under PRMS as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		
	Not e:	*A Reporting Standard applied to specific assets must be used consistently.*		
18.33	A Mineral Company must ensure that:—			
	(1)	where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;		
	(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;		
	(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;		

	(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;		
		Note:	*In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.*	
	(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;		
		Note:	*Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.*	
	(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and		
	(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.		
18.34	*Mineral or Petroleum Asset Valuation Reports*			not applicable
18.34	A Mineral Company must ensure that:—			
	(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;		
	(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;		
	(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and		
	(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.		

Appendix D Chapter 2.6 of the Guide for New Listing Applicants

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	7.12; 7.14; 7.15; 8
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	not applicable
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	Yes
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	4.1
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	8; 9
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	10; 15.2
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/ oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	not applicable
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	16

Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

Term / Abbreviation	Meaning / Definition
%	percent
°	degree, angle of inclination
°C	degrees of temperature
3D	Three-dimensional
AAS	atomic absorption spectrometry
Rosebel	Rosebel Gold Mines N.V
AN/FO	Ammonium nitrate / fuel oil
ARD	Acid rock drainage
asl	above sea level
Au	the element symbol of gold
AusIMM	Australasian Institute of Mining and Metallurgy
Capex	capital expenditure(s)
CIC	Carbon-in-Column
CIL	carbon-in-leach
CIT	corporate income tax
cm	centimetres
COG	cut-off grade
Company or Zijin Gold International	Zijin Gold International Group Company Limited
CPR	Competent Person's Report
DCF	discounted cash flow
E	East
EIA	Environmental Impact Assessment
EPMP	Environmental Protection and Management Plan
FAusIMM	Fellow of the Australasian Institute of Mining and Metallurgy
Exploration Results	Data and information generated by mineral exploration programs that might be of use to investors, but which do not form part of a declaration of Mineral Resources or Ore Reserves
Exploration Target	A statement or estimate of the exploration potential of a mineral deposit in a defined geological setting where the statement or estimate, quoted as a range of tonnes and a range of grade (or quality), relates to mineralisation for which there has been insufficient exploration to estimate a Mineral Resources
FS or Feasibility Study	A Feasibility Study is a comprehensive technical and economic study of the selected development option for a mineral project that includes appropriately detailed assessments of applicable Modifying Factors together with any other relevant operational factors and detailed financial analysis that are necessary to demonstrate at the time of reporting that extraction is reasonably justified (economically mineable). The results of the study may reasonably serve as the basis for a final decision by a proponent or financial institution to proceed with, or finance, the development of the project. The confidence level of the study will be higher than that of a Pre-Feasibility Study
FY	financial year
G&A	general and administration
g	gram
g/cm^3	gram(s) per cubic centimetre
g/t	gram per tonne
ha	hectare(s)

HKEX	Hong Kong Exchanges and Clearing Ltd
Indicated Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit
Inferred Mineral Resource	That part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
JORC Code	2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves prepared by the Joint Ore Reserves Committee of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
JORC Committee	Joint Ore Reserves Committee
K	the element symbol of potassium
kg	kilogram, equivalent to 1,000 grams
km	kilometres, equivalent to 1,000 metres
km^2	square kilometres
kt	thousand tonnes
ktpa	thousand tonnes per annum
kV	kilovolts, equivalent to 1,000 volts
kVA	kilovolt ampers
kW	kilowatt, equivalent to 1,000 watts
kWh	kilowatt hours
L	litres
Li	the element symbol of lithium
LHD	load-haul-dump
L/s	litres per second
LoM	life-of-mine
M	million
m	metres
m^2	square metre
m^3	cubic metre
MAusIMM	member of the Australasian Institute of Mining and Metallurgy
m asl	metres above sea level
m/s	metres per second
Measured Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit.
Mineral Resource	A concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.
ML	megalitres (million metres); Mining Licence
mg	milligram
mm	millimeter(s)
MRE	Mineral Resource estimate
Mt	million tonnes

Mtpa	million tonnes per annum
MW	megawatts
MWh	megawatts hours
NPV	net present values
NSR	net smelter return
OK	Ordinary Kriging
Opex	operating expenditure(s)/cost(s)
Ore Reserve	The economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified
ORM	Ore Reserves Model
PFS	A Preliminary Feasibility Study (Pre-Feasibility Study) is a comprehensive study of a range of options for the technical and economic viability of a mineral project that has advanced to a stage where a preferred mining method, in the case of underground mining, or the pit configuration, in the case of an open pit, is established and an effective method of mineral processing is determined. It includes a financial analysis based on reasonable assumptions on the Modifying Factors and the evaluation of any other relevant factors which are sufficient for a Competent Person, acting reasonably, to determine if all or part of the Mineral Resources may be converted to an Ore Reserve at the time of reporting. A Pre-Feasibility Study is at a lower confidence level than a Feasibility Study
PPE	Personal protective equipment
ppm	parts per million, equivalent to gram(s) per tonne (g/t)
Probable Ore Reserve	the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve
Proved Ore Reserve	the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors
QA/QC	quality assurance/quality control
RC	reverse circulation
RGM	Rosebel Gold Mine
ROM	run-of-mine
RPEEE	reasonable prospects for eventual economic extraction
S	South, also the element symbol of sulphur
SG	specific gravity
SRK	SRK Consulting China Ltd
Stock Exchange	The Stock Exchange of Hong Kong Ltd, a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("HKEX")
t	tonnes
t/d or tpd	tonnes per day
t/m^3	tonnes per cubic metre
TSF	tailings storage facilities
US$	United States dollar
VALMIN Code	2015 edition of the Australasian Code for the Public Reporting of Technical Assessments and Valuations of Mineral Assets.
WRD	waste rock dump
VAT	value-added tax
Zijin Gold International	Zijin Gold International Group Company Limited (紫金黄金国际有限公司)
Zijin Mining	Zijin Mining Group Company Ltd.(紫金矿业集团股份有限公司)

Executive Summary

Introduction

SRK Consulting China Ltd ("**SRK**") was commissioned by Rosebel Gold Mines N.V. ("**Rosebel**"), a subsidiary company of Zijin Gold International Company Limited ("Zijin Gold International " or the "Company") to undertake an independent assessment of all relevant technical aspects of the Rosebel Gold Mines Project in Suriname ("**Rosebel Project**" or the "**Project**") which is located in Brokopondo and Sipaliwini Districts, Northern Suriname. The Project includes the Rosebel gold mine ("**RGM**"), Saramacca gold mine and associated one ore processing and metallurgical plant ("**Rosebel Processing Plant**").

It is SRK's understanding that the independent technical assessment on the Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Company on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEX**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on the Stock Exchange including the Chapter 18 requirements and other relevant regulations of the Stock Exchange and HKEX.

Summary of Principal Objectives

The principal objective of this Report is to provide Zijin Gold International and potential equity investors and future shareholders of the Company with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserves, mining methodologies, processing and metallurgical technologies, environmental and social aspects, and etc of the Project based on all available technical data. It is understood that the aim of this Report will be used by the Company for the proposed listing on the Stock Exchange and HKEX.

Outline of Work Programme

The work program for this project consisted of:

- review of dataset and resource models provided by Rosebel and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection.
- a site visit in June 2025, to the Rosebel Project, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.
- review of all available documents, including operating licenses and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating expenses ("**Opex**"), etc.

- discussion with Rosebel and Zijin Gold International management and technical personnel, as well as the professionals of Xiamen Zijin Engineering Design Co., Ltd ("**Xiamen Zijin**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Rosebel Project.
- preparation of a draft report in accordance with the JORC Code and the requirements of the Chapter 18 on the Stock Exchange and other regulations of the HKEX (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- submission of the draft to Zijin Gold International and Rosebel and the related third party for comments and finalise the draft based on the feedback.

Results

Overall

Operational Licences and Permits

The Rosebel and Saramacca land package consists of three exploitation concessions, Gross Rosebel (Rosebel), Pikin Saramacca (Saramacca) and Moeroekreek, and nine exploration concessions. Rosebel contains the following producing deposits, Royal Hill (RH), Mayo (MA), Rosebel (RB), Koolhoven-J Zone (KH-JZ), Pay Caro (PC), and East Pay Caro (EPC). Saramacca contains the producing Saramacca (SM) deposit.

Geology and Mineralogy

Rosebel and Saramacca are located in the Paleoproterozoic Guiana Shield greenstone belt, formed during the 2.26–2.08 giga-annum (Ga) Transamazonian orogeny. Key rock types include TTG, greenstone belts, the Marowijne Supergroup (Paramaka volcanic rocks and Armina sedimentary rocks), and the Rosebel Formation (quartz-rich sandstone and conglomerates). Tropical weathering has created a laterite/saprolite profile up to 100 m thick.

Rosebel: Hosted in the Marowijne Supergroup and Rosebel Formation, with key lithologies including volcanic rocks, sedimentary rocks, felsic intrusions, and late diabase dykes. Gold mineralization is structurally controlled, concentrated in shear zones, fold hinges, and lithological contacts.
Saramacca: Hosted in Paramaka basalt, with gold mineralization associated with the Faya Bergi fault.
High-grade mineralization is concentrated in dolomite breccias with pyrite.
Rosebel: Divided into North, Central, and South domains, with gold hosted in shear and tension veins.
Vein mineralogy varies by domain, including quartz, carbonate, feldspar, and hematite.
- Saramacca: Mineralization occurs along N-NW structures, primarily in dolomite breccias within the Faya Bergi fault zone.

Rosebel and Saramacca are orogenic greenstone-hosted gold deposits. Rosebel includes seven main deposits, with mineralization controlled by shear zones and folds. Saramacca mineralization is concentrated along the Faya Bergi fault and subsidiary shear zones.

Mineral Resource Estimation

The Mineral Resource Statement for the Rosebel Project has been prepared in accordance with the JORC Code (2012), with an effective date of 31 May 2025. This report outlines the methodology and key assumptions used in the Mineral Resource estimation. SRK considers the estimation to be a reasonable representation of the global gold Mineral Resources at the current level of sampling. However, Mineral Resources are not Ore Reserves, and there is no guarantee that they will be converted into Ore Reserves.

The database used for the estimation was audited by SRK, which found the drilling and assay data to be reliable for defining gold mineralization boundaries and supporting the estimation process. The Mineral Resource model was developed using datasets provided by Rosebel Gold Mines, covering various domains (North: Pay Caro, East Pay Caro, Koolhoven-J Zone, East Tailing Road; South: Royal Hill, Mayo, Roma East, Roma West; Center: Rosebel; and others such as Saramacca, Overman, and Moeroekreek.

The Rosebel Project possess the Mineral Resources as shown in Table ES- 1.

Table ES- 1: Mineral Resources Statement, as of 31 December 2024

Category	Tonnes Au (Mt)	Grade Au (g/t)	Contained Metal Au (kg)	Contained Metal Au (koz)
Measured	270.52	0.83	223,533	7,187
Indicated	156.60	0.81	126,658	4,072
Measured + Indicated	427.13	0.82	350,191	11,259
Inferred	29.93	0.81	24,152	777

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr Pengfei Xiao and Mr Liang Li who are full-time employee of SRK Consulting China Ltd. Mr Pengfei Xiao is a Fellow of AusIMM and a Member of AIG; and Mr Liang Li is a Member of AusIMM. Both Mr Pengfei Xiao and Mr Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2 g/t for Laterite, Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Fresh Rock.

[4] The Project covers various domains (North: Pay Caro, East Pay Caro, Koolhoven-J Zone, East Tailing Road; South: Royal Hill, Mayo, Roma East, Roma West; Center: Rosebel); and others such as Saramacca, Overman, and Moeroekreek.

Exploration

Gold was first discovered at the Rosebel property in 1879, with small-scale miners (SSMs) operating in the area. Since then, the district has contributed approximately half of Suriname's recorded gold production. Early commercial activities (1885–1939) included alluvial mining, surface deposits, and vein exploitation by companies such as Guyana Gold Placer Company, De Jong Brothers, White Water Mines Ltd., and Van Emden Gold Mines Ltd.

Modern exploration began in 1974 when Surplacer, a joint venture between Placer Development Ltd. and the Surinamese Government, identified gold anomalies along two major trends. Subsequent exploration by Grassalco (1979–1985) and Golden Star Resources Ltd. (1992–1994) led to resource estimates and feasibility studies. Cambior Inc. acquired Golden Star's interest in 2001, achieving commercial production in February 2004. IAMGOLD acquired Cambior in 2006, gaining a 95%

interest in the property. In 2013, a new joint venture (UJV) was established, granting the Republic a 30% paid interest in the Rosebel concession.

Exploration at the Saramacca deposit began in 1994 under Golden Star Resources, focusing on Anomaly M. Newmont Corporation later acquired a 51% interest in the Saramacca JV in 2009. Ownership was transferred to Newmont in 2012. In 2016, IAMGOLD-RGM signed agreements with the Republic to acquire a 70% interest in Saramacca, completing payments and share issuances by 2019.
Exploration transitioned from RGM's Suriname Exploration Department (SurEx) to its Mine Exploration Department (MinEx) in 2018. Following the declaration of mineral reserves in 2018, technical studies and permitting applications were submitted. An Environmental and Social Impact Assessment (ESIA) was approved in January 2019, enabling construction activities. First ore from Saramacca was processed at the Rosebel Plant in October 2019.

Quality Assurance and Quality Control

Sampling at Rosebel Gold Mine and Saramacca deposits utilizes DD, RC, and channel sampling methods, ensuring reliable data aligned with industry best practices. IAMGOLD-RGM personnel conduct standardized procedures under geologist supervision to uphold quality control protocols. Sample intervals are defined during logging, with typical lengths of 1 to 1.5 meters. Two analytical methods are employed to analyze Rosebel and Saramacca DD and RC samples: Fire Assay ("FA") and Pulverize and Leach ("PAL").

Quality Assurance and Quality Control (QA/QC) programs are established to ensure the reliability and integrity of exploration data. Including inserting Certificated Reference Materials (CRMs), blanks and duplicates into the sample streams submitted to the laboratory. The historical QAQC performance for the Rosebel and Saramacca projects aligns with industry best practices, demonstrating strong accuracy and precision in both the RGM laboratory and Filab. SRK is confident that the data quality is sufficient to support reliable and meaningful mineral resource estimates.

Mining and Ore Reserves

SRK has estimated the Ore Reserves for the Pay Caro, J-Zone, Koolhoven, Mayo, Royal Hill, Rosebel, and East Tailing Road deposits at the Rosebel Mine, as well as the deposits at the Saramacca Mine, in accordance with the guidelines outlined in the JORC Code. These Ore Reserve estimates are supported by Modifying Factors based on technical studies and ongoing operational records, which are considered to meet the Pre-Feasibility Study level of confidence.

Key factors applied in the estimation process include design scope, pit optimization, pit design, mining losses, and dilution. Additional considerations include processing capabilities, market conditions, environmental factors, as well as legal and political constraints, or other factors that may influence the quantity and classification of the Ore Reserves.

The economically mineable portions of the Measured and Indicated Mineral Resources within the designed open pits, inclusive of dilution and allowances for mining losses, have been classified as Proved Ore Reserves and Probable Ore Reserves, respectively.

The Ore Reserve Statement for the Rosebel Gold Mine is shown in Table ES- 2.

Table ES- 2：Ore Reserve Statement for the Rosebel Gold Mine, as of 31 December 2024

Category	Tonnes Mt	Grade Au (g/t)	Contained Metal Au (kg)	Contained Metal Au (koz)
Open pit				
Proved	180.01	0.79	141,310	4,543
Probable	35.64	0.82	29,263	941
Sub-total	215.65	0.79	170,573	5,484
Stockpile				
Proved				
Probable	5.93	0.52	3,073	99
Sub-total	5.93	0.52	3,073	99
Proved				
Proved	180.01	0.79	141,310	4,543
Probable	41.57	0.78	32,336	1,040
Total	221.58	0.78	173,646	5,583

Notes:

1 The information in this report which relates to Ore Reserve is based on information compiled by Mr Falong Hu who is a full-time employee of SRK Consulting China Ltd. Mr Falong Hu is a Fellow of AusIMM. Mr Falong Hu has sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Falong Hu consents to the reporting of this information in the form and context in which it appears.

2 Number was rounded to the second significant digit to reflect the uncertainties in estimate.

3 Total may not add due to rounding discrepancies

4 Koolhoven Open Pit: A mining dilution rate of 20% (including waste rock and Inferred Mineral Resources) and a mining loss rate of 1%.

5 J-Zone Open Pit: A mining dilution rate of 17% (including waste rock and Inferred Mineral Resources) and a mining loss rate of 4%.

6 Pay Caro Open Pit: A mining dilution rate of 15% (including waste rock and Inferred Mineral Resources) and a mining loss rate of 1%.

7 Mayo Open Pit: A mining dilution rate of 13% (including waste rock and Inferred Mineral Resources) and a mining loss rate of 1%.

8 Royal Hill Open Pit: A mining dilution rate of 31% (including waste rock and Inferred Mineral Resources) and a mining loss rate of 5%.

9 Rosebel Open Pit: A mining dilution rate of 13% (including waste rock and Inferred Mineral Resources) and a mining loss rate of 3%.

10 East Tailing Road Open Pit: A mining dilution rate of 15% (including waste rock and Inferred Mineral Resources) and a mining loss rate of 1%.

11 Saramacca Open Pit: A mining dilution rate of 21% (including waste rock and Inferred Mineral Resources) and a mining loss rate of 2%.

12 The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources

Mining Assessment

The Rosebel and Saramacca operations utilize conventional open-pit mining methods with a truck-and-shovel fleet supported by drill-and-blast techniques. RGM operates an owner-managed mining fleet, supplemented by subcontractors for auxiliary functions.

Rosebel mine:

- Pay Caro (PC) Pit
  - Located northeast of the Rosebel processing plant.
  - Mining commenced in 2003.
  - Haulage distance to the processing plant: 1.8 kilometers.
  - Natural drainage west of the pit is progressively managed.
- J-Zone (JZ) Pit
  - Positioned north of the PC Pit and east of the Koolhoven Pit.
  - Mining began in 2014.
  - Haulage distance to the processing plant: 2.5 kilometers.
  - Limited infrastructure space due to proximity to WRSFs and TSFs.
- Koolhoven (KH) Pit
  - Located north of the PC Pit and west of the J-Zone Pit.
  - Haulage distance to the processing plant: 2.6 kilometers.
  - Primary haul access is on the southeast side.
- Royal Hill (RH) Pit
  - Situated along Rosebel's southern boundary.
  - Mining began in 2004 and continues without interruption.
  - Haulage distance: 5.9 kilometers.
  - Contains archaeological and environmental constraints.
- Mayo (MA) Pit
  - Located along Rosebel's southern boundary.
  - Mining resumed in 2021 after a pause in 2020.
  - Haulage distance: 8.8 kilometers.
  - Drainage systems direct water away from the pit's south and east sides.
- Rosebel (RB) Pit
  - Positioned southeast of Rosebel and isolated from other pits.
  - Mining began in 2012.
  - Haulage distance: 12 kilometers.

  - Accessed via a 13.5-kilometer haul road connected to the EPC area.

- East Tailing Road (ETR) Pit
  - A satellite deposit located approximately 2 kilometers east of the Pay Caro (PC) pit.
  - Planned project consistent with other pit designs, based on assumptions and geotechnical recommendations.

Saramacca Mine

- Saramacca Pit
  - Located 30 kilometers southeast of the Rosebel concession.
  - Mining started in late 2019.
  - Primary haul route located on the east side.

Operation method:

Rosebel Mine

The loading fleet at the Rosebel Mine comprises shovels configured for both excavator and front shovel operations, optimizing versatility and productivity. ROM stockpile management is carried out with a single loader, ensuring efficient material handling. Material transport is managed by a haulage fleet including trucks, while dust suppression is effectively achieved using water trucks. Ancillary equipment, such as fuel trucks and service vehicles, provides essential support for continuous operations. The current fleet is designed to facilitate cost-effective material movement and maximize infrastructure utilization across the Rosebel pits.

Saramacca Mine

The Saramacca (SM) pit operates with a simplified and focused fleet of core equipment to increase operational efficiency. Primary loading is conducted with a face shovel and backhoes, while ROM stockpile management is performed by a single loader. Haulage requirements are met with a fleet of Komatsu trucks for in-pit operations, complemented by trucks dedicated to long-distance ore transport to the Rosebel processing plant. This streamlined fleet configuration enables flexible equipment sharing between the Saramacca and Rosebel operations, promoting efficient resource utilization and minimizing idle time.

Drilling and Blasting operation:

The drilling and blasting program is executed using a reduced yet versatile fleet of drills, tailored to match the geological and operational conditions of each pit. Drill hole parameters are standardized with a uniform diameter of 165 mm, ensuring consistency in blasting activities. Blasting is designed to minimize ore displacement while achieving optimal rock fragmentation. All blasting activities are carried out by RGM personnel using bulk explosives initiated with non-electric detonators.

To enhance post-blast performance, blast movement monitors are systematically deployed in mineralized zones. These monitors measure vertical and horizontal ore displacement (typically 6 meters horizontally and 3 meters vertically on a nine-meter bench) to allow for precise adjustments to post-blast ore boundaries. This process minimizes waste contamination, optimizes grade recovery, and reduces disruptions to production activities.

Mineral Processing and Metallurgy

The Rosebel Gold Mine (RGM) processing plant has been operating commercially since February 2004 to treat a blend ore material of hard rock, transition and soft rock. Following upgrade to the crushing system in September 2024, the plant achieved an annual processing capacity of 10 Mtpa under a blend of 70% hard rock and 30% soft rock.

Currently, the plant is processing a blend of ore from RGM and SGM at a ratio of about 4:1, in a proportion of 60-70% hard rock. The metallurgical process employed a flowsheet consisting of "two-stage crushing + semi-autogenous grinding & ball milling & pebble crushing ("SABC") + gravity separation + carbon-in-leach ("CIL") + elution/electrowinning + smelting", with the final product being gold doré bullion.

Table ES- 3 summarized the historical production data from 2022 to 2024. The data indicated that over the past three years, ROM throughput has ranged between 8.3 Mtpa and 10 Mtpa, with approximately 70-80% sourced from the RGM mine and 20-30% from the SM mine. The overall recovery rate ranged between 94% and 97%, averaging 95%. The gold output in 2022, 2023, and 2024 was 7,839 kg, 8,821 kg, and 8,424 kg, respectively. It should be noted that when RGM contributed 100% and SM contributed 70%, the gold output from February to December 2023 and for the year 2024 was 7,483 kg and 7,460 kg, respectively.

Table ES- 3: Historical Production Data of RGM Plant

Item		Unit	2022	2023	2024	2023.2-12
RGM	ProcessedTonnes	t	5,722,592	7,309,766	7,668,852	6,866,644
	Au Feed Grade	g/t	0.94	0.98	0.78	0.96
	Au Feed to Mill	kg	5,391	7,192	5,956	6,562
	Au Recovery Rate	%	94	97	97	97

Environmental, Social, and Permitting Overview

Rosebel Gold Mines N.V. (RGM) operates under a comprehensive framework of environmental and social permits in Suriname, with approvals obtained through formal government processes. SRK has reviewed the relevant permits, licenses, and documentation provided by RGM and assesses the operation as broadly compliant with applicable regulatory requirements. However, certain areas present potential risks to continued operations, which should be monitored, including infrastructure development within exploration concessions, the status of Environmental Impact Assessments (EIAs), and the discharge of surface water.

Since 2002, RGM has completed four Environmental and Social Impact Assessments (ESIAs) in accordance with both national requirements and international standards, including those of the International Finance Corporation (IFC). While there are historical gaps, such as the absence of formal approval documentation for the original 2002 ESIA, the granting of the Rosebel Exploitation Concession is considered to reflect tacit approval of the 2002 ESIA, in line with the terms of the Mineral Agreement. RGM's view, which is supported by local legal counsel, is that the lack of formal approval documentation from 2002 does not pose a material risk to operations, given that the mine has been in operation for over two decades. Additionally, the Company has conducted more recent and separate ESIAs for the Saramacca Exploitation Concession. While gaps in formal approval documentation exist, the Company has implemented regular environmental monitoring and maintains engagement with relevant authorities to address any associated risks.

The TSF is located within an exploration permit area (Thunder Mountain GMD 467/24). The company legal counsel has advised that the Mining Decree permits the holder of the exploration right to install necessary infrastructure, and there is no evidence to suggest that the construction of the TSF violates this provision. However, it should be noted that the Thunder Mountain exploration permit expires in 2026. The Company is in the process of assessing the next steps for the conversion of the exploration permit to an exploitation title. Although RGM has indicated that it will apply for conversion in due course, it is important to monitor any regulatory developments and ensure that the necessary legal rights are secured in a timely manner.

The National Environmental Authority (NMA) was established in July 2024, though it is still in the early stages of its operations. The absence of a comprehensive Environmental Act and detailed discharge regulations creates some uncertainty in the legal framework surrounding surface water discharge. The Minerals Agreement only references Environmental Impact Statements (EIS) without providing specific provisions on discharge. Based on the current regulatory environment, legal counsel has advised that a formal water discharge permit may not be required at this stage. However, as the regulatory landscape evolves, future developments may necessitate the acquisition of such a permit. RGM has indicated that its operations are in line with international standards for treated water discharge, ensuring that no harm is caused to human health or the environment.

There are certain areas where potential risks exist, including the lack of formal approval of the 2002 ESIA, the potential need for a water discharge permit, and the conversion of exploration permits. While these issues are not expected to present immediate threats to RGM's operations, the evolving regulatory framework in Suriname must be closely monitored. RGM has implemented proactive measures, including regular monitoring and engagement with authorities, and is committed to staying aligned with emerging regulations.

Social considerations have also been assessed. RGM's operations are located near five Maroon communities, including one within the mining concession. The company has developed a robust stakeholder engagement framework, cultural heritage management plans, and community compensation mechanisms aligned with international best practices. While permitting gaps, land use limitations, and evolving regulatory requirements could pose future compliance risks, these are not considered material to the Ore Reserve estimation. See Section 13 for further details.

Capital Expenditures and Operating Costs

Capital Expenditure(s)

The Sustaining Capex and Expansion Capex provided by the mine are summarized in Table ES- 4. Among them, the Sustaining Capex was 438 million US dollars, the Expansion Capex was 109 million US dollars, and the total Capex was 547 million US dollars.

Table ES- 4: Forecasted Sustaining Capex and Expansion Capex for the Project

Item	Unit	2025	2026	2027	2028	2029	Total
Sustaining Capex	US$ million	84	81	89	89	94	438
Expansion Capex	US$ million	39	28	21	11	10	109
Subtotal	US$ million	124	109	110	100	104	547

Source: Mine data.

Operating Costs

The cash operating cost mainly includes mining costs, processing costs, and other costs. It should be noted that other costs primarily consist of general and administrative (G&A) costs, refining and sales costs, taxes & surcharges, and royalties, among others. The all-in sustaining cost (AISC) includes the cash operating cost and Sustaining Capex.

All-in sustaining costs (AISC) for the Project in 2022, 2023 and 2024 are US$ 1,834/oz gold, US$ 1,518/oz gold and US$ 1,547/oz gold respectively.

The forecasted unit cash operating cost and AISC is average of US$ 1,503/oz and US$ 1,590/oz gold respectively. The forecasted unit cost of ore processed is average of US$ 34.3/t ROM.

Economic Analysis

SRK estimated the NPV in a range of US$ 947 million (at 12% discount rate) to US$ 1,430 million (at 6% discount rate), with a base case of US$ 1,177 million using a discount rate of 8.6%. The positive NPVs indicate that the Project is economically viable. The sensitivity analysis indicates the NPV is most sensitive to the gold price, followed by Opex and Capex.

Risk Assessment

SRK completed a risk assessment of the risks identified for the Project in relation to their likelihood of occurrence and consequence in accordance with the Listing Rules of the Stock Exchange and the HKEX.

Table ES- 5: Risk Assessment for Rosebel Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Unlikely	Moderate	Low
Unexpected Groundwater Ingress	Possible	Moderate	Low
Significant Unexpected Geological Faulting	Unlikely	Moderate	Low
Mining			
Lack of updated data for pit drainage	Unlikely	Moderate	Low
Lack of Skilled Labor and Operation Management	Possible	Moderate	Low
Bad Weather interrupting	Unlikely	Moderate	Low
Ore Processing and Metallurgy			
Lower Throughput	Possible	Moderate	Medium
Lower Recovery	Possible	Moderate	Medium
Higher Production Cost	Possible	Moderate	Medium
Environmental and Social			
Lack of Environmental Permits	Possible	Moderate	Medium
Impact on Flora and Fauna	Unlikely	Minor	Low
Poor Water Management/Dicharge Permits	Possible	Moderate	Medium
Poor Waste Rock and Tailings Management/Approval	Possible	Major	High
Poor Hazardous Materials Management	Unlikely	Moderate	Low
Social Licensee to Operate	Possible	Moderate	Medium
Capital and Operating Costs			
Project Timing Delay	Possible	Moderate	Medium
Capital Cost Increases	Possible	Moderate	Medium
Capital Costs- Ongoing	Possible	Moderate	Medium
Operating Cost Underestimated	Possible	Moderate	Medium

Recommendations

SRK offers the following recommendations:

- The East Tailing Road (ETR) pit is a planned project with a design consistent with other pits, based on preliminary assumptions and geotechnical recommendations. RGM is required to conduct a detailed technical study to validate and finalize the design for the ETR pit.
- For the Saramacca Mine, the existing geotechnical study is outdated, and RGM should undertake an updated geotechnical analysis to ensure the design remains aligned with current operational and safety standards.
- With the development and utilization of the challenging SM ore, the processing plant will need to handle high-organic-carbon ores (approximately 5–6%) and high-arsenic ores (around 1–2%) from the SM deposit. These ore characteristics are anticipated to affect the production performance of the RGM plant. It is recommended that a detailed economic study be conducted by an engineering institute to evaluate the feasibility of constructing a stand-alone processing plant with a flowsheet of "Gravity + Flotation + Bio-oxidation Pre-treatment of Concentrate + Cyanidation."

1 Introduction and Scope of Report

SRK Consulting China Ltd ("**SRK**") was commissioned by Rosebel Gold Mines N.V. ("**Rosebel**"), a subsidiary company of Zijin Gold International Company Limited ("Zijin Gold International " or the "Company") to undertake an independent assessment of all relevant technical aspects of the Rosebel Gold Mines Project in Suriname ("**Rosebel Project**" or the "**Project**"), which is located in Brokopondo and Sipaliwini Districts, Northern Suriname. The Rosebel Project includes the Rosebel gold mine ("**RGM**"), Saramacca Mine and associated one mineral processing and metallurgical plant ("**Rosebel Processing Plant**").

It is SRK's understanding that the independent technical assessment on the Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Company on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEX**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on the Stock Exchange including the Chapter 18 requirements and other relevant regulations of the Stock Exchange and HKEX.

Silver Source Group has a 95% interest in the RGM. An unincorporated joint venture company (Saramacca UJV ("UJV") holds a 100% interest in the Saramacca Gold Mine. Rosebel Gold Mines N.V. holds a 70% interest in UJV, and a wholly owned company of the Government of Suriname, Staatsolie, holds a 30% interest in UJV.

2 Program Objectives and Work Program

2.1 Purpose of the Report

The principal objective of this Report is to provide Zijin Gold International and potential equity investors and future shareholders of the Company with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserves, mining methodologies, processing and metallurgical technologies, environmental and social aspects, and etc of the Project based on all available technical data. It is understood that the aim of this Report will be used by the Company for the proposed listing on the Stock Exchange and HKEX.

2.2 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "**Valmin Code**"). The Valmin Code incorporates the JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy ("**AusIMM**") members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the JORC Code.

2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that the Company has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Company has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Company and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

2.4 Effective Date

The effective date for this CPR is deemed to be 31 May 2025 (the "Effective Date"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as of 31 December 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK.

2.5 Work Program

- review of dataset and resource models provided by Rosebel and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection.
- a site visit to be held between 1st and 30th June 2025, to the Rosebel Project, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.
- review of all available documents, including operating licenses and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.
- discussion with Rosebel and Zijin Gold International management and technical personnel, as well as the professionals of Xiamen Zijin Engineering Design Co., Ltd ("**Xiamen Zijin**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Rosebel Project.
- preparation of a draft report in accordance with the JORC Code and the requirements of the Chapter 18 on the Stock Exchange and other regulations of the HKEX (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- submission of the draft to Zijin Gold International and Rosebel and the related third party for comments and finalise the draft based on the feedback.

2.6 SRK Experience

The SRK Consulting Group ("SRK Consulting") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK China was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience in providing Independent Expert Reports to mining companies for successfully listing on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-1.

Table 2-1: SRK's Reports for Listing on the HKEX

Company	Year	Nature of Transaction
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on the HKEX
Citic Dameng Holdings Limited	2010	IPO Listing on the HKEX
China Hanking Holdings Limited	2011	IPO Listing on the HKEX
China Daye Non-Ferrous Metal Mining Limited	2012	Very Substantial Acquisition on the HKEX
China Nonferrous Mining Corporation Limited	2012	IPO Listing on the HKEX
Hengshi Mining Investments Limited	2013	IPO Listing on the HKEX
Future Bright Mining Holdings Limited	2014	IPO Listing on the HKEX
King Stone Energy Group Limited	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte LTD	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Limited	2016	IPO Listing on the HKEX
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Limited	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Limited	2022	IPO Listing on the HKEX
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on HKEX
Chifeng Jilong Gold Mining Co., Ltd	2025	IPO Listing on HKEX

2.7 Project Team

The SRK project team and responsibilities are shown in Table 2-2.

Table 2-2: SRK Project Team

Consultant	Title	Discipline and Task
Pengfei Xiao	Principle Consultant (Geology)	Project Manager, whole report, CP，Mineral Resource Review, Technical Economy Review
Liang (Elian) Li	Senior Consultant (Geology)	Geology, Mineral Resource Estimation
Falong Hu	Principal Consultant (Mining)	Mining and Ore Reserve Review
Donghao Luo	Consultant (Mining)	Mining and Ore Reserve Review
Xiangfeng Yang	Senior Consultant (Processing)	Processing and Metallurgical Review
Lanliang Niu	Principal Consultant (Processing)	Processing and Metallurgical Review

Consultant	Title	Discipline and Task
Anne Gimonet	Principal Consultant (Environmental)	Environment, Social, and Permitting Review
Jiayue (Ciara) Bi	Assistant Consultant (Environmental)	Environment Review
Ting (Mia) Qiu	BD and Project Coordinator	Project Coordination and Translation
Dr Yonglian Sun	Corporate Consultant (Geotechnical Engineering)	Internal Peer Review and Quality Control
Alexander Thin	Corporate Consultant (Mining)	Internal Peer Review and Quality Control

Pengfei Xiao, *MSc, MAusIMM, MAIG,* is the Managing Director of SRK China. He is a Principal Consultant (Geology) with a specialty in mineral exploration applying comprehensive geological and geophysical methods; and his expertise also includes resource modelling and estimation. He is familiar with both theory and practice in sampling, sample preparation and chemical analysis. As a consulting geoscientist, he has been active in mining projects including due diligence reviews, exploration design, data verification and resource estimation in China, Mongolia, Africa, America, Southeast and Central Asia. His experience relates precious metal (Au, Ag, PGE), base metal (Cu, Ni, Pb, Zn) and other metal deposits (Fe, Mn, V, Mo, Co), and also includes a few non-metal projects (phosphorite, potash, gypsum). In the past ten years he has been working in geology and resource assessment with SRK, and co-authored dozens of technical reports aiding clients in successful property transactions; and more than half of them are published in stock exchanges.

Liang Li*, MEng*, is a Senior Consultant (Geological) at SRK China. Prior to joining SRK, he worked as an on-site geologist for certain mining companies and has gained lots of experiences and expertise in mine geology, grade control and optimization, and resources/reserves management. He is familiar with Chinese procedures and principles for metallic ore deposits prospecting and specialises in geological statistics for resources and reserves estimation. Liang Li is a proficient user of the Surpac modelling software.

Falong Hu, *MBA, B.Eng, FAusIMM, Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Chinese Certified Consulting Engineer (Investment),* is a Principal Consultant (Mining). He obtained his Bachelor's degree in mining engineering from Central South University and Master of Business Administration (MBA) in China University of Geosciences (Beijing). Before joining SRK he worked as an on-site and head office mining engineer in 2 different international mining companies which were called Sino Gold Mining Limited (later merged with Eldorado Gold Corp.) and Silvercorp Metals Inc. He is familiar with underground and open pit mines' production systems and has been involved in mining engineering and development design, scheduling, long-hole blasting and production operation, rock mechanics, ventilation, back-fill; and cost accounting. After take part in SRK, he accumulated extensive experience in ore reserve estimation, economic analysis, project valuation, mining assessment, scoping/pre-feasibility/feasibility studies and so on. Minerals include gold, silver, lead, zinc, copper, iron, bauxite, laterite-nickel, sylvine, phosphate and graphite, as well as quartzite, marble, bentonite and so on. He is a modeler on both technical and economic and also proficient in digital modeling by using Surpac, Whittle, Minesched, Datamine and AutoCAD.

Donghao Luo, *BEng*, Consultant (Mining) at SRK China. He obtained his Bachelor's degree in mining engineering from Laurentian University. He has three years of experience in underground mining, having worked as a headquarters engineer at Silvercorp Metals Inc. His expertise includes production planning, production management, and the design of development and mining engineering projects.

Xiangfeng Yang*, MEng; MAusIMM, Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Certified Cost Engineer,* is a Senior Consultant (Mineral Processing) with SRK Consulting China Ltd. She has over 12 years' experience in processing Feasibility Study, processing design and technical consultancy service, especially in industrial minerals including gold, silver, lead, zinc, copper as well as phosphate. She obtained bachelor's degree and master's degree in mineral processing engineering from Jiangxi University of Science and Technology and Wuhan University of Science and Technology, during which she systematically studied the processing flowsheet and plant design on nonferrous metals ore and non-metallic ores. Before joining SRK, she engaged in ore Feasibility Study, Preliminary design, Construction drawing design and equipment procurement evaluation in Bluestar Lehigh Engineering Institute Co., Ltd and Nanchang Mineral Systems Co. Ltd. She has published several journal papers and utility models. She has conducted and participated in the plant design of many medium and large phosphate ore, potash salt, sulfide ore, iron ore and other projects.

Anne Gimonet, *MSc (Environmental Sciences), BSc (Geology),* is a Principal Consultant (Environmental) with SRK China. Anne has 15 years of experience in international environmental consulting for multinational companies and SOEs. She specializes in Contaminated Site Assessment (Characterization, Investigation, Remediation & Closure), Environmental Due Diligence and Regulatory Compliance for industrial sites in various sectors. Her experience covers hundreds of industrials sites across Europe, Asia (China, Philippines, Iraq), Africa (Uganda, Equatorial Guinea) and Oceania (Papua New Guinea), with an increasing focus on Site Closure governance.Anne first started her career in France, as an environmental consultant in a leading French environmental consulting firm, then moved to China to work as an environmental consultant in Asia. She joined Golder in 2013 where she performed numerous Phase II ESA and remediation studies to international standards. From 2015 to 2022, Anne took over the management of the Contaminated Site Assessment Team for Golder in China. Anne is recognized as a senior advisor to global clients on environmental compliance strategies in emerging Asian frameworks (environmental regulatory monitoring, ESG, innovation), as well as for key account management and business development.

Ciara (Jiayue) Bi is an Assistant Consultant in the Environment team of SRK. She graduated from University College London in 2024 with a master's degree in Global Natural Resource Management and joined SRK Beijing office in the same year. During her time at university, she mainly studied the usage and processing of minerals, prevention and remediation of environmental contamination, and social licensing. She has participated in field trips organized by schools in the UK, Finland and Australia on the treatment of high-level radioactive nuclear waste and acid wastewater.

Ting（Mia）Qiu, BA, is a Marketing and Business Development Assistant at SRK China. After graduation, she worked for Jiangxi Geological Engineering Co., Ltd, mainly dealing with issues of administration and project coordination. She then spent a short period of time at a project site in Tanzania, East Africa, where she was responsible for the interface and coordination between the project owner and the local authorities, thus gaining some experience in working on overseas projects. Since joining SRK, she has mainly assisted project managers with coordination, management and technical translation. So far she has worked on the projects including: Due Diligence Report for a uranium mine project in Kazakhstan, Competent Person's Report for a copper mine project in Serbia, and an independent technical review for a copper mine in DRC,Competent Person's Report and Valuation for Makola-Ouest Potash Project in Congo, Competent Person's Report for Coal Project in Indonesia, Qualified Person's Report for Gold Project in China, Laos and Ghana.

Dr Yonglian Sun, *BEng, PhD, FAusIMM, FIEAust, CPEng*, is a Corporate Consultant (Geotech) with over 30 years' experience in geotechnical and mining engineering in five countries across four continents. He has extensive international mining experience with an emphasis on site investigation, analysis, and modelling of geotechnical issues in open pits, underground mines, and civil tunnels. He also possesses considerable experience in evaluating mining projects. In recent years, Yonglian has coordinated and led dozens of due diligence projects, most of which have been successfully listed in the Stock Exchange of Hong Kong Limited.

Alexander (Alex) Thin, BEng (Hons), FAusIMM (CP Min), is a Corporate Consultant (Project Evaluation and Mining) with SRK. He is an experienced mining professional with over 30 years' experience. His strategy and leadership experience spans feasibility studies, mineral asset audits and evaluations, independent technical reports, techno-economic studies, capital raising, merger and acquisitions, managing joint ventures, local and international stock exchange compliance, business development and investor/ stakeholder relations. Alex's industry experience spans operational (underground and open pit), technical, consulting and corporate within the metalliferous resources sector, covering precious metals, base metals and bulk commodities.

2.8 Warranties

Zijin Gold International has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

2.9 Indemnities

As recommended by the VALMIN Code, Zijin Gold International has provided SRK with an indemnity under which SRK is to be compensated for any liability and/or any additional work or expenditure resulting from any additional work required:

- Which results from SRK's reliance on information provided by Zijin Gold International or to Zijin Gold International not providing material information; or
- Which relates to any consequential extension workload through queries, questions or public hearings arising from this Report.

2.10 Compliance Statement

The information in this report that relates to Mineral Resources/Ore Reserves is based on information compiled by Mr Pengfei Xiao, a Competent Person who is a Fellow of AusIMM and a Member of Australian Institute of Geologists, and Mr Falong Hu, a Competent Person who is a Fellow of the AusIMM. Both are full-time employees of SRK.

This Report is a Competent Person's Report in line with the Listing Rules of the Stock Exchange and HKEX.

Mr Pengfei Xiao and Mr Falong Hu have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code.

Mr Pengfei Xiao and Mr Falong Hu consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Dr Yonglian Sun, *FAusIMM*, a Corporate Consultant (Geotech), a Fellow Charted Professional Engineer and Alexander Thin, *FAusIMM (CP Min)*, a Corporate Consultant (Mining and Project Evaluation).

2.11 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Zijin Gold International or Zijin Gold International's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

2.12 Consent

SRK consents to this Report being included, in full, in the Zijin Gold International prospectus, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

2.13 Forward Looking Statement

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

3 Operating Licenses and Permits

SRK relies on the information provided by Zijin Gold Internationaland Rosebel, and SRK did not conduct a legal due diligence review of the Rosebel Project since such work is outside the scope of SRK's technical review.

3.1 Land Tenure

The Project is comprised of three exploitation concessions, Rosebel Saramacca and Moeroekreek, and nine exploration concessions as mentioned hereunder, all located on contiguous ground, which is shown in Figure 3-2.

Current mining operations at Rosebel and Saramacca are governed by the Suriname Gold Mining Project – Mineral Agreement (the Mineral Agreement) dated April 7, 1994, as first amended, and supplemented on March 13, 2003, followed by a second amendment and supplemental agreement (the Second Amendment) on June 6, 2013. The Second Amendment of the Mineral Agreement contains the terms and conditions for the establishment of an Unincorporated Joint Venture (UJV) with the Republic to undertake exploration and possible exploitation in concessions surrounding Rosebel (the UJV Area). Saramacca is one of the areas subject to the UJV. The Moeroekreek concession is an exploitation concession newly applied for in 2025, which was carved out from the previously held exploration license.

Exploitation Concessions:

(1) Gross Rosebel concession

Which contains the Pay Caro (PC) & East Pay Caro (EPC), Koolhoven-J Zone (KH-JZ), East Tailing Road (ETR), Royal Hill (RH), Mayo (MA), and Rosebel (RB) producing deposits.

(2) Saramacca concession (under the UJV Agreement):

Which contains the producing Saramacca (SM) deposit.

(3) Moeroekreek concession

Which contains Moeroekreek concession under development. No active mining is being conducted there by RGM.

Exploration Concessions:

(1) Moeroekreek concession

(2) Brokolonko concession

(3) Concessions under the UJV Agreement:

- Headley's Reef concession
- Charmagne 1
- Charmagne 2
- Charmagne West
- Thunder Mountain
- Anjoemara

- Lef

The Gross Rosebel concession (GMD No. 468/02) covers an area of 17,000 ha in the north-central part of Suriname at a latitude of 5° 25' N and a longitude of 55° 10' W and lies in the district of Brokopondo, between the Suriname River to the east and the Saramacca River to the west, approximately 80 km south of the capital of Paramaribo, Figure 3-1.

The Saramacca concession (GMD No. 301/19) covers an area of approximately 4,975 ha,straddling the Brokopondo and Sipaliwini districts of Suriname. To the northeast, Saramacca is adjoined to the Headley's Reef concession. Saramacca is also adjacent to the Moeroekreek concession. The centre of the Saramacca property is located at an approximate latitude of 4° 55' N and a longitude of 55° 22' W, which is shown in Figure 3-1.

The Moeroekreek concession (GMD No. 536/24) covers an area of approximately 466 ha,straddling the Brokopondo and Sipaliwini districts of Suriname. To the northeast of Kleine Saramacca river and to the west of the road leading to Pokigronis. Moeroekreek is also adjacent to the Saramacca concession. The centre of the Moeroekreek property is located at an approximate latitude of 4° 57' N and a longitude of 55° 24' W, which is shown in Figure 3-1.

Figure 3-1: Location and Accessibility of the Project

Sources: SRK

3.2 Exploitation Permits

3.2.1 Gross Rosebel

On December 16, 2002, in accordance with the Mining Decree 1986 of Suriname (the Mining Decree), RGM was granted 25 years renewable Right of Exploitation (ROE) for the Gross Rosebel concession by the Republic, following the Government's approval. In accordance with Article 15 of the Second Amendment, the term of the Gross Rosebel concession may be extended by a period of 15 years from its current expiration date of December 16, 2027, the information is presented in Table 3-1.

3.2.2 Saramacca

Saramacca is located approximately 25 km southwest of the Rosebel processing plant (the Rosebel Plant). RGM legally obtained the ROE to Saramacca on May 2, 2019, and subsequently registered it as such with the Management Institute for Ground Registration and Land Information System (MI-GLIS), the information is presented in Table 3-1.

3.2.3 Moeroekreek

On February 3, 2025, in accordance with the Mining Decree 1986 of Suriname (the Mining Decree), RGM was granted 5 years renewable Right of Exploitation (ROE) for the Moeroekreek concession by the Republic, following the Government's approval, presented table below.

Table 3-1: Exploitation Concessions Information

ID	Concession	Concession Name	Area（km^2）	Expiry Date
1	GMD No. 468/02	Gross Rosebel	170	2027/12/16
2	GMD No. 301/19	Saramacca	50	2044/5/2
3	GMD No. 536/24	Moeroekreek	5	2030/2/3

Note: Gross Rosebel and Saramacca are exploitation right which have been issued for a consecutive period of 25 years.

Moeroekreek is exploitation right which have been issued for a consecutive period of 5 years.

Gross Rosebel will expire in 2027and will be extended to 2042.

SRK notes that the geographic coordinates of the exploitation tenement presented in Table 3-2**.**

			D	4°56' 39.48"	55°24'43.95"

3.3 Exploration Permits

RGM obtained seven rights of exploration, namely Charmagne 1, Charmagne 2, Charmagne West, Anjoemara, LEF, Headley's Reef and Thunder Mountain under the terms and conditions of the Second Amendment and the Mining Decree in August 2017. The seven rights of exploration under the Second Amendment extended in May 2024.

Upon acquisition, the Moeroekreek concession was an exploitation concession for the benefit of the previous owner, namely Sarafina NV. (Sarafina). Based on the Mineral Agreement as amended, however, RGM is not yet authorized to conduct exploitation activities pending compliance with additional requirements, including the possession of a valid ROE. This was reaffirmed by the Minister of Natural Resources in a formal letter dated December 19, 2018.

In June 2022, RGM has obtained the 3 - year concessionary exploration right for the Moeroekreek project. RGM filed for extension of the right of exploration Moeroekreek concession. In February 2025, RGM applied for its first extension of the ROE, granting an additional 2 years. Simultaneously, the Moeroekreek exploitation concession, spanning approximately 466 hectares, was carved out from the original exploration permits.

The Brokolonko concession was granted by the Republic to RGM on February 7, 2018, for a period of three years. RGM applied for the extension of the ROE in Feb 2022 for the frist time, with the extended period being 2 years. RGM has just completed the application for extending the ROE for another two years in May 2024.

The Mining Decree sets the terms and conditions for the application and extension for the rights of exploration and exploitation. It further states that exploration concessions are held for a maximum of seven years (an initial term of three years, a first extension of two years, and a second extension of two years).

Information related to the mining and exploration concessions is listed in Table 3-3.

Table 3-3: Exploration Concessions Information

No.	Concession Name	Concession	Owner	Area (km^2)	Expiry Date	Number Times of Extension	Remaining Number Times of Extension

4 Project Description

4.1 Accessibility

There are presently two access routes from Paramaribo to the Gross Rosebel and Saramacca operations. One route utilizes a 30 km paved road which connects Paramaribo to Paranam. From Paranam, a paved road courses south following the Afobaka road. From there an unpaved road courses south and west to the Gross Rosebel and Saramacca properties. The other route is a paved road which connects Paramaribo to the international airport at Zanderij. A paved road connects Zanderij to the Afobaka road halfway between Paranam and Afobaka. The route then follows the Afobaka, Brownsweg, and Nieuw - Koffiekamp roads until reaching the property access road.

Travel distance for both routes from Paramaribo is approximately 100 km. The Saramacca (SM) pit is located approximately 25 km southwest of the Rosebel Plant and is accessed primarily via a purpose built 36 km mine haulage road from the Mine.

4.2 Surface Area and Physical Resources

The Rosebel and Saramacca areas currently host the small village of Nieuw-Koffiekamp, located approximately two kilometres from the former Rosebel exploration base camp and approximately one kilometre from the RH pits. Nieuw-Koffiekamp consists of approximately 500 permanent inhabitants belonging primarily to the Maroon group, who are descendants of African slaves.

The economy of the village remains dependent on the Surinamese coastal economy. Main activities include subsistence agriculture on relatively poor land, small scale gold mining, forestry, and trade.

Relations between the RGM and the villagers has occasionally been strained due primarily to the conduct of illegal mining activities on the Rosebel property by the villagers and others.

Other than the road between Paramaribo and the Mine site, the local site infrastructure consists of various access and haulage roads from the main gate to the camp, pits, tailings area, the Rosebel Plant area, and administration building area.

An existing airstrip with an approximate length of 1.2 km is available for emergency evacuation. The airstrip is located six kilometres from the administration building. The accommodation camp complex is located approximately 0.5 km to the south of the Rosebel Plant and truck shop/administration building and includes a kitchen mess, recreation area, camp offices, and different types of dormitories with an accommodation capacity of approximately 2,300 people.

Miscellaneous outbuildings and infrastructure include core logging and storage facilities, laboratories, security gates, lunchrooms, and a 5 MW solar plant. Electrical energy (purchased directly from the Surinamese Government) is delivered from the Afobaka hydroelectric generating station and augmented by a 5 MW solar plant operated by RGM. Potable water and process water is supplied from water wells located along the Mamanari Creek near the camp complex.

4.3 Physiography and Climate

The climate of Suriname is classified as tropical, i.e., warm during the entire year with the mean temperature of the coldest month being higher than 20°C. The average monthly rainfall is greater than 60 mm in the driest month(s). Like much of Suriname, the Rosebel and Saramacca areas are characterized by consistently warm temperatures and high humidity with little seasonal variation.

Suriname's weather is dictated mainly by a north-east and south-east wind called the InterTropical Convergence (ITC) zone, also known as the Equatorial Trough. The ITC zone passes over Suriname twice a year and results in four seasons:

- Late February to late April, a short dry season.
- Late April to mid-August, a long rainy season.
- Mid-August to early December, a long dry season.
- Early December to late February, a short rainy season.

The climate of Suriname is classified as tropical, i.e., warm during the entire year with the mean temperature of the coldest month being higher than 20°C. The average monthly rainfall is greater than 60 mm in the driest month(s). Like much of Suriname, the Rosebel and Saramacca areas are characterized by consistently warm temperatures and high humidity with little seasonal variation.

Suriname's weather is dictated mainly by a north-east and south-east wind called the InterTropical Convergence (ITC) zone, also known as the Equatorial Trough. The ITC zone passes over Suriname twice a year and results in four seasons:

- Late February to late April, a short dry season.
- Late April to mid-August, a long rainy season.
- Mid-August to early December, a long dry season.
- Early December to late February, a short rainy season.

4.4 Topography, Elevation and Vegetation

The physical geography of Suriname is divided into three areas: the Coastal Plain, the Savannah Belt, and the Guiana Shield. The Guiana Shield comprises approximately 80% to 85% of the total land area of Suriname, and extends into French Guiana to the east, Brazil to the south, and Guyana, Colombia, and Venezuela to the west. The Rosebel and Saramacca concessions are located within the Guiana Shield terrane.

The Guiana Shield is predominately low-lying (below 250 MASL) and hilly, with discrete ranges reaching 1,200 MASL. Most of the Guiana Shield is pristine and covered with extensive tropical rainforest, except where poor soil or repeated burning of the vegetation have led to the creation of savannahs.

The surficial features of Suriname are the product of a tropical and wet weathering environment resulting in generally extensive deep oxidation of the surface exposures. In general rock outcrops are generally scared and limited to road cuts and creek beds. Ground cover various from locally preserved laterite profiles including duricrust layers on ridge crests, with pisolithic clays, clays, and colluvium in lower areas.

5 Geological Setting and Mineralisation

5.1 Regional Geology

Rosebel and Saramacca lie within a greenstone belt of the Paleoproterozoic Guiana Shield which extends from the Amazon River in Brazil to the Orinoco River in Venezuela, covering an area of more than 900,000 km^2. Most of the rocks of the Guiana Shield were formed during the Paleoproterozoic Transamazonian or Late-Transamazonian orogeny. In general, the Proterozoic part of the Guiana Shield exhibits a south-westward younging of units with tonalitetrondhjemite-granodiorite (TTG) and greenstone belt to the North, granitoid succession mainly in the central portion, and Late Paleoproterozoic to Mesoproterozoic volcanic, intrusive, and sedimentary rocks in the southernmost portion, which is shown in Figure 5-1. Geologically, the region is well endowed for gold for which the potential for additional discoveries is favourable with continued investment in exploration.

The geological evolution of the Guiana Shield is divided in four distinct stages which are either related to the formation or reworking of in-situ lithologies. The four stages are: Formation of the Archean basement – Main Transamazonian orogeny – Late Transamazonian orogeny – subsequent Proterozoic and Paleozoic anorogenic events.

The main Transamazonian orogeny (D1), constrained between 2.26 Ga to 2.08 Ga, consisted of a crustal growth event that generated the TTG – greenstone belts found North of the Guiana Shield. The evolution of the orogeny has led to the development of strike-slip structures forming pull-apart basins along the North Guiana Trough. The lithostratigraphic succession of the greenstone belts is defined by a lower unit of oceanic basalt overlain by a calc-alkaline volcanic suite including felsic to mafic members, and various sedimentary rocks including greywacke, pelite, chert, and conglomerates. In Suriname, the sedimentary and volcanic units of the greenstone belt are grouped into the Marowijne Supergroup, which is divided into two formations: the Paramaka Formation and the Armina Formation. The Paramaka Formation consists of volcanic rocks, whereas the Armina Formation consists of flysch sedimentary sequences.

The greenstone belt and the TTG sequence rocks are uncomfortably overlain by the upper detrital series of the Rosebel Formation, which is mainly represented by arenitic quartz-richse quences interlayered with conglomerates. This sedimentary sequence is interpreted as being deposited in the intracontinental pull-apart basins formed during the latest stages of the Main Transamazonian Orogeny, between 2.11 Ga and 2.08 Ga. Synchronously with the formation of those basins, granitic magmatism took place in the eastern part of the Guiana Shield (Suriname, French Guiana, and Brazil). The Guiana Shield has undergone prolonged chemical weathering, reflecting a humid, tropical paleoclimate that may have started as far back as the Cretaceous period. The chemical weathering has produced a laterite/saprolite profile which locally reaches up to 100 m below surface. In the Rosebel property area, fresh rock can be observed around 30 m depth in valleys, where the water table is less affected by seasonal fluctuations. The thick cover of rain forest vegetation has protected the soil from erosion, and the thin soil profile is generally preserved.

The chemical effects of the deep weathering include leaching of mobile constituents (alkali and alkali earths), partial leaching of SiO2 and Al2O3, formation of stable secondary minerals (clays, Fe-Ti, and Al-oxides), mobilization and partial precipitation of iron and manganese, and concentration of resistant minerals (zircon, magnetite, and quartz).

5.2 The Deposit Geology

5.2.1 Rosebel

The Rosebel deposits are hosted by a volcano-sedimentary sequence of the Marowijne Supergroup and by the overlying detrital sedimentary sequence of the Rosebel Formation. Five types of lithologies are distinguished on the Rosebel property: felsic to mafic volcanic rocks, felsic intrusion, flysch sequence, arenitic sedimentary rocks, and late diabase dykes. Gold mineralization is predominately hosted in the sedimentary and volcanic rocks, while the intrusion rarely mineralized, and the late diabase dykes are barren.

The volcanic and the felsic intrusive lithologies are interpreted as being part of the regional greenstone - TTG suite. The volcanic assemblage, part of the Paramaka Formation, consists of andesite in the northern portion of Rosebel, and of felsic (rhyolite) to mafic (tholeiitic basalt) rock to the South. In the southern portion of Rosebel, the volcanic rocks surround a tonalite intrusion (Brinks intrusion), while in the northern portion, up to the Charmagne concession, they form bands a few kilometres thick alternating with the sedimentary rocks of the Armina Formation, which is shown in Figure 5-2 **and** Figure 5-3 .

The flysch sequence pertaining to the Armina Formation is found in the northern portion of Rosebel. The sequence consists in an assemblage of greywacke alternating with finer mudstone beds interbedded with conglomerate lenses of few metres to several metres thick, continuous over a few kilometres. The sedimentary rocks of the Rosebel Formation form the central sedimentary basin unconformably overlaying the volcanic rocks. The Rosebel Formation consists of an arenitic sequence interlayered with finer sedimentary rocks and continuous conglomeratic beds.

On the eastern portion of Rosebel (near the RB deposit) the rocks are intruded by three post mineralization north-south trending diabase dykes of the Permo-Triassic Apatoe dyke swarm. Regional metamorphism ranges from lower greenschist to greenschist facies. The main regional fabric varies from E-W in the southern portion of Rosebel to WNW-ESE to the North. Two phases of deformation are recognized at Rosebel. The first phase of deformation (D1) is characterized by the development of an early fabric and ductile shear zones which has affected only the volcanic rocks. The second phase (D2) is characterized by the development of the regional foliation, the presence of open to closed folds, and the formation of the main faults. Rosebel is marked by two major faults that have affected the volcanic and the sedimentary sequences. The fault present in the north strikes WNW-ESE and is interpreted as a dextral strike-slip shear zone which has undergone a late normal movement that has juxtaposed the volcanic units with the upper part of the sedimentary sequence of the Rosebel Formation. The fault present in the south is interpreted as a major reverse fault which has brought the volcanic rocks over the arenitic sequence.

Source: Daoust, 2016.

5.2.2 Saramacca

Saramacca is underlain by metabasalt of the Paramaka Formation. The main volcanic units are a massive basalt overlain by a thinner amygdular basalt unit and a thick unit of pillow basalts, with a southwest to northeast younging direction. Rocks have been metamorphosed to the greenschist facies and have developed an assemblage of actinolite-chlorite-epidote-plagioclase. Rare, barren, thin felsic dykes crosscut the volcanic pile.

The massive basalt is a homogeneous, green, medium grained unit in which leucoxene sporadically develops. The true thickness of the unit is unknown, exceeding 50 m. The basalt’s northeastern contact with the amygdular unit is commonly obliterated by hydrothermal alteration. The amygdular basalt unit is a greenish grey to buff colour where hydrothermally altered. Quartz amygdules are generally one to three millimetres in diameter and constitute up to 5% of the rock. The pillow basalt is over 75 m thick and exhibits typical periodic arcuate selvages in the core. It is of a medium to dark green colour and is commonly moderately magnetic. Some graphitic shears appear to be spatially associated to the main mineralized structure.

The Faya Bergi fault zone is localized along the contact between the massive and pillow basalts along the thinner amygdular unit. The Faya Bergi fault zone and the Brokolonko structures represent a major brittle-ductile vertical dip-slip fault zone to which gold mineralization is associated. Various kinematics suggest that the northeast block moved up relative to the southwest block. Typical brittle features include cataclasite, gouge, fractured zones, and striated fault slip planes, while typical ductile features include shear foliation and minor folding, which is shown in Figure 5-4 **and** Figure 5-5. Several sub-parallel minor shear zones occur on either side of the fault zone.

A review of the structural geology at Saramcca（SM） was undertaken by SRK to assist with geological interpretation and modelling in 2017. The structural study focussed on the following aspects:

- Reviewing available core to identify and characterize the main structures controlling gold mineralization.
- Reviewing available oriented core to extract key information regarding the orientation of controlling structures and integrate the data in the geological model.
- Defining the preferential orientation and the controls on higher grade gold mineralization and determine whether high grade sub-domains should be modelled within the existing gold domains.
- Investigating the distribution, geometry, and kinematics of post-mineralization structures that could have displaced the gold domains.
- Characterizing the nature, geometry, and distribution of gold bearing breccia and vein fields to ensure that the modelled gold domains accurately reflect their distribution.

5.3 Mineralization

5.3.1 Rosebel

Three mineralized/structural domains are observed at Rosebel: the North, Central, and South domains. The North domain includes the Koolhoven-J Zone (KH-JZ), Pay Caro (PC), and East Tailing Road (ETR) deposits located along two trends following a WNW-ESE orientation. The Central domain includes the Rosebel (RB) deposit, which strikes EW. The South domain is also E-W striking and hosts the Mayo (MA), Roma (RM), and Royal Hill (RH) deposits.

Mineralization within the Rosebel deposits is structurally controlled and gold is hosted in both shear and tension veins which are tightly associated in space and time. Relations between veining and folding demonstrate that veining occurred after folding and has commonly borrowed pre-existent structures, such as extensional fractures, or along rock heterogeneities, which is shown in Figure 5-6.

As a result, elements such as an anticline hinges, lithological contacts and conglomeritic beds have provided structural traps for mineralized fluids. As the veins exhibit no significant signs of deformation, the mineralization is interpreted as being emplaced during the latest stage of the Transamazonian orogeny event.

The general vein mineralogy consists of a quartz - carbonate – tourmaline – plagioclase – pyrite/pyrrhotite assemblage. However, the proportion of the main minerals and the nature of the secondary and trace minerals vary between the different domains. In the South domain, the characteristic vein mineralogical assemblage is quartz + carbonate (calcite) + tourmaline ± chlorite ± sericite ± pyrrhotite ± pyrite, where accessory minerals comprise sphalerite, plagioclase, and magnetite. Alteration aureoles are defined by the presence of chlorite, carbonate (mostly calcite), sericite, pyrrhotite and locally tourmaline and pyrite. In the North domain, the vein mineralogy consists of in an assemblage of quartz + carbonate (calcite – ankerite) + plagioclase + hematite + chlorite ± sericite ± pyrite ± tourmaline. A zonation of vein mineralogy occurs at the deposit scale, with plagioclase and hematite constrained to the main shear zone, while all other minerals are distributed throughout the Rosebel deposits. In the Central domain, the characteristic vein mineralogical assemblage is quartz + carbonate (calcite + ankerite) ± chlorite ± sericite ± pyrite. Ankerite alteration halo is typical of the Central domain and is associated to the highest grade zones.

Notes:1. a) North domain, PC main mineralized shear zone with Qz-Pl assemblage, b) North domain, KH stockwork with smoky Qz veins, c) South domain, RH tension Qz vein with tourmaline, d) Central domain, RB tension vein with strong ankerite alteration halo.

5.3.2 Saramacca

The Saramcca (SM) deposit mineralization is principally hosted within a series of N-NW trending structures ranging from two metres to 40 m in width over a strike length of 2.2 km and is open along strike.

Several sub-parallel structures have been identified, however, the Faya Bergi and Brokolonko structures are the primary mineralized structures over a continuous distance. The other structures are variably mineralized, though more drilling is required to test their prospectivity.

Dolomite breccias observed in the main fault zone are characterized by repeated "crack/seal" and dilatational infilling textures. These veins are also boudinated and folded, having formed within an active dip-slip environment. Higher grade gold is typically associated with dolomite breccias and pyrite mineralization, with the best gold grades located along thick fault segments to the northwest and the southeast.

The alteration pattern enclosing the fault zone shows the destruction of magnetite and the formation of leucoxene at distal ranges. Carbonate-chlorite alteration becomes more dominant with increasing proximity to the Faya Bergi fault. Within the fault zone, the protolith is destroyed by quartz-dolomite-pyrite and minor mica. The alteration footprint is commonly wider in the northeast block (pillow basalt) and can extend up to 50 m from the fault zone, while in the southwest block (amygdaloidal and massive basalt) it is observed up to 15 m to 20 m from the fault zone. The larger northeast alteration footprint may be ascribed to the presence of smaller, variably mineralized, subsidiary fault and shear zones northeast of the Faya Bergi fault.

5.4 DEPOSIT TYPES

Gold mineralization within the Rosebel and Saramacca deposits is structurally controlled and exhibits similar geological, structural, and metallogenic characteristics to orogenic greenstone hosted gold deposits. Mineralization at Rosebel consists of quartz-carbonate tension and shear vein association, while mineralization at Saramacca is predominately hosted in a brecciated hydrothermal dolomite along a major fault. Rosebel hosts seven main deposits and several smaller gold occurrences in three mineralized domains within the Rosebel area. They are respectively：the North, Central, and South domains.

- The North domain includes the Koolhoven-J Zone (KH-JZ), Pay Caro (PC), and East Tailing Road (ETR) deposits
- The Central domain includes the Rosebel (RB) deposit.
- The South domain hosts the Mayo (MA), Roma (RM), and Royal Hill (RH) deposits.

To date, the Saramacca (SM) deposit is the only proven economic gold deposit within the Saramacca area, however, active exploration continues to evaluate the potential of mineralization located towards the northwest of the Saramacca (SM) deposit.

5.4.1 Rosebel: Mineralized Domains and Deposits

(1) North Domain

The North domain is formed by two sub-parallel mineralized trends striking WNW-ESE: the southern trend comprises the Pay Caro (PC) and East Pay Caro (EPC) deposits (and ETR exploration area), while the northern trend includes the Koolhoven-J Zone (KH-JZ) deposits (and MK exploration area). The mineralized trends are found on both flanks of an anticline exposing the volcanic rock and plunging 35° to the WNW.

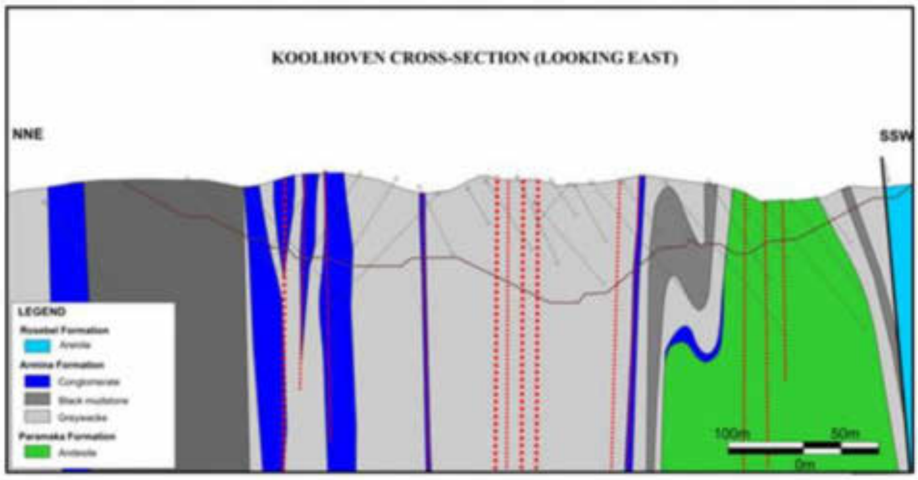
The volcanic rocks are overlain by the Rosebel Formation to the south, and by the Armina Formation to the North. A regional dextral strike-slip fault exhibiting late normal movement marks the southern limit of the North domain and is closely associated with the mineralization.

Koolhoven-J Zone

The Koolhoven-J Zone (KH-JZ) deposits are hosted in a similar geological environment as the Pay Caro (PC) deposit and lie along the North trend of the North domain, Figure 5-8. The host rock consists of an intermediate volcanic and volcanoclastic assemblage to the south of the Koolhoven-J Zone (KH-JZ) deposits overlain by the flysch sequence of the Armina Formation to the north. The sedimentary sequence exhibits alternating mudstone and greywacke facies locally marked by the presence of conglomeratic lenses in the northern portion of the Koolhoven-J Zone (KH-JZ) deposits. The bedding is vertical and parallel to the local foliation and to the mineralized shear zones. The greywacke exhibits closed folds plunging approximately 45° to the WNW, while some mudstone units located near the shear zones indicating isoclinal folding plunging vertically.

The mineralization is observed in sets of discrete WNW-ESE vertical to steeply south dipping shear zones associated with two sets of tension veins, one dipping moderately to the north and the other oriented N-S and steeply dipping to the west. The distribution of gold bearing veins is strongly controlled by the competency of the host rocks. While the less competent, mudstone units tend to be strongly folded and do not host significant amounts of veins, the more competent greywacke and conglomerate units tend to crack more easily, and as a result are host to most of the gold bearing quartz veins.

Figure 5-6: Cross-Section Koolhoven Deposit



Source: Iamgold, 2022

Pay Caro

The PC-EPC deposit is located along the strongly deformed south mineralized trend of the North domain. The stratigraphic sequence comprises an intermediate volcanic pile, predominantly andesitic flows and minor volcaniclastics, overlain by the sedimentary rocks of the Rosebel Formation. A polymictic conglomerate marks the base of the sedimentary sequence which evolves into a fine to medium grain well-sorted arenite locally interbedded with mudstone to the south. The volcano-sedimentary package shows z-type parasitic folding plunging approximately 30° to 50° to the WNW. The bedding and the foliation are steeply dipping to the south. The regional dextral strike-slip fault occurs in the central portion of the PC deposit and is characterized by the abundance of shear veins, brecciation, and intense alteration of the host rocks. Tension veins are of three types: N-S west-dipping veins, E-W sub-vertical to north-dipping veins and stacks of WNW-ESE moderately (30° to 50°) north-dipping veins. All sets of veins carry a similar grade of gold. The gold mineralization in EPC is mainly hosted in the hinge of the anticline at the volcano-sedimentary contact, however, a few shear veins transect the anticline hinge and increase the amount of gold present in the hinge and along the flanks.

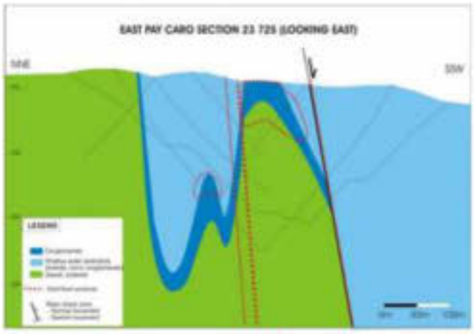
Source: Iamgold, 2022

Figure 5-8: Cross-Section East Pay Caro Deposit



Source: Iamgold, 2022

East Tailing Road

(2) South Domain

The South domain includes the Royal Hill (RH), Mayo (MA) and Roma (RM) deposits. The local geology is characterized by the presence of a volcanic basement overlain by detrital sedimentary rocks of the Rosebel Formation. The Royal Hill (RH), Mayo (MA) and Roma (RM) deposits are all hosted in the footwall of a major reverse fault striking E-W and which is closely related to the onset of mineralization. The sequence is folded into relatively open and slightly dipping (0 to 15°) east or west folds. Mineralization is associated with the major and\or subsidiary shear zones and in the hinges of anticlines.

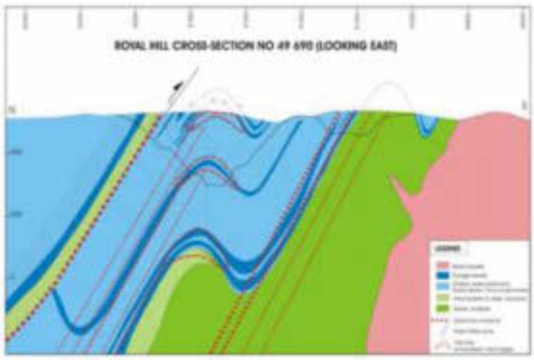
Royal Hill

The Royal Hill (RH) deposit is located at the eastern portion of the South domain. The lower portion of the stratigraphic sequence consists of andesitic to basaltic volcanic rocks. Those volcanic rocks are overlain by two levels of conglomerate and by an immature arenite interlayered with other conglomerate levels, which is shown in Figure 5-10. The **Royal Hill (RH)** deposit is bordered to the south by a tonalite intrusion.

The sequence is folded in a succession of open anticlines and synclines gently plunging 10°W to 20°W. Folding has resulted in the formation of two distinct mineralized zones related to two anticlines (known as the NW pit and the SE pit) separated by a nearly barren syncline. A regional reverse fault parallel to the stratigraphy has truncated the sedimentary sequence to the north and has shifted the volcaniclastic rocks (mainly felsic tuff and lapilli tuff) on top of the sedimentary sequence.

The NW pit is bounded to the north by the regional north-dipping reverse fault. The fault is associated to mineralized shear veins, however, most of the mineralization is hosted in the footwall of the regional structure. The mineralization consists of quartz-carbonate tension veins emplaced in the hinge of the anticline near the conglomerate beds, and in stacks of north dipping to flat tension veins associated with north dipping shear zones. In the SE pit, the mineralization is hosted in E-W shear veins dipping 60° N associated with stacks of gently north dipping tension veins. These mineralized veins are more abundant near the contact between sedimentary and volcanic rocks. N-S to NNE-SSW steeply west dipping veins are also observed locally.

Figure 5-9: Cross-Section Royal Hill Deposit



Source: Iamgold, 2022

Mayo

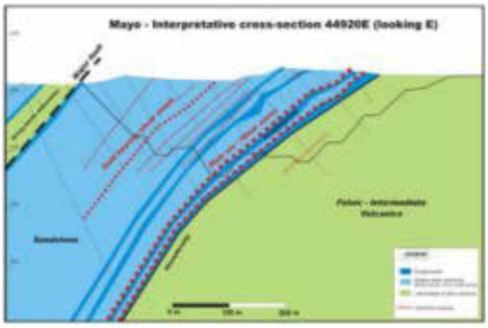
The Mayo (MA) deposit lies at the western extension of the South domain. The base of the stratigraphy is a fine grained, generally featureless felsic volcanic unit. The volcanic unit is unconformably overlain by a sedimentary sequence, represented by two levels of conglomerate at the base and a thick arenitic sequence interbedded with conglomerate beds at the top, striking 260° and dipping 40°N. This sequence is truncated to the north by the same regional reverse shear as observed at Royal Hill (RH), which is shown in Figure 5-10.

The major reverse fault is mostly barren in the MA area, with most of the mineralization hosted along subsidiary shears and associated tension veins in the footwall of the reverse fault. The subsidiary shears have been predominately formed along pre-existing lithologic contacts, such as conglomerate beds and the volcano-sedimentary contact. Two sets of tension veins are observed in association with the shear veins:

1) stack of flat to slightly north dipping veins, and

2) a set of N-S to NNE-SSW steeply west dipping veins. The strongest gold intercepts are observed in two shear veins located near the volcano-sedimentary contact along the basal conglomerate beds.

Figure 5-10: Cross-Section Royal Hill Deposit



Source: Iamgold, 2022

Roma

The Roma (RM) deposit is located between the Royal Hill (RH) and Mayo (MA) deposits and is divided into the East Roma (RME) and West Roma (RMW) deposits. The lithological succession encountered is the same as that observed at Royal Hill (RH) and Mayo (MA) with a volcanic basement overlain by conglomerates and an arenitic sequence. The East Roma (RME) deposit is separated from the RH deposit by a late NNW-SSE steeply west dipping fault, while the West Roma (RMW) deposit is on strike with the Mayo (MA) deposit. Both deposits are hosted in anticlinal hinges.

Mineralization is associated with small centimetric to decimetric north-dipping to flat tension veins hosted in the hinge of the folds, and locally associated with shear zones. The veins in the West Roma (RMW) pit are usually thicker than in the East Roma (RME), exhibit a greater density, and locally have higher grades. Shear veins strike E-W to SSW-NNW, dipping 45° N and are observed in the northern portions of the Roma (RM) deposits where bedding is also dipping north. A small amount of pyrite, generally less than 1% to 3%, is associated with gold mineralization.

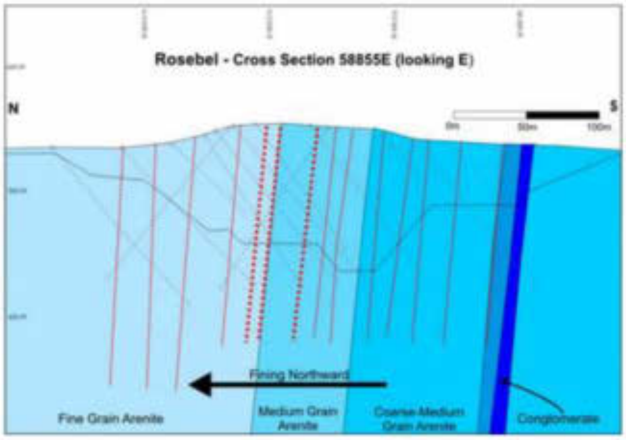
(3) Central Domain

Rosebel

The Roseble (RB) deposit is hosted in a sedimentary sequence of siltstone and arenite of the Rosebel Formation. Roseble (RB) is the only deposit not located along a volcano-sedimentary contact. The southern portion of the Roseble (RB) pit exposes one interval of conglomerate interbedded within a coarse grained, quartzrich arenite. This sequence evolves to finer grained arenites and siltstones suggesting a general northward younging direction. The sequence strikes 100° and is sub-vertical to steeply dipping to the north. The sedimentary sequence and the mineralization are intruded by three post-mineralization, sub-vertical, north-south diabase dykes, Figure 5-11.

Gold is observed within quartz-carbonate tension veins associated with sub-vertical shear corridors that are sub-parallel to bedding. Tension veins vary in orientation and dip with N-S steeply west dipping veins in the west, moderately north and south dipping veins (conjugate system) in the central portion of Roseble (RB) and gently east dipping veins in the east. This latest set is associated with ankerite alteration and exhibits the highest grades. Mineralization is predominately concentrated at the contact between sedimentary rocks exhibiting different competencies (i.e., between siltstone and coarse arenite).

Figure 5-11: Cross-Section Rosebel Deposit



Source: Iamgold, 2022

5.4.2 Saramacca: Mineralized Domains and Deposits

The Saramacca (SM) deposit is hosted exclusively in volcanic rocks, along a major fault zone (Faya Bergi) at the contact between massive basalt to the SW and pillow basalt to the NE. The mineralized fault zone varies from few a metres to more than 50 m thick. Most of the high grade mineralization is hosted in the main fault exhibiting brittle ductile texture with dolomite breccias hosting pyrite and minor arsenopyrite mineralization. Although the fault is continuous overseveral kilometres, the fault is not systematically mineralized, even within the Saramacca (SM) deposit. Lower grade mineralization is observed in subsidiary shears within the pillow basalt unit. These form discontinuous sub-vertical mineralized lenses well developed in SE and NW portions of the Saramacca (SM) deposit, but thinner in the central part of Saramacca (SM), Figure 5-12.

Figure 5-12: Cross-Section Saramacca Deposit

6 Exploration

6.1 Rosebel Exploration History

Gold was first discovered in the area of the Rosebel property in 1879, when small scale miners (SSMs) were reported to be working on the property. Since that time, it is estimated that approximately half of the recorded production of Suriname has been produced from the district.

• Initial commercial production activities were carried out between 1885 and 1939 by various companies exploiting alluvial material, surface deposits, and veins with various levels of success, including Guyana Gold Placer Company operated dredges in Niew Foto and Groote Louis Creeks of the KH area circa 1910. Guyana Gold sub-leased some ground in the KH area to an American group, who underground mined a series of quartz veins up to five metres wide. Production was said to include a "nugget" of nearly eight ounces.

• De Jong Brothers who mined the RH area both underground and in open cuts during the 1920s and early 1930s.

• White Water Mines Ltd. Acquired the RH area from De Jong in 1935 and continued underground mining of widespread veins, until production ceased in 1939, at the start of the Second World War.

• Van Emden Gold Mines Ltd. Operated three mines in the area in the 1930s at MA, KH, and Donderbari.

More recently, several companies conducted various exploration and evaluation studies, and resource estimates on the Rosebel deposits

（1）In 1974, the property was granted to Surplacer, a JV between Placer Development Ltd. (Placer) of Vancouver and the Surinamese Government. The exploration program identified gold anomalies several kilometres long, located along two major trends, one in the North and the other in the South of the Rosebel area. Detailed follow up work, involving 900 hand auger holes, four kilometres of bulldozer trenches and 43 reverse circulation (RC) drill holes, partially delineated surficial and near-surface gold mineralization in the RH, MA, and RB areas in the south and PC in the north. Placer terminated the JV in 1977.

（2）In 1979, the Rosebel property was awarded to Grassalco, which carried out a new resource estimate based on 1,500 hand auger holes and excluded the Placer data. Grassalco abandoned the property in 1985, due to an unstable political situation.

（3）Golden Star Resources Ltd. (Golden Star) acquired the ROE to the Rosebel property pursuant to a Preliminary Mineral Agreement between Golden Star, Grassalco, and the Republic dated May 8, 1992. A finalized 1994 Mineral Agreement was agreed between the parties signed on April 7, 1994, granting Golden Star a ROE on the Rosebel property for five years.

Golden Star then entered into an agreement with Cambior Inc. (Cambior) on June 7, 1994, granting Cambior the option to earn an undivided 50% of Golden Star's interest in the 1994 Mineral Agreement and the Rosebel property. Under the terms of the agreement, Cambior could exercise its option by funding approximately US$6.1 million in exploration and development expenditures on the Rosebel property by June 30, 1996.

Cambior filed a feasibility study (FS) and an Environmental Impact Statement with the Republic in May 1997 and filed a revised FS incorporating additional drilling results in December 1997, before placing the project on care and maintenance from 1998 to 2000.

In December 2000, a prefeasibility study (PFS) was filed with the Ministry of Natural Resources envisaging an initial development involving the mining and processing of only the soft and transition ore of the Rosebel deposits, reducing the estimated capital expenditures to US$80 million from the US$175 million contemplated in the original 1997 FS. A revised FS, subsequently completed and filed in August 2002, replaced the earlier studies.

On October 26, 2001, Cambior agreed to acquire Golden Star's 50% interest in the Rosebel property, to hold a 100% interest in the property, for a total cash consideration of US$8.0 million and a gold price participation right on future production from the Mine, US$5.0 million was paid at closing (May 2002) and the remainder in three equal instalments paid over a three year period. Under its gold price participation right, Golden Star would receive a quarterly payment of an amount equal to 10% of the excess, if any, of the average quarterly market price above

US$300/oz Au for gold production from the Rosebel deposits soft and transitional rock portions and above US$350/oz Au from the hard rock portion, up to a maximum of 7.0 Moz Au produced.

In addition, Golden Star transferred its rights in the adjacent Headley's Reef and Thunder Mountain exploration properties.

In 2002, RGM was established in accordance with the provisions as included in the Mineral Agreement entered into by the Republic and Cambior, whereby the Republic would hold a 5% free carried interest and Cambior a 95% interest in the company.

Commercial production at the Mine was achieved in February 2004. Golden Star subsequently sold its royalty interest in production at the Rosebel property to Euro Resources (formerly Guyanor Resources SA) in 2004.

（4）In November 2006, IAMGOLD acquired a 100% interest in Cambior, thereby acquiring a 95% interest in the Rosebel property.

In December 2008, IAMGOLD acquired 84.55% of the current share capital of Euro Resources.In June 2013, IAMGOLD, RGM, Grasshopper Aluminum Company N.V., and the Republic executed the Second Amendment to the Mineral Agreement. The Second Amendment created a new UJV in which the Republic, through NV 1, a wholly owned subsidiary of the Republic, could elect to hold a paid 30% interest and RGM would hold a 70% interest. Under the terms of the

Second Amendment, NV 1 was also granted an option to acquire an increased interest in production from the Rosebel concession if RGM approves a Significant Expansion of the existing Rosebel Plant and if NV 1 elects to participate in the expansion by funding 30% of the capital required for the expansion. A Significant Expansion is defined as an increase in the milling capacity of the Rosebel Plant of 3.0 million tonnes per annum (Mtpa) or as otherwise agreed by the UJV partners, NV 1, and RGM. At the present time, RGM has not approved a Significant Expansion and the UJV partners are not currently evaluating a potential Significant Expansion scenario. In December 2015, IAMGOLD announced the closing of a simplified tender offer for Euro Resources through the Euronext Paris. At the closing of the simplified tender, in conjunction with purchases made by IAMGOLD through the facilities of the Euronext Paris since the submission of the draft offer to the French Autorité des

Marchés Financiers, IAMGOLD owns and controls approximately 90% of the outstanding common shares of Euro Resources.

6.2 Saramacca Exploration History

In 2013 IAMGOLD, RGM, Grassalco, and the Republic signed the Second Amendment with the goal among others of establishing an area of mutual interest, with a radius of 45 km from a point with the following coordinates: 694 000 East, 597 000 North, but excluding Rosebel (the UJV Area) and certain activities to be undertaken regarding the UJV Area and the establishment of an UJV between RGM and NV 1 in which NV 1 would hold 30% participating interest on behalf of the Republic and RGM would hold the remaining 70%.

In 2020, the Saramacca UJV was established between RGM and NV 1. The 30% participating interest was returned by NV 1 to the Republic, and immediately thereafter designated by the latter to be held by Staatsolie along with all the associated rights and obligations, which Staatsolie accepted. As such, IAMGOLD holds a 66.5% interest in Saramacca.

Furthermore, seven exploration concessions were brought in under the Second Amendment and are therefore, part of the UJV. All other concessions acquired within the UJV Area by the UJV parties shall be presented to the other party to potentially bring these into the UJV partnership.

In August 2006, Golden Star signed a JV with Newmont Corporation (Newmont), whereby the latter would fund all exploration activities and Golden Star would be the operator of the property. In 2009, Newmont had earned a 51% interest in Saramacca by spending US$6.0 million on exploration expenditures and took over management of the programs.

In November 2009, Golden Star agreed to sell its interest in the Saramacca JV to Newmont. In December 2012, all requirements for the sale and transfer were met, and ownership and control of Saramacca was turned over to Newmont for a total consideration of US$9.0 million in cash.

On 31 August 2013, the Saramacca ROE was issued to NV 1.

On 30 August 2016, RGM signed a LOA with the Republic to acquire the rights to Saramacca.

The terms of the LOA included an initial payment of US$200,000 which enabled immediate RGM access to the property to conduct due diligence and included access to historical data from previous Saramacca exploration activity.

On September 29, 2016, RGM ratified the LOA by a Ratification Letter. An amendment to the LOA on December 12, 2016, allowed RGM to acquire a 70% interest in Saramacca by completing the agreed terms. Under the terms of the LOA, RGM subsequently paid US$10 million in cash

and agreed to pay an additional adjustment amount of US$10 million in cash, as well as to issue 3,125,000 Common Shares of IAMGOLD to NV 1 in three approximately equal annual instalments on each successive anniversary of the date the right of exploration was transferred to RGM. The title to Saramacca was transferred from NV 1 to RGM on December 14, 2016. (GMD No 706/16.)

Following approval of the ESIA by the Minister of Natural Resources in February 2019, the Saramacca ROE was received on May 2, 2019.

The first recorded exploration on the SM deposit was undertaken by Golden Star in 1994. During this time, Saramacca was part of a larger grant package known as Kleine Saramacca. Much of the work focussed on the discovery and delineation of Anomaly M, which was the subject of successive auger and diamond drilling (DD) programs, with over 200 auger holes and 90 DD holes completed in the anomaly area. Anomaly M became the Saramacca project after IAMGOLD-RGM carried out exploration work in 2016 and 2017.

From 2016 to 2019, exploration work conducted on Saramacca was performed by RGM's Suriname Exploration Department (SurEx) which conducts exploration work outside of the Rosebel concession. In early 2018, exploration and evaluation activities were transitioned to RGM's Mine Exploration Department (MinEx) who continue to conduct the ongoing exploration activities at Saramacca.Upon the declaration of the first mineral reserves estimate for the SM deposit in September 2018, RGM commenced various technical studies and activities to support the submission of permitting applications for an eventual mine development. An ESIA was subsequently approved by the Republic on January 17, 2019, which allowed for the commencement of construction activities including, the haulage road from the Mine to the Saramacca site, timber clearing and stripping of the SM deposit area and the construction of supporting site infrastructure. In October 2019, first ore from the SM deposit was shipped to the Rosebel Plant for processing.

6.3 Sampling, Sample Preparation and Analyses

The most recent technical reports for Rosbel project are *TECHNICAL REPORT ON THE ROSEBEL GOLD MINE, SURINAME* Prepared by I AM GOLD COOPERATION, January 2021, and *RGM – Yearly QAQC Report – 2023 and 2024* by ROSEBEL GOLD MINES N.V., the descriptive information of this section is derived from these reports unless otherwise noted.

6.3.1 Sampling

Sampling at the Rosebel Gold Mine and Saramacca deposits has been carried out using diamond drilling ("DD"), reverse circulation ("RC") drilling and channel sampling methods. These techniques are implemented to ensure the collection of reliable and accurate data, in alignment with industry best practices. Sampling procedures are standardized and performed by IAMGOLD-RGM personnel, under the supervision of geologists to maintain adherence to established quality control protocols.

For DD, all geological and geotechnical logging, as well as core splitting and sampling, conducted by MinEx were performed at the Rosebel MinEx core shack. Similarly, the drilling campaign at Saramacca was executed by SurEx at the Saramacca camp core shack. Following the initial logging and handling, the core boxes were transported to the mine, where the half-core was split and sampled.

After the core is received, it undergoes a washing process to remove any residual drilling fluids. For saprolite, the top layer is carefully peeled away to reveal structural features within the softer material. Geotechnical logging is then performed by the geotechnician, who meticulously records core recovery, rock quality designation ("RQD"), rock hardness, and fracture density.

The core is then subjected to geologist for detailed logging, focusing on lithology, alteration, and vein presence. Sample intervals are defined during logging, with typical lengths of 1 to 1.5 meters, adjusted as needed for poor core recovery. Sampling boundaries are based on visual geological indicators such as lithology, weathering, alteration, mineralization, structure, and hole diameter changes. Before splitting, the core is photographed, then divided into sample intervals. The remaining half is securely stored in the core yard for reference or future testing.

6.3.2 Sample Preparation and Analyses

Two analytical methods are employed to analyze Rosebel and Saramacca DD and RC samples: Fire Assay ("FA") and Pulverize and Leach ("PAL"). These samples are processed at two distinct laboratories: the onsite Rosebel Gold Mines ("RGM") laboratory and the independent, accredited Filab Suriname laboratory ("Filab"), which represents ALS Limited ("ALS") in Suriname, located in Paramaribo.

Filab and ALS are independent, commercial geochemical laboratories that operate autonomously from IAMGOLD-RGM, while the RGM laboratory is an internal mine laboratory operated by IAMGOLD-RGM. The RGM laboratory is capable of performing both FA and PAL analyses, whereas Filab specializes in FA only. Both Filab and ALS are accredited to ISO/IEC 17025 for geochemical analyses, including those used by IAMGOLD-RGM. ALS holds ISO/IEC 17025 accreditation through the Canadian Association for Laboratory Accreditation, Inc. (CARLA), with registration number A1719. The RGM laboratory is also ISO/IEC 17025 accredited (accreditation number A3711) and has undergone 53 audits by IAMGOLD-RGM staff between April 2018 and June 2021. Additionally, Filab and the RGM laboratory are audited by IAMGOLD-RGM staff at least bimonthly.

Rosebel samples can be analysed using either PAL or FA. Typically, grade control RC samples and exploration RC samples are analysed using the PAL method, whereas DD samples are analysed using FA. For Saramacca samples, both grade control and exploration samples are systematically analysed using FA due to the lower metallurgical recoveries observed for the Saramacca deposit.

All samples are collected by IAMGOLD-RGM personnel or under their secure supervision, ensuring chain-of-custody integrity from the point of sampling through to their receipt at the primary laboratory.

For FA sample preparation, whole samples (approximately four kilograms) are placed in large drying pans and dried at 105˚C for about four hours to ensure complete drying. Once cooled, the samples are crushed to approximately 75% passing -8 mesh using a Bico-Badger crusher. To monitor this process, one in every 21 samples is screened for percentage passing -8 mesh. After this initial comminution, the material is referred to as a coarse sample.

The coarse samples are then riffle split to approximately 800g, with the remaining coarse material retained by the laboratory until the Geology department determines which coarse rejects can be discarded. The 800 g portion is pulverised to approximately 95% passing -170 mesh using a Bico UA pulveriser, producing what is referred to as pulp. One in every 21 samples is screened for percentage passing -170 mesh. The pulverized material is homogenized by rolling, and a 30 g (RGM laboratory) or 50 g (Filab) pulp sample is taken for analysis. The remaining pulp is retained by the laboratory until the Geology department decides which pulp rejects can be discarded. To prevent contamination, a sand wash is used to clean the pulverizing equipment between samples.

For FA analysis, approximately 30 g (RGM laboratory) or 50 g (Filab) of pulp material, prepared to 95% passing -170 mesh is used. The pulp is mixed with the appropriate flux and silver nitrate solution and placed in a crucible. The sample undergoes fusion in a furnace at 900˚C for 45 minutes. Once cooled, the lead button containing gold is separated and placed in a pre-fired cupel, which is heated in the furnace at approximately 950˚C for 30 minutes. When the molten lead is fully absorbed, a gold-silver bead remains in the cupel. The bead is analysed using atomic absorption (AA) with a detection limit of 0.005 g/t Au (Filab method code FA50) or 0.014 g/t Au (RGM method code FA-AAS). Since 2017, samples exceeding 5 ppm gold have been reanalysed using a gravimetric finish for higher precision.

For PAL sample preparation, whole samples (approximately five kilograms) are placed in large drying pans and dried at 105˚C for about four hours to ensure complete drying. Once cooled, the samples are crushed to approximately 75% passing -8 mesh, with one in every 52 samples screened for percentage passing -8 mesh. After this initial comminution, the material is referred to as a coarse sample. The coarse samples are then riffle split to approximately 800 g, with the remaining material retained by the RGM laboratory until the Geology department determines which rejects can be discarded. From the split material, 300 g of coarse sample is selected for assaying.

Excess coarse rejects and pulp from DD and RC samples are returned to IAMGOLD-RGM and securely stored onsite. Approximately 8% of these samples are selected for check assay testing, either randomly or to verify specific assay results at the umpire laboratory.

For PAL analysis, approximately 300 g of coarse material, prepared to greater than 75% passing -8 mesh, is precisely measured for processing. The material is placed in an iron container along with 1,000 ml of water, two cyanide assay tabs, and steel grinding media (two 36 mm balls, four 27 mm balls, and 1 kg of 12 mm balls). The PAL machine grinds and leaches the material simultaneously for 90 minutes. After processing, a 10 ml aliquot is collected from each pot (the PAL system operates 52 pots simultaneously). The aliquot is filtered to remove the grinding media and sent for atomic absorption (AA) analysis.

6.3.3 Specific Gravity Data

Specific gravity samples, previously identified in core trays using blue flagging tape or marker pen, are collected (10 cm to 20 cm of half-core), and a sample tag with a unique specific gravity sample ID is attached to the core tray where the sample was taken. A detailed list of all specific gravity samples, including their sample IDs and 'from' and 'to' values, is recorded. This list is entered into the database by either the geologist who logged the hole or the database manager. Specific gravity samples are collected after assay samples to ensure that entire intervals are assayed, avoiding any gaps where specific gravity samples were taken.

Specific gravity samples consist of 10 cm segments of half core with representative of geological unit. These samples are collected from the top to the bottom of each diamond drill (DD) hole, encompassing both mineralized and barren material. Since 2015, MinEx has collected specific gravity samples from Rosebel and Saramacca every 10 metres across all material types. The SurEx team collects samples every 10 metres in soft oxidized material down to the transition zone, and every 25 metres in fresh rock thereafter. Prior to 2015, specific gravity samples were taken at each change in weathering type and lithology, typically resulting in an average of two to three samples in saprolite and transition material, and a minimum of three samples in hard rock. Sampling frequency was locally increased to account for rapid lithological changes, ensuring all lithotypes were adequately represented.

Soft samples are wrapped in plastic film, tagged, and placed inside a thick paper bag labeled with a sample tag, while fresh, hard rock samples do not require wrapping. Specific gravity is measured using the gravimetric method, where the sample is coated in paraffin wax, weighed in air, and then weighed while suspended in water. After the specific gravity determinations are completed, the laboratory returns the samples, which are subsequently placed back in their original core boxes. The results are transmitted electronically and entered into the database by the database manager.

6.4 Quality Assurance and Quality Control Programs

Quality Assurance and Quality Control (QA/QC) programs are established to ensure the reliability and integrity of exploration data. Including inserting Certificated Reference Materials (CRMs), blanks and duplicates into the sample streams submitted to the laboratory.

Since 2014, Filab and ENZA Analytical Services ("ENZA") have served as check laboratories for the FA process conducted by the RGM laboratory. For PAL samples, the RGM laboratory utilizes external laboratories such as CRS Laboratories Oy-Activation Laboratories Ltd., Newmont Corporation's Merian Gold Mine laboratory in Suriname, and ENZA. Additionally, umpire testing of samples is performed by ALS in Vancouver, Canada.

QAQC from 2017 to 2021

CRMs

Between 2017 and 2021, IAMGOLD-RGM utilized 13 different CRM types, with gold grades ranging from 0.20 g/t Au to 14.18 g/t Au, covering both oxide and sulphide facies, as summarized in Table 6-1.

Table 6-1: Summary of CRMs Used by IAMGOLD-RGM from 2017 to 2021

Low Grade Au CRM (0 ppm to 1 ppm)				Low Grade Au CRM (1 ppm to 5 ppm)			
CRM ID	Expected Value	SD	Inserts	CRM ID	Expected Value	SD	Inserts
SurEx				SurEx			
250	0.309	0.013	288	209	1.58	0.044	296

Low Grade Au CRM (>5 ppm)			
CRM ID	**Expected Value**	**SD**	**Inserts**
		SurEx	
210	5.49	0.152	126
257	14.18	0.264	7

Blanks

Since 2014, blank material from Sunway Lab Supplies has been used, replacing barren core material from condemnation drilling. In 2016 and 2017, SurEx utilized OREAS-certified blanks (24c and 26b) with a value of 0.01 g/t Au, sourced from Ore Research & Exploration Pty Ltd, Australia. Additionally, a locally sourced coarse blank from a barren intrusive sill was used.

Safety limits for blanks are set at twice the detection limit for pulp blanks and three times for coarse blanks. The detection limits are 0.014 g/t Au for the RGM laboratory and 0.005 g/t Au for Filab. If a blank exceeds these limits, contamination is flagged, and the associated batch or sample sequence must be re-assayed.

A contamination period is identified if 10% of coarse blanks or 5% of pulp blanks exceed safety limits. In such cases, all assays between the affected blanks are re-assayed, and an investigation is conducted.

Duplicates

Approximately 2% of MinEx samples undergo systematic check assaying of coarse reject and pulp material at the primary laboratory (RGM or Filab), selected randomly or to verify specific assay results. Similarly, around 3% of SurEx coarse duplicate samples are submitted to the primary laboratory for check assaying.

For analytical data verification, SurEx and MinEx submit sample pulps to external laboratories (Filab, Chemex, or ALS in Vancouver) for umpire check assays using FA with an AA finish, covering a range of gold values. Additionally, IAMGOLD-RGM SurEx collected one field duplicate per 25 samples from RC holes, though field duplicates were not systematically collected for drill core.

QAQC from 2022 to 2024

Following Zijin's acquisition in 2022, the QAQC program was seamlessly inherited and maintained. Annual QAQC reports, along with the associated database, were provided to SRK for review. SRK has thoroughly evaluated the reports and verified the database, with a summary of the QAQC sample performance provided below.

In 2022, the Results of MinEx QAQC program in FILAB are presented below, including blanks, standards and duplicates.

Table 6-2: FA QAQC Performance in 2022

Name	Assays	Reference Value (g/t)	Assay Value (g/t)	> 2*st.dev	Outliers

The historical QAQC performance for the Rosebel and Saramacca projects aligns with industry best practices, demonstrating strong accuracy and precision in both the RGM laboratory and Filab. SRK is confident that the data quality is sufficient to support reliable and meaningful mineral resource estimates.

6.5 SRK Data Verification

To be added after site visit.

7 Mineral Resource Estimates

7.1 Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Rosebel Project in accordance with the JORC Code 2012.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Rosebel Project Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

SRK has used the datasets made available by ROSEBEL GOLD MINES to prepare a Mineral Resource model for the **Rosebel（North Domain: Pay Caro & East Pay Caro, Koolhoven-J Zone, East Tailing Road; South Domain: Royal Hill, Mayo, Roma；Center Domain: Rosebel）, Saramacca, Overman and Moeroekreek.**

The basic model was prepared by ROSEBEL GOLD MINES in Leapfrog using conventional 3D block modelling and OK estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, the grade interpolation as well as the resources classification, were completed by ROSEBEL GOLD MINES in the Early of 2025. All of the geological model data of the project except Saramcca we have received are in local UTM coordinates which can be to UTM coordinates set in zone 21N projection coordinate system, WGS 1984 by using relevant transformation parameters.

SRK has reviewed the database and model, performed grade estimation, and reported the resource. The mineral resources are reported in accordance with JORC Code (2012). Mineral resources are not Ore Reserves and do not have demonstrated economic viability. There is no certainty that all or any part of the mineral resource will be converted into Ore Reserve.

7.2 Rosebel North Domain: Pay Caro & East Pay Caro

7.2.1 Introduction

The resource study estimation of Pay Caro & East Pay Caro Project has been conducted by ROSEBEL GOLD MINES. SRK has reviewed the information made available for this study and has used the datasets for the preparation of the SRK model. Presented below is a summary of the main datasets available for the previous study.

Data provided by ROSEBEL GOLD MINES:

- Exploration Database, including collar, survey, assay, and lithological logs codes
- Composites, orebodies wireframe, and topography in dxf format of CAD software.
- Block model in csv format of Microsoft office software

7.2.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold mineralisation;
- Definition of Mineral Resource domains;
- Data conditioning (compositing and capping) for geostatistical analysis and variography;
- Block modelling and grade interpolation;
- Mineral Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

7.2.3 Resource Database

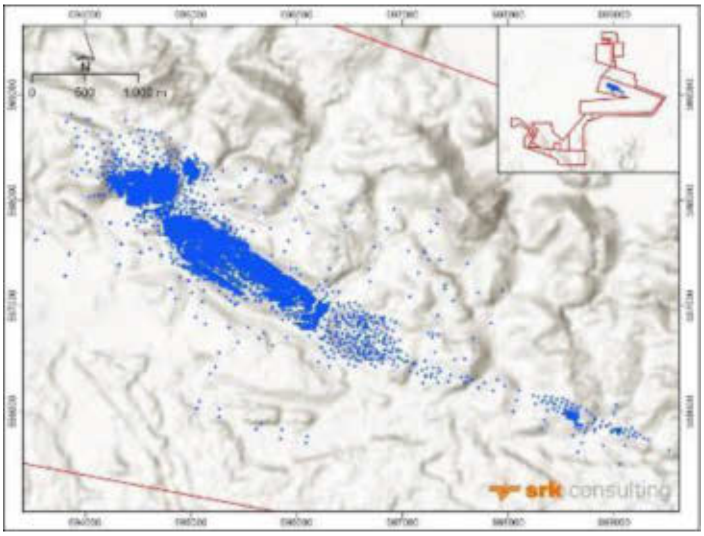
The data SRK received from the client include: previous technical reports, working technical process documents and QAQC data, databases, resource models etc.

Overall, the mineral resource of **Pay Caro & East Pay Caro Project** was estimated by SRK based on database provided by ROSEBEL GOLD MINES. As of January 1, 2025. There were 8,820 drillholes (**688,210.4 m**) in the database, as shown in Table 7-1 **and** Figure 7-1**.**

Table 7-1: Resource Database Statistics of Pay Caro & East Pay Caro Project

Area	Drillholes	Length（m）	Samples
Pay Caro & East Pay Caro	8,820	688,210.4	369,152

Figure 7-1: Drillhole Location of Pay Caro & East Pay Caro Project



7.2.4 Solid Body Modelling

All the wireframe models of **Pay Caro & East Pay Caro Project** were provided by ROSEBEL GOLD MINES in April, 2025. SRK has reviewed the wireframe which were created by Implicit modelling techniques of the drilling dataset by used Leapfrog. We believe that they are basically reasonable and can be used for resource estimation, as shown in Figure 7-2 to Figure 7-7**.**

Figure 7-2: Lithology model of Pay Caro & East Pay Caro Project

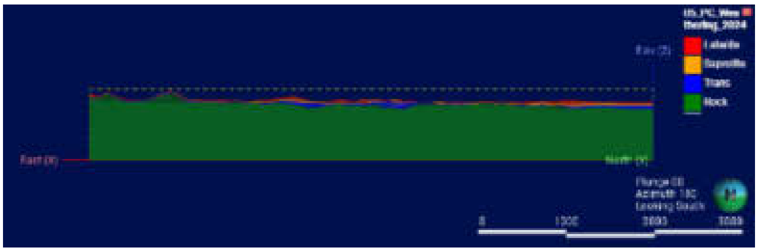

Figure 7-6: Mineral zone model of Pay Caro & East Pay Caro Project

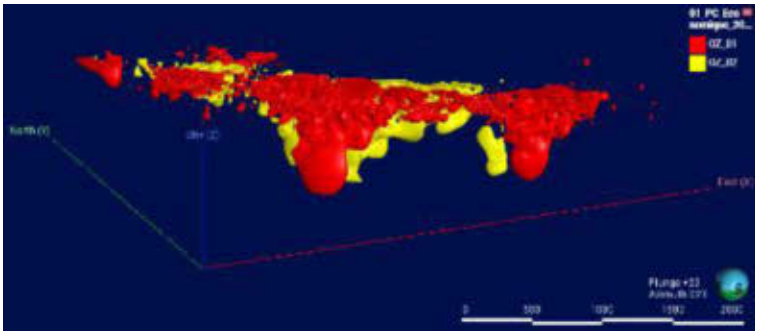

Figure 7-7: Cross Section of Mineral zone system model of Pay Caro & East Pay Caro Project

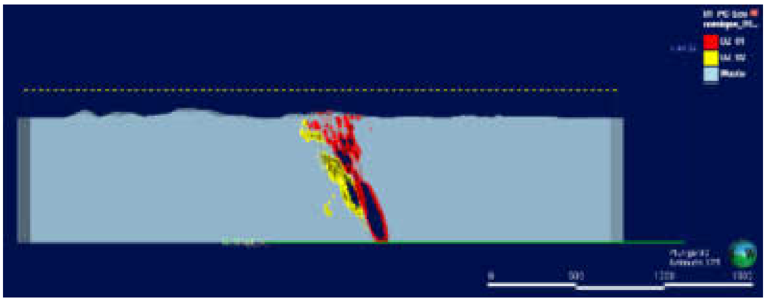

7.2.5 Specific Gravity

A total of 5,585 specific gravity samples which listed in geology database were collected from **Pay Caro & East Pay Caro Project.** Samples were collected from different lithologies and different parts of the mineralised body of **Pay Caro & East Pay Caro Project.** and the representative of density samples are considered sufficient, **as shown in** Figure 7-8. The specific gravity ("SG") is listed in the Table 7-2 **,**which are applied in SRK's resource estimation.

Figure 7-8: The Distribution Specific Gravity Samples of Pay Caro & East Pay Caro Project

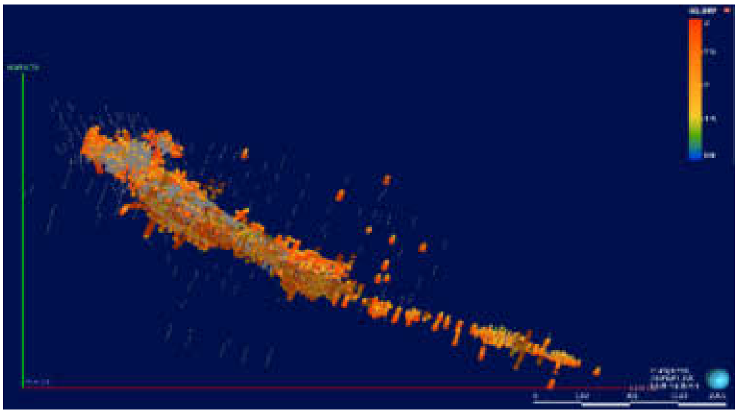

Table 7-2: Specific Gravity of Pay Caro & East Pay Caro Project

No	Weathering	Average（t/m³）
1	Laterite	1.72
2	Saprolite	1.86
3	Transition	2.32
4	Rock	2.75

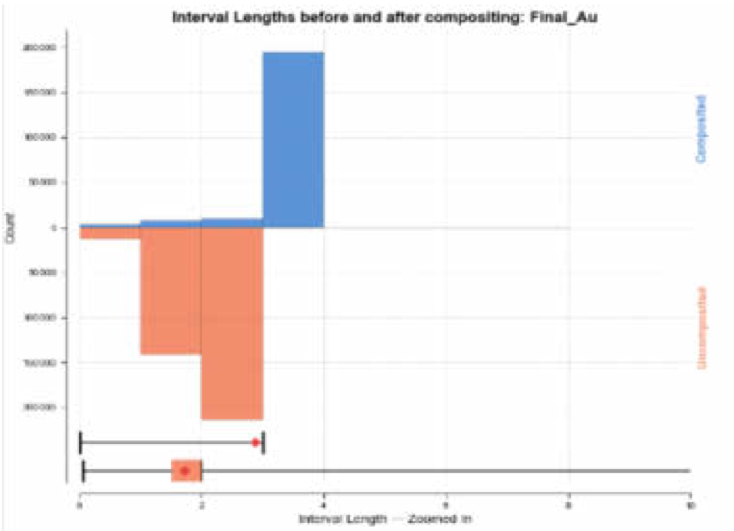
7.2.6 Compositing

The basic statistics of raw sampling length **of Pay Caro & East Pay Caro Project** indicates that most of the sample intervals are 1.71 m, comprehensively consider the height of the steps and the previous work achievements 3 m interval composite length was selected for compositing. All raw samples were composited to 3 m downhole lengths, with a minimum of 0 m for each composite sample. The distribution of sample length and Au Grade before and after composite is provided in Table 7-3 and Figure 7-9**.**

Table 7-3: Statistics of Original Samples and Composite Samples of Pay Caro & East Pay Caro Project

Iterm	Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Original	Sample Length	368949	1.71	0.40	0.23	0.16	0.06	41
	Au Grade	368949	0.29	1.97	6.64	3.9	0.00	520.1
Composite	Sample Length	232497	2.87	0.47	0.16	0.22	0.00	3
	Au Grade	213886	0.30	1.42	4.69	2.02	0.00	185.6

Figure 7-9: Compositing Comparison Histogram of Sample Length of Pay Caro & East Pay Caro Project



The distribution of sample length and Au Grade before and after composite is provided in Figure 7-10 to Figure 7-11**.**

Figure 7-10: Compositing Comparison Histogram of Sample Au of Pay Caro & East Pay Caro Project

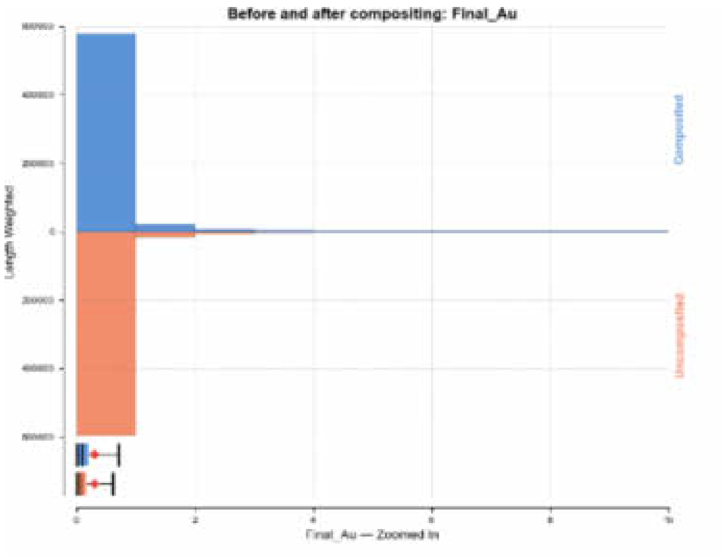


Figure 7-11: Au Raw Samples Histogram and Cumulative Histogram of Pay Caro & East Pay Caro Project

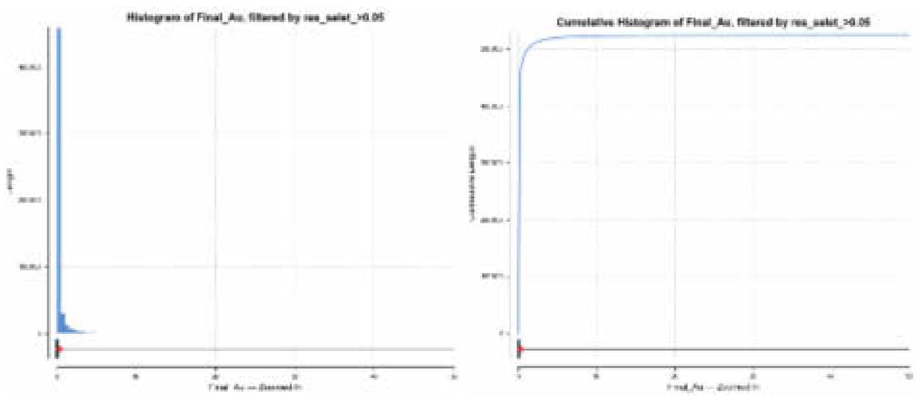


Note:
[1] The mean is indicated by the red diamond.
[2] The median is indicated by the line that crosses the inside of the box

7.2.7 Evaluation of Outliers

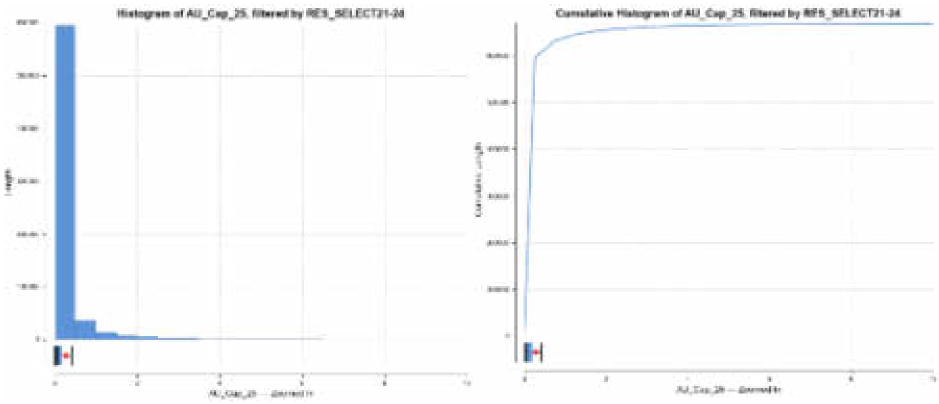
Based on the cumulative frequency and distribution characteristics of the sample histograms, the Au grades show a discontinuous distribution. As shown in Figure 7-11, 25 g/t Au, the continuity became sparse, thus 25 g/t Au was used as value capping.

Assay capping was applied for the **Pay Caro & East Pay Caro** Deposit. The capping values by domain were presented in Table 7-4**.** The histogram and cumulative-probability plots for the composite samples are presented in Figure 7-12.

Table 7-4: Statistics of Samples after capping of Pay Caro & East Pay Caro Project

Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Au_cap Grade	232497	0.26	0.79	3.00	0.62	0.00	25

Figure 7-12: Au Composite Samples Histogram and Cumulative Histogram after capping of Pay Caro & East Pay Caro Project



Note：
1 The mean is indicated by the red diamond.
2 The median is indicated by the line that crosses the inside of the box

7.2.8 Statistical Analysis and Variography

SRK has reviewed the variogram model for Au based on the composite samples by adopting a spherical variation function to fitting the experimental variogram, and the result has the characteristics of geometric anisotropy. The structure of the variogram is detailed in Table 7-5 and Figure 7-13 and Figure 7-14.

Table 7-5: Variogram Structure within Orebody and waste of Pay Caro & East Pay Caro Project

Domain	Element	Bearing	Dip	Dip Azimuth	Nugget	Sill	Range	Major/Semi-major	Major/Minor
orebody	Au	0	90	220	0.6	0.12	45	1.5	1.87
						0.54	40	1.6	2.00
waste	Au	160	82	188	0.66	0.4	76	2.17	2.24

Figure 7-13: Variogram Model within Orebody of Pay Caro & East Pay Caro Project

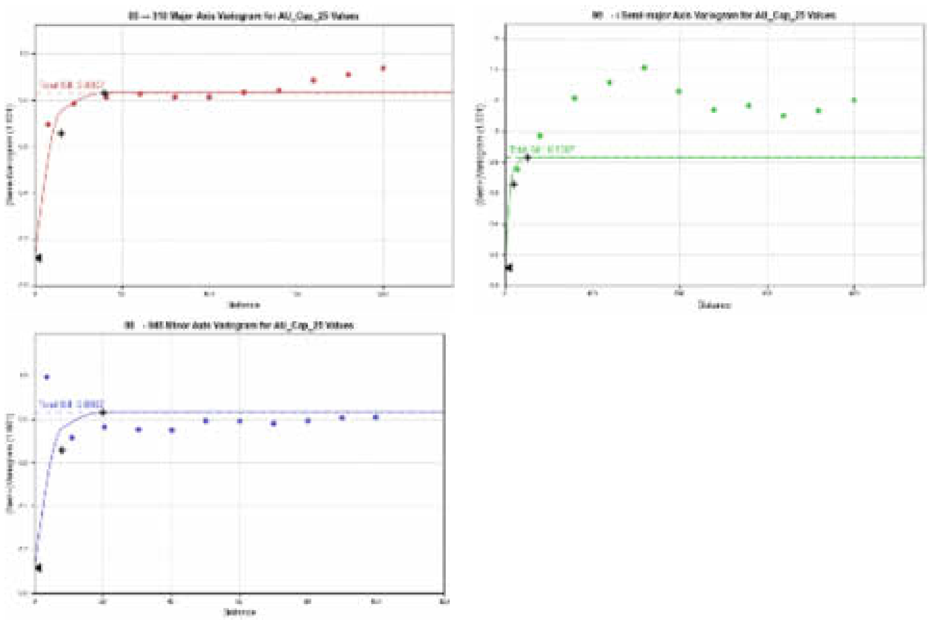


Figure 7-14: Variogram Model within waste of Pay Caro & East Pay Caro Project

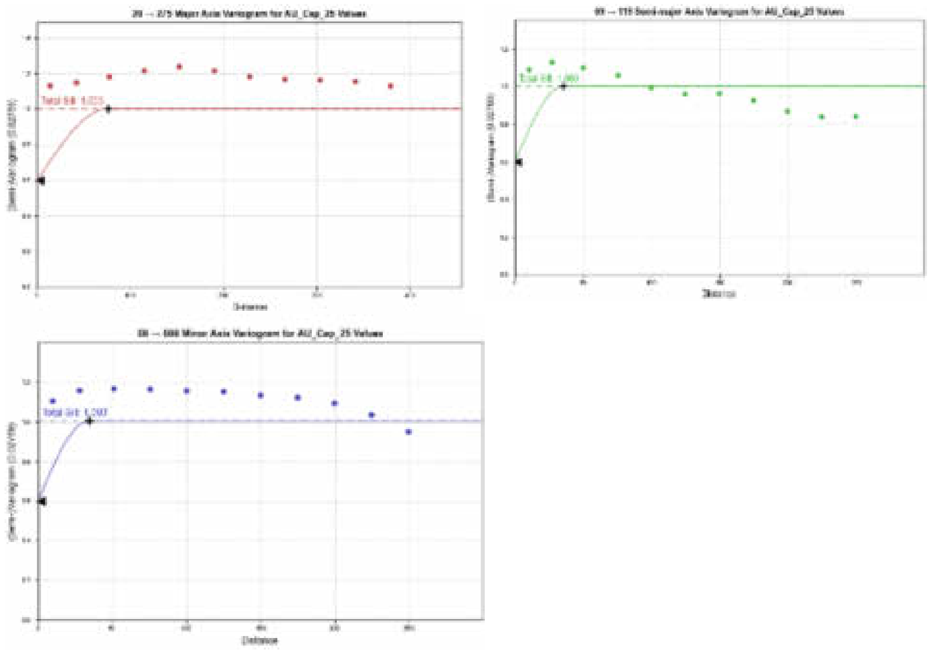

7.2.9 Block Model and Grade Estimation

The block model for each domain was created using Leapfrog geo software for grade and tonnage estimation. Appropriate block cell size was selected for the deposit.

For the **Pay Caro & East Pay Caro**, a block size of 8 m easting (X) by 6 m northing (Y) by 9 m elevation (Z) was used. A summary of the block model specifications is listed in Table 7-6. The attribute and description of the block model are presented in Table 7-7**.**

Table 7-6: Block Model Specifications of Pay Caro & East Pay Caro Project

	Min	Max	Block Size	Bub Block Size	Rotation

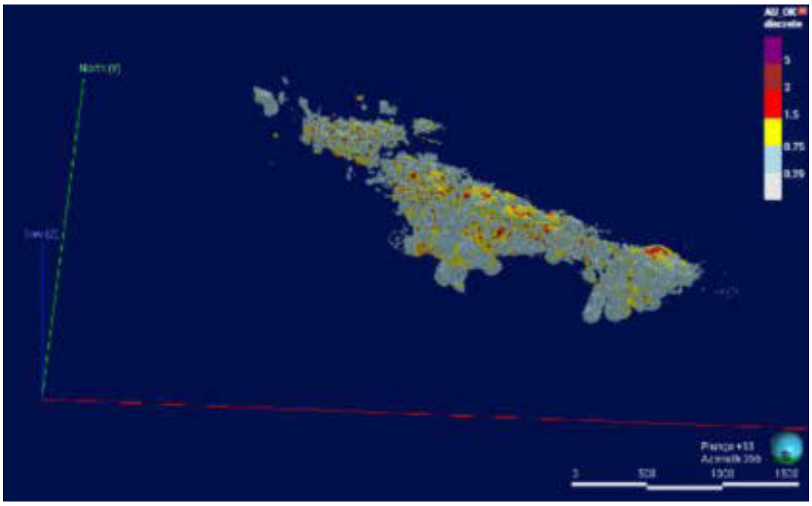
Figure 7-15: Au Estimation Grade of Pay Caro & East Pay Caro Project



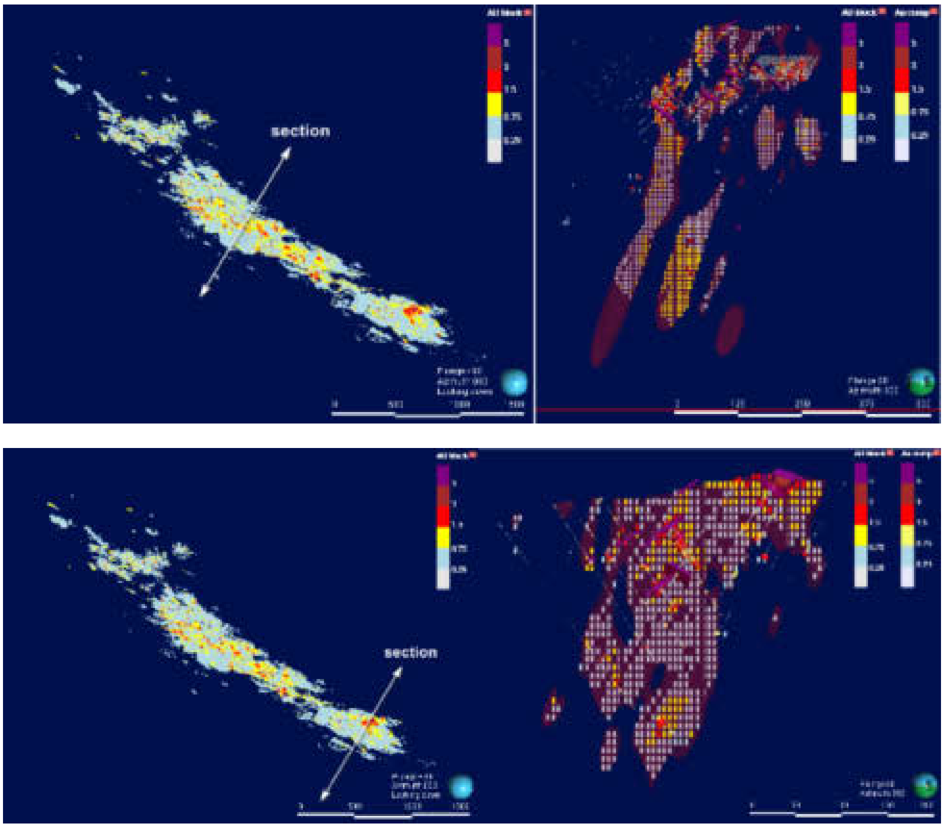
7.2.10 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the resource estimate.

SRK adopted the visual Inspection approaches to validate the model:

A series of cross-sections were cut to compare the composite samples used in resource estimation with the block model estimation results, in order to verify the reasonableness of the estimation parameters and results. Visual inspections were conducted for the mineralized zone. By comparing the block model with the relevant composite samples within the orebody, it was found that although there may be some local variability due to the nugget effect of the composite samples, overall, the areas of higher (or lower) grades in the block model correspond well with the areas of higher (or lower) grades in the composite samples. The comprehensive comparison of the composite samples overlaid on the block model shows in Figure 7-16 for the main mineralized zone.

Figure 7-16: Au Visual Inspection (block vs composite) of Pay Caro & East Pay Caro Project



7.2.11 Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

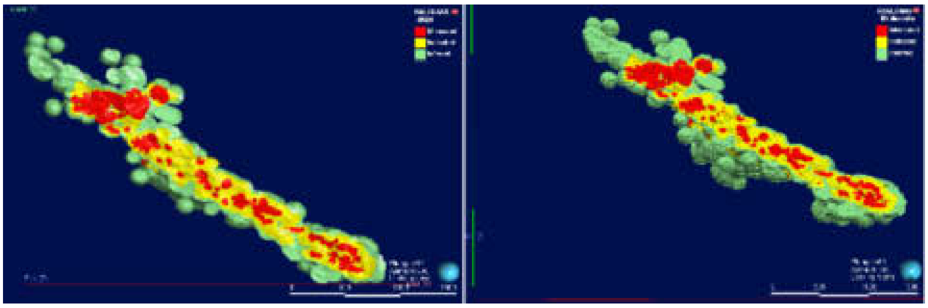
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For the **Pay Caro & East Pay Caro Project**, the Mineral Resource at the space of 25m (strike) × 25m (dip) is defined as Measured Mineral Resource, the resource at the space of 50m (strike) × 50m (dip) is defined as Indicated Mineral Resource and the resource at the space of 75m (strike) × 75m (dip) and greater is defined as Inferred Mineral Resource. Figure 7-17 shows the resource category classification of the **Pay Caro & East Pay Caro** Project.

Figure 7-17: Mineral Resource Category Distribution of Pay Caro & East Pay Caro Project



7.2.12 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions **of the Pay Caro & East Pay Caro Project** are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **Pay Caro & East Pay Caro Project** are summarised in Table 7-9**.** The spatial relationship between RPEEE and block Model shows in Figure 7-18.

Table 7-9: Assumptions Considered for the Pay Caro & East Pay Caro Project

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Pengfei Xiao and Liang Li who are a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is Fellow of AusIMM, respectively. Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2 g/t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

7.2.13 Grade Sensitivity Analysis

The mineral resources of the **Pay Caro & East Pay Caro Project** are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates [or the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources (although the global grade tonnage information is generally more appropriate characteristics of the grade tonnage characteristics of the deposit)] are presented in Table 7-11 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-19 presents this sensitivity as grade tonnage curves.

7.3 Rosebel North Domain: Koolhoven-J Zone

7.3.1 Introduction

The resource study estimation of Koolhoven-J Zone Project has been conducted by ROSEBEL GOLD MINES. SRK has reviewed the information made available for this study and has used the datasets for the preparation of the SRK model. Presented below is a summary of the main datasets available for the previous study.

Data provided by ROSEBEL GOLD MINES:

- Exploration Database, including collar, survey, assay, and lithological logs codes
- Composites, orebodies wireframe, and topography in dxf format of CAD software.
- Block model in csv format of Microsoft office software

7.3.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold mineralisation;
- Definition of Mineral Resource domains;
- Data conditioning (compositing and capping) for geostatistical analysis and variography;
- Block modelling and grade interpolation;
- Mineral Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

7.3.3 Resource Database

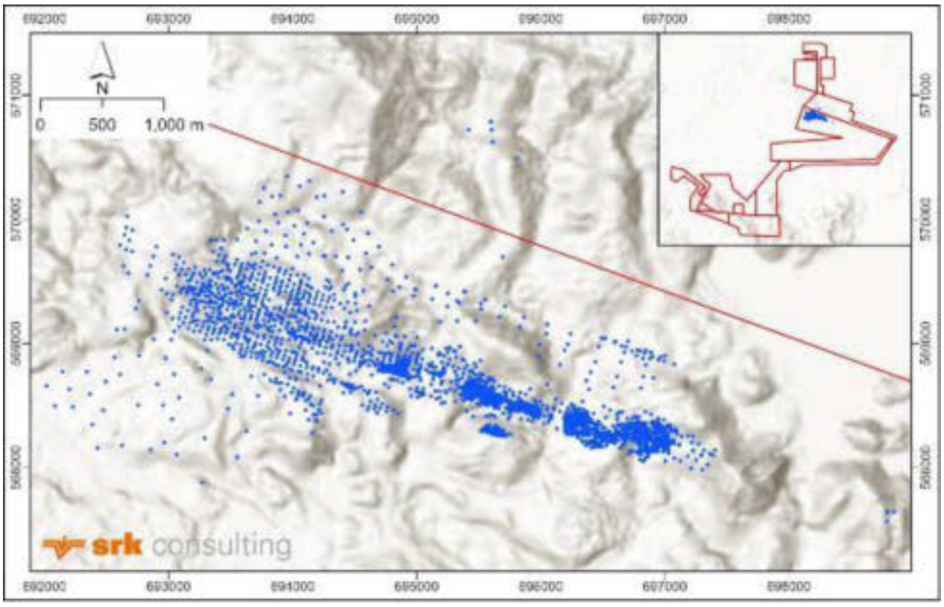
The data SRK received from the client include: previous technical reports, working technical process documents and QAQC data, databases, resource models etc.

Overall, the mineral resource of **Koolhoven-J Zone Project** was estimated by SRK based on database provided by ROSEBEL GOLD MINES. As of January 1, 2025. There were 1,365 drillholes (201,446.76 m) in the database, as shown in Table 7-12 **and** Figure 7-20**.**

Table 7-12: Resource Database Statistics of Koolhoven-J Zone Project

Area	Drillholes	Length（m）	Samples
KoolHoven	856	125,758.56	84,408
Jzone	509	75,688	102,998

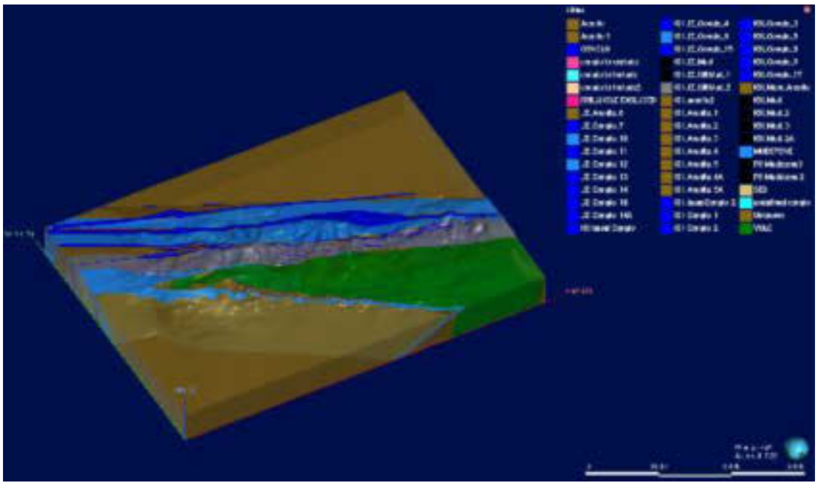
Figure 7-20: Drillhole Location of Koolhoven-J Zone Project



7.3.4 Solid Body Modelling

All the wireframe of **Koolhoven-J Zone Project** were provided by ROSEBEL GOLD MINES in April, 2025. SRK has reviewed the wireframe and believes they are basically reasonable and can be used for resource estimation. The location of the mineralized veins is shown in Figure 7-21 to Figure 7-26.

Figure 7-21: Lithology model of Koolhoven-J Zone Project



THIS DOCUMENT IS IN DRAFT FORM, INCOMPLETE AND SUBJECT TO CHANGE AND THAT THE INFORMATION MUST BE READ IN CONJUNCTION WITH THE SECTION HEADED "WARNING" ON THE COVER OF THIS DOCUMENT.

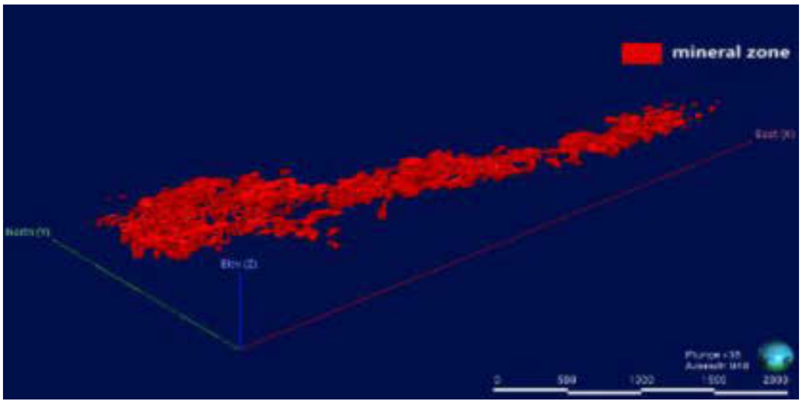

Figure 7-26: Cross Section of Mineral zone system model of Koolhoven-J Zone Project

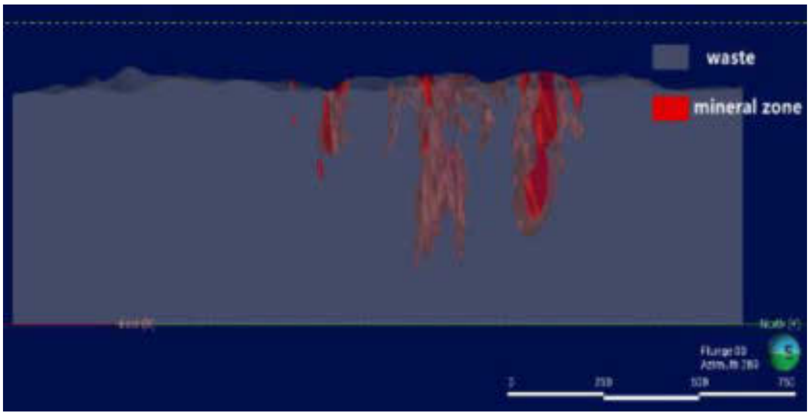

7.3.5 Specific Gravity

A total of 7,354 specific gravity samples which listed in geology database were collected from **Koolhoven-J Zone Project**. Samples were collected from different lithologies and different parts of the mineralised body of **Koolhoven – J Zone**, and the representative of density samples are considered sufficient, Figure 7-27. The specific gravity ("SG") is listed in the Table 7-13 which are applied in SRK's resource estimation.

Figure 7-27: The Distribution Specific Gravity Samples of Koolhoven-J Zone Project

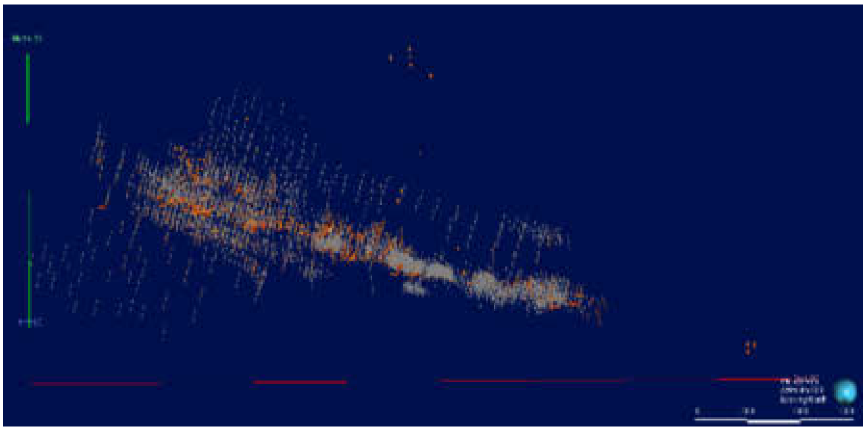

Table 7-13: Specific Gravity of Koolhoven-J Zone Project

No	Weathering	Average（t/m³）
1	Laterite	1.76
2	Saprolite	1.73
3	Transition	2.27
4	Rock	2.73

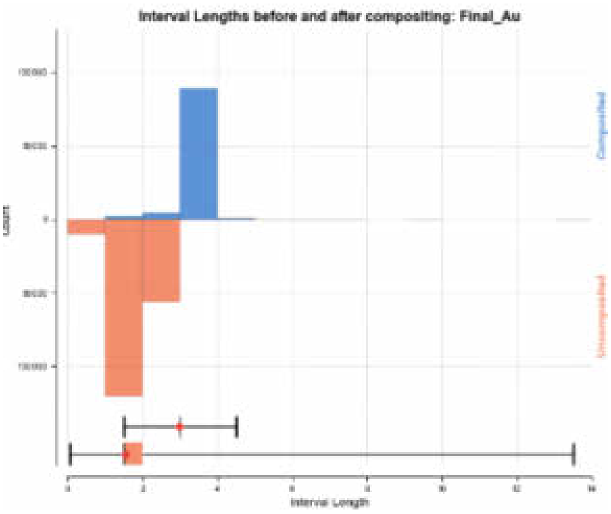
7.3.6 Compositing

The basic statistics of raw sampling length **of Koolhoven-J Zone Project** indicates that most of the sample intervals are 1.54 m, comprehensively consider the height of the steps and the previous work achievements 3 m interval composite length was selected for compositing. All raw samples were composited to 3 m downhole lengths, with a minimum of 1.5 m for each composite sample. The distribution of sample length and Au Grade before and after composite is provided in Table 7-14 and Figure 7-28**.**

Table 7-14: Statistics of Original Samples and Composite Samples of Koolhoven-J Zone Project

Iterm	Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Original	Sample Length	187,402	1.54	0.39	0.25	0.15	0.07	13.5
	Au Grade	187,402	0.27	2.29	8.33	5.28	0.005	460.98
Composite	Sample Length	95,806	2.98	0.27	0.09	0.07	1.50	4.49
	Au Grade	95,806	0.28	1.89	6.74	3.58	0.05	307.3

Figure 7-28: Compositing Comparison Histogram of Sample Length of Koolhoven-J Zone Project



The distribution of sample length and Au Grade before and after composite is provided in Figure 7-29 and Figure 7-30.

Figure 7-29: Au Raw Samples Histogram and Cumulative Histogram of Koolhoven-J Zone Project

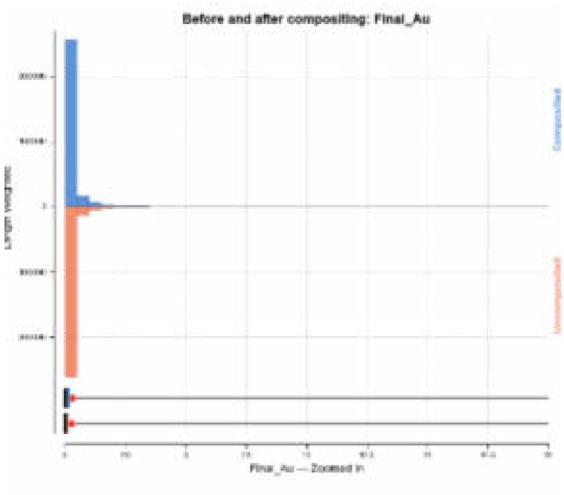


Figure 7-30: Au Raw Samples Histogram and Cumulative Histogram of Koolhoven-J Zone Project

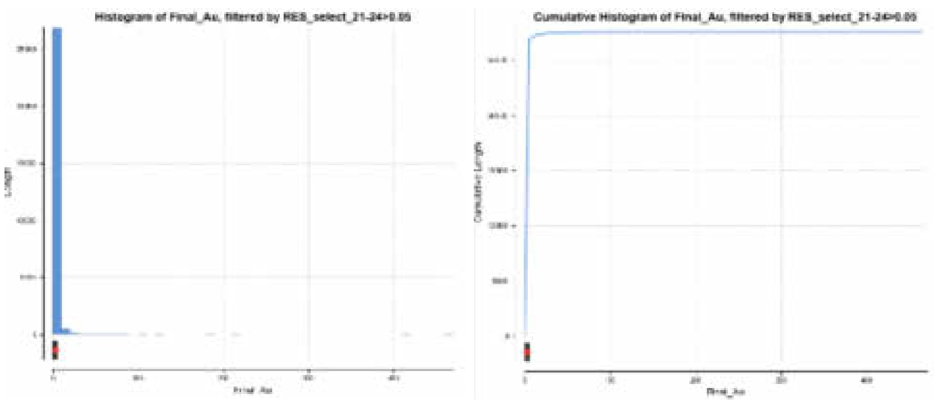

Note:
[1] The mean is indicated by the red diamond.
[2] The median is indicated by the line that crosses the inside of the box

7.3.7 Evaluation of Outliers

Based on the cumulative frequency and distribution characteristics of the sample histograms, the Au grades show a discontinuous distribution. As shown in Figure 7-30, 20 g/t Au, the continuity became sparse, thus 20 g/t Au was used as value capping.

Assay capping was applied for the **Koolhoven – J Zone Deposit.** The capping values by domain were presented in Table 7-15. The histogram and cumulative-probability plots for the composite samples are presented in Figure 7-31**.**

Table 7-15: Statistics of Samples after capping of Koolhoven-J Zone Project

Name	Count	Mean	SD	CV	Variance	Minimum	Maximum

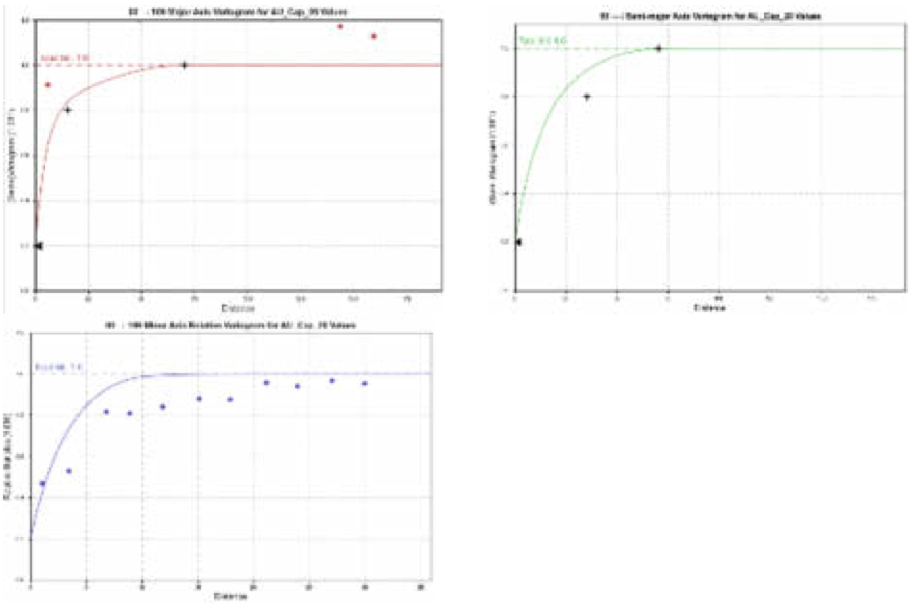

Figure 7-33: Variogram Model of Waste of Koolhoven-J Zone Project

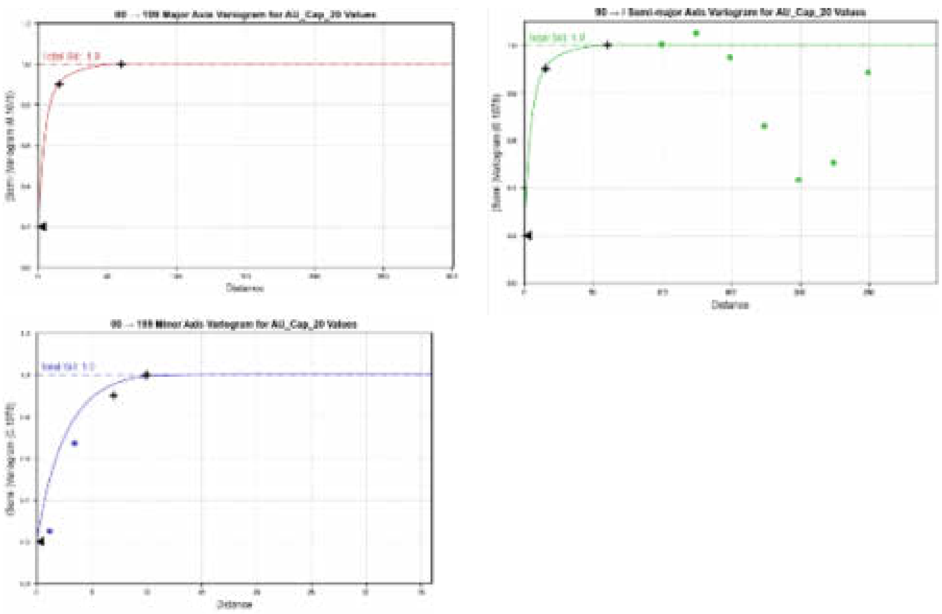

7.3.9 Block Model and Grade Estimation

The block model for each domain was created using Leapfrog geo software for grade and tonnage estimation. Appropriate block cell size was selected for the deposit.

For the **Koolhoven-J Zone**, a block size of 8 m easting (X) by 6 m northing (Y) by 9 m elevation (Z) was used. A summary of the block model specifications is listed in Table 7-17**.** The attribute and description of the block model are presented in Table 7-18.

Table 7-17: Block Model Specifications of Koolhoven-J Zone Project

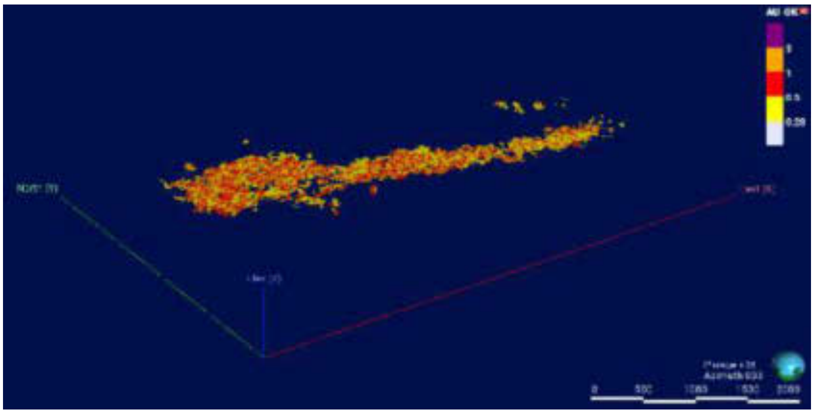
Figure 7-34: Au Estimation Grade of Koolhoven-J Zone Project



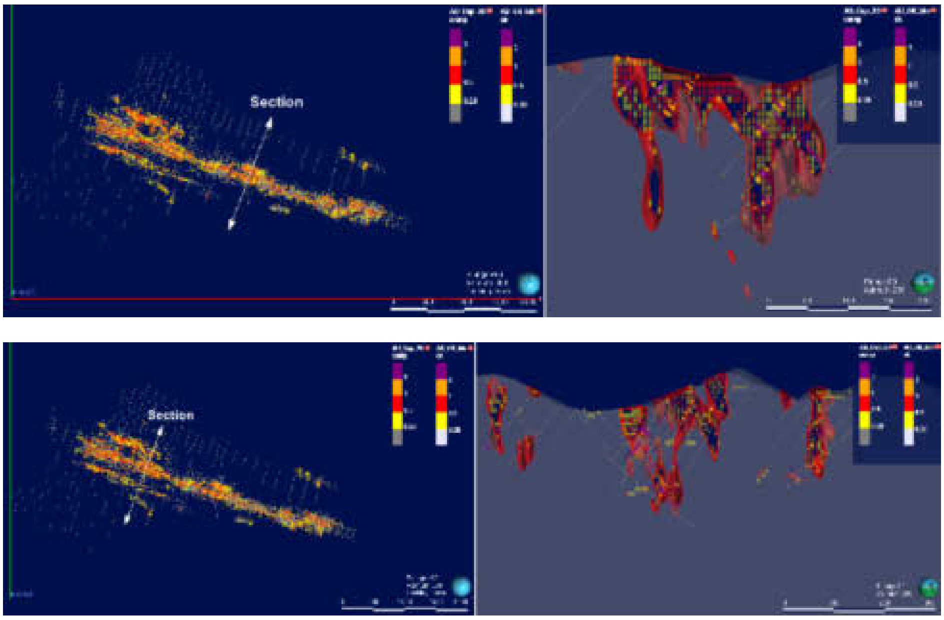
7.3.10 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the resource estimate.

SRK adopted the visual Inspection approaches to validate the model:

A series of cross-sections were cut to compare the composite samples used in resource estimation with the block model estimation results, in order to verify the reasonableness of the estimation parameters and results. Visual inspections were conducted for the mineralized zone. By comparing the block model with the relevant composite samples within the orebody, it was found that although there may be some local variability due to the nugget effect of the composite samples, overall, the areas of higher (or lower) grades in the block model correspond well with the areas of higher (or lower) grades in the composite samples. The comprehensive comparison of the composite samples overlaid on the block model shows in Figure 7-35 for the main mineralized zone.

Figure 7-35: Au Visual Inspection (block vs composite) of Koolhoven-J Zone Project



7.3.11 Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

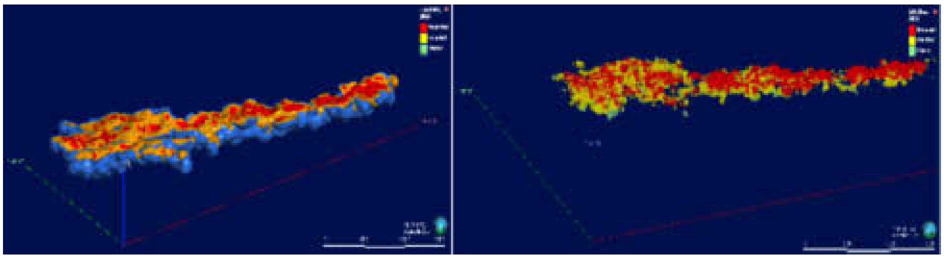
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For the **Koolhoven – J Zone Project**, the Mineral Resource at the space of 25m (strike) × 25m (dip) is defined as Measured Mineral Resource, the resource at the space of 50m (strike) × 50m (dip) is defined as Indicated Mineral Resource and the resource at the space of 75m (strike) × 75m (dip) and greater is defined as Inferred Mineral Resource. **Figure 7-36** shows the resource category classification of the **Koolhoven – J Zone Project.**

Figure 7-36: Mineral Resource Category Distribution of Koolhoven-J Zone Project



7.3.12 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portion**s of the Koolhoven-J Zone Project** are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **Koolhoven – J Zone Project** are summarised in Table 7-20**.** The spatial relationship between RPEEE and block Model shows in Figure 7-37.

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Pengfei Xiao and Liang Li who are a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is Fellow of AusIMM, respectively. Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2 g/t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

7.3.13 Grade Sensitivity Analysis

The mineral resources of the **Koolhoven – J Zone Project** are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates [or the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources (although the global grade tonnage information is generally more appropriate characteristics of the grade tonnage characteristics of the deposit)] are presented in Table 7-22 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-38 presents this sensitivity as grade tonnage curves.

Table 7-22: Global Block Model Quantities and Grade Estimates[1], Koolhoven – J Zone Project at Various cut-off Grades.

Cut-off Grad Au (g/t)	Quantity (Mt)	Grade Au (g/t)	Material Content k oz
0	130.93	0.68	2861
0.5	66.60	0.99	2127

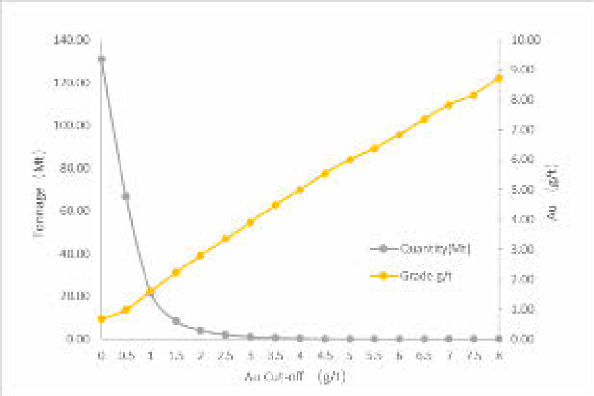
Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

Figure 7-38: Au Grade-Tonnage Plot of Koolhoven – J Zone Project



7.4 Rosebel North Domain: East Tailing Road

7.4.1 Introduction

The resource study estimate of **East Tailing Road Project** has been conducted by ROSEBEL GOLD MINES for East Tailing Road. SRK has reviewed the information made available for this study and has used the datasets for the preparation of the SRK model. Presented below is a summary of the main datasets available for the previous study.

Data provided by ROSEBEL GOLD MINES:

- Exploration Database, including collar, survey, assay, and lithological logs codes
- Composites, orebodies wireframe, and topography in dxf format of CAD software.
- Block model in csv format of Microsoft office software

7.4.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold mineralisation;
- Definition of Mineral Resource domains;
- Data conditioning (compositing and capping) for geostatistical analysis and variography;
- Block modelling and grade interpolation;
- Mineral Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

7.4.3 Resource Database

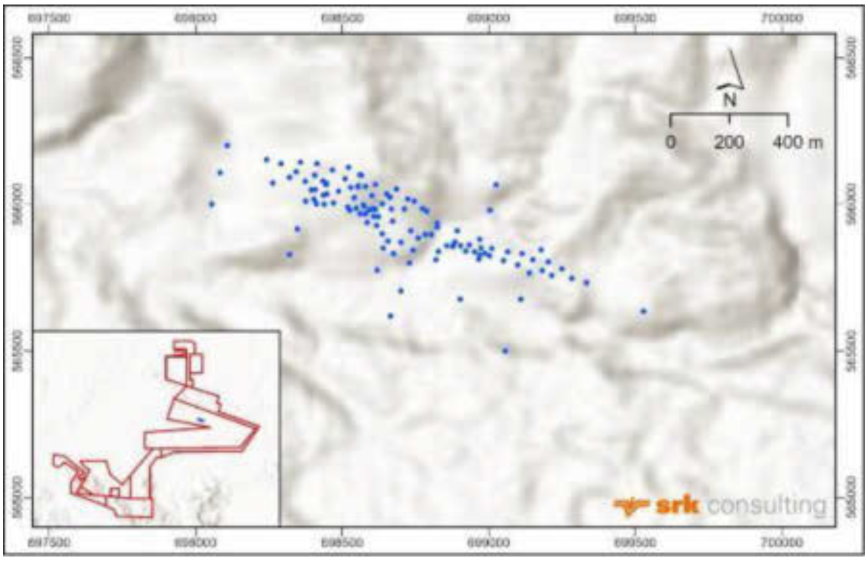
The data SRK received from the client include: previous technical reports, working technical process documents and QAQC data, databases, resource models etc.

Overall, the mineral resource of **East Tailing Road Project** was estimated by SRK based on database provided by ROSEBEL GOLD MINES. As of January 1, 2025. There were 119 drillholes (**150,45.8 m**) in the database, as shown in Table 7-23 and Figure 7-39.

Table 7-23: Resource Database Statistics of East Tailing Road Project

Area	Drillholes	Length（m）	Samples
East Tailing Road	119	150,45.8	9,800

Figure 7-39: Drillhole Location of East Tailing Road Project



7.4.4 Solid Body Modelling

All the wireframe models of **East Tailing Road Project** were provided by ROSEBEL GOLD MINES in April, 2025. SRK has reviewed the wireframe which were created by Implicit modelling techniques of the drilling dataset by used Leapfrog. We believe that they are basically reasonable and can be used for resource estimation, as shown in Figure 7-40 to Figure 7-45**.**

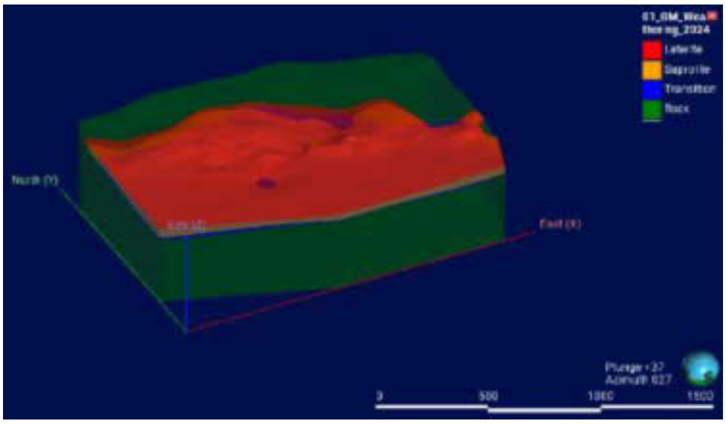

Figure 7-43: Cross Section of weathering model of East Tailing Road Project

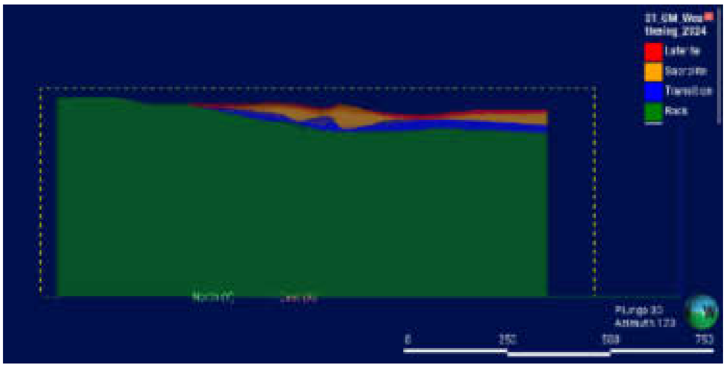

Figure 7-44: Mineral zone model of East Tailing Road Project

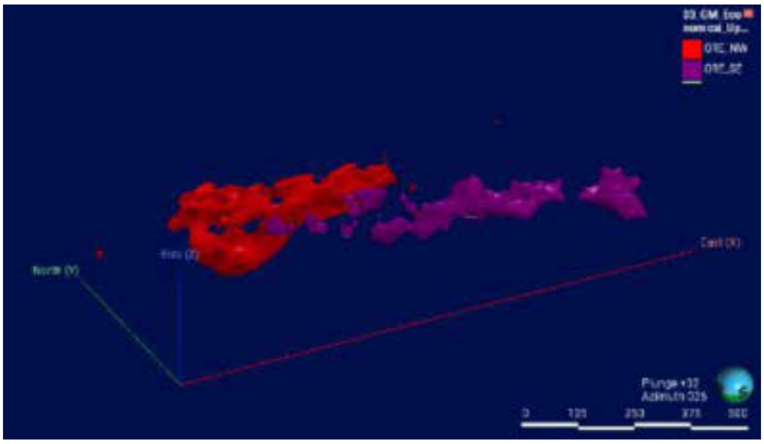

Figure 7-45: Cross Section of Mineral zone system model of East Tailing Road Project

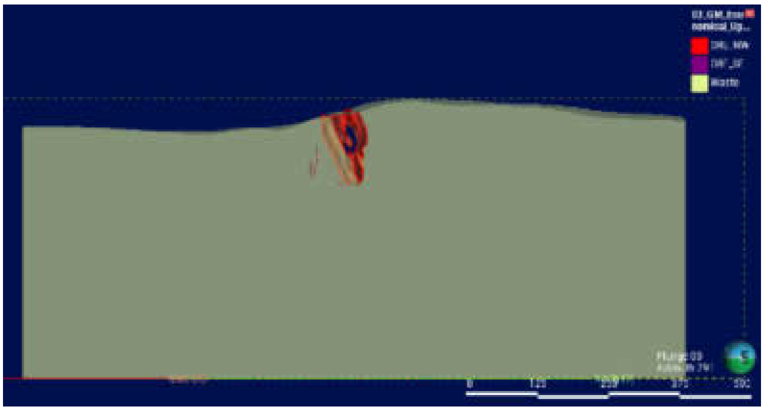

7.4.5 Specific Gravity

A total of 544 specific gravity samplesl which listed in geology database were collected from **East Tailing Road Project**. Samples were collected from different lithologies and different parts of the mineralised body of **East Tailing Road Project**, and the representative of density samples are considered sufficient**,** as shown in Figure 7-46. The specific gravity ("SG") is listed in the Table 7-24 **,** which are applied in SRK's resource estimation.

Figure 7-46: The Distribution Specific Gravity Samples of East Tailing Road Project

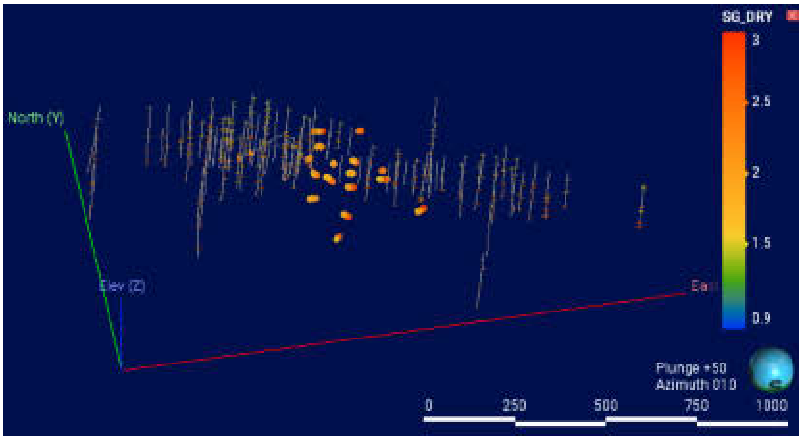

Table 7-24: Specific Gravity of East Tailing Road Project

No	Weathering	Average（t/m³）
1	Laterite	1.72
2	Saprolite	1.86
3	Transition	2.32
4	Rock	2.75

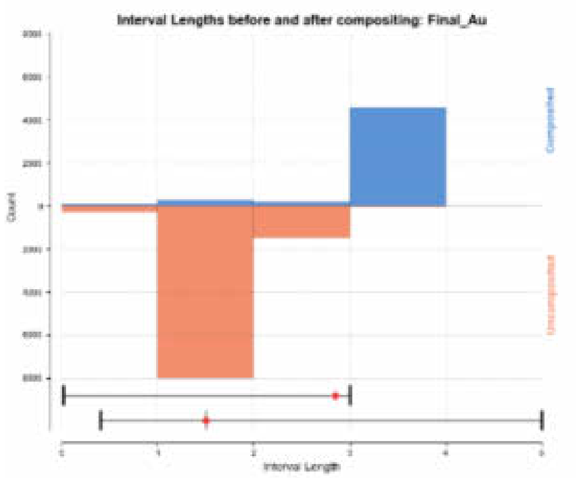
7.4.6 Compositing

The basic statistics of raw sampling length **of East Tailing Road Project** indicates that most of the sample intervals are 1.50 m, comprehensively consider the height of the steps and the previous work achievements 3 m interval composite length was selected for compositing. All raw samples were composited to 3 m downhole lengths, with a minimum of 0.01 m for each composite sample. The distribution of sample length and Au Grade before and after composite is provided in Table 7-25 **and** Figure 7-47**.**

Table 7-25: Statistics of Original Samples and Composite Samples of East Tailing Road Project

Iterm	Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Original	Sample Length	9800	1.50	0.30	0.20	0.09	0.40	5.00
	Au Grade	9800	0.16	1.13	7.18	1.27	0.01	75.50
Composite	Sample Length	5148	2.85	0.50	0.18	0.25	0.02	3.00
	Au Grade	5148	0.16	0.73	4.66	0.53	0.01	27.31

Figure 7-47: Compositing Comparison Histogram of Sample Length of East Tailing Road Project



The distribution of sample length and Au Grade before and after composite is provided in Figure 7-48 to Figure 7-49.

Figure 7-48: Compositing Comparison Histogram of Sample Au of East Tailing Road Project

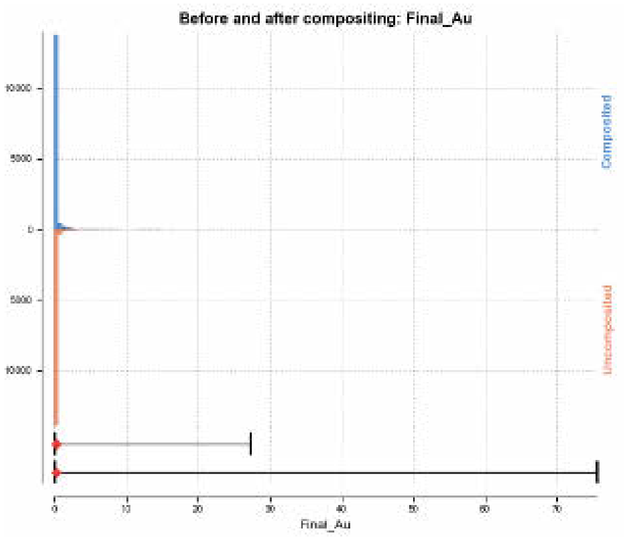


Figure 7-49: Au Raw Samples Histogram and Cumulative Histogram of East Tailing Road Project

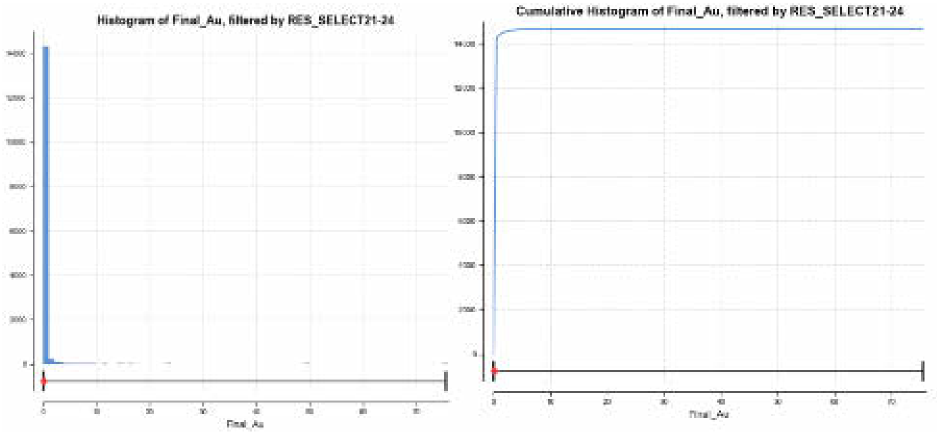


Note:
[3] The mean is indicated by the red diamond.
[4] The median is indicated by the line that crosses the inside of the box

7.4.7 Evaluation of Outliers

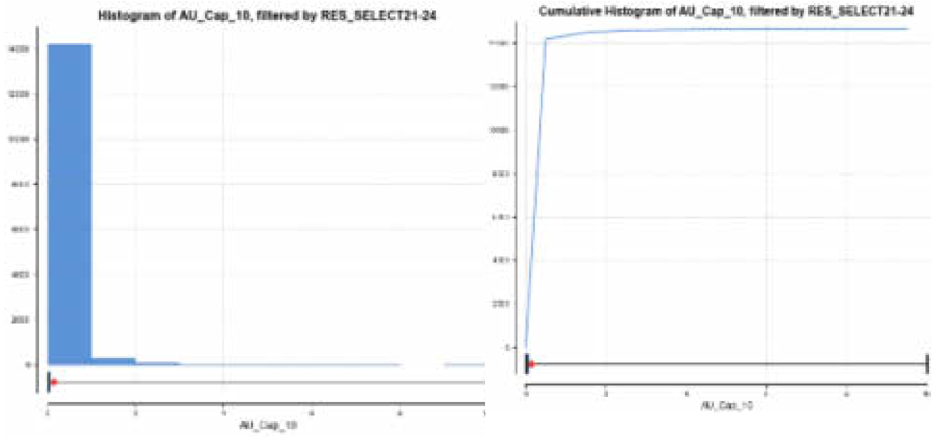
Based on the cumulative frequency and distribution characteristics of the sample histograms, the Au grades show a discontinuous distribution. As shown in Figure 7-49, 10 g/t Au, the continuity became sparse, thus 10 g/t Au was used as value capping.

Assay capping was applied for the East Tailing Road Deposit. The capping values by domain were presented in Table 7-26. The histogram and cumulative-probability plots for the composite samples are presented in Figure 7-50.

Table 7-26: Statistics of Samples after capping

Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Au_cap Grade	5148	0.14	0.44	3.14	0.20	0.00	10

Figure 7-50: Au Composite Samples Histogram and Cumulative Histogram after capping



Note:
[1] The mean is indicated by the red diamond.
[2] The median is indicated by the line that crosses the inside of the box

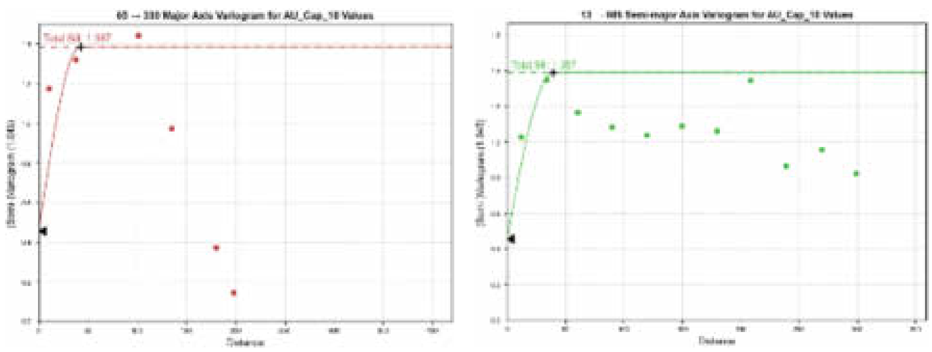
7.4.8 Statistical Analysis and Variography

SRK has reviewed the variogram model for Au based on the composite samples by adopting a spherical variation function to fitting the experimental variogram, and the result has the characteristics of geometric anisotropy. The structure of the variogram is detailed in Table 7-27 and Figure 7-51 to Figure 7-53.

Table 7-27: Variogram Structure within Orebody and waste

Domain	Element	Bearing	Dip	Dip Azimuth	Nugget	Sill	Range	Major/Semi-major	Major/Minor	Note
NW	Au	76	68	3	0.46	0.93	42	1.08	2.8	Spherical
SE	Au	39	76	18	41	0.96	43	1.19	1.79	Spherical
Waste	Au	90	0	0	0	1.00	200	1.67	133	Spherical

Figure 7-51: Variogram Model within Domian NW



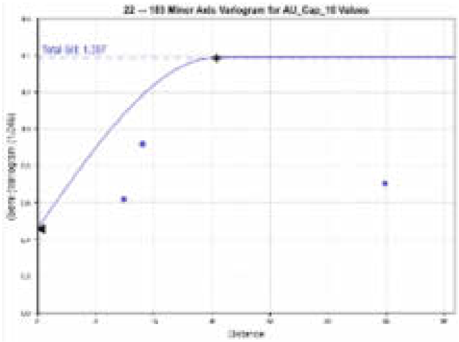


Figure 7-52: Variogram Model within SE

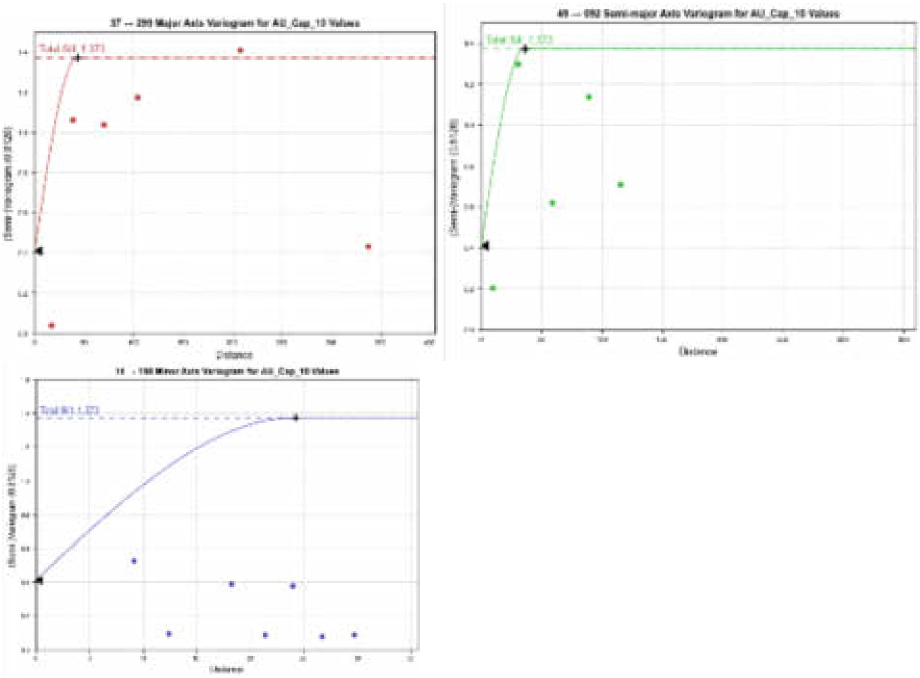

Figure 7-53: Variogram Model within waste

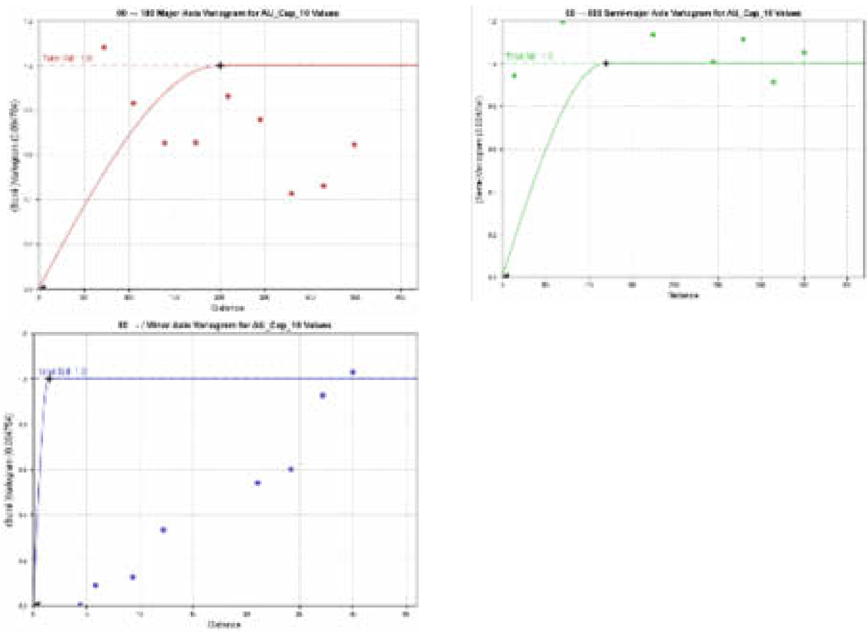

7.4.9 Block Model and Grade Estimation

The block model for each domain was created using Leapfrog geo software for grade and tonnage estimation. Appropriate block cell size was selected for the deposit.

For the **East Tailing Road**, a block size of 8 m easting (X) by 6 m northing (Y) by 9 m elevation (Z) was used. A summary of the block model specifications is listed in Table 7-28. The attribute and description of the block model are presented in Table 7-29.

Table 7-28: Block Model Specifications of East Tailing Road Project

	Min	Max	Block Size	Bub Block Size	Rotation
N	85100	86200	6	/	18
E	51766	53315	8	/	0
Z	-18	585	8	/	0
Total Blocks			9515943		

Table 7-29: Attribute and Description of East Tailing Road Project

Attribute	Description
Au_OK	Au grade (g/t)
Vein System	Veins domain (NW, SE, waste)
lithology	Lith (Sediments, Volc_Contact)

Weathering	5(Laterite),7200(Saprolite),9200(Transition),8200(Rock)
Density	Specific Gravity
Class	Mea, Ind, Inf.

Ordinary Kriging ("OK") method was applied for Au in main orebodies of **East Tailing Road**.

The three progressively more relaxed search criteria used for OK estimation are presented in Table 7-30. The search ellipsoids were aligned with the general mineralization orientation. The typical grade of Au estimated of **East Tailing Road** was shown in Figure 7-54.

Table 7-30: Specific Search Parameters of East Tailing Road Project

Iterm		NW			SE			waste

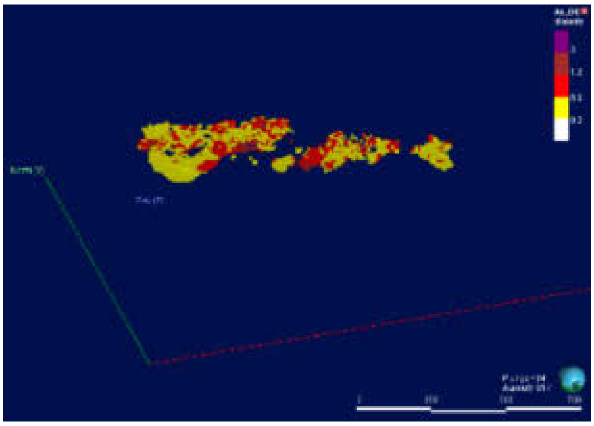
	Value threshold	5	1	/	5	/	/	/	/	/

Figure 7-54: Estimated Au Grade of East Tailing Road Project



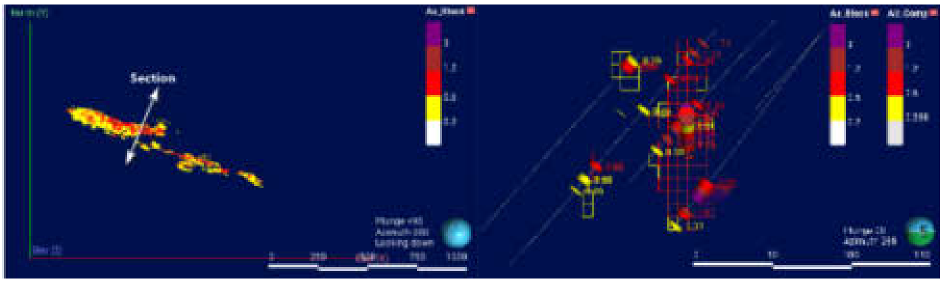
7.4.10 Model Validation and Sensitivity

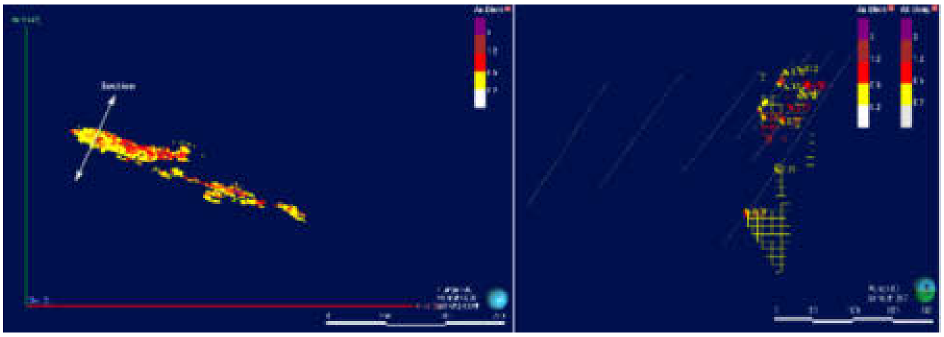
Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the resource estimate.

SRK adopted the visual Inspection approaches to validate the model:

A series of cross-sections were cut to compare the composite samples used in resource estimation with the block model estimation results, in order to verify the reasonableness of the estimation parameters and results. Visual inspections were conducted for the mineralized zone. By comparing the block model with the relevant composite samples within the orebody, it was found that although there may be some local variability due to the nugget effect of the composite samples, overall, the areas of higher (or lower) grades in the block model correspond well with the areas of higher (or lower) grades in the composite samples. Figure 7-55 shows a comprehensive comparison of the composite samples overlaid on the block model for the main mineralized zone.

Figure 7-55: Visual Inspection of Au (block vs composite) of East Tailing Road Project





7.4.11 Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

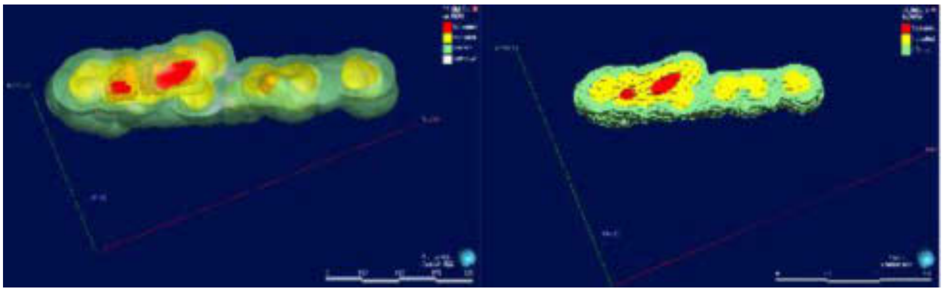
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For the **East Tailing Road** Project, the Mineral Resource at the space of 25m (strike) × 25m (dip) is defined as Measured Mineral Resource, the resource at the space of 50m (strike) × 50m (dip) is defined as Indicated Mineral Resource and the resource at the space of 75m (strike) × 75m (dip) and greater is defined as Inferred Mineral Resource. Figure 7-56 shows the resource category classification of the **East Tailing Road** Project.

Figure 7-56: Mineral Resource Category Distribution of East Tailing Road Project



7.4.12 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the **East Tailing Road Project** are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **East Tailing Road** Project are summarised in Table 7-31. The spatial relationship between RPEEE and block Model shows in Figure 7-57.

Table 7-31: Assumptions Considered for East Tailing Road Project

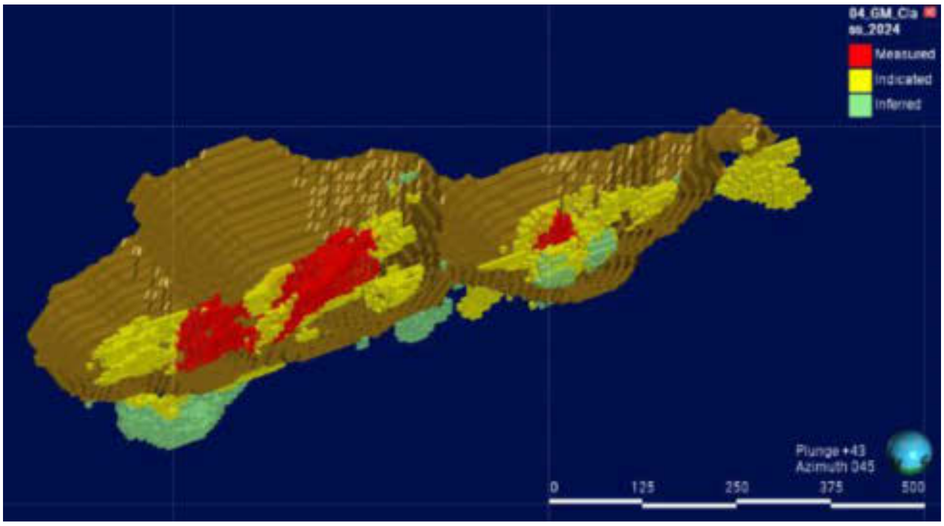
Figure 7-57: Spatial Relationship between RPEEE and Block Model of East Tailing Road Project



As of 31 December 2024 and at a cut-off grade of 0.2 g/t Au for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock. The East Tailing Road Project is estimated to contain **1,369** kt of Measured Mineral Resources with an average grade of **0.85** g/t Au, **1,548** kt of Indicated Mineral Resources with an average grade of **0.77** g/t Au, and **47** kt of Inferred Mineral Resources with an average grade of **0.39** g/t Au (see Table 7-32) .

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Pengfei Xiao and Liang Li who are a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is Fellow of AusIMM, respectively. Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2 g/t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

7.4.13 Grade Sensitivity Analysis

The mineral resources of the **East Tailing Road** Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates [or the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources (although the global grade tonnage information is generally more appropriate characteristics of the grade tonnage characteristics of the deposit)] are presented in Table 7-33 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-58 presents this sensitivity as grade tonnage curves.

Table 7-33: Global Block Model Quantities and Grade Estimates[1], East Tailing Road Project at Various cut-off Grades.

Cut-off Grad Au (g/t)	Quantity (Mt)	Grade Au (g/t)	Material Content k oz
0	5.46	0.71	125
0.25	5.23	0.74	124
0.5	3.26	0.95	100
0.75	1.71	1.26	69
1	1.01	1.54	50
1.25	0.63	1.80	37
1.5	0.41	2.04	27
1.75	0.27	2.26	20
2	0.16	2.54	13
2.25	0.10	2.79	9
2.5	0.06	3.05	6
2.75	0.04	3.28	4
3	0.03	3.53	3

7.5 Rosebel South Domain: Royal Hill

7.5.1 Introduction

The resource study estimate of **Royal Hill project** has been conducted by ROSEBEL GOLD MINES. SRK has reviewed the information made available for this study and has used the datasets for the preparation of the SRK model. Presented below is a summary of the main datasets available for the previous study.

Data provided by ROSEBEL GOLD MINES:

- Exploration Database, including collar, survey, assay, and lithological logs codes
- Composites, orebodies wireframe, and topography in dxf format of CAD software.
- Block model in csv format of Microsoft office software

7.5.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold mineralisation;
- Definition of Mineral Resource domains;
- Data conditioning (compositing and capping) for geostatistical analysis and variography;
- Block modelling and grade interpolation;
- Mineral Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

7.5.3 Resource Database

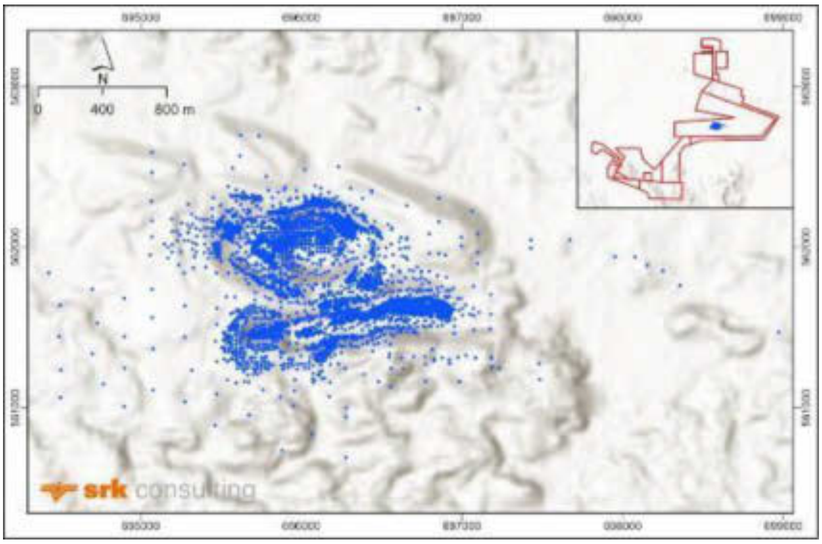
The data SRK received from the client include: previous technical reports, working technical process documents and QAQC data, databases, resource models etc.

Overall, the mineral resource of **Royal Hill project** was estimated by SRK based on database provided by ROSEBEL GOLD MINES. As of January 1, 2025. There were 4,077 drillholes (403,954.19 m) in the database, as shown in Table 7-34 and Figure 7-59.

Table 7-34: Resource Database Statistics of Royal Hill Project

Area	Drillholes	Length（m）	Samples
Royal_Hill	4,077	403,954.19	329,983

Figure 7-59: Drillhole Location of Royal Hill project



7.5.4 Solid Body Modelling

All the wireframe of **Royal Hill** project were provided by ROSEBEL GOLD MINES in April, 2025. SRK has reviewed the wireframe which were created by Implicit modelling techniques of the drilling dataset by used Leapfrog. We believe that they are basically reasonable and can be used for resource estimation, as shown in Figure 7-60 to Figure 7-65.

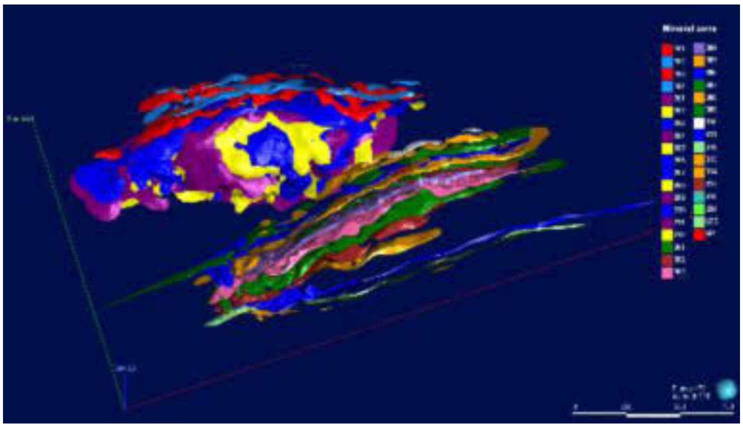

Figure 7-65: Cross Section of Mineral zone system model of Royal Hill project

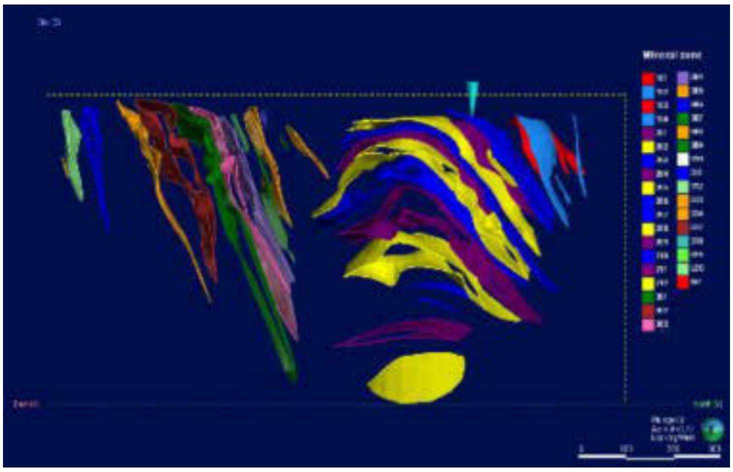

7.5.5 Specific Gravity

A total of 5,585 specific gravity samples which listed in geology database were collected from **Royal Hill Project** Samples were collected from different lithologies and different parts of the mineralised body of **Royal Hill**, and the representative of density samples are considered sufficient, as shown in Figure 7-66. The specific gravity ("SG") is listed in the Table 7-35 which are applied in SRK's resource estimation.

Figure 7-66: The Distribution Specific Gravity Samples of Royal Hill Project

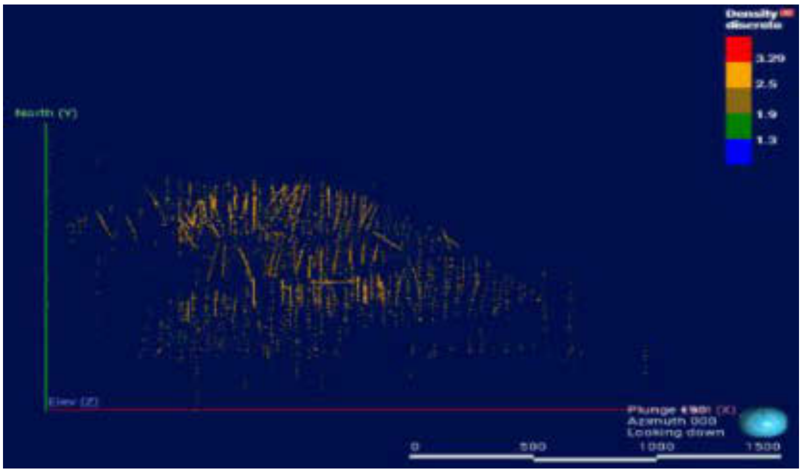

Table 7-35: Specific Gravity of Royal Hill Project

No	Weathering	Average（t/m^3）
1	Laterite	1.66
2	Saprolite	1.72
3	Transition	2.26
4	Rock	2.74

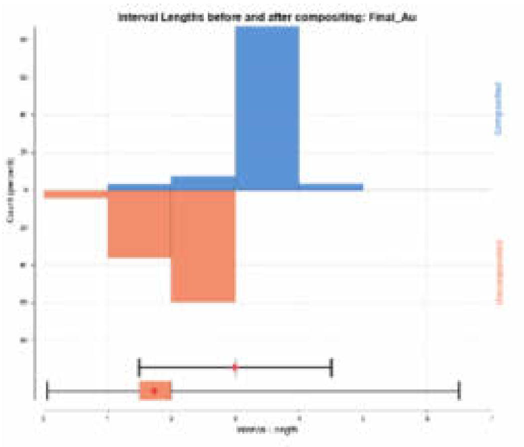
7.5.6 Compositing

The basic statistics of raw sampling length of **Royal Hill Project** indicates that most of the sample intervals are 1.67 m, comprehensively consider the height of the steps and the previous work achievements 3 m interval composite length was selected for compositing. All raw samples were composited to 3 m downhole lengths, with a minimum of 1.5 m for each composite sample. The distribution of sample length and Au Grade before and after composite is provided in Table 7-36 and Figure 7-67.

Table 7-36: Statistics of Original Samples and Composite Samples of Royal Hill Project

Iterm	Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Original	Sample Length	226143	1.60	0.42	0.26	0.17	0.06	6.50
	Au Grade	226143	0.33	9.37	28.30	87.70	0.00	4279.00
Composite	Sample Length	121257	2.98	0.34	0.11	0.12	1.50	4.50
	Au Grade	121257	0.33	6.68	20.10	44.67	0.00	2139.72

Figure 7-67: Compositing Comparison Histogram of Sample Length of Royal Hill Project



The distribution of sample length and Au Grade before and after composite is provided in Figure 7-68 and Figure 7-69.

Figure 7-68: Compositing Comparison Histogram of Sample Au of Royal Hill Project

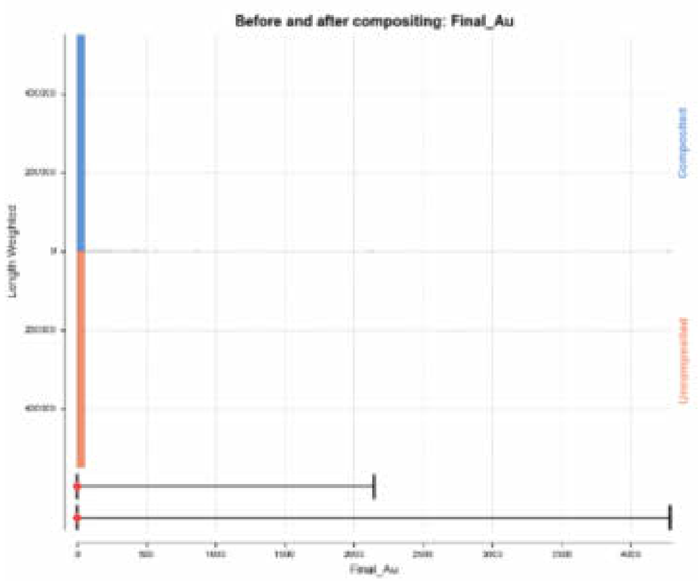


Figure 7-69: Cumulative Histogram of Sample Au of Royal Hill Project

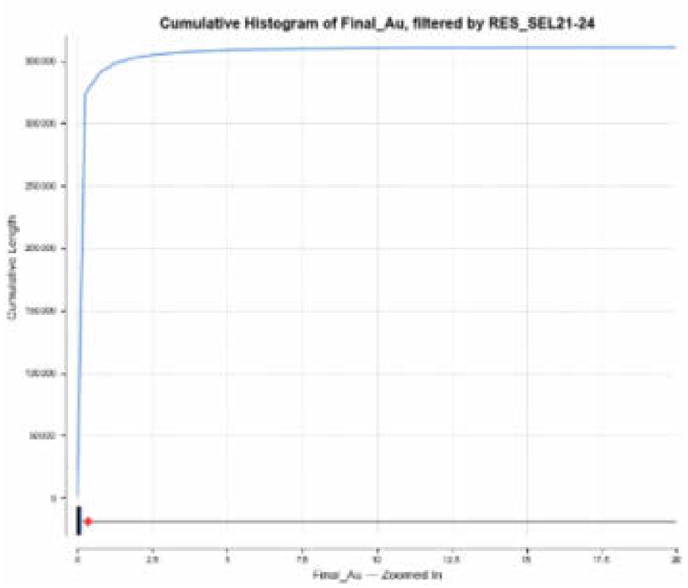


7.5.7 Evaluation of Outliers

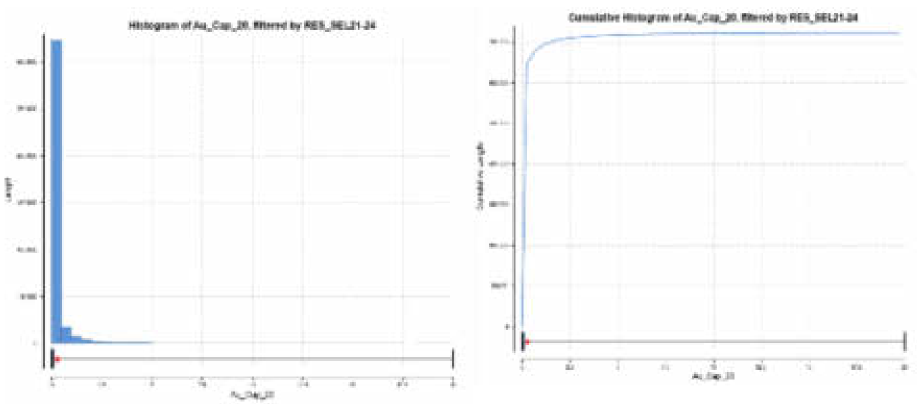
Based on the cumulative frequency and distribution characteristics of the sample histograms, the Au grades show a discontinuous distribution. As shown in Figure 7-69 20 g/t Au, the continuity became sparse, thus 20 g/t Au was used as value capping.

Assay capping was applied for the **Royal Hill** Deposit. The capping values by domain were presented in Table 7-37. The histogram and cumulative-probability plots for the composite samples are presented in Figure 7-70.

Table 7-37: Statistics of Samples after capping of Royal Hill Project

Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Au_cap Grade	121257	0.27	0.92	3.39	0.84	0.00	20.00

Figure 7-70: Au Composite Samples Histogram and Cumulative Histogram after capping of Royal Hill Project



Note:
[1] The mean is indicated by the red diamond.
[2] The median is indicated by the line that crosses the inside of the box

7.5.8 Statistical Analysis and Variography

[Statistical analysis of original samples and composite; variogram parameters and variogram validation]

SRK has reviewed the variogram model for Au based on the composite samples by adopting a spherical variation function to fitting the experimental variogram, and the result has the characteristics of geometric anisotropy. The structure of the variogram is detailed in Table 7-38 and Figure 7-71 to Figure 7-79.

Table 7-38: Variogram Structure within Orebody and waste of Royal Hill Project

Domain	Element	Bearing	Dip	Dip Azimuth	Nugget	Sill	Range	Major/Semi-major	Major/Minor	Note
orebody511	Au	21	50	15	0.29	0.14	40	1.33	4	Exponential

7.5.9 Block Model and Grade Estimation

The block model for each domain was created using Leapfrog geo software for grade and tonnage estimation. Appropriate block cell size was selected for the deposit.

For the **Royal Hill**, a block size of 8 m easting (X) by 6 m northing (Y) by 9 m elevation (Z) was used. A summary of the block model specifications is listed in Table 7-39. The attribute and description of the block model are presented in Table 7-40.

Table 7-39: Block Model Specifications of Royal Hill Project

	Min	Max	Block Size	Bub Block Size	Rotation
N	80400	82602	6	/	0
E	48650	51746	8	/	0
Z	-18	585	9	/	0
Total Blocks			9515943		

Table 7-40: Attribute and Description of Royal Hill Project

Attribute	Description
Au_OK	Au grade (g/t)
Area	'North', 'Central', 'South', 'WST'
Vein System	Veins domain (511,512,521,522,523,531,532,533,999)
Weathering	5(Laterite),7200(Saprolite),9200(Transition),8200(Rock),15(Dump)
Density	Specific Gravity
Class	Mea, Ind, Inf.

Ordinary Kriging ("OK") method was applied for Au in main orebodies of **Royal Hill**.

The three progressively more relaxed search criteria used for OK estimation are presented in Table 7-41. The search ellipsoids were aligned with the general mineralization orientation. The typical grade of Au estimated of **Royal Hill** project was shown in Figure 7-80.

Table 7-41: Specific Search Parameters of Royal Hill Project

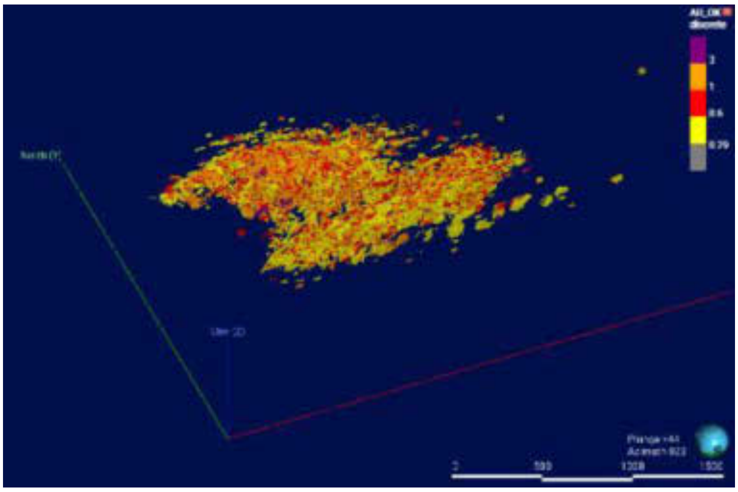
Figure 7-80: Estimated Au Grade of Royal Hill Project



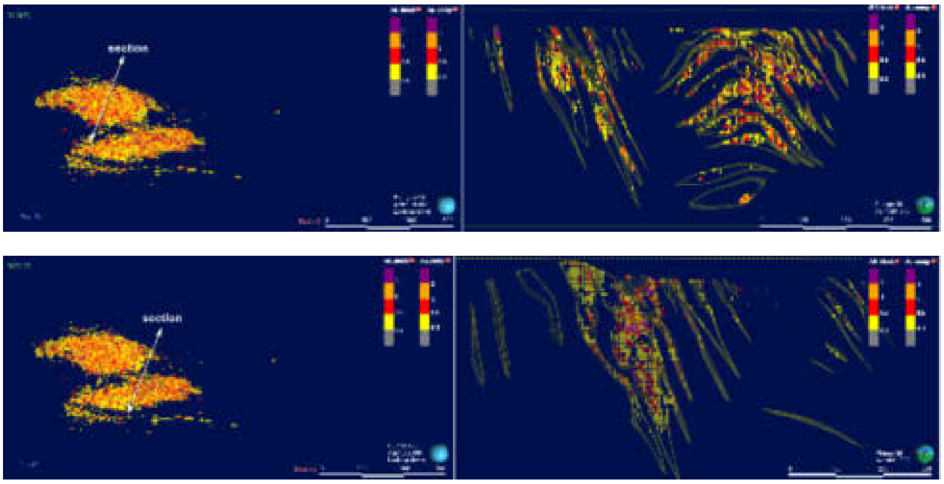
7.5.10 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the resource estimate.

SRK adopted the visual Inspection approaches to validate the model:

A series of cross-sections were cut to compare the composite samples used in resource estimation with the block model estimation results, in order to verify the reasonableness of the estimation parameters and results. Visual inspections were conducted for the mineralized zone. By comparing the block model with the relevant composite samples within the orebody, it was found that although there may be some local variability due to the nugget effect of the composite samples, overall, the areas of higher (or lower) grades in the block model correspond well with the areas of higher (or lower) grades in the composite samples. Figure 7-81 shows a comprehensive comparison of the composite samples overlaid on the block model for the main mineralized zone.

Figure 7-81: Visual Inspection of Au (block vs composite) of Royal Hill Project



7.5.11 Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

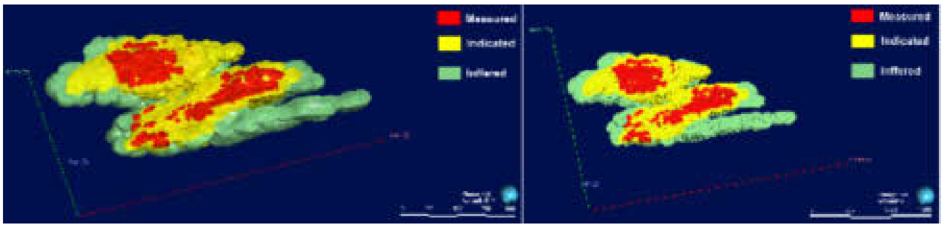
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For the **Royal Hill** Project, the Mineral Resource at the space of 25m (strike) × 25m (dip) is defined as Measured Mineral Resource, the resource at the space of 50m (strike) × 50m (dip) is defined as Indicated Mineral Resource and the resource at the space of 75m (strike) × 75m (dip) and greater is defined as Inferred Mineral Resource. Figure 7-82 shows the resource category classification of the **Royal Hill** Project.

Figure 7-82: Mineral Resource Category Distribution of Royal Hill Project



7.5.12 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the **Royal Hill** are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **Royal Hill** Project are summarised in Table 7-42. The spatial relationship between RPEEE and block Model shows in Figure 7-83.

Table 7-42: Assumptions Considered for the Royal Hill Project

Item	Rock Type	Unit	Royal Hill

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Pengfei Xiao and Liang Li who are a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is Fellow of AusIMM, respectively. Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2 g/t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

7.5.13 Grade Sensitivity Analysis

The mineral resources of the **Royal Hill** Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates [or the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources (although the global grade tonnage information is generally more appropriate characteristics of the grade tonnage characteristics of the deposit)] are presented in Table 7-44 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-84 presents this sensitivity as grade tonnage curves.

Table 7-44: Global Block Model Quantities and Grade Estimates[1], Royal Hill Project at Various cut-off Grades.

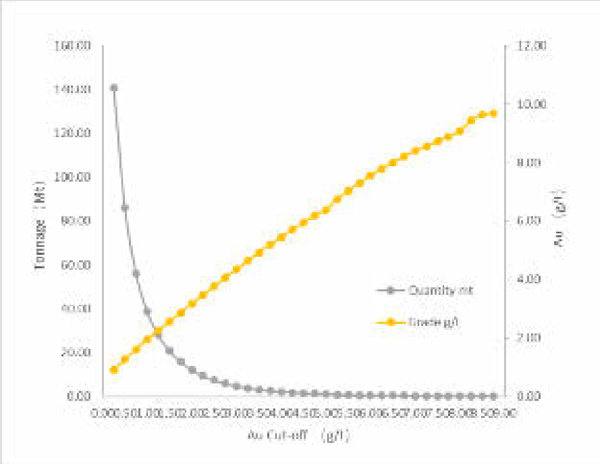
Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

Figure 7-84: Au Grade-Tonnage Plot of Royal Hill Project



7.6 Rosebel South Domain: Mayo

7.6.1 Introduction

The resource study estimate of **Mayo Project** has been conducted by ROSEBEL GOLD MINES. SRK has reviewed the information made available for this study and has used the datasets for the preparation of the SRK model. Presented below is a summary of the main datasets available for the previous study.

Data provided by ROSEBEL GOLD MINES:

- Exploration Database, including collar, survey, assay, and lithological logs codes
- Composites, orebodies wireframe, and topography in dxf format of CAD software.
- Block model in csv format of Microsoft office software

7.6.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold mineralisation;
- Definition of Mineral Resource domains;
- Data conditioning (compositing and capping) for geostatistical analysis and variography;
- Block modelling and grade interpolation;
- Mineral Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

7.6.3 Resource Database

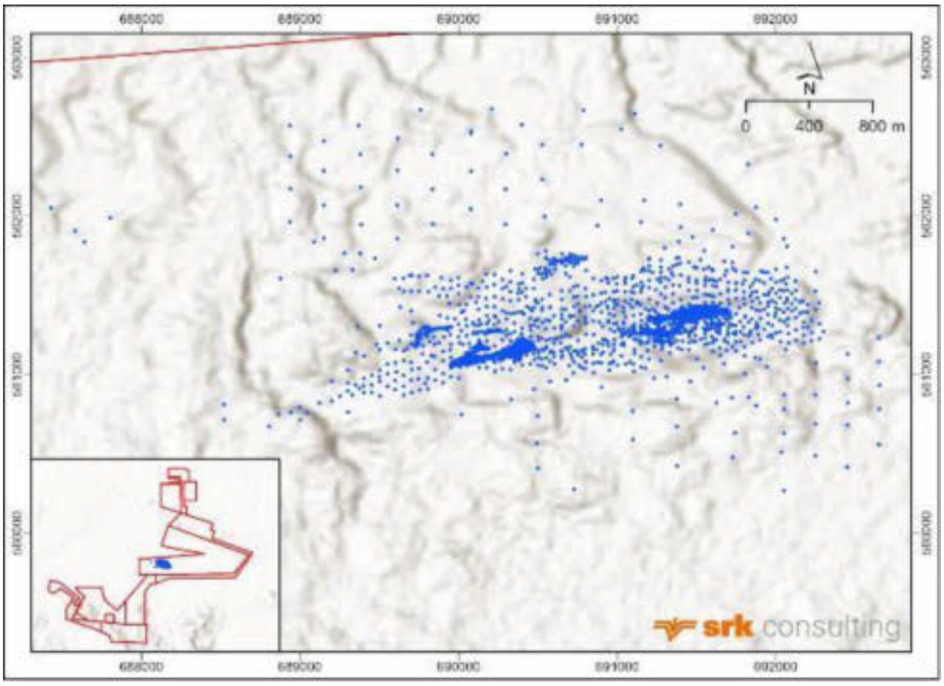
The data SRK received from the client include: previous technical reports, working technical process documents and QAQC data, databases, resource models etc.

Overall, the mineral resource of **Mayo Project** was estimated by SRK based on database provided by ROSEBEL GOLD MINES. As of January 1, 2025. There were 2,054 drillholes (234,925.13 m) in the database, as shown in Table 7-45 and Figure 7-85.

Table 7-45: Resource Database Statistics of Mayo Project

Area	Drillholes	Length（m）	Samples
Mayo	**2,054**	234,925.13	143072

Figure 7-85: Drillhole Location of Mayo Project



7.6.4 Solid Body Modelling

All the wireframe of Mayo project were provided by ROSEBEL GOLD MINES in April, 2025. SRK has reviewed the wireframe which were created by Implicit modelling techniques of the drilling dataset by used Leapfrog. We believe that they are basically reasonable and can be used for resource estimation, as shown in Figure 7-85 to Figure 7-90.

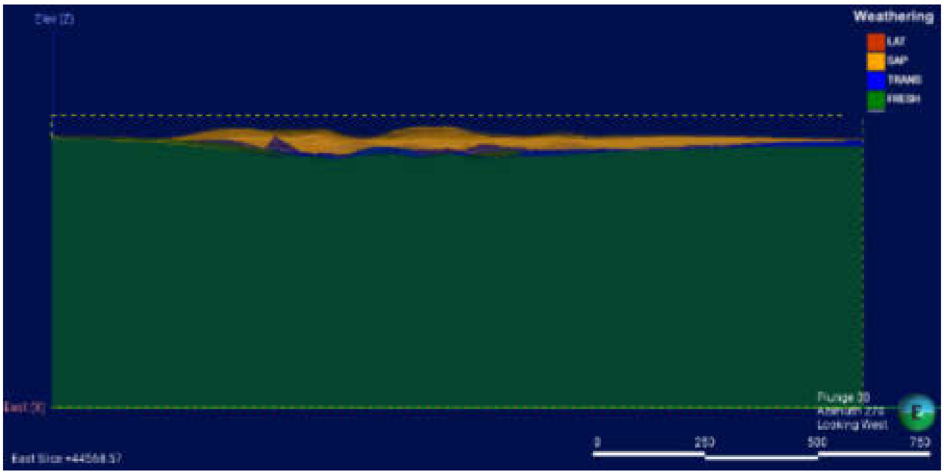

Figure 7-89: Mineral zone model of Mayo Project

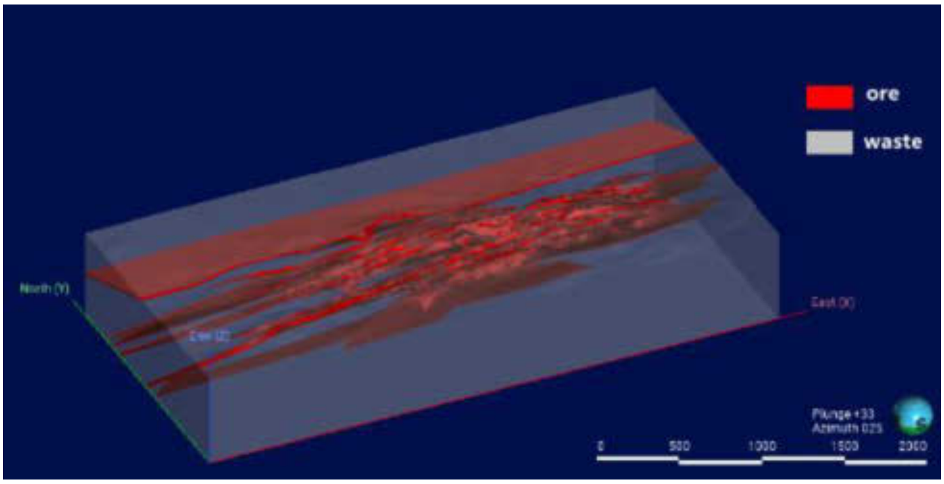

Figure 7-90: Cross Section of Mineral zone system model of Mayo Project

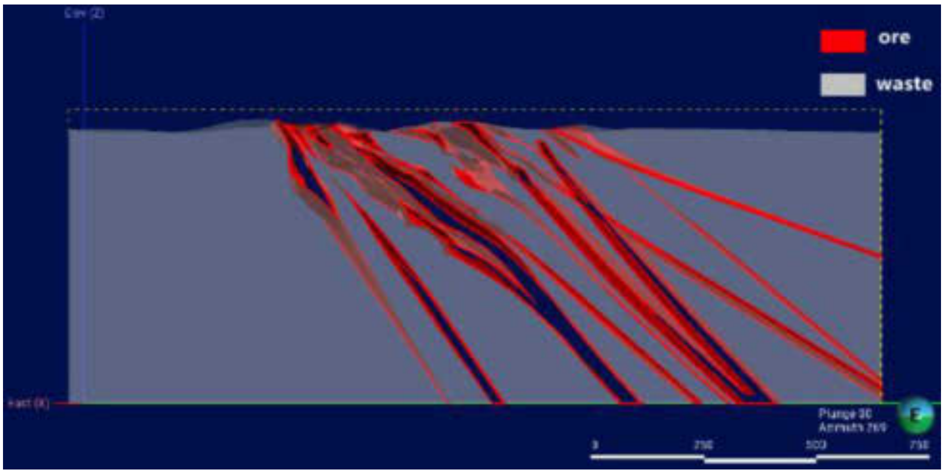

7.6.5 Specific Gravity

A total of 9,328 specific gravity samples which listed in geology database were collected from of **Mayo Project**. Samples were collected from different lithologies and different parts of the mineralised body of **Mayo**, and the representative of density samples are considered sufficient, as shown in Figure 7-91. The specific gravity ("SG") is listed in the Table 7-46 which are applied in SRK's resource estimation.

Figure 7-91: The Distribution Specific Gravity Samples of May Project

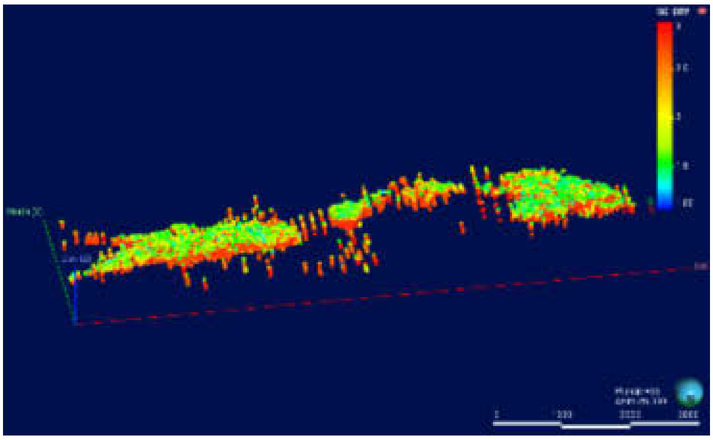

Table 7-46: Specific Gravity of Mayo Project

No	Weathering	Average（t/m³）
1	Laterite	1.71
2	Saprolite	1.73
3	Transition	2.22
4	Rock	2.703

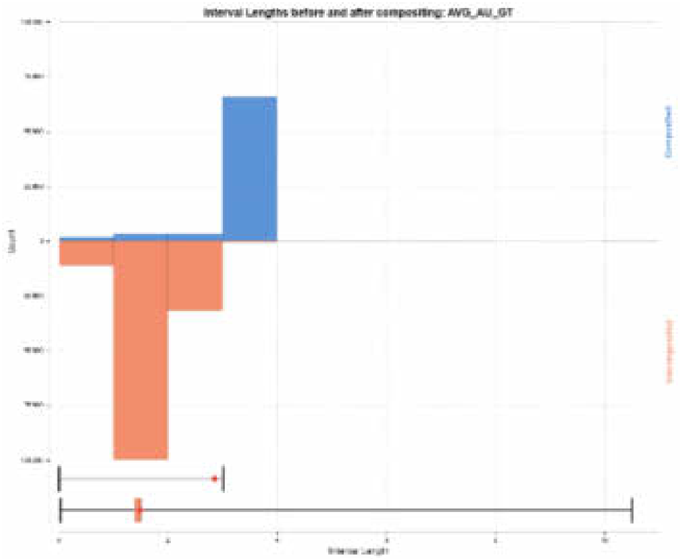
7.6.6 Compositing

The basic statistics of raw sampling length of **Mayo Project** indicates that most of the sample intervals are 1.67 m, comprehensively consider the height of the steps and the previous work achievements 3 m interval composite length was selected for compositing. All raw samples were composited to 3 m downhole lengths, with a minimum of 1.5 m for each composite sample. The distribution of sample length and Au Grade before and after composite is provided in Table 7-47 and Figure 7-92.

Table 7-47: Statistics of Original Samples and Composite Samples of Mayo Project

Iterm	Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Original	Sample Length	143064	1.48	0.41	0.28	0.17	0.03	10.50
	Au Grade	143064	0.18	3.56	19.43	12.68	0.00	1066.87
Composite	Sample Length	73399	2.86	0.50	0.17	0.25	0.00	3.00
	Au Grade	73399	0.19	2.96	15.85	8.77	0.00	399.02

Figure 7-92: Compositing Comparison Histogram of Sample Length of Mayo Project



The distribution of sample length and Au Grade before and after composite is provided in Figure 7-93 and Figure 7-94.

Figure 7-93: Compositing Comparison Histogram of Sample Au of Mayo Project

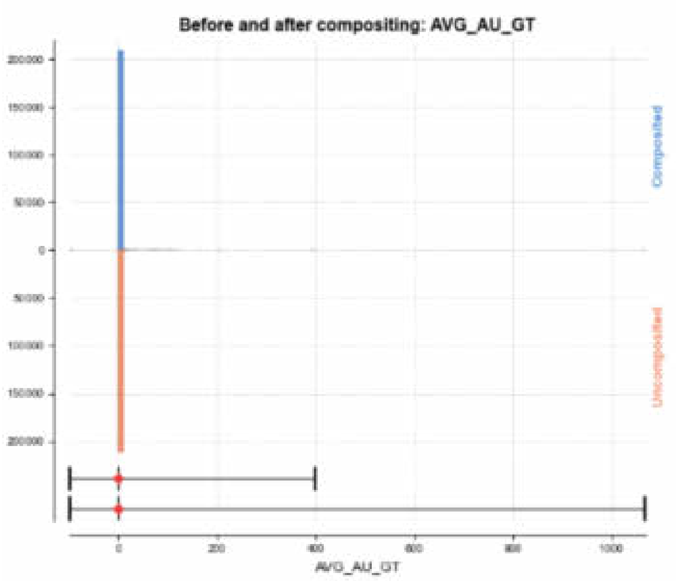


Figure 7-94: Cumulative Histogram of Sample Au of Mayo Project

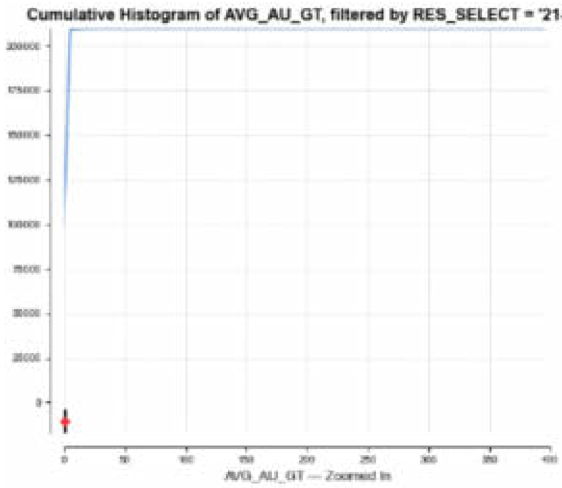


7.6.7 Evaluation of Outliers

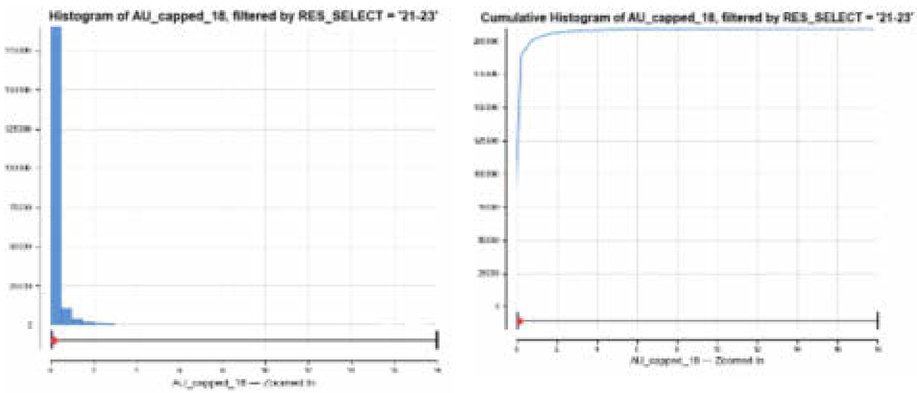
Based on the cumulative frequency and distribution characteristics of the sample histograms, the Au grades show a discontinuous distribution. As shown in Figure 7-94, 18 g/t Au, the continuity became sparse, thus 18 g/t Au was used as value capping.

Assay capping was applied for the of **Mayo** Deposit. The capping values by domain were presented in Table 7-48. The histogram and cumulative-probability plots for the composite samples are presented in Figure 7-95.

Table 7-48: Statistics of Samples after capping of Mayo Project

Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Au_cap Grade	70148	0.16	2.38	14.68	5.67	0.00	18.00

Figure 7-95: Au Composite Samples Histogram and Cumulative Histogram after capping of Mayo Project



Note:
1 The mean is indicated by the red diamond.
2 The median is indicated by the line that crosses the inside of the box

7.6.8 Statistical Analysis and Variography

Since no information or data on this aspect has been received, SRK has not conducted a review of the content in this regard.

7.6.9 Block Model and Grade Estimation

The block model for each domain was created using Leapfrog geo software for grade and tonnage estimation. Appropriate block cell size was selected for the deposit.

For the **Mayo**, a block size of 8 m easting (X) by 6 m northing (Y) by 9 m elevation (Z) was used. A summary of the block model specifications is listed in Table 7-49. The attribute and description of the block model are presented in Table 7-50.

Table 7-49: Block Model Specifications of Mayo Project

	Min	Max	Block Size	Bub Block Size	Rotation
N	80400	81852	6	/	0
E	42600	46304	8	/	0
Z	-3	573	9	/	0
Total Blocks			7,170,944		

Table 7-50: Attribute and Description of Mayo Project

Attribute	Description
Au_OK	Au grade (g/t)
Area	'North', 'Central', 'South', 'WST'
Vein System	Veins domain

Weathering	5(Laterite),7200(Saprolite),9200(Transition),8200(Rock),15(Dump)
Density	Specific Gravity
Class	Mea, Ind, Inf.

Ordinary Kriging ("OK") method was applied for Au in main orebodies of **Mayo**.

Since no information or data about search parameters of Mayo project has been received, SRK has not conducted a review of the content in this regard.

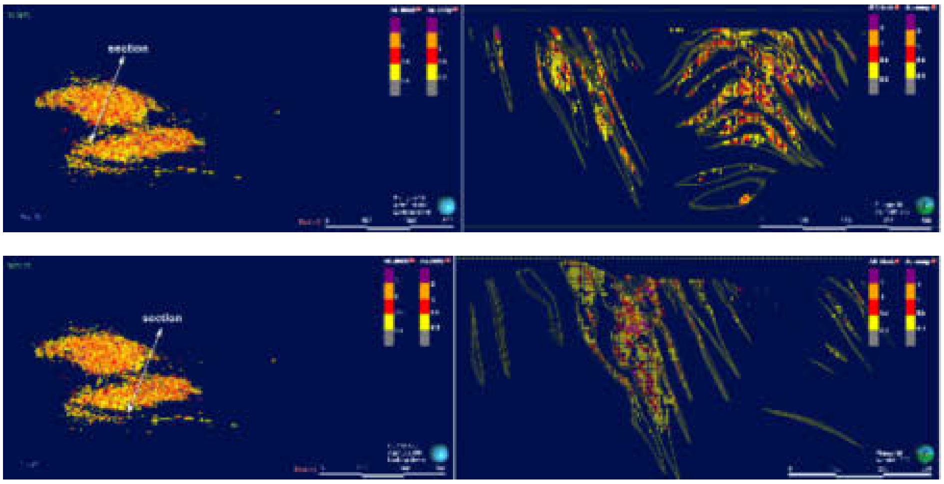
7.6.10 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the resource estimate.

SRK adopted the visual Inspection approaches to validate the model:

A series of cross-sections were cut to compare the composite samples used in resource estimation with the block model estimation results, in order to verify the reasonableness of the estimation parameters and results. Visual inspections were conducted for the mineralized zone. By comparing the block model with the relevant composite samples within the orebody, it was found that although there may be some local variability due to the nugget effect of the composite samples, overall, the areas of higher (or lower) grades in the block model correspond well with the areas of higher (or lower) grades in the composite samples. Figure 7-96 shows a comprehensive comparison of the composite samples overlaid on the block model for the main mineralized zone.

Figure 7-96: Visual Inspection of Au (block vs composite) of Mayo Project



7.6.11 Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

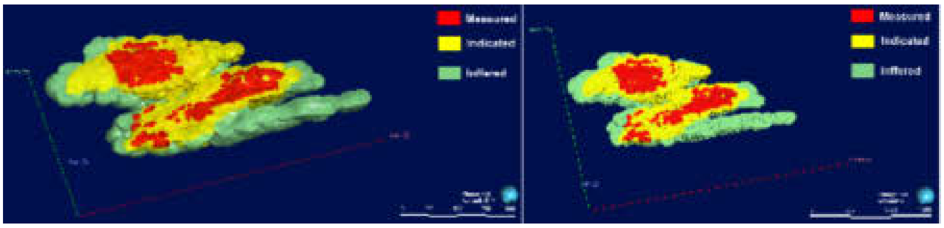
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For the **Mayo** Project, the Mineral Resource at the space of 25m (strike) × 25m (dip) is defined as Measured Mineral Resource, the resource at the space of 50m (strike) × 50m (dip) is defined as Indicated Mineral Resource and the resource at the space of 75m (strike) × 75m (dip) and greater is defined as Inferred Mineral Resource. Figure 7-97 shows the resource category classification of the **Mayo** Project.

Figure 7-97: Mineral Resource Category Distribution of Mayo Project



7.6.12 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the **Mayo** are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **Mayo** Project are summarised in Table 7-51. The spatial relationship between RPEEE and block Model shows in Figure 7-98.

Table 7-51: Assumptions Considered for the Mayo Project

Item	Rock Type	Unit	Mayo

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Pengfei Xiao and Liang Li who are a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is Fellow of AusIMM, respectively. Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2 g/t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

7.6.13 Grade Sensitivity Analysis

The mineral resources of the **Mayo** Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates [or the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources (although the global grade tonnage information is generally more appropriate characteristics of the grade tonnage characteristics of the deposit)] are presented in Table 7-53 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-99 presents this sensitivity as grade tonnage curves.

Table 7-53: Global Block Model Quantities and Grade Estimates[1], Mayo Project at Various cut-off Grades.

Cut-off Grad Au (g/t)	Quantity (Mt)	Grade Au (g/t)	Material Content k oz
0.25	267.12	0.66	5631
0.50	124.10	1.00	4004

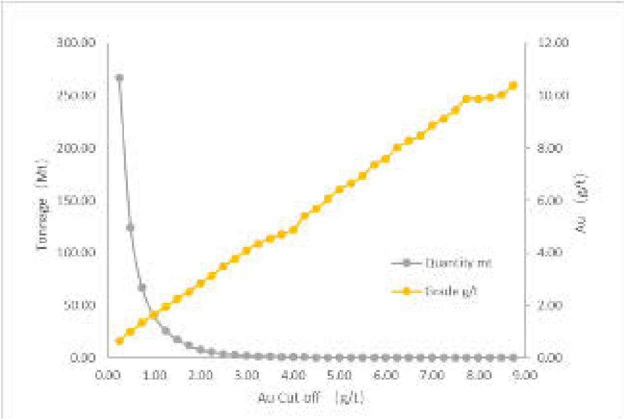
Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

Figure 7-99: Au Grade-Tonnage Plot of Mayo Project



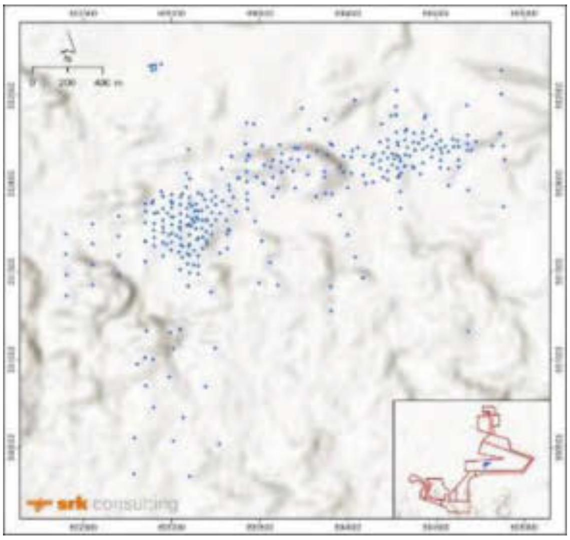
7.7 Rosebel South Domain: Roma (RM)

Block models for Roma West (RMW) and Roma East (RME) were not updated because there has been no new drilling or mining at these deposits. The most recent block models for these deposits are: RME_LOM2017, RMW_LOM: 2018.

Roma East was calculated using 2017 Whittle shells (WCL) and parameters as no new shells nor BM updates have been done in 2024 by RGM for those deposits.

Roma West was calculated using 2018 Whittle shells (WCL) and parameters as no new shells nor BM updates have been done in 2024 by RGM for those deposits.

Figure 7-100: Drillhole Location of Roma Project



SRK considers that major portions **of Roma West (RMW) and Roma East (RME) Project** are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **Roma West (RMW) and Roma East (RME) Project** are summarised in Table 7-54**.** The spatial relationship between RPEEE and block Model shows in Figure 7-101.

Table 7-54: Assumptions Considered for the of Roma Project

Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2 g/t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

[4] Block models and Whittle pit shells were not updated.

7.8 Rosebel Center Domain: Rosebel

7.8.1 Introduction

The resource study estimate of **Rosebel Project** has been conducted by ROSEBEL GOLD MINES. SRK has reviewed the information made available for this study and has used the datasets for the preparation of the SRK model. Presented below is a summary of the main datasets available for the previous study.

Data provided by ROSEBEL GOLD MINES:

- Exploration Database, including collar, survey, assay, and lithological logs codes
- Composites, orebodies wireframe, and topography in dxf format of CAD software.
- Block model in csv format of Microsoft office software

7.8.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold mineralisation;
- Definition of Mineral Resource domains;
- Data conditioning (compositing and capping) for geostatistical analysis and variography;
- Block modelling and grade interpolation;
- Mineral Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

7.8.3 Resource Database

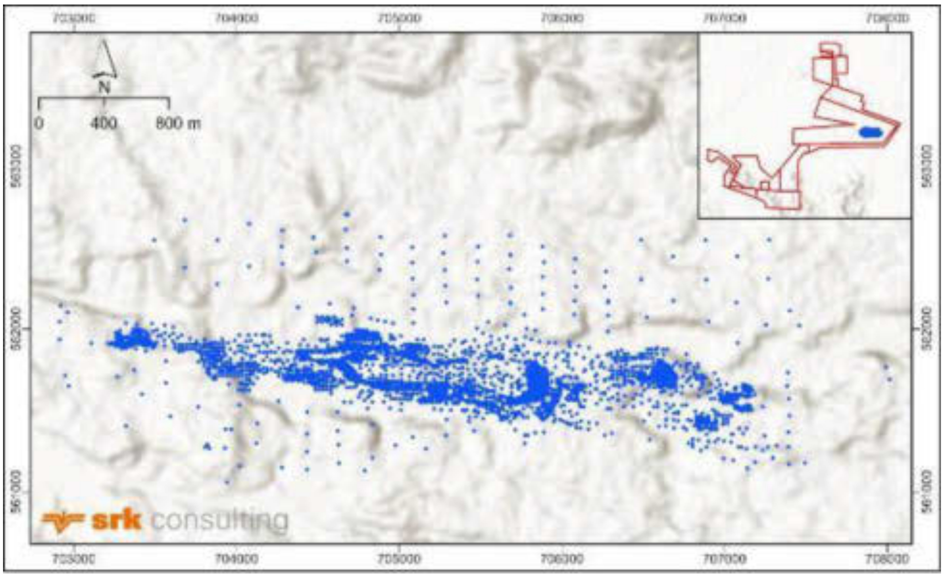
The data SRK received from the client include: previous technical reports, working technical process documents and QAQC data, databases, resource models etc.

Overall, the mineral resource of **Rosebel Project** was estimated by SRK based on database provided by ROSEBEL GOLD MINES. As of January 1, 2025. There were 3,116 drillholes (302,801.03 m) in the database, as shown in Table 7-56 and Figure 7-102.

Table 7-56: Resource Database Statistics of Rosebel Project

Drillhole Type	Drillholes	Length（m）	Samples
Drillholes	894	132,162.03	88,118
RC	2,223	170,639	72,011

Figure 7-102: Drillhole Location of Rosebel Project



7.8.4 Solid Body Modelling

All the wireframe of Rosebel project were provided by ROSEBEL GOLD MINES in April, 2025. SRK has reviewed the wireframe which were created by Implicit modelling techniques of the drilling dataset by used Leapfrog. We believe that they are basically reasonable and can be used for resource estimation, as shown in Figure 7-102 to Figure 7-107.

Figure 7-103: Lithology model of Rosebel Project

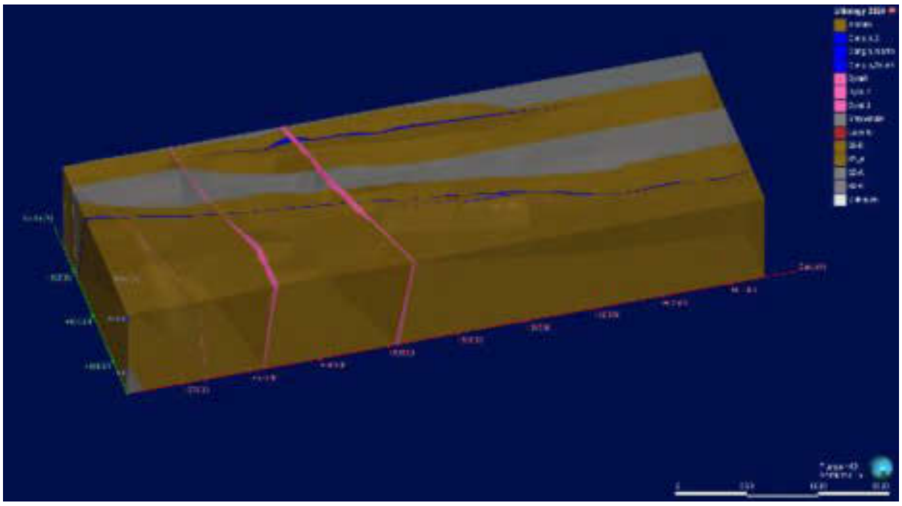


Figure 7-104: Cross Section of lithology model of Rosebel Project

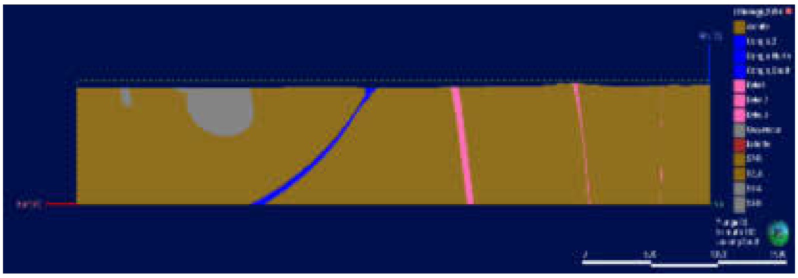

Figure 7-105: Weathering model of Rosebel Project

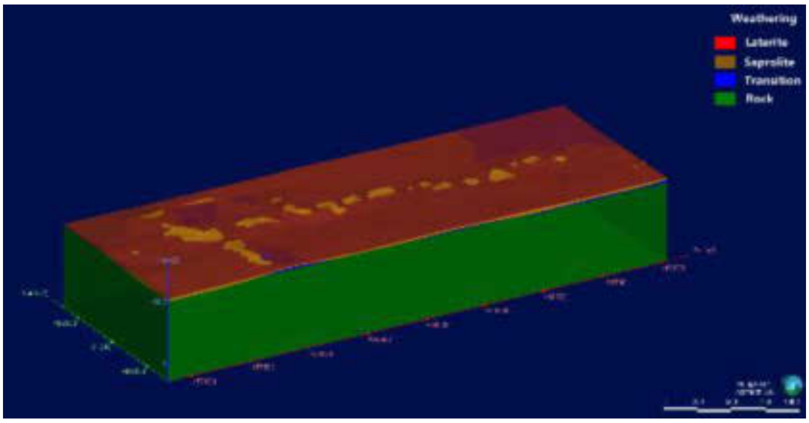

Figure 7-106: Cross Section of weathering model of Rosebel Project

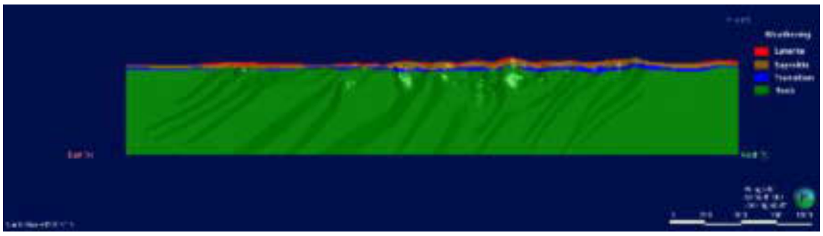

Figure 7-107: Vein system model of Rosebel Project

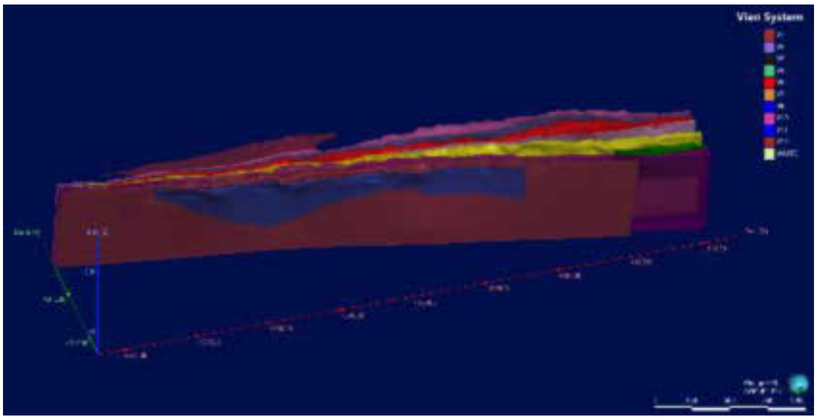

7.8.5 Specific Gravity

A total of 7,354 specific gravity samples which listed in geology database were collected from **Rosebel** project. Samples were collected from different lithologies and different parts of the mineralised body of Rosebel, and the representative of density samples are considered sufficient, as shown in Figure 7-108. The specific gravity ("SG") is listed in the Table 7-57 which are applied in SRK's resource estimation.

Figure 7-108: The Distribution Specific Gravity Samples of Rosebel Project

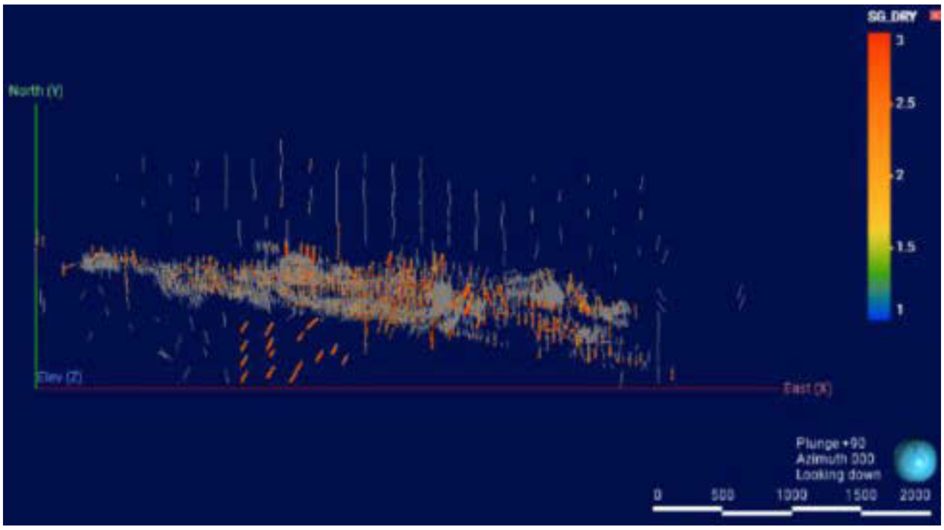

Table 7-57: Specific Gravity of Rosebel Project

No	Weathering	Average（t/m^3）
1	Laterite	1.69
2	Saprolite	1.82
3	Transition	2.29
4	Rock	2.69
5	Ohers	1.50

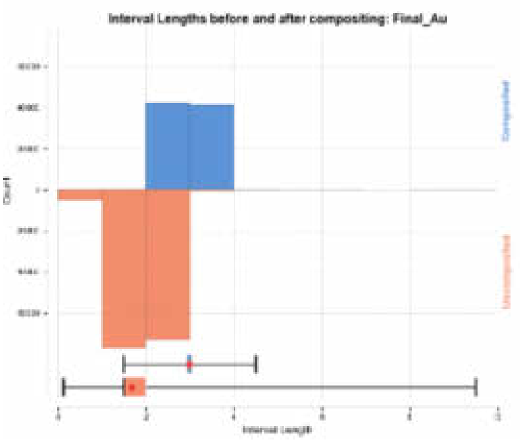
7.8.6 Compositing

The basic statistics of raw sampling length of **Rosebel Project** indicates that most of the sample intervals are 1.67 m, comprehensively consider the height of the steps and the previous work achievements 3 m interval composite length was selected for compositing. All raw samples were composited to 3 m downhole lengths, with a minimum of 1.5 m for each composite sample. The distribution of sample length and Au Grade before and after composite is provided in Table 7-58 and Figure 7-109.

Table 7-58: Statistics of Original Samples and Composite Samples of Rosebel Project

Iterm	Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Original	Sample Length	154,988	1.67	0.36	0.22	0.13	0.12	9.5
	Au Grade	154,988	0.26	1.91	7.35	3.64	0.00	297.30
Composite	Sample Length	83584	2.99	0.12	0.04	0.02	1.50	4.48
	Au Grade	83584	0.27	1.33	5.03	1.78	0.00	159.17

Figure 7-109: Compositing Comparison Histogram of Sample Length of Rosebel Project



The distribution of sample length and Au Grade before and after composite is provided in Figure 7-110 and Figure 7-111.

Figure 7-110: Compositing Comparison Histogram of Sample Au of Rosebel Project

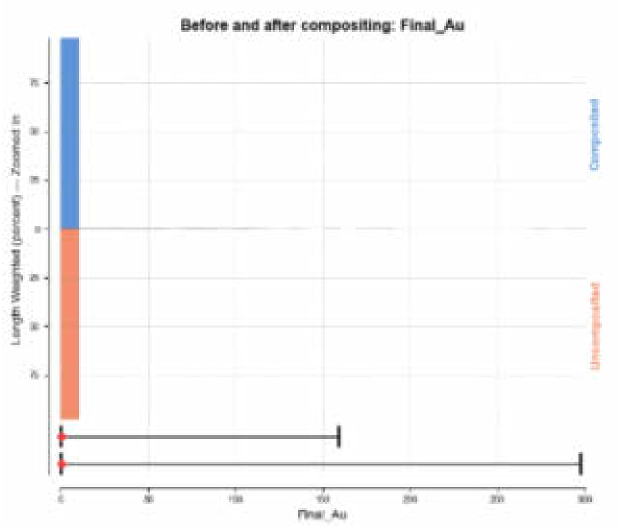


Figure 7-111: Cumulative Histogram of Sample Au of Rosebel Project

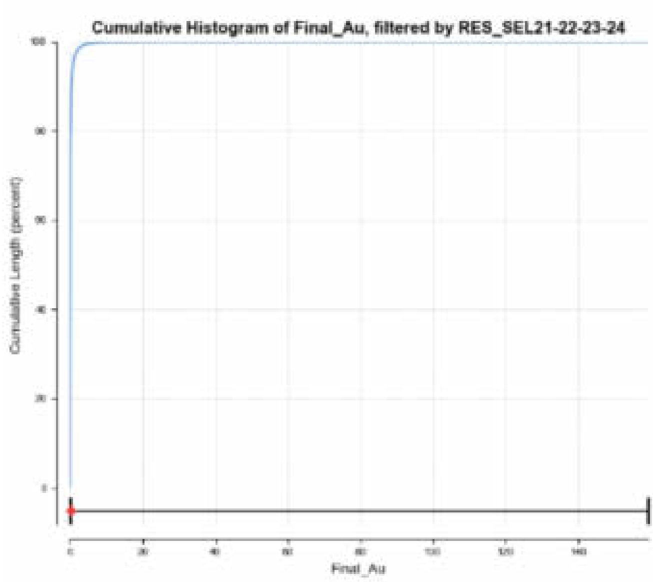


7.8.7 Evaluation of Outliers

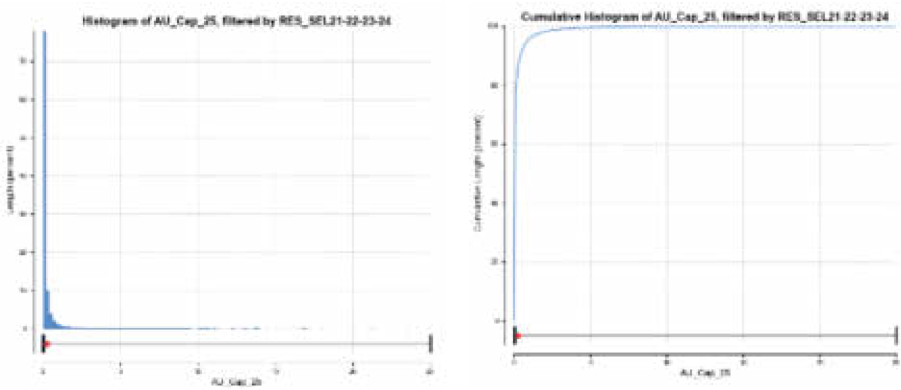
Based on the cumulative frequency and distribution characteristics of the sample histograms, the Au grades show a discontinuous distribution. As shown in Figure 7-111, 25 g/t Au, the continuity became sparse, thus 25 g/t Au was used as value capping.

Assay capping was applied for the **Rosebel** Deposit. The capping values by domain were presented in Table 7-59. The histogram and cumulative-probability plots for the composite samples are presented in Figure 7-112.

Table 7-59: Statistics of Samples after capping

Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Au_cap Grade	83584	0.25	0.76	3.05	0.58	0.00	25.00

Figure 7-112: Au Composite Samples Histogram and Cumulative Histogram after capping of Rosebel Project



Note:
[1] The mean is indicated by the red diamond.
[2] The median is indicated by the line that crosses the inside of the box

7.8.8 Statistical Analysis and Variography

SRK has reviewed the variogram model for Au based on the composite samples by adopting a spherical variation function to fitting the experimental variogram, and the result has the characteristics of geometric anisotropy. The structure of the variogram is detailed in Table 7-60 and Figure 7-113 to Figure 7-114.

Table 7-60: Variogram Structure within Orebody and waste of Rosebel Project

Domain	Element	Bearing	Dip	Dip Azimuth	Nugget	Sill	Range	Major/Semi-major	Major/Minor
orebody	Au	147	82	7.6	0.6	0.4	45	1.36	2.8
waste	Au	147	82	7.6	0.6	0.4	45	1.36	2.8

Figure 7-113: Variogram Model within Orebody

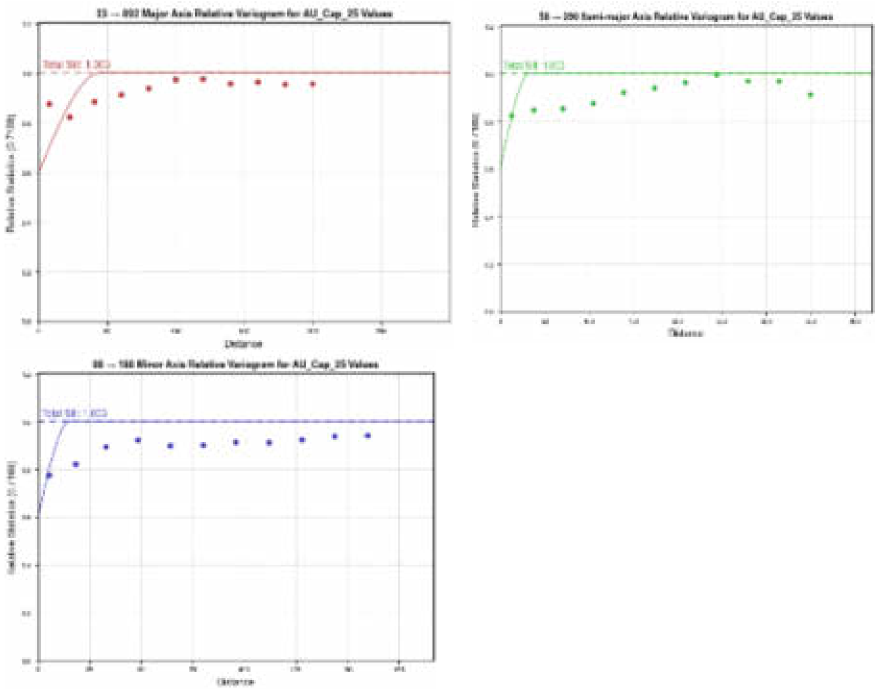


Figure 7-114: Variogram Model within Waste

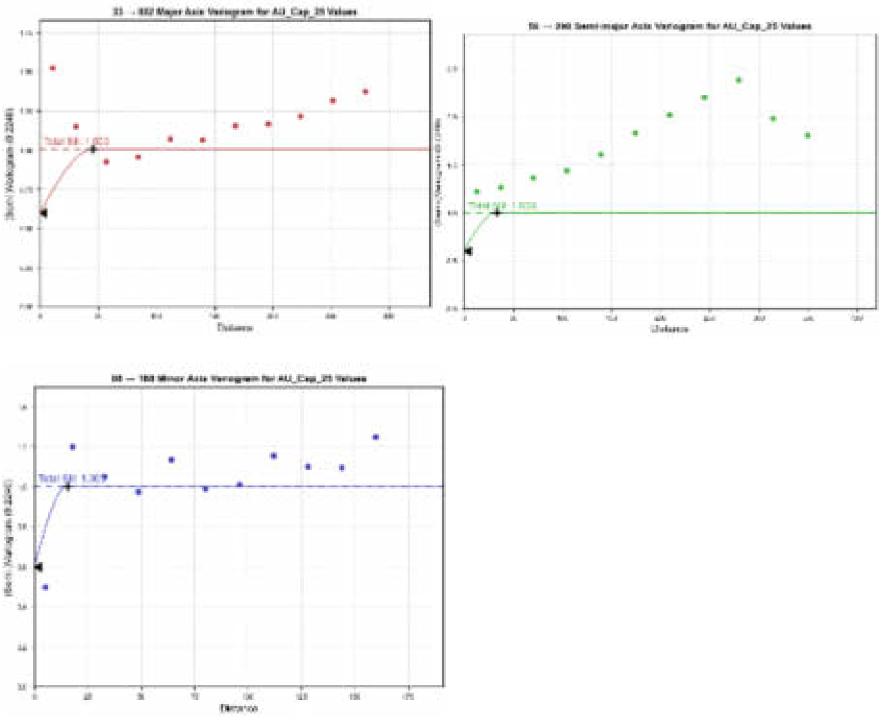

7.8.9 Block Model and Grade Estimation

The block model for each domain was created using Leapfrog geo software for grade and tonnage estimation. Appropriate block cell size was selected for the deposit.

For the **Rosebel**, a block size of 8 m easting (X) by 6 m northing (Y) by 9 m elevation (Z) was used. A summary of the block model specifications is listed in Table 7-61. The attribute and description of the block model are presented in Table 7-62.

Table 7-61: Block Model Specifications of Rosebel Project

	Min	Max	Block Size	Bub Block Size	Rotation
N	80700	82182	6	/	0
E	56800	61048	8	/	0
Z	0	603	9	/	0
Total Blocks			8787519		

Table 7-62: Attribute and Description of Rosebel Project

Attribute	Description
Au_OK	Au grade (g/t)
Lithology	Lithology of the deposit (Dyke1,Conglo_north,Conglo_south,Conglo_2,Arenite,Greywacke)
Vein System	Veins domain
Weathering	5(Laterite),7200(Saprolite),9200(Transition),8200(Rock)
Density	Specific Gravity
Class	Mea, Ind, Inf.

Ordinary Kriging ("OK") method was applied for Au in main orebodies of Rosebel. The three progressively more relaxed search criteria used for OK estimation are presented in Table 7-63. The search ellipsoids were aligned with the general mineralization orientation. The typical grade of Au estimated of **Roseble** was shown in Figure 7-115.

Table 7-63: Specific Search Parameters of Rosebel Project

Iterm		Orebody			Waste		
Element		Au			Au		
Estimation Method		OK			OK		
Runs		1	2	3	1	2	3
Search Distance		25	45	75	25	45	75
Min Num of Samples		5	3	3	7	3	1
Max Num of Samples		12	15	24	12	15	18
Max Num of Samples per Hole		3	2	/	3	3	/

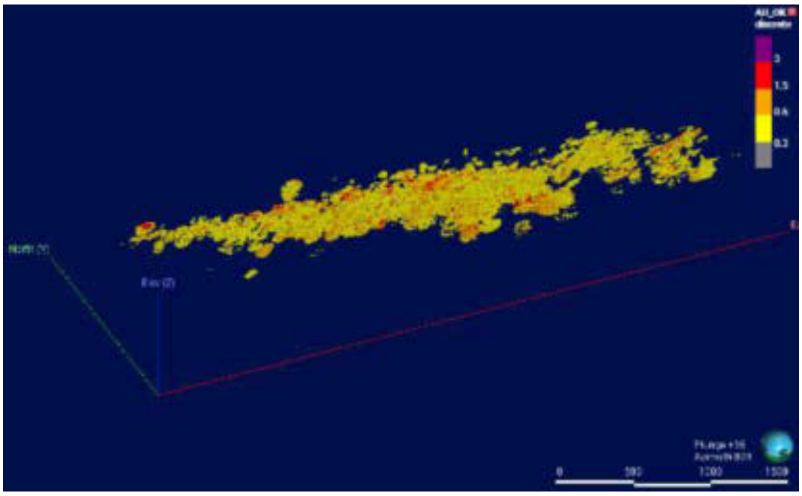
	Max num of empty Sector	/	2	/	/	/	/
Outliers Restriction	**Distance of search(%)**	/	/	50	/	/	/
	Value threshold	/	/	4	/	/	/

Figure 7-115: Estimated Au Grade of Rosebel Project



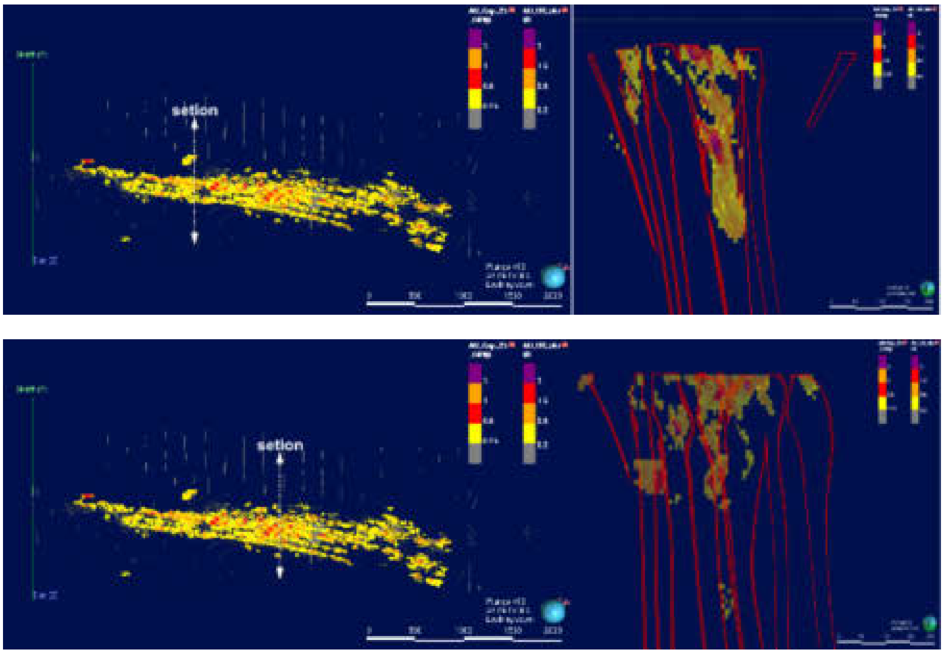
7.8.10 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the resource estimate.

SRK adopted the visual Inspection approaches to validate the model:

A series of cross-sections were cut to compare the composite samples used in resource estimation with the block model estimation results, in order to verify the reasonableness of the estimation parameters and results. Visual inspections were conducted for the mineralized zone. By comparing the block model with the relevant composite samples within the orebody, it was found that although there may be some local variability due to the nugget effect of the composite samples, overall, the areas of higher (or lower) grades in the block model correspond well with the areas of higher (or lower) grades in the composite samples. Figure 7-116 shows a comprehensive comparison of the composite samples overlaid on the block model for the main mineralized zone.

Figure 7-116: Visual Inspection of Au (block vs composite) of Rosebel Project



7.8.11 Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

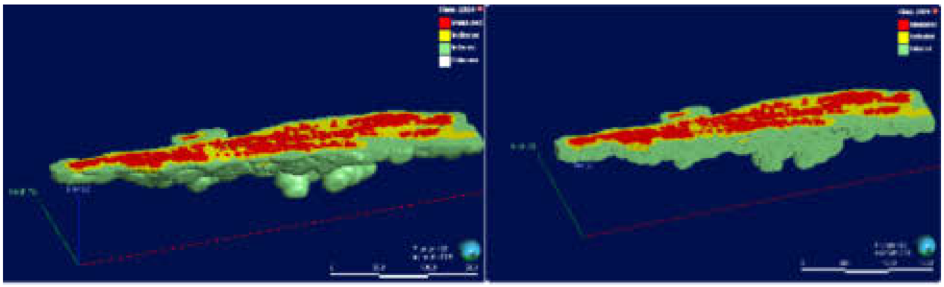
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For the **Rosebel** Project, the Mineral Resource at the space of 25m (strike) × 25m (dip) is defined as Measured Mineral Resource, the resource at the space of 50m (strike) × 50m (dip) is defined as Indicated Mineral Resource and the resource at the space of 70m (strike) × 70m (dip) and greater is defined as Inferred Mineral Resource. Figure 7-117 shows the resource category classification of the **Rosebel** Project.

Figure 7-117: Mineral Resource Category Distribution of Rosebel Project



7.8.12 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the **Roseble Project** are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **Roseble** Project are summarised in Table 7-64. The spatial relationship between RPEEE and block Model shows in Figure 7-118.

Table 7-64: Assumptions Considered for the Roseble Project

Item	Rock Type	Unit	Rosebel
Preferred COG	Saprolite	%	0.2
	Transition		0.2

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Pengfei Xiao and Liang Li who are a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is Fellow of AusIMM, respectively. Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2g /t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

7.8.13 Grade Sensitivity Analysis

The mineral resources of the **Rosebel Project** are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates [or the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources (although the global grade tonnage information is generally more appropriate characteristics of the grade tonnage characteristics of the deposit)] are presented in Table 7-66 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-119 presents this sensitivity as grade tonnage curves.

Table 7-66: Global Block Model Quantities and Grade Estimates[1], Rosebel Project at Various cut-off Grades.

Cut-off Grad Au (g/t)	Quantity (Mt)	Grade Au (g/t)	Material Content koz
0.2	160.6	0.63	3,267
0.4	100.6	0.82	2,656
0.6	54.0	1.11	1,925
0.8	32.5	1.39	1,450

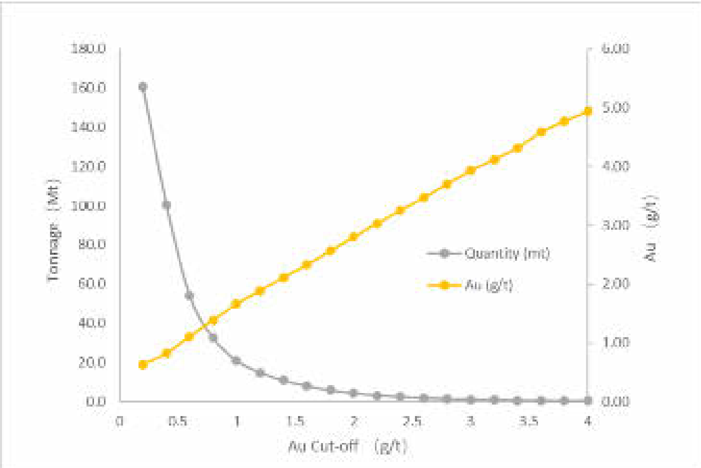
Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

Figure 7-119: Au Grade-Tonnage Plot of Rosebel Project



7.9 Saramacca

7.9.1 Introduction

The resource study estimate of **Saramacca** Project has been conducted by ROSEBEL GOLD MINES. SRK has reviewed the information made available for this study and has used the datasets for the preparation of the SRK model. Presented below is a summary of the main datasets available for the previous study.

Data provided by ROSEBEL GOLD MINES:

- Exploration Database, including collar, survey, assay, and lithological logs codes
- Composites, orebodies wireframe, and topography in dxf format of CAD software.
- Block model in csv format of Microsoft office software

7.9.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold mineralisation;
- Definition of Mineral Resource domains;
- Data conditioning (compositing and capping) for geostatistical analysis and variography;
- Block modelling and grade interpolation;
- Mineral Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

7.9.3 Resource Database

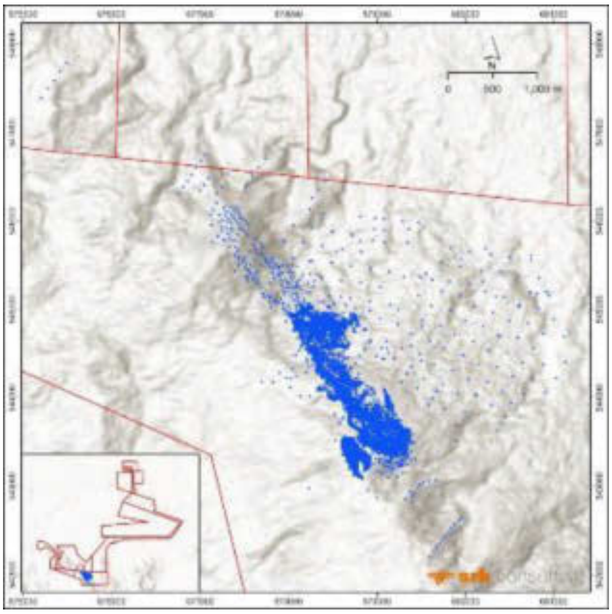
The data SRK received from the client include: previous technical reports, working technical process documents and QAQC data, databases, resource models etc.

Overall, the mineral resource of **Saramacca Project** was estimated by SRK based on database provided by ROSEBEL GOLD MINES. As of January 1, 2025. There were 3,899 drillholes (424,129.88 m) in the database, as shown in Table 7-67 and Figure 7-120.

Table 7-67: Resource Database Statistics of Saramacca Project

Area	Drillholes	Length（m）	Samples
Saramcca	3,899	424,129.88	230,119

Figure 7-120: Drillhole Location



7.9.4 Solid Body Modelling

All the wireframe of Saramacca project were provided by ROSEBEL GOLD MINES in April, 2025. SRK has reviewed the wireframe which were created by Implicit modelling techniques of the drilling dataset by used Leapfrog. We believe that they are basically reasonable and can be used for resource estimation, as shown in Figure 7-121 to Figure 7-126.

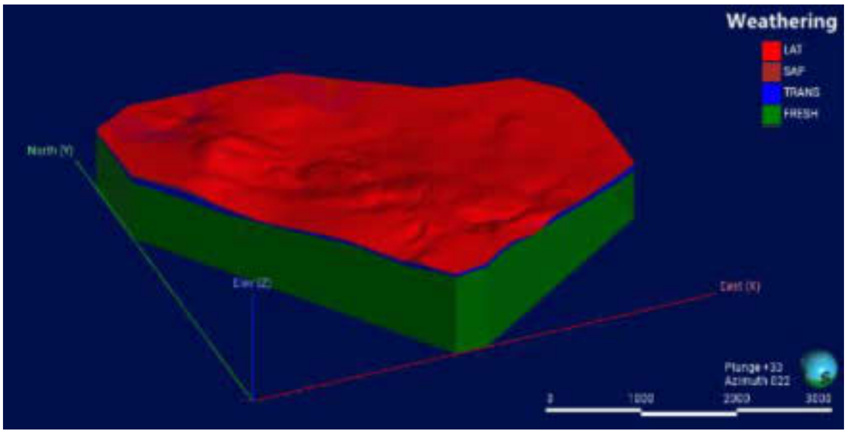

Figure 7-124: Cross Section of weathering model of Saramacca Project

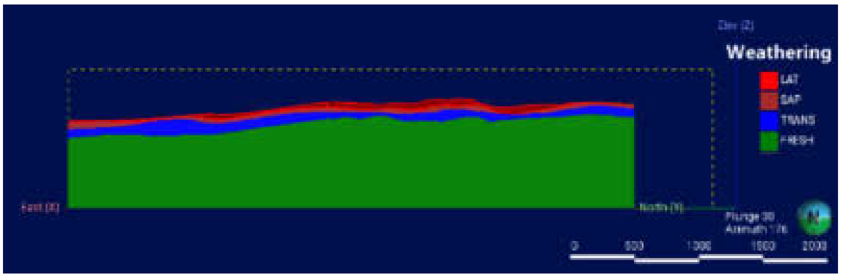

Figure 7-125: Graph vein system model of Saramacca project

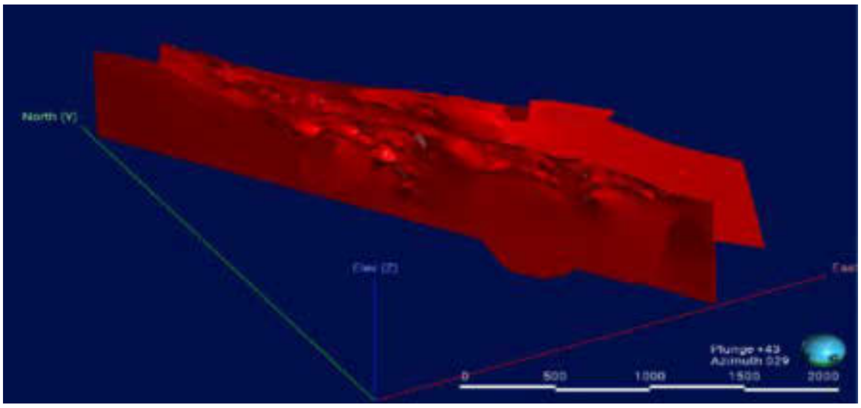

Figure 7-126: Cross Section of vein system model of Saramacca Project

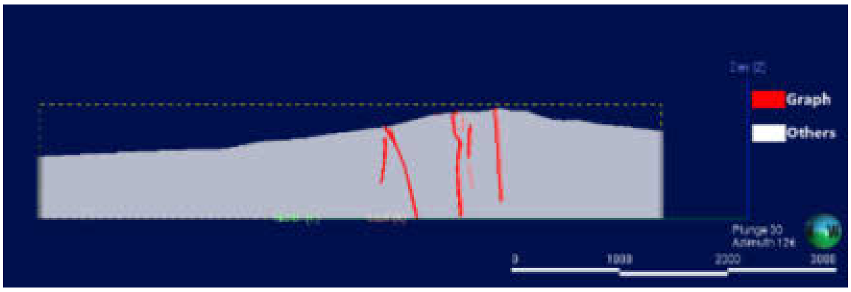

7.9.5 Specific Gravity

A total of 10562 specific gravity samples which listed in geology database were collected from **Saramacca**. Samples were collected from different lithologies and different parts of the mineralised body of **Saramacca**, and the representative of density samples are considered sufficient, as shown in Figure 7-127. The specific gravity ("SG") is listed in the Table 7-68 which are applied in SRK's resource estimation.

Figure 7-127: The Distribution Specific Gravity Samples of Saramacca Project

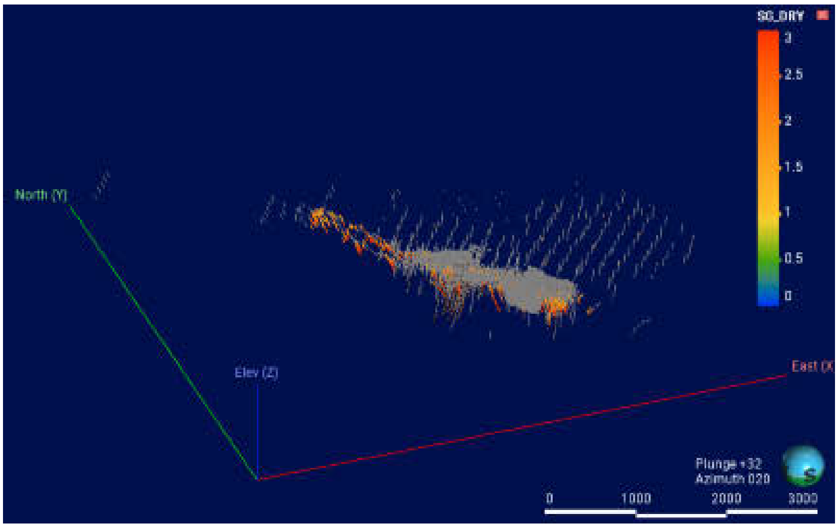

Table 7-68: Specific Gravity of Saramacca Project

No	Weathering	Average（t/m^3）
1	Laterite	1.82
2	Saprolite	1.52
3	Transition	1.92
4	Rock	2.77
5	Ohers	1.68

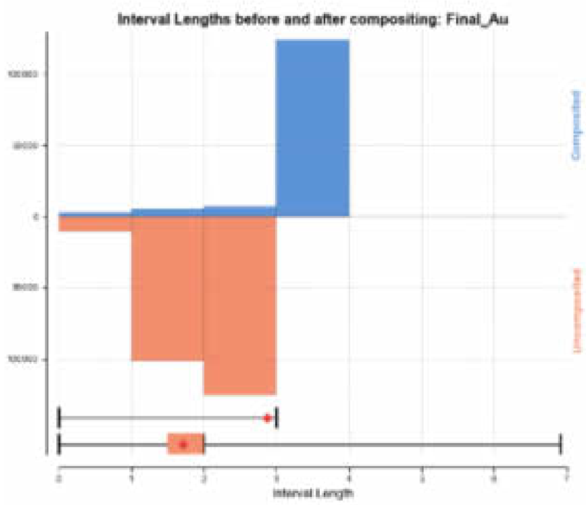
7.9.6 Compositing

The basic statistics of raw sampling length of **Saramacca** Project indicates that most of the sample intervals are 1.75 m, comprehensively consider the height of the steps and the previous work achievements 3 m interval composite length was selected for compositing. All raw samples were composited to 3 m downhole lengths, with a minimum of 1.5 m for each composite sample. The distribution of sample length and Au Grade before and after composite is provided in Table 7-69 and Figure 7-128.

Table 7-69: Statistics of Original Samples and Composite Samples of Saramacca Project

Iterm	Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Original	Sample Length	230117	1.75	0.31	1.74	0.09	0.18	7.00
	Au Grade	230117	0.32	2.61	8.04	6.83	0.00	487.00
Composite	Sample Length	139113	2.87	0.48	0.17	0.23	0.00	3.00
	Au Grade	139113	0.32	2.16	6.66	4.68	0.00	244.62

Figure 7-128: Compositing Comparison Histogram of Sample Length of Saramacca Project



The distribution of sample length and Au Grade before and after composite is provided in Figure 7-129 and Figure 7-130.

Figure 7-129: Compositing Comparison Histogram of Sample Au of Saramacca Project

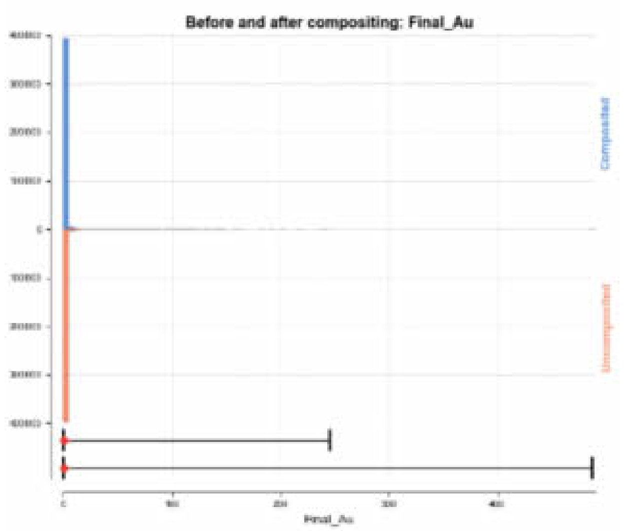


Figure 7-130: Cumulative Histogram of Sample Au of Saramacca Project

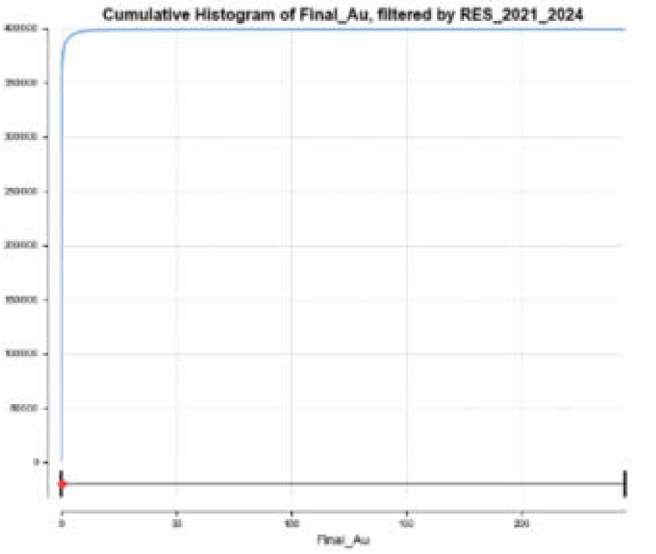


7.9.7 Evaluation of Outliers

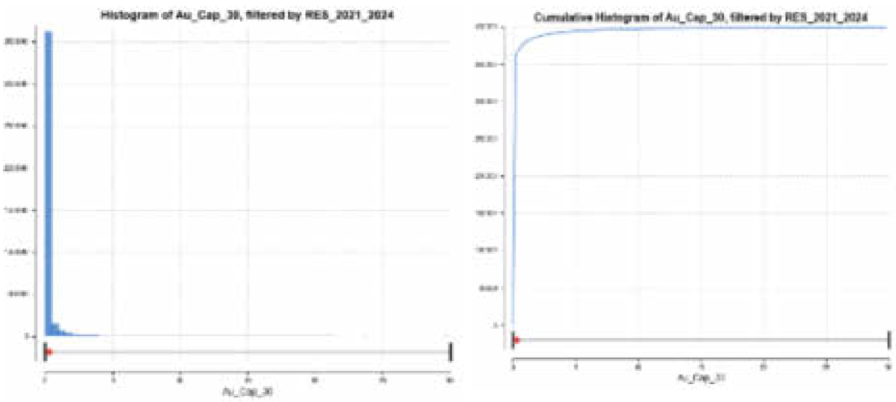
Based on the cumulative frequency and distribution characteristics of the sample histograms, the Au grades show a discontinuous distribution. As shown in Figure 7-130, 30 g/t Au, the continuity became sparse, thus 30 g/t Au was used as value capping.

Assay capping was applied for the **Saramacca** Deposit. The capping values by domain were presented in Table 7-70. The histogram and cumulative-probability plots for the composite samples are presented in Figure 7-131.

Table 7-70: Statistics of Samples after capping of Saramacca Project

Name	Count	Mean	SD	CV	Variance	Minimum	Maximum
Au_cap Grade	139113	0.30	1.35	4.56	1.84	0.00	30

Figure 7-131: Au Composite Samples Histogram and Cumulative Histogram after capping of Saramacca Project



Note：
[1] The mean is indicated by the red diamond.
[2] The median is indicated by the line that crosses the inside of the box

7.9.8 Statistical Analysis and Variography

SRK has reviewed the variogram model for Au based on the composite samples by adopting a spherical variation function to fitting the experimental variogram, and the result has the characteristics of geometric anisotropy. The structure of the variogram is detailed in Table 7-71 and **Figure 7-132** to **Figure 7-141**.

Table 7-71: Variogram Structure within Orebody of Saramacca Project

Domain	Element	Bearing	Dip	Dip Azimuth	Nugget	Sill	Range	Major/Semi-major	Major/Minor	Note
10	Au	142	0	0	0.2	0.64	18.61	0.44	1.09	Spherical

7.9.9 Block Model and Grade Estimation

The block model for each domain was created using Leapfrog geo software for grade and tonnage estimation. Appropriate block cell size was selected for the deposit.

For the **Saramacca**, a block size of 8 m easting (X) by 5 m northing (Y) by 8 m elevation (Z) was used. A summary of the block model specifications is listed in Table 7-72. The attribute and description of the block model are presented in Table 7-73.

Table 7-72: Block Model Specifications of Saramacca Project

	Min	Max	Block Size	Bub Block Size	Rotation
N	542402	546789	5	/	55
E	676416	680178	8	/	0
Z	-89	951	8	/	0
Total Blocks			8787519		

Table 7-73: Attribute and Description of Saramacca Project

Attribute	Description
Au_OK	Au grade (g/t)
Lithology	Lithology of the deposit (Dyke1,Conglo_north,Conglo_south,Conglo_2,Arenite,Greywacke)
Roctype	(GPS 7, 5, 10, 20, 30, 40)
Weathering	5,10(Laterite),20(Saprolite),30(Transition),40(Rock)
Density	Specific Gravity
Graph	GPS, Blank
Class	Mea, Ind, Inf.

Ordinary Kriging ("OK") method was applied for Au in main orebodies of **Saramacca**. The three progressively more relaxed search criteria used for OK estimation are presented in Table 7-74. The search ellipsoids were aligned with the general mineralization orientation. The typical grade of Au estimated of **Saramacca** was shown in Figure 7-142.

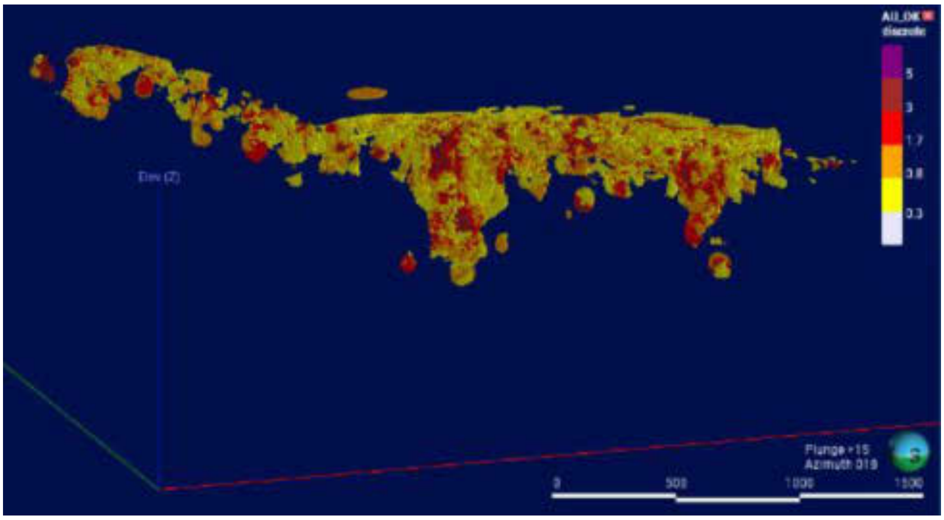
Figure 7-142: Estimated Au Grade of Saramacca Project



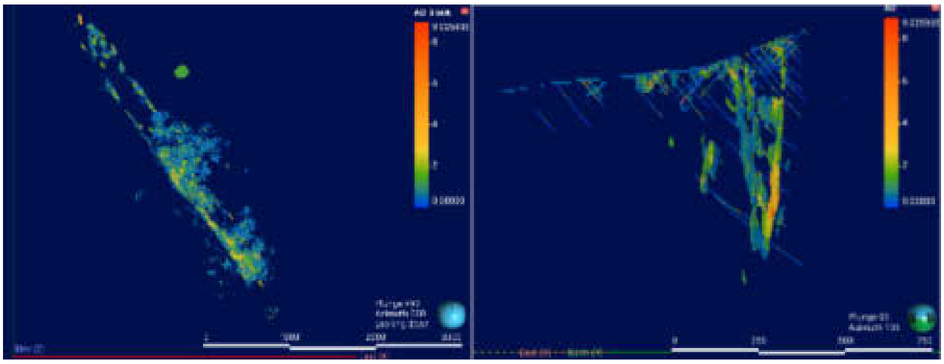
7.9.10 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the resource estimate.

SRK adopted the visual Inspection approaches to validate the model:

A series of cross-sections were cut to compare the composite samples used in resource estimation with the block model estimation results, in order to verify the reasonableness of the estimation parameters and results. Visual inspections were conducted for the mineralized zone. By comparing the block model with the relevant composite samples within the orebody, it was found that although there may be some local variability due to the nugget effect of the composite samples, overall, the areas of higher (or lower) grades in the block model correspond well with the areas of higher (or lower) grades in the composite samples. Figure 7-143 shows a comprehensive comparison of the composite samples overlaid on the block model for the main mineralized zone.

Figure 7-143: Visual Inspection of Au (block vs composite) of Saramacca Project



7.9.11 Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

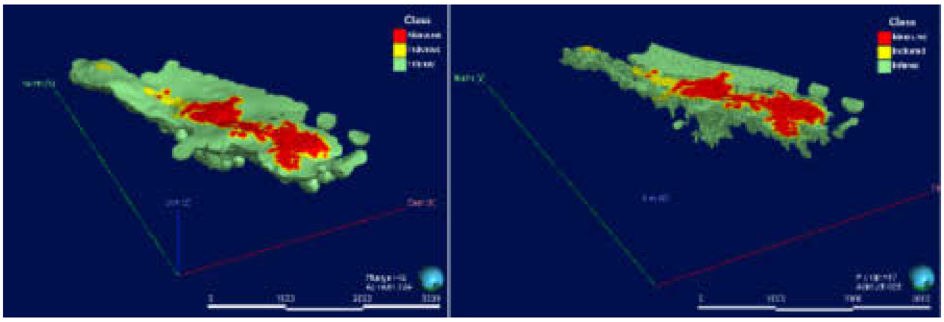
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For the **Saramacca** Project, the Mineral Resource at the space of 25m (strike) × 25m (dip) is defined as Measured Mineral Resource, the resource at the space of 50m (strike) × 50m (dip) is defined as Indicated Mineral Resource and the resource at the space of 70m (strike) × 70m (dip) and greater is defined as Inferred Mineral Resource. Figure 7-144 shows the resource category classification of the **Saramacca** Project.

Figure 7-144: Mineral Resource Category Distribution of Saramacca Project



7.9.12 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the **Saramacca** project are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **Saramacca** project are summarised in Figure 7-145.

Table 7-75. The spatial relationship between RPEEE and block Model shows in Figure 7-145.

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Pengfei Xiao and Liang Li who are a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is Fellow of AusIMM, respectively. Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2g /t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

7.9.13 Grade Sensitivity Analysis

The mineral resources of the Rosebel Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates [or the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources (although the global grade tonnage information is generally more appropriate characteristics of the grade tonnage characteristics of the deposit)] are presented in Table 7-77 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-146 presents this sensitivity as grade tonnage curves.

Table 7-77: Global Block Model Quantities and Grade Estimates[1], Saramacca Project at Various cut-off Grades.

Cut-off Grad Au (g/t)	Quantity (Mt)	Grade Au (g/t)	Material Content k oz
0.00	85.13	1.15	3138
0.50	63.05	1.42	2883
1.00	36.22	1.94	2257
1.50	20.44	2.49	1633

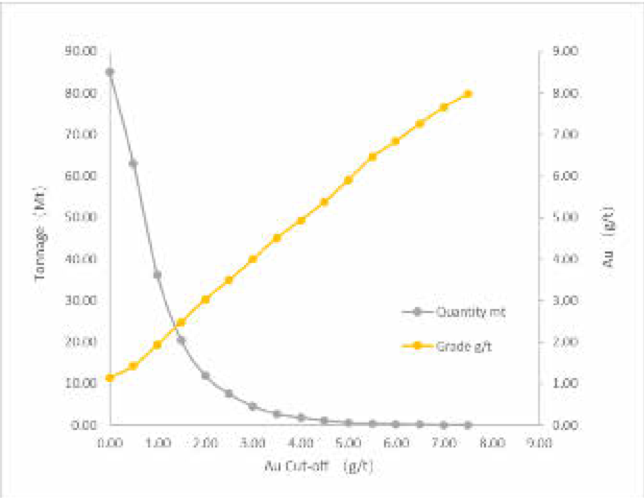
Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

Figure 7-146: Au Grade-Tonnage Plot of Saramacca Project



7.10 Moeroekreek(MK) and Overman(OV)

Block models for Moeroekreek (MK) and Overman (OV) were not updated because there has been no new drilling or mining at these deposits. The most recent block models for these deposits are:

MK_LOM2013_GEMS and OV_2017_RR_5m_Aug 17

Moeroekreek was calculated using 2017 Whittle shells (WCL) and parameters as no new shells nor BM updates have been done in 2024 by RGM for those deposits.

Overman was calculated using 2017 Whittle shells (WCL) and parameters as no new shells nor BM updates have been done in 2024 by RGM for those deposits.

SRK considers that major portions **of Moeroekreek (MK) and Overman (OV) Project** are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the **Moeroekreek (MK) and Overman (OV) Project** are summarised inTable 7-78**. The spatial relationship between RPEEE and block Model shows in** Figure 7-147 and Figure 7-148.

Table 7-78: Assumptions Considered for the Moeroekreek and Overman Project

7.11Conclusions and Recommendations

As of 31December 2024 and at a cut-off grade of 0.2 g/t Au for Laterite Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

(1) **Rosebel** North Domain

The **Pay Caro & East Pay Caro** Project is estimated to contain **29.71** Mt of Measured Mineral Resources with an average grade of **0.76** g/t Au, **39.87** Mt of Indicated Mineral Resources with an average grade of **0.72** g/t Au, and **4.44** Mt of Inferred Mineral Resources with an average grade of **0.62** g/t Au.

The **Koolhoven** Project is estimated to contain **13.83** Mt of Measured Mineral Resources with an average grade of **0.80** g/t Au, **15.23** Mt of Indicated Mineral Resources with an average grade of **0.74** g/t Au, and **0.68** Mt of Inferred Mineral Resources with an average grade of **0.59** g/t Au.

The **J Zone** Project is estimated to contain **25.53** Mt of Measured Mineral Resources with an average grade of **0.73** g/t Au, **7.40** Mt of Indicated Mineral Resources with an average grade of **0.63** g/t Au, and **0.16** Mt of Inferred Mineral Resources with an average grade of **0.35** g/t Au.

The **East Tailing Road** Project is estimated to contain **1.37** Mt of Measured Mineral Resources with an average grade of **0.85** g/t Au, **1.55** Mt of Indicated Mineral Resources with an average grade of **0.77** g/t Au, and **0.05** Mt of Inferred Mineral Resources with an average grade of **0.39** g/t Au.

(2) Rosebel South Domain

The **Royal Hill** Project is estimated to contain **42.23** Mt of Measured Mineral Resources with an average grade of **0.98** g/t Au, **22.31** Mt of Indicated Mineral Resources with an average grade of **1.05** g/t Au, and **0.64** Mt of Inferred Mineral Resources with an average grade of **0.90** g/t Au.

The **Mayo** Project is estimated to contain **84.94** Mt of Measured Mineral Resources with an average grade of **0.76** g/t Au, **32.76** Mt of Indicated Mineral Resources with an average grade of **0.79** g/t Au, and **14.39** Mt of Inferred Mineral Resources with an average grade of **0.78** g/t Au.

The **Roma** (**Roma East & Roma West**) Project is estimated to contain **2.60** Mt of Measured Mineral Resources with an average grade of **0.62** g/t Au, **2.55** Mt t of Indicated Mineral Resources with an average grade of **0.81** g/t Au, and **0.45** Mt of Inferred Mineral Resources with an average grade of **0.51** g/t Au.

(3) Rosebel Centre Domain

The **Rosebel** Project is estimated to contain **43.18** Mt of Measured Mineral Resources with an average grade of **0.69** g/t Au, **18.23** Mt of Indicated Mineral Resources with an average grade of **0.63** g/t Au, and **5.34** Mt of Inferred Mineral Resources with an average grade of **0.87** g/t Au.

(4) Saramacca

The **Saramacca** Project is estimated to contain **20.46** Mt of Measured Mineral Resources with an average grade of **1.26** g/t Au, **13.10** Mt of Indicated Mineral Resources with an average grade of **1.18** g/t Au, and **3.28** Mt of Inferred Mineral Resources with an average grade of **1.23** g/t Au.

(5) Moeroekreek and Overman

The Moeroekreek Project is estimated to contain **0.57** Mt of Measured Mineral Resources with an average grade of **0.33** g/t Au, **0.87** Mt of Indicated Mineral Resources with an average grade of **0.56** g/t Au, and **0.51** Mt of Inferred Mineral Resources with an average grade of **0.40** g/t Au.

The **Overman** Project is estimated to contain **6.10** Mt of Measured Mineral Resources with an average grade of **1.04** g/t Au, **2.73** Mt of Indicated Mineral Resources with an average grade of **0.72** g/t Au, and **0.00** Mt of Inferred Mineral Resources with an average grade of **0.00** g/t Au.

The total Gold Mineral Resource in RPEE is shown in Table 7-81.

Table 7-81: Mineral Resource Statement in RPEE as of 31 December 2024

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Pengfei Xiao and Liang Li who are a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is Fellow of AusIMM, respectively. Pengfei Xiao and Liang Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under

consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Xiao and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral resources are reported at a cut-off grade is 0.2 g/t for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock.

[4] Rosebel Gold Project covers various domains (North: Pay Caro, East Pay Caro, Koolhoven-J Zone, East Tailing Road; South: Royal Hill, Mayo, Roma East, Roma West; Center: Rosebel); and others such as Saramacca, Overman, and Moeroekreek.

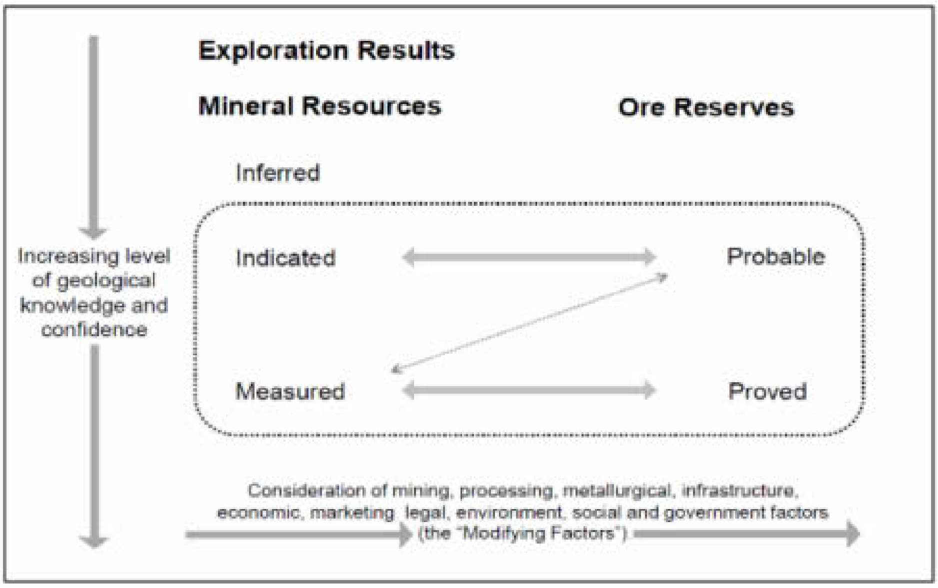
8 Ore Reserve Estimation

The definition of Ore Reserves in accordance with the JORC Code (2012) is as follows:

An 'Ore Reserve' is the economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.

The conversion from Mineral Resources to is Ore Reserves is presented in Figure 8-1.

Figure 8-1: General Relationship between Mineral Resources and Ore Reserves



Sources: JORC Code (2012)

The Ore Reserves for the Mines have been estimated by SRK in compliance with the JORC Code guidelines. These estimates are based on technical studies and operational data, with the work conducted to a pre-feasibility study standard, ensuring a reliable assessment of the project's economic and technical viability.

8.1 Technical Studies

SRK has received the following technical studies:

- Geotechnical Slope Designs and Implementation Requirements for the J-Zone Pit were conducted by SRK Consulting (Canada) in December 2014 (referred to as SRK 2014)
- Geotechnical Slope Designs and Implementation Requirements for the Rosebel Pit were conducted by SRK Consulting (Canada) in December 2014 (referred to as SRK 2014)

- Geotechnical Slope Designs and Implementation Requirements for the Mayo Pit were conducted by SRK Consulting (Canada) in February 2015 (referred to as SRK 2015)
- Geotechnical Slope Designs and Implementation Requirements for the Pay Caro Pit were conducted by SRK Consulting (Canada) in February 2015 (referred to as SRK 2015)
- Technical Report on The Rosebel Gold Mine, Suriname were conducted by IAMGOLD CORPORATION in December 2021 (referred to as IAMGOLD 2021)
- Structural Model Update Report on Saramacca Mine were conducted by SRK Consulting (Canada) in September 2021 (referred to as SRK Saramacca Structural Model 2021)
- Tailing Facility Expansion Design Report on Rosebel Gold Mine were conducted by Golder Associated 2012 (referred to as Golder 2012)
- Hydrogeology Assessment at the Rosebel Gold Mines were conducted by Julie L'Heureux 2013 (referred to as JLH 2013)

SRK reviewed technical studies, as well as the current mining plan and actual operation data, and supportive studies, the level of accuracy of the Modifying Factors proposed in the studies and/or modified by the Company, are considered by SRK to be akin to a pre-feasibility level study ("PFS"), which are suitable for the Ore Reserve Estimates.

8.2 Cut-off Grade

The Mineral Resources of the Rosebel Mine primarily consist of gold, which serves as the main saleable product and the key criterion for determining whether material is classified as 'ore' or 'waste.'

The J-Zone, Kollhoven, Mayo, Pay Caro, Rosebel, Royal Hill and East Tailing Road pits within the Rosebel Mine, as well as the Saramacca pit in the Saramacca Mine, have been assessed and designed using a bench mining surface method. The marginal cutoff grade (COG) for gold in the Run-of-Mine (ROM) feed has been determined using the following formula

$$A = \frac{C_p + C_g}{(P - C_s - R_t) * R_r}$$

Table 8-1: Estimated for Cut-off Grades on J-Zone, Kollhoven, Mayo, Pay Caro, Rosebel, Royal Hill and East Tailing Road pits within the Rosebel Mine, as well as the Saramacca pit in the Saramacca Mine by SRK Consulting

Item	Rock Type	Unit	J-Zone	Koolhoven	Mayo	Pay Caro	Rosebel	Royal Hill	Saramacca	East Tailing Road	Description

8.2.1 Rosebel and Saramacca Mine

Based on the parameters and assumptions outlined, SRK considers that material with an average gold (Au) grade exceeding a cutoff grade (COG) of approximately 0.3% Au (dependent on rock type and deposit) demonstrates reasonable prospects for economic extraction under the stated conditions. A review of the processing methods and historical operational data indicates that the hardness of the feed ore significantly influences processing plant production. To maximize the production efficiency of the processing plant, the company has implemented a strategy to stockpile run-of-mine (ROM) material and segregate it into bins based on rock type.

- Soft Rock: This category includes ore types such as saprolite, and laterite.
- Transition Rock: This category includes ore types such as transition rock
- Hard Rock: This category includes ore types classified as hard rock.

8.3 Modifying Factors

In accordance with the JORC Code, the Measured and Indicated Mineral Resources are converted to Ore Reserves through the application of appropriate modifying factors. The primary factors considered in the Ore Reserve estimation include mining design, pit optimization, pit design, mining losses, and mining dilution. Additional parameters, such as processing capabilities, market conditions, and environmental, legal, and political constraints, are also taken into account, as these may impact the quantity and classification of the Ore Reserves. The specific modifying factors applied to the Reserve estimates for the J-Zone, Koolhoven, Mayo, Pay Caro, Rosebel, Royal Hill, East Tailing Road, and Saramacca pits are detailed below:

- Mining design:
  - The Ore Reserve is constrained within the boundaries of the mining license.
  - The Ore Reserve is based on open-pit mining methods.
  - Only Measured and Indicated Mineral Resources, along with ore in the stockpile, are included in the Ore Reserve estimate
  - End of month survey ("EOM") of 31 December 2024 is the latest data source for the cutoff date.
- Pit optimization:
  - Pit optimization incorporates mining costs, processing expenses, general and administrative costs, gold price, processing recovery rate, cost of sell, royalties, and overall slope angle.
  - The optimal pit shell is derived from the Measured and Indicated Resources to identify the economic surface mining potential.
- Pit Design:
  - Pit designs are guided by slope parameters, including bench height, batter face angle, berm width, minimum mining width, and haul road design, consistent with the results of optimization.
- Mining dilution and Mining Loss:

- The Mineral Reserve estimate accounts for mining dilution based on rock type, the geometry of the mineralized ore zone, and geological dilution incorporated in the initial resource model. The dilution calculation follows a two-step approach using programmed scripts:
  - Step 1: Simulates material movement during blasting by redistributing material from one block to surrounding blocks.
  - Step 2: Evaluates the block's position within the orebody and the diluted grades of adjacent blocks to determine whether each block is classified as ore or waste.
- As described, dilution, considering the ore type, has been integrated into the pit optimization and mine planning process. Mining loss is calculated using the same methodology applied to determine dilution.
- The table below presents the dilution and ore loss factors for each deposit as determined through the dilution process.

Table 8-2: Ore Reserve Statement of Rosebel Project as of December 31, 2024

Deposit	Unit	Dilution	Ore loss
J-Zone	%	17	4
Koolhoven	%	20	1
Mayo	%	13	1
Pay Caro	%	15	1
Rosebel	%	13	3
Royal Hill	%	31	5
Saramacca	%	21	2
ETR	%	15	1

Sources: RGM

8.4 Ore Reserve Statement

SRK Consulting has estimated the Ore Reserves for the Rosebel Mine in compliance with the guidelines specified by the JORC Code. These Ore Reserve estimates are supported by technical studies and operational records that meet the level of a Pre-Feasibility Study.

The company operates two distinct mining operations: the Rosebel Mine and the Saramacca Mine. The economically mineable portions of Measured and Indicated Mineral Resources within the designed open pits have been classified as Proved and Probable Ore Reserves, inclusive of allowances for dilution and mining losses. The Ore Reserve estimate was determined with the reference point at the stockpile preceding crusher feed, in alignment with best practices under the JORC Code framework.

8.4.1 Rosebel Mine

As of 31 December 2024, the Ore Reserve estimates for the Rosebel Mine are as follows:

- Koolhoven open pit: 15,281 kt at an average grade of 0.74 g/t Au, containing 11,345 kg of gold.

- J-Zone open pit: 22,556 kt at an average grade of 0.66 g/t Au, containing 14,811 kg of gold.
- Pay Caro open pit: 26,177 kt at an average grade of 0.70 g/t Au, containing 18,309 kg of gold.
- Mayo open pit: 49,563 kt at an average grade of 0.78 g/t Au, containing 38,413 kg of gold.
- Royal Hill open pit: 47,164 kt at an average grade of 0.82 g/t Au, containing 38,481 kg of gold.
- Rosebel open pit: 29,762 kt at an average grade of 0.72 g/t Au, containing 21,504 kg of gold.
- East Tailing Road open pit: 1,564 kt at an average grade of 0.88 g/t Au, containing 1,384 kg of gold.

Table 8-3: Ore Reserve Statement for open pits at Rosebel Mine as of December 31, 2024

[4] Mining dilution (waste rock and inferred Mineral Resources) rate is 21%. Mining loss rate is 2%.

[5] The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

8.4.3 Stockpile

As of 31 December 2024, the Ore Reserve estimates for the Stockpile are as follows:

- Koolhoven open pit: 200 kt at an average grade of 0.49 g/t Au, containing 97 kg of gold.
- J-Zone open pit: 420 kt at an average grade of 0.43 g/t Au, containing 179 kg of gold.
- Pay Caro open pit: 2,002 kt at an average grade of 0.51 g/t Au, containing 1,019 kg of gold.

- Mayo open pit: 1,513 kt at an average grade of 0.52 g/t Au, containing 791 kg of gold.
- Royal Hill open pit: 916 kt at an average grade of 0.47 g/t Au, containing 429 kg of gold.
- Rosebel open pit: 467 kt at an average grade of 0.59 g/t Au, containing 277 kg of gold.
- Saramacca open pit: 408 kt at an average grade of 0.69 g/t Au, containing 281 kg of gold

Notes:

[11] The information in this Report which relates to the Stockpile Ore Reserve is based on information provided by the Company,

[12] The Ore Reserves are reported at the reference point at the stockpile.

[13] The Ore Reserves are reported inclusive of Mineral Resources.

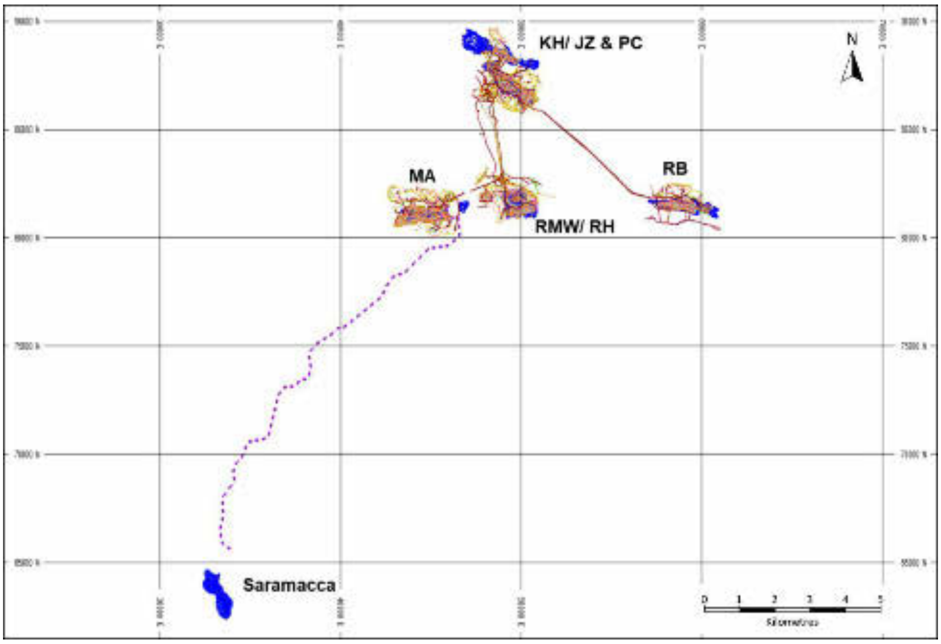
[14] The Mineral Resources are effective as of 31 December 2024.

9 Mine Mining Assessment

The Rosebel Gold Mine N.V. comprises two exploitation concessions, namely Gross Rosebel and Pikin Saramacca, along with nine exploration concessions. The Rosebel concession hosts seven active deposits: Royal Hill, Mayo, Rosebel, Koolhoven, J-Zone, Pay Caro, and East Pay Caro. The Saramacca concession includes the producing Saramacca deposit. Ore extracted from all deposits is transported to a single processing plant for treatment.

9.1 Mine Operating Status

Figure 9-1: General View of the Rosebel and Saramacca Pits



Source: RGM

9.1.1 Pay Caro pit

The Pay Caro (PC) pits are situated northeast of the Rosebel processing plant, on the northern side of the Rosebel concession. Mining activities at the PC pits began in 2003 and have been ongoing since. Nearby features include the Koolhoven (KH) pit to the northwest, the J-Zone (JZ) pit to the north, and the tailings storage area to the northeast. Natural drainage west of the PC pits will be managed progressively as mining phases advance.

Access to the Rosebel processing plant and main complex is provided via a haul road located on the south side of the active PC pits, which connects to the main haulage road of the mine. The distance from the PC pits to the Rosebel processing plant is approximately 1.8 kilometers.

The waste disposal for the Pay Caro (PC) pits will primarily occur at the PC North and South Waste Rock Storage Facilities (WRSFs). To optimize operations by minimizing truck haul distances and reducing the environmental footprint, in-pit waste deposition may also be considered as a future option.

9.1.2 J-Zone Pit

The J-Zone (JZ) pits are located along the northern boundary of the Rosebel concession, north of the Pay Caro (PC) pits and east of the Koolhoven (KH) pits. Mining operations at the JZ pits commenced in 2014.

Due to the proximity of the JZ pits to other pits, WRSF, and the TSF, there is limited space in the surrounding area for the development of additional infrastructure associated with mining these pits. The primary ore haul route is situated on the southwest side of the west pit, with a secondary access route connected to the PC North WRSF, which provides access to the east pit. The central drainage zone between the two main pits is preserved to maintain natural water flow. The haulage distance from the JZ pits to the Rosebel processing plant is approximately 2.5 kilometers. Waste material from the JZ pit will be deposited in the PC North WRSF.

9.1.3 Koolhoven Pit

The Koolhoven (KH) pit is located along the northern boundary of the Rosebel concession, positioned north of the Pay Caro (PC) pits and west of the J-Zone (JZ) pits.

The primary ore haul route is situated on the southeast side of the KH pit, with additional access routes on the west side providing quicker access to WRSF. The haulage distance from the KH pit to the Rosebel processing plant is approximately 2.6 kilometers. Waste material from the KH pit will be deposited in the KH WRSF, located southwest of the KH deposit.

9.1.4 Royal Hill Pit

The Royal Hill (RH) pit is situated along the southern boundary of the Rosebel concession. Mining activities at the RH pit commenced in 2004 and have continued uninterrupted since.

To the north of the RH pit are an archaeological site (burial ground), a power line, and old camp infrastructure. To the east lies the Nieuw Koffiekamp village, which RGM is committed to preserving, ensuring no further mining advancement toward the village. Expansion of the RH pit to the south is restricted by the Rosebel concession boundary.

A drainage line exists to the east of the pit and will be maintained throughout the life of the mine. Additionally, a surface water drainage system west of the RH pit directs water to a settling pond located southwest of the pit. Access to the Rosebel processing plant is via a haul road located to the north of the RH pit, with a haulage distance of approximately 5.9 kilometers. Waste material from the RH pits will be deposited in the RH West WRSF.

9.1.5 Mayo Pit

The Mayo (MA) deposit is located along the southern boundary of the Rosebel concession. Mining activities at the MA pit commenced in 2009 and continued uninterrupted until March 2020, when operations were paused. Mining resumed in June 2021.

Natural drainage systems are located to the north of the North MA WRSF. On the southern and eastern sides of the MA pit, diversion drains have been constructed to channel surface water away from the pit and maintain stable operating conditions.

Access to the Rosebel processing plant is provided via a haul road on the northeast side of the MA pit, which connects to the RH haul road. The haulage distance to the processing plant is approximately 8.8 kilometers. Waste material from the MA pit will initially be deposited in the MA WRSF. Once the MA North WRSF reaches its capacity, the remaining waste material will be redirected to the MA South WRSF.

9.1.6 Rosebel Pit

The Rosebel (RB) pit is located in the southeast section of the Rosebel concession and is isolated from other pits and infrastructure. Mining activities at the RB pit commenced in 2012 and have continued uninterrupted since.

Diversion drainage systems have been established to the north and south of the RB pit to manage surface water and ensure stable operating conditions. Access to the Rosebel processing plant is provided via a haul road situated on the north side of the pit, which connects to the PC haul road near the processing plant.

The RB pit is located approximately 12 kilometers southeast of the Rosebel processing plant and is accessed via a 13.5-kilometer haul road that links the east side of the East Pay Caro (EPC) area to the RB pit. Waste material from the North RB pit will primarily be deposited in the RB WRSF, while material from the South RB pit will be directed to the RB South WRSF.

9.1.7 Saramacca Pit

The Saramacca (SM) pit is located approximately 30 kilometers southeast of the Rosebel concession, within the Saramacca concession. Mining of the SM deposit commenced at the end of 2019, although small-scale mining (SSM) activities have historically taken place near the SM pit. The primary ore haul route is situated on the eastern side of the SM pit.

Waste material from the SM pit will be selectively placed to ensure adequate stability and drainage. The SM WRSF will be constructed on shallow sloping ground with gradients ranging from 5° to 16°, located to the east of the SM pit. Drainage channels have naturally incised the broader sloping topography. The WRSF is designed to reach approximate heights of 120 meters, with a final slope gradient of 3:1, incorporating 15-meter-high platforms.

In the early years of mining, excavated saprolite will form the majority of the construction material for the WRSF. Stability will be enhanced by supporting the internal saprolite platforms with downslope buttresses constructed using imported fresh rock. To improve drainage, rock drains will be installed along natural gullies where peak surface water runoff is higher, and finger drains will be added to establish positive hydraulic connections with the rock drains and buttresses.

9.1.8 Historic Production

Operational records from the last two years, following Zijin's acquisition of the Rosebel Project, are presented in the table below.

Table 9-1: Annual Mine Production Schedule

Pit	Item	Unit	2023	2024
Pay Caro	Total Material Movement	Mt	20.11	14.24

Sources: RGM

9.2 Hydrogeology

9.2.1 Rosebel Mine

The hydrostratigraphy of the RGM concession is primarily related to the weathering profile described in Section 2.4 (JLH 2013) Groundwater is typically not present within the regolith profile, although localized groundwater flow systems may occur in areas with topographic lows or coarser-grained material, possibly forming perched aquifers.

A previous field investigation conducted by Golder Associates in 2012 (Golder, 2012) indicated that standpipe wells installed in the regolith zone were permanently dry 88% of the time over an annual monitoring period (2011–2012). However, all standpipe wells installed in the transition zone showed groundwater presence, with potentiometric surfaces indicative of a semi-confined aquifer system (where groundwater under pressure rises in boreholes). This investigation conducted adjacent to the Tailings Storage Facility (TSF), recorded groundwater levels ranging from 50 cm to 30 m below the surface. Additionally, water content testing of 34 saprolite samples revealed results ranging from a minimum of 7% to a maximum of 67%, with an average of 30%.

In relation to the RGM mining operations, the primary groundwater system of significance is the Transition Zone, which is characterized as a moderately permeable aquifer with variable secondary porosity. The Transition Zone is defined as moderately to slightly weathered bedrock, comprised of approximately 50% rock material decomposed or disintegrated to soil, along with some occurrences of fresh or discolored rock forming continuous frameworks or corestones. At this stage of weathering, basement rocks exhibit minimal primary porosity, while secondary porosity (associated with shear zones, faults, and fractures) typically corresponds to low permeability. This is supported by the observed lack of groundwater seepage from pit slopes below the water table, which reinforces the hypothesis of low permeability in the host rock formations.

9.2.2 Saramacca Mine

The following hydrogeological considerations have been incorporated into the design and mine planning for the Saramacca (SM) pit:

- Initial pit development focuses on exploiting dry saprolite along the ridgeline, which is located above the phreatic surface, to facilitate excavation in dry conditions.
- The mine deployment plan supports the natural drawdown of groundwater in the saprolite and structured saprolite zones by prioritizing early slope exposure in the central and southern pit areas. Shallower interim platforms will be excavated to manage surface water and provide space for the installation of active depressurization equipment, such as horizontal drain holes, if required.
- In the southern pit, a slower excavation rate is planned to allow adequate time for passive groundwater drawdown in the higher saprolite and structured saprolite slopes.
- In the northern pit, excavation will advance more quickly through the saprolite units to reach the transition rock zone. This approach aims to utilize the higher permeability of the transition and upper fresh rock units to promote underdrainage of the overlying materials. This strategy mirrors the hydrogeological approach successfully implemented in the Rosebel pits.

9.3 Geotechnical Conditions

9.3.1 Pay Caro Pit

Within the proposed Pay Caro (PC) pit area, the geological sequence youngs to the southwest, with the Arenitic sequence in the south unconformably overlying Andesitic volcanics, which include minor tuffs, to the north. The base of the Arenitic sequence is defined by a conglomerate band, locally folded, and includes a thin zone of dark, fissile mudstone. The entire lithological package has been subjected to greenschist facies metamorphism.

The contact between the volcanics and the overlying conglomerates/Arenites is folded and offset by a major sub-vertical shear zone, oriented WNW-ESE. Major faults in the PC pit area are concentrated parallel and sub-parallel to this contact zone, which defines the two structural domains within the area. (SRK, 2015)

9.3.2 J-Zone and Koolhoven Pit

The geology of the J-Zone primarily consists of thinly interbedded mudstones, siltstones, and sandstones, with occasional conglomerate lenses.

In the Koolhoven south wall, grey, fissile shale horizons (argillic zones) have been observed, which are very weak and particularly prone to sliding and toppling. Numerous slope failures have been recorded in the Koolhoven south wall, even at relatively low stack heights of 30–40 meters. To assess whether these argillic zones extend along the strike into the J-Zone, SRK analyzed drillhole photographs. The results indicate that the dark argillic zone is present and extends through the south wall of the J-Zone pit, as confirmed by drillhole data and blast hole observations in the J-Zone.

The dark argillic zone is typically 5–10 meters thick. However, based on observations from Koolhoven and core photographs from J-Zone, this weak, fissile material may extend to thicknesses of up to 50 meters. At greater depths, in fresh rock, the argillic zone becomes less pronounced, with improved rock quality observed.

A 3D model of this domain has been created and divided into Weathered Rock and Fresh Rock. The Weathered Rock is expected to have the greatest impact on wall stability due to its more pronounced foliation and more readily opened joints. Observations from Koolhoven suggest that the orientation of these argillic zones relative to the pit face is also critical: wall stability is better when the zones are striking into the wall, compared to when they are parallel to the pit face.

SRK concludes that the south wall of the J-Zone pit is likely to perform similarly to the south wall of the Koolhoven pit, with comparable geotechnical stability challenges. (SRK, 2014)

9.3.3 Royal Hill Pit

The Royal Hill deposit primarily consists of sedimentary rock units, including Greywackes, Arenites, and local conglomerate horizons, alongside volcanic units composed of Andesites, Basalts, and pyroclastic tuffs (Daoust et al., 2011). The lithological sequence has undergone Greenschist facies metamorphism.

The deposit features gently west-plunging folds throughout the pit, with fold axes striking approximately east-west. In the northern wall of Royal Hill, an intermediate north-dipping shear zone, referred to as the "Main Shear," juxtaposes pyroclastic tuffs (overlain by conglomerates and fine sediments) against Greywackes and Arenites to the south. The Main Shear is characterized as a brittle-ductile structure and hosts mineralization within the footwall.

The southern wall predominantly comprises Andesites with some Basalts, with the contact between the Andesites and the overlying Arenites defined by an erosional unconformity. This unconformity dips approximately 50–60° to the north and strikes east-west through the center of the Royal Hill South pit.

9.3.4 Mayo Pit

The geological model indicates massive sedimentary rocks, primarily Arenites, in the northern part of the deposit, transitioning to intermediate to felsic volcanic rocks (referred to as the Southern Volcanics) in the south. A thin band of Basal Conglomerates marks the base of the Arenite sequence, while a zone of Pyroclastic Tuffs strikes east-west through the northern wall. The entire lithological sequence has undergone Greenschist facies metamorphism.

The contact between the Southern Volcanics and the Arenites is characterized by an erosional unconformity that dips at an angle of 30°–50° to the north. This contact represents a structurally weak zone, comprising rubble zones and broken, altered material. These characteristics are likely the result of flexural slip and hydrothermal alteration during deformation. Lithological solids for the model have been provided by IAMGOLD.

9.3.5 Rosebel Pit

The Rosebel Pit is predominantly hosted in Arenite and Greywacke rock. A diabase dyke striking NNW-SSE traverses the pit, while a thin band of Conglomerate strikes east-west along the south wall, dipping sub-vertically. Additionally, another diabase dyke is present beyond the western margin of the pit, also striking NNW-SSE.

9.3.6 Saramacca Pit

The 2021 fault model incorporates a total of 93 faults. The updated model integrates a new regional geophysical interpretation, which was used to identify and model a series of cross faults interpreted as D3 structures. Additionally, the model includes a single dyke and several graphitic shear zones located in both the hanging wall and footwall of the mineralized zone. (SRK Saramacca Structural Model 2021)

Updated fault logs were used to model additional faults, including both foliation-parallel faults and cross-cutting faults. Faults from the previous model, which are predominantly NW-trending, were retained; however, they were adjusted to accommodate the newly modeled NE-trending D3 fault system. (SRK Saramacca Structural Model 2021)

A key geotechnical concern is the potential identification of shallow-dipping fault sets that could negatively impact pit slope stability. During the 2021 model update, no major shallow-dipping fault structures were conclusively identified. However, shallow-dipping joints were observed within the rock mass, suggesting that the possibility of shallow-dipping faults cannot be excluded. This risk remains significant and should be reassessed as new geological data are collected. (SRK Saramacca Structural Model 2021).

9.3.7 Slop design

Rosebel mine

RGM has recently increased the bench heights in all pits to nine meters to enhance productivity and reduce costs. Pit wall profiles have been designed based on the three main weathering profiles: saprolite, transition, and fresh rock. Slope designs were informed by an extensive geotechnical drilling program conducted in 2013, 2014, and 2017, which established geotechnical domains for each deposit. In addition to the weathering domains, geotechnical sectors were developed for each pit based on structural rock mass characteristics.

Five Rosebel pits—Pay Caro (PC), Royal Hill (RH), Mayo (MA), Rosebel (RB), and J-Zone (JZ)—were included in the field investigations, with slope design parameters developed by SRK. The slope design for the East Tailing Road (ETR) pit is based on assumptions provided by RGM's design framework and technical guidance from RGM's geotechnical specialists. Between 2014 and 2021, pit slope designs underwent slight adjustments to accommodate changes to the Bench Face Angle (BFA) in certain sections.

Saramacca mine

The Saramacca (SM) deposit is characterized by a substantial thickness of saprolite, which is deeper and depressed near the mineralized zone located at the center of the SM pit. The geotechnical variability of the materials and the complexity of the weathering profile exposed in the pit slopes pose significant challenges to mining operations and slope stability.

SRK conducted comprehensive geotechnical and hydrogeological investigations for the SM pit, which included 12 diamond drill (DD) holes, laboratory testing, and the installation of instrumentation. These investigations were complemented by a detailed geotechnical review of exploration DD holes to evaluate rock mass quality and the structural geology of the SM deposit. The results were used to develop a 3D structural geological model integrating field investigation and core review data.

9.4 Mine Design and Planning

9.4.1 Pit Optimization

Block Model

The pit design and resource estimation were based on the Mineral Resource Model ("MRM") developed by the Rosebel Project, with an effective date of 31 December 2024. The model was provided in excel spread sheet (.CSV) format.

The block model used for developing the production schedule is presented in the table below.

Table 9-2: Resource Block Model Parameters

Pit/Deposit	Reserves BM	Resources BM	SRK Checked BM

Optimization Inputs Parameters

The conversion of a Mineral Resource into a mineable open pit Ore Reserve begins with open pit optimization. This process applies physical, technical, and economic parameters to the mineralized area to determine the optimal geometry for open pit excavation. If the economic assessment of the resulting optimal pit shell is positive, the shell serves as the foundation for subsequent pit design.

RGM employs a standard optimization approach to determine pit shells, utilizing Whittle Four-X software (Whittle). This software evaluates the estimated revenues and costs associated with mining each block while adhering to slope angle constraints.

The selection of final pit limits is based on both quantitative and qualitative factors, including total contained ounces, minimum mining width, strip ratio, discounted cash flows, and proximity to local infrastructure or villages.

An optimization cost model was developed using RGM's 2024 budget, which incorporates mining costs, processing costs, general and administrative (G&A) costs, sustaining costs, and capital expenditures.

Using the selected final pit shell and its concentric shells, a series of engineered final and intermediate pit designs was developed for each deposit. These designs integrate operational and geotechnical parameters, such as berms, geotechnical benches, haul roads, and other critical mining features.

Whittle adjusts the base input price using a range of revenue factors (RF), both above and below the base value of 1. For each RF value, the software generates a three-dimensional pit shell that maximizes the intrinsic value based on the input parameters and the adjusted price. Smaller RF values generate smaller pit shells, while higher RF values create larger shells. This iterative methodology produces a series of 'nested' pit shells, with each shell enclosed within the next larger one.

A summary of the pit optimization parameters for the Rosebel Project is provided in Table 9-4.

Optimization Results

A series of nested pit shells were generated using Whittle software, applying a range of revenue factors (RF) to gold prices. Preliminary cash flow analyses were conducted using a 8% discount rate and a nominal gold price of $2,200/oz. It is important to note that, during this evaluation stage, relative values are used to identify the optimal pit shell, while absolute values hold no operational significance.

Whittle automatically produced three pit optimization scenarios for analysis:

- Best Case: Pit shells are mined sequentially, one after the other.
- Worst Case: The final pit is mined bench by bench.

The results of the pit optimization for each deposit are summarized as follows:

- Pay Caro Pit: RF = 0.909 selected as the final pit design limit (see Figure).
- J-Zone Pit: RF = 0.909 selected as the final pit design limit (see Figure).
- Koolhoven Pit: RF = 0.932 selected as the final pit design limit (see Figure).
- Royal Hill Pit: RF = 0.909 selected as the final pit design limit (see Figure).
- Mayo Pit: RF = 0.818 selected as the final pit design limit (see Figure).
- Rosebel Pit: RF = 0.909 selected as the final pit design limit (see Figure).
- East Tailing Road Pit: RF = 0.909 selected as the final pit design limit (see Figure).
- Saramacca Pit: RF = 0.773 selected as the final pit design limit (see Figure).

9.4.2 Mine Design

The detailed mine design was initially completed during the 2023 Feasibility Study (FS) and subsequently updated in 2025 by RGM, using the selected LG 3D pit shell as a guide. The updated design incorporates revised input parameters based on 2025 assumptions, including a base gold price of $2,200/oz as defined by RGM. The proposed pit design incorporates practical mining geometry, including pit access, haulage ramps to all pit benches, pit slope configurations, benching alignments, smoothed pit walls, and catch berms.

Design Parameters

The major design parameters used are described in Table below.

Table 9-5: Mine Design Parameter of Rosebel Gold Mine

Mining Methods

The Rosebel and Saramacca operations employ conventional open-pit mining methods, utilizing a truck-and-shovel fleet with drill-and-blast techniques. RGM operates an owner-managed mining fleet, with subcontractors providing support for auxiliary activities.

Rosebel Mine

The mine's loading fleet comprises five Caterpillar (CAT) 6030 shovels and two CAT 6020 shovels, configured for both excavator and front shovel operations, supported by a single CAT 993 loader used for reclaiming material from the run-of-mine (ROM) stockpiles.

The hauling fleet includes 35 CAT 777 haul trucks and 18 CAT 785 haul trucks, ensuring efficient material transport. Dust control on the site is managed using seven CAT 777 water trucks.

Additional ancillary equipment includes fuel trucks, mobile light plants, and service trucks, providing essential operational support for the mine.

Saramacca Mine

The Saramacca (SM) pit is equipped with a primary loading fleet comprising Caterpillar (CAT) 6030 face shovels, two Komatsu PC2000 backhoes, and one Komatsu PC1250 excavator. The fleet is supported by a Caterpillar (CAT) 993 loader, which is used at the run-of-mine (ROM) stockpile for loading material onto long-haul trucks.

The haulage fleet for the SM pit includes seven Komatsu HD1500 haul trucks and three Komatsu HD785 haul trucks operating within the pit, in addition to 14 HaulMax trucks responsible for transporting ore from the SM pit to the Rosebel processing plant.

As required, the mining fleet is shared between the Saramacca operations and other parts of the mine to ensure efficient utilization of equipment resources.

Production Drilling

The drilling fleet for the Rosebel and Saramacca operations consists of a mixed fleet of nineteen drills.

Drill and blast parameters are tailored for each pit, reflecting variations in material types and pit designs. All drill holes have a diameter of 165 mm, and all blasting activities are carried out by RGM employees. Blast holes are loaded with a bulk explosive matrix and initiated using non-electric detonators.

Ore displacement during blasting is a critical consideration for both Rosebel and Saramacca operations. To address this, blast movement monitors are systematically used when blasting mineralized areas. These monitors measure vertical and horizontal ore displacement, enabling precise adjustments to post-blast ore boundaries. Current measurements indicate typical blast movement of approximately six meters horizontally and three meters vertically on a nine-meter bench.

Mining Service

The climate in the region is classified as tropical warm. Suriname's weather is predominantly influenced by the Inter-Tropical Convergence Zone (ITCZ), commonly referred to as the Equatorial Trough. The movement of the ITCZ over Suriname twice a year creates four distinct seasons:

- Early February to late April: Short dry season
- Late April to mid-August: Long rainy season
- Mid-August to early December: Long dry season
- Early December to late February: Short rainy season

The mean temperature in the region ranges from a minimum of 21°C to a maximum of 34°C, with an annual average temperature of 28°C.

Rosebel Mine Dewatering

The Rosebel Mine is situated in a tropical climate with an average annual precipitation of 2,284 mm and an average annual potential evaporation of 1,513 mm. This results in an estimated potential groundwater recharge of 771 mm per year. However, potential evapotranspiration exceeds rainfall during the period from August to November, which may limit groundwater recharge during this time. As a result, the actual annual groundwater recharge is likely below 771 mm.

The average monthly relative humidity at Rosebel ranges from 80% in October to 92% in May, with an annual average humidity of 87%.

Given the low permeability and high storage capacity of the regolithic sequence overlying the main aquifer, the formation of water ponds near the edge of the pit should be avoided to optimize the effectiveness of the surface water management plan (SWMP). Water ponds can act as sources of aquifer recharge and create preferential erosion pathways to the base of the pit during heavy rainfall events, increasing the risk of pit wall instabilities.

Permanent and efficient in-pit pumping systems are critical to minimizing aquifer recharge, controlling seepage rates, and enhancing pit wall stability.

Saramacca Mine Dewatering

The Saramacca site has one climate station, installed in April 2017, to monitor local climatic conditions. Additionally, climate data is monitored at the Rosebel Mine site through nine meteorological stations, with the longest dataset available from the Old Camp Climate Station, located approximately 25 kilometers northeast of Saramacca. (SARAMACCA PILOT DEPRESSURIZATION WELLS -SUMMARY REVIEW)

Atmospheric rainfall and groundwater seepage accumulate at the bottom of the Saramacca pit. During the rainy season, water inflow into the pit typically averages 186 mm/month, with peak volumes reaching up to 323 mm/month. Based on the site's mining characteristics, drainage for the open pit is managed using vertical pumping wells.

Hydrogeological modeling suggests that vertical pumping wells can provide sufficient yield over time and enable effective drawdown in the saprolite for managing pit slope water conditions. The modeling also indicates that a combination of perimeter wells and in-pit dewatering wells would deliver the best results for maintaining interim pit slope stability. (THE GROUNDWATER MODEL FOR THE SARAMACCA PIT SLOPE ANALYSIS)

9.5 Mine Production Plan

The Life of Mine (LOM) production schedule for the Rosebel Gold Mine (RGM) has been developed using MinePlan Schedule Optimizer (MPSO), based on the open-pit design provided by RGM. The MinePlan 3D software aggregates pit inventory by stage, bench, and predefined grade bins, enabling detailed production planning and the prioritization of early gold production to optimize operational efficiency.

9.5.1 Operating Schedule and Production Capacity

The Life of Mine (LOM) schedule and production rate have been designed to maximize utilization of the Rosebel Plant's processing capacity while adhering to annual mining rate constraints, phase drop-down limitations, and minimizing peak truck demand requirements.

9.5.2 Production Plan and LOM

Pay Caro Pit

The results of the mine scheduling are presented in Table 9-7, as well as Tables A and B. The Life of Mine (LOM) is estimated at 15 years, commencing in January 2025. The total ROM (run-of-mine) material is 26,177 kt, with an average grade of 0.70 g/t Au. This equates to contained metal totals of 18,309 kg of gold (Au). The total waste material is estimated at 69,131 kt, resulting in an average stripping ratio of 2.64.

J-Zone Pit

The results of the mine scheduling are presented in Table 9-8 as well as Tables A and B. The Life of Mine (LOM) is estimated at 8 years, commencing in January 2026. The total ROM (run-of-mine) material is 22,556 kt, with an average grade of 0.66 g/t Au. This equates to contained metal totals of 14,811 kg of gold (Au). The total waste material is estimated at 51,082 kt, resulting in an average stripping ratio of 2.26.

Koolhoven Pit

The results of the mine scheduling are presented in Table 9-9, as well as Tables A and B. The Life of Mine (LOM) is estimated at 8 years, commencing in January 2028. The total ROM (run-of-mine) material is 15,281 kt, with an average grade of 0.74 g/t Au. This equates to contained metal totals of 11,345 kg of gold (Au). The total waste material is estimated at 75,032 kt, resulting in an average stripping ratio of 4.91.

Royal Hill Pit

The results of the mine scheduling are presented in Table 9-10, as well as Tables A and B. The Life of Mine (LOM) is estimated at 14 years, commencing in January 2025. The total ROM (run-of-mine) material is 47,164 kt, with an average grade of 0.82 g/t Au. This equates to contained metal totals of 38,481 kg of gold (Au). The total waste material is estimated at 208,187 kt, resulting in an average stripping ratio of 4.41.

Mayo Pit

The results of the mine scheduling are presented in Table 9-11, as well as Tables A and B. The Life of Mine (LOM) is estimated at 14 years, commencing in January 2029. The total ROM (run-of-mine) material is 49,563 kt, with an average grade of 0.78 g/t Au. This equates to contained metal totals of 38,413 kg of gold (Au). The total waste material is estimated at 246,217 kt, resulting in an average stripping ratio of 4.97.

Rosebel Pit

The results of the mine scheduling are presented in Item, as well as Tables A and B. The Life of Mine (LOM) is estimated at 10 years, commencing in January 2025. The total ROM (run-of-mine) material is 29,762 kt, with an average grade of 0.72 g/t Au. This equates to contained metal totals of 21,504 kg of gold (Au). The total waste material is estimated at 77,802 kt, resulting in an average stripping ratio of 2.61.

East Tailing Road Pit

The results of the mine scheduling are presented in Table 9-13, as well as Tables A and B. The Life of Mine (LOM) is estimated at 5 years, commencing in January 2027. The total ROM (run-of-mine) material is 1,564 kt, with an average grade of 0.88 g/t Au. This equates to contained metal totals of 1,384 kg of gold (Au). The total waste material is estimated at 10,565 kt, resulting in an average stripping ratio of 6.75.

Saramacca Pit

The results of the mine scheduling are presented in Table 9-14, as well as Tables A and B. The Life of Mine (LOM) is estimated at 10 years, commencing in January 2025. The total ROM (run-of-mine) material is 23,583 kt, with an average grade of 1.12 g/t Au. This equates to contained metal totals of 26,324 kg of gold (Au). The total waste material is estimated at 135,846 kt, resulting in an average stripping ratio of 5.76.

Sources: SRK

Notes:

[1] The original production schedule was prepared by Rosebel Mine. During SRK's review, it was identified that the original run-of-mine schedule included some Inferred material and backfill material as a result of dilution. In accordance with JORC code, Inferred material and backfill material are not included in the Ore Reserve. Therefore, SRK has assigned a grade of zero (as waste) to both Inferred material and backfill material in the reserve estimation and production schedule.

Notes:

[1] The original production schedule was prepared by Rosebel Mine. During SRK's review, it was identified that the original run-of-mine schedule included some Inferred material and backfill material as a result of dilution. In accordance with JORC code, Inferred material and backfill material are not included in the Ore Reserve. Therefore, SRK has assigned a grade of zero (as waste) to both Inferred material and backfill material in the reserve estimation and production schedule.

10 Mineral Processing and Metallurgy

10.1 Overview

The Rosebel Processing Plant has been operating commercially since February 2004, primarily to treat a blend ore material of hard rock, transitional and soft rock. Following upgrade to the crushing system in September 2024, the plant achieved an annual processing capacity of **10** Mtpa under a blend of 70% hard rock and 30% soft rock.

Currently, the plant is processing a blend of ore from RGM and Saramacca (SM) at a ratio of about 4:1, in a proportion of 60-70% hard rock. The metallurgical process employed a flowsheet consisting of "two-stage crushing + semi-autogenous grinding & ball milling & pebble crushing (SABC) + gravity separation + carbon-in-leach (CIL) + elution-electrowinning + smelting", with the final product being gold bullion.

In 2024, the plant processed 10.03 million tons of ore with an average feed grade of 0.95 g/t Au and an average recovery rate of 94.47%, producing a total of 290,662 ounces of gold. Approximately 15% of the gold is recovered through gravity concentration, 83% through the CIL process, and 2% through the Carbon-in-Column (CIC, a soluble gold adsorption column system of tailings wastewater) process.

10.2 Metallurgical Testing

Metallurgical testing on the Rosebel deposits has been carried out since 1995 in order to understand the metallurgical characteristics of the deposits. Historically, test work has focused on saprolite, transition, and hard rock materials from various Rosebel deposits. Furthermore, since 2017, three phase metallurgical test work programs were conducted on the SM deposit. Variability and composites samples from different weathering profiles were tested to assess hardness and metallurgical response of duricrust, laterite, saprolite, transition, and hard rock materials. Detailed summaries of previous metallurgical test work program on Rosebel and SM deposits can be found in the 2022 Technical Report (IAMGOLD, 2022).

The primary results from previous test work are concluded as follows:

- The difference in hardness between historical data for the Rosebel pits and the samples tested in the 2021 is small except for the JZ deposit mineralized material which appears to be harder at depth and PC deposit mineralized material that appears to be slightly softer than historical values.
- The hard rock and transition material from the SM deposit present two key challenges. The first challenge is the presence of variable amounts of refractory gold locked within pyrite and arsenic pyrite , and the second is the occurrence of graphitic carbon in specific mineralized zones.
- For the refractory gold, recoveries may be improved by 6% to 8% using sulphide flotation followed by ultrafine grinding and cyanidation.
- Regarding graphitic carbon, while flotation could remove a substantial amount of carbon, it will result in significant additional gold losses. Furthermore, the carbon flotation tails would still contain an amount of graphite that would impact the CIL circuit due to its preg-robbing behaviour. It has been decided that any ores containing a significant amount of graphitic material should be stockpiled until the end of the mine life and processed at that time.

This section presents a summary of metallurgical test programs performed within recent two years. In April 2023, Xiamen Zijin Mining and Metallurgy Technology Co. Ltd. ("Xiamen Zijin Tech") was commissioned by Rosebel to conduct the " *Optimization Tests on Ore Samples from Rosebel Gold Mines"* and "*Optimization & Process Investigations on Saramacca Refractory Ore*". The subsequent sections will provide an overview of these tests.

10.2.1 Test Samples

Two sample shipments were collected for testing purposes. The first shipment, consisting of split core and assay reject samples weighing over 1,500 kg, was collected from seven pits at Rosebel Gold Mines, including Saprolite, Transition Ore, and Hard Rock. These samples were received on October 30, 2023, and the details are provided in Table 10-1.

Table 10-1: List of First Batch Samples

Pit	Ore Type	Material	Weight (kg)
Saramacca	Saprolite Graphite	Rejects	70
	Transition Ore Graphite	Rejects	130
	Hard Rock Graphite	Rejects	129
	Transition High Carbon Ore	1/4 core	22
	Hard Rock High Carbon Ore	1/4 core	67
	Saprolite High Arsenic ore	1/4 core	13
	Transition High Arsenic ore	1/4 core	28
	Hard Rock High Arsenic ore	1/4 core	63
Pay Caro	Transition Ore	1/4 core	32
	Hard Rock	1/4 core	122
Rosebel	Saprolite	1/4 core	11
	Transition Ore	1/4 core	33
	Hard Rock	1/4 core	140
Royal Hill	Saprolite	1/4 core	4
	Transition Ore	1/4 core	30
	Hard Rock	1/4 core	120
J-Zone	Transition Ore	1/4 core	30
	Hard Rock	Core only	120

Mayo	Saprolite	1/4 core	27
	Transition Ore	1/4 core	23
	Hard rock (from the main ore zone Sedimentary rock)	1/4 core	56
	Hardest Hard Rock (Volcanic rocks - Rhyolite and Andesite)	Core	121
Kool Hoven	Transition Ore	1/4 core	20
	Hard Rock	Core only	121
Total Weight			1532

Source: Optimization Tests on Ore Samples from Rosebel Gold Mines, Xiamen Zijin Tech, August 2024. The same applies for the tables below.

A second batch of low-grade samples weighing 230.3 kg was collected from four mine pits Saramacca (SM), Rosebel (RB), Royal Hill (RH), and Pay Caro (PC), and received at Xiamen Zijin Tech on January 22, 2024. These samples were categorized into three types: Low-grade (LG) Saprolite, LG Transition Ore, and LG Hard Rock. The specifics of these samples are detailed in Table 10-2.

Table 10-2: List of Second Batch Samples

Pit	Ore Type	Weight (kg)
SM	SM Saprolite 1 (LG) SM Saprolite 2 (LG)	30
	SM Transition Ore1 (LG) SM Transition Ore 2 (LG)	14.6
	SM Hard Rock (LG)	24.8
RH	RH Saprolite (LG)	25.9
	RH Transition Ore (LG)	22.6
	RH Hard Rock (LG)	20.8
RB	RB Saprolite (LG)	25.6
	RB Hard Rock (LG)	20.9
PC	PC Transition Ore (LG)	21
	PC Hard Rock (LG)	24

After being crushed to -2 mm, the samples underwent chemical analysis and were subsequently prepared to meet the requirements for metallurgical validation samples and ore compositing test samples. Additionally, in line with the ore reserves and production plans, various test composites were prepared following the 2024 mining plan.

10.2.2 Mineralogy

Main chemical assays of the samples from the first and second shipments are presented in Table 10-3 and Table 10-4 respectively. The results indicated that for the SM deposit, certain ore types have a total carbon content as high as 0.76%.

Gold Preg-Robbing Index (PRI) tests were conducted on four SM transition and hard rock ore samples to evaluate the gold preg-robbing characteristics. The results indicated that the SM high-carbon hard rock ore has a PRI value of 3.36, demonstrating extremely strong gold preg-robbing behaviour. During the cyanide leaching process, this preg-robbing effect is likely to occur, leading to low gold recovery rates for the SM high-carbon hard rock ore. This poses a significant challenge for processing such ore types in the future.

Table 10-3: Head Assays on the First Batch Samples

Pit	Ore Type	Au(g/t)	TS(%)	TOC(%)	As(%)

Additionally, bulk mineralogy analysis and a detailed gold deportment study were conducted on the SM hard rock ore to identify the primary minerals content, associations, liberation characteristics, as well as the types of gold minerals, gold grain sizes, and gold-bearing minerals in the hard rock ore. Furthermore, a gold deportment study was also performed on hard rock leach tailings to investigate the reasons for gold losses into the leach tailings. The conclusions are as follows:

Bulk Mineralogy and Gold Deportment Study on SM Hard Rock Ore

The primary sulfides in the SM hard rock ore are pyrite, followed by arsenopyrite, with minor amounts of chalcopyrite, sphalerite, tetrahedrite, and other sulfides. At a grind size of P_{80}=75μm, approximately 48.9% of the gold in the hard rock ore is liberated, while 44.69% is locked within sulfide minerals. Gold primarily occurs as native gold and electrum, mainly between 20–75μm, followed by particles larger than 75μm. Of these, 61.93% of the gold particles are larger than 38 μm, making them favorable for gravity recovery. The unliberated gold is predominantly associated with sulfide minerals (~97%), of which is suitable for recovery via flotation. Based on mineralogy analysis and gold deportment studies, the expected gold recovery is approximately 89% using the gravity-bulk flotation process and 52% using the gravity + cyanidation process.

Carbon Analysis on High-Carbon Hard Rock

At a grind size of **P_{80}=75 μm**, the **organic carbon** predominantly occurs as **fine** and **ultra-fine particles**, with most of the organic carbon being smaller than **20 μm** and embedded within gangue minerals as complex inclusions. A small portion of organic carbon, sized **20–100 μm**, is encapsulated within **pyrite** or gangue minerals. Trace amounts of organic carbon are observed along the edges of gangue minerals.

Gold Loss in Leach Tailings

The residual gold content in the hard rock tailings is 1.24 g/t, with approximately 92% of the gold encapsulated within sulfide minerals, 5.73% either liberated or semi-liberated, and trace amounts encapsulated within gangue minerals. The particle size of the sulfide-encapsulated gold is generally below 5 μm, with some particles smaller than 1 μm. This suggests that the low leaching recovery of SM hard rock ore is primarily attributed to the high proportion of sulfide-encapsulated gold and the ultrafine particle size of the gold minerals.

10.2.3 Comminution Test

The results of the SMC test and Bond Ball Mill Work Index (BWi) test are presented in Table 10-5 and Table 10-6 .

SMC testing conducted on hard rock ore samples from J-Zone, Kool Hoven, Mayo, Pay Caro, Rosebel, Royal Hill, and Saramacca revealed that the A*b values of the test samples range from 24 to 37.9. Based on the Frequency Distribution of A*b in the JKTech Database, all the hard rock ore samples are classified as hard.

The BWi values ranged from 11.67 to 16.39 kWh/t. The findings indicated that Royal Hill and Mayo hard rock ores are classified as hard ore, Saramacca hard rock ore falls into the moderately hard ore category, and Pay Caro and Rosebel are medium-hard ores. Within the proportion of hard rock ranging from 65% to 100%, the BWi does not show significant variation, indicating that the proportion of hard rock within the range of 65% to 100% has a minimal impact on the grindability of the feed ore.

Table 10-5: SMC Test Results for Rosebel Gold Mines

Sample Name	A*b	DWi	Mia	Mic	Mih
			KWh/t		
J-Zone	32.4	8.2	23.2	9.2	17.8
Kool Hoven	33.9	7.8	22.3	8.8	17.0
Mayo	24.0	11.2	29.3	12.4	24.0
Pay Caro	37.9	7.4	20.4	8.0	15.4
Rosebel	27.4	10.2	26.4	11.0	21.3
Royal Hill	26.6	10.6	26.9	11.3	21.8
Saramacca	32.1	9.0	23.0	9.3	18.0

Table 10-6: BWi Test Results for Rosebel Gold Mines

Item	Saramacca		Royal Hill		Pay Caro	Mayo	Rosebel
	Hard Rock 100%	Hard Rock 65%	Hard Rock 100%	Hard Rock 65%	Hard Rock 100%	Hard Rock 100%	Hard Rock 100%
F_{80}(μm)	2385.8	2174.5	2335.5	1896.1	1972.7	1868.1	1930.4
P_{80}(μm)	73.8	66.6	70.53	66.94	68.58	61.07	62.66
Bwi (kWh/t)	13.95	12.59	16.2	15.34	13.59	16.39	11.67

10.2.4 Metallurgical Test and Results

Rosebel Pits Samples Test

Confirmatory cyanide leach tests were conducted under current RGM process conditions on transition and hard rock ore samples from the Pay Caro, Rosebel, Mayo, Kool Hoven, J-Zone, and Royal Hill mining pits to evaluate the amenability of each ore type to the cyanidation process. Additionally, laboratory tests were performed on 2024 Mill Feed Composite samples, following the on-site process flowsheet of gravity concentration and cyanidation of gravity tailings. The tests yielded the following conclusions:

- For transition ore samples from the six mining pits (Pay Caro, Rosebel, Mayo, Kool Hoven, J-Zone, and Royal Hill), the CIL gold recovery ranged from 84.5% to 92.1%, with an average of 89.4%. For hard rock ore samples, the CIL gold recovery varied from 86.5% to 96.6%, averaging 92.3%.
- The 2024 Mill Feed responded well to cyanidation, achieving 95.3% gold recovery on composites made from the 1st shipment samples and 91.3% gold recovery on composites formulated from the 2nd shipment samples.

- Based on historical metallurgical investigations by third parties and test results from Xiamen Zijin Tech on the 2024 Mill Feed samples, the overall gold recovery is expected to decrease slightly when the grind size changes from P_{80}=75 μm to P_{80}=100 μm. Depending on ore properties (e.g., sulfide inclusions) and the proportion of hard rock, the total recovery may decrease by approximately 2%. and
- Increasing the hard rock proportion in the mill feed from 60% to 80% does not have a significant impact on gold recovery.

SM Pit Samples Test

A variety of experimental studies were conducted on SM ore samples, including:

- Leaching characteristics studies for different ore types;
- Adaptability studies of transition ore to the existing process;
- Research on arsenic treatment in leach solutions. and
- Investigations on different beneficiation processes for SM hard rock.

The main conclusions from these tests are as follows:

1. Leaching Characterization Test

At a target grind size of P_{80} = 75 μm, SM saprolite and transition carbon-free ore exhibit excellent response to cyanidation, achieving gold recovery rates of >95%. However, the transition and hard rock ore with carbon and arsenic behave differently with gold recovery varies from 7.2% on the high-carbon hard rock ore, 53.4% on carbon-containing hard rock ore, 69% on high-arsenic hard rock ore and 73.8% on high-carbon transition.

2. Behaviour of Transition Ore

Following the current RGM process of gravity+cyanidation, a gold recovery of >94% is achieved on a composite representing the SM transition ore.

3. Arsenic Treatment in Leach Solution

The coprecipitation of arsenic with iron is an effective method for removing toxic arsenic from leach solutions generated during the processing of SM high-arsenic hard rock ore. At an iron-to-arsenic molar ratio of >6, arsenic concentration in the leach solution can be reduced from 6.22 mg/L to below the local discharge standard of 0.1 ppm As.

4. Process Evaluation for SM LoM Hard Rock Ore

Blending SM hard rock ore with RGM ore does not negatively impact gold recovery in the RGM Plant. However, approximately 40% of sulfide-encapsulated gold in SM hard rock ore remains unleached, resulting in low recovery. When carbon-free hard rock ore is blended with RGM ore at varying ratios, the difference between actual leaching recovery and theoretical recovery (calculated by treating each ore separately) is minimal. However, blending carbon-containing hard rock ore into RGM ore significantly affects gold recovery. To mitigate this impact, the proportion of carbonaceous hard rock in the blend must remain below 10% and the organic carbon content after blending must be less than 0.042%.

The combined process of **gravity concentration**, **sulfide flotation**, followed by **roasting**, **pressure oxidation**, and **biological oxidation** pre-treatment of flotation concentrate yields the following gold recovery rates, summarized in Table 10-7. The results indicated that biological oxidation is an effective pre-treatment method for carbon-containing hard rock ore, while pressure oxidation is more suitable for carbon-free hard rock ore.

Table 10-7: Gold Recovery Rate on Different Beneficiation Processes for SM Hard Rock (%)

Ore Type	Roasting	Pressure Oxidation	Biological Oxidation
Carbon-containing Hard Rock Ore	85.75	80.28	88.85
Carbon-free Hard Rock Ore	86.68	96.09	91.89

10.3 Processing Practice

10.3.1 Production Flowsheet

The metallurgical flowsheet applied in Rosebel processing plant consists of two-stage crushing, SABC grinding, Gravity recovery by Knelson concentrator with Acacia intensive leaching and electrowinning, CIL gold extraction with elution/electrowinning, which is demonstrated in Figure 10-1.

In addition to the main process circuit, a CIC system is installed between two tailings ponds to adsorb about 0.04-0.06 mg/L leached gold left in tailings wastewater. The CIC system is able to recover an additional 500~800 ounces of gold monthly.

The main process is specified as follows:

Crushing and Stockpile

Run-of-Mine (RoM) material is delivered to the primary crushing facility using haul trucks and front-end loaders. The primary crushing system consists of a gyratory crusher, followed by a vibrating grizzly and a secondary crushing system, which produces the required feed size for the SAG mill. An active hard rock stockpile is maintained at approximately 50,000 tonnes.

Soft rock is fed by excavators through two apron feeders, reporting to the grinding circuit on the same conveyor as the hard and transition rock. The active soft rock stockpile is maintained at a capacity of approximately 200,000 tonnes. The crushed product particle size is of 80% passing 68~100mm (P_{80} =68~100 mm).

Grinding and Classification

The grinding process at the Plant follows a SABC configuration. The SAG mill discharge fed two vibratory screens. The screen oversize material is re-crushed through a cone crusher (pebble crusher), with the crushed product returning to the SAG mill. Screen undersize is pumped to a pressure distributor, where it is combined with the ball mill discharge and process water.

The ball mills operate in a closed circuit with cyclones. The cyclone underflow is recirculated back to the ball mills, while the cyclone overflow flows by gravity to linear screens, which remove trashes from the slurry. The final grinding fineness achieves 75%–85% passing 74 μm.

Gravity Recovery

Around 20% of the cyclone underflow from each cyclone cluster is directed to vibratory screens equipped with 10 mesh panels. The screen oversize is sent to the ball mill discharge pump boxes, while the undersize feeds into the gravity circuit. The gravity recovery system consists of three Knelson concentrators, a Acacia intensive leach reactor, and a Deister shaking table.

The gravity concentrate (grading ~2 kg/t Au) undergoes high-strength cyanide leaching (Acacia), which is controlled at a lower pulp density of 20-25% in 2-3% NaCN solution at pH ~12 which is adjusted with NaOH for a leach residence of 16-24 hours. The resulting pregnant solution is processed in the electrowinning cell. When the Acacia reactor is offline, the Deister table further upgrades the concentrate to 75% purity before smelting. The gravity tailings are returned to the SAG screen undersize pump box for reprocessing.

Pre-Leach Thickening

Trashes are removed from the cyclone overflow ahead of the pre - leach thickener by linear screen. The trash is discharged into a bin for disposal. The screen underflow gravitates to the pre - leach thickener feed. The thickener underflow (pulp concentration of about 50%~55%) is pumped to the pre-leaching tank of the CIL circuit. The thickener overflow gravity flows to the process water tank.

Leaching and Adsorption Circuit

The current leaching and adsorption circuit consists of two parallel lines, each comprising two agitated leach tanks followed by seven leach-adsorption stages. The CIL circuit residence time ranges from approximately 28 to 34 hours, depending on mill throughput and tank availability.

Lime is added to the grinding circuit to raise the slurry pH to 10.5, ensuring optimal conditions to keep cyanide from decomposition. Sodium cyanide is introduced at the SAG feed chute and the initial leach tanks to facilitate gold leaching. Active carbon is injected into the last CIL tank, operating counter-current to the pulp flow. The gold-loaded carbon is hydraulically transferred to a carbon recovery screen, where the screen oversize (gold-loaded carbon) is directed to the elution circuit acid wash hopper for further processing.

The tailings slurry passes through carbon safety screens (20 mesh) to capture any fine carbon before being pumped to the Tailings Storage Facility (TSF). The fine carbon is collected and sold to a contract smelter.

Elution and Carbon Regeneration

The gold - loaded carbon enters to the acid treatment vessel and is washed with with 5% HNO_3 to remove inorganic impurities and then transferred to the elution column. Carbon stripping and desorption process is operated at 135-150℃, 0.35-0.5 MPa pressure, 1-3.5 g/L NaCN and 30g/L NaOH for 8 hours to achieve <100 g/t Au in carbon. After desorption, the carbon is re-generated in a carbon regeneration kiln system in three stages at 650, 700 and 685℃ to drive off and inorganic contaminants.

Electrowinning and Smelting

The gold pregnant solution is passed through two electrowinning cells equipped with stainless steel cotton cathodes. The loaded cathodes are pressure washed, and the gold sludge is filtered and dried, and then smelted onsite gold room to produce doré bullion at 80-90% purity. The gold doré bullion is shipped in 30-40kg batches to a contracted smelter for further processing and subsequent sale.

10.3.2 Main Facilities and Equipment

The main equipment of RGM plant mainly includes crusher, SAG mill, ball mill and hydrocyclones, etc. in the process of crushing, grinding and classification. Leaching tanks, adsorption tanks, carbon recovery screen and carbon safety screen, etc. in leaching process. Gravity concentrator and Acacia Reactor etc. in gravity process. Acid wash & elution column, electrowinning cell, etc. in desorption electrowinning process. The main processing equipment is shown in Table 10-8. Figure 10-2 shows some photos of the main processing equipment.

10.3.3 Material Consumption

The materials and reagents consumption of Rosebel Processing Plant in 2024 are shown in Table 10-9. The data showed that the actual consumption of almost all reagents and materials is lower than budget (except for lime), indicating that the processing plant has effectively controlled the usage of materials and reagents during actual production operations.

Table 10-9: Material and Reagent Consumption of RGM Plant (Year 2024)

Item	Actual Consumption (kg/t Milled)	Budget Consumption (kg/t Milled)
5.25" Balls	0.166	0.321
3" Balls	0.480	0.835
Lime	1.393	1.376

10.4 Historical Production Index

Table 10-10 summarized the historical production data from 2022 to 2024. The feed materials of the processing plant are roughly divided into soft rock, transition rock, and hard rock ores. The data indicated that over the past three years, ROM throughput has ranged between 8.3 Mtpa and 10 Mtpa, with approximately 70-80% sourced from the RGM mine and 20-30% from the SM mine. The overall recovery rate ranged between 94% and 97%, averaging 95%.

The gold output in 2022, 2023, and 2024 was 7,839 kg, 8,821 kg, and 8,424 kg, respectively. It should be noted that when RGM contributed 100% and SM contributed 70%, the gold output from February to December 2023 and for the year 2024 was 7,483 kg and 7,460 kg, respectively.

The relationship of gold recovery and feed grade is roughly illustrated in Figure 10-3

Table 10-10: Historical Production Data of RGM Plant

Item		Unit	2022	2023	2024	2023.2-12

10.6 Tailings Storage Facilities (TSF)

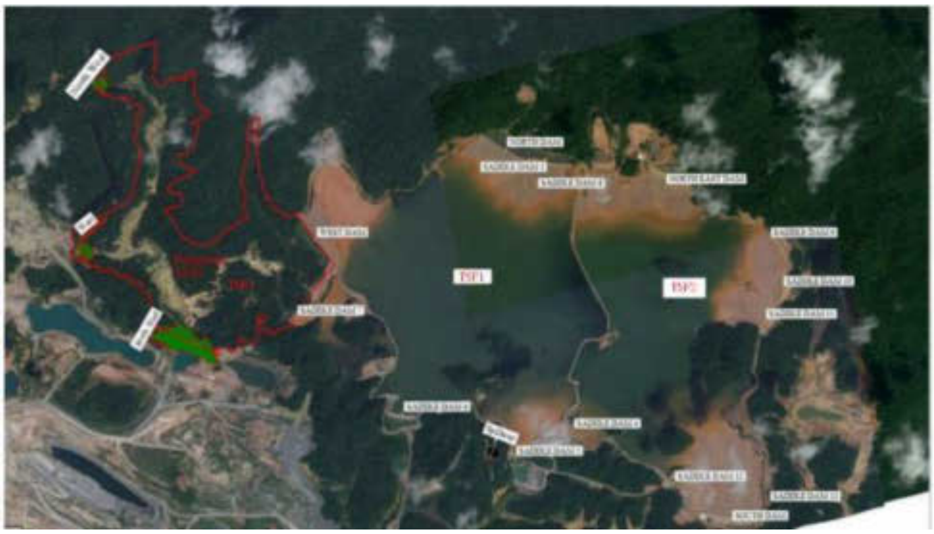
For the purpose of this reporting, the original tailings facility is referred to as TSF1, the tailings expansion to the east is TSF2 and the tailings expansion to the west is TSF3, which is shown in Figure 10-4. The TSF is located northeast of the Rosebel Processing Plant, and TSF1 has been used for storage of tailings since RGM began operation in 2004. The water collected in the TSF is reclaimed for use in the mill, while excess water is treated before being released.

Historically, dam designs have been modified to accommodate updates to the Life of Mine (LoM) and subsequent requirements for increased pond capacity. In 2014, the TSF1 was expanded to the east to form the expansion facility, namely TSF2, which contains a total of eight additional dams in operation. The total combined storage capacity of TSF1 and TSF2 is approximately 287 Mt (204 Mm^3) when constructed to the proposed final elevation of 565 m. In 2019, a CIC system was constructed and utilized for gold extraction during the reclaim process from TSF2 to TSF1.

Following extensive environmental, structural, social, health, and safety studies for the proposed TSF3 area, construction of the Southwest Dam (SW-dam) began in July 2023. In 2024, construction of Saddle Dam 14 commenced, while continuously raising the SW dam. The TSF3 basin will provide an additional capacity of 45 Mm^3, providing a total storage capacity of 249 Mm^3. The plan is to create a platform for the construction of the CIC, which will be relocated from TSF2 to TSF3 as part of the water reclaim system. In 2025, tailings discharge into TSF3 will begin at the SW-dam, with a gradual transition to full tailings discharge into the TSF3.

Throughout the year 2024 bathymetric surveys were conducted in TSF1 and TSF2 to measure the volume of water in the pond and therefore the remaining capacity was derived, which is about 22.7 Mm^3. The highest dam elevation will be 566m at the South dam of TSF2 and construction will continue in the years 2031 and 2032.

Figure 10-4: Overall Layout of TSF



10.7 Conclusions and Recommendations

Based on the review of the metallurgical tests and processing plant practice, SRK has reached the following conclusions and recommendations:

- The Rosebel Processing Plant processes a blend of hard rock, transition ore and soft ore from RGM and SM at an approximate ratio of 4:1, with hard rock comprising 60–70% of the feed. After an upgrade to the crushing system in September 2024, the plant reached an annual processing capacity of 10 Mtpa while handling a blend of 70% hard rock and 30% soft rock.
- The overall performance of the RGM plant is excellent with an average gold recovery of over 94% within recent three years, indicated that the process is relatively reasonable and suitable for processing the ore types.
- Ores contained high pyrite and arsenic pyrite, contained high organic carbon from Saramacca deposit are refractory to cyanidation. Historical production performance showed incase these kinds of ore are blended into the mill feed material, the overall gold recovery will decrease. Rosebel is planning to use flotation and concentrate pressure oxidation or bacteria oxidation to pre-treat the refractory ores.
- With the development and utilization of the challenging SM ore, the processing plant will need to handle high-organic-carbon ores (approximately 5–6%) and high-arsenic ores (around 1–2%) from the SM deposit. These ore characteristics are anticipated to affect the production performance of the RGM plant. It is recommended that further metallurgical tests and technical economic studies should be carried out to seek for proper methods for the specific refractory ores.

11 Environmental Studies, Permitting, and Social Impact

11.1 Review Process, Scope, and Standards

The following section presents an overview and assessment of the environmental and social aspects related to the Rosebel Mine and Saramacca satellite deposit, operated by Rosebel Gold Mines N.V. (RGM) and located in the Brokopondo District, northeastern Suriname.

This assessment is based on a review of documentation provided by RGM and interviews conducted with representatives of RGM's Environmental and Legal teams on 8 May 2025. As of the date of this report, no site visit has been undertaken by SRK.

The verification process evaluated the Project's environmental management performance against:

- Surinamese national environmental regulatory requirements;
- International good practice, including World Bank/IFC Performance Standards; and
- Environmental and social considerations relevant to the Modifying Factors described in the JORC Code (2012).

11.2 Environmental Legal Framework

Suriname's national legislation comprises the following legal instruments: Laws, Decrees, Government Decrees, Presidential Decrees, Presidential Order, and Ministerial Orders. These legislative tools regulate diverse sectors such as industry, tourism, and environmental protection. Key laws and regulations include:

Mineral Resource:

- **Mining Decree (1986, amended in 1997):** The Decree establishes governmental authority over all mineral exploration and extraction activities. Through this regulatory framework, mining rights are conferred via ministerial order, authorizing license holders to conduct mineral exploitation, processing and commercialization, construct requisite infrastructure, and utilize available on-site resources for operational purposes.
- **Environmental Framework Act (2020):** Creating a structure for sustainable development, this legislation facilitates coordinated national planning while ensuring transparency through public access to environmental data. It promotes stakeholder participation and enforces environmental compliance through violation monitoring and legal recourse. As it currently stands, the Act serves as a general framework with key implementing regulations still pending.
- **Drilling Act (1952):** Regulating subsurface investigations, this act authorizes controlled drilling operations for geotechnical research purposes across Suriname.

Land Use and Water:

- **Planning Act (1973):** This legislation establishes guidelines for national and regional development planning, encompassing land use management and the National Development Program. It requires project proposals to account for both environmental conservation and community welfare considerations.

- **Police Criminal Act (1915, amended in 1990)**: The Act establishes fundamental regulations governing citizen conduct, property rights, and police jurisdiction, while incorporating specific provisions for the safe discharge of water from designated tailings storage facilities.
- **Penal Code (1911, amended in 2015)**: Suriname's 2015 Penal Code revision introduced stricter environmental protections, particularly against water pollution, with scaled penalties based on violation severity. These measures establish legal accountability for activities that degrade water resources, serving both as deterrents against pollution and safeguards for aquatic ecosystems.

Natural Ecosystems:

- **Forest Management Act (1992):** Replacing the 1947 Timber Act, this legislation establishes sustainable forest governance frameworks covering timber harvesting, processing, and export operations. It designates protected conservation zones while permitting regulated tree removal for infrastructure development, requiring logging permits for public forests and safeguarding indigenous traditional land use rights.
- **Plant Protection Act (1965):** This biosecurity legislation controls phytosanitary risks through import restrictions and quarantine zone establishment, prohibiting unauthorized entry of plant materials or soil while allowing controlled vegetation clearance for construction purposes.
- **Fishstock Protection Act (1961, amended in 1981):** Regulating Suriname's inland fisheries (excluding marine waters), the Act mandates fishing licenses issued by the Agriculture Department, with fee structures varying by location (e.g., river estuaries). It establishes catch limits, seasonal restrictions, gear specifications, and minimum size requirements to ensure sustainable freshwater fish populations.
- **National Biodiversity Strategy and Action Plan Suriname (2024):** Implemented pursuant to UN Convention obligations, this framework promotes conservation of Amazonian ecosystems alongside sustainable development. It integrates species protection targets with responsible resource management protocols and equitable benefit-sharing mechanisms, aligning national growth objectives with global biodiversity commitments.

Cultural Heritage:

- **Monuments Act (2002):** This legislation establishes the legal framework for identifying, designating, and conserving cultural heritage sites across Suriname.
- **Nature Conservation Act (1954, amended in 1992):** The Act enables the designation of nature reserves based on cultural, scientific, or ecological significance, with strict protection measures prohibiting unauthorized activities within these areas.

Occupational Health & Safety/ Public Health:

- **Occupational Safety and Health Act (1947, amended in 1980):** Mandating workplace safety standards, this Act aims to prevent occupational hazards and illnesses, requiring full compliance for all project-related employment.
- **Labor Inspection Decree (1983):** Outlining the authority of labor inspectors, this Decree empowers officials to enforce safety regulations, including the temporary closure of hazardous work environments.
- **Decision Negative List (2003):** Regulating international trade, this law prohibits the import/export of hazardous substances (e.g., mercury, radioactive materials, banned pesticides) without prior government approval, in alignment with FAO guidelines.

Suriname's legal framework is implemented through key agencies including the Ministries of Natural Resources (MNH), Justice & Police, Agriculture (LVV), and Trade & Industry, along with specialized bodies like the National Environment Authority (NMA) and Forest Management Foundation (SBB). Mining operators must comply with national environmental and social legislation, subject to regular audits for standards adherence.

International Standards:

Suriname is a participant in two major international initiatives aimed at improving mining sector governance:

- **Extractive Industries Transparency Initiative (EITI**): Suriname joined the EITI in 2016 and achieved full compliance in 2017. The initiative promotes transparency in extractive sector revenues through multi-stakeholder reporting. In its 2023 EITI Validation, Suriname received an overall score of 58.5, indicating a "fairly low" level of compliance with the 2019 EITI Standard. The assessment highlighted the need for improved disclosure of licensing data, revenue flows, and stakeholder engagement.
- **Intergovernmental Forum on Mining, Minerals, Metals and Sustainable Development (IGF):** Suriname adopted the IGF standards in 2019, following initial engagement in 2017. A comprehensive assessment conducted in 2016–2017 reviewed national mining policies, including site visits to Rosebel and Grassalco, and stakeholder consultations in Paramaribo.

11.3 Permitting

Rosebel Gold Mines N.V. (RGM) operates two key mining assets in northeastern Suriname's Brokopondo district: the Rosebel mine (170 km², located 85 km south of Paramaribo) and the Saramacca satellite operation (positioned 100 km southwest of Paramaribo and 25 km from the main Rosebel site). Gold mining at the Rosebel Mine site began in 2004 and has been carried out at eight separate open pits to date. Mining at the Saramacca mine began May 2019 in one open pit and two Waste Rock Facilities.

This section outlines the key environmental and social permits and approvals required to undertake mining operations in Suriname, all of which are essential for ensuring regulatory compliance. These approvals are obtained through formal application procedures with the relevant government authorities. SRK has undertaken a thorough review of the permits and licenses submitted by RGM, with its evaluation based on the documentation made available for review.

The Rosebel operations are governed by the Suriname Gold Mining Project – Mineral Agreement (Mineral Agreement, 1994) with the Government of Suriname that establishes the terms and conditions under which Rosebel operations and development are conducted. The Mineral Agreement references closure of the site and broad expectations of RGM for closure. It also cross-references to the commitments made in the Rosebel EIA (Rescan, 2002).

A summary table of the relevant documents reviewed, along with their status, is presented below in Table 11-1.

Table 11-1: Summary of RGM permits and licenses status (May 2025)

Licences/Permits	No.	Issued by	Issue Date	Expiry Date
Granting of the exploitation rights for gold, diamond and other minerals (Gross Rosebel)	GMD No. 468/02	Ministry of Natural Resources (NH)	24-Feb-03	24-Feb-28
Granting of the right to exploitation of gold and associated minerals (Saramacca)	GMD No. 301/19	Ministry of Natural Resources (NH)	20-Mar-19	20-Mar-44
Approval of ESIA (2013) for the expansion of RGM Tailing Storage Facility 2	NH13/791	Ministry of Natural Resources (NH) following recommendations from National Institute for Environment and Development in Suriname (NIMOS)	9-Oct-13	/
Approval of ESIA (2022) for the expansion of RGM Tailing Storage Facility 3	NH23/62	Ministry of Natural Resources (NH) following recommendations from National Institute for Environment and Development in Suriname (NIMOS)	27-Feb-23	/
Approval of ESIA for Saramacca Project and haulroad	NH19/33	Ministry of Natural Resources (NH) following recommendations from National Institute for Environment and Development in Suriname (NIMOS)	17-Jan-19	/
Second Amendment and Supplemental Mineral Agreement	/	Ministry of Natural Resources (NH) and Ministry of Finance	6-Jun-13	2028
Extract from the Trade Register	File No. 37120	Chamber of Commerce & Industry	22-May-02	/
Business Conditions for the Gross Rosebel	No. NH0265	Ministry of Natural Resources (NH)	1-Oct-02	/

- **Land Use Permit:** In Suriname, land not under documented private ownership is considered state-owned, and land rights are granted through government-issued titles. Surface rights in the area of the Gross Rosebel Mining Concession belong to the Republic of Suriname, with utilization rights granted to RGM under the Mineral Agreement of 1994 and its associated exploitation mining concession (GMD 468/02), along with additional exploration licenses. These rights are subject to specific legal and regulatory conditions.

  A portion of the Tailings Storage Facilities (TSFs) is located within the Thunder Mountain GMD 467/24 exploration permit area, which lies outside the formal exploitation concession (GMD 468/02). Exploration permits in Suriname are generally limited to exploration activities and do not authorize the development of infrastructure such as TSFs. SRK has reviewed the Mineral Agreement and the GMD 467/24 exploration permit, and it appears that the latter does not grant rights to construct mining infrastructure.

  Although the TSF expansion has been documented and granted environmental approval following the ESIA processes in 2013 and 2023, such approval does not, in itself, confer the legal right to construct infrastructure like TSFs without the necessary land rights. Separate legal authorizations, such as exploitation permits, would be required for the lawful development and operation of project infrastructure.

  The Thunder Mountain exploration permit is valid until November 2026. If it is not converted into an exploitation title by that time, the associated rights will expire. This may expose RGM to regulatory non-compliance, land tenure disputes, financial liabilities, or potential operational interruptions if infrastructure continues to operate outside of the exploitation area. This limitation on infrastructure development under exploration titles is standard in the mining industry and aligns with Suriname's permitting framework.

- **Surface Water Discharge Permit:** Effluent from mining and processing activities is discharged into nearby water bodies, including the Saramacca and Mindrineti Rivers. While the Environmental Framework Act (No. 97 of 2020) now mandates formal permitting for effluent discharge, this legislation came into force well after mine operations began in 2004. The Act currently functions as a general framework, with key implementing regulations still pending. SRK did not receive evidence of an approved surface water discharge permit. A letter from the National Institute for Environment and Development in Suriname (NIMOS), dated 20 October 2016, acknowledged RGM's assumption that no permit was required at the time but did not grant formal authorization. Instead, it emphasized the importance of applying the precautionary principle and maintaining oversight through monitoring. While the absence of implementing regulations under the 2020 Environmental Framework Act limits enforceability at present, operating without a formal discharge permit may present future compliance risks as the regulatory framework is completed. Nonetheless, alignment with existing legislation is considered international good practice. Discharging without a formal permit could also present material risks, including environmental harm, reputational exposure, and strained community relations. Discussions with RGM's Legal and HSE Departments indicate ongoing engagement with the National Environmental Authority (NMA). Although no formal permit documentation was provided, RGM reports that the NMA has expressed satisfaction with the company's regular submission of quarterly water quality monitoring data as an interim compliance measure.

- **Original RGM EIA (2002)**: Although the original 2002 EIA was reportedly approved by the Suriname Government, SRK has not received or reviewed the official approval documentation. Furthermore, the EIA only covers five pits (namely Pay Caro, Koolhoven, Royal Hill, Mayo, and Rosebel) while 8 pits have been historically operated at the Mine. There is no clear evidence of government approval for the exploitation of additional pits such as Overman, J-Zone, East Railing Road, Roma, and MamaKreek.

- **Exploration Permits**: In Suriname, mineral exploration concessions are initially granted for a period of three years and may be renewed twice, each renewal granting an additional two years. Accordingly, the maximum allowable exploration period is seven years.
  SRK has received and reviewed documentation provided by RGM relating to the first extension of the exploration concessions. As of the current reporting date, all first-extension concessions have expired, with the exception of Moeriekreek, which remains valid until 10 June 2025. Regarding the second extension, RGM has advised that new applications were submitted to the government in 2024. Although SRK has not received official documentation confirming these approvals, RGM has reportedly obtained approval for the exploration rights at Charmagne West, Thunder Mountain, and Headly's Reef, with a new expiry date of 18 November 2026. The exploration right for Brokolonko has also reportedly been approved, with an expiry date of 3 June 2026. RGM further advised that renewal outcomes for Charmagne I, Charmagne II, Anjoemara, and Lef Resources are still pending, with decisions expected by May 2025. While SRK has not yet reviewed the official approvals or updated

exploration licences, the information provided by RGM suggests that the relevant concessions are likely in compliance with regulatory requirements; however, until formal documentation is obtained and verified, a degree of regulatory uncertainty remains that may pose potential legal or permitting risks to ongoing and future exploration activities.

11.4 Status of Environmental Studies

According to the documentation received and reviewed, a total of four Environmental and Social Impact Assessments (ESIAs) have been prepared for the Rosebel Project and its related infrastructure to date, as follows:

- **2002 ESIA** prepared by Rescan for Cambior, covered the **Gross Rosebel** Project and included five primary deposits: Pay Caro, Koolhoven, Royal Hill, Mayo, and Rosebel Hill. This ESIA was developed in accordance with voluntary national guidelines in Suriname at the time and applicable international environmental and social standards. At that point, Suriname did not have a formal legal framework mandating ESIA, and the process was undertaken on a voluntary basis.
  Although this ESIA was reportedly approved by the Ministry of Natural Resources (NH) based on a recommendation from the National Institute for Environment and Development in Suriname (NIMOS), official documentation confirming this approval was not available to SRK for review and verification
  It is SRK's understanding that the scope of the 2002 ESIA was limited to the five deposits listed above. Based on available documentation and information provided, it appears that some additional pits developed and operated between 2002 and 2025 were not supported by updated ESIAs, which would be expected under international good practice for impact assessment and permitting of expanded mining operations.
  Since the enactment of the Environmental Framework Act in 2020, Suriname requires a formal ESIA for any new developments, including expansions at existing mining sites. In line with these regulatory changes, SRK understands that RGM intends to address past ESIA gaps and improve future compliance by implementing a concession-wide ESIA review on a five-year cycle, in accordance with both international standards and the national legal framework, once the implementing regulations under the 2020 Act are in effect.

- **2013 ESIA**, prepared by ERM for IAMGOLD, supported the proposed **expansion of the Tailings Storage Facility (TSF2)** operated by Rosebel Gold Mines (RGM), and was completed in accordance with local and international ESIA standards. It was approved by NH on 10th September 2013 and SRK was able to review both the ESIA and its approval.

- **2018 ESIA**, also completed by ERM on behalf of IAMGOLD, assessed the **Saramacca Satellite Mine**. This ESIA aligned with Suriname's national regulatory framework and international best practice environmental and social standards. It was approved by NH on 17th January 2019 and SRK was able to review both the ESIA and its approval.

- **2022 ESIA**, prepared by ERM for IAMGOLD, focused on the **expansion of the Tailings Storage Facility (TSF3)** at RGM. It was conducted under local ESIA legislation and guided by internationally recognised environmental and social performance benchmarks. It was approved by NH on 27th February 2023 and SRK was able to review both the ESIA and its approval.

Each ESIA report included a comprehensive project description, detailed baseline studies, impact assessments, environmental and social management and mitigation plans, and reclamation and mine closure strategies.

The assessment of potential environmental and social impacts, including cumulative effectsis consistent across the 2013 ESIA Addendum, the 2018 Saramacca ESIA (approved in 2019), and the most recent 2022 report. All three assessments apply the same underlying methodology, ensuring continuity in approach and comparability of findings. These methodologies are informed by existing baseline data, input from technical subject matter experts, professional judgment, and stakeholder consultations, including with RGM, local sources, and NIMOS.

Baseline characterization was conducted prior to the impact assessments and includes both environmental and social components. The biological baseline is based on biodiversity studies conducted at the project site from 2002 to the present. A targeted literature review was also undertaken to enhance the biodiversity baseline, and its findings have been incorporated accordingly.

More recent ESIA efforts have placed greater emphasis on developing robust Environmental and Social Management Plans (ESMPs), which serve as practical tools to implement recommended controls during all phases of the project, culminating in responsible decommissioning and closure.

In addition, the project has developed several individual environmental management plans under a comprehensive Environmental Management System (EMS), covering areas such as biodiversity, hazardous materials, reclamation and mine closure, surface water and groundwater monitoring, and waste management. The RGM EMS is certified under ISO 14001:2015 since 2018, and was certified under ISO 14001:2004 since 2005.

11.5 Flora and Fauna

Comprehensive biodiversity baseline studies conducted within the Project Area of Influence (AOI) have documented ecological conditions across wet and dry seasons through Environmental and Social Impact Assessment (ESIA) reports. Supplemental 2022 studies in the TSF3 area expanded upon prior datasets from TSF2 (2011) and historical Rosebel mine surveys (pre-2003), collectively revealing that the Gross Rosebel and Saramacca project areas occupy previously disturbed forest ecosystems impacted by mining, timber extraction, and other anthropogenic activities rather than intact primary forests.

The concession lies within Suriname's Guiana moist forest ecoregion, comprising 75% dryland forest with smaller proportions of swamp forest (9%), marshland (5%), and savanna (11%). Nearby protected areas include the Brinckheveul Nature Reserve located 3 km west across the Mindrineti River. Flora surveys through 2018 recorded 232 species at Gross Rosebel and 661 species at Saramacca, including IUCN Red List threatened species such as *Minquartia guianensis* and nationally protected taxa like *Copaifera guianensis*.

Faunal assessments identified diverse species assemblages, including five Near Threatened and four Vulnerable bird species in Saramacca - such as the Ciaca Parrot (*Pyrilia caica*) and Mealy Parrot (*Amazona farinosa*) - whose regional populations decline due to habitat loss. Aquatic monitoring documented 46-82 fish species (2014-2016), while herpetological surveys confirmed presence of the Vulnerable Pebas stubfoot toad (*Atelopus spumarius*). Mammalian studies (2006-2017) recorded 28 species including Near Threatened (Jaguar, *Panthera onca*) and Vulnerable (Brazilian Tapir, *Tapirus terrestris*) taxa.

To address projected habitat impacts from TSF expansion and mine development, Biodiversity Management Plans (BMPs) implement mitigation measures including wildlife relocation corridors, vegetation conservation zones, and ecological monitoring protocols. RGM carries out comprehensive environmental protection measures to preserve local biodiversity and minimize ecosystem impacts. RGM avoids construction in ecologically important areas and maintains buffer zones around sensitive habitats. Strict environmental controls are in place to protect plants and wildlife, with particular focus on reducing operational impacts.

As outlined in the 2024 Mine Closure Plan, RGM's revegetation program restores native plants to disturbed areas through soil preparation, native species planting, and hydroseeding techniques. This approach promotes natural forest regrowth and ecosystem recovery. As of 2017, records indicated that about 71.35 hectares of land had undergone successful revegetation efforts. Continuous monitoring and gradual reclamation efforts help achieve sustainable results while preventing damage to restored areas.

SRK has reviewed ESIA and BMP documentation and confirms alignment with international best practices for minimizing operational impacts on sensitive ecosystems.

11.6 Water Management

11.6.1 Surface Water

Rosebel

The Rosebel mine is located on a natural north-south drainage divide, with surface water flowing west to the Saramacca River via the Mindrineti River and east to the Suriname River. The concession primarily lies within the Saramacca River catchment (~9,400 km²), with the Mindrineti River being the main perennial stream, draining a sub-catchment of approximately 704 km². Other streams in the area are intermittent or ephemeral, influenced by seasonal rainfall and historic disturbance from small-scale mining (SSM).

Process water for the mill (which treats ~35,000 tonnes of ore/day) is sourced predominantly from reclaim water (80%) collected from the Tailings Storage Facilities (TSFs), supplemented by recycled water from the Treated Water Storage Pond (TWSP). Rosebel is a net water-positive site; RGM discharges treated excess tailings water, pit dewatering and mine rock area runoff / seepage, wastewater, and site runoff to the receiving environment. These include:

- Discharge to Mindrineti River upstream of SW21 through the Treated Water Storage Pond (TWSP) as a single outfall;
- Pit dewatering, WRF seepage / runoff, and site runoff that do not require treatment and are discharged directly to tributaries of Mindrineti River, i.e., Nieuw Foto upstream of SW17, Mamanari Creek upstream of SW8, and Maikaboe Creek upstream of SW4; and
- Pit dewatering and WRF seepage/runoff that do not require treatment and are discharged to Compagnie Creek upstream of SW13, a tributary of Suriname River.

The Effluent Treatment System (ETS) at the Rosebel Gold Mine is designed to treat water from the tailings pond, which contains elevated levels of suspended solids and metals like copper and iron. The system reduces these parameters to meet discharge limits set by the World Bank-IFC and the US EPA for the Mindrineti River. It includes a clarifier to precipitate solids and metals, an aerated lagoon (AL) for ammonia and cyanide complex removal, and a Treated Water Storage Pond (TWSP) to settle solids and further reduce cyanide levels. The water is only discharged to the Mindrineti River once quality criteria are met, as authorized by the Environmental Department.

Cyanide levels in treated water are reported to meet International Cyanide Management Code (2002) standards, with no detectable concentrations in receiving waters.

Although the Environmental Framework Act (No. 97 of 2020) now mandates effluent discharge permits, this legislation was introduced after mining operations at Rosebel began in 2004. SRK did not receive evidence of an approved discharge permit for Rosebel Gold Mines (RGM). However, RGM reports that it submits quarterly effluent monitoring data to the National Environmental Authority (NMA), which is reportedly accepted as a form of interim compliance, although no formal acknowledgment was available for review. SRK reviewed RGM's quarterly environmental monitoring reports for Q2, Q3, and Q4 of 2024, and Q1 of 2025. These reports include detailed water quality testing results from various discharge points, comparing the data against the World Bank Group – IFC Environmental, Health, and Safety (EHS) Guidelines for Mining (2007). The reports indicate that discharge water quality consistently exceeded 98% compliance with the IFC EHS Guidelines for Mining, which specify numeric limits for key water quality parameters, including pH (6–9), Total Suspended Solids (TSS, max. 50 mg/L), total cyanide (max. 0.5 mg/L), ammonia as nitrogen (max. 10 mg/L), and total iron (max. 2 mg/L).

Suriname has not implemented specific numeric water quality guidelines for the protection of aquatic life or other designated water uses. Therefore, the results have been compared to the long-term water quality guidelines established by the Canadian Council of Ministers of the Environment (CCME) for the Protection of Aquatic Life.

Long-term water quality monitoring has been conducted since 1994. Natural surface waters in the concession are typically slightly acidic, with low alkalinity and high dissolved organic matter. During the wet season (April–August), increased sediment load results in elevated total suspended solids (TSS). Metal concentrations—particularly aluminum, cadmium, copper, iron, and occasionally zinc—can exceed CCME thresholds, especially downstream of the mine discharge point (SW21). Upstream concentrations at SW9 are generally lower but reflect elevated background levels linked to natural mineralization.

Saramacca

Surface waters at Saramacca are generally circumneutral in pH (range: 3.95 to 8.18), with most values between 6.0 and 8.0. Water hardness is predominantly soft (<60 mg/L), except for isolated instances of higher hardness at TSW-2. Sulfate and nitrate concentrations are typically low.

Suriname has not implemented specific numeric water quality guidelines for this area either. Therefore, water quality data are also benchmarked against the Canadian Council of Ministers of the Environment (CCME) guidelines for freshwater aquatic life. Metal concentrations across the Saramacca concession are variable and reflect both natural geology and the influence of SSM. Most dissolved and total metal values remain below CCME water quality criteria. Anomalies in pH and metal levels are localized and do not appear to represent broader site-wide water quality concerns.

11.6.2 Groundwater

Rosebel:

Groundwater at Rosebel occurs in three systems: deep fractured bedrock with low flow; saprolite/laterite with moderate storage but low permeability; and shallow sand/silt lenses with higher flow potential (ERM, 2013). Monitoring began in 2004 and includes water levels and quarterly sampling. In 2021, three wells were added near TSF3, showing near-neutral pH, low sulfate, and negligible nitrate. Seepage collection and new surface water monitoring sites were added under the 2022 ESIA. Groundwater quality shows higher pH and lower metal levels than surface water. Pit dewatering and TSF seepage are the main potential impacts, actively managed through monitoring. Groundwater is not widely used on-site, with limited use primarily for water supply at Camp David. There are no significant known users of groundwater in the immediate vicinity of the Rosebel concession, though the broader region may rely on groundwater for local agriculture or domestic consumption.

Saramacca:

Baseline groundwater monitoring (2019–2023) showed neutral pH (7–8), with slightly acidic values in shallow wells. Dissolved aluminum and iron occasionally exceeded guidelines; other metals remained within limits. Overall, groundwater is neutral to slightly basic with no widespread concerns, based on the information received by SRK.

The potential negative impacts of the mine to surface water and groundwater are due to the indiscriminate discharge of untreated production and domestic wastewater. In addition, the mining activities may lead to the change of the groundwater table. The main wastewater pollution sources of the project include mine dewatering water, processing wastewater, tailings and waste rock leachate, hazardous waste leachate, wastewater from maintenance workshop, contact water of industrial site, domestic sewage, etc.

11.6.3 Potable Water Supply

Potable water at the Rosebel Gold Mine is supplied from shallow wells west of Camp David, treated through a potable water treatment plant, and distributed to the camp and mill site. Additionally, a reverse osmosis plant bottles drinking water in 5-gallon plastic jugs, with daily water quality analysis ensuring consumer safety. The fire protection system, sourced from the treated water storage pond, includes pumps, a distribution network, hose stations, and sprinklers, with hydrants spaced a maximum of 90 meters around the mill complex and supporting infrastructure.

11.7 Waste Rock and Tailings Management

11.7.1 Waste Rock Facilities (WRFs)

Waste rock generated from mining activities is deposited in low-profile Waste Rock Facilities (WRFs) situated adjacent to the respective pits to minimize haul distances and reduce overall environmental disturbance. Site selection for WRFs considers natural surface drainage and aims to avoid watercourses to the extent practical. In-pit waste rock disposal is also employed where mine sequencing allows. Prior to deposition, areas are cleared of vegetation, which is typically burned or cast aside. Perimeter drainage ditches and surface water management structures, such as berms, diversion channels, and grading, are constructed as needed to control runoff, minimize ponding, and prevent erosion of WRF slopes.

The current design approach for WRFs is focused primarily on minimizing the risk of major slope failure; however, closure considerations such as long-term erosion control and facilitation of self-sustaining revegetation are not yet fully incorporated. Progressive reclamation efforts have been implemented in certain inactive areas (e.g., Royal Hill North, Pay Caro South), but these have seen limited success, with reclaimed zones sometimes re-disturbed due to changes in mine planning and with revegetation outcomes remaining suboptimal.

Geochemical characterization studies (ERM, 2018) indicate that the Koolhoven and J-Zone WRFs present elevated risks of acid rock drainage (ARD) and metal leaching (ML), requiring targeted mitigation measures. RGM has proposed the development of engineered cover systems for these high-risk facilities to reduce infiltration and mitigate ARD/ML potential. Currently, runoff and seepage from WRFs are directed to adjacent water bodies, with no engineered collection or treatment infrastructure in place. The 2022 Environmental and Social Impact Assessment (ESIA) identified the need for further investigation into ARD/ML risks associated with both waste rock and tailings. As of the date of reporting, SRK has not received documentation confirming whether these investigations have been completed or formally incorporated into the site's environmental management plans.

11.7.2 Tailings Storage Facilities (TSFs)

Tailings from the ore processing plant are transported as conventional slurry through three 22-inch pipelines to a valley-type Tailings Storage Facility (TSF) complex located in the northern portion of the Rosebel concession. Tailings deposition began with TSF1 in 2004, followed by the construction of TSF2 in 2015, and more recently TSF3, which began construction in 2022. Together, these three TSFs will ultimately form an integrated containment system with a combined storage capacity of approximately 240 million cubic meters, covering a tailings surface area of around 231 hectares (Golder, 2022).

The TSFs are formed by a series of embankment dams constructed between local hills to enclose the tailings deposition area. The original TSF1 facility was designed to store approximately 46 Mt over 200 ha (Rescan, 2002) and was expanded following an approved Environmental and Social Impact Assessment (ERM, 2013) to accommodate up to 245 Mt over an 810 ha footprint, with a maximum dam height of 45 meters. The TSF3 facility, consisting of South Dam 3 (SD3), West Dam 3 (WD3), and North Dam 3 (ND3), is scheduled for phased construction from 2023 to 2026, with operations projected through 2035.

Embankment dams are constructed from locally excavated saprolite, with upstream slopes at 2:1 and downstream slopes at 2.5:1. The dam heights are raised progressively to match increasing storage needs. Geotextile and soil covers are applied on downstream slopes to minimize erosion risk; Saddle Dam 6 includes erosion protection on both slopes. All TSFs incorporate geotextile lining along downstream saprolite slopes to limit seepage and maintain structural integrity. Controlled seepage is managed via embedded pipe drains and perimeter ditches. Environmental performance is monitored through a network of groundwater wells, surface water sampling stations, and geotechnical instrumentation (e.g., vibrating wire piezometers and settlement plates). Annual inspections by independent third-party professionals are conducted to ensure the facilities are operating as designed.

During both the operation and closure phases of the TSF, potential environmental impacts include degradation of surface water quality in Nieuw Foto Creek and the Mindrineti River due to seepage, contact water, or emergency discharges; uncontrolled stormwater runoff containing elevated sediment or contaminants; and changes in surface and pore water chemistry within the merged TSF system. There are increased risks of acid rock drainage (ARD) and metal leaching (ML) as tailings from different sources are combined, particularly those with higher metal concentrations. These risks are especially elevated during wet seasons. The ESIA and accompanying Environmental and Social Management Plan (ESMP) identified these concerns and called for mitigation measures such as geochemical testing, monitoring, adaptive management, and engineered controls to reduce impacts on surrounding surface waters and ecological receptors.

For detailed designs of WRDs and TSFs, as well as information on waste rock and tailings discharge volumes, please refer to the preceding mining and processing chapters.

11.8 Air and Noise Emissions

At RGM, the main sources of dust are from heavy equipment operations and vehicular traffic along unpaved haul roads, combined with industrial activities at RGM mill site. The ambient air quality is influenced by both natural factors (seasonal wind-blown dust) and anthropogenic emissions from Small Scale Mining (SSM), logging operations, transportation networks, and residential fuel combustion utilizing wood. Key pollutants of concern include total suspended particulate matter (TSP), particulate matter less than 10 microns in diameter (PM_{10}), particulate matter less than 2.5 microns in diameter ($PM_{2.5}$), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and carbon monoxide (CO). According to the Environment Performance Measurement (2024), suspended particulate matter (i.e. $PM_{2.5}$) was monitored 24 hours every day from mid-August to early December 2024 (long dry season).

Due to the absence of national air quality standards in Suriname, RGM uses the international standards of WHO (also used by NIMOS) and US National Ambient Air Quality Standards to compare the air quality measurements in 2019. The measurements were carried out at three locations: New Camp, the Solar Plant and Main Gate from sunny to rainy days. All the mean concentrations for $PM_{2.5}$ and PM_{10} were below WHO air quality guidelines (25 µg/m³ for $PM_{2.5}$ and 50 µg/m³ for PM_{10}).

SRK also reviewed the Air Quality, Noise and Vibration Management Plan for Saramacca mine site, the Control of Dust Emissions from Roads, and the Environmental Performance Measurement and Monitoring Plan. These documents present air quality monitoring results, assess the environmental impact of dust, and detail measurement protocols. Effective dust control measures include regular road watering, and the installation of both temporary and permanent erosion and sedimentation controls.

Regarding greenhouse gas (GHG) emissions at the RGM operation, which includes both the Rosebel and Saramacca sites, the primary sources are ore processing, diesel-powered construction equipment, and onsite power generation. According to the Environmental and Social Impact Assessment for Saramacca (ESIA, 2018), carbon dioxide (CO_2) is the dominant GHG emitted at the Site, while methane (CH_4) and nitrous oxide (N_2O) emissions are considered negligible.

At the Rosebel site, which is the main operation, electrical power is primarily supplied through transmission lines from the national grid. This significantly reduces direct emissions associated with electricity generation. Two 480-volt, 600 kVA diesel generators are maintained onsite but are used solely for backup purposes. To further reduce emissions and reliance on fossil fuels, RGM constructed a 5 MW solar power plant at the Rosebel mine, which was commissioned in October 2014.

In contrast, the Saramacca mine, a satellite operation, relies entirely on onsite power generation from three 800 kW diesel-fired generators, making power supply a major contributor to its direct (Scope 1) emissions. As such, Saramacca's operations are more carbon-intensive compared to Rosebel due to the exclusive use of diesel for energy needs.

RGM reports only Scope 1 (direct) emissions, since indirect (Scope 2) emissions are minimal or not applicable under current operations. SRK reviewed the emission data submitted by RGM for the years 2023 through 2025. Reported total emissions were 195,226.77 tCO_2 in 2023, 163,137.43 tCO_2 in 2024, and 38,611.94 tCO_2 for January–March 2025 for both Rosebel and Saramacca. While emissions declined from 2023 to 2024 and appear lower in early 2025, the available data is insufficient to determine whether this represents a sustained decreasing trend or the direct impact of specific mitigation measures.

Noise levels at the Rosebel Gold Mines project vary by development phase. During construction, primary noise sources include vehicle movements, heavy machinery operation, and intermittent blasting. In the operational phase, noise is generated from regulated daytime pit blasting, mineral processing activities—particularly primary crushing—and onsite power generation.

In 2017, RGM conducted ambient noise surveys at four representative locations along the mine site and transport corridor. One-hour measurements were taken during both day and night periods to establish baseline conditions. Although natural features such as vegetation and terrain provide some attenuation, low-frequency noise may propagate beyond the immediate project boundary.

To mitigate community and ecological impacts, facilities were strategically located to maintain buffer distances: operational zones are several kilometres from the Nieuw Koffiekamp community, and haul roads maintain a separation of approximately 3 km. In the absence of a concession-wide Air Quality, Noise and Vibration Management Plan, SRK reviewed the Saramacca-specific plan included in the 2018 ESIA. This plan incorporates baseline noise monitoring, use of low-emission equipment, and scheduling restrictions on high-noise activities to manage exposure and facilitate adaptation to elevated noise levels near the project.

Based on the information reviewed, SRK notes that a formal, ongoing noise monitoring program does not appear to be currently implemented at the site.

11.9 Hazardous Substances and Waste Management

Waste Management

The waste management procedures at RGM aim to protect health, safety, and the environment, with waste classified by the Environmental Department. Solid waste includes non-hazardous materials like domestic waste, wood, and metals, which are either recycled, reused, or disposed of through local contractors. Hazardous waste, such as oils, chemicals, and electronic waste, is carefully managed and either incinerated, landfilled, or removed by contractors. Special waste, including medical waste, sewage, and used reagent containers, is disposed of under specific protocols. During closure, waste management will follow operational procedures, ensuring adequate landfill capacity for closure activities.

Hazardous materials at RGM include substances that are corrosive, reactive, explosive, toxic, flammable, and potentially biologically infectious, which pose risks to human and environmental health. These materials are primarily generated from the project's construction, mining, and processing operations. The main hazardous materials handled on-site include hydrocarbons (such as fuels, waste oils, and lubricants), oil containers, batteries, medical waste, processing reagents, reagent containers, and explosives.

To mitigate the risks of contamination to soils, surface water, and groundwater, RGM has implemented several detailed management plans. These plans cover spill and leakage management, hazardous materials management, and procedures for chemical handling, transportation, and storage. These measures are integrated into RGM's ISO 14001:2015 certification and environmental management system (EMS), ensuring compliance with international environmental protection standards.

Explosives

An oil emulsion-ammonium nitrate (ANFO) plant is located on-site for the production of explosives, which are a combination of 30% ammonium nitrate fuel oil and 70% emulsion. The explosive storage facility is situated between the mill site and the tailings impoundment area. It is secured with a steel fence and earth berms, designed to direct the energy from potential explosions upwards. The facility is monitored 24/7 by both the Surinamese Army and RGM security personnel, and motion detectors are in place to alert authorities of unauthorized access. Explosives supplies such as bulk emulsion, ANFO prills, and detonators are stored in secure, locked steel containers.

Fuel

Fuel is essential for the operation of the mine's fleet, power generators, and other equipment. The fuel storage facility is located near the truck shop, with satellite stations at various locations such as the Rosebel pit and Mayo pit. The total storage capacity is 227,100 liters, and the fuel tank farm is designed to contain at least 110% of the volume of the largest tank in the event of a spill. All bulk fuel and oil storage tanks over 1000 liters are equipped with secondary containment, either double-walled tanks or single-walled tanks surrounded by concrete or earth berms. Additionally, oil cubes, oil drums, and grease drums are stored upright, placed on concrete floors or containment trays, and at least 100 meters away from streams to minimize spill risks.

Hazardous Reagents

In the mill area, hazardous chemicals, including lime, nitric acid, and sodium cyanide (NaCN), are used for processing activities. Sodium cyanide (NaCN) is a particularly hazardous substance, and its handling and storage are carefully controlled.

RGM has established a Spill and Leakage Management Plan to respond effectively to any accidental release of hazardous substances. This plan includes protocols for the rapid identification, containment, and clean-up of spills, as well as procedures for reporting incidents. The plan ensures that all hazardous substances are handled according to best practices to minimize environmental impacts.Mine Closure and Rehabilitation

11.10 Mine Closure and Rehabilitation

The site closure and rehabilitation planning process for the Rosebel Gold Mine and Saramacca satellite operation involves identifying and consulting stakeholders to establish closure criteria and post-operational land use, while maintaining records of these consultations. The process also includes setting rehabilitation objectives, defining site closure liabilities, creating management strategies, and estimating associated costs. Additionally, a financial process for closure is established, and post-closure monitoring activities are planned to ensure compliance with the rehabilitation objectives.

SRK has reviewed the Mine Closure Plan (MCP) which was prepared by Carrieres in November 2024 and updated in February 2025. This MCP outlines the strategies and activities necessary for the closure and reclamation of the mining sites in Suriname. It encompasses all aspects of the closure process, including the open pits, waste rock facilities, the tailings storage facility, the processing plant, and associated infrastructure across both the Rosebel and Saramacca concessions.

The MCP takes into account the regulatory framework, reclamation standards, biophysical settings, progressive and final reclamation activities, and a comprehensive monitoring plan. The closure strategy involves progressive reclamation, where feasible, during operations, with special attention given to managing acid rock drainage risks at certain waste rock facilities through engineered cover systems. The closure process also integrates adaptive management strategies and provides a detailed reclamation schedule.

Mining operations are scheduled to continue until 2033, with ore processing extending into 2034. The closure of the Rosebel pit is planned for the end of 2026, followed by the Pay Caro pit closure in 2027, the Royal Hill and J-Zone / Koolhoven pits by 2031, the Saramacca pit closure in 2032, and the Mayo pit closure in 2033. Key closure activities include flooding the open pits to create pit lakes, re-sloping and covering waste rock facilities, revegetating disturbed areas with native species, decommissioning and removing infrastructure, and implementing surface water management systems. Long-term monitoring of environmental parameters will be conducted to assess the effectiveness of these activities.

The plan also considers socio-economic aspects, such as supporting sustainable livelihoods for local communities, managing impacts on small-scale mining activities, developing post-closure land use options, and planning for worker retrenchment. Stakeholder engagement will be maintained throughout the closure process to ensure all concerns are addressed.

The estimated total closure cost is US$201 million, which includes a 30% contingency to cover both direct reclamation activities and indirect costs, such as ongoing monitoring and maintenance. After active reclamation, a comprehensive post-closure monitoring program will be implemented for at least five years to ensure that closure objectives are met.

Certain areas and assets, such as the town of Nieuw Koffiekamp, severance and employee retrenchment, exploration areas, and the administration office in Paramaribo, are excluded from both the MCP and the associated closure cost estimate.

This plan is consistent with the environmental commitments outlined in the 2002 Environmental Impact Assessment (Rescan), ensuring that all necessary mine closure and reclamation activities align with the project's environmental management framework.

11.11 Health, Safety and Occupational Hygiene

Occupational Health and Safety (OHS) Reviewed Documentation

Occupational health and safety (OHS) is a critical component of responsible mining operations. SRK's review focused on evaluating RGM's health and safety management systems, policies, and performance in line with national regulations and international standards. The objective was to assess whether adequate measures are in place to protect workers, contractors, and surrounding communities throughout the life of the project.

As part of this assessment, SRK reviewed the following key documentations:

- Health, Safety and Sustainability Policy (2023)
- Environmental, Health & Safety Management System (EHSMS) Manual
- Explosive Management Plan (2023)
- Hazardous Materials Management (2024)
- Hoisting, Rigging & Crane Management (2023)
- Fatigue Management Program (2023)
- Emergency Management, Preparedness & Response Plan (2023)
- Lock-out Tag-out Verification (LOTOV) program (2023)
- Fall Prevention Standard (2023)
- Confined Space Safety (2023)
- Mobile equipment Vehicle standard (2023)

These documents collectively demonstrate RGM's structured approach to health and safety, and its alignment with recognized industry best practices and standards.

OHS Assessment & Observations

SRK has reviewed the **Environmental, Health & Safety Management System (EHSMS) Manual**, as well as the **Health, Safety and Sustainability Policy**, which outlines the key occupational health and safety (OHS) management measures in place for the Project. The system addresses operational risks and controls associated with core mining activities, including:

- Mining, crushing, blasting, and explosives handling
- Waste rock management and disposal
- Dust and noise suppression
- Emergency preparedness and response
- Fire protection and suppression
- Sanitation and worker welfare facilities
- Labour management, supervision, and safety oversight
- Safety administration and procedural compliance

The EHSMS Manual covers all operations including mine, milling, tailing impoundment and related infrastructures on the Rosebel concession, the Saramacca concession, the Saramacca haul road, and the offices located in Paramaribo. These measures are structured to ensure safe working conditions across all project areas, in alignment with national legislation and international best practice.

RGM's EHSMS Manual and other documentations for OHS includes formal procedures for safety performance monitoring, hazard identification, risk assessment, internal audits and management reviews. Safety measures such as engineering controls, emergency response equipment and employee training are implemented across all operational areas.

RGM's Environmental, Health and Safety Management System (EHSMS) is designed to align with international standards, including ISO 14001 and ISO 45001, to ensure effective occupational health and safety management across all operations. According to RGM's official website, the Rosebel mine was certified under OHSAS 18001 in October 2011 and successfully transitioned to ISO 45001 in 2021, reinforcing its commitment to international H&S standards. SRK has reviewed the official ISO 14001 and ISO 45001 certificates for the site, that are currently valid.

Historical Occupational Health and Safety Records

RGM's 2023 and 2024 safety records indicate incidents including hand and finger injuries during equipment operation and maintenance, as well as vehicle accidents such as rollovers and haul truck events. SRK reviewed associated incident reports, which provide detailed descriptions, causal analysis, and corrective actions. The 2024 occupational health and safety (OHS) strategy also addresses a broad spectrum of workplace risks with measures intended to prevent recurrence.

11.12 Social Considerations

The Brokopondo and Saramacca regions, historically sparsely populated, underwent significant demographic transformation following the 1960s hydroelectric dam construction that displaced approximately 6,000 Maroon inhabitants. Subsequent civil conflict (1986-1992) accelerated the region's economic transition from traditional farming and forestry to mining-dominated activities, with small-scale mining (SSM) emerging as a persistent economic mainstay alongside industrial operations.

The ESIA (ERM, 2022) identifies five Maroon communities within the indirect Area of Influence (AOI) holding biological resource rights: Nieuw Koffiekamp (situated within Rosebel's concession boundary), Klaaskreek, Marshallkreek, Kwakoegron/Commissariskondre, and Nieuw Lombe.

According to the ESIA (ERM, 2022), the project does not cause direct impacts requiring community relocation, but several nearby settlements may experience indirect effects from potential environmental and social changes related to the project's operations. Here are five Maroon communities within the indirect Area of Influence (AOI):

- Nieuw Koffiekamp: a Maroon settlement of around 300 people, located within the Rosebel Concession, 8km southwest of the tailings ponds. It was established in 1964 following the flooding of the original Koffiekamp village due to the Afobaka Dam construction. This community has basic infrastructure, offering only primary education while lacking essential public services including running water, sewage systems, and waste management.
- Klaaskreek: approximately 1500 residents located 15km downstream from the existing TSF Locus and Klaaskreek.
- Nieuw Lombe: approximately 500 residents, located 16km downstream from the existing TSF Locus, alongside the Suriname River.
- Marshallkreek: approximately 350 residents, located 10km North of Klaaskreek at the confluence of Marshallkreek and the Suriname River.
- Kwakoegron: approximately 100 residents located 16km North West of the taitailings facility downstream of the confluence of the Mindrineti and the Saramacca River.These

communities, governed through traditional leadership structures (Kapitein paramount chiefs and Basja assistants), demonstrate heavy economic reliance on mining activities. Notably, over 50% of Nieuw Koffiekamp's population engages in SSM, while Kwakoegron/Commissariskondre functions as a regional SSM transit hub. Although RGM serves as the primary formal sector employer, SSM continues to provide vital livelihood opportunities, supplemented by small-scale trade, forestry, and subsistence agriculture.

The concession area contains three categories of heritage sites: Pre-Columbian Amerindian archaeological locations, Maroon historical sites, and more recent historic settlements. Current documentation shows twenty Pre-Columbian sites located 25-50 km from the TSF3 expansion area, with Rupicola Cave representing the first identified archaeological feature within Saramacca concession. Recent archaeological investigations (Singh et al., 2022) revealed Donderbari Cave as the second significant cave system in RGM's concessions, now potentially impacted by TSF3 development. In response, RGM has implemented a Cultural Heritage Management Plan incorporating enhanced survey protocols and Chance Finds Procedures to mitigate potential damage to cultural assets.

RGM has implemented a comprehensive stakeholder management framework comprising verified stakeholder registration and developed 2023-2025 Stakeholder Engagement and Communication Plan (SECP). The registration system, reviewed by SRK, maintains detailed stakeholder categorization, records of engagement requirements and preferred communication methods for all stakeholder groups. The SECP establishes a structured approach to stakeholder relations through three key components: (1) annual action plans that align operational timelines with community engagement activities, (2) transparent grievance mechanisms, and (3) comprehensive communication tracking systems.

SECP specifically addresses emerging social risks including the influx of new stakeholders, local investment expectations, and employment-related concerns. For the 2024-2025 period, three major operational initiatives - the TSF3 expansion, Mine Closure Plan update, and Zijin transition - will be accompanied by targeted engagement activities. These include regular Traditional Authority meetings, Communication Committee sessions, and multi-stakeholder workshops to validate SECP implementation.

According to the SECP, to strengthen community relations, RGM implements a range of engagement initiatives aimed at fostering mutual understanding. Executive leadership conducts regular village walkabouts to gain firsthand insight into local contexts, while organized mine site visits help stakeholders better understand operational activities. RGM actively participates in cultural ceremonies to show respect for local traditions and supports sporting events to build a sense of camaraderie. This multifaceted approach addresses socioeconomic concerns and enhances RGM's standing in the community through transparent and consistent dialogue with all stakeholders.

RGM has also developed the following conceptual plans to manage social risks, SRK received and reviewed these plans, including:

- **Community Compensation Plan (2025):** provides fair, transparent compensation to local communities affected by mining operations in forested areas, following international standards (IFC Performance Standard 5 and UN Guiding Principles on Business and Human Rights) and Surinamese law. It ensures full replacement costs for lost access to forest resources while promoting sustainable livelihood restoration through structured community engagement.

- **Community Investment Strategy 2025-2029 (2024):** focuses on sustainable community development through targeted investments, stakeholder engagement, and local capacity building. Aligned with Zijin Gold International's ESG principles, it promotes socioeconomic growth, infrastructure development, and responsible mining practices while addressing operational impacts and preparing for post-closure sustainability. The strategy incorporates international standards like TSM and SDGs to ensure lasting benefits for surrounding communities.
- **Community Response Mechanism (2024):** provides a transparent process for stakeholders to raise and resolve mining-related concerns, following IFC Standards. It handles valid complaints through clear steps while redirecting non-operational issues to appropriate channels, aiming to build trust and address impacts responsibly.

Together, these documents provide a structured framework for maintaining transparent and effective stakeholder relations. RGM maintains close cooperation with various stakeholders, elected officials, Traditional Authorities, and various community groups to ensure transparency about its activities and to maximize benefits while minimizing negative social impacts.

12 Capital Expenditures and Operating Expenses

12.1 Capital Expenditures

Historically capital expenditures ("Capex") refer to those invested into the Project that have been provided by the Company. The total capital invested on the Project by 31 December 2024 is about US$544,271,000, and the asset value as of 31 December 2024 is about US$432,260,000. The historical Capex was not involved in the technical and economic analysis.

The sustaining capital expenditures (Sustaining Capex) and Expansion Capex provided by the mine are summarized in Table 12-1. Among them, the Sustaing Capex was 583,596 thousand US dollars, the Expansion Capex was 91,206 thousand US dollars, and the total Capex was 674,802 thousand US dollars.

Table 12-1: Forecasted Sustaining Capex and Expansion Capex for the Project

Item	Unit	2025	2026	2027	2028	2029	Total
Sustaining Capex	US$ '000	129,536	109,411	117,304	106,212	121,133	583,596
Expansion Capex	US$ '000	39,454	17,809	11,070	11,821	11,052	91,206
Subtotal	US$ '000	168,990	127,220	128,374	118,033	132,186	674,802

Source: Mine data.

12.2 Historical Cash Operating Cost and All-in Sustaining Costs

The cash operating cost mainly includes mining costs, processing costs, and other costs. It should be noted that other costs primarily consist of general and administrative (G&A) costs, refining and sales costs, taxes & surcharges, and royalties, among others. The all-in sustaining cost (AISC) includes the cash operating cost and Sustaining Capex. The historical cash operating cost and AISC are summarized in Table 12-2 and Table 12-3.

Table 12-2: Operating Costs in Years 2022 to 2024 by Cost Categories

Item	Unit	2022	2023	2024
Mining cash cost	US$	101,882,777	143,688,244	129,130,800

12.3 Forecasted Cost

The Project is an operating open pit complex with mining and processing/ hydrometallurgical production. SRK was provided with the Opex estimates for 8 open pits of Koolhoven, J Zone, Pay Caro-East Pay Caro, Rosebel, Mayo, Royal Hill, ETR and Saramacca. The Opex at each pit was estimated with breakdown of oxidised, transitional and fresh ores.

Table 12-4 summarizes a summary of mining operating costs estimated for various open pits.

Table 12-4: Unit Mining Cost

Mining Sector	Type	Unit	Koolhoven	J Zone	PC-EPC*	Rosebel	Mayo	Royal Hill	Saramacca	ETR
Ore	Oxide	$/t	2.35	2.27	2.36	2.3	2.46	2.39	2.23	2.36
	Transitional	$/t	2.71	2.64	2.72	2.67	2.83	2.75	2.62	2.72
	Fresh	$/t	2.73	2.66	2.76	2.69	2.85	2.8	2.64	2.76
Waste	Oxide	$/t	2.38	2.3	2.45	2.33	2.49	2.39	2.23	2.45
	Transitional	$/t	2.72	2.65	2.8	2.68	2.84	2.75	2.62	2.8
	Fresh	$/t	2.79	2.72	2.83	2.74	2.9	2.8	2.64	2.83

* PC – Pay Caro; EPC – East Pay Caro

Administrative costs are estimated in Table 12-5.

Table 12-5: Unit Administrative Cost

Type	Unit	Koolhoven	J Zone	PC-EPC	Rosebel	Mayo	Royal Hill	Saramacca	ETR	Stockpile
Oxide	$/t	3.89	3.89	3.89	3.89	3.89	3.89	3.89	3.89	3.89
Transitional	$/t	3.20	3.20	3.20	3.20	3.20	3.20	3.20	3.20	3.20
Fresh	$/t	4.51	4.51	4.51	4.51	4.51	4.51	4.51	4.51	4.51

The processing unit cost is estimated for US$ 12/t ROM.

Based on the above cost data, SRK calculated the forecasted cash operating cost and AISC, which are summarized in Table 12-6. The forecasted unit cash operating cost and AISC is average of US$ 1,503/oz and US$ 1,590/oz gold respectively.

The forecasted unit cost of ore processed is summarized inTable 12-7, which is average of US$ 34.3/t ROM.

Table 12-6: Forecasted Cash Operating Cost and AISC

Item	Unit	Total	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036

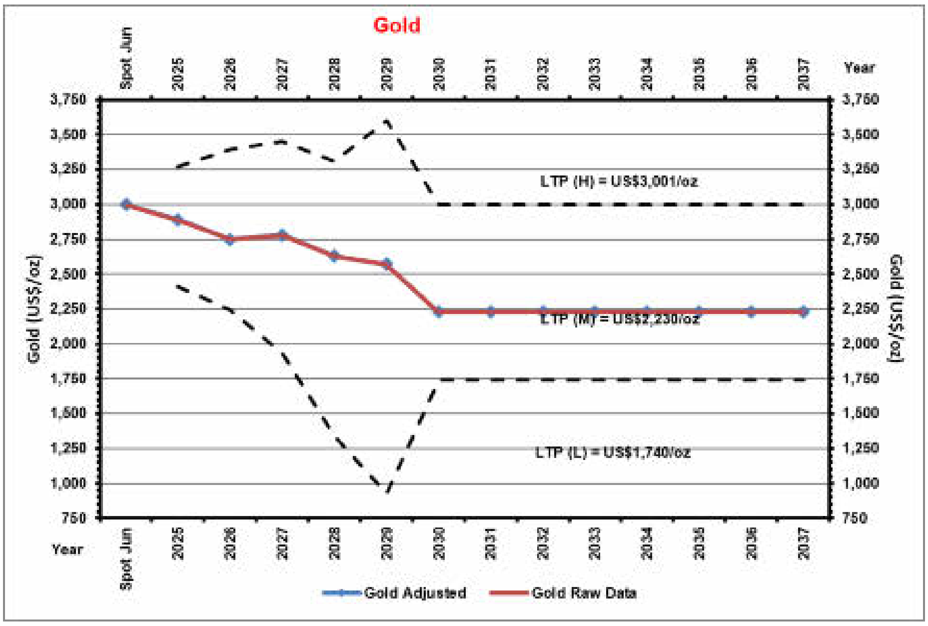
13 Economic Analysis

13.1 Price Forecast

The gold price forecast of Consensus Market Forecast ("**CMF**") published in March 2025 is shown in Figure 13-1 and Table 13-1. SRK was also provided with forecasts in Table 13-2, which sourced from the Zijin Gold International.

Figure 13-1: Gold Price Forecasts of CMF



Sources: CMF forecasts in March 2025

Notes: Gold price in real US$.

Table 13-1: Gold Price Forecasts of CMF

Price Level	Unit	2025	2026	2027	2028	2029	Post-2029
High	US$/oz	3,270	3,390	3,453	3,311	3,600	3,001
Middle	US$/oz	2,890	2,750	2,780	2,630	2,570	2,230
Low	US$/oz	2,414	2,243	1,933	1,339	927	1,740
High	US$/g	105.1	109.0	111.0	106.4	115.7	96.5

Notes: Gold price in real US$.

Table 13-2: Gold Price Forecast of Zijin Gold International

Commodity	Unit	2025	2026	2027	2028	2029	2030	Post-2030
Gold	US$/oz	3,016	3,000	2,800	2,751	2,500	2,500	2,275
Gold	US$/g	97.0	96.5	90.0	88.4	80.4	80.4	73.1

Sources: Zijin Gold International
Notes: Gold price in real US$.

At the Effective Date, Zijin Gold International suggested that the long-term forecast of CMF was rounded to the second significant figure to estimate Ore Reserves, while the price forecasts of Zijin Gold International were used for economic analysis post year 2024. Comparison of Table 13-1 and Table 13-2 indicates that the long-term forecast of Zijin Gold Internation is about 2.0% higher than that of CMF, and that Zijin Gold International's forecasts are generally near to those of CMF's at the middle level. SRK accepted the suggestions due to similar forecasts of gold prices.

13.2 Sales Contracts

There is no specific concern around sales contracts as gold bullion is the final product. A refining cost at US$3.0/oz is applicable in the Project.

13.3 Tax Obligations

A royalty of 2.25% is chargeable on the basis of RGM' revenue and a further 6.5% is applicable to the rest revenue part with gold price exceeding US$425/oz.

- Royalty paid US$ per oz: 2.25%*Au price+0.9775*(Au price-425)*6.5%

Table 13-3: Royalty and Tax Obligations

Item	Unit	Amount	Remarks
Income Tax	%	36	On taxable income
Royalty	%	2.25	On total revenue from the metals
Extra Royalty	%	6.5	On the part of revenue gold price exceeding US$425/oz

13.4 Technical and Economic Analysis

It should be emphasised that the economic analysis presented in this section is based purely on the results of the technical review provided in previous sections and some key assumptions. It is mainly provided for Mineral Reserve estimation/ reporting purposes as required by JORC Code.

13.4.1 Principal Assumptions

As discussed in previous sections, various technical and economic parameters have been reviewed. The discount cash flow ("DCF") model has been used in the economic analysis of the Rosebel Projects and the following simplifications and assumptions are made:

- The production rates are as planned on a yearly basis and ore quality are evenly distributed over a production year (average grades were used).
- The final products will be gold bullion.

- US dollar (US$) is used as the currency and inflation is not considered in the model (real-term model).
- Unit cash costs are also considered constants over a year; and the cash costs do not include depreciation and amortization.
- The base price is shown in Table 13-2.
- Previous capital investment and newly investments have been considered as capital costs. and
- Discount rate of 8.6% will be used in base case, and the WACC assumptions are given in Table 13-4.

Table 13-4: Discount Rate Calculation (WACC Method)

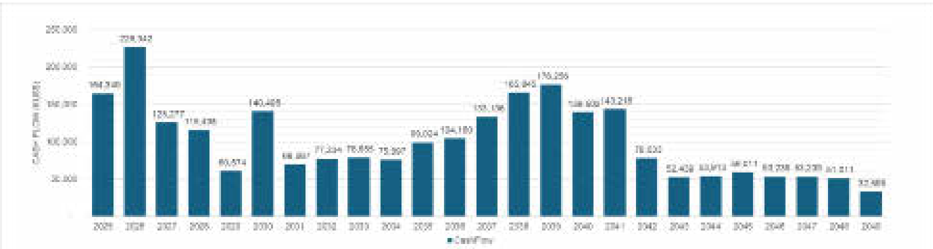
Item	Unit	Value	Remarks
Risk Free Rate	%	2.55%	Treasury bonds rate
Market and Country Risk Premium	%	2.0%	
Beta of the Investment	/	1.5	
Cost of Equity	%	24.0%	
Debt Margin	%	5.0%	Policy rate
Cost of Debt	%	9.93%	
CIT	%	36.0%	
Post-tax Cost of Debt	%	6.3%	
Target Debt Equity Ratio	%	30.0%	
WACC	%	11.0%	
Inflation Rate	%	5.0%	
WACC in Real Terms	%	8.6%	

13.4.2 Net Cash Flow

For the economic analysis of the Rosebel Project, SRK adopted a discount cashflow analysis based on previous assumptions and parameters as discussed in previous sections.

Figure 13-2 shows the Net Cash Flow ("NCF") for the LOM.

Figure 13-2: LOM NCF



Source: SRK prepared.

13.4.3 Net Present Value Result

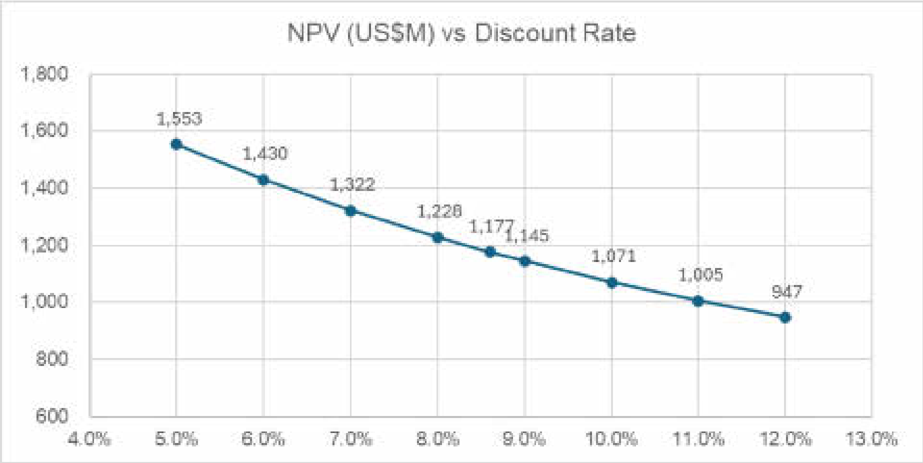
Table 13-5 below presents the net present value ("NPV") for the Rosebel Project as calculated using SRK's discount cash flow ("DCF") analysis. SRK estimated the NPV in a range of US$ 947 million (at 12% discount rate) to US$ 1,430 million (at 6% discount rate), with a base case of US$ 1,177 million using a discount rate of 8.6%. The positive NPVs indicate that the Project is economically viable.

Table 13-5: NPV Projections

Item	Upper Case	Base Case	Lower Case
Discount Rate	6.0%	**8.6%**	12.0%
NPV (US$ Million)	1,430	**1,177**	947

Figure 13-3 shows the NPV varies with the discount rate.

Figure 13-3: NPV Vs Discount Rate



Source: SRK prepared.

13.4.4 Sensitivity Analysis

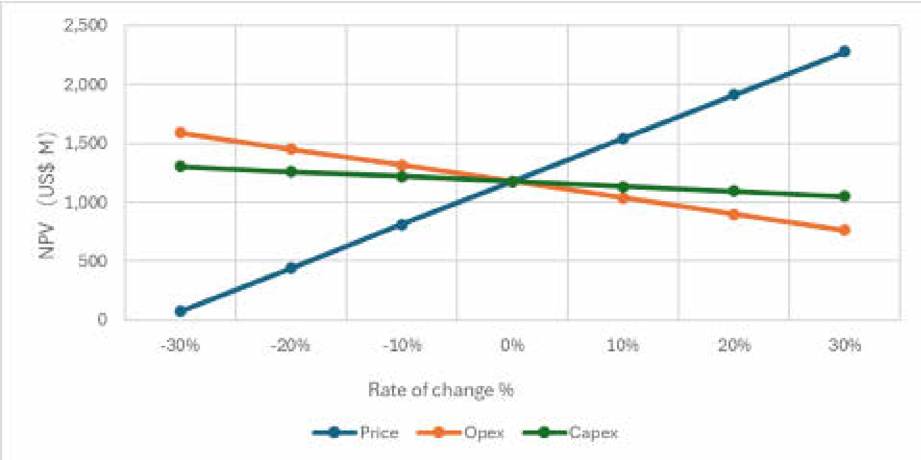
SRK applied the single factor method for conducting the sensitivity analysis. The parameters are considered independent from each other as only one parameter is changed at a time, with all other values kept constant.

Many parameters can affect the Project's NPV. To simplify the calculations, the Opex, Capex, and product price were selected as the essential variable factors on cash flow. The effects of these essential factors on the NPV were analysed within a ±30% range. The corresponding results for the Project are presented in Table 13-6, respectively. The result indicates that the NPV is most sensitive to price, followed by Opex and Capex.

Table 13-6: Sensitivity Coefficient of NPV (at 8.6% Discount Rate, in US$ M)

Factors	Changes								
	-30%	-20%	-10%	0%	10%	20%	30%	Average+1%	Average-1%
Price	75	442	810	1,177	1,544	1,911	2,278	3.12	-3.12
Opex	1,591	1,453	1,315	1,177	1,039	900	762	-1.17	1.17
Capex	1,302	1,260	1,219	1,177	1,135	1,093	1,051	-0.36	0.36

Figure 13-4: Sensitivity Analysis on NPV



Source: SRK prepared.

14 Risk Assessment

SRK completed a risk assessment of the specific risks identified for the Project in relation to their likelihood of occurrence within the LoM and consequence in accordance with the listing rules of the Stock Exchange and the HKEX.

In general, the risk of a project decreases from exploration, through development, to the production stage. The RGM Project is an advanced project.

SRK considered various technical aspects which may affect the feasibility and future cash flow of the RGM Project. SRK's final Risk Assessment is presented in the following table.

Table 14-1:Risk Assessment for RGM Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Unlikely	Moderate	Low
Unexpected Groundwater Ingress	Possible	Moderate	Low
Significant Unexpected Geological Faulting	Unlikely	Moderate	Low
Mining			
Lack of updated data for pit drainage	Unlikely	Moderate	Low
Lack of Skilled Labour and Operation Management	Possible	Moderate	Low
Bad Weather interrupting	Unlikely	Moderate	Low
Ore Processing and Metallurgy			
Lower Throughput	Possible	Moderate	Medium
Lower Recovery	Possible	Moderate	Medium
Higher Production Cost	Possible	Moderate	Medium
Environmental and Social			
Lack of Environmental Permits	Possible	Moderate	Medium
Impact on Flora and Fauna	Unlikely	Minor	Low
Poor Water Management/Dicharge Permits	Possible	Moderate	Medium
Poor Waste Rock and Tailings Management/Approval	Possible	Major	High
Poor Hazardous Materials Management	Unlikely	Moderate	Low
Social Licensee to Operate	Possible	Moderate	Medium
Capital and Operating Costs			
Project Timing Delay	Possible	Moderate	Medium
Capital Cost Increases	Possible	Moderate	Medium
Capital Costs- Ongoing	Possible	Moderate	Medium
Operating Cost Underestimated	Possible	Moderate	Medium

15 Conclusions and Recommendations

15.1 Geology

Rosebel and Saramacca are orogenic greenstone-hosted gold deposits.

Rosebel: Hosted in the Marowijne Supergroup and Rosebel Formation, with key lithologies including volcanic rocks, sedimentary rocks, felsic intrusions, and late diabase dykes. Gold mineralization is structurally controlled, concentrated in shear zones, fold hinges, and lithological contacts.

Rosebel: Divided into North, Central, and South domains, with gold hosted in shear and tension veins. Vein mineralogy varies by domain, including quartz, carbonate, feldspar, and hematite.

Saramacca: Hosted in Paramaka basalt, with gold mineralization associated with the Faya Bergi fault. High-grade mineralization is concentrated in dolomite breccias with pyrite.

Saramacca: Mineralization occurs along N-NW structures, primarily in dolomite breccias within the Faya Bergi fault zone.

15.2 QA/QC

The historical QAQC performance for the Rosebel and Saramacca projects aligns with industry best practices, demonstrating strong accuracy and precision in both the RGM laboratory and Filab. SRK is confident that the data quality is sufficient to support reliable and meaningful mineral resource estimates.

15.3 Resource Estimation

The database used for the estimation was audited by SRK, which found the drilling and assay data to be reliable for defining gold mineralization boundaries and supporting the estimation process. The Mineral Resource model was developed using datasets provided by Rosebel Gold Mines, covering various domains (North: Pay Caro, East Pay Caro, Koolhoven-J Zone, East Tailing Road; South: Royal Hill, Mayo, Roma East, Roma West; Center: Rosebel; and others such as Saramacca, Overman, and Moeroekreek.

As of 31 December 2024 and at a cut-off grade of 0.2 g/t Au for Laterite Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock, the total Mineral Resources for the projects are as follows:

- Measured Mineral Resources: 270.52 Mt grading 0.83 g/t Au, containing 223,533 kg of gold.
- Indicated Mineral Resources: 156.60 Mt grading 0.81 g/t Au, containing 126,658 kg of gold.
- Inferred Mineral Resources: 29.93 Mt grading 0.81 g/t Au, containing 24,152 kg of gold.

15.4 Mining and Ore Reserve

The Rosebel and Saramacca operations utilize conventional open-pit mining methods with a truck-and-shovel fleet, supported by drill-and-blast techniques. Key pits at the Rosebel Mine include Pay Caro, J-Zone, Koolhoven, Royal Hill, Mayo, Rosebel, and the planned East Tailing Road pit, with haulage distances ranging from 1.8 km to 13.5 km. The Saramacca Pit is located 30 kilometers southeast of the Rosebel concession, with mining beginning in late 2019.

At the Rosebel Mine, shovels configured for excavator and front shovel operations, along with a haulage fleet and ancillary equipment, ensure cost-efficient material movement. The Saramacca Mine operates with a simplified fleet of equipment, including a face shovel, backhoes, and Komatsu trucks, sharing resources with Rosebel to promote operational efficiency.

The drilling and blasting program use a standardized fleet of drills with 165 mm boreholes, and all blasting is conducted by RGM personnel. Blast movement monitors are used to track ore displacement, enabling precise adjustments to ore boundaries, minimizing waste contamination, and improving grade recovery. This operational setup ensures optimal productivity across all pits while maintaining cost-efficiency and resource utilization.

Ore Reserve Estimates

Ore Reserves have been estimated for eight open-pit deposits, comprising seven deposits located within the Rosebel Mine area and one deposit within the Saramacca Mine area.

As of December 31, 2024, the total Mineral Reserves for the operation are as follows:

- Proven Reserves: 180,008 kt grading 0.79 g/t Au, containing 141,310 kg of gold.
- Probable Reserves: 41,568 kt grading 0.78 g/t Au, containing 32,336 kg of gold.
- Proven and Probable Reserves: 221,576 kt grading 0.78 g/t Au, containing 173,646 kg of gold.

Open-Pit Operations

The mining operation comprises multiple open pits contributing ore to the processing plant, ensuring a stable annual production rate of 10 Mtpa starting from January 2025. Mining is carried out using conventional truck-and-shovel methods, managed by contractors. Bench heights are designed at 9 meters, with double benching extending to 18 meters in hard rock zones. Haul road configurations include double-lane roads measuring 11 meters in width and single-lane roads measuring 7 meters, ensuring efficient and safe access to mining areas.

The approximate lifespans and start dates of key open-pit operations are as follows:

- Pay Caro Pit: Remaining life of approximately 15 years, commencing January 2025.
- J-Zone Pit: Remaining life of approximately 8 years, commencing January 2026.
- Koolhoven Pit: Remaining life of approximately 9 years, commencing January 2028.
- Royal Hill Pit: Remaining life of approximately 14 years, commencing January 2025.
- Mayo Pit: Remaining life of approximately 14 years, commencing January 2029.
- Rosebel Pit: Remaining life of approximately 10 years, commencing January 2025.
- East Tailing Road Pit: Remaining life of approximately 5 years, commencing January 2027.
- Saramacca Pit: Remaining life of approximately 10 years, commencing January 2025.

- The East Tailing Road (ETR) pit is a planned project with a design consistent with other pits, based on preliminary assumptions and geotechnical recommendations. RGM is required to conduct a detailed technical study to validate and finalize the design for the ETR pit.
- For the Saramacca Mine, the existing geotechnical study is outdated, and RGM should undertake an updated geotechnical analysis to ensure the design remains aligned with current operational and safety standards.

15.5 Mineral Processing and Metallurgy

The RGM plant processes a blend of hard rock, transition ore and soft ore from RGM and SM at an approximate ratio of 4:1, with hard rock comprising 60–70% of the feed. After an upgrade to the crushing system in September 2024, the plant reached an annual processing capacity of 10 Mtpa while handling a blend of 70% hard rock and 30% soft rock.

The overall performance of the RGM plant is excellent with an average gold recovery of over 94% within recent three years, indicated that the process is relatively reasonable and suitable for processing the ore types.

With the development and utilization of the challenging SM ore, the processing plant will need to handle high-organic-carbon ores (approximately 5–6%) and high-arsenic ores (around 1–2%) from the SM deposit. These ore characteristics are anticipated to affect the production performance of the RGM plant. It is recommended that a detailed economic study be conducted by an engineering institute to evaluate the feasibility of constructing a stand-alone processing plant with a flowsheet of "Gravity + Flotation + Bio-oxidation Pre-treatment of Concentrate + Cyanidation."

15.6 Economic Analysis

The LOM all-in sustaining cost ("**AISC**"), including Opex and Sustaining Capex, is US$1,590 per ounce of gold sold.

The DCF method is selected as the foundation of economic analysis. The estimated NPV for the Project is US$ 1,177 million at a discount rate of 8.6%. The base date is set on 31 December 2024.

The positive NPV indicates the Project is economically viable. The sensitivity analysis indicates the NPV is most sensitive to the gold price.

Closure

I. Aan: **ROSEBEL GOLDMINES N.V.**
gevestigd aan de President da Costalaan no. 2 te Paramaribo, voor de tijd van **25 (vijfentwintig) jaren het recht tot exploitatie van goud en geasssocieërde mineralen te verlenen** in of op een perceelland vermoedelijk groot – **4.975 - ha.**, gelegen in de districten Sipaliwini en Brokopondo ten oosten van de Kleine Saramaccarivier en ten westen van de Rijweg naar Pokigron, nader aangeduid op de figuratieve kaart van de landmeter lic. rer.reg. R.I. Amelo Lcs. van 20 maart 2019 en omsloten door de navolgende geografische coördinaten:
(zie achterzijde van het blad)

H 1576 1047o.

II. Te bepalen, dat dit RECHT TOT EXPLOITATIE naast de voorwaarden, welke bij dit aangehaalde decreet bepaaldelijk worden genoemd, verleend wordt onder de volgende voorwaarden:

a. de mijnbouwwerkzaamheden moeten geschieden met eerbiediging van de rechten van derden en bij geschil daaromtrent overeenkomstig de voorschriften door / of vanwege de Staat te geven;

b. dat binnen 3 (DRIE) MAANDEN na de dagtekening dezer beschikking een aanvang dient te worden gemaakt met de mijnbouwwerkzaamheden;

c. voor een aanvang wordt gemaakt met de veldwerkzaamheden, dient het Hoofd van de Geologisch Mijnbouwkundige Dienst officieel in het bezit te zijn van een uitvoerig werkprogramma met bijbehorende schema van de te verrichte werkzaamheden zoals dat tijdens de eerste maanden van het veldwerk afgewerkt zal worden;

d. de houder van dit MIJNBOUWRECHT is verplicht periodiek en wel om de 3 (DRIE) MAANDEN schriftelijk verslag uit te brengen aan het Hoofd van de Geologisch Mijnbouwkundige Dienst, omtrent alle bij of door de werkzaamheden verkregen gegevens en resultaten;

e. het Hoofd van de Geologisch Mijnbouwkundige Dienst en het door hem daartoe aangewezen personeel hebben gedurende de normale werktijden toegang tot het werkterrein teneinde erop toe te zien dat het MIJNBOUWRECHT in het algemeen en bij dit MIJNBOUWRECHT geldende voorwaarden in het bijzonder correct worden nageleefd;

f. de verlenging van het RECHT TOT EXPLOITATIE zal slechts mogelijk zijn zolang de houder hiervan voldoet aan de in de punten b, c, d en e gestelde bepalingen en voorwaarden en deze correct zijn nagekomen, een en ander ter beoordeling van de Minister van Natuurlijke Hulpbronnen.

III. De bijzondere aandacht van betrokkene erop te vestigen, dat:

a. jaarlijks een bedrag van **SRD. 11.940 (elfduizend en negenhonderd veertig Surinaamse Dollars voor jaar 1 t/m jaar 5); SRD. 14.328 (veertienduizend en driehonderd achtentwintig Surinaamse Dollars voor jaar 6 t/m jaar 10); SRD. 17.910 (zeventienduizend en negenhonderd tien Surinaamse Dollars voor jaar 11 t/m jaar 15) en SRD. 23.880 (drieentwintig duizend en achthonderd en tachtig Surinaamse Dollars voor jaar 16 t/m jaar 25)** gestort dient te worden in Staatskas aan oppervlakterechten; "Dit bedrag geldt totdat bij wet en/of ministeriële beschikking aanpassingen zijn gepleegd, waarbij nieuwe bedragen van kracht zijn ".

b. slechts met toestemming van de Overheid buitenlanders in dienst mogen worden genomen;

c. rekening gehouden zal moeten worden met de plaatselijke omstandigheden;

d. **de verlengingsaanvraag dient niet langer dan twee jaren voorafgaande aan de vervaldatum van het recht te geschieden;**

g. bij het voldoen aan de onder III d genoemde verplichting een door het Hoofd van de Geologisch Mijnbouwkundige Dienst afgegeven verklaring overgelegd dient te worden, waarin vermeld staat dat gedurende het afgelopen jaar geheel is voldaan aan het onder punt II gestelde en verder aan punt III a en III b.

IV. Aan te tekenen voor zover nodig:

1. dat de Staat op generlei wijze aansprakelijk zal zijn voor geleden schade, verlies dan wel vermindering van verwacht voordeel, als gevolg van het onderzoek naar en van de bouw en uitbreiding van werken tot het in ontwikkeling brengen van het waterkrachtpotentieel van Suriname en meer in het bijzonder van dat van het Brokopondoproject;

2. dat de Staat op generlei wijze aansprakelijk zal zijn voor geleden schade, verlies dan wel vermindering van verwacht voordeel door maatregelen, die getroffen zullen moeten worden ter veiligstelling van het beheer en onderhoud van een of meer stuwmeerbekkens, voor het volledig gebruik en benutten van het water, dat toevloeit naar de stuwmeerbekkens en ook geen aansprakelijkheid zal dragen voor de gevolgen van overlast door het water of de ecologische gevolgen van het ontstaan en van het beheer van de stuwmeren;

3. dat geen werken zullen worden uitgevoerd die waterverlies zullen veroorzaken of overlast van het beheer en het onderhoud van stuwmeren tengevolge zullen hebben.

V. Afschrift van deze beschikking ingevolge het Staatsbesluit van 11 mei 1989 S.B.1989 No.39) binnen een voor verlenging door de Minister vatbare termijn van EEN MAAND, na de dagtekening daarvan, aan de Hypotheekbewaarder ter overschrijving in de openbare registers aan te bieden, nadat de verschuldigde zegelrechten en overschrijvingskosten, respectievelijk ten bedrage van **SRD. 10.447,50 (tienduizend en vierhonderd zevenenveertig 50/100 Surinaamse Dollars)** en Srd. 22.50 (tweeentwintig 50/100 Surinaamse Dollar) ten Hypotheekkantore gestort zijn.

VI. Afschrift van deze beschikking te zenden aan de Rekenkamer van Suriname,
de Districtscommissarissen van – **Sipaliwini en Brokopondo** - ,
het Hoofd van de Dienst der Domeinen,
de Inspecteur der Invoerrechten en Accijnzen,
het Hoofd van de Geologisch Mijnbouwkundige Dienst, het Hoofd van de Dienst Grondinspektie, de Secretaris van de Kamer van Koophandel en Fabrieken en de Direkteur van Ruimtelijke Ordening, Grond- en Bosbeheer, alsmede AANGETEKEND aan belanghebbende.

Voor éénsluidend afschrift,
De Direkteur van Natuurlijke Hulpbronnen

Paramaribo, 02 mei 2019
De Minister van Natuurlijke Hulpbronnen,

MINISTERIE VAN
NATUURLIJKE HULPBRONNEN

HYPOTHEEKKANTOOR
DAGREGISTER A
DEEL/No 1442
d.d. 24 febr. 2003

No.: G.M.D. : 468/02

Onderwerp: Verlening van het recht tot EXPLOITATIE van Goud, Diamant en andere Delfstoffen

Aan : Rosebel Gold Mines N.V.

DE MINISTER VAN NATUURLIJKE HULPBRONNEN

Herlezen de Delfstoffenovereenkomst van 07 april 1994 tussen de Republiek Suriname, Golden Star Resources Ltd. en N.V. Grasshopper Aluminum Company (N.V. Grassalco)

Gezien het advies van de Onderdirecteur Mijnbouw van 13 december 2002.

Gehoord de Districtscommissaris van BROKOPONDO

GELET OP:

1. het "Decreet Mijnbouw" E-58 (S.B. 1986 no. 28), houdende algemene reglement omtrent de opsporing en ontginning van delfstoffen;
2. de Staatsbesluiten van 11 mei 1989 (S.B. 1989 No. 39 en 40);
3. de Brokopondo - overeenkomst behorende bij de wet 25 januari 1958 (G.B. No. 4) en op de wet van 3 augustus 1977 No.8821 (Staatsblad No.45).
4. de Delfstoffenovereenkomst van 07 april 1994
5. de Wet van 22 maart 1994 van de Delfstoffenovereenkomst met Golden Star Resources Ltd. en N.V. Grasshopper Aluminum Company (N.V. Grassalco)
6. de Wijzigingen en Aanvullingen van de Delfstoffenovereenkomst van 07 april 1994, na goedkeuring door de Nationale Assemblee

HEEFT BESLOTEN:

I. Aan : Rosebel Gold Mines N.V. gevestigd te Paramaribo, Heerenstraat no. 8, voor de tijd van 25 (vijf en twintig) JAREN het RECHT TOT DE EXPLOITATIE VAN GOUD, Diamant en andere Delfstoffen te verlenen in of op een perceelland vermoedelijk groot 17. 000 ha., gelegen in het district Brokopondo, aan weerszijden van de spoorbaan, nader aangeduid op de figuratieve kaart van de landmeter J.G. van der Jagt, d.d. 11 maart 1991, omsloten door de volgende geografische coördinaten :

N.B.: 5° 9' 56.7"	W.L. : 55° 16' 3.9"
5° 3' 16.7"	55° 7' 6.2"
5° 5' 21.3"	55° 20' 3.3"
5° 7' 9.5"	55° 16' 59.7"
5° 5' 50.8"	55° 5' 0"
5° 3' 10.2"	55° 5' 0"
5° 6' 0.7"	55° 11' 7.2"

II. Te bepalen, dat dit RECHT TOT EXPLOITATIE naast de voorwaarden, welke bij dit aangehaalde decreet bepaaldelijk worden genoemd ,verleend wordt onder de volgende voorwaarden:

a. dat binnen 3 (DRIE) MAANDEN na de dagtekening dezer beschikking een aanvang dient te worden gemaakt met de mijnbouwwerkzaamheden;

b. voor een aanvang wordt gemaakt met de veldwerkzaamheden, dient het Hoofd van de Geologisch Mijnbouwkundige Dienst officieel in het bezit te zijn van een uitvoerig werkprogramma met bijbehorende schema van de te verrichte werkzaamheden zoals dat tijdens de eerste maanden van het veldwerk afgewerkt zal worden;

c. de houder van dit MIJNBOUWRECHT is verplicht periodiek en wel om de 3 (DRIE) MAANDEN schriftelijk verslag uit te brengen aan het Hoofd van de Geologisch Mijnbouwkundige Dienst, omtrent alle bij of door de werkzaamheden verkregen gegevens en resultaten;

d. het Hoofd van de Geologisch Mijnbouwkundige Dienst en het door hem daartoe aangewezen personeel hebben gedurende de normale werktijden toegang tot het werkterrein teneinde erop toe te zien dat het MIJNBOUWRECHT in het algemeen en bij dit MIJNBOUWRECHT geldende voorwaarden in het bijzonder correct worden nageleefd;

e. de verlenging van het RECHT TOT EXPLOITATIE zal slechts mogelijk zijn zolang de houder hiervan voldoet aan de in de punten a, b, c en d gestelde bepalingen en voorwaarden en deze correct zijn nagekomen, een en ander ter beoordeling van de Minister van Natuurlijke Hulpbronnen.

III. De bijzondere aandacht van betrokkene erop te vestigen , dat:

a. 's jaarlijks een bedrag van Sf 3.400.000,- (drie miljoen vierhonderd duizend gulden) gestort dient te worden in Staatskas aan oppervlakterechten;

b. slechts met toestemming van de Overheid buitenlanders in dienst mogen worden genomen;

c. rekening gehouden zal moeten worden met de plaatselijke omstandigheden;

d. de verlengingsaanvraag tenminste 30 (DERTIG) DAGEN voor de vervaldatum van dit recht zal moeten geschieden;

e. bij het voldoen aan de onder III d genoemde verplichting een door het Hoofd van de Geologisch Mijnbouwkundige Dienst afgegeven verklaring overgelegd dient te worden, waarin vermeld staat dat gedurende het afgelopen jaar geheel is voldaan aan het onder punt II gestelde en verder aan punt III a.

IV. Aan te tekenen voor zoveel nodig:

1. dat de Staat op generlei wijze aansprakelijk zal zijn voor geleden schade, verlies dan wel vermindering van verwacht voordeel, als gevolg van het onderzoek naar en van de bouw en uitbreiding van werken tot het in ontwikkeling brengen van het waterkrachtpotentieel van Suriname en meer in het bijzonder van dat van het Brokopondoproject;

2. dat de Staat op generlei wijze aansprakelijk zal zijn voor geleden schade, verlies, dan wel vermindering van verwacht voordeel door maatregelen, die getroffen zullen moeten worden ter veiligstelling van het beheer en onderhoud van een of meer stuwmeerbekkens, voor het volledig gebruik en benutten van het water, dat toevloeit naar de stuwmeerbekkens en ook geen aansprakelijkheid zal dragen voor de gevolgen van overlast door het water of de ecologische gevolgen van het ontstaan en van het beheer van de stuwmeren;

3. dat geen werken zullen worden uitgevoerd die waterverlies zullen veroorzaken of overlast van het beheer en het onderhoud van stuwmeren tengevolge zullen hebben.

V. Afschrift van deze beschikking ingevolge het Staatsbesluit van 11 mei 1989 (S.B.1989 No.39) binnen een voor verlenging door de Minister vatbare termijn van EEN MAAND, na de dagtekening daarvan, aan de Hypotheekbewaarder ter overschrijving in de openbare registers aan te bieden, nadat de verschuldigde zegelrechten en overschrijvingskosten, respectievelijk ten bedrage van Sf.2.975.000,- (twee miljoen negenhonderd vijf en zeventig duizend gulden) en Sf.1000,- (één duizend gulden) ten Hypotheekkantore gestort zijn.

VI. Afschrift van deze beschikking te zenden aan de Rekenkamer van Suriname, de Districtscommissaris van Brokopondo, het Hoofd van de Dienst der Domeinen, de Inspecteur der Invoerrechten en Accijnzen, het Hoofd van de Geologisch Mijnbouwkundige Dienst, de Secretaris van de Kamer van Koophandel en Fabrieken, Centrale Bank van Suriname (afd. Goudopkoop), almede AANGETEKEND aan belanghebbende.

Appendix B JORC Code,2012 Edition - Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• After logging, the on-site geologist defined intervals to be sampled and recorded "cut from/ to" intervals in a sampling sheet kept on site. In general, only mineralised portions of the drill core was sampled for assaying including some samples of wall rocks. The core was manually cut in half lengthways using a saw splitter. • Geologists perform geological logging first then mark sample location to ensure sample representivity. • Geologists observe the drill core then mark cut line to ensure the core cutting is even.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The Rosebel Gold Mine and Saramacca deposits has been carried out using diamond drilling ("DD"), reverse circulation ("RC") drilling. • For DD, Major Drilling uses UDR-200D track mounted rigs at both Rosebel and Saramacca.Production varies between 45 m/shift and 65 m/shift. Holes are drilled using HQ size wireline equipment in saprolite, reducing to NQ size in transitional to hard rock. • RC drilling has been executed by Major Drilling at both Rosebel and Saramacca. Major Drilling uses a Maxi Drill for exploration purposes. The Maxi Drill uses a detached auxiliary compressor of 1,150 cfm and 500 psi. • Since 2016, core orientation using a Reflex ACTII tool is done on DD core from the Rosebel and Saramacca concessions.

Criteria	JORC Code explanation	Commentary
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• For DD Drilling, the recovery is usually very good (>90%), and drill holes with unacceptably low recovery in mineralized zones are redrilled until reaching an acceptable level of representativeness (minimum of 65% on short intervals and a minimum average of 75% to 80% is targeted). Core recovery in saprolite and transition material is improved by using polymer additives combined with high concentrations of bentonite. • For RC Drilling, the RC Maxi rig can drill holes up to 150 m using a compressor to collect good quality dry samples. The cuttings pass through a Metzke cyclone splitter and samples are taken every two metres and weigh in average three to five kilograms.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The RGM SurEx and MinEx teams implement for all sampling methods to be strictly followed by its staff and personnel. These SOPs are reviewed on a regular basis dependent on site conditions and other specific requirements. • logging is qualitative in nature; all cores were photographed. • All logging and sample information is stored in a secure SQL database.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• For DD, all geological and geotechnical logging, as well as core splitting and sampling, conducted by MinEx were performed at the Rosebel MinEx core shack. Similarly, the drilling campaign at Saramacca was executed by SurEx at the Saramacca camp core shack. Following the initial logging and handling, the core boxes were transported to the mine, where the half-core was split and sampled. • For FA sample preparation, the coarse samples are then riffle split to approximately 800g, than pulverised to approximately 95% passing -170 mesh, and a 30 g (RGM laboratory) or 50 g (Filab) pulp sample is taken for analysis. • For FA analysis, approximately 30 g (RGM laboratory) or 50 g (Filab) of pulp material, prepared to 95% passing -170 mesh is used. • Each machine, sample pan, and work area were cleaned using compressed air between sample runs. • Sample grain size were calculated with the empirical formula to have appropriate representative.

Criteria	JORC Code explanation	Commentary
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Rosebel samples can be analysed using either PAL or FA. Typically, grade control RC samples and exploration RC samples are analysed using the PAL method, whereas DD samples are analysed using FA. For Saramacca samples, both grade control and exploration samples are systematically analysed using FA due to the lower metallurgical recoveries observed for the Saramacca deposit. • The main laboratory adopted their own internal quality control management systems. All samples delivered for assaying were inserted quality control/ QC samples including blank samples, Certificated Reference Materials (CRMs), internal duplicates and umpire check samples.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Pengfei Xiao and Bonnie Zhao visited the site between 26th to 30th June. • No twin hole used. • Pengfei Xiao and Bonnie Zhao discussed with site geologists respond for geological logging, sampling and data management.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Drill hole surveys are completed using a Flex-IT or Reflex EZ TRAC single-shot / multi-shot instrument, which can also provide magnetometric data down the length of the hole. • Since 2016, core orientation using a Reflex ACTII tool is done on DD core from Rosebel and Saramacca. • The coordinate system of this Project is based on the UTM (WGS 1984 Datum,Zone 21N) projection system and Local UTM coordinates. • Local UTM coordinates which can be to UTM coordinates set in zone 21N projection coordinate system, WGS 1984 by using relevant transformation parameters. • The field technician locates the planned drill hole collar by using a hand held GPS or a ground based high precision Leica GPS unit. • The drillhole spacing is sufficient to support Mineral Resource estimation and classification. •

Criteria	JORC Code explanation	Commentary
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Not applicable for exploration results. • The drillhole spacing is sufficient to support Mineral Resource estimation and classification. • All data from the database containing the flagged raw sample intervals were composited at equal length.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Most drill holes were almost vertical to the mineralisation. No material biased sampling result was recognised. • Not applicable to this project.
Sample security	• *The measures taken to ensure sample security.*	• Chain of custody was managed by site staff. geologists managed the process from sampling to sample delivery to preparation facility. All operational information was recorded, and each sample and assay have traceable record.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• A review of the sampling techniques and data was carried out by SRK as part of the Mineral Resource estimate and the database is considered to be sufficient quality to carry out the Mineral Resource estimation.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• See Section 3.1, 3.2 and 3.3 • SRK have not independently verified the standing of the tenements.

Criteria	JORC Code explanation	Commentary
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• See Section 6.1 and 6.2
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Rosebel and Saramacca are orogenic greenstone-hosted gold deposits. Rosebel includes seven main deposits, with mineralization controlled by shear zones and folds. • Saramacca mineralization is concentrated along the Faya Bergi fault and subsidiary shear zones. • Three mineralized/structural domains are observed at Rosebel: the North, Central, and South domains. • The Saramcca (SM) deposit mineralization is principally hosted within a series of N-NW trending structures ranging from two metres to 40 m in width over a strike length of 2.2 km and is open along strike. • Mineralization within the Rosebel deposits is structurally controlled and gold is hosted in both shear and tension veins which are tightly associated in space and time. • Several sub-parallel structures have been identified within the Saramcca (SM) deposit
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• See Section 7.2.3, 7.3.3, 7.4.3, 7.5.3, 7.6.3, 7.8.3, 7.9.3

Criteria	JORC Code explanation	Commentary
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• The main ore body outlier value samples has been capping. • All raw samples were composited along downhole lengths. • No metal equivalents are reported.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• SRK was provided with the Leapfrog format orebody wireframes of all mineralized domains. SRK has reviewed the solid models provided by the client and they are acceptable for the Mineral Resource estimation.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Please refer to the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Please refer to the report of about *Exploration Project*
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• SRK is not aware of any material or substantive exploration data that has not been reported.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• SRK suggests that further geological studies and mineability assessments (including metallurgical testing and preliminary economic evaluations) should be conducted to better define the potential of these mineralized material.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• SRK was provided with the Csv format tables and database of all drill holes/ trenches/ underground channel samples. SRK has reviewed the tables and database provided by the client and they are acceptable for the Mineral Resource estimation. • The data validation process involves: Setting restrictions in the database to ensure validation, such as checking for duplicate/ exact sampling intervals, ensuring sampling intervals do not exceed the maximum hole depth, validating geological codes, and addressing missing assays. Inspecting for errors in the import of Collar, Survey, and Assay data through a 3D view.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The site visit was conducted during 26 to 30 June 2025.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Geological interpretation is based on information such as collar, survey, lithology, and assay data. It is also supported by surface geological mapping and trenching. • The mineralized domains were interpretated by the samples collected based on grade and geological domain. • The data used for the Mineral Resource estimation is derived from reliable exploration reports and laboratory analysis. • See Section 7.2.4, 7.3.4, 7.4.4, 7.5.4, 7.6.4, 7.8.3, 7.9.4
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• Extrapolation was limited to approximately half of the level interval and the drill spacing.

Criteria	JORC Code explanation	Commentary
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	• Block models were used for grade estimation. The block model used the local coordinate system as that was used in data collection. • The Ordinary Kriging method was used for grade estimation via Leapfrog software. • Conduct three sets of search interpolations, with the different search radius. • SRK performed a thorough validation of the interpolation model results, which included visual examination.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• Specific gravity (SG) ore samples sealed and sent to the laboratory for both Au and SG analysis, the tonnages are estimated on a dry basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• A cut-off grade of 0.2 g/t Au for Laterite、Saprolite and Transition, and cut-off grade of 0.3 g/t Au for Rock were used to report the in situ Mineral Resources. This cut-off grade is estimated to be the minimum grade required for economic extraction at current prices.

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• Open pit mining is adopted.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• The RGM Plant has been operating commercially for over 20 years. • Historically, test work has focused on saprolite, transition, and hard rock materials from various Rosebel deposits. Furthermore, since 2017, three phase metallurgical test work programs were conducted on the SM deposit. • In April 2023, Xiamen Zijin Tech conducted the " *Optimization Tests on Ore Samples from Rosebel Gold Mines*" and "*Optimization & Process Investigations on SM Refractory Ore*". • The test details are summarized in Section 9.2.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	Environmental factors or assumptions: • RGM has been operating under a series of environmental and social permits approved through formal government channels in Suriname. Environmental assumptions for the Mineral Resource estimation rely on the continuation of these permitted activities and infrastructure, including tailings storage and water management systems. While a formal Environmental Impact Assessment (EIA) approval is not in place, four Environmental and Social Impact Assessments (ESIAs) have been conducted since 2002, aligned with both national and IFC standards. • Although gaps exist—such as the absence of formal EIA approval and discharge permits—interim measures, including environmental monitoring and engagement with authorities, support continued compliance. These measures form the basis of the assumption that existing waste and residue disposal practices can continue under the current regulatory regime. However, as Suriname's Environmental Framework Act (2020) evolves, future permitting requirements may change.

Criteria	JORC Code explanation	Commentary
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person’s view of the deposit.*	• See section 5, 6 and 7.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• See section 7.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• See section 6.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• The Mineral Resource estimate was reviewed by SRK in-house geologist(s) which is the basis of Ore Reserve Estimate dated 31 December 2024 • Reported Mineral Resource is inclusive of potential Ore Reserve material.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• Mr. Pengfei Xiao and a team including geologist Mr. Liang Li; mining engineer Mr. Falong Hu, Mr. Donghao Luo; processing engineer Mr. Lanliang Niu; and environmental scientist Mr. Nan Xue, conducted the site visit from 26 to 27 June 2025.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• This project is an operating mine with 1 processing plant and fed from 4 open pits. • The Feasibility Study/ technical study was updated by Newmount in 2022. • SRK reviewed technical studies, as well as the current mining plan and actual operation data, and supportive studies, the level of accuracy of the Modifying Factors proposed in the studies and/ or modified by the Company, are considered by SRK to be akin to a pre-feasibility level study ("PFS"), which are suitable for the Ore Reserve Estimates.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Due to the different mineralization type and applied different processing methodology to J-Zone, Kollhoven, Mayo, Pay Caro, Rosebel, Royal Hill and East Tailing Road pits within the Rosebel Mine, as well as the Saramacca pit in the Saramacca Mine, different inputs for the Cut-off grade (COG) estimates were employed. Refer to Table 8-1 Estimated for Cut-off Grades on J-Zone, Kollhoven, Mayo, Pay Caro, Rosebel, Royal Hill and East Tailing Road pits within the Rosebel Mine, as well as the Saramacca pit in the Saramacca Mine by SRK Consulting

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining loss factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• The open pit mining method is applied to J-Zone, Kollhoven, Mayo, Pay Caro, Rosebel, Royal Hill and East Tailing Road pits within the Rosebel Mine, as well as the Saramacca pit in the Saramacca Mine. The open pit optimization, detail design, scheduling processes were considered during the mine plan. • Roseble gold mine optimized the open pit shell support the mine design review using Whittle program package. The optimized pit shell was generated using the Lerchs-Grossman 3D or Psuedoflow algorithm. The open pit design was guided by optimization parameters and input criteria before being manually refined by engineers. The inputs parameters have been reviewed. • The slope parameters were provided during the previously studied and not updated this time, The last geotechnical study was conducted by SRK Consulting (Canada) Inc. in 2017. There were no material changes since the last study as reviewed by Newmount at 2025. The overall slope angle was in range of 22 to 35 degree in different open pit wall zones. • Based on reviewing the operational practices, SRK has applied mining dilution factors of 20% for the Koolhoven Open Pit, 17% for the J-Zone open pit, 15% for the Pay Caro Open Pit, 13% for Mayo Open Pit, 31% for the Royal Hill Open Pit, 13% for the Rosebel Open Pit, 15% for the East Tailing Road Open Pit, and 21% for the Saramacca open pit in the Ore Reserve estimates. • Based on reviewing the operational practices, SRK has applied mining dilution factors of 1% for the Koolhoven Open Pit, 4% for the J-Zone open pit, 1% for the Pay Caro Open Pit, 1% for Mayo Open Pit, 5% for the Royal Hill Open Pit, 3% for the Rosebel Open Pit, 1% for the East Tailing Road Open Pit, and 2% for the Saramacca open pit in the Ore Reserve estimates. • The minimum mining width is 5 meters. • End of month survey ("EOM") of 31 December 2024 is the latest data source for the cut-off date. • Inferred Mineral Resources are excluded during open pit shell generated nor in the Ore Reserves conversion. • All open pits are operating, and various facilities are well developed. All necessary mining infrastructure, such as the explosives magazine, mine drainage, and waste rock dump, is fully established. All necessary infrastructure accounted for to support mining operations

Criteria	JORC Code explanation	Commentary
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.* • *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• The RGM Plant has been operating commercially for over 20 years. • Historically, test work has focused on saprolite, transition, and hard rock materials from various Rosebel deposits. Furthermore, since 2017, three phase metallurgical test work programs were conducted on the SM deposit. • In April 2023, Xiamen Zijin Tech conducted the " Optimization Tests on Ore Samples from Rosebel Gold Mines" and "Optimization & Process Investigations on SM Refractory Ore". • The Gravity by Falcon & Acacia and CIL process are adopted in the plant and have obtained average gold recovery of about 95% over past three years. • The details are summarized in Section 9.
Environmen-tal	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Environmental studies have been undertaken through four ESIAs since 2002. While historical documentation gaps exist (e.g., missing formal approval for the 2002 ESIA and lack of updated EIAs for specific pits), the operation has continued under a functioning regulatory framework and regular environmental oversight. • The current Tailings Storage Facility (TSF) infrastructure spans into an exploration permit area (Thunder Mountain GMD 467/24), which does not legally authorize infrastructure development. Although environmental approvals for the TSF expansion have been granted, the necessary exploitation permits for legal infrastructure use remain pending. The permit expires in 2026, and if not converted, may result in non-compliance or operational disruption. • Additionally, the absence of a formal surface water discharge permit, as required under Suriname's evolving environmental legislation, represents a compliance risk. These issues are not considered material to the current Ore Reserve estimate but could influence future regulatory obligations.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• See section 10 and section 11

Criteria	JORC Code explanation	Commentary
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• See section 12
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Sensitivity analysis has been conducted against the changes of • production prices (or incomes), Opex and Capex. • The project has its own smelters, and can produce saleable gold products, and copper cathodes in the market.
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• See section 12
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• Section 13.4.3
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• RGM operates near five Maroon communities, including one located within the concession area. The company has developed a structured stakeholder engagement strategy, cultural heritage management plans, and compensation mechanisms that align with international standards. These initiatives help maintain its social license to operate. No unresolved land access disputes or significant social opposition are currently reported.

Criteria	JORC Code explanation	Commentary
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	**Other – Governmental Approvals** The operation holds the required licenses and approvals for current activities. However, key permitting gaps remain, including: - Lack of formal approval documentation for historical EIAs; - No formal surface water discharge permit under newly introduced environmental law; - TSF infrastructure located on an exploration concession, requiring conversion to an exploitation title. • These gaps could pose medium-term compliance risks, particularly as Suriname's environmental regulatory framework continues to develop.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• See section 8.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• See section 8 and 9.

Criteria	JORC Code explanation	Commentary
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• See section 8.

Appendix C Compliance with Chapter 18

Chapter 18				Sections in SRK's Report
18.01	**DEFINITIONS AND INTERPRETATION**			
18.02-18.04	**CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES**			
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.			
18.03	A Mineral Company must:—			
	(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—		3.1
		(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or	
			Note: 'control over a majority' means an interest greater than 50%.	
		(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which gives it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
	(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—		
		(a)	Indicated Resources; or	7.8
		(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	7;8
	(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—		12;13

Chapter 18				Sections in SRK's Report
		(a)	workforce employment;	
		(b)	consumables;	
		(c)	fuel, electricity, water and other services;	
		(d)	on and off-site administration;	
		(e)	environmental protection and monitoring;	
		(f)	transportation of workforce;	
		(g)	product marketing and transport;	
		(h)	non-income taxes, royalties and other governmental charges; and	
		(i)	contingency allowances;	
		Note:	A Mineral Company must: • set out the components of cash operating costs separately by category; • explain the reason for any departure from the list of items to be included under cash operating costs; and • discuss any material cost items that should be highlighted to investors.	
	(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—		13
		(a)	general, administrative and operating costs;	
		(b)	property holding costs; and	
		(c)	the cost of any proposed exploration and/or development; and	
		Note:	Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.	

Chapter 18			Sections in SRK's Report
	(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has sufficient available working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.	12
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.		
	Note:	A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.	
18.05-18.08	**CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS**		
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—		
	(1)	a Competent Person's Report;	Whole Report

Chapter 18				Sections in SRK's Report
	(2)	a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;		
	(3)	the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;		3
	(4)	a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;		
	(5)	disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and		14
	(6)	if relevant and material to the Mineral Company's business operations, information on the following:—		
		(a)	project risks arising from environmental, social, and health and safety issues;	11
		(b)	any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	
		(c)	compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	

Chapter 18				Sections in SRK's Report
		(d)	sufficient funding plans for remediation, rehabilitation and closure and removal of facilities in a sustainable manner;	
		(e)	environmental liabilities of its projects or properties;	
		(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	
		(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	
		(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	
18.06-18.08	**Additional disclosure requirements that apply to certain new applicant Mineral Companies**			not applicable
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.			
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.			

Chapter 18			Sections in SRK's Report
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.		
18.09-18.13	**RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION** OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS		not applicable
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—		
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;	
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;	Whole Report
		Note: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.	
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and	
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.	

Chapter 18		Sections in SRK's Report
	Note: Material liabilities that remain with the issuer on a disposal must also be discussed.	
18.10-18.11	**Requirements that apply to listed issuers**	not applicable
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.	
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.	
18.12-18.13	Requirements that apply to Mineral Companies and listed issuers	not applicable
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.	

Chapter 18		Sections in SRK's Report
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.	
18.14-18.17	**CONTINUING OBLIGATIONS**	not applicable
18.14	Disclosure in reports	
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.	
18.15-18.17	Publication of Resources and Reserves	not applicable
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.	
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.	
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18.	

	Chapter 18		Sections in SRK's Report
	Note :	Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.	
18.18-18.27	**STATEMENTS ON RESOURCES AND/OR RESERVES**		
18.18	Presentation of data		Whole Report
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.		
18.19	Basis of evidence		
18.19	All statements referring to Resources and/or Reserves:—		
	(1)	in any new applicant listing document or circular relating to a Relevant Notifiable Transaction must be substantiated in a Competent Person's Report which must form part of the document; and	Whole Report
	(2)	in all other cases, must at least be substantiated by the issuer's internal experts.	
18.20	Petroleum Competent Persons' Reports		
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.		

Chapter 18			Sections in SRK's Report
18.21-18.22	**Competent Person**		
18.21	A Competent Person must:—		
	(1)	have a minimum of five years' experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	2.10
	(2)	be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	2.10
	(3)	take overall responsibility for the Competent Person's Report.	
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—		2.11
	(1)	have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2)	not be remunerated with a fee dependent on the findings of the Competent Person's Report;	

Chapter 18			Sections in SRK's Report
	(3)	in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4)	in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
18.23	**Additional requirements of Competent Evaluators**		not applicable
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—		
	(1)	have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2)	have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3)	hold all necessary licences.	
	Note :	A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.	
18.24	**Scope of Competent Persons' Reports and Valuation Reports**		
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—		2.2
	(1)	be addressed to the Mineral Company or listed issuer;	2.1

Chapter 18			Sections in SRK's Report
	(2)	have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	2.4
	(3)	set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	2.2
18.25-18.26	**Disclaimers and Indemnities**		
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.		2.3
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.		2.9
18.27	Obligations of sponsor		

Chapter 18				Sections in SRK's Report
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.			
18.28-18.34	REPORTING STANDARD			
18.28-18.30	Mineral reporting standard			
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.			
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—			
	(1)	under:		
		(a)	the JORC Code;	2.2
		(b)	NI 43-101; or	
		(c)	the SAMREC Code,	
		as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		

Chapter 18				Sections in SRK's Report
	Note:	The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.		
18.30	A Mineral Company must ensure that:—			
	(1)	any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;		8
	(2)	estimates of mineral Reserves and mineral Resources are disclosed separately;		7;8
	(3)	Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;		
	(4)	for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—		12;13
		(a)	the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	
		(b)	if a contract for future prices of mineral Reserves exists, the contract price is used; and	
	(5)	for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.		13

Chapter 18			Sections in SRK's Report
18.31-18.33	**Petroleum reporting standard**		not applicable
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.		
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—		
	(1)	under PRMS as modified by this Chapter; or	
	(2)	under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	Note:	A Reporting Standard applied to specific assets must be used consistently.	
18.33	A Mineral Company must ensure that:—		
	(1)	where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;	

Chapter 18			Sections in SRK's Report
	(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
	(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	
	(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	
		Note: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.	

Chapter 18			Sections in SRK's Report
	(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
		Note: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.	
	(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
	(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	
18.34	**Mineral or Petroleum Asset Valuation Reports**		not applicable
18.34	A Mineral Company must ensure that:—		
	(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
	(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	

Chapter 18			Sections in SRK's Report
	(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
	(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

Appendix D Chapter 2.6 of the Guide for New Listing Applicants

	Chapter 2.6	Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	7
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	not applicable
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	11
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	3;7;8;9;12
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	10
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	12;13
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/ oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	not applicable
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	14

Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

Term/Abbreviation	Meaning/Definition
%	percent
°	degree, angle of inclination
°C	degrees of temperature
3D	Three-dimensional
ARD	Acid rock drainage
Au	the element symbol of gold
AusIMM	Australasian Institute of Mining and Metallurgy
Capex	capital expenditure(s)
CIL	carbon-in-leach
CIP	Carbon in Pulp
cm	centimetres
COG	cut-off grade
Company	Zijin Gold International Company Limited
CPR	Competent Person's Report
DA	depreciation and amortisation
DCF	discounted cash flow
DD	diamond drilling
DSO	Deswik Stope Optimizer
E	East
EIA	Environmental Impact Assessment
EPA	Environmental Protection Agency
EPMP	Environmental Protection and Management Plan
ESAs	Environmentally Sensitive Areas
Exploration Results	Data and information generated by mineral exploration programs that might be of use to investors, but which do not form part of a declaration of Mineral Resources or Ore Reserves
Exploration Target	A statement or estimate of the exploration potential of a mineral deposit in a defined geological setting where the statement or estimate, quoted as a range of tonnes and a range of grade (or quality), relates to mineralisation for which there has been insufficient exploration to estimate a Mineral Resources
FAusIMM	Fellow of the Australasian Institute of Mining and Metallurgy
FS or Feasibility Study	A Feasibility Study is a comprehensive technical and economic study of the selected development option for a mineral project that includes appropriately detailed assessments of applicable Modifying Factors together with any other relevant operational factors and detailed financial analysis that are necessary to demonstrate at the time of reporting that extraction is reasonably justified (economically mineable). The results of the study may reasonably serve as the basis for a final decision by a proponent or financial institution to proceed with, or finance, the development of the project. The confidence level of the study will be higher than that of a Pre-Feasibility Study
FY	financial year
g	gram
G&A	general and administration
g/cm^3	gram(s) per cubic centimetre
g/t	gram per tonne
GRG	Gravity Recoverable Gold
ha	hectare(s)
HKEx	Hong Kong Exchanges and Clearing Ltd
HPGR	high-pressure grinding rolls
Indicated Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit

Term/Abbreviation	Meaning/Definition
Inferred Mineral Resource	That part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
ISBD	Insitu bulk densities
JORC Code	2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves prepared by the Joint Ore Reserves Committee of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
JORC Committee	Joint Ore Reserves Committee
K	the element symbol of potassium
kg	kilogram, equivalent to 1,000 grams
km	kilometres, equivalent to 1,000 metres
km^2	square kilometres
koz	kilo ounces
kt	thousand tonnes
ktpa	thousand tonnes per annum
kV	kilovolts, equivalent to 1,000 volts
kVA	kilovolt ampers
kW	kilowatt, equivalent to 1,000 watts
LoM	life-of-mine
M	million
m	metres
m/s	metres per second
m^2	square metre
m^3	cubic metre
MAusIMM	member of the Australasian Institute of Mining and Metallurgy
MCPs	Multiple Mine Closure Plans
Measured Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit.
mg/L	milligrams per liter
Mineral Resource	A concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.
mm	millimeter(s)
MRE	Mineral Resource estimate
mRL	meters Reduced Level
MRM	Mineral Resource Model
Mt	million tonnes
Mtpa	million tonnes per annum
MW	megawatts
MWh	megawatts hours
MIK	Multiple Indicator Kriging
NAF	Non-Acid Forming
NGF	Norton Gold Fields Pty Ltd
NPV	net present values
NSR	net smelter return
OC	open cut
OK	Ordinary Kriging
Opex	operating expenditure(s)/cost(s)

Term/Abbreviation	Meaning/Definition
Ore Reserve	The economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified
ORM	Ore Reserves Model
PFS	A Preliminary Feasibility Study (Pre-Feasibility Study) is a comprehensive study of a range of options for the technical and economic viability of a mineral project that has advanced to a stage where a preferred mining method, in the case of underground mining, or the pit configuration, in the case of an open pit, is established and an effective method of mineral processing is determined. It includes a financial analysis based on reasonable assumptions on the Modifying Factors and the evaluation of any other relevant factors which are sufficient for a Competent Person, acting reasonably, to determine if all or part of the Mineral Resources may be converted to an Ore Reserve at the time of reporting. A Pre-Feasibility Study is at a lower confidence level than a Feasibility Study
PPE	Personal protective equipment
ppm	parts per million, equivalent to gram(s) per tonne (g/t)
Probable Ore Reserve	the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve
Proved Ore Reserve	the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors
QA/QC	quality assurance/quality control
RC	reverse circulation
ROM	run-of-mine
RPEEE	reasonable prospects for eventual economic extraction
S	South, also the element symbol of sulphur
SG	specific gravity
SRK	SRK Consulting China Ltd
Stock Exchange	The Stock Exchange of Hong Kong Ltd, a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("HKEx")
t	tonnes
t/d or tpd	tonnes per day
t/m^3	tonnes per cubic metre
TSF	tailings storage facilities
UG	underground
US$	United States dollar
VALMIN Code	2015 edition of the Australasian Code for the Public Reporting of Technical Assessments and Valuations of Mineral Assets.
WOCN	whole ore cyanidation
WRD	waste rock dump
Xiamen Zijin	Xiamen Zijin Engineering Design Co., Ltd
Zijin Gold International	Zijin Gold International Company Limited
Zijin Mining	Zijin Mining Group Company Ltd. (紫金矿业集团股份有限公司)

Executive Summary

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Ltd. (hereafter referred to as "**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of Norton Gold Fields Pty Ltd ("**Norton**" or "**NGF**")'s gold projects ("**Norton Project**", "**NGF Project**" or the "**Project**") which are located in Kalgoorlie Region, Western Australia, Australia. Norton is a subsidiary of Zijin Mining Group Company Ltd. ("**Zijin Mining**"). Zijin Gold International is wholly-owned by Zijin Mining.

The Norton Project has two gold operation areas, the Binduli Operation Centre and Paddington Operation Centre, and comprise forty-nine (49) gold deposits and two ore processing plants, the Paddington Processing Plant ("**Paddington Plant**") and Binduli Heap Leach Plant ("**Binduli Plant**"). The 49 gold deposits are grouped into five gold projects based on their locations. Details of the five projects and their contained gold deposits are:

- Binduli Gold Project ("**Binduli Project**") consists of ten gold deposits: Fort William, Fort Scot, Karen Louise, Janet Ivy, Navajo Chief, Centurion, Ben Hur, Apache, Nefertiti, and Walsh deposits.
- Greater Mt Pleasant Gold Project ("**Mt Pleasant Project**") comprises twenty-one gold deposits: Lady Bountiful, Lady Bountiful Extended, Mt Pleasant, Racetrack OC and UG, Royal Standard, Green Gum, Blue Gum, Homestead UG, Golden Kilometre UG, Quarters 040 UG, Tuart OC and UG, Marlock, Natal, Golden Swan, Black Flag OC and UG, and Rose deposits.
- Carbine Gold Project ("**Carbine Project**") has five gold deposits: Bullant UG, Bullant South, Bullant West, Wattlebird, and Breakaway Dam deposits.
- Ora Banda Gold Project ("**Ora Banda Project**") includes six gold deposits: Enterprise UG, Enterprise West, North Sandalwood, Gimlet South UG, Sleeping Beauty, and Tom Allen deposits.
- Golden Cities Gold Project ("**Golden Cities Project**") consists of seven gold deposits: Havana, Federal UG, Mt Jewell, Mulgarrie, Tregurtha South, Tregurtha, and Hughes deposits.

It is SRK's understanding that the independent technical assessment on the Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Company on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**SEHK**" or "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEx**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the *Rules Governing the Listing of Securities on the Stock Exchange* (the "**Listing Rules**") including the Chapter 18 requirements and other relevant regulations of the Stock Exchange.

This Report does not express an opinion as to the value of mineral or other assets involved.

Summary of Principal Objectives

The principal objective of this Report is to provide Zijin Gold International and potential equity investors and future shareholders of the Company with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserves, mining methodologies, processing and metallurgical technologies, environmental and social aspects, and etc of the Project based on all available technical data, as of the Effective Date of this report. It is understood that the aim of this Report will be used by the Company for the proposed listing on the Stock Exchange.

Outline of Work Programme

The work program for this project consisted of:

- Review of dataset and resource models provided by Norton and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection.
- A site visit between 16 and 20 June 2025, to the Norton Projects, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and smelting plants, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.
- Review of all available documents, including operating licenses and permits, geology reports and environmental and social reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.
- Discussion with Norton and Zijin Gold International management and technical personnel, as well as the professionals of Xiamen Zijin Engineering Design Co., Ltd ("**Xiamen Zijin**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Norton Projects.
- Preparation of a draft report in accordance with the JORC Code and the requirements of the Chapter 18 on the Stock Exchange and other regulations of the HKEx (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- Submission of the draft to Zijin Gold International and Norton and the related third party for comments and finalise the draft based on the feedback.

Results

Overall

The Norton Project, including mines and deposits and two processing plants are location in Kalgoorlie area, the Eastern Goldfield region of Western Australia. Kalgoorlie is a city in the Goldfields-Esperance region of Western Australia, located approximately 595 kilometres ("km") east-northeast of Perth, the provincial capital of Western Australia. There are daily direct flights between Perth and Kalgoorlie, and there is also a paved Great Eastern Highway connects Perth and Kalgoorlie. All mines and the plans are accessible via paved roads.

The mines/ or deposits and processing plants are wholly owned and operated by Norton, a subsidiary company of Zijin Mining. Currently, Zijin Mining directly holds 89% of Norton's shares, with the remaining shares held by Zijin Mining through its wholly-owned subsidiary, Jinyu (Hong Kong) International Mining Company. Zijin Gold International is a wholly-owned by Zijin Mining.

The production capacity and status of Norton's Mining, Paddington Plant and Binduli Plant are listed in Table ES- **1**.

Table ES- 1: Details of the Norton Mine and Associated Processing and Plant

Company	Mine Area/Plant	Products	Unit	Production Capacity		Status
				Designed [1]	2024 actual [2]	
Norton	Binduli Mining Area	Raw Ore	kt/a	5,000	4,097	Production
	Binduli Heap Leach Plant	Raw Ore	kt/a	5,000	4,097	Production
		Doré Bullion	kg/a	2,310	1,597

Notes:

1 Designed mining and processing capacity refers to the production scale proposed in the *FS 2021*.

2 Actual mining and processing capacity refers to the production scale that the Norton Project can achieve.

Based on reasonable gold cut-off grades for the gold deposits, SRK has estimated the Mineral Resources and Ore Reserves for the Norton Project. As of 31 December 2024, the Mineral Resources and Ore Reserves of the Norton Project, as per the *JORC Code* guidelines, were listed in Table ES- 2.

Table ES- 2: Summary of Mineral Resources and Ore Reserves, as of 31 December 2024

Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (kg)	(koz)
Mineral Resources [1, 2, 3]				
Measured	17,470	1.23	21,453	690
Indicated	193,733	0.84	162,424	5,222
Measured +Indicated	***211,203***	***0.87***	***183,877***	***5,912***
Inferred	100,283	1.03	103,674	3,333
Total	**311,486**	**0.92**	**287,550**	**9,245**
Ore Reserves [4, 5, 6, 7]				
Proved	4,865	1.19	5,793	186
Probable	115,577	0.78	89,683	2,883
Total	**120,442**	**0.79**	**95,476**	**3,070**

1 All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

2 The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the *JORC Code*. Mr. Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

3 The Mineral Resources are reported inclusive of Ore Reserves.

4 The information in this report which relates to Ore Reserve is based on information compiled by Ms TzuHsuan Chuang, MAusIMM, Mr Falong Hu, FAusIMM and Dr Yiefei Jia, FAusIMM (CP. Geo), who are full time employees of SRK Consulting China Ltd. They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the *JORC Code*. Ms Chuang, Mr Hu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

[5] Number was rounded to the second significant digit to reflect the uncertainties in estimate.
[6] Total may not add due to rounding discrepancies
[7] The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

The Norton Project comprises multiple small-scale deposits with individual open pit, employing a conventional truck-and-shovel method. The underground mine is accessed via a main decline and utilises a trackless haulage system and a sub-level open stoping with cemented paste backfill is primarily used for underground mining.

Based on the production schedule for the Norton Project, the remaining life of mine ("**LoM**") is 14 years from 2025 to 2038, the total forecasted sustaining Capex are about United States Dollars ("**US$**") 74.53 million, and the total forecasted Opex are about US$ 4,636 million.

SRK estimated the Norton Project's net present value ("**NPV**") using the discount cashflow method. At a discount rate of 10%, the NPV for the Norton Project is about US$504 million.

Operational Licences and Permits

The Norton Project currently holds the necessary operation licences such as the air emission permit, solid waste emission permit, and land use permit.

Geology and Mineralogy

Regional Geology

The Eastern Goldfields region of Western Australia, Australia is a geologically significant area within the Yilgarn Craton, known for its exceptional gold and nickel mineralisation. The region's unique geological characteristics have made it one of the world's premier mineral provinces. This executive summary provides an overview of the geological framework, major formations, gold mineralisation processes, and tectonic structures underpinning the region's mineral wealth.

The Eastern Goldfields Superterrane, a vital part of the granite-greenstone terrain of the Yilgarn Craton, exhibits a rich geological history dating back 2.94–2.63 billion years ("**Ga**"). It consists of several fault-bounded tectono-stratigraphic terranes, reflecting a complex history of crustal accretion, volcanic activity, and tectonic deformation. The key Rock Groups:

- Kalgoorlie Group (2.726–2.680 Ga): Composed predominantly of mafic and ultramafic volcanic rocks, including komatiites and basalts, formed during mantle plume-driven rifting events.
- Black Flag Group (2.692–2.665 Ga): A felsic volcanic suite with some mafic sequences, dominant in the Kalgoorlie and surrounding regions.
- Gindalbie Group (2.694–2.680 Ga): Found near volcanic centers, characterized by basaltic to rhyolitic volcanic successions and associated intrusive rocks.

These formations are interspersed with siliciclastic sedimentary rocks, banded iron formations ("**BIFs**"), and granitic intrusions, reflecting the complex magmatic and tectonic evolution of the region. The spatial distribution forms elongated greenstone belts surrounded by granitic terrains.

Mineralisation

The Eastern Goldfields ranks as one of the most prolific gold provinces globally, containing serial world-class orogenic gold deposits. Several key factors drive its gold mineralisation:

- Structural Controls: Gold deposition is closely associated with major shear zones, faults, and folds, which act as conduits for hydrothermal fluids carrying gold. Examples include the Boulder-Lefroy Fault Zone, a critical gold-hosting structure.
- Lithological Hosts: Iron-rich rock types like komatiites, basalts, and dolerites, such as the Golden Mile Dolerite, serve as chemically reactive hosts for gold precipitation.
- Timing: The primary phase of mineralisation occurred during the Neoarchean (2.66–2.63 Ga), coinciding with major deformation events that created the necessary structural and thermal conditions for hydrothermal gold deposits.

The integration of these structural, lithological, and temporal factors has resulted in enormous mineral endowment, particularly in regions such as the Kalgoorlie Goldfield.

The Eastern Goldfields consists of four major tectono-stratigraphic terranes: Kalgoorlie, Kurnalpi, Burtville, and Yamarna. These terranes are delineated by significant crustal shear zones that were instrumental in shaping the region's deformation and mineralisation patterns:

- Ida Fault Zone: Separates the Kalgoorlie Terrane from the Youanmi Terrane to the west.
- Ockerburry Shear Zone: Defines the boundary between the Kalgoorlie and Kurnalpi Terranes.
- Hootanui Shear Zone and Yamarna Shear Zone: Separate the more distal Burtville and Yamarna Terranes.

These major fault systems, coupled with regional-scale folds and granitic intrusions, have shaped the distribution of rock units and significantly influenced mineralisation processes. Advanced geophysical techniques, such as seismic reflection surveys, have further refined the understanding of subsurface geological structures, pinpointing areas of hydrothermal alteration conducive to gold exploration.

Local Geology and Mineralisation

Binduli Project

The Binduli Project includes two areas: Binduli South District and the Binduli North District. The Binduli South District comprises four deposits and the Binduli North District consists of six gold deposits. Of these ten gold deposits, the Navajo Chief, Centurion, Ben Hur, Apache and Janet Ivy deposits have the most resources of the Binduli Project. The geological and mineralisation characteristics for the five deposits are described below:

- Navajo Chief deposit is located in the northwest end of the Navajo Chief ("**NC**")-Beaver ("**BE**")-Centurion ("**CT**")-Ben Hur ("**BH**") trend. The lithology is dominated by quartz-carbonate altered siltstones, greywackes, and kaolin-rich zones within transitional zones between weathered and fresh rock. The deposit is associated with small brittle-ductile faults and sodic-altered siltstones and sandstones, with higher gold grades (5-8g/t) concentrated in the transitional zones, while quartz veins typically carry low-grade mineralisation (<0.3g/t) reflecting supergene enrichment.

- Centurion deposit is situated at the middle of the NC-BE-CT-BH trend. It is composed of volcano-sedimentary units, porphyry facies, and multi-impurity conglomerates. Gold mineralisation occurs in volcanic-sedimentary units in two styles as Eastern Contact Mineralisation ("**ECM**") and Western Contact Mineralisation ("**WCM**"). ECM is associated with feldspar-rich porphyries having high-grade gold and pyrite in a quartz-rich alteration zone, while WCM is associated with sediments and porphyry breccias, influenced by large-scale hydrothermal systems.
- Ben Hur deposit is situated southeast of the trend in the footwall of the Centurion Fault. The lithology comprises porphyry breccias, folded porphyries, and fine to coarse epiclastic sediments. Gold mineralisation occurs in porphyry breccias, folded porphyry, and clastic sediments, forming shallow, west-dipping veins in hematite-magnetite altered feldspar-quartz porphyries.
- Apache deposit lies east of Navajo Chief and is dominated by metamorphosed sediments and quartz-feldspar porphyry intrusions. Gold mineralisation is associated with weak quartz vein stockwork and pyrite disseminations. Bleaching and silicification are dominant alteration styles with mineralisation in shallow east-dipping zones.
- The Janet Ivy deposit is a broad, strike extensive zone of mineralisation contained within the Janet Ivy porphyry, a massive rhyodacitic intrusion, extending over about 2.5 km long and up to 150 m wide. The porphyry is faulted and sheared along its margins, with a weathering profile extending 50–60 m below surface. Mineralisation is controlled by a vein stockwork zone, individual fault-controlled veins and pervasive wallrock alteration of the porphyry. Gold is spatially correlated with quartz veins and sodic alteration halos. The high-grade mineralisation (>1.5g/t) is sporadically distributed, with higher concentrations along faults near the western margin of the porphyry.

Mt Pleasant Project

Mt Pleasant Project area is located within the Ora Banda region of the Archean Kalgoorlie Terrane, bounded by the Zuleika Shear Zone to the west and the Abattoir Shear Zone to the east. The Mt Pleasant Project consists of 21 gold deposits and the Racetrack and Tuart deposits are the two deposits with the largest resources in this project. The geology and mineralisation characteristics of the two deposits are described below:

- Racetrack deposit, including Racetrack OC and Racetrack UG, is predominantly hosted within the Victorious Basalt ("**VB**"), extending into the Bent Tree Basalt ("**BTB**") and intermediate porphyries. Both basalts are massive to pillowed tholeiitic basalts, with distinctions in texture and mineral composition. Gold mineralisation at Racetrack is refractory in nature, bound within sulphides, with arsenopyrite being the dominant sulphide mineral. Four mineralogical assemblages are founded: Gold-pyrite (13%), gold-arsenopyrite (50%), gold-rutile-muscovite-quartz-carbonate (25%), and electrum-tennantite-tetrahedrite (12%).
- Tuart deposit is hosted within the BTB sequence on the western limb of the Mt Pleasant Anticline: The deposit comprises a series of high-grade quartz-carbonate-sulphide brecciated or laminated veins. Three main lode orientations are defined: (1) northeast-trending (060°) lodes, with moderate northwest dip, disjointed extending over 1,100-1,300m along strike; (2) east-southeast-trending (115°) lodes, with southwest dip and continuous extending 500–600 m along strike; and (3) brittle-ductile shear zones and smaller splays emanate from the main lodes, shaping the structural framework. Gold mineralisation at the Tuart deposit is structurally controlled and associated with quartz veins and silica-carbonate-chlorite-sulphide alteration zones with visible gold in association with pyrite, galena, and sphalerite. Supergene oxide

mineralisation is developed in the regolith immediately above and/or adjacent to the primary veins.

The distribution of gold grades shows strong correlation with structural orientations, particularly within the 060° lode systems, emphasizing their significance for ongoing exploration.

Carbine Project

The Carbine Project area is located within the northwest-trending Coolgardie-Carbine Archean greenstone belt. The primary structure in this area is a gently dipping, northwest-trending syncline composed mainly of sedimentary rocks, felsic volcanic rocks, and minor mafic/ultramafic intrusions from the Black Flag Group. Gold mineralisation typically occurs along geological contact zones, particularly between mafic and ultramafic units. The Carbine Project comprises five deposits and the Bullant UG deposit contains the largest resources in the Carine Project. The geology and mineralisation characteristics of this deposits are described below:

- Bullant deposit is situated along the Zuleika Shear Zone ("**ZSZ**"), a prospective regional north-northwest trending structure. The ZSZ is a broad ductile to brittle structural corridor contained within a mafic unit and dips sub-vertically to steep east dipping. It is characterized by sheared basalt with significant biotite-silica-pyrite alteration and minor quartz veining.

  Four lodes have been identified: Main, East, West, and Cross. The Main Lode is the principal ore zone, striking north-northwest ("**NNW**") and occurring parallel to the shear structure, while the East Lode is a similar parallel shear structure. Minor lodes include West and Cross lodes. The mineralised lodes are approximately 2 m thick, continuous extending over about 400 m along strike. High-grade gold mineralisation is concentrated along the eastern contact of the shear structure.

Ora Banda Project

The greenstone sequence in the Ora Banda Project area consists of thick ultramafic and mafic volcanic rocks, overlain by intermediate to felsic volcaniclastic rocks and sediments. The Ora Banda Project consists of six deposits and the Gimlet South deposit contains the largest resources in the Ora Banda Project. The Key geology and mineralisation features include:

- Gimlet South deposit is hosted within the Ora Banda ultramafic and mafic volcanic rocks, a southwest-dipping sequence of late Archaean-age mafic volcanics on the eastern limb of the Kurrawang Syncline. Lithologically, the ultra mafic and mafic volcanic rocks are massive to pillowed tholeiitic basalts. The Kurrawang Syncline, a major regional fold structure, influences the deposit's lithological and structural framework, with fault zones serving as key pathways for mineralisation.

  The Gimlet-style mineralisation is primarily hosted within the northeast (060°) trending brittle-ductile faults that cut through the BTB and VB units.

Golden Cities Project

The Golden Cities Project includes seven deposits: Havana, Federal, Mt Jewell, Mulgarrie, Tregurtha, Tregurtha South, and Hughes. Gold mineralisation in this area is linked to Archean orogenic tectonic and metamorphic events. All deposits are part of the Norseman-Wiluna greenstone belt, characterized as ductile shear zone-type gold deposits, with gold sourced from granitoid complexes and deep hydrothermal activity. The Federal deposit, for example, is hosted within a hornblende-biotite-granodiorite of the Kanowna-Scotia Granite Complex, and is located in brittle and brittle-ductile deformation zones trending northeasterly and dipping to the northeast, with a dip angle of 60°.

Exploration, Sampling, Analytical Procedures and Quality Assurance and Quality Control

Norton has undertaken extensive, long-term exploration programs across its two operation areas in the Eastern Goldfields region of Western Australia, including the Binduli, Mt Pleasant, Carbine, and Ora Banda Projects. These exploration programs reflect a progression from early-stage discovery through to advanced resource definition and long-term resource expansion planning. All activities have been conducted in accordance with the principles of the JORC Code and aligned with international best practices in mineral exploration.

Exploration history at these projects spans over a century, beginning with early gold discoveries in the late 19th century. The Binduli Project, for example, was first identified in 1897 during the Eastern Goldfields gold rush and has since undergone multiple exploration phases, including geochemical sampling, shallow rotary air blast ("**RAB**") drilling, and deeper reverse circulation ("**RC**") and diamond core ("**DC**") drilling. Over the decades, exploration methodologies have evolved significantly—from rudimentary surface sampling to integrated geophysical modelling and three-dimensional ("**3D**") geological interpretations supported by high-resolution drilling.

The Binduli Project's key targets, including Centurion, Choctaw, and Pandora, were systematically delineated through regional geochemical anomalies followed by targeted drilling that identified both supergene and primary gold mineralisation. Notably, the Pandora prospect yielded high-grade intercepts at depth (e.g., 6m at 9.38 g/t Au from 144m), demonstrating strong down-plunge continuity. Modern exploration at Binduli has focused on refining geological models, expanding mineralized zones beyond existing deposits, and integrating geophysical targets with structural interpretations.

At the Mt Pleasant Project, exploration has been centred on shear-hosted mineralization along defined structural corridors, including the Racetrack Shear and Tuart vein systems. Mineralisation is typically confined within narrow, steeply dipping shear and breccia zones. Racetrack, in particular, has undergone multiple drilling campaigns targeting oxide and refractory ore zones, with recent efforts extending mineralisation at depth beyond -200 m. Tuart, located in mafic volcanic units, exhibits quartz-carbonate-sulphide veining with laminated and brecciated textures. Systematic diamond and RC drilling from 2007 onwards has delineated both open pit and underground resource potential, leading to portal development in 2020 and subsequent underground mining by Byrnecut Mining under a multi-year contract.

The Carbine Gold Project, specifically the Bullant Underground Mine, has a history of high-grade production from steeply dipping shear-hosted lodes within basaltic host rocks along the Zuleika Shear Zone. Following previous ownership by Barrick Gold and Kalgoorlie Mining Company, Norton recommissioned the mine in 2015. From 2016 onward, exploration focused on deeper unmined zones, parallel structures, and down-dip extensions of the Main Lode, supported by extensive diamond core drilling. These programs strengthened the resource base and enhanced confidence for long-term underground mining strategies.

Ora Banda and Mt Pleasant areas have seen decades of exploration and mining activities, with contributions from several operators including Newcrest, Centaur Mining, Aurion Gold, Placer Dome, and Barrick Kanowna. Exploration techniques included large-scale geophysical surveys, relogging of historical holes, and integration of legacy and modern datasets. Norton Gold Fields, after acquiring the tenements, implemented systematic drilling with 100m-spaced fences to validate mineralized trends, particularly at Enterprise and Gimlet South. This drilling confirmed continuity of gold mineralization and provided inputs for updated resource models.

Across all projects, Norton’s drilling strategy has evolved to suit specific geological and operational objectives. RC drilling is utilized for rapid delineation of shallow mineralization, employing face sampling hammers and bit sizes of 5.25"–5.5". DC drilling is preferred for structural, geotechnical, and deep mineralized zones, with hole diameters ranging from HQ (63.5 mm) to NQ2 (50.5 mm). Underground drilling has employed Boart Longyear LM110 diamond rigs, capable of deep penetration and operating efficiently in complex ground conditions.

Drillhole collar positions are established using high-precision Leica TS15 total stations (±0.005 m), ensuring sub-centimetre spatial accuracy. Downhole surveys have transitioned from historical magnetic single/multi-shot systems to advanced Reflex Gyro SPRINT IQ™ tools, providing precise azimuth and inclination data. All spatial data is integrated into standardized grid systems, i.e., Map Grid of Australia (“MGA94”) Zone 51 and AHD vertical datum), enabling consistency across geological models, pit designs, and block models.

Drill spacing varies by project phase. Regional exploration is typically conducted on 80m × 80m grids, while infill and classification drilling is performed on denser grids (20m × 20m, 10m × 10m), with grade control drilling as tight as 5m × 5m where required. These multi-tiered grids allow efficient prioritization of resource definition versus cost management.

Geological logging is performed on 100% of drillholes. Logging captures lithology, alteration, mineralisation, structural features, weathering profiles, and veining characteristics. Real-time monitoring of drilling recovery ensures data quality, with most diamond drilling programs achieving core recoveries above 96%. Drillholes are routinely photographed, and geological data is entered into controlled databases (e.g., LogChief, Datashed) to ensure traceability, consistency, and seamless integration with resource estimation workflows.

Collectively, Norton’s exploration activities demonstrate a high degree of technical rigor, strategic planning, and continuous refinement of geological models. The integration of high-quality exploration data with structured QA/QC protocols, advanced drilling techniques, and digital database management provides a strong foundation for robust Mineral Resource estimation, long-term mine planning, and project development across both Binduli and Paddington Operations.

Diamond drill core was handled and processed according to standardized protocols. Core was laid in trays, oriented using TruCore™ systems, and logged for geological and structural features. For regolith zones, whole-core sampling was undertaken, while half-core sampling was applied to fresh rock, selecting the right-hand side of the orientation line. Core was sawn using a three-phase Almonte Core Saw, and samples were placed in pre-labelled calico bags, batched, and securely transported to accredited laboratories.

Sample intervals were predominantly 1 m in length, with shorter intervals used where geological boundaries dictated. One hole per fence-line was sampled in regolith zones to evaluate supergene potential. Field duplicates, blanks, and certified standards were routinely inserted as part of a quality assurance and quality control (“**QA/QC**”) program.

Between 2021 and 2024, all samples were submitted to Jinning Laboratories in Kalgoorlie and Perth. Both laboratories are the National Association of Testing Authorities ("**NATA**") accredited facilities following ISO-compliant protocols. Sample preparation included drying at 105°C, coarse crushing to -10 mm, and pulverization to >85% passing 75 µm. Oversize samples (>3 kg) were split using a riffle splitter. Rejected residues were retained for three months, and pulverized subsamples (~200 g) were extracted for analysis.

Fire assay ("**FA**") was the primary analytical method for gold, with multi-element analysis via mixed acid digest and Inductively Coupled Plasa Optical Emission Spectrometry ("**ICP-OES**") performed as needed. Stringent quality control included mass checks, grind-size verification, and full traceability through the lab chain of custody.

Norton has implemented quite a comprehensive QA/QC program, Standards, consisting of commercially sourced certified reference materials ("**CRMs**"), blank samples and duplicate samples were inserted into the sample submission streams to monitor the accuracy and precision of the analysis. QA/QC reports were prepared quarterly by Norton staff to summarize the QA/QC performance and to give suggestions for the following sample analysis. The QA/QC reports from 2021 to 2024 were provided to SRK for review.

CRMs' performance was generally consistent, with most CRMs returning results within 1 to 2 standard deviations of expected values. Overall, blank performance showed consistent improvement over the reporting period, with failures decreasing year by year. The high percentage repeats which are either sample weight or analysis result above 10% different raises concerns about the reliability of sampling techniques and laboratory processes, including inconsistencies in sample preparation, cross-contamination, and analytical methods. lab pulp check showed better repeatability than field duplicates, it is estimated that the bias is due to nugget effect.

Mineral Resource Estimation

The Mineral Resource Statement presented herein represents the Mineral Resource estimation prepared for the Norton Project in accordance with the JORC Code. The effective date of the Mineral Resource statement is 31 December 2024.

The database used to estimate the Norton Project Mineral Resources was audited by SRK. SRK is of the opinion that the current exploration information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The solid models were prepared in GEOVIA Surpac software using conventional 3D block modelling and Multiple Indicator Kriging ("**MIK**") or Ordinary Kriging ("**OK**") estimation techniques. The entire estimate procedure, consisting of database compilation, mineralised domains construction, the grade interpolation as well as the Mineral Resources classification, were completed by SRK.

Table ES- 3 presents summaries of the estimated Mineral Resources for the Norton Project, as of 31 December 2024.

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a fellow of AusIMM and a Chartered Professional Geologist. Both have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

[3] The mined-out Mineral Resource was deducted during the Resources reporting.

Mining and Ore Reserves

SRK has estimated the Ore Reserves for open pit and underground in compliance with the JORC Code guidelines. The Ore Reserve Estimates as of 31 December 2024 is in Table ES- 4.

The total Ore Reserve for the NGF Project is estimated at 120,442 thousand tonnes ("**kt**") at an average grade of 0.79g/t Au, containing approximately 3,070 koz of gold. This includes Proved Ore Reserve estimated at 4,865 kt with an average grade of 1.19g/t Au, containing 186 koz of gold; and Probable Ore Reserve estimated at 115,577 kt at an average grade of 0.78g/t Au, containing 2,883 koz of gold.

Table ES- 4: Ore Reserve Statement for the Norton Project, as of 31 December 2024 by SRK Consulting China Ltd

Mining Method	Category	Tonnage (kt)	Au (g/t)	Metal Au (kg)	Metal Au (koz)
Open Pit	Proved	3,682	0.53	1,936	62
	Probable	106,245	0.76	81,239	2,612
	Proved +Probable	109,928	0.76	83,175	2,674
Underground	Proved	1,182	3.26	3,857	124

Notes:

[1] The information in this report which relates to Mineral Resource is based on information compiled by Ms. Tzuhsuan Chuang and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Ms Chuang is a member of AusIMM, Mr Falong Hu is a Fellow of AusIMM and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms Chuang, Mr Hu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

[2] The Ore Reserves for surface operations include open-pit mining and ROM pads.

[3] Proved and Probable Ore Reserves are reported on 100% basis.

[4] Total may not add due to rounding discrepancies

[5] The Ore Reserves are included in the Mineral Resources.

Mining Assessment

The NGF Project currently comprises two distinct mining operations: the Binduli operation, which exclusively feeds its Run-of-Mine ("**ROM**") material to the Binduli Heap Leach, and the Paddington operation, which processes all its ROM material at the Paddington Mill Plant. The Paddington Mill handles both free milling ore and refractory material from specific deposits. Looking forward, NGF plans to integrate these operations, allowing higher-grade Binduli ROM to be sent to Paddington Mill, and lower-grade Paddington ROM to the Binduli Heap Leach.

The NGF Project comprises multiple small-scale deposits with individual open pits typically separated by several kilometres, employing a conventional truck-and-shovel method. Mined material is transported via graded haul roads to either the ROM pad or the waste dump.

The underground mine is accessed via a main decline and utilizes a trackless haulage system. Underground mining primarily utilizes sub-level open stoping, employing either a bottom-up or top-down sequencing approach. The backfill is Cemented Rock Fill (CRF) or paste fill with tailings based on the deposits. It is designed spanning 3 to 4 vertical levels, advancing from the orebody's end and retreating towards the primary level access. For shallow-dipping deposits, hand-held (airleg) mining is adopted.

Mineral Processing and Metallurgy

Norton Gold Fields owns dozens of gold deposits, ore stockpiles, and old tailings. Extensive metallurgical testing has been conducted historically to evaluate the adaptability of gravity and carbon-in-pulp ("**CIP**") process at the Paddington processing plant. Based on this criterion, the ores can be broadly categorized into two groups: amenable ores and refractory ores.

The amenable ores are further divided into low-grade and high-grade categories. Low-grade ores are processed using agglomeration heap leaching method, while high-grade ores are treated using the gravity-CIP process. Refractory ores are further classified based on the reasons for their refractory nature into two types: sulfide (mainly pyrite and arsenopyrite) encapsulated ores and carbonaceous shale preg-robbing ores.

Sulfide encapsulated ores are planned to be processed at the Paddington processing plant by adding a flotation circuit to the existing gravity-CIP process, forming a gravity-flotation-CIP process. The products will include marketable gold concentrates and gold doré bars. Preg-robbing ores typically exhibit low gold leaching rates, which are often correlated with the amount of carbonaceous shale mixed in. This type of ores require further technical and economic studies.

The current processing capacity of the Paddington plant is 4.0 million tonnes per year ("**Mtpa**"). It uses the gravity-CIP process to treat high-grade amenable ores and produces gold doré bars. Historical production performance has been favorable (see Table ES-5). The historical doré bar productions at the Paddington Plant in 2022, 2023 and 2024 were 176,758 ounce ("**oz**"), 189,048 oz and 214,627 oz, respectively. Plans are in place to add a flotation circuit to the existing process to treat sulfide encapsulated gold ores, producing marketable gold concentrates and gold doré bars. The planned sulfide encapsulated ores include Racetrack and Gimlet South, with design recovery targets as shown in Table ES- 6.

The Binduli heap leaching plant, completed in 2022, is designed to process low-grade amenable ores with a processing capacity of 5 Mtpa. Norton has planned to expand the processing capacity to 8 Mtpa, including 6 Mtpa of Binduli ores and 2 Mtpa of mineralized waste rock. Since its commissioning, the plant has been using the ultra-fine crushing-agglomeration heap leaching process to treat Binduli ores, achieving an actual recovery reaching 70.5% with designed recovery rate of 74.5% (see Table ES- 7). The historical doré bar productions at Binduli Plant in 2023 and 2024 were 27,188 oz and 51,339 oz, respectively. Due to the long heap leaching period, SRK believes that as long as the crushed ore particle size is maintained at no larger than P_{80}=7mm, the designed recovery rate can be achieved.

There are currently no plans to develop preg-robbing refractory ore. This type of ore requires further metallurgical testing and techno-economic studies.

Production in 2022 totalled 176,758 ounces. This increased to 216,236 ounces in 2023, with 2024 production reaching 265,966 ounces.Table ES- 5: Paddington Processing Plant Historical Performance in Gravity-CIP Process

Environmental and Social Impacts

The Binduli North Project ("**BNP**") was referred to the Environmental Protection Authority ("**EPA**") in January 2021 and on the 10 May 2021 the decision not to assess the BNP was published. Accordingly, no approvals have been granted under Part IV for the BNP. No other parts of the Projects have ever been referred to the EPA during the approvals process and there are therefore no approvals are granted pursuant to Part IV of the Environmental Protection ("**EP**") Act. Accordingly, no public Environmental Impact Assessment ("**EIA**") has been required as of the effective date of this report. However, any future project expansions or modifications may be subject to referral and potential assessment by the EPA, depending on their environmental significance. In contrast, Works Approvals and Environmental Licences pursuant to Part V of EP Act are issued by DWER for the Norton Projects. Norton has provided the copies of GWL160697(4), GWL160697(4), and GWL167686(6) for dewatering for mining purposes, dust suppression for mining purposes, mineral ore processing and other mining purposes, and treatment of tailings. All licences are currently valid and within their effective periods.

Norton undertook monitoring of the nine (9) groundwater monitoring bores surrounding the heap leach of Binduli North Operations. Overall, 2024 monitoring results are consistent with trends observed in 2022 and 2023. No cyanide was detected in any bore samples. In the waste characterization studies conducted so far, most of the waste rock has been identified as non-acid-forming. However, some areas have not yet undergone geochemical analysis to assess their potential for acid mine drainage.

Based on the information currently provided, a number of Aboriginal Heritage sites or European Heritage sites have been identified within the tenements of Carbine, Paddington, Ora Banda, Mt Pleasant, Golden Cities and Binduli. Norton will ensure the sites are not disturbed during any closure activities that occur. Consultation with the relevant Native Title Groups is ongoing to ensure that mining operations do not disturb any significant sites and that the final land use of the mining areas and associated objectives are achievable.

Capital Expenditures and Operating Costs

Capital Expenditure(s)

The NGF Project's initial capital expenditure is estimated at approximately US$103.79 million for Paddington (primarily for Federal underground mine infrastructure and future mill upgrades) and US$60.97 million for Binduli (focused on mining equipment and a new heap leach pad), with both largely distributed across 2025 and 2026. Sustaining capital for both operations follows an initial plan for the first few years (2025-2027), transitioning to annual averages from 2028 onwards, with a reduced allocation for the final year of the Life of Mine ("**LoM**"). The total sustaining Capex over the LoM is shown in Table ES- 8.

Table ES- 8: Forecast Sustaining Capex Over LoM

Operation	Department/Category/Mine	Unit (US$'000)
Paddington	Exploration (Geology Exploration)	145
	Underground Mining (Bullant Mine Operation)	4,304
	Underground Mining (Enterprise Mine Operation)	70
	Underground Mining (Tuart Mine Operation)	4,969
	Production (Environment, IT, Emergency Response, Safety)	1,312
	Processing Plant (Operation)	7,014
	Open-Pit Mining (Maintenance)	832
	Other (SRK Estimate)	31,259
	Paddington Subtotal	**49,904**
Binduli	Production (Warehouse)	33
	Processing Plant (Operation)	572
	Open-Pit Mining (Maintenance)	5,077
	Other (SRK Estimate)	19,318
	Binduli Subtotal	24,999
	Total	**74,525**

Source: SRK

Operating Costs

Operating cost estimates are based on a combination of historical costs, cut-off grade assumptions, and NGF's budget data, covering key cost centers such as mining (open pit and underground), inter-operational haulage, processing (Heap Leach and Mill), and general & administrative expenses. The forecast unit Opex over the LoM is shown in Table ES- 9.

Table ES- 9: Forecast Operating Unit Costs Over LoM

Item	Mine/Deposit	Unit	Unit Cost (US$)
	Open Pit Mining		
Paddington Operations			
Mt Pleasant Project:	Lady Bountiful, Racetrack Main and Black Flag	$/t-TMM	3.73
Carbine Project	Wattlebird and Breakaway Dam	$/t-TMM	3.73

Note:

[1] Total number may not be added due to rounding errors.

[2] These costs are fixed during full-production period and varied during ramp-down period.

Economic Analysis

The economic analysis, based on the project's technical review and key assumptions, provides a foundation for technical evaluation and Mineral Reserve estimation, employing conventional Discounted Cash Flow ("**DCF**") techniques. The summary of overall economics is shown in Table ES- 10. The Net Present Value ("**NPV**") was assessed using discount rates from 5% to 15%, with a NPV of US$504 million at a 10% discount rate, which is shown in Table ES- 11. Key assumptions include a fixed exchange rate of AUD 0.65 per US Dollar, no future inflation or currency/cost fluctuations over the LoM, 100% equity financing, and a working capital assumption of 30% of Opex, fully recovered at LoM end. Exploration Capex and salvage value are excluded.

Risk Assessment

SRK completed a risk assessment of the risks identified for the Norton Project in relation to their likelihood of occurrence and consequence in accordance with the Listing Rules of the Stock Exchange and the HKEx.

SRK considers various technical aspects which may affect the feasibility and future cash flow of each operating mine and conducts risk assessments for the Norton Project, which have been summarized in Table ES- 12.

Table ES- 12: Risk Assessment for Norton Projects

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource and Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Major	Low
Lack of Significant Ore Reserves	Unlikely	Major	Low
Unexpected Groundwater Ingress	Possible	Moderate	Medium
Significant Unexpected Geological Faulting	Possible	Moderate	Medium
Mining			
Significant Production Shortfalls	Possible	Moderate	Medium
Significant Geological Structure	Unlikely	Moderate	Low
Poor Underground/Slope Condition	Possible	Moderate	Medium
Poor Mine Plan	Possible	Moderate	Medium
Significant Lacking Ore Reserves	Unlikely	Major	Medium
Ore Processing and Metallurgy			
Process Adaptability	Unlikely	Moderate	Low
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Possible	Moderate	Moderate
Low Plant Reliability	Unlikely	Moderate	Low
Environmental and Social			
Lack of Environmental Permits	Unlikely	Moderate	Low
Impact on Flora and Fauna	Possible	Minor	Low
Poor Water Management	Unlikely	Moderate	Low
Poor Waste Rock and Tailings Management	Possible	Moderate	Medium
Poor Hazardous Materials Management	Unlikely	Moderate	Low

Risk Source/Issue	Likelihood	Consequence	Risk
Capital and Operating Costs			
Project Timing Delay	Possible	Minor	Low
Capital Cost Increases	Possible	Moderate	Medium
Capital Costs- Ongoing	Possible	Moderate	Medium
Operating Cost Underestimated	Possible	Moderate	Medium

Recommendations

SRK offers the following recommendations:

Geology and Mineral Resources

- Infill drilling is recommended in areas with sparse data or structurally complex settings to improve the resolution of geological models. Additionally, targeted deep drilling should be undertaken in high-grade or structurally open zones to test the down-dip and down-plunge continuity of mineralisation.
- Broader application of 3D geological modelling tools is encouraged to improve spatial understanding, visualisation, and communication of complex geological structures, especially in areas with limited control at depth.
- A reconciliation study should be performed comparing block model outputs with historical and current production data to assess estimation accuracy. The modelling approach should increasingly integrate geological controls, such as structural frameworks and lithological boundaries to enhance model robustness.
- Mineral Resource classification should continue to follow established criteria, including data spacing, QA/QC performance, and geological continuity, and should also address the elimination of geologically unsupported "spot dog" features. For areas advancing to pre-feasibility or feasibility stages, upgrading Indicated to Measured Resources through closer-spaced drilling is recommended to ensure a reliable basis for mine planning and economic evaluation.

Mining and Ore Reserves

- NGF incorporates numerous small-scale satellite open pits. To consistently ensure a stable mill feed to the processing plant, it is recommended to further optimize the mine schedule, which focus on achieving a dynamic balance ore mining and waste stropping to prevent instances of over-stripping in certain years while ensuring sufficient ore supply in others.
- NGF has already planned an optimized ore blending strategy for future operations. To ensure a consistent and stable feed amount and grade to the processing plant, it's recommended to dynamically update this blending strategy, including the routing of higher-grade ore to the Paddington Mill and lower-grade material to the Binduli Heap Leach Plant.
- Some mined-out pits are currently utilized as water storage; however, with rising gold prices, these submerged pits may still hold significant economic value. Therefore, during pit optimization, it's recommended to re-evaluate whether current open pit designs have reached their economic limits.

Mineral Processing and Metallurgy

- The classification of cyanidation amenable ores into high-grade and low-grade categories should be adjusted based on changes in market gold prices. SRK recommends conducting regular technical and economic evaluations to determine whether these type ores should be sent to the Paddington processing plant or the heap leaching plant. Additionally, considering the transportation costs of low-grade ores, SRK suggests studying the feasibility of constructing heap leaching plants near multiple mining sites.
- Sulfide-encapsulated refractory ores are suitable for flotation recovery due to the good floatability of both gold and sulfide minerals. Plans are in place to add a flotation circuit to the existing gravity-CIP process at the Paddington plant, enabling the use of a combined gravity-flotation-CIP process to treat these ores. The products will include directly marketable gold concentrates and gold doré bars. SRK considers this approach feasible and recommends making reasonable arrangements for construction and production.
- Gold preg-robbing refractory ores are primarily caused by the inclusion of carbonaceous shale wall rock during mining. Treatment methods include kerosene/diesel passivation-CIL and flotation-concentrate pre-oxidation-CIL. SRK recommends controlling the amount of wall rock mixed during mining of such deposits. Additionally, further testing and research should be conducted to develop suitable metallurgical processes for these resources, along with feasibility studies.

Environmental and Social

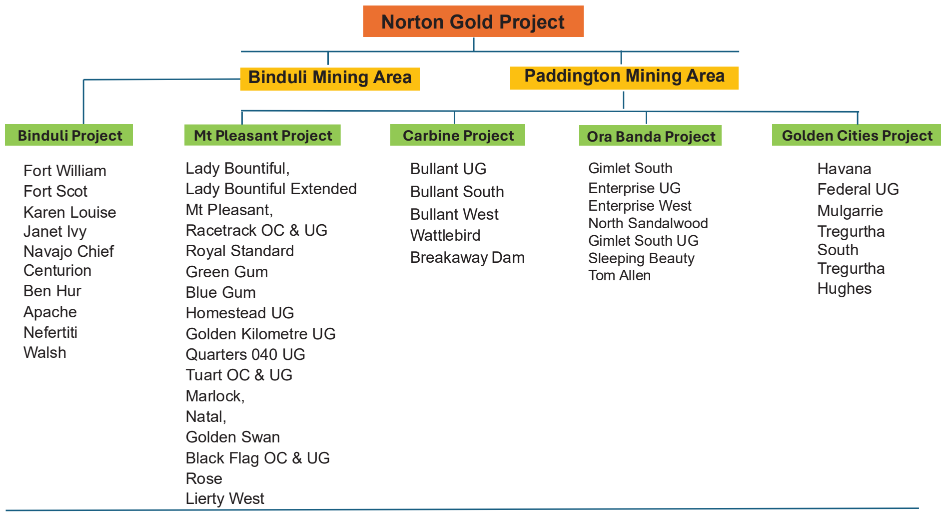
- No EIAs have been required for the project operations. However, any future project expansions or modifications may be subject to referral and potential assessment by the EPA, depending on their environmental significance.
- In the waste characterization studies conducted so far, most of the waste rock has been identified as non-acid-forming. However, some areas have not yet undergone geochemical analysis to assess their potential for acid mine drainage. It is recommended to carry out waste characterization for these areas, as well as for regions planned for future development.
- There are Aboriginal heritage sites within certain tenement areas of the project. These sensitive areas should be avoided or left undisturbed during the course of project development. It is also recommended to utilize the grievance mechanism to promptly address stakeholder concerns and reduce the social risks associated with project development.

1 Introduction and Scope of Report

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Ltd. ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of Norton Gold Fields Pty Ltd ("**Norton**" or "**NGF**")'s gold projects ("**Norton Project**", "**NGF Project**" or the "**Project**") which are located in Kalgoorlie Region, Western Australia, Australia.

The Norton Project has two gold mining operation areas, the Binduli Operation Centre and the Paddington Operation Centre, and comprise forty-nine (49) gold deposits and two ore processing plants, the Paddington Processing Plant ("**Paddington Plant**") and Binduli Heap Leach Plant ("**Binduli Plant**"). The 49 gold deposits are grouped into five gold projects based on their locations, including Binduli Gold Project ("**Binduli Project**"), Greater Mt Pleasant Gold Project ("**Mt Pleasant Project**"), Carbin Gold Project ("**Carbine Project**"), Ora Banda Gold Project ("**Ora Banda Project**") and Golden Cities Gold Project ("**Golden Cities Project**"). Figure 1-1 shows each project and the gold deposits it contains.

Figure 1-1: Details of Each Project and its Contained Deposits



Source: SRK

Currently, Zijin Mining Group Company Ltd. ("**Zijin Mining**") directly holds 100% of Norton's shares, with the remaining shares held by Zijin Mining through its wholly-owned subsidiary, Jinyu (Hong Kong) International Mining Company. Zijin Gold International is a wholly-owned subsidiary of the Zijin Mining.

It is SRK's understanding that the independent technical assessment on the Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Company on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEx**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on the Stock Exchange including the Chapter 18 requirements and other relevant regulations of the Stock Exchange and HKEx.

2 Program Objectives and Work Program

2.1 Purpose of the Report

The purpose of this Report is to provide an independent technical assessment for inclusion in a prospectus to be issued by Zijin Gold International to support the proposed listing on the Stock Exchange and the HKEx. The SRK's report is proposed to provide an unbiased technical assessment of the risk and opportunities associated with the reviewed project.

2.2 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "**Valmin Code**"). The Valmin Code incorporates the JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy ("**AusIMM**") members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the JORC Code.

2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that the Client has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Client has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Client and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

2.4 Effective Date

The effective date for this CPR is deemed to be 31 May 2025 (the "Effective Date"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as of 31 December 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK.

2.5 Work Program

The work program for the Norton Project consists of:

- Review of dataset and resource models provided by Norton and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection.
- A site visit between 16 and 20 June 2025, to the Norton Projects, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and smelting plants, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.
- Review of all available documents, including operating licenses and permits, geology reports and environmental and social reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.
- Discussion with Norton and Zijin Gold International management and technical personnel, as well as the professionals of Xiamen Zijin Engineering Design Co., Ltd ("**Xiamen Zijin**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Norton Projects.
- Preparation of a draft report in accordance with the JORC Code and the requirements of the Chapter 18 on the Stock Exchange and other regulations of the HKEx (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- Submission of the draft to Zijin Gold International and Norton and the related third party for comments and finalise the draft based on the feedback.

2.6 SRK Experience

The SRK Consulting Group ("SRK Consulting") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK China was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience in providing Independent Expert Reports to mining companies for successfully listing on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-2.

Table 2-1: SRK's Reports for Listing on the HKEx

Company	Year	Nature of Transaction
Yanzhou Coal Limited (listed in HKEx)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on the HKEx and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on the HKEx
Lingbao Gold Limited	2005	IPO Listing on the HKEx
Yue Da Holdings Limited (listed in HKEx)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on the HKEx
Sino Gold Mining Limited	2007	Dual Listing on the HKEx
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on the HKEx
Kiu Hung International Holding Limited	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Limited	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Limited	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Limited	2009	Acquisition of a molybdenum mining project in Shaanxi, China
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on the HKEx
Citic Dameng Holdings Limited	2010	IPO Listing on the HKEx
China Hanking Holdings Limited	2011	IPO Listing on the HKEx
China Daye Non-Ferrous Metal Mining Limited	2012	Very Substantial Acquisition on the HKEx
China Nonferrous Mining Corporation Limited	2012	IPO Listing on the HKEx
Hengshi Mining Investments Limited	2013	IPO Listing on the HKEx
Future Bright Mining Holdings Limited	2014	IPO Listing on the HKEx
King Stone Energy Group Limited	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte LTD	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Limited	2016	IPO Listing on the HKEx
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Limited	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Limited	2022	IPO Listing on the HKEx
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on HKEx
Chifeng Jilong Gold Mining Co., Ltd	2025	IPO Listing on HKEx

2.7 Project Team

The SRK project team and responsibilities are shown in Table 2-2.

Table 2-2: SRK Project Team

Consultant	Title	Discipline and Task
Dr. Yiefei Jia	Corporate Consultant (Geology)	Project Manager, whole report, CP
Yanfang Zhao	Principal Consultant (Geology)	Geology, Mineral Resource Estimation
Zhuanjian Liu	Principal Consultant (Geology)	Geology, Mineral Resource Estimation
Kun Cao	Consultant (Geology)	Geology, Mineral Resource Estimation
Feng Li	Principal Consultant (Geology)	QAQC Review
Falong Hu	Principal Consultant (Mining)	Mining, Ore Reserve, and LOM Review
Tzu Hsuan Chuang	Senior Consultant (Mining)	Mining, Ore Reserve, and LOM
Lanliang Niu	Principal Consultant (Processing)	Processing and Metallurgical Review
Chao Ding	Consultant (Processing)	Processing Review
Nan Xue	Principal Consultant (Environment)	Environment, Social, and Permitting
Hongchen Huang	Consultant (ESG)/ Project Coordinator	Environment, Social, and Permitting/ Project Coordination
Meining Dai	Project Coordinator	Project Coordination
Pengfei Xiao	Principal Consultant (Geology)	Internal Peer Review (Geology & Resource)
Alexander Thin	Corporate Consultant (Mining)	Internal Peer Review and Quality Control

Yiefei Jia, *PhD, FAusIMM (CP Geo)*, is a Corporate Consultant (Geology and Project Evaluation) with over 25 years' experience in a combination of exploration, resource estimation, mineral deposit evaluation, and the delivery of multidisciplinary technical assessment reports. He is highly experienced in the management of exploration and resource estimation of precious metals (Au, Ag, and PGE), alkali and base metals (Li, K, Pb, Zn, Cu, V and Ni), black metals (Fe and Mn) as well as non-metallic metals (fluorite and graphite) and decorative stone (marble) ore deposits in different geological settings in Australia, China, Mongolia, Africa, America and Southeast and Central Asia. He also has over five years' experience in coal deposits exploration and due diligence in China, Indonesia and Mongolia. Yiefei's background has provided him with a firm understanding of key criteria required for the successful delivery of projects across a variety of disciplines. In recent years, Yiefei, as both a geologist and project manager, has led and coordinated a dozen of due diligence projects with technical reports for mergers and acquisitions, financing and exchange listings, such as the Stock Exchange of Hong Kong Limited.

Zhuanjian (Leo) Liu, *BEng, Member of the Australian Institute of Geoscientists("MAIG"),* is a Principal Consultant (Geology) with SRK China. Since graduated from the China University of Mining and Technology, He has been engaged in geological survey, due diligence and technical consulting in China, Indonesia and Mongolia for over 10 years. After joining SRK, he has provided consulting services for Peabody Energy (USA), SABIC (Saudi Arabia), Salim Group (Indonesia) and other large corporations. He participated in several successful cases of independent technical report/due diligence work in recent years, including China Unienergy IPO Listing on HKEx and Agritrade Resource acquisition of Shareholding in Indonesia.

Kun Cao, *BEng*, a Consultant (Geology) at SRK China. He graduated from North China Institute of Science and Technology in 2021. From 2021 to 2023, he worked at Huaibei Mining Group Co., Ltd., where he gained experience in coal mine geology, coalfield exploration, and underground coal mine production processes. He joined SRK in 2024 and is primarily engaged in coalfield geology, responsible for drafting, data processing, and geological modeling. He is proficient in Origin and AutoCAD, and has practical experience with software such as ArcGIS, Global Mapper, GEOVIA Minex, and Leapfrog.

Feng (Frank) Li, *BEng, MSc, MAuIMM*, is a Senior Consultant (Geology). He joined SRK in 2010 and has been involved in more than one hundred projects, including project coordination, exploration management, geological logging and mapping, data verification, resource modelling and estimation. the projects located in China, Mongolia, Southeast Asia, Africa and South America; the projects include gold, silver, lead, zinc, iron, nickel, vanadium, magnesium, marble, bauxite, etc. He has a deep understanding of analysis and mineral resource reporting conversions between of Chinese and JORC Code standards and has abundant experience in exploration management and quality control.

Falong Hu, *MBA, B.Eng, FAusIMM, Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Chinese Certified Consulting Engineer (Investment)*, is a Principal Consultant (Mining). He obtained his bachelor's degree in mining engineering from Central South University and Master of Business Administration (MBA) in China University of Geosciences (Beijing). Before joining SRK he worked as an on-site and head office mining engineer in 2 different international mining companies which were called Sino Gold Mining Limited (later merged with Eldorado Gold Corp.) and Silvercorp Metals Inc. He is familiar with underground and open pit mines' production systems and has been involved in mining engineering and development design, scheduling, long-hole blasting and production operation, rock mechanics, ventilation, back-fill; and cost accounting. After take part in SRK, he accumulated extensive experience in ore reserve estimation, economic analysis, project valuation, mining assessment, scoping/pre-feasibility/feasibility studies and so on. Minerals include gold, silver, lead, zinc, copper, iron, bauxite, laterite-nickel, sylvine, phosphate and graphite, as well as quartzite, marble, bentonite and so on. He is a modeler on both technical and economic and also proficient in digital modelling by using Surpac, Whittle, Minesched, Datamine and AutoCAD.

Tzu Hsuan (Shan) Chuang, *MEng, MAusIMM,* is a Senior Consultant (Mining). She has extensive experience in on-site production and consulting, with expertise in technical studies and project evaluations for both open-pit and underground mines. She is capable of independently conducting stope and pit optimization, mine design, long-term planning, ore reserve modeling, and technical-economic analysis. Her project experience spans Asia, Australia, Africa, Europe, and South America. She is proficient in various industry-standard software, including Deswik, Whittle, and Surpac.

Erwei Lu, *M.Eng.*; Senior Consultant (Mining) at SRK China**,** he obtained his bachelor's degree and master's degree in mining engineering from Central South University. He has over five years of practice of underground operation, and about one year's mineral project evaluation experience. He worked as an on-site mining engineer in Zambia for China Nonferrous Metal Mining (Group) Co., Ltd. after graduation in 2017. He also worked for an autonomous driving application and mineral project investment companies since 2022. He is familiar with large scale underground mobile equipment operation and training, long-hole blasting, mine design and scheduling, and production management, as well as autonomous driving application in open pit mine, and project evaluation.

Donghao* Luo, *BEng, Consultant (Mining) at SRK China. He obtained his bachelor's degree in mining engineering from Laurentian University. He has three years of experience in underground mining, having worked as a headquarters engineer at Silvercorp Metals Inc. His expertise includes production planning, production management, and the design of development and mining engineering projects.

Lanliang Niu, B.Eng, MAusIMM, is a Principal Mineral Processing Engineer, who graduated in 1987 from Beijing University of Science and Technology majoring in ore processing. He has worked on the industrial testing of gold leaching with low grade ores, managed or participated in processing and metallurgical testing for more than 10 precious and non-ferrous metals projects. With SRK, he has been responsible for the ore processing and metallurgical scope of work and involved in many key projects.

Chao Ding*, M Eng.,* Consultant (Mineral Processing) at SRK China. Prior to joining SRK, he worked for Weihai Haiwang Cyclone Co., Ltd. and Ramu NiCo Management Co., Ltd. He has accumulated certain experience in mineral dressing test research and has a certain understanding and mastery of plant design; in addition, he has accumulated rich experience in production and management of hydrometallurgy of nickel laterite ore.

Nan Xue, *M.Sc, MAusIMM,* is a Principal Environmental Consultant with SRK Consulting China Ltd. He holds a master's degree in environmental sciences from Nankai University in Tianjin. He has four years' experience in environmental impact assessment, environmental planning, and environmental management. He has been involved in a number of large EIA projects and pollution source surveys for SINOPEC, as well as the environmental planning project funded by UNDP. He has particular expertise in construction project engineering analysis, pollution source calculations, and impact predictions. In recent years after he joined SRK, Nan Xue has been involved in a number of due diligence projects, such as the Fuguiniao Mining project in China.

Hongchen (Cynthia) Huang, *BA,* is a consultant (ESG) at SRK China, possessing 10 years of expertise in marketing, technical translation and project management within the mining industry. In recent years, she has shifted her focus towards environmental, social, and governance (ESG) aspects, contributing to environmental and social assessments, working closely with the SRK South Africa ESG team on proposal preparation and capability building, and playing a key role in SRK's carbon accounting program. Since joining SRK, Cynthia has provided project co-ordination and management, technical translations, and environmental review for a diverse range of projects, including Guizhou Union Coal Project, Hanking Indonesian Nickel Project, Mongolian Sujishan Graphite Project, Australian Greenbushes Lithium Project, Chilean Salar Project, Angola Binga Copper Project, and Zijin Group Tajik Gold Project. Cynthia speaks Mandarin and English.

Pengfei Xiao, *MSc, FAusIMM,* is the Managing Director of SRK China. He is a Principal Consultant (Geology) with a specialty in mineral exploration applying comprehensive geological and geophysical methods; and his expertise also includes resource modelling and estimation. He is familiar with both theory and practice in sampling, sample preparation and chemical analysis. As a consulting geoscientist, he has been active in mining projects including due diligence reviews, exploration design, data verification and resource estimation in China, Mongolia, Africa, America, Southeast and Central Asia. His experience relates precious metal (Au, Ag, PGE), base metal (Cu, Ni, Pb, Zn) and other metal deposits (Fe, Mn, V, Mo, Co), and also includes a few non-metal projects (phosphorite, potash, gypsum). In the past ten years he has been working in geology and resource assessment with SRK, and co-authored dozens of technical reports aiding clients in successful property transactions; and more than half of them are published in stock exchanges.

Alexander (Alex) Thin, BEng (Hons), FAusIMM (CP Min), is a Corporate Consultant (Project Evaluation and Mining) with SRK. He is an experienced mining professional with over 30 years' experience. His strategy and leadership experience spans feasibility studies, mineral asset audits and evaluations, independent technical reports, techno-economic studies, capital raising, merger and acquisitions, managing joint ventures, local and international stock exchange compliance, business development and investor/ stakeholder relations. Alex's industry experience spans operational (underground and open pit), technical, consulting and corporate within the metalliferous resources sector, covering precious metals, base metals and bulk commodities.

2.8 Warranties

Zijin Gold International has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

2.9 Indemnities

As recommended by the VALMIN Code, Zijin Gold International has provided SRK with an indemnity under which SRK is to be compensated for any liability and/or any additional work or expenditure resulting from any additional work required:

- Which results from SRK's reliance on information provided by Zijin Gold International or to Zijin Gold International not providing material information; or
- Which relates to any consequential extension workload through queries, questions or public hearings arising from this Report.

2.10 Compliance Statement

The information in this report that relates to Mineral Resources/Ore Reserves is based on information compiled by Dr. Yiefei Jia, a Competent Person who is a Fellow of AusIMM and a Chartered Professional in Geology (CP Geo) and Mr. Falong Hu, a Competent Person who is a Fellow of the AusIMM. They are full-time employees of SRK.

This Report is a Competent Person's Report in line with the Listing Rules of the Stock Exchange and HKEX.

Dr. Yiefei Jia and Mr. Falong Hu have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code".

Dr. Yiefei Jia and Mr. Falong Hu consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Mr Pengfei Xiao, *FAusIMM*, a Principal Consultant (Geology) and Alexander Thin, *FAusIMM (CP Min)*, a Corporate Consultant (Mining).

2.11 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Zijin Gold International or Zijin Gold International's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

2.12 Consent

SRK consents to this Report being included, in full, in the Zijin Gold International prospectus, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

2.13 Forward Looking Statement

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

3 Operating Licenses and Permits

SRK relies on the information provided by NGT and Zijin Gold International, and SRK did not conduct a legal due diligence review of the Norton Projects since such work is outside the scope of SRK's technical review.

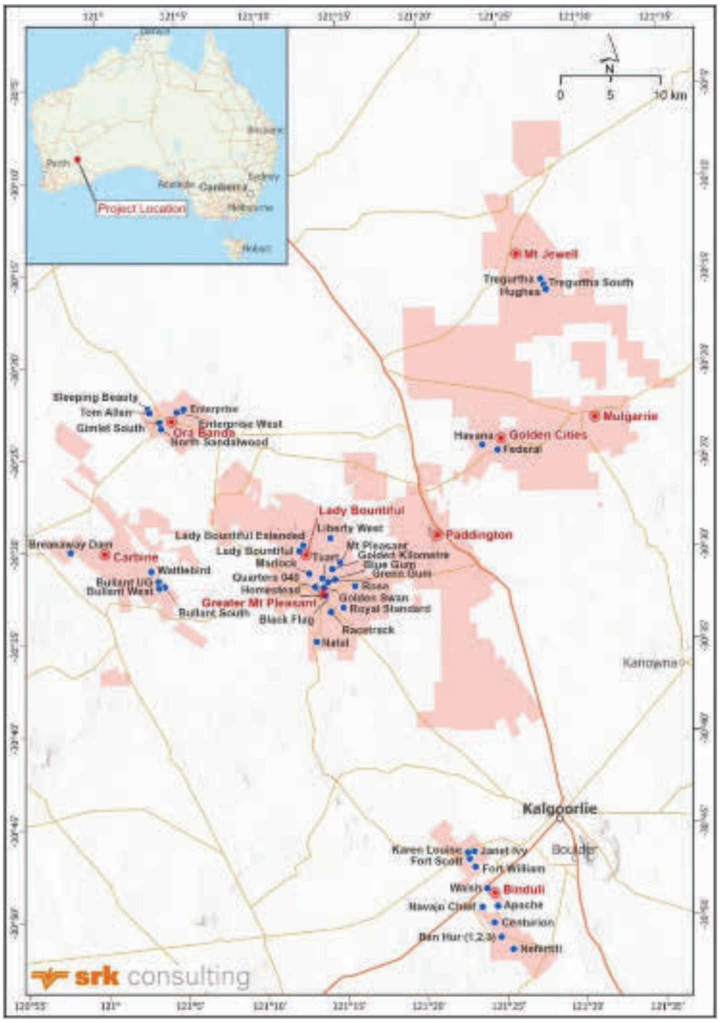
4 Regional Description and Location

4.1 Location and Accessibility

As shown in Figure 4-1, all Norton's gold deposits and two processing plants are location in Kalgoorlie area, the Eastern Goldfield region of Western Australia. Kalgoorlie is a city in the Goldfields-Esperance region of Western Australia, located approximately 595 kilometres ("km") east-northeast of Perth, the provincial capital of Western Australia. There are daily direct flights between Perth and Kalgoorlie, and there is also a paved Great Eastern Highway connects Perth and Kalgoorlie.

Figure 4-1: Location Map of the Projects and Deposits



Source: SRK

4.1.1 Binduli Project

The Binduli Project is located approximately 10km southwest of Kalgoorlie City, and is about 40km south of the Paddington Plant. Railways and highways pass through the project area and divide it into the north and south parts. The Binduli Project consists of 10 gold deposits, among which, the Navajo Chief, Centurion, Ben Hur, Janet Ivy and Apache are the main gold deposits of the Binduli Project. There is good road access to the project via the paved Great Eastern Highway.

4.1.2 Mt Pleasant Project

The Mt Pleasant Project is located approximately 40 km northwest of Kalgoorlie, and 547 km east of Perth, the capital city of Western Australia, and is just 16.5 km southwest of the Paddington Plant. The Mt Pleasant Project consists of 20 gold deposits, of which, the Lady Bountiful, Racetrack OC, Racetrack UG, and Tuart UG are the main gold deposits of the Mt Pleasant Project. All deposits and the plants are accessible via paved roads.

4.1.3 Carbine Project

The Carbine Project contains 5 gold deposit and they are located just about 15 km west of the Mt Pleasant Project, and 60 km northwest of Kalgoorlie, Western Australia. The Bullant UG is the main gold deposit of the Carbine Project. All deposits and the plants are accessible via paved roads.

4.1.4 Ora Banda Project

The Ora Banda Project consists of 7 gold deposits and all of them are situated approximately 1-2 km away from the Ora Banda Township, 30 km northwest of the Paddington Plant, and 65 km northwest of Kalgoorlie, Western Australia. The Gimlet South is the main gold deposit of the Ora Banda Project. Also, all deposits and the plants are accessible via paved roads.

4.1.5 Golden Cities Project

The Golden Cities Project consists of a total of 6 gold deposits and all of them are situated approximately 10 to 25 km northeast of the Paddington Plant, or about 50-65 km north of Kalgoorlie, Western Australia. The Mt Jewell and Mulgarrie are the main gold deposits of the Golden Cities Project. All deposits and the plants are accessible via paved roads.

4.2 Local Resources and Infrastructure

In Kalgoorlie region, the local resources and infrastructure are heavily tied to its robust mining industry, with significant deposits of gold, nickel, lithium, and iron ore driving the local economy. The region boasts strategic road, rail, and air access, facilitating investment in mineral processing, renewables, education, tourism, land development and various services industries.

Salt-alkali lakes of large scale in the south of the mine area include White Lake, Douglas Lake, Red Lake and Brown Lake. Within this area are wildlife and aboriginal sites protected by laws. Since this is an environmentally sensitive area, the development of Binduli South Project area is under significant impact.

Located in the eastern part of the mine site, Kalgoorlie, a major mining town and business centre in south central Western Australia, is heavily populated.

4.3 Physiography and Climate

The area where the Norton Project is located is part of gold fields in the east of the Western Australia with a hot desert climate and a cool semi-arid climate with hot summary from October to March and mild winter from April to September.. The maximum temperature in summer is in January and the average max temperature stands at 33.7°C; the minimum temperature in winter is in July and the average min is 5°C. The average annual evaporation is 2,665mm, and the annual precipitation is 260mm on an average of 68 days, making the evaporation far surpassing precipitation.

The terrain for the project area is flat, basically plains, with low elevation differences, and the terrain is higher in the north and lower in the south from the mean elevation. . With an elevation of 340-490 m above sea level ("m ASL"), the area is an undulating greenstone plain with occasional low hills and outcrops of bauxite or bedrock, and the entire plain dips to the south. The surface is basically woodland formed by acacia shrubs and small eucalyptus trees; the topsoil is bauxite, with a thickness of 20-30 m.

5 Geological Setting and Mineralisation

5.1 Regional Geology

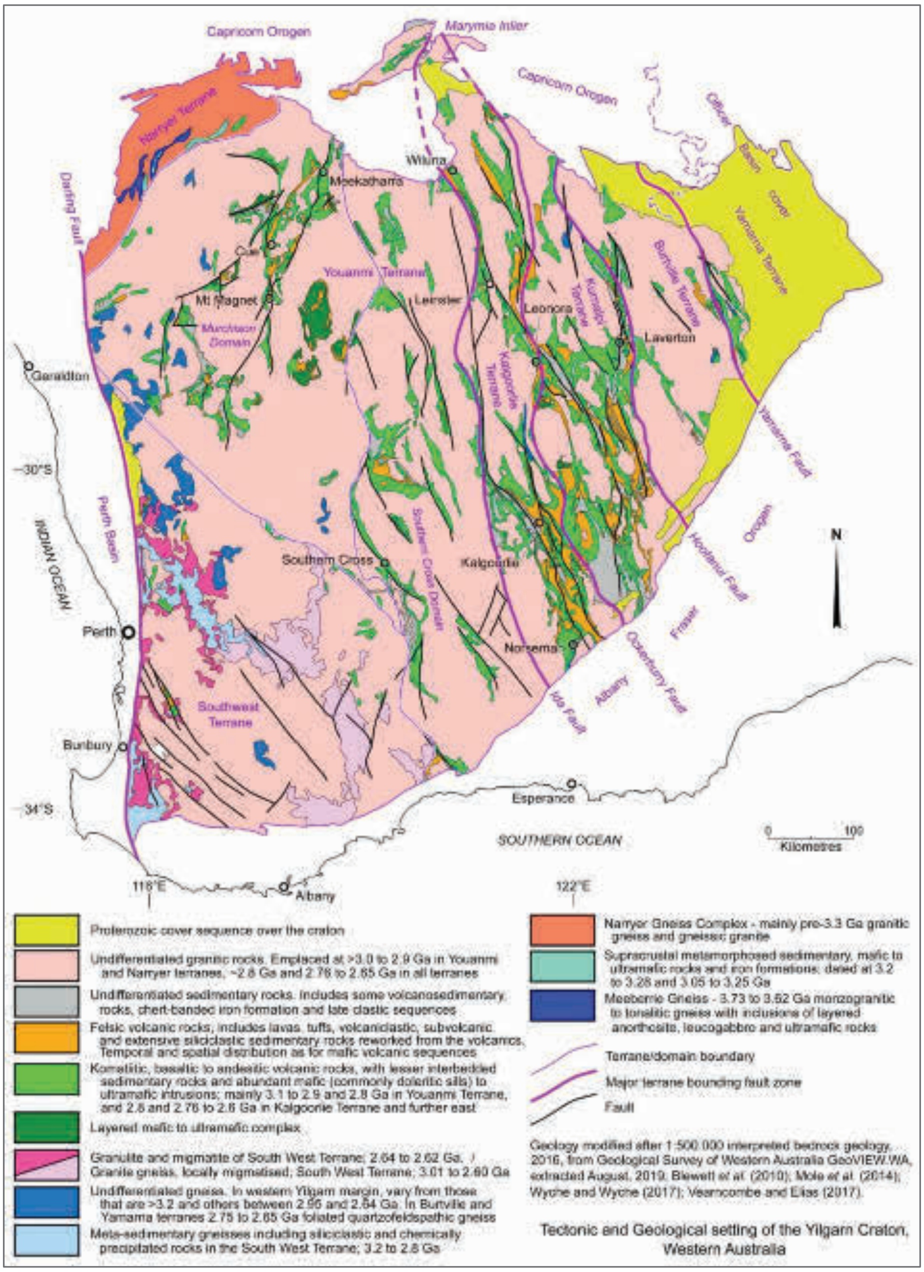
(https://portergeo.com.au/database)

The Eastern Goldfields region of Western Australia stands as a globally significant area renowned for its extensive deposits of gold and nickel. The Eastern Goldfields region forms a major component of the Yilgarn Craton, a vast expanse of ancient continental crust that has remained relatively stable for billions of years. This craton is characterized by a distinctive "granite-greenstone terrain," a geological term describing the intimate association of metamorphosed volcanic and sedimentary rocks (the greenstones) with extensive bodies of granitic rocks that either surround or intrude into them. The Yilgarn Craton, including the Eastern Goldfields, holds evidence of some of the Earth's oldest materials, indicating a long and complex geological history. Within this broad granite-greenstone province, geologists have identified several large-scale subdivisions known as terranes, each potentially possessing a distinct geological history before their eventual amalgamation. The Eastern Goldfields itself is recognized as a major structural entity, often referred to as the Eastern Goldfields Superterrane, which is further subdivided into several fault-bounded tectono-stratigraphic terranes. Understanding this hierarchical framework, from the ancient and stable craton to the more localized terranes, is crucial for deciphering the geological architecture and mineral endowment of the Eastern Goldfields.

THIS DOCUMENT IS IN DRAFT FORM, INCOMPLETE AND SUBJECT TO CHANGE AND THAT THE INFORMATION MUST BE READ IN CONJUNCTION WITH THE SECTION HEADED "WARNING" ON THE COVER OF THIS DOCUMENT.

Figure 5-1: Tectonic and Geological Setting of the Yilgarn Craton, WA



Source: https://portergeo.com.au/database/mineinfo.asp?mineid=mn1626

Geological History and Evolution

The formation of the Yilgarn Craton, including the Eastern Goldfields, is a story spanning hundreds of millions of years in the Meso- to Neoarchean, approximately 2.94 to 2.63 billion years ago. Geological evidence suggests that the craton was not formed as a single, monolithic block but rather through the accretion, or coming together, of numerous smaller crustal fragments or terranes that had previously existed as separate entities. This process of assembly involved significant tectonic activity and magmatism. In the early history of the region, mantle plume events played a crucial role, leading to extensive periods of volcanic activity and potentially initiating the rifting of the early crust. Around 2.7 billion years ago, a major mantle plume event is believed to have been instrumental in the formation of the Kalgoorlie-Kurnalpi Rift (KKR) within the Eastern Goldfields Superterrane. This rifting event exploited zones of weakness in the eastern margin of the early Yilgarn proto-craton, resulting in the eruption of thick sequences of komatiite and basalt in the area that is now known as the Kalgoorlie Terrane, between approximately 2.71 and 2.69 billion years ago. Following these major magmatic episodes, the region underwent further intense tectonic activity, characterized by deformation, faulting, and the widespread intrusion of granitoid rocks. This period of intense crustal reworking culminated around 2.66 to 2.63 billion years ago and is considered to be particularly significant as it coincides with the formation of the majority of the gold deposits found within the Yilgarn Craton.

Major Geological Formations and Rock Types

The Eastern Goldfields Superterrane comprises a complex array of geological formations, which are broadly categorized into stratigraphic groups that reflect their age and dominant lithology. Among the most significant are the Kalgoorlie Group, the Black Flag Group, and the Gindalbie Group.[7] The Kalgoorlie Group, with an age range of approximately 2.726 to 2.680 billion years, forms a substantial part of the lower mafic-ultramafic sequences within the greenstone belts between Norseman and Leinster. This group is characterized by a predominance of mafic and ultramafic volcanic rocks, including komatiites and basalts, which are remnants of the intense volcanic activity associated with the region's early mantle plume events and the formation of the KKR. Overlying the Kalgoorlie Group in the Kalgoorlie-Coolgardie-Kambalda region is the Black Flag Group, which formed between 2.692 and 2.665 billion years ago.[7] This group is distinguished by a greater proportion of felsic volcanic and volcaniclastic rocks, along with mafic volcanic components. To the north, in the Lawlers region, the Mount White Group exhibits similar lithological characteristics, age, and stratigraphic relationships to the Black Flag Group. The Gindalbie Group, found in volcanic centers near Melita and Teutonic Bore, dates to around 2.694 to 2.680 billion years ago and is composed of bimodal (basaltic to rhyolitic) and calc-alkaline volcanic successions, along with associated intrusive rocks and quartz-rich sedimentary rocks. In addition to these major volcanic-dominated groups, sedimentary rocks, including siliciclastic sequences and banded iron formations (BIFs), are found both within and overlying the volcanic successions.1 Intruding and surrounding these greenstone belts are extensive bodies of granitic rocks, which constitute a significant percentage of the Yilgarn Craton's geology. These granites exhibit a variety of compositions and emplacement ages, reflecting a complex magmatic history that played a crucial role in the tectonic and thermal evolution of the Eastern Goldfields. The general spatial distribution reveals a pattern of elongated greenstone belts, rich in volcanic and sedimentary rocks, enveloped and often separated by vast domains of granitic terrain.

Gold Mineralisation

The Eastern Goldfields region is renowned for its exceptional endowment in gold, with the Yilgarn Craton as a whole being recognized as a highly prospective terrain for gold deposits. The majority of the significant gold deposits in this area are classified as orogenic gold deposits, which typically form deep within the Earth's crust during major tectonic events involving compression and crustal deformation. The formation of these world-class gold deposits is intricately linked to several key geological controls. Structurally, major shear zones, faults, and folds have played a critical role by acting as pathways for the migration of hydrothermal fluids, which are the carriers of gold and associated elements. These structures often represent zones of weakness and intense deformation within the crust, facilitating the focusing of fluid flow and the subsequent deposition of gold. Lithologically, the type of host rock in which the gold mineralisation occurs is also significant. While gold deposits can be found in various rock types, iron-rich rocks such as dolerites, basalts, komatiites, and banded iron formations are particularly common hosts due to their chemical reactivity, which can promote gold precipitation from the hydrothermal fluids. Notably, the Golden Mile Dolerite and the Paringa Basalt in the Kalgoorlie Goldfield are prime examples of significant gold-hosting lithologies. Temporally, the main phase of gold mineralisation in the Eastern Goldfields is generally associated with the late stages of the Yilgarn Craton's formation, coinciding with major deformation events in the Neoarchean, approximately 2.66 to 2.63 billion years ago. This period of intense tectonic activity provided the necessary structural framework and likely the driving forces for the hydrothermal systems that led to the concentration of gold.

Tectonic Setting and Structural Features

The Eastern Goldfields Superterrane is internally divided into several distinct tectono-stratigraphic terranes, each separated by major crustal structures. The most widely recognized subdivision includes the Kalgoorlie Terrane, the Kurnalpi Terrane, the Burtville Terrane, and the Yamarna Terrane. These terranes are bounded by significant shear zones, which represent zones of intense deformation and movement within the Earth's crust. For instance, the Kalgoorlie Terrane, the westernmost of these subdivisions, is separated from the Youanmi Terrane to the west by the major Ida Fault Zone. To the east, the Kalgoorlie Terrane is bounded by the Ockerburry Shear Zone (also known as the Mount George and Keith-Kilkenny Shear System), which separates it from the Kurnalpi Terrane.[11] Further east, the Kurnalpi Terrane is separated from the Burtville Terrane by the Hootanui Shear Zone (or Laverton Shear Zone), and the eastern margin of the Burtville Terrane is defined by the Yamarna Shear Zone, which separates it from the Yamarna Terrane. In addition to these major terrane-bounding structures, the region is characterized by other significant structural elements. The Boulder-Lefroy Fault Zone, for example, is a crucial structure in the Kalgoorlie Goldfield and is closely associated with many of the major gold deposits. On a broader scale, regional-scale folds, often with granitic intrusions forming the cores of anticlines, are a common feature of the Eastern Goldfields' structural architecture. These folds, along with the shear zones and faults, have played a significant role in shaping the distribution of rock units and the localization of mineral deposits. Modern geophysical techniques, such as high-resolution seismic reflection surveys, have provided valuable insights into the three-dimensional geometry of these structures and the underlying lithotectonic units at depth, revealing features like reflective greenstone successions and non-reflective granitic intrusions, as well as potential zones of hydrothermal alteration.

5.2 Local and Property Geology

5.2.1 Binduli Project

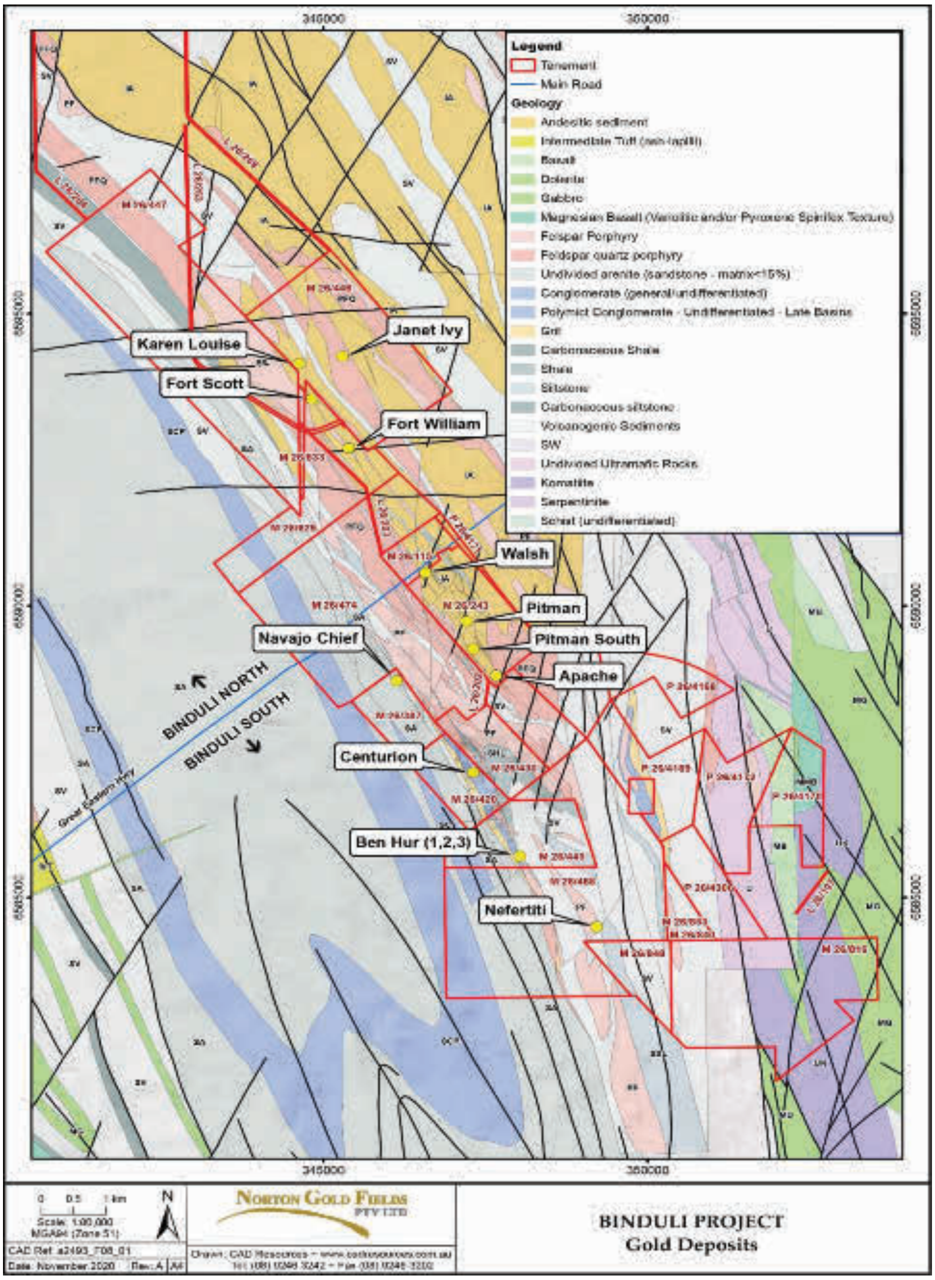
The Binduli gold camp is situated within the Ora Banda Domain of the Archean Kalgoorlie Terrane, Western Australia. The geological architecture of the Binduli region is structurally controlled, primarily by the Mount Pleasant Anticline and the Kurrawang Syncline, which exhibit a shallow south-southeast plunge. Principal fault structures within the district include the north-northwest trending Abattoir Shear and the northwest trending Zuleika Shear. These structures are spatially distinct, located approximately 3 km east and 8 km west of Binduli, respectively. Additional significant structures include the Binduli Shear, a north-south trending fault system that interconnects the Abattoir and Zuleika Shears, and the Centurion Fault, a north-northwest trending structure. The Centurion Fault is characterized by local intrusions of felsic porphyries and is interpreted to juxtapose the Kurrawang Formation. A series of secondary structures, exhibiting north and northeast trends, transect the regional geological sequence. A spatial association between these secondary structures and zones of gold mineralisation has been observed, suggesting a potential genetic link.

The Centurion fault is an east dipping regional structure with a long history of deformation, possibly beginning as a pre D1 basin fault that controlled emplacement of the numerous porphyries and ending with reverse movement that was coincident with gold mineralisation, and which continued after mineralisation ended.

The deposits of Ben Hur and Centurion line occur in epiclastic and high-level porphyry intrusions, domes and related porphyry breccias in the immediate footwall of the fault. While deposits of the Beaver-Navajo line occur in the conjugates and splays in Kurrawang Formation arenites further to the west.

The project geology is comprised of units from the upper part of the Ora Banda Domain. The stratigraphy has a general north-west strike and there are several late east-northeast and north-northwest striking faults. The stratigraphy dips to the west. Overburden is between 1 m and 111 m down hole with an average of 19m.

Figure 5-2: Local Geology Map of Binduli Project



Source: Norton Gold Fields Pty Ltd

Navajo Chief Deposit

The Navajo Chief mineralised body is located in the northwest end of the NC-BE-CT-BH continuous ore section. Regional shear zones and faults are underdeveloped within the NC mineralised body, with only a number of small brittle/ductile faults. In the centre of the NC pit there is an 80° strike, several meters wide fault with quartz veins, which occurs only at the bottom of the pit and not on the pit wall. In the north of the fault and on the east wall of the mine, there are two north-northeast trending, medium dip faults. Most of the dikes in the pit are shallow extended quartz dikes with an average strike of 22 ~ 213°, a south-southwest dip and a width of several centimetres. Quartz veins on the west wall are separated by an average of several meters and surrounded by greywacke and layers rich in white kaolin. The eastern quartz veins developed in the middle of the quartz-carbonate alteration unit and extended into the adjacent siltstone unit, partially undergoing hydrothermal alteration.

In the southern part of the Navajo Chief Pit, kaolin-rich rocks are interpreted as weather sodic-altered siltstones. There are a few quartz veins present in the south pit but most of the mineralisation is thought to have been hosted in the sodic-altered siltstone and sandstone. Dominantly, throughout the Navajo Chief pit as "whole" the higher gold grades lie in the transitional zone between weathered and fresh rock and probably represent supergene mineralisation. Unmistakably, primary gold mineralisation is associated with sodic alteration (Norton 2020).

Janet Ivy Deposit

The larger Janet Ivy deposit is hosted in the Janet Ivy porphyry, a massive porphyritic felsic intrusive of rhyodacite composition. The porphyry is approximately 2.5 km long and up to 150 m wide and faulted and sheared along its margins. The deposit is thought to have formed along a splay structure off the Pitman – Fort William thrust fault system. The weathering profile in the project area is typical of the Eastern Goldfields with a clay-saprolite horizon (below intermittent remnant laterite) which transitions to fresh basement rock. In the Binduli area the weathering profile extends around 50 to 60 m below surface (GRM, 2016).

Ben Hur Deposit

The Ben Hur deposit is located in the northwest of the NC-BE-CT-BH continuous ore section, located in the footwall of the Centurion fault. The lithology is mainly porphyry breccia, folded porphyry and clastic sediments. The felsic volcanic sequences form anticlines, and felsic porphyry intrudes along the fold axis. The rock strata on the west side of the porphyry dips 50 ~ 80° to the west, and the east side of the porphyry is mainly black shale with feldspar volcanic rocks and a small amount of sediments, which dips steeply to the east. The western contact zone of porphyry strikes 330°, dips northeast and dips 70°.

Gold mineralisation in hosted in porphyry breccias, folded porphyries, fine and coarse epi-clastic sediments. The mineralisation is in the form of very shallow west-dipping veins that have selectively developed in hematite-magnetite altered feldspar-quartz porphyry, in which the porphyry is decomposed of clays in the upper weathering profile. The supergene gold is typically covered by a leached zone that is 20m to 30m thick (Norton 2020).

Apache Deposit

The Apache deposit is located to the east of the NC mineralised body. The lithology is mainly metamorphic sediments and quartz-feldspar porphyry intrusions, controlled by the Abattoir fault. The Abattoir fault is a western-dip regional structure that divides the Binduli and Kalgoorlie greenstone sequences. The Apache mineralised body is located within a small area of the western fold of the Abattoir fault and is controlled by NE and NW trending faults.

Gold mineralisation to occur within a weakly developed quartz vein stockwork with associated bleaching, silicification and disseminated pyrite. Quartz veins are typically around 1cm in width and occur at a frequency of 1-2/m. (Binduli South Scoping Study, 2020, P.26-32.)

Centurion Deposit

The CT mineralised body is located in the middle of the NC-BE-CT-BH continuous ore section. The eastern wall of the Centurion fault is a series of steep-dipping east-dipping sequences, which are mainly composed of black carbonaceous shale, sandstone and siltstone, and felsic porphyry intrusions rich in feldspar. In the western margin of CT pit, the main lithofacies is massive to weakly graded multi-impurity conglomerate deposit with small crystal lithic sandstone. The porphyry facies rich in feldspar has hydrothermal alteration of different degrees related to gold mineralisation. The conglomerate bed is supported by hetero-groups, and the difference between the contact zones of the fine strata is the slight change of grain size and detrital, and there are sutures. Clastic rocks include feldspar porphyry, feldspar quartz porphyry, siltstone, sandstone, semi-massive sulphide, and layered mudstone, generally nearly round to round. The felsic pyroclastic rocks of this sequence strike 260°, dip to northwest and dip 60°.Sandstones and siltstones are turbidite deposits that are conformable with porphyry conglomerates.

The gold mineralisation in the Centurion deposit occurs as two distinct types within volcano-sedimentary units. The mineralisation styles have been divided into two main categories, Eastern Contact Mineralisation (ECM) and Western Contact Mineralisation (WCM) (Norton 2020).

5.2.2 Mt Pleasant Project

The Mt Pleasant project area is located within the Ora Banda Domain of the Archaean Kalgoorlie Terrane. The Ora Banda Domain is bounded by the Zuleika Shear to the west and the Abattoir Shear to the east. The stratigraphic succession consists of a lower basalt unit (Pole Group), komatiite unit (Linger and Die Group), upper basalt unit (Grants Patch Group), felsic volcanic and sedimentary unit (Black Flag Group) and a polymictic conglomerate unit (Kurrawang Formation). The architecture of this domain is dominated by the Goongarrie – Mt Pleasant anticline. Within the anticline core beneath the lower basalt unit occurs the basement Owen Complex granite. The post-folding Liberty Granodiorite has intruded the sequence along the anticline axis. Late north, north-east trending strike slip faulting and associated linking structures have provided structural loci for the mixing and accumulation of gold bearing fluids.

The deposit types are classified as narrow vein, orogenic gold deposits within the Norseman-Wiluna greenstone sequence. The accepted interpretation for gold mineralisation is related to (regional D2-D3) deformation of the stratigraphic sequence during an Archaean orogeny event. The mineralisation is hosted within the upper-mafic rock units of the Kalgoorlie stratigraphy.

The project area geology is dominated by mafic volcanic and intrusive units of the Grants Patch Group which host the bulk of the primary gold mineralisation discovered and mined to date. Overlying the mafic sequence are intermediate to felsic volcaniclastics and sediments of the Black Flag Beds. Structural complexity through the interaction of north, north-east trending faults, associated splays and linking structures together with proximity to large felsic intrusive bodies, in particular the Liberty granodiorite, enhance the mineralisation potential of the sequence in the Mount Pleasant area. The north, north-east trending Black Flag and Royal Standard faults form a corridor within which the bulk of the primary mineralisation at Mt Pleasant has been discovered. The main host rock units for gold mineralisation within the area are the Victorious Basalt (VB) and the Bent Tree Basalt (BTB). These two mafic volcanic units host the majority of mines/deposits within the project area.

Racetrack OC and UG Deposit

The Racetrack deposit is hosted primarily in the Victorious Basalt (VB) and then continues into the underlying Bent Tree Basalt (BTB) with black shale on the contact. The basalt contact dips at approximately -400 to the southwest. The shale is oriented 120°/-20° south-west and offset 80m across a 040° trending fault through Dogtrack north. Both basalts have coarse-grained intervals that are interpreted as thick flows. The Bent Tree Basalt is a fine grained, massive to pillow tholeiitic basalt with a true thickness estimated to be 900m. The Victorious Basalt is a plagioclase phyric, massive to pillowed tholeiitic basalt. Plagioclase phenocrysts are generally hexagonal to rounded and up to 20mm in diameter.

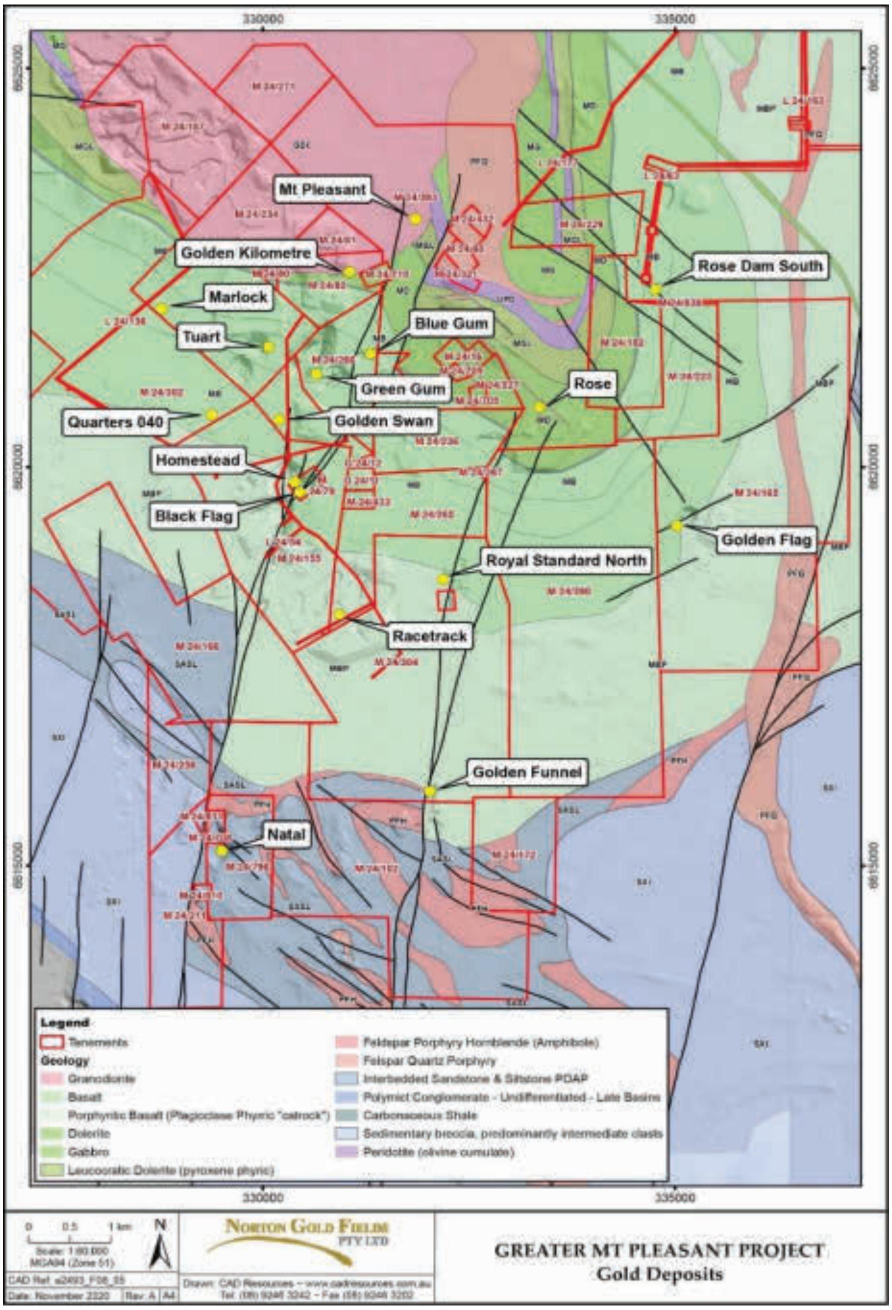
Although the two basalts are texturally different whole rock analysis completed indicated that the two are quite similar chemically, with the Bent Tree Basalt being marginally higher in Mg, Cr and Ni. These minimal chemical differences would not explain the differences in gold mineralisation styles present in the greater Mt Pleasant area.

Also present in the Racetrack open cut ("OC") mine is an intermediate porphyry, which crosscuts both the Bent Tree and Victorious Basalts. The intermediate porphyry is plagioclase-phyric and hard to distinguish from the Victorious Basalt. Plagioclase phenocrysts within the intermediate porphyry tend to be tabular compared to the rounded form in the Victorious basalt. The boundary between Racetrack East and Racetrack West is marked by the intermediate porphyry. Boundaries between the basalt units and intermediate porphyries are sharp or foliated. Shear zones form along some of these boundaries. The intermediate porphyries terminate against both the Dogtrack shear zone from the north and Racetrack shear zone to the south.

Tuart UG Deposit

The Tuart deposit is hosted within the Bent Tree Basalt (BTB) on the western limb of the Mt Pleasant anticline. The thick sequence of fine-grained and pillowed basalts contains some sparse coarser grained layers ranging from 1-10 m in width. These have gradational boundaries with the fine-grained zones. Pillow margins often contain brecciated quartz and numerous sulphide minerals. The contact between the fine- and coarse-grained units dips 35-50º to the south and is weakly sheared in several places. The coarse-grained unit contains some minor inter-layered fine-grained zones in addition to a pyroxene rich unit.

Figure 5-3: Local Geology Map (Greater Mt Pleasant)



Source: Norton Gold Fields Pty Ltd

5.2.3 Carbine Project

The gold deposits of the Carine Project are located in the north-west trending Coolgardie-Carbine Archean greenstone belt. The major structure in the region is a gently plunging, north-west trending syncline dominantly composed of sediments, felsic volcanics and minor mafic/ultramafic intrusives of the Black Flag Beds. This sequence of rocks is cut by the west, northwest striking Carbine Shear, which is interpreted as a reidel structure bounded to the northeast by the major Zuleika Shear.

The Zulieka Shear Zone is a broad brittle-ductile structural corridor where gold mineralisation is typically contained along geological contact zones (i.e. mafic/ultramafic). The shear zones usually dip sub-vertically to steep east dipping.

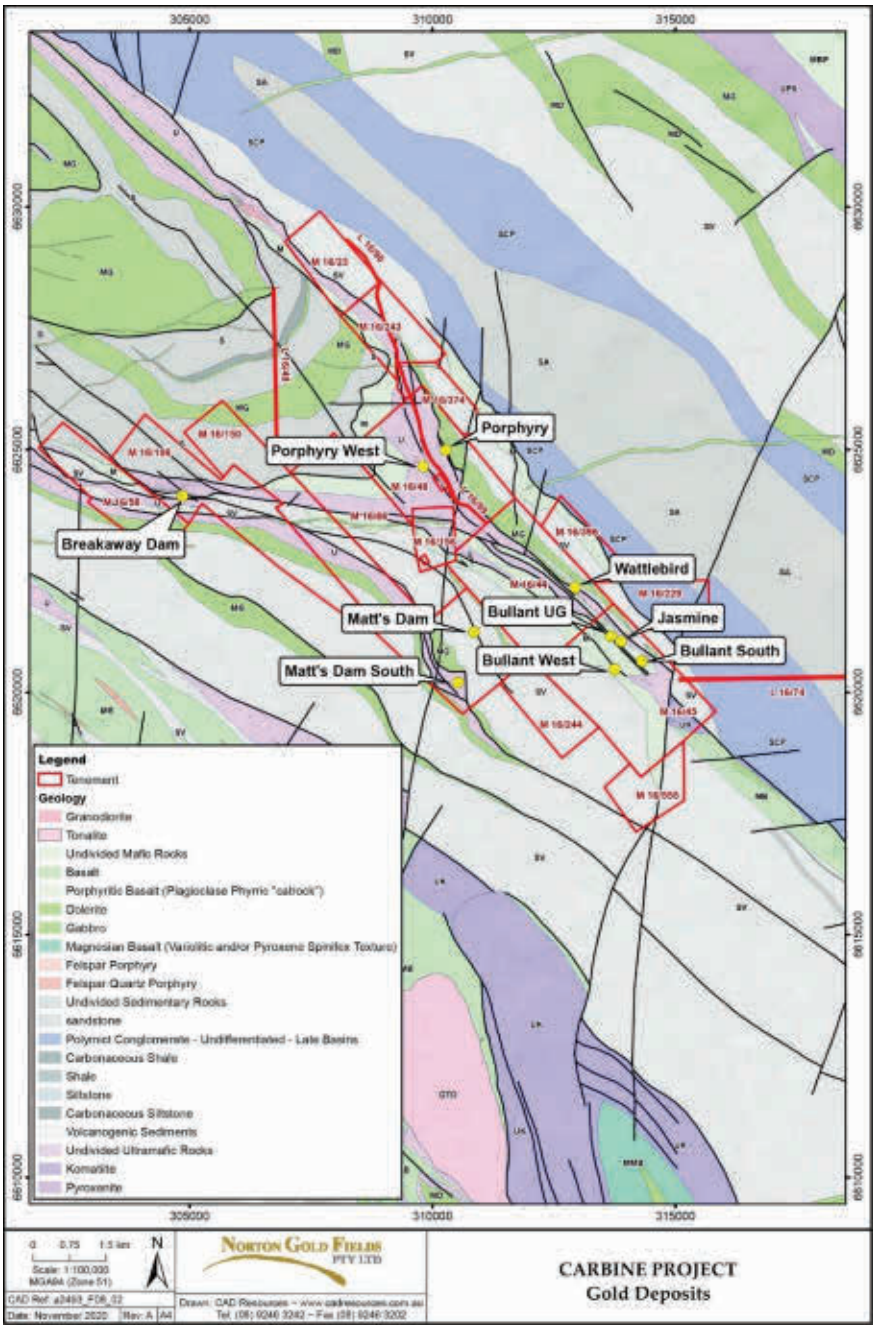
The majority of the lode systems, especially within the main Bullant Gold Mine area are commonly 2 metres in thickness that strike 320º with a sub-vertical dip. They typically have a strike length of approximately 400 m. These lodes are parallel to the main shear structure.

Mineralisation is generally hosted within the sheared/faulted contact of very coarse grained mafic volcaniclastics and fine grained mafic volcaniclastics. Alteration within the lode systems is typically a pervasive biotite ± chlorite ± silica alteration and this is common with elevated gold grades. Sulphidation associated with the gold bearing systems is usually pyrrhotite, while weak pyrite ± galena ± sphalerite are also present. Quartz veining is also associated with the main gold bearing shears, but not always present.

Bullant UG Deposit

The Bullant Underground Mine is situated along the Zuleika Shear Zone, a highly prospective regional north, north-west trending structure. The Shear Zone is a broad brittle-ductile structural corridor contained within a mafic unit within the mine area. The shear zone dips sub-vertically to steeply east dipping. Mineralisation occurs in up to four lodes (labelled the Main, East, West and Cross lodes) and is associated with biotite-silica-pyrite altered basalt and minor local quartz veining. Both the Main and East lodes remain open at depth and in various other positions around previously mined areas.

Figure 5-4: Local Geology Map of Carbine Project



Source: Norton Gold Fields Pty Ltd

5.2.4 Ora Banda Project

The Ora Banda area covers a portion of the Ora Banda greenstone sequence on the southwestern limb of the Goongarrie-Mt Pleasant Anticline. The greenstone sequence consists of a pile of ultramafic and mafic volcanics up to 10 km thick overlain by intermediate to felsic volcaniclastics and sediments. Numerous mafic sills intrude the entire sequence.

The Ora Banda Greenstone (mafic) sequence can be divided into several units. The oldest is the Siberia Komatiite, comprising a sequence of ultramafic flows and serpentinites overlain by a high magnesium basalt sequence (Big Dick Basalt). A thin sequence of siltstone, shales and quartz porphyry separates these basalts from the upper tholeiites.

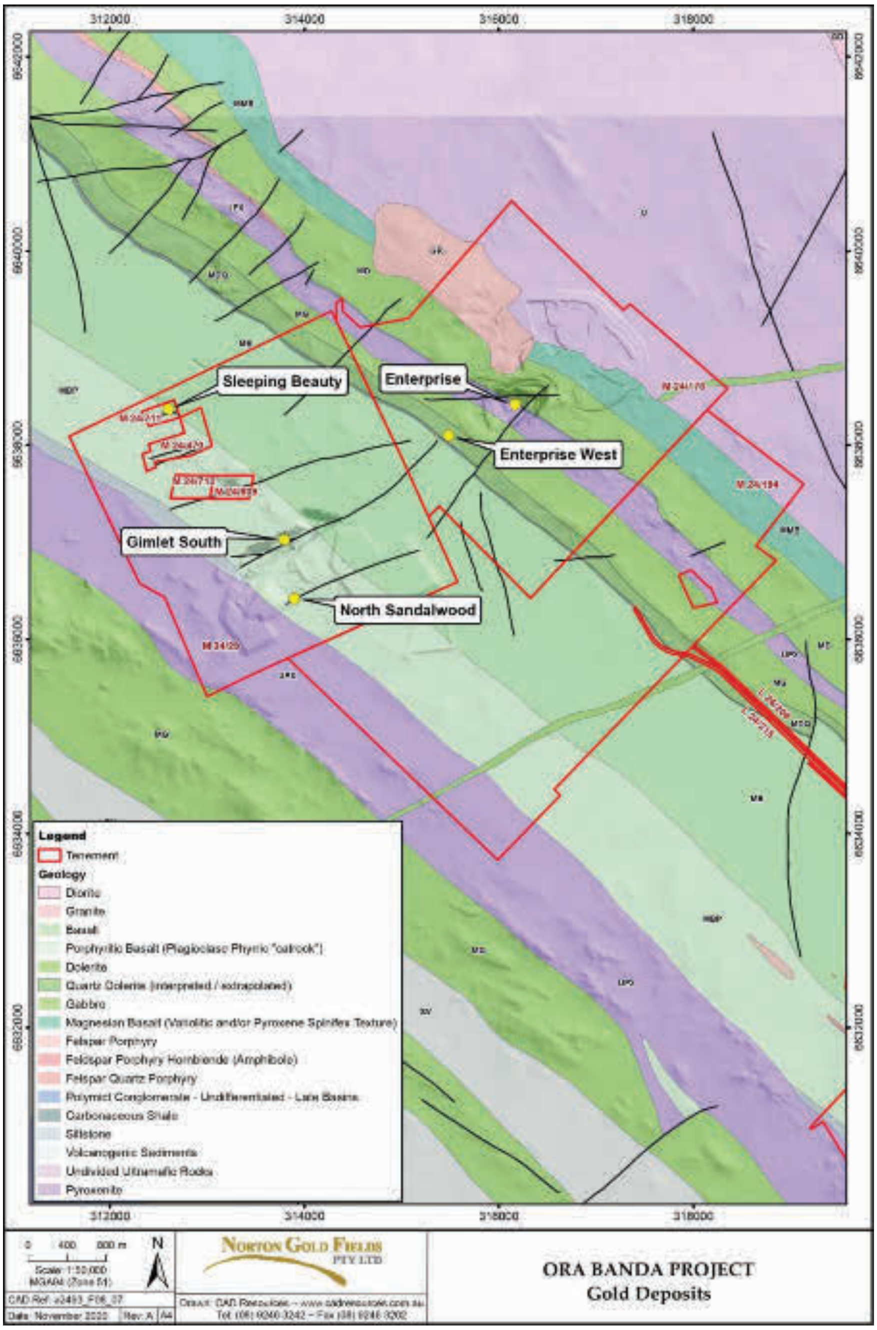
The upper basalt sequence consists of the BTB and overlying VB. They are separated by a thin bed of graphitic shales. Both basalt sequences consist of pillowed and massive flow units. The VB is characterised by its distinct porphyritic texture.

Layered sills intrude the sequence at three horizons. The Enterprise Dolerite intrudes the upper part of the Big Dick Basalt below the shale/quartz porphyry horizon, the Mt Pleasant Sill along the base of the tholeiitic sequence and the Ora Banda Sill is emplaced at or just below the top of the upper basalt unit.

This sequence was subjected to low to middle greenschist facies metamorphism coincident with the regional deformation event which formed the Goongarrie-Mt Pleasant Anticline. Subsequent deformation resulted in the formation of north-south (350 to 020º) and northeast-southwest (040 to 080º) trending strike-slip fault sets with limited dextral offset. The southwest-trending faults are commonly intruded by basaltic and doleritic dykes of Proterozoic age.

The Ora Banda area includes oxide and sulphide resources located within approximately 5 km of the abandoned Ora Banda Mill, these include Boundary, Enterprise, Gimlet South, Nazzaris, Sleeping Beauty, Slippery Gimlet and Whitehaven North. The mineralisation is structurally hosted on mostly 060º to 090º trends with some influence from 020º faults as well as being stratigraphically controlled in a north-westerly direction. The regional geology of the area is illustrated in Figure 5 10.

Figure 5-5: Local Geology Map (Ora Banda Project)



Source: Norton Gold Fields Pty Ltd

Gimlet South Deposit

The Gimlet South deposit is hosted within the Ora Banda District on the Eastern Limb of the Kurrawang Syncline. The Kurrawang Syncline is a major regional fold structure in the Norseman-Wiluna Greenstone Belt of the Eastern Goldfields Province. The geology of the Ora Banda district is dominated by the Ora Banda mafic sequence, a moderately southwest dipping sequence of late Archaean age rock. These are underlain by ultramafic rocks of the Linger and Die Group to the east of the project area, and overlain by intermediate to felsic igneous rocks of the Black Flag West Group to the west of the project area.

The Gimlet South deposit straddles the contact zone between the Bent Tree and the Victorious Basalt units.

5.2.5 Golden Cities Project

The Golden Cities Project lies within 3 mining leases, M24/564, M24/565 and M24/616.

A significant proportion of exploration, resource development & mining was completed by companies which held tenure over the deposits since 1996. Companies included: AMX Resources NL Minerals International (1996-2000), Goldfields Exploration Pty Ltd (2000-2002), Placer Dome Asia Pacific (2002-2005), Barrick (2005-2007).

The project lies within the granite/granodiorite Scotia-Kanowna dome, located within the Boorara domain greenstones of the Kalgoorlie Terrane. The deposit type is classified as an orogenic gold deposit within the Norseman-Wiluna greenstone sequence. The accepted interpretation for gold mineralisation is related to (regional D2-D3) deformation of the stratigraphic sequence during an Archaean orogeny event. The mineralisation is hosted within Kanowna-Scotia Granitoid Complex. The metamorphic grade is defined as lower greenschist facies.

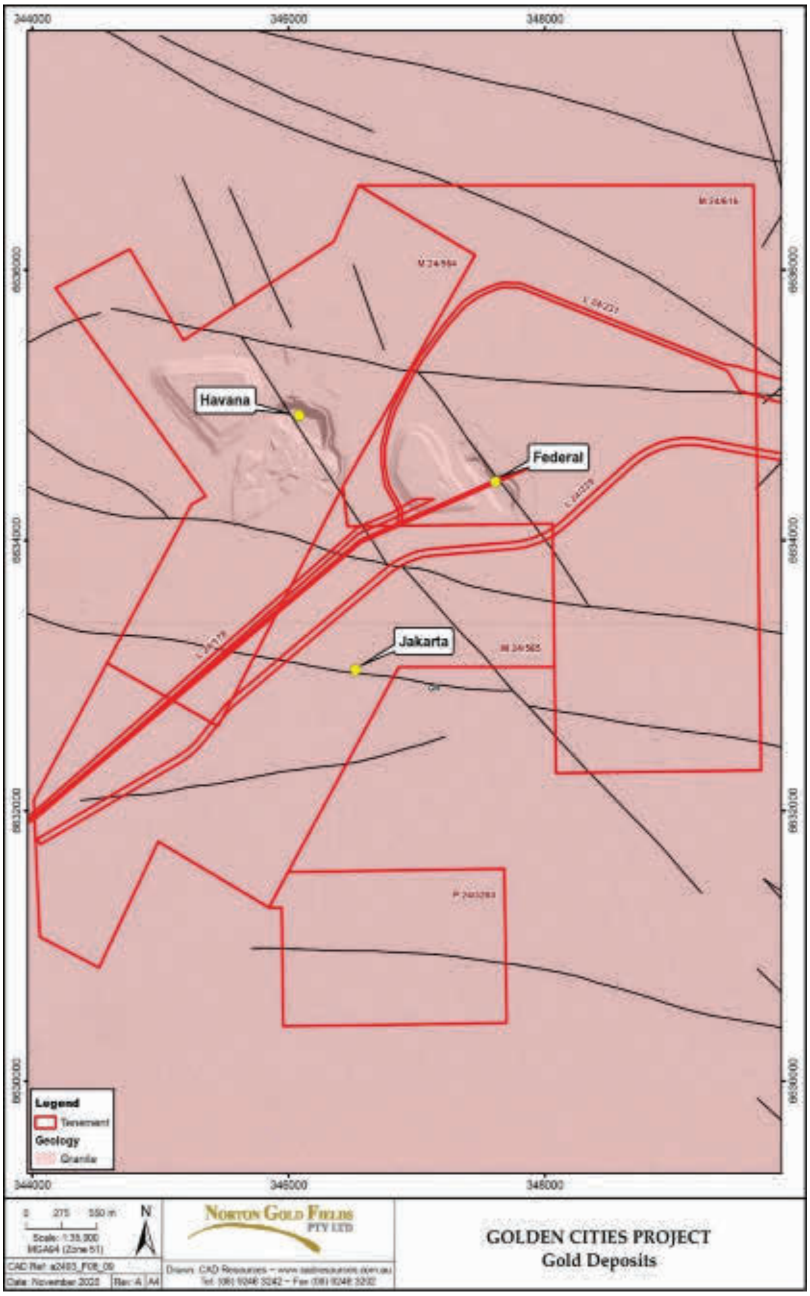
The Scotia-Kanowna Granitoid Dome realised final uplift during local extension prior to D3, late D2 (syn-D2). Havana is located in a north-west trending D2-D3 thrust fault which is 5km away from the greenstone stratigraphy. The location of the Golden Cities deposits are primarily located at the intersection of sheeted north-east to north, north-east fractures with the north-west trending faults. These structures are associated with demagnetisation of the granitic rocks that form the dome.

Hydrothermal alteration is extensively developed within the Golden Cities area and consists of broad distal epidote alteration with associated hematite. Primary gold mineralisation is typically associated with intense biotite –hornblende alteration within the shear/vein sets.

Three styles of gold mineralisation occurs at the Golden Cities Project. Surface laterite mineralisation which is hosted in the upper laterite portion of the weathered profile. It is flat lying in nature and reasonably pervasive across all of the deposits, thickness is 1-2 meters and locally up to 4 meters. This is followed by a supergene mineralisation layer which is usually present within the saprolite horizon of the weathering profile. This layer typically has a depth from surface of 25-35m, with a thickness of 2-6m, locally up to 10m.

Primary Gold is hosted within narrow quartz-pyrite veins/shears and commonly in pyrite linings on the fracture surfaces. Intense biotite alteration is always associated with the primary mineralisation lodes.

Figure 5-6: Local Geology Map (Golden Cities Project)



Source: Norton Gold Fields Pty Ltd

Federal UG Deposit

The Federal deposit is hosted within a hornblende-biotite-granodiorite of the Kanowna-Scotia Granite Complex. There are two main types of granite, the fine-grained granodiorite and the coarse-grained granodiorite, identified within the Federal deposit.

A minor phase of monzodiorite is insignificant in terms of both its volume and gold distribution. The coarse-grained granodiorite is distributed in the northern part of the open pit at Federal. It is grey in colour, and contains abundant hornblende and biotite. Epidote alteration is very common in the coarse-grained granodiorite. The fine-grained granodiorite is located in the southern part of the open pit at Federal. The fine-grained granodiorite is normally grey in colour, and contains abundant biotite with lesser hornblende. Epidote is also common in the fine-grained phase, but it is not as modally intensive as that in the coarse-grained phase. According to drill core logging and in-pit mapping, the overall contacts trend north-west, and dip moderately to the north-east. The contact, however, is largely irregularly shaped.

5.3 Control on Mineralisation

5.3.1 Binduli Project

Navajo Chief Deposit

In the southern part of the Navajo Chief Pit, kaolin-rich rocks are interpreted as weather sodic-altered siltstones. There are a few quartz veins present in the south pit but most of the mineralisation is thought to have been hosted in the sodic-altered siltstone and sandstone. This interpretation is consistent with core observation where gold mineralisation has intersected a sodic alteration zone.

Gold mineralisation in the central part of the Navajo Chief Pit is associated with the eastern mineralised zone and the thin unit of quartz-carbonate altered siltstone located on the contact between siltstones and sandstones. This unit is unweathered and strongly pyritic and cut by shallow-dipping quartz veins. However, the shallow dipping quartz-veins are thought to have little influence on gold mineralisation, as the main contribution is thought to be the quartz-carbonate altered host unit. The western half of the central load appears to be conterminous with the unaltered greywacke unit but there may be a more detailed relationship with the white kaolin units that has been smeared by supergene processes. A pyritic quartz-carbonate altered unit within the greywackes exposed on the west wall of the central pit area is broadly coincident with the western mineralised zone and is a likely source of mineralisation. Selective rock chip sampling of the shallowly dipping quartz veins from this area suggests that their contribution is to gold is nuggetty, erratic and unlikely dominant.

Gold mineralisation in the north pit is partially associated with quartz veins. All veins seen in this area steeply oriented and have nothing to do with the shallowly-dipping vein set seen in other parts of the pit.

Dominantly, throughout the Navajo Chief pit as "whole" the higher gold grades lie in the transitional zone between weathered and fresh rock and probably represent supergene mineralisation. Unmistakably, primary gold mineralisation is associated with sodic alteration (Witt, 2010)

Pervasively, sodic alteration zones contain some quartz-carbonate (-pyrite-tourmaline) veins. The economic significance of these veins relative to sodic altered wallrocks was addressed by Witt (2011) in the selective resampling of diamond core. The highest gold grades (5 to 8g/t Au) came from intervals where quartz veins were absent. Selective sampling of quartz veins returned low grade results (<0.27g/t Au) suggesting that quartz veins are mineralised but are of low grade compared to grades from the sodic altered zones.

Gold and pyrite are often depleted in zones of brittle-ductile faulting compared with the sodic alteration zones above and below the faults. This has occurred because gold has either been remobilized or because the brittle-ductile faults were never a major conduit for ore fluids.

Janet Ivy Deposit

The millimetres to centimetres-scale quartz veins up to a width of about 40 cm, and commonly containing minor sulphides (mainly pyrite) are common in the feldspar porphyry. They occur in both the potassic and carbonate alteration zones but are slightly more abundant, wider and carry more sulphides in the potassic alteration zone. Most are associated with sodic alteration halos but some in the Western Splay have a muscovite halo, presumably as a result of fault-related muscovite alteration. The veins range from simple veins of massive quartz to breccia veins to veins with fibrous quartz. Where present, the orientation of quartz fibres can be used to determine the opening direction of the veins. Where oriented normal to vein walls, the veins are classified as extensional and where the fibres form at an angle to the walls, they are classified as oblique. The veins show a broad distribution with maxima equivalent to planes that dip 35° towards 019° and 80° towards 342°, with a minor maximum equivalent to 55° towards 170°. The orientations of quartz fibres in these veins are strongly biased towards a shallow north-northwest plunge in both extension and oblique extension veins, indicating that the veins formed to accommodate sub-horizontal NNW-SSE extension. Extension veins are steep and oriented 050° to 070°, the other two maxima may represent a conjugate set of oblique extension veins.

There is unlikely to be any significant degree of supergene modification of gold concentrations, at least in the porphyry unit, which is essentially fresh at the pit floor. The data defines an NNW trending zone of mineralisation (>0.5g/t Au) along the western margin of the porphyry intrusion. Mineralisation (thus defined) extends into the Western Fault and the Eastern Splay Fault but there are few values >0.5g/t Au in the sedimentary unit. The mineralisation envelope, including high-grade samples, extends beyond the potassic alteration zone, northwards into the carbonate alteration zone. High-grade values (>1.5g/t Au) occur sporadically throughout the broader mineralisation envelope. There are few clearly defined high-grade shoots but there appears to be a tendency for higher grade samples to be located in broad zones adjacent to the Western Fault and the Eastern Splay Fault in the south, and adjacent to the Western Fault only in the north. Selective rock chip sampling within the potassic alteration zone of the pit targeted cm-scale massive to fibrous quartz (±sulphide) veins with halos of pyritic sodic alteration. Results are not available at the time of writing, but it is presumed that these veins and their sodic alteration halos are the major source of gold because i) there is a good correlation between mineralisation and areas containing the veins, ii) previous workers at Janet Ivy noted an association between gold and quartz veins with the same orientations and iii) pyritic sodic alteration controls gold in other deposits of the Binduli camp and at similar intrusion-hosted gold deposits in the Eastern Goldfields e.g. Navajo Chief.

Ben Hur Deposit

The Ben Hur line of deposits extends northwest southeast in the immediate footwall of the CF. Gold mineralisation in hosted in porphyry breccias, folded porphyries, fine and coarse epi-clastic sediments. The mineralisation is in the form of very shallow west-dipping veins that have selectively developed in hematite-magnetite altered feldspar-quartz porphyry, in which the porphyry is decomposed of clays in the upper weathering profile. The supergene gold is typically covered by a leached zone that is 20m to 30m thick. This style of mineralisation is commonly situated directly above primary gold zones, forming a mushroom shaped geometry. There seems to be multiple supergene fronts with moderate dispersion of gold along supergene blankets. The multiple fronts are likely to be related to fluctuating water tables. Primary gold mineralisation predominantly forms in steep dipping west oriented veins striking ~340° (See figures below). The water in the pits prevents observation of primary lodes. Earlier mapping of Ben Hur Pits 1 and 2 infers that primary mineralisation is wedged between a splay of the Centurion Fault (CF) and sheared carbonaceous shales. The diamond drillhole data supports steep dipping primary structures. The alteration assemblage associated with the gold mineralisation is typically hematite-pyrite-carbonate-sericite.

Apache Deposit

The Apache deposit is located east of the Navajo Chief deposit. The local geology consists of a sequence of metasediments intruded by a quartz-feldspar porphyry. Gold mineralisation is characterized by a weakly developed tension quartz vein stockwork, strong bleaching, strong silicification and disseminated pyrite throughout the porphyry. The mineralisation has a shallow (<30°) east dipping morphology and plunges slightly south, sub-parallel to the BOCO horizon.

Gold mineralisation is reported to occur within a weakly developed quartz vein stockwork with associated bleaching, silicification and disseminated pyrite. Quartz veins are typically around 1cm in width and occur at a frequency of 1-2/m.

Centurion Deposit

The gold mineralisation in the Centurion deposit occurs as two distinct types within volcano-sedimentary units.

The mineralisation styles have been divided into two main categories, Eastern Contact Mineralisation (ECM) and Western Contact Mineralisation (WCM).

The ECM mineralisation is dominated by a high-grade gold, pyrite-quartz rich zone between 4920N and 5040N, adjacent to the black shale contact. This zone plunges 20° to 45° N and appears to follow the hinge zone of the Centurion antiform.

High grade ECM occurs in a wedge of fine sediments in the crest of the Centurion anticline. The sediments may represent sea floor deposition intruded by a porphyry cryptodome, on to which a porphyry breccia derived from the top of the dome was accumulated. Hydrothermal fluids moving up the Centurion Shear and the sheared flanks of the porphyry accumulated in the hinge zone resulting in a gold-silica-sericite-pyrite alteration in the sediments.

The association of both the ECM and WCM with significant hematite-magnetite alteration has provided a geophysical target, with one model being a large magnetic body with areas of subdued magnetism representing magnetically destructive albite-silica-sericite-pyrite alteration.

5.3.2 Mt Pleasant Project

Racetrack OC and UG Deposit

In general, the gold bearing ores contained within the fresh rock of the Racetrack deposit are Refractory in nature.

Numerous metallurgical and one mineralogical study have been completed to date on the Racetrack mineralisation. Of the metallurgical studies the most used is the study completed by AMMTEC for Delta Gold to ascertain if Racetrack mineralisation was suitable for treatment at the Kanowna Belle treatment plant. All studies indicate that the majority of the gold within the Racetrack mineralisation is bound within sulphide crystals, with the major sulphide present being arsenopyrite. This in turn generates problems with treatment of resultant arsenic. Metallurgical studies were completed using either composite samples or samples taken pre-dominantly from one end of the deposit. All of the studies also indicated that metallurgical recovery was extremely variable, ranging from 4% up to 90%. There was no discussion or follow-up in any of the reports regarding metallurgical recovery variability.

The mineralogical study reported by Zhou in 1998 indicates that the distribution of gold within the overall mineralisation system contained a series of various assemblages. There were four assemblages identified:

- Gold –pyrite – made up 13% of the samples studied.
- Gold – arsenopyrite – made up 50% of the samples studied.
- Gold - rutile – muscovite – quartz+/-carbonate – made up 25% of the samples studied.
- Electrum – tennantite – tetrahedrite – made up 12% of the samples studied.

Zhou also conducted recovery test work using the Leachwell (simulating normal cyanide leaching) process to ascertain if there was any correlation between sulphide abundance, sulphide phase and gold recovery. The following observations were drawn from this study:

Samples with abundant sulphides all have a gold recovery of less than 50%. The sulphide phase with the greatest number of samples returning a better than 50% gold recovery was pyrite. The arsenopyrite assemblage only returned one sample with a better than 50% gold recovery.

Samples with only minor sulphides (regardless of assemblage) returned better than a 50% gold recovery.

Samples with abundant detectable gold (visible under a light microscope) all returned a better than 30% gold recovery.

In terms of host rock, samples with a gold recovery of >50% were most likely to be hosted in (or adjacent to) intermediate porphyries. Samples from both Bent Tree and Victorious basalts exhibited poor gold recoveries with the Bent Tree Basalt showing a smaller range than the samples from the Victorious Basalt.

Tuart UG Deposit

There are 3 main lode systems: 060°, 080° and 115° lodes. Numerous other small lodes have been encountered and resource modelled but are essentially small splays emanating from the three main lode orientations.

The Tuart 060° trending lodes have a moderate north-west dip and are structurally disjointed over an interpreted 1,100-1,300m strike length. The Tuart 115° trending lode has a moderate south-westerly dip, and is structurally continuous with an interpreted strike length between 500-600m.

Vein styles within the various lode horizons range from 'brittle-ductile', 'brittle-faulted', to 'extensional' types of veining with associated alteration assemblages and gold mineralisation.

Gold mineralisation is usually associated with pyrite sulphidation that contains minor traces of sphalerite and galena. These base metals are usually associated with high gold grades.

High gold grades are associated with quartz veins and/or silica-carbonate-chlorite-sulphide (+/- visible gold) alteration assemblages. There are currently a large number of existing drilling intersections into the 060° and 115° lodes that demonstrate that high grades are associated with these strike orientations.

The main Tuart 060° vein structures are differentiated between 3 dominant lodes. The Main (601), Footwall (621) and Hanging wall lode (609) have formed, alongside several minor parallel lodes. The 060° veins commonly display different textural characteristics, from brittle, brittle-ductile and ductile variants (see figures below). The 115º Lode is a brittle-ductile ≥2m shear structure.

5.3.3 Carbine Project

Bullant UG Project

The majority of the Bullant gold mineralisation is hosted within the steeply dipping Main and East lodes. Both lodes are commonly 2 m in thickness that strike 320º with a vertical dip. High grade gold is commonly on the eastern contact of the shear structure. Strike length of the lode system is approximately 400 m. The Main lode is the principal mineralised body, parallel to the shear structure. The East Lode is a parallel structure to the Main Lode and is similar in terms of structural orientation and mineralisation style.

5.3.4 Ora Banda Project

Gimlet South Project

Mineralisation styles in the Ora Banda area have been historically sub-divided into Gimlet style and Enterprise style. Gimlet style mineralisation is hosted by 060° trending brittle-ductile faults within the Victorious Basalt and Bent Tree Basalt. Both pillowed and massive horizons within the mafic volcanics tend to be favourable to mineralisation, with structural intersections producing south-west plunging ore shoots.

Gimlet-style ore is predominantly pyrite-pyrrhotite-gold with localised concentrations of arsenopyrite, sphalerite, galena and tellurides. Pyrite is the dominant ore mineral with arsenopyrite, sphalerite, marcasite, chalcopyrite and pyrrhotite occurring as inclusions within euhedral pyrite grains. Chalcopyrite and arsenopyrite are commonly attached to coarse pyrite grains that are aligned in trails along micro fractures.

Gimlet gold mineralisation styles are generally refractory in nature, with metallurgical recoveries varying with deposit and lode.

5.3.5 Golden Cities Project

Federal UG Project

The mineralisation is located in brittle & brittle-ductile deformation zones trending 315° and dipping 60° to the northeast. Gold is hosted within vein sets in the brittle (northern) zone of the open pit & in the ductile S/C fabric within the brittle-ductile (southern) zone. A brittle vein array exists in the footwall of the deformation zones. Discrete alteration assemblages proximal to the ore zone are muscovite & biotite and act as a visual indicator to the higher-grade portions of the ore zone.

The Federal deposit is hosted within a hornblende-biotite-granodiorite of the Kanowna-Scotia Granite Complex. There are two major supergene gold enriched zones in the regolith, namely one zone near the base of weathering (saprolite) and the other at the base of highly oxidation(Boho). Primary gold mineralisation is localized by a sinistral brittle-ductile shear zone(315NW/-60NE) in the granodiorite complex.

5.4 Alteration and Structure

5.4.1 Binduli Project

Navajo Chief Deposit

Alteration is characterised by hematite-magnetite alteration that has been successively overprinted by biotite-chlorite-carbonate then silica-sericite-pyrite alteration.

The alteration assemblage associated with the gold mineralisation is silica-hematite-pyrite-carbonate-sericite.

The overall stratigraphy of the deposit has a dip/dip direction of -60°/260°. These sandstone and siltstone units are interpreted to be deposits from turbidites and they exhibit a conformable contact with the porphyry conglomerates. The thickness of the beds ranges from 10cm to 1m.

The mineralised corridor appears to form an elongated zone that plunges at -10° and trends toward 155º based on lineation measurements from the pit mapping.

Janet Ivy Deposit

Muscovite alteration around the faults overprints more extensive areas of potassic and carbonate alteration within the porphyry. Potassic alteration takes the form of disseminated and veinlet biotite, biotite on fracture surfaces and is commonly pyritic. In the carbonate alteration zone, primary ferromagnesian minerals (pyroxene, amphibole, biotite) are replaced by carbonate. Dusty hematite in both the potassic and carbonate alteration zones imparts a pink to red colour to the porphyry.

Quartz veins up to 40 cm wide formed extensively along the western margin of the porphyry intrusion. These veins and the associated sodic (albite-ankerite-pyrite-rutile) alteration halos overprint initial primary potassic and carbonate alteration. Some veins carry coarse patches and veinlets of galena. Hematite is displaced outwards from the veins and is concentrated in the outer part of the alteration halo. Gold is thought to be related to quartz veins with pyritic sodic alteration haloes because the distribution of veins shows a broad correlation with grade control data.

The contact between feldspar porphyry intrusion and metasedimentary rocks is highly strained within a steep, contact-parallel fault (the Western Fault) which is defined by a strong foliation and muscovite alteration. A second fault, the Eastern Splay Fault, bounds the mineralisation on the east but does not form the eastern contact of the intrusion.

These 2 dominant structures strike north, north-west at between 330° to 350°. Additionally, several narrow brittle fault zones, up to about 1 metre wide, have been recorded within the feldspar "Janet Ivy" porphyry. These faults strike approximately north-south with a moderate to steep east dip and approximate to 070º and subvertical in nature. These faults form an irregular network of mutually cross-cutting crush zones within the intrusive body.

Ben Hur Deposit

Magnetite alteration to hematite, characterised by a pink colouration, is common in mineralised intersections at Ben Hur. The pink alteration haloes extend up to 1.0m either side of the mineralised vein edge.

Silicification haloes associated with quartz veining tend to be narrow at Ben Hur 1, generally up to 30cm from the vein edge. Carbonate alteration of the host rocks is rare. Occasional quartz veins have carbonate as vein selvages and there are rare irregular thin carbonate veinlets in the porphyry. Sericite alteration of feldspar is pervasive throughout the sequences and where the porphyry is strongly foliated.

Two main north trending faults are prominent within the ore body and these have been inferred by the displacement of distinctive units and thickness variations along strike. Movement sense is dextral [i.e. - north block east]. A number of ductile structures have been identified where porphyry textures are obliterated by shearing which is dipping 10 to 40° east.

Apache Deposit

Alteration haloes of silica and pyrite extend far away from the mineralised quartz vein edges by up to 20cm, giving a lighter grey, bleached colour around mineralised intersections. Sericite alteration is also pervasive, more so when the porphyry is strongly foliated. Carbonate as vein selvedges and discrete disseminated grains is associated with altered mineralised zones.

Magnetite is pervasive throughout the rocks, it is distinguished by pink hematite alteration, especially in oxide/transitional horizons. The relationship between gold mineralisation and magnetite is unsure at this point. However, hematite alteration is absent in mineralised intervals.

The Apache deposit is part of the Binduli South gold camp area. Mineralisation within this sector is tectonically and structurally controlled by fault splays off the Abattoir Fault. The Abattoir Fault is a regional structure that dips west and separates Binduli from the Kalgoorlie greenstone sequence. The area is within a cotractional jog located on the west bend of the Abattoir Fault which is then crosscut by a mixture of north-east and north-west trending splay faults.

Centurion Deposit

Alteration is characterised by hematite-magnetite alteration that has been successively overprinted by biotite-chlorite-carbonate then silica-sericite-pyrite alteration.

The felsic volcaniclastics in this succession have a dip/dip direction of -60°/260°. These sandstone and siltstone units are interpreted to be deposits from turbidites and they exhibit a conformable contact with the porphyry conglomerate. The thickness of the beds ranges from 10cm to 1m.

5.4.2 Mt Pleasant Project

Racetrack OC and UG Deposit

The broader alteration halo at Racetrack is characterised by a large 2.5km x 1km chlorite and carbonate alteration envelope indicating a significant fluid and mineralisation system.

The alteration has converted the regional actinolite and epidote assemblage to chlorite-calcite, ankerite and muscovite-pyrite-gold alteration zones. This is most evident proximal to the mineralised gold bearing ore zones.

In general, the Victorious Basalt (VB) alteration has a relatively wide halo, whereas the Bent Tree Basalt (BTB), which is a higher Mg content, has narrow alteration halos.

The geological model is one of multiple mineralised directions at Racetrack, but with an overall dominant 0600 orientation of the mineralised envelope. It should be noted that hydrothermal veins are relatively uncommon at Racetrack. It is inferred that the mineralisation is mainly associated with ductile shear zones and breccia zones. There is no inference that each structural style was confined to a particular rock type or particular area of the mineralised system. There is some evidence that both styles were occurring together. Quartz veining is prevalent in the ductile shear zones.

Gold mineralisation occurs in both shear zones and brecciated zones with associated quartz veining, although the quartz veining does not always occur within the mineralised ore lodes. High grade gold is usually developed best within quartz shear lodes trending 040 and 100°, whereas low-grade gold is predominately developed in shear zones that trend 070° and with shallow northerly dip. The breccia zones are best mineralised in the 060° orientation and exhibit moderate dips.

As within other deposits in the Mt Pleasant area, where the dominant 060° structure is intersected with a 020° structure, then high gold grades tend to be encountered and usually within the 060° structure itself.

Shear veins are the most common type at racetrack and quartz/sulphides are typically intruded into the shear zones. Open spaced veins are relatively uncommon within the racetrack deposit, representing <5% of the mineralised ore zones.

The dominant structures are shear zones and breccia zones oriented at four main directions:

- 0600/-600 major mineralised structure
- 0400/-550 major mineralised structure
- 1000/-500 significant mineralised structure
- 0200/-900 minor mineralised structure

Tuart UG Deposit

The alteration assemblages at Tuart are essentially similar to that of the adjoining deposit at Quarters from which the underground portal is located. The local geology has been affected by low-grade metamorphism equivalent to the greenschist facies. Alteration mineral assemblages observed include chlorite ± carbonate ± silica ± sericite ± iron carbonate (ankerite) ± muscovite ± biotite.

The alteration assemblages contained within the system usually occurs as haloes around the quartz lodes. Scheelite and rare fluorite has also been noted. These two minerals appear to be very late in the evolution of the veins and are usually seen intergrown with the carbonate alteration.

Two major faults control gold mineralisation within the Greater Mt Pleasant Project. The Black Flag and Royal Standard faults are both steeply-dipping north-east striking (020°) structures that change orientation to 045° around the gold camp and are accompanied by a zone of dilational vein emplacement. The Black Flag Fault is interpreted to be an early ductile structure overprinted by a series of brittle failure events, resulting in multigenerational hydrothermal vein breccias. Several mineralised vein orientations have been described within the Mount Pleasant Gold Camp including: 020°, 040°, 060°, 080°, 115° and 150° which have been interpreted to be accommodation structures associated with the changing orientation and reactivation of the Black Flag fault.

Mineralised structures within the Tuart deposit can be designated by their general strike direction (080°, 060° and 115° structures). These structures have been interpreted to be accommodation structures associated with the changing orientation and reactivation of the higher order north, north-east trending Black Flag fault which lies to the east. The 060° Main Lode dips at -40 towards the north-west and includes distinct, steeper dipping hanging wall and footwall structures. The Tuart 060°, and sub parallel hanging wall and footwall lodes have been the major target for resource definition.

The 115° Lode is a 1.5m wide, shear-hosted quartz-pyrite breccia, with a distinctive biotite-carbonate alteration halo and varying amounts of accessory arsenopyrite, galena, sphalerite and free gold in patches. It is narrow, commonly less than 0.5 metres wide. Fine arsenopyrite is associated with low gold grade (less than 1 g/t Au), whereas higher gold grade (greater than 20 g/t gold) is generally restricted to areas of the 115° lode with abundant quartz, sphalerite and galena. A set of regional scale north-south trending faults offset the lodes. These faults are manifest in the original Tuart open cut mine as 010° to 020° striking shear zones with occasional quartz veins but are not gold mineralised. North-South offset of the lodes on these faults is in the order of 10 to 40 m.

5.4.3 Carbine Project

Bullant UG Deposit

Pervasive biotite ± chlorite ± silica alteration is significant in the Bullant lode system and is associated with elevated gold grades. Biotite alteration itself however, is not homogeneous and tends to meander within the shear from footwall to hanging wall and in a vertical sense. Pyrrhotite is the dominant sulphide associated with the Main and East lodes, while weak pyrite ± galena ± sphalerite are characteristic of the Cross lode.

The Bullant deposit is a shear-hosted lode, located within the Zulieka Shear Zone which is a main structural feature that controls most of the gold endowment within the Carbine Project area. The Zuleika Shear Zone is a high strain corridor that separates the Ora Banda Domain from the Coolgardie Domain. Further, this structure is characterised by intense deformation, approximately 1 km wide, within which lithological contacts were the dominant loci for shearing.

The average strike of the shear zones in the area is 028º north-west with a dip of -88º southwest. At mine scale, the lodes are represented as the Main lode; East lode; Cross lode and the Jasmine lode.

5.4.4 Ora Banda Project

Gimlet South Deposit

The typical gold-related alteration assemblage for Gimlet-style mineralisation is muscovite/sericite – pyrite/pyrrhotite-calcite/ankerite, with minor zones of biotite and tourmaline. Alteration zonation from distal to proximal comprises chlorite-calcite, muscovite/sericite-calcite and muscovite/sericite-ankerite-pyrite/pyrrhotite-quartz-gold. Alteration haloes have been described as approximately 3 times the width of the accompanying structure.

Folding of the Kurrawang Syncline/ Goongarrie-Mt Pleasant Anticline fold couplet dominates the region, intersected by several major brittle-ductile faults labelled the Gimlet fault array, these structures form an array of east-west to ENE-WSW trending structures, with mineralisation commonly at structural intersections with favourable litho-geochemical stratigraphic units.

The D4 Gimlet fault array comprises a series of five ENE-WSW trending parallel mineralised structures spaced at intervals.

Stereograms of structural elements compiled from underground mapping at the Gimlet South mine show three dominant brittle-ductile fracture sets striking 057°, 172° and 085°. The 057° cluster is the main trend of the structure with the weak 085° cluster representing spur lodes. Cross-cutting brittle-ductile faults are subordinate features along the 172° trend.

5.4.5 Golden Cities Project

Federal UG Project

Hydrothermal alteration is extensively developed at Federal. A broad distal epidote alteration zone has a peripheral hematite alteration zone. The proximal muscovite-biotite zone bounds quartz-pyrite veins. The bleached zone of muscovite alteration was largely used as a guide for mining by geologists at Federal open pit.

Sulphide alteration occurs in the proximal alteration zone normally coexisting with muscovite-biotite alteration. Pyrite is the dominant sulphide with minor telluride minerals and chalcopyrite. Sulphide alteration occurs associated with quartz veins or as veinlets along small fracture systems and varies from less than 1cm to over 10cm in thickness. Abundance of sulphide minerals is the most important indicator for gold mineralisation.

The Federal deposit lies on parallel north-west (315º) strike shear structures within the Scotia Granodiorite, same as the Havana deposit. The shear structures are both about 2km along and join 100º striking structures at the ends of both of the shears. The northern half of the open-pit is dominated by brittle deformation in the coarse-grained granodiorite, whereas the southern half is dominated by ductile to brittle-ductile deformation in the fine-grained granodiorite. A change in grain-size of the host rocks may have affected the type of deformation, with ductile fabrics more prominent in fine-grained granodiorite and brittle fabrics more prominent in coarse-grained phases.

6 Exploration

6.1 Exploration History

6.1.1 Binduli Project

Gold was first discovered within the project area in 1897 as part of the Eastern Goldfields prospecting rush. Up to 1942 the recorded production was 225 ounces of gold from 358 tonnes of ore.

In the late 1960s: BHP Ltd and Dampier Mining Pty Ltd explored the area for base metals at a time when gold exploration was of minimal interest due to a low prevailing gold price. During this period samples were not even routinely analysed for gold.

A change in the fiscal status of gold brought about a gold exploration boom, and in 1987 Defiance Mining NL ("Defiance") commenced gold exploration in the project area, concentrating on the known gold occurrences at the old Binduli mining centre. In 1990, Defiance entered into a joint venture agreement with Australian Consolidated Minerals Ltd ("ACM") and a more regionally oriented geochemically based exploration programme was undertaken.

The results from ACM's work identified a series of soil geochemical anomalies over a 10km strike length on the western side of the project area. A follow-up rotary air blast drilling ("RAB") programme was completed to a predetermined depth of 40 m over soil anomalies reported values higher than 30 parts per billion ("ppb"). A number of low-grade intercepts were recorded but were not of sufficient tenor for ACM to continue, and they withdrew from the joint venture in 1991.

In 1993: Croesus Mining NL ("Croesus") purchased the "Binduli" tenements and commenced open pit mining at the Pitman deposit. Croesus also resumed routine exploration. Initial efforts were concentrated on soil geochemical anomalies identified by ACM, which were drill tested to unweathered rock (often well beyond the previous 40 m drill depth). As a result, new saprolite hosted supergene gold deposits were identified at Centurion and Choctaw. Significant primary gold mineralisation was subsequently delineated at Centurion. Exploration conducted included geophysical surveys and geochemical and drilling programmes.

In February 2001: Croesus entered into a farm-in and joint venture agreement with Placer Dome Asia Pacific Ltd ("Placer"). Drilling programmes were conducted to test geophysical anomalies beneath and adjacent to some of the existing open pits. The best intercept in Placer's initial phase of exploration came from the northern end of the Ben Hur 3 mineralisation, at the Pandora prospect, where drilling intersected 6 m at 9.38g/t Au from 144 m as well as 10 m at 3.2g/t Au in hole BHD34.

Continued exploration resulted in the discovery of a new mineralised zone (Nefertiti) about 400 m east of the existing line of open pits. The mineralisation here is hosted by altered sedimentary rocks sandwiched between porphyries and is considered to be similar in style to the high-grade Eastern Contact Mineralisation ("ECM") mined in the Centurion Pit.

2008-2007: On the 29 May 2008, Norton and Bellamel agreed to merge the two companies by means of an off-market takeover offer by Norton for all the shares in Bellamel. The acquisition was finalised in September 2008.

Norton acquired Paddington in August 2007. Paddington is a wholly owned subsidiary company of NGF. Paddington is the operating manager of the Bellamel Mining Ltd tenements.

2008–2012: NGF completed extensive drilling at Navajo Chief, Fort William, Fort Scott and Janet Ivy. During this period the first phase of open pit mining was completed (February 2012) at Janet Ivy. Alongside Janet Ivy, the bulk of the mined tonnes were from the Navajo Chief Pit in a major mining phase adjoining and extending the three original (Navajo North, South and West) smaller pits.

2013-2014: Open pit mining at Navajo Chief was completed (September 2013), resource drilling was completed at Fort Scott and resource studies were conducted on multiple prospects. In addition, large scale geophysical reprocessing of GSWA data was completed by 'Vector Research' to aid NGF target generation.

2015-2017: Open pit mining was completed at Janet Ivy (May 2015-January 2016). The second major mining phase at Janet Ivy Pit was conducted from September 2015–March 2016. Metallurgical sampling and Mineral Resource infill drilling using reverse circulating ("RC") and Diamond drilling ("DD") was planned and conducted during this period. The drilling covered the major prospects within the Binduli reporting group.

The third major mining phase at Janet Ivy Pit recommenced in April 2017. RC drilling at Victoria United and hydrogeological bore sampling was conducted throughout the major prospects (See Table 6-1). Resource studies were also completed on the Apache prospect and Janet Ivy.

2017–2018: Activities undertaken include database work and one RC drilling programme totalling 2,673 m was completed. Extensive exploration planning was undertaken covering seven deposits within the Binduli Project area. Open pit mining continued at Janet Ivy and was completed in August 2018. Ore production totalled 1,551,773 t at an average grade of 0.89g/t Au.

2018-2019: Activities include reporting on the results of a drilling programme at Apache. Diamond drilling at Centurion deposit targeted gold mineralisation at depth. RC drilling on the eastern side of the Fort William open pit targeted mineralisation at depth. Diamond drilling at Fort Scott aimed to infill the gold resource and test mineralisation at depth.

First pass exploration auger soil sampling programmes were planned for five prospecting licences.

Open pit mining continued at Janet Ivy and was completed in July 2019. Ore production totalled 601,474 t at a grade of 0.96g/t Au.

2019-2020: Activities undertaken include extensive drilling of RC and DD programmes at Fort Scott, Fort William, Karen Louise, Janet Ivy, Ben Hur and Centurion. Exploration activities included RC drilling at Crake as well as auger soil sampling on prospecting licences.

2020-2021: In mid-2021, the Binduli North Mining Proposal was approved by DMIRS. The proposal consists of the expansion of the existing open pits (Janet Ivy, Fort Scott and Fort William), as well as the development of a new open pit (Karen Louise). A key feature will be a heap leach facility and associated processing plant infrastructure.

RC and Diamond drilling programmes were undertaken at the seven main gold deposits to improve the gold resources and also for mining studies.

2021-2022: In June 2021, construction of the heap leach project commenced. In early July 2022, the project was officially opened. Mining of the cut-back of Fort William open pit commenced at the end of July 2022. The first ore processing began in September 2022.

During the reporting year, due to the construction activities occurring in the northern area of the project, the exploration drilling focus shifted to gold deposits in the Binduli South area.

RC and Diamond drilling programmes were undertaken at six main gold deposits including Walsh, Pitman, Apache, Navajo Chief, Centurion, and Ben Hur. The overall aim of the drilling programmes was to improve the gold resources and for mining studies.

2022–2023: Four RC drilling programmes were completed at the Pitman, Apache, Karen Louise gold deposits. The overall aim of the drilling programmes was to improve the gold resources and for mining studies.

Drilling at the Binduli South area was designed to sterilize the ground for future extensions of waste dump areas in and around the proposed Binduli South open pits.

Open pit mining of the Fort Scott deposit temporarily stopped in December 2022. Open pit mining of the Janet Ivy deposit restarted in November 2022 and continued during the reporting period.

The Binduli North Heap Leach Project began processing ore in September 2022 and continued operating during the reporting period.

Current Exploration Programs in 2024: The current exploration strategy centers on expanding resources at known deposits and sterilizing land for infrastructure development, the details information is presented in Table 6-1.

Table 6-1: Summary of Current Exploration Activities

Tenement Number	Current Exploration
M26/243	**Pitman Drilling Programmes** 9 DD drill holes for 2,757.35 m were completed. 2 RC drill holes for 395 m were completed.
M26/243 and M26/474	**Apache RC Drilling Programme** 42 RC drill holes for 4,901 m were completed.
M26/387, M26/420 and M26/474	**Navajo Chief Drilling Programmes** 109 RC drill holes for 18,830 m were completed.
All tenements	**Database Project Update** Work on the exploration database (NGF shed) continued.
	Mining Activities
M26/115, M26/243, M26/430 and M26/474	**Apache Open Pit** – mining started 27 August 2024 and continued during the reporting period.
M26/446	**Janet Ivy Open Pit - t**he current phase of open pit mining started 20 November 2022 and continued during the reporting period.
	Processing Activities
	Binduli North Heap Leach Project

Tenement Number	Current Exploration
M26/446, M26/447, M26/629 and M26/833	The first ore processing began in September 2022 and has continued during the reporting period.

6.1.2 Mt Pleasant Project

A significant proportion of exploration, resource development and mining were completed by companies which held tenure over Mt Pleasant since the mid 1990's. Companies included: Centaur Mining and Exploration PL (1995-2001), Auriongold (2001-2002), Placer Dome Asia Pacific (2002-2005) and Barrick Kanowna (2005-2007). Results of exploration and mining activities by the afore-mentioned companies have assisted in Norton's more recent exploration, resource development and mining in the area.

Racetrack OC and UG Deposit

The Racetrack deposit was discovered in November 1986. The two-kilometre strike length Racetrack Shear is the dominant ore bearing structure, hosting refractory gold mineralisation and is situated between the north-northeast ("NNE") trending Black Flag and Royal Standard Faults. The 240º-trending Racetrack Shear hosts the previously mined oxide Racetrack Open Cut ("OC"), and subsidiary structures, which have also been exploited by shallow open cut mining methods during the late eighties to early nineties. Gold mineralisation is hosted within narrow (generally less than 2 m), 40º to 50º north dipping, moderate- to high-grade shear and related breccia zones.

Prior to Centaur's purchase, the Western Joint Venture and the Black Flag II Joint Venture had an interest in the Racetrack deposit.

A drilling program was conducted at Racetrack in 1999 to target the underground potential at the eastern end of the current pit. Thirteen RC holes were drilled, nine of which had diamond tails.

Recent work at Racetrack East has included a metallurgical study, and an underground resource delineation during the **DD** campaign in 2002 (see Table 6-2).

Table 6-2: Diamond Drilling Campaign in 2002

Company	DD		RC	
	Holes	Length (m)	Holes	Length (m)
AOR/GLD	11	4,153.10	21	2,334
CTR	44	20,225.50	321	32,704
Pre_CTR	133	18,858.50	2,178	125,201
Total	**188**	**43,237.15**	**2,520**	**160,238**

In 2012, Norton acquired the mining rights for this project. To explore the area's resource potential and assess ore processability, drilling programs were carried out between 2014 and 2015. These included 22,270 m/89 DD/RC_DD drillholes and 26,960 m/272 RC drillholes for resource exploration, as well as 1,731 m/8 RC drillholes specifically targeting ore processability studies.

Exploration results indicate that high-grade gold mineralisation persists at elevations ranging from 0 to -200 m in the eastern deep zones, with mineralisation remaining open at depth. This provides strong evidence for significant exploration potential in the deeper parts of the deposit.

The 2019 drilling program at the Racetrack deposit is focused on testing historically mineralised areas along selected profiles and exploring extensions to deeper zones of known orebodies. Based on detailed sectional interpretations, the program includes 10 drill holes totalling 6,140 m. Of these, 8 holes (4,630 m) are categorized as mandatory (first batch), while 2 holes (1,510 m) are contingency holes (second batch) to be drilled based on initial outcomes. The design spans profiles 91, 67, 51, 39, 4, 32, 56, 68, and 80, targeting key mineralisation zones and testing the continuity of mineralised structures. Holes RTZK3901, RTZK6801, and RTZK8001 are designated as infill holes to validate continuity, while the remaining holes aim to explore mineralised extensions along strike and plunge.

The detailed drilling design is summarized in the Table 6-3 below, highlighting parameters such as location coordinates, elevations, planned depths, azimuths, dips, and batch sequences. The program is structured to prioritize accurate validation of mineralised zones while targeting deeper exploration areas to enhance geological understanding and expand the resource base.

Table 6-3: Diamond Drilling Campaign in 2019

Hole ID	East Coord.	North Coord.	Elevation (m)	Depth (m)	Azimuth (°)	Dip (°)
RTZK9101	329969.05	6617932.24	339.92	350	147	-66
RTZK6701	330082.69	6618197.93	347.8	520	147	-73
RTZK5101	330203.38	6618305.85	347.44	550	147	-72
RTZK3901	330335.96	6618322.02	348.6	400	147	-53

RTZK8001	331248.43	6619120.24	359.28	680	147	-66

Tuart UG Deposit

The Tuart Underground Mine, located approximately 40 km northwest of Kalgoorlie in the Mount Pleasant/Black Flag District, has been a significant component of Norton Gold Fields' operations since its acquisition in 2007. Host geology comprises mafic volcanic units, with gold mineralized in high-grade quartz-carbonate-sulphide brecciated or laminated veins. Near-surface supergene oxide gold mineralization has also been identified, contributing to the resource base.

The Tuart prospect was first identified in the early 2000s within the Mt Pleasant Gold Camp. Following its acquisition from Barrick Gold in 2007 as part of the Paddington operations, Norton Gold Fields began drilling programs to delineate vein geometry, focusing on zones such as Tuart 060, 115, and Golden Swan 090. During this period, the nearby Homestead Underground Mine entered development and production, with Tuart considered a key satellite target to complement operations.

Drilling efforts continued into 2009–2010 to define deeper, high-grade underground resources. Tuart was subsequently integrated into Norton's long-term strategy as a high-potential underground mine to supplement production at the Paddington Mill. By 2010, a resource estimate compiled by Norton highlighted significant reserves, including an open-pit resource of 4.55 Mt at 1.75 g/t Au (256,000 oz), an underground resource of 0.91 Mt at 6.39 g/t Au (187,000 oz), and probable reserves of 1.72

Mt at 1.67g/t Au (~92,273 oz). This evaluation confirmed the mine's development potential and its capacity to contribute to long-term production.

From 2014–2018, exploration efforts intensified, with RC and diamond drilling programs undertaken to upgrade mineral resources and define mineable zones. These programs targeted down-plunge extensions of known vein systems, enhancing confidence in deeper lodes and opportunities for expansion. By 2020, Byrnecut Mining was awarded a four-year contract for underground development at Tuart and Enterprise, with portal development commencing in December 2020.

Between 2021 and 2023, full-scale mining operations ramped up at Tuart Underground, supported by infill and extension drilling campaigns. These efforts focused on increasing confidence in deeper lodes below 200 meters and evaluating vein systems in proximity to existing operations, ensuring sustained production and resource definition within this high-grade underground asset.

6.1.3 Carbine Project

Bullant UG Deposit

The Bullant Underground Mine, situated along the Zuleika Shear Zone approximately 70 km northwest of Kalgoorlie, showcases a rich history of development and exploration in one of the Eastern Goldfields' most prospective structural corridors. Initially operated by Barrick Gold from ~1999 to 2009, the mine exploited steeply dipping quartz-carbonate shear zones hosted within basalt, extending operations to a depth of ~700 meters. During this period, mining largely focused on underground development and periodic downhole drilling to maintain resource continuity. Operations ceased in December 2009 due to economic constraints, infrastructure was removed, and the mine subsequently flooded.

In 2010, Kalgoorlie Mining Company ("KMC") acquired the Bullant Mine from Barrick Gold for approximately $10 million. Following the acquisition, KMC installed a crushing circuit and conducted limited drilling and sampling to evaluate resource redevelopment potential. However, mining operations initiated in 2011 faced challenges due to high operating costs and lower-than-expected grades, leading to the mine being placed on care and maintenance in February 2012.

Norton acquired Bullant from KMC in 2013 and immediately commenced a series of strategic initiatives to recommission the underground mine. By January 2015, operational activities resumed with ore trucked to the Paddington Mill for processing. Initial production targeted approximately 280,000 tonnes, supported by exploration drilling campaigns aimed at extending the Main Lode and uncovering adjacent unmined zones.

From 2016 to 2023, Norton made substantial progress toward developing underground resources at Bullant. Drilling programs focused on depth extensions and identifying high-grade zones beyond historical mining fronts. These initiatives have systematically explored the Zuleika Shear Zone and adjacent lodes, enhancing resource definition and opening pathways for long-term underground production in this prolific region.

Both Tuart and Bullant demonstrate Nortons' commitment to leveraging high-grade underground assets while contributing sustainably to the Paddington Mill's gold production pipeline

6.1.4 Ora Banda Project

A significant proportion of exploration, resource development and mining were completed by companies which held tenure over the Ora Banda area since the mid 1980's. Companies included: BHP (pre-1991), Newcrest Mining PL (1992-1997), Centaur (1997-2001), Goldfields Exploration (2001-2002), Placer Dome Asia Pacific Ltd (2002-2005) and Barrick Kanowna (2005-2007). Results of exploration and mining activities by the aforementioned companies have assisted in Norton's more recent exploration, resource development and mining in the area.

Gimlet South Deposit

Newcrest started mining underground at Gimlet South in January 1992 and almost the entire decline and an important number of stopes were mined at that time. By August 1996 Centaur bought the leases and continued the mining using sublevel open stopes to extract the remaining orebodies. Underground mining ceased in December 1996, and the underground operations were put on care and maintenance.

In December 1998 Centaur closed the Ora Banda Mill and all ore was treated at the Mount Pleasant Mill due to economies of scale.

During that time, additional development and exploration drilling was carried out. A major mass blast was conducted on the Victorious Deep's main mineralised body between the 1330 and 1210 Levels, which caused the collapse of the crown pillar located at the bottom of the pit. Although this affected no significant infrastructure, the accesses to the development drives to the eastern side of the main mineralised body were cut out in most of the levels.

To isolate the cave from working areas located at the bottom of the mine, a crown pillar was left behind between 1210 and1180 levels. Several months later, poor mill recovery at Ora Banda mill due to high contents of sulphur and arsenic, approximately 3.5% and 0.05% respectively, in conjunction with low grade and narrow ore intersections forced the abandonment of any plans to extend the decline further down. Finally, all underground operations were declared in care and maintenance by December 1996.

In 1997, most tenements of the Ora Banda Project, except for P24/3326 and P24/3327, were acquired by Centaur Mining and Exploration Company along with Taipan Resources. Centaur held a 75% stake and began aggressively expanding the known resource base. By 1998, Centaur focused on resource improvement through aeromagnetic analysis, relogging of 1,032 drillholes, re-assaying 366 drillholes, and updating resource models. Geological mapping of the Kurrawang Group further refined the understanding of the area's geological features.

Exploration activities in 1999 concentrated on integrating geophysical data (aeromagnetic and radiometric surveys) with geological mapping alongside drilling campaigns. Rotary Air Blast ("RAB") drilling consisted of 62 m (1 hole), while RC drilling totalled 5,867 m across 100 holes. These efforts continued in the years 2000–2001, during which Centaur performed advanced geological interpretation, resource model updates, and feasibility studies. This period also focused on metallurgical testing, pit boundary optimization, underground mining design, and engineering surveys. Additionally, drilling programs included 9,740 m of RC drilling and 6,300.4 m of diamond drilling spread over 12 drillholes. By October 2001, ownership of the Ora Banda tenements transferred to Paddington Gold Mines under a mutual agreement.

In 2002, Paddington Gold Mines commissioned Aurion Gold Exploration to conduct detailed geophysical surveys, including aeromagnetic, resistivity, and gravity. Geological mapping, at both a 1:10,000 scale and within a pit-scale context, complemented substantial drilling work comprising 24,096 m of RAB drilling across 435 holes, 14,736 m of Air Core ("AC") drilling across 192 holes, 10,747 m of RC drilling across 66 holes, and 1,951.2 m of diamond drilling across 7 holes.

From 2003 to 2005, Placer Dome Asia Pacific initiated a three-year exploration and optimization program focused on geological mapping, resource modelling improvements, geochemical analysis, and drilling. During this period, AC drilling totalled 1,960 m across 24 holes, while RC drilling involved 6,093 m across 47 holes. Subsequent work in 2006 by Barrick Kanowna included resource optimization at Slippery Gimlet and Enterprise deposits, supported by RC drilling totalling 2,454 m across 48 holes.

Between 2007 and 2012, Paddington Gold Mines advanced to extensive feasibility studies, including metallurgical performance testing and resource reviews. Over this five-year span, drilling work covered 12,991 m of RC drilling and 7,860.78 m of diamond drilling, aiming to support near-term production initiatives and resource growth.

In 2012, the Ora Banda Project transitioned under the ownership of Zijin Mining Group. Following the principle of "mining while designing and exploring," Zijin initiated resource extensions westward within the Enterprise deposit. This exploration phase focused on diamond drilling, totalling 6,278.5 m across 19 holes, aimed at evaluating lateral mineralisation potential while ensuring operational consistency.

In 2018, to further quantify the resource potential within the mining license area, expand resource reserves, and secure resources for the future survival and development of the mine, Norton Gold Fields Limited commissioned Zijin Mining Group Co., Ltd.'s Mineral Geology Exploration Institute to conduct supplementary exploration in favourable target areas within the license boundaries.

A total drilling program of 11,320 m/19 drillholes was designed in the Ora Banda mining area, including 4,370 m across 6 drillholes in the Enterprise segment and 6,950 m across 13 drillholes in the Gimlet South segment.

For the Enterprise segment, the exploration line orientation was set to W270°-E90°, with a line spacing of 100 m, and a total of 18 exploration lines were arranged, covering most of the areas with existing drillhole distribution. In the Gimlet South segment, the exploration line orientation was set to NW331°-SE151°, with a line spacing of 100 m. A total of 32 exploration lines were arranged to cover part of the Enterprise segment.

6.1.5 Golden Cities Project

Federal UG Deposit

The Federal deposit was first recognised in the early 1990s during regional exploration programs targeting gold-bearing structures associated with the broader Paddington mineral field. Between 1994 and 1996, Normandy Mining conducted initial geophysical and geochemical surveys, delineating several gold anomalies. Follow-up RC drilling campaigns from 1996 to 1998 confirmed near-surface mineralisation with encouraging gold grades ranging from 1–3 g/t Au.

From 1999 to 2004, under the operatorship of Normandy and subsequently Barrick, systematic RC and diamond drilling was undertaken to define mineralised lodes at depth. A maiden mineral resource estimate was completed in 2001; however, unfavourable gold prices delayed development. Ongoing drilling and structural interpretation during this period confirmed the mineralisation to be shear-hosted with moderate depth continuity.

Between 2005 and 2010, exploration activity was limited to historical data review, validation, and digitisation. A small-scale bulk sampling trial was conducted circa 2008, though this did not lead to commercial mining. A renewed phase of exploration began in 2011 when Norton Gold Fields acquired the Paddington operations. A comprehensive review of the Federal deposit led to the commencement of new drilling campaigns in 2012 to validate historical results and test mineralisation extensions. By 2014, revised geological and resource models were completed using Surpac and Leapfrog software, confirming the underground mining potential.

Between 2015 and 2018, a pre-feasibility study included a preliminary underground portal design, and infill drilling programs upgraded a significant portion of the resource to JORC (2012) Indicated status. In 2018, Stage 1 open cut trial mining was conducted, yielding several thousand ounces of gold.

Underground development was approved in mid-2019 following favourable economic assessments. Portal establishment and initial decline development began in late 2020, with ongoing underground drilling throughout 2021 successfully extending the mineralised zones and supporting further mine life planning. Deep drilling in 2022 intersected high-grade mineralisation in the C10–C12 lodes. A 2023 resource update reported significant underground resource growth, with average grades of 2.8–3.5 g/t Au.

As of early 2024, the Federal model has been regionally integrated with nearby Apache and Tuart models. Continued deep drilling and model integration through H1 2025 reflect Federal's inclusion in Zijin Mining's broader strategic asset consolidation.

6.2 Drilling Exploration

6.2.1 Binduli Project

Drilling

1987 to 1991: RC drilling was completed by various drilling contractors and drill rigs. Bit sizes ranged from 4.25" (105mm) upwards in diameter. Earlier holes were drilled by AC blade in relatively soft ground, then RC hammer with cross-over sub where harder ground was encountered. It is unknown if face sampling hammer methods were used for any of these drill programs. Diamond core ("DC") drilling was generally HQ size.

1993 to 2000: RC drilling was completed by various drilling contractors and drill rigs. Early holes were drilled by RC blade in relatively soft ground, and RC hammer where harder ground was encountered. Face hammer sampling using a 5.25" or 5.5" diameter drill bit with a 5" bottom face sampling hammer was introduced in 1996 with drilling rigs equipped with booster compressors.

DC drilling was HQ size (63.5mm diameter) and NQ (50.5mm diameter) core sizes. DC was orientated by a bottom of hole spear.

2001 Onward: RC sampling completed using a 5.25" or 5.5" diameter drill bit with a 5" bottom face sampling hammer. RC drilling rigs were equipped with a booster compressor.

DC sampling was a combination of HQ (63.5mm diameter) and/or NQ (50.5mm diameter) core sizes. Drilling was orientated utilizing either a bottom of hole spear, EZI-Mark or ACE system.

Generally drilling at Binduli was performed on variable 20m x 10m, 20m x 15m, 20m x 20m to 40m x 20m grid spacing, with most holes dipping -60º towards local grid east.

Logging and Recovery

RC samples are geologically logged. Specifically, each interval is inspected and the weathering, regolith, rock type, alteration, mineralisation and structure recorded.

The entire length of RC holes are logged on a 1m interval basis (i.e. 100% of the drilling is logged). Where no sample is returned due to voids or lost sample, it is logged and recorded as such. DC is logged over its entire length and any core loss or voids are recorded.

For DC, it is orientated then geologically and geotechnically logged, photographed and cut in half. DC loss is recorded in the logging process. In some instances, partial drillhole orientations may occur in holes that are surrounded my numerous other holes. In these cases, only the mineralised portion of the hole is orientated and structural measurements taken. In this scenario the entirety of the drillhole is still logged for weathering, regolith, rock type and alteration.

Geological logging is qualitative and quantitative in nature. Logged data is currently captured by a portable data logger utilising LogChief software.

RC drillers were instructed to adopt an RC drilling strategy for the ground conditions advised by geologist expected for each hole to maximize sample recovery, minimize contamination and maintain specified spatial position.

RC sample recovery was not recorded quantitatively prior to 2000. Sample quality and moisture content was recorded in some instances, but in qualitative terms. Post 2000 RC drill samples were visually logged for moisture content, sample recovery and contamination.

DC contractors use a core barrel and wire line unit to recover the DC, adjusting drilling methods and rates to minimize core loss (e.g. changing rock type, broken ground conditions etc.). DC was orientated, length measured and compared to core blocks denoting drilling depths by the drilling contractor. Any recovery issues are recorded.

Survey

On completion of drilling, drill hole collar positions were surveyed by either contract or site-based surveyors (utilising a differential GPS or conventional surveying techniques, with reference to a known base station) with a precision of less than 0.2m. Some earlier drilling was surveyed prior to drilling, but not resurveyed on completion.

Down hole surveys consist of regular spaced Eastman single shot, electronic multishot surveys (generally <30m apart down hole). Ground magnetics affect the result of the measured azimuth reading for these survey instruments. A number of holes were survey by north seeking gyro instruments where readings were obtained every 50m down hole.

Many of the earlier shallower drill holes (≤50m) were not down-hole surveyed and design azimuth and dip applied.

Data was collected in local grid, in Australian Geodetic Datum ("AGD") 84/ Australian Map Grid ("AMG") 84 Zone 51 and in Map Grid of Australia ("MGA") 94 Zone 51 and Australian Height Datum ("AHD").

Topographic control was generated from survey pick-ups of the area over the last 20 years.

6.2.2 Mt Pleasant Project

Drilling

A significant proportion of exploration, resource development and open pit mining was completed by companies which held tenure over the Homestead and Tuart deposits since the mid 1990's. Companies included: Centaur Mining and Exploration PL (1995-2001), Aurion Gold (2001-2002), Placer Dome (2002-2005) Asia Pacific and Barrick Kanowna (2005-2007). Results of exploration and mining activities by the afore-mentioned companies aid in Norton Gold Field's more recent exploration, resource development and mining in the area.

Drilling methods and equipment used in the project have varied over time based on operational requirements. In 2024, all drilling was conducted using a Boart Longyear LM110 Diamond Drill Rig. Historically, RC sampling was performed using drill bits ranging from 4.5" to 5.5" in diameter with a face sampling hammer, supported by rigs equipped with booster compressors. RC drilling has predominantly been used for upper deposit limits and open-pit grade control applications.

DC sampling has utilized combinations of core sizes, including HQ (63.5mm), HQ3 (61.1mm), NQ2 (50.5mm), NQ3 (45mm), and LTK60 (44mm). Orientation methods for DC have evolved over time, transitioning from the use of bottom hole spears, EZI-Mark, and ACE systems to the TruCore™ and SPRINT IQ systems currently in use. Orientation techniques ensure precision in geological and structural data collection for resource estimation.

In 2024, significant additions to the database included 168 underground drilled DC and 1,015 face samples. Sludge drilling, performed using an Underground Production top hammer drill rig, is used exclusively for operational guidance within the mine and is not incorporated into the final database for resource estimation.

The nominal drill spacing for the project is typically 20m x 20m, with some areas spaced at 40m x 40m, and extending to 80m x 80m beyond the 0mRL level. This description of drill spacing applies to both classified and unclassified portions of the deposit, providing coverage suitable for geological modeling and resource classification.

Grade Control ("GC") drilling data, where applicable, is conducted on a tighter spacing of 5m x 5m to 10m x 10m. This higher-density sampling ensures precise control over grade estimation and includes verified data from previous exploration activities. These drilling practices ensure an appropriate level of detail for accurate resource estimation and project evaluation.

Logging and Recovery

DC drilling undergoes comprehensive geological logging to document core loss, orientation (when needed), structural data, and a range of geological parameters including weathering, regolith, lithology, alteration, mineralisation, veining, and structure. Selected drill holes are additionally chosen for geotechnical logging, where critical parameters such as Rock Quality Designation ("RQD") and fracture frequency are collected. DC samples are logged over their entire length, and any core loss or voids are systematically recorded. Where samples are not returned due to voids or poor recovery, these losses are logged and documented.

Logging is performed using standardized codes that have been set up for direct computer input, streamlining data collection and ensuring consistency. Geological logging is qualitative in nature and subject to peer review by a second geologist or supervisor prior to sampling, ensuring that logs meet industry standards. After logging, all core is photographed using a digital camera, creating high-quality visual documentation before cutting.

Historical RC samples were also logged with geological parameters such as weathering, rock type, alteration, mineralisation, and structure captured to ensure continuity with modern data collection practices.

For underground development, mapping of faces and walls is an essential part of the logging process, conducted before sampling. Geological sketches of exposed faces, sample lines painted by geologists, sample numbers and lengths, geological data for each sample length, and gold assay results upon lab return are all systematically recorded on face map sheets. Photographs of each face are taken and stored to enable cross-verification against face maps during geological modelling. Distance measurements from survey stations are also recorded on face sheets to ensure accurate coordinates for 3D modelling and resource estimation.

Face mapping data is entered into specialized software, Logchief, which is synced to Datashed for centralized data management. This integration ensures the logging process is efficient, precise, and aligned with standards for reliable resource modelling and estimation.

To optimize sample recovery and ensure data quality, RC drillers are guided by geologists who provide ground condition assessments for each drill hole. Drillers are instructed to implement strategies that maximize sample recovery, minimize contamination, and maintain spatial accuracy. For RC drilling, one-meter samples are collected into ultraviolet ("UV")-resistant bags and are visually logged on-site for key factors such as moisture content, estimated recovery, and contamination.

DC samples undergo rigorous handling and verification procedures. DC is orientated where possible, with its length measured and compared against core blocks provided by the drilling contractor to ensure consistency with drilling depths. Recovery issues, including sample loss or gain, are reviewed in real time and recorded directly on the core blocks. Core cleanliness and presentation are regularly inspected on-site and during mark-up, with feedback provided to drill contractors to ensure the samples are representative. Before laboratory submission, all samples are weighed and monitored for reliability.

DC contractors utilize core barrel and wire line units for sample recovery, adapting drilling methods and rates to minimize core loss in challenging ground conditions, such as fractured or broken rock. Core recoveries are meticulously documented within geology, geotechnical, and lithology tables in the Datashed database, providing a centralized record of recovery performance.

Recorded core recovery averages 96%, with even higher recovery rates achieved during recent drilling campaigns. These procedures ensure that sample integrity, quality, and representativeness meet the standards necessary for accurate geological modelling and reliable resource estimation.

Survey

Accurate surveying is a critical component of the resource estimation process. All drill holes included in resource estimation are surveyed for easting, northing, and reduced level. Drill hole collars are measured using a Leica Total Station (Model TS15), which provides a high level of precision with an accuracy of ± 0.005m. Collar positions are validated against planned coordinates and underground development pick-ups in Surpac software. Once confirmed, surveyed collar points are updated into the Datashed database to ensure resource models are properly aligned in 3D space.

Topographic control for the area has been developed through comprehensive survey pick-ups performed over the past 30 years. Additionally, adjustments for Kalgoorlie's moving magnetic declination (average change of +0.108 degrees every five years) have been applied to drill holes completed since 2019.

The upload and transformation of surveying data have been automated since 2019, ensuring efficient transfers into Datashed following site validation by the responsible geologist. For face sampling surveys, collar points are digitized in 3D software using laser distance measurements and pick-ups conducted every three cuts.

Historically, drill holes were surveyed using magnetic-based methods such as DEMS Multi-shot or Single-shot cameras. However, since 2020, Reflex Gyro SPRINT-IQ™ surveying tools have been adopted for resource definition and grade control drilling with the LM rig. These tools offer continuous, single-shot, multi-shot, and overshot modes with survey speeds up to three times faster than previously utilized gyros. During drilling, single-shot measurements are taken, and continuous multi-shot readings are performed twice—on the way in and on the way out at the end of the hole—ensuring maximum measurement accuracy, which is critical for resource estimation.

Survey results are processed and validated in the IMDEX hub. Approved data is automatically synced into Datashed via an API connection, streamlining data integration. Recent drill holes were surveyed using a combination of magnetic and gyro-based instruments to further enhance accuracy. These practices collectively establish a robust system for spatial data management and resource estimation alignment.

6.2.3 Carbine Project

Drilling

The number of rigs and rig type has varied through time depending on operational circumstances and objectives. In 2024 all the drilling was conducted with a Boart Longyear LM110 Diamond Drill Rig

Historically, RC sampling was completed using a 4.5" to 5.5" diameter drill bit with a face sampling hammer (1992 to 2020). RC drilling rigs were equipped with a booster compressor. DC sampling is a combination of HQ (63.5mm) or HQ3 (61.1mm), NQ2 (50.5mm) or NQ3 (45mm) diameter core sizes. Selected DC is orientated by either a bottom of hole spear, EZI-Mark or ACE system historically, TruCoreTM or current the SPRINT IQ system.

In 2024 a total of 165 underground drilled DC and 875 face samples were added to the database

As at end of 2024, the dataset in the Bullant area consists of 17181 drill holes and face channels. Of these, there are 11,257 face channel samples, 1,612 diamond drill holes and 3,144 RC drill holes.

The RC drilling is predominantly confined to the upper limits of the deposit including open pit grade control, with infrequent use of underground RC grade control and resource definition drilling that was discontinued due to reduced cost effectiveness against conventional diamond drilling.

Logging and Recovery

All drill cores are comprehensively logged, with core loss recorded and accounted for. Orientation is performed when necessary, and structural, geological, and geotechnical details are documented. Geological logging for drill cores is qualitative in nature, covering various parameters such as weathering, regolith, lithology, alteration, mineralisation, veining, and structure. Selected drill holes undergo geotechnical logging to gather data on parameters such as RQD and fracture frequency. Core loss due to voids or poor sample recovery is meticulously logged and recorded. Additionally, all drill cores are digitally photographed after logging and before cutting, ensuring accurate visual documentation.

Drill hole data is input directly into a software system using standardized coding. Selective holes are peer-reviewed to ensure the logging detail is appropriate for Mineral Resource estimation. Historical reverse circulation samples have also been geologically logged for parameters including weathering, rock type, alteration, mineralisation, and structure, further contributing to geological understanding.

Underground development faces are systematically logged before sampling, with mapping conducted using map sheets. Geological sketches, sample lines, sample numbers, sample lengths, geological data, and assay results are recorded on these face maps. After logging, this data is entered into specialized software, Logchief, which is integrated into Datashed for centralized database management. Each face is also photographed to cross-check geological information against the face maps during modelling.

Furthermore, face mapping includes documentation of distance from survey stations, which provides precise coordinates for subsequent use in 3D geological modelling and resource estimation. By systematically recording and verifying geological data, including photographs, sketches, and sampling information, the logging process supports detailed geological modelling and underpins reliable resource estimation efforts.

RC drilling recovery is optimized through close collaboration between geologists and drillers. Geologists provide ground condition assessments for each hole and advise drillers on appropriate strategies to maximize sample recovery, minimize contamination, and maintain accurate spatial positioning. All RC samples are collected in UV-resistant bags and undergo visual logging on-site to evaluate moisture content, estimated recovery rates, and potential contamination.

Diamond core samples are carefully orientated (where achievable), measured for length, and compared to core blocks provided by the drilling contractor to verify drilling depths. Any issues with recovery are noted, and sample loss or gain is immediately reviewed and recorded on core blocks.

Core cleanliness and presentation are regularly assessed during drilling and mark-up stages, and feedback is offered to ensure the reliability and representativeness of samples sent to the laboratory. To further confirm sample integrity, all samples delivered to the lab are weighed and monitored.

To minimize core loss, diamond core drilling contractors use core barrels and wire line units, tailoring their drilling methods and rates to suit changing rock conditions, such as fractured or broken ground. Average recorded core recovery across drilling efforts was 96%, with even higher recovery rates achieved in recent drill campaigns. All core recovery data is stored in the Datashed database, providing centralized tracking and ensuring sample reliability for future analysis and reporting.

Survey

All drill holes utilized in the resource estimation have been surveyed for easting, northing, and reduced level to ensure spatial accuracy. Drill hole collars were surveyed using a Leica Total Station (Model TS15), which achieves a distance measurement accuracy of ±0.005m. The collar positions are validated in Surpac software against planned coordinates and underground development data. Surveyed collar points are then updated in the Datashed database, allowing for precise alignment of resource models in 3D space.

Recent surface and underground data has been collected using the local Zuleika grid, which is based on the local mine grid. However, historic data (pre-2010) lacks specific grid information in the database due to multiple companies using various grids during collection. As a result, historical data likely underwent transformations between grids, and potentially across multiple iterations, leading to some uncertainty in its spatial positioning.

Topographic control has been continuously refined over the past 30 years through detailed survey pick-ups of the area. For drill holes drilled since 2019, adjustments have been made for the magnetic declination of Kalgoorlie, which on average changes by +0.108 degrees every five years. This ensures data remains consistent with changes in magnetic declination over time.

Since 2019, the upload and transformation process has been automated, with site validation completed by the responsible geologist. Additionally, face sampling collars are digitized in 3D software using laser distance measurements and survey face pick-ups—conducted systematically every three cuts. These practices collectively ensure the spatial accuracy and reliability of all data used in resource modelling and estimation.

Most historic drill holes in the project were surveyed using magnetic-based methods such as DEMS Multi-shot or Single-shot cameras. However, since 2020, resource definition and grade control drill holes drilled with the LM rig have been surveyed using advanced Reflex Gyro SPRINT-IQ™ or Reflex Gyro OMNI-IQ™ tools. These tools are capable of continuous, single-shot, or multi-shot modes, providing highly accurate and reliable survey data.

Survey results from the Reflex Gyro tools are validated through the IMDEX hub and approved if within acceptable limits. Once validated, the survey data is auto-synced into the Datashed database via an API, ensuring efficient and seamless integration of the spatial information.

Since 2018, underground RC drill holes have been surveyed using a Reflex gyro survey instrument. Measurements are systematically collected every 3 m, ensuring a high level of precision and accuracy in determining drill hole orientation. These practices ensure that all survey data is robust, reliable, and suitable for resource estimation and other geological modelling processes.

6.2.4 Ora Banda Project

Drilling

All assays referred to for resource estimation (1992-2012) were collected from either RC (83% of the dataset) or DC (6% of the dataset) drilling using a drilling contractor. The most recent drilling campaign accounts for 3% of the total drilling dataset.

RC sampling completed using a 4.5" to 5.5" diameter drill bit with a face sampling hammer (1992 to 2013). RC drilling rigs were equipped with a booster compressor. DC sampling is a combination of HQ (63.5mm diameter) and/or NQ2 (50.5mm diameter) or NQ3 (45mm) core sizes (1992 to 2013). DC is orientated by either a bottom of hole spear, EZI-Mark or ACE system.

In the case of utilising diamond tails, RC pre-collars are up to 180m deep. This technique was employed to effectively drill down to the mineralisation and collect DC through this zone.

RC Drillers are advised by geologists on the ground conditions expected for each hole and instructed to adopt an RC drilling strategy to maximize sample recovery, minimize contamination and maintain required spatial position.

All RC 1m samples are collected into a UV resistant bag. Samples are visually logged for moisture content, estimated sample recovery and contamination. The DC samples are orientated, length measured and compared to core blocks denoting drilling depths by the drilling contractor. Any recovery issues are recorded. Sample loss or gain is reviewed at the time of drilling and feedback is provided to the drilling contractor to ensure the samples are representative. All samples sent to the laboratory are weighed and monitored to ensure that they are representative.

DC contractors use a core barrel and wire line unit to recover the DC, adjusting drilling methods and rates to minimize core loss (e.g. changing rock type, broken ground conditions etc.).

A study of the weights of the 1m RC sample splits and gold grades (2012-2013 drilling) show no correlation between the two. The drilling contractors utilized drilling techniques to ensure minimal loss of any size fraction.

Drill spacing varies from 10m x 20m in specific locations to 40m x 40m with some areas of the deposit at 80m x 80m at depth. This spacing includes data that has been verified from previous exploration activities on the project.

Logging and Recovery

All current RC samples are geologically logged at 1m intervals, which is an appropriate level of detail to support Mineral Resource estimation; in some historical RC drilling samples were selectively logged. Currently, each interval is inspected and the following parameters are recorded: weathering, regolith, rock type, alteration, mineralisation and structure. All drill core is logged for core loss, marked into 1m intervals, orientated, structurally logged, geotechnically logged and geologically logged for the following parameters: weathering, regolith, rock type, alteration, and mineralisation.

Geological logging is qualitative and quantitative in nature.

All RC holes are logged in their entirety on a 1m interval basis. Where no sample is returned due to voids or lost sample, it is logged and recorded as such. DC is also logged over its entire length and any core loss or voids are recorded.

RC Drillers are advised by geologists on the ground conditions expected for each hole and instructed to adopt an RC drilling strategy to maximize sample recovery, minimize contamination and maintain required spatial position.

All RC 1m samples are collected into a UV resistant bag. Samples are visually logged for moisture content, estimated sample recovery and contamination. The DC samples are orientated, length measured and compared to core blocks denoting drilling depths by the drilling contractor. Any recovery issues are recorded. Sample loss or gain is reviewed at the time of drilling and feedback is provided to the drilling contractor to ensure the samples are representative. All samples sent to the laboratory are weighed and monitored to ensure that they are representative.

DC contractors use a core barrel and wire line unit to recover the DC, adjusting drilling methods and rates to minimize core loss (e.g. changing rock type, broken ground conditions etc.).

A study of the weights of the 1m RC sample splits and gold grades (2012-2013 drilling) show no correlation between the two. The drilling contractors utilized drilling techniques to ensure minimal loss of any size fraction.

Survey

All drill holes used in the resource estimation have been surveyed for easting, northing and reduced level. Recent data is collected in MGA 94 Zone 51 and AHD. Data pre-2012 is collected in AMG 84 Zone 51 and AHD.

Drill hole collar positions are surveyed by the site-based survey department (utilising a differential GPS or conventional surveying techniques, with reference to a known base station) with a precision of less than 0.2m.

Down hole surveys consist of regular spaced Eastman single or mutli-shot borehole camera, and digital electronic multi-shot surveys (generally <30m apart down hole). A minor amount of historic drill holes only has collar surveys. Ground magnetics can affect the result of the measured azimuth reading for these survey instruments.

Topographic control was generated from comprehensive survey pick-ups of the area over the last 20 years, which have been used to generate a Digital Terrain Model ("DTM").

6.2.5 Golden Cities Project

Drilling

All assays and geological logging data referred to for resource estimation (1996-2019) were collected from either: RC (93 % of the dataset) or DC (7 % of the dataset).

The Federal Underground Resource Estimation uses 45523.28m of diamond drill (DD) core in 158 holes. The increase in holes utilised in modelling is a function of both additional drilling from 2019 to 2023.

All diamond drilling is triple tube wireline diamond core drilling from surface. HQ, and NQ core diameters are used in the Mineral Resource estimate. All drill core is routinely oriented by a bottom of hole spear system.

DD core diameter is HQ (63.5mm diameter), NQ (47.6mm diameter). Surface holes are collared using HQ core, both as a means of improving core recovery and to provide greater opportunity to case off and reduce diameter when drilling through broken ground.

RC sampling completed using a 5.25 to 5.5" diameter drill bit with a face sampling hammer. RC drilling rigs were equipped with a booster compressor

In the case of utilising diamond tails, RC pre-collars range from 90m to 300m deep. This technique was employed to effectively drill down to the mineralisation & collect DD through this zone.

Logging and Recovery

Geological logging is conducted systematically for both RC (Reverse Circulation) drilling and DD (Diamond Drilling) to support Mineral Resource estimation.

RC samples are logged at 1m intervals, capturing geological features such as weathering, regolith, rock type, alteration, mineralization, and structure. In cases of historic RC drilling, selective logging methods were applied. For DD, the core is logged in detail for core loss, and intervals are typically marked at nominal 1m lengths, though they may vary from 0.3m to 1.2m.

DD cores are also orientated, structurally logged, geotechnically logged, and geologically characterized for parameters similar to RC logging. Both qualitative and quantitative aspects of geology are recorded. Any voids or lost samples, whether in RC or DD drilling, are logged and documented.

Drilling and sampling practices are designed to ensure the collection of representative and reliable data for both RC (Reverse Circulation) and DC (Diamond Core) drilling. RC drillers are guided by geologists regarding expected ground conditions and instructed to adopt strategies that maximize sample recovery, minimize contamination, and maintain precise spatial positioning. RC samples are collected into UV-resistant bags and visually logged for moisture content, estimated recovery, and contamination.

For DC samples, the orientation and lengths are measured and compared to core blocks indicating drilling depths provided by the contractor. Any issues with sample recovery are recorded, and feedback is promptly given to the contractor to ensure sample representativeness. DC contractors employ core barrels and wireline units, modifying drilling methods and rates to minimize core loss, especially in challenging conditions like variable rock types or broken ground.

All samples sent to the laboratory are weighed and monitored to confirm their representativeness. Additionally, a study conducted in 2000 as part of the CME QAQC process analyzed RC sample split weights and gold grades to enhance sampling confidence. Drilling contractors also employed techniques to minimize the loss of any size fraction, ensuring high-quality sample collection.

Survey

All drill holes used for the resource estimation have been accurately surveyed for easting, northing, and reduced levels, with data initially collected using local grids or AMG 84 Zone 51 or MGA 84 Zone 51 systems. For consistency in geological and block modelling, all non-MGA coordinates were converted to MGA 94 Zone 51.

The most recent RC and DD drilling utilized a north-seeking down-hole gyro instrument for surveys, achieving an accuracy of ±0.250° in azimuth and ±0.050° in dip, with measurements taken at 5m intervals down hole. Down-hole survey methodologies employed include GYRO (11%), DEMS (26%), DEV (1%), UNSPEC (4%), VERT (1%), and EST (57%, primarily for grade control holes). The choice of survey tool and methodology prioritizes reliability and accuracy, though the calibration status of the instruments is unspecified.

Topographic control has been established using survey pick-ups conducted over the past 20 years, forming the basis for the creation of a comprehensive Digital Terrain Model (DTM) for the project area.

6.3 Sampling, Sample Preparation and Analyses

6.3.1 Sampling

Diamond drill ("DD") core was drilled using rod lengths of 3 m and 6 m. After drilling, the core was carefully removed from the rods, cleaned, and placed into plastic core trays. Core blocks were inserted between each run, documenting the run length, recovery, core loss, drillers' initials, and the status of core orientation (pass or fail). The core trays were labelled externally with the drill-hole ID, peg ID, and tray sequence. Drill core was securely stored at the drill site under the supervision of the drillers and collected weekly or more frequently if the drillers relocated to another site by NORTON field staff.

Core orientations were marked at the end of each successful run with a red orientation line, accompanied by the offsider's initials next to the line. During the reporting period, core orientations were determined using the Boart Longyear TruCore™ system.

Sample length is normally 1m, with samples analysed using the fire assay method. Additionally, one drill hole per drilling fan or fence-line was sampled in the regolith for supergene resource evaluation. Areas with anticipated supergene mineralisation were sampled regardless of their location. Once samples were selected, they were marked directly on the drill core using a yellow permanent paint marker.

The DD core is processed using an automatic 3-phase Almonte Core Saw. Samples are prepared and placed into pre-numbered calico bags. For regolith material, the entire core is sampled, whereas for saprock and fresh rock, the core is cut in half, and the right-hand side of the orientation line (viewed looking down-hole) is selected for sampling.

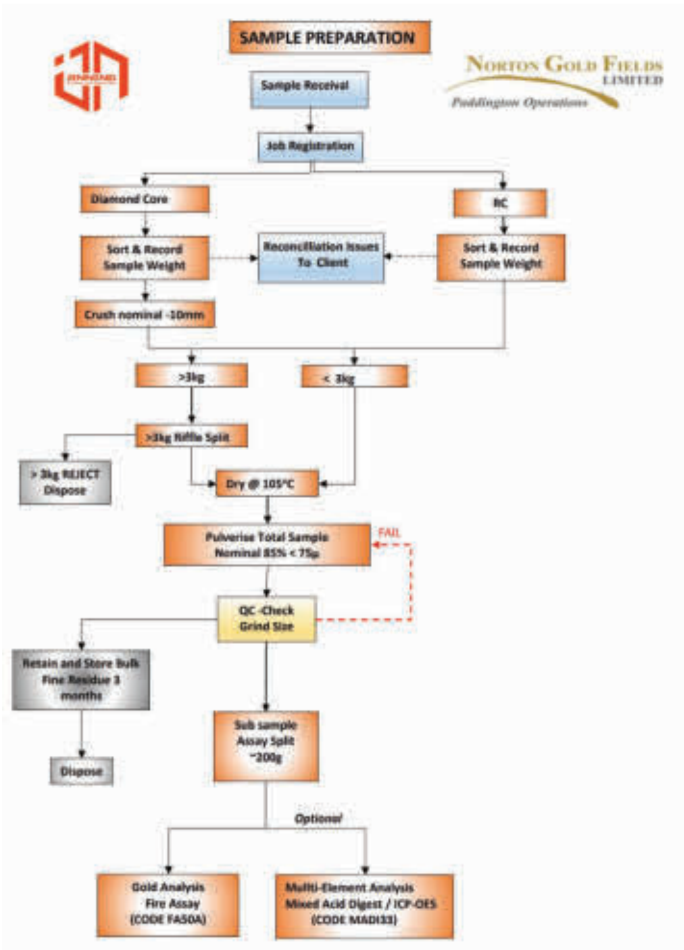
The calico bags are then grouped into large green bags, which are labelled externally with the laboratory submission number and bag sequence. These green bags are placed into a large tub for secure transport to laboratory for sample preparation and analyses.

6.3.2 Sample Preparation and Analyses

From 2021 to 2024, samples were sent to Jinning Kalgoorlie laboratory ("Jinning Kalgoorlie") for analysis, Jining Kalgoorlie is a National Association of Testing Authorities ("NATA") Accredit laboratory, accreditation number is 20933. the overflow samples from Kalgoorlie were sent to Jinning Perth laboratory ("Jinning Perth") for fast turnaround time, both Jinning Kalgoorlie and Jinning Perth follows the same laboratory management protocol.

The sample preparation process is a standardized and traceable workflow. It begins with sample receipt and registration, where sample information is recorded, core samples are organized, weights are documented, and any discrepancies (e.g., weight mismatches or labelling errors) are promptly reported to the client. Samples undergo coarse crushing to a nominal size of -10 mm, with those weighing over 3 kg proceeding to riffle splitting, while smaller samples (<3 kg) move directly to pulverization. Rejected samples are labelled "REJECT" and discarded. Samples are dried at 105°C to eliminate moisture interference. During fine grinding, the target is to achieve >85% of particles passing <75 μm, verified through quality control ("QC") checks, with non-conforming samples reprocessed or documented. Pulverized residues are retained for 3 months for potential retesting, and subsamples (~200 g) are taken for analysis. Analytical testing includes gold analysis via fire assay (Code: FASOA) and multi-element analysis using mixed acid digest/ICP-OES (Code: MADI33). Key quality control measures include strict weight screening, grind fineness verification, and immediate client notification for non-conformance issues.

Figure 6-1: Sample Preparation Flow Chart in Jinning Laboratory



Source: Jinning Laboratory

6.3.3 Specific Gravity Data

Representative Specific gravity ("SG") samples were collected for each lithology, mineralisation type, and weathering state. These values align with 476 bulk density measurements obtained from 29 diamond drill holes, as well as historical and current production data from several pits within the regional district.

Bulk density measurements for bulk material were conducted using methods that adequately account for void spaces (e.g., vugs and porosity), moisture content, and variations between rock types and alteration zones within the deposit. In situ bulk densities ("ISBD") on a dry basis, applied to the Mineral Resource estimate, were derived from systematic test work performed on hand specimens of selected material types. The ISBD determination method utilized a water immersion technique, with results reconciled against production tonnages from both historic and current mining operations within the project area. Porous samples were sealed using various methods to ensure accurate bulk density calculations.

Individual bulk density values were applied based on specific lithology, mineralisation, and weathering states. The density values for specific weathering states were as follows:

- Oxide: 1.8 grams per cubic milimetres ("g/cm³")
- Transitional: 2.1–2.3 g/cm³
- Fresh/Primary: 2.65 g/cm³
- Waste rock: 2.1 g/cm³

6.4 Quality Assurance and Quality Control Programs

Standards, consisting of commercially sourced Certified Reference Material ("CRM"), blank samples and duplicate samples were inserted into the sample submission streams to monitor the accuracy and precision of the analysis. Quality assurance and quality control ("QAQC") reports were prepared quarterly by Norton staff to summarise the QAQC performance and to give suggestions to following sample analysis. QAQC reports from 2021 to 2024 were provided to SRK for review.

Table 6-4: QAQC Samples from 2021 to 2024

Item	2021	2022	2023	2024
Analyses Sample	120,522	29,945	37,913	57,980
CRMs	5,177	1,840	2,220	2,525
Blanks	416	183	375	317
Duplicates	3,694	807	668	1575

Source: Summarized from QAQC reports 2021-2024

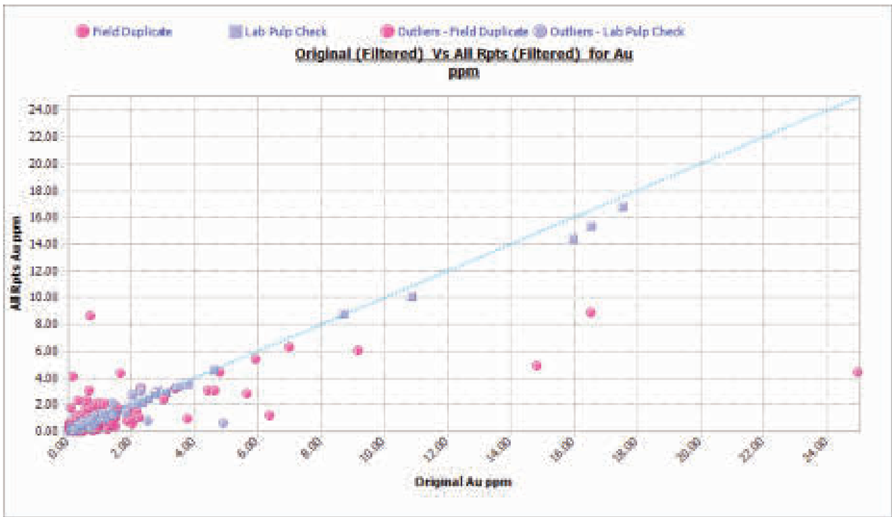
From 2021 to 2024, a total of 11,762 Certified Reference Materials (CRMs) were used as part of QAQC measures to ensure assay accuracy and reliability. CRMs were inserted at a target rate of 1 in 20 samples (5%), with actual insertion rates ranging from 3.7% to 6.7% across the reporting period. The number of CRMs used varied by quarter, with 7 to 11 different CRMs utilized depending on the year and quarter. Performance was generally consistent, with most CRMs returning results within 1 to 2 standard deviations of expected values. Failures were rare and typically attributed to issues such as sample swaps or standards not reaching the lab. Overall, CRM performance demonstrated strong compliance with QAQC protocols, ensuring reliable assay results throughout the reporting period.

From 2021 to 2024, a total of 1,291 blanks were returned as part of QAQC measures, with 14 failures reported, resulting in an overall failure rate of 1.08%. Blanks are considered failures if their assay results exceed 10 times the detection limit (e.g., >0.1 parts per million ("ppm") Au for a detection limit of 0.01 ppm Au). Failures were primarily due to contamination during sample preparation or blanks not reaching the lab. In 2021, 416 blanks were returned, with 2 failures reported. In 2022, 183 blanks were returned, with 7 failures, mostly due to blanks not reaching the lab. In 2023, 375 blanks were returned, with 4 failures, including contamination and missing blanks. Performance improved significantly in 2024, with 317 blanks returned and only 1 failure reported due to contamination (0.06g/t Au). Overall, blank performance showed consistent improvement over the reporting period, with failures decreasing year by year.

From 2021 to 2024, a total of 6,744 field duplicate analyses were reported as part of QAQC measures, with 4,835 samples (71.7%) classified as "bad repeats." A field duplicate is considered a "bad repeat" if its weight or assay result differs from the original sample by 10% or more. The percentage of bad repeats varied across quarters and years, highlighting significant variability in sampling and testing processes.

The high percentage of bad repeats raises concerns about the reliability of sampling techniques and laboratory processes, including inconsistencies in sample preparation, cross-contamination, and analytical methods. Recommendations include implementing standardized sampling procedures, improving equipment calibration, and conducting more frequent audits to reduce variability and improve duplicate performance; it is also suggested to also perform lab pulp check vs field duplicates, as shown in Figure 6-2 below, in the 2021 Q2 QAQC report, the lab pulp check performance is much better than field duplicates, indicating significant nugget effect.

Figure 6-2: Field Duplicates vs Lab Pulp Check (2021 Q2)



6.5 SRK Data Verification

During the site visit from 16 to 20 June 2025, SRK geologist, Mr Zhuanjian Liu and Dr Yiefei Jia inspected several open pits and drill core in the core shed, which have exposed the typical orogenic gold mineralisation in the Eastern Goldfields of Western Australia,

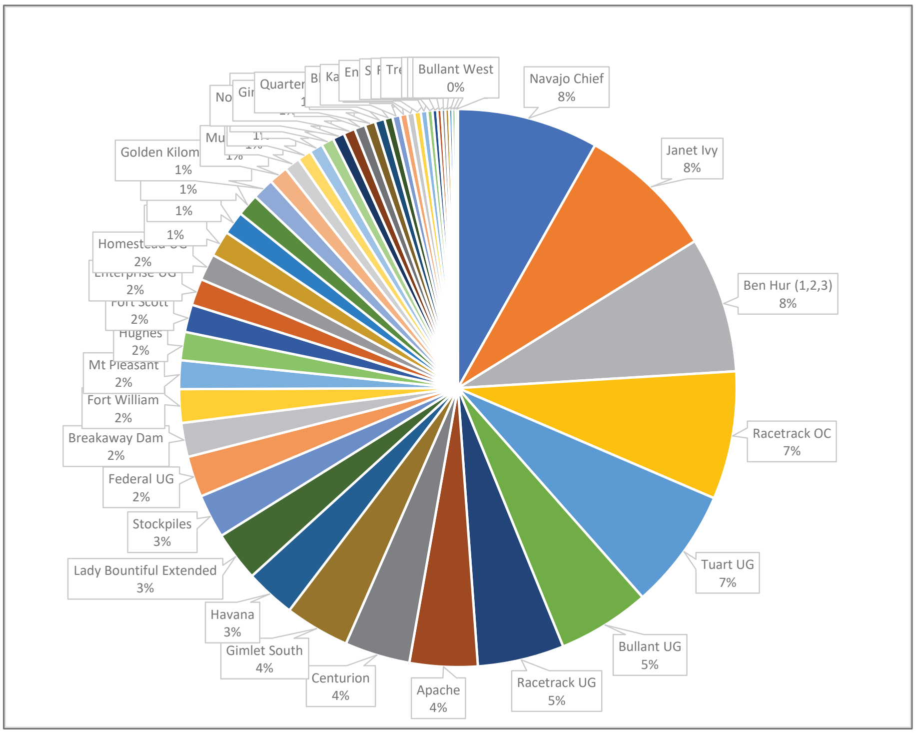
SRK conducted review all the exploration datasets and resource models provided by Norton and had a full communication and discussion with Norton's exploration geologists and resource geologists on exploration drilling designs, quality of exploration, sampling, sample preparation and analytical procedures and quality assurance and quality control.

Overall, SRK is satisfied with the quality and result of the sample preparation and assay conducted by related analytical laboratories. The analytical procedures are consistent with generally accepted industry practices and the primary sample results are therefore suitably reliable for use in Mineral Resource estimation.

7 Mineral Resource Estimates

The Norton Gold Projects consists of two processing areas: the Binduli Operation Centre and the Paddington Operation Centre. A total of 49 mineral deposits are grouped into 5 projects, including the Binduli, Mt Pleasant, Carbine, Ora Bana, and Golden Cities projects based their distribution. According to resource statistics provided in Norton's annual resource report, the top 10 deposits, ranked by contained gold metal, contribute approximately 60% of the total gold metal content within the project, as illustrated in Figure 7-1. These deposits belong to 5 projects, comprising 7 open-pit and 3 underground mines. SRK considers that these 10 deposits are representative of the overall characteristics of the Norton Gold Project, encompassing both ming methods (open pit and underground), two main resource modelling interpolation methodologies ("MIK" and "OK"), as well as different mineral processing methods (heap leaching and gravity–CIP). Therefore, this report provides a detailed geology and resource estimation overview for each of these 10 deposits.

Figure 7-1: Pie-chart of 49 Deposits by Gold Metal Content



For reporting consistency, certain deposits have been consolidated in this chapter. This includes cases where geographically proximate deposits are combined within the same database and model, or where open-pit and underground operations are part of the same mineralised system. These adjustments ensure clarity and alignment with reporting standards while appropriately reflecting the resource estimation methodology.

7.1 Binduli Project

7.1.1 Navajo Chief, Centurion and Ben Hur Deposits

Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Navajo Chief, Centurion and Ben Hur deposits in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Navajo Chief, Centurion and Ben Hur deposits at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Navajo Chief-Centurion-Ben Hur deposit Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The basic model was prepared by NORTON in GEOVIA Surpac software using conventional 3D block modelling and Multiple Indicator Kriging ("MIK") estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, geostatistics analysis, the grade interpolation as well as the resources classification, was completed by NORTON in 2024. An appropriate cut-off grade was selected by SRK, based on SRK's assumptions of the RPEEE which used a conceptual open pit to report the Mineral Resources.

Resource Estimation Procedures

Data provided by NORTON:

- Exploration Database, including collar, survey, assay (gold g/t), and lithological logs codes in Surpac format
- Composites, mineralised domains, weathering types, and topography in Surpac format
- Variogram models by GS3 format
- Mineral Resource model in Surpac format
- Mineral Resource model summary presentation

SRK major findings:

- The mineralised domain is constructed based on the geology and grade conditions; however, the deep extensions in certain areas are considered to have optimistic exploration potential, but these parts not defined resource categories

- According to SRK's visual checking, the gold mineralisation continuity is basically consistent with the block grade interpolation trend
- The variograms model used in the grade interpolation is reasonable
- The model validation gives an acceptable comparison between composites and block grades

Combining information provided by NORTON and SRK's findings, SRK chose the following data to form the basis for an independent review of the Mineral Resources.

- Current topography (bin_south_asmined_202311.dtm, bininf1_mga_awb.dtm).
- Database provided by NORTON (DS_Binduli_Sorth.mdb)
- Mineralised domain (dom_all.dtm, dom_all_no_supergene.dtm)
- Variogram models
- Weathering type boundaries of oxide-transitional-fresh: Block model weathering type parameters, after validation based on the separation boundaries
- Block model (nc_cen_mik_sep2024_class.mdl, bin_s_mik_01_2022nov_class.mdl)

The section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK, as the following procedures:

- Database compilation and validation
- Data conditioning (compositing and capping) for exploration data analysis
- Resource adjustment and validation.
- Assessment of "RPEEE" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

Resource Database

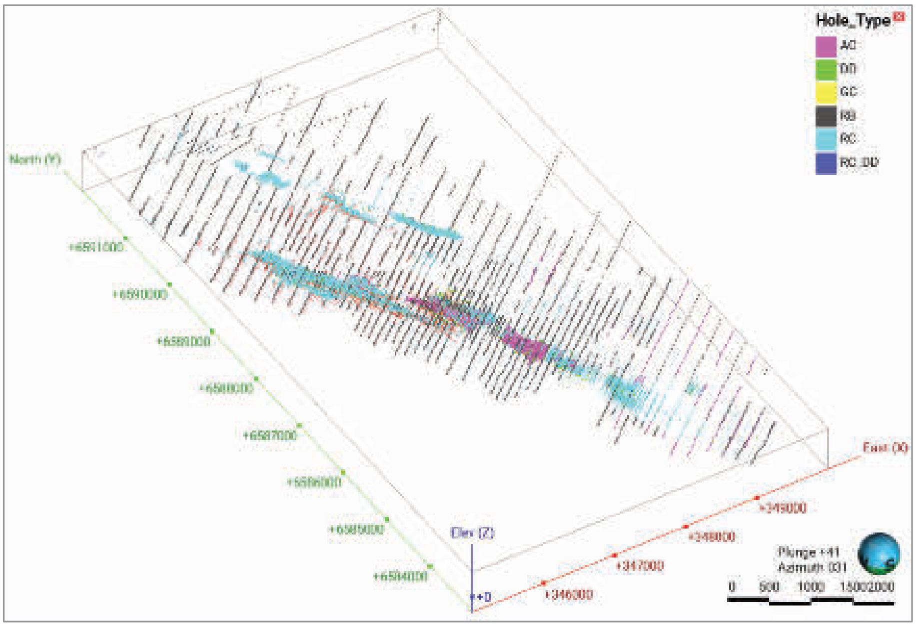
SRK reviewed the database provided by NORTON in Access format and conducted validation and removal of repeated samples. The database used for the resource estimation of the Navajo Chief-Centurion-Ben Hur deposits consists of 13,435 drill holes.

The Navajo Chief, Centurion and Ben Hur deposits are part of the larger database DS_Binduli South and contains 485,993 gold sample records. The topographic map for the area is based on the MGA94_51 coordinate system, with a 1:1,000 scale and 2 m contour intervals. These three mines are included as a single entity in the database due to their close spatial proximity to each other. All drill hole's location is shown in Figure 7-2, and the summary of the database is presented in Table 7-1.

Table 7-1: Summary of the Database Binduli South

Hole Type	Hole Number	Profiles (m)	Assay Records
AC	1,062	50,030	20,764
DD	336	77,184.94	61,501
RB	3,530	136,653	36,521
RC	8,463	527,257.65	361,629
RC_DD	27	5,404.90	5,428
GC	17	150	150

Figure 7-2: Drilling Hole Location of the Database Binduli South



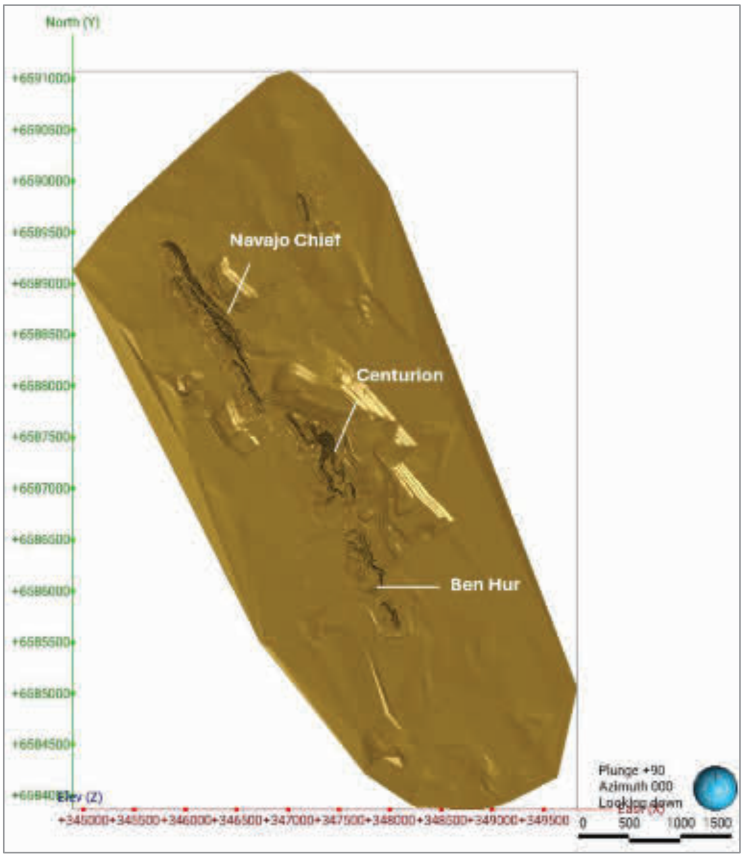
Source: SRK

SRK checked the drillhole database of the Binduli South. The collar, assay, lithological logs, and downhole survey data and loaded into Leapfrog for validation, which included:

- Checks for holes without samples
- Checks for duplicated samples
- Checks for correct collar positions
- Checks and adjustments the missing intervals

The latest topographic map of the Navajo Chief-Centurion-Ben Hur deposit area is shown in Figure 7-3 below.

Figure 7-3: Current Topography of the Navajo Chief, Centurion and Ben Hur Deposits

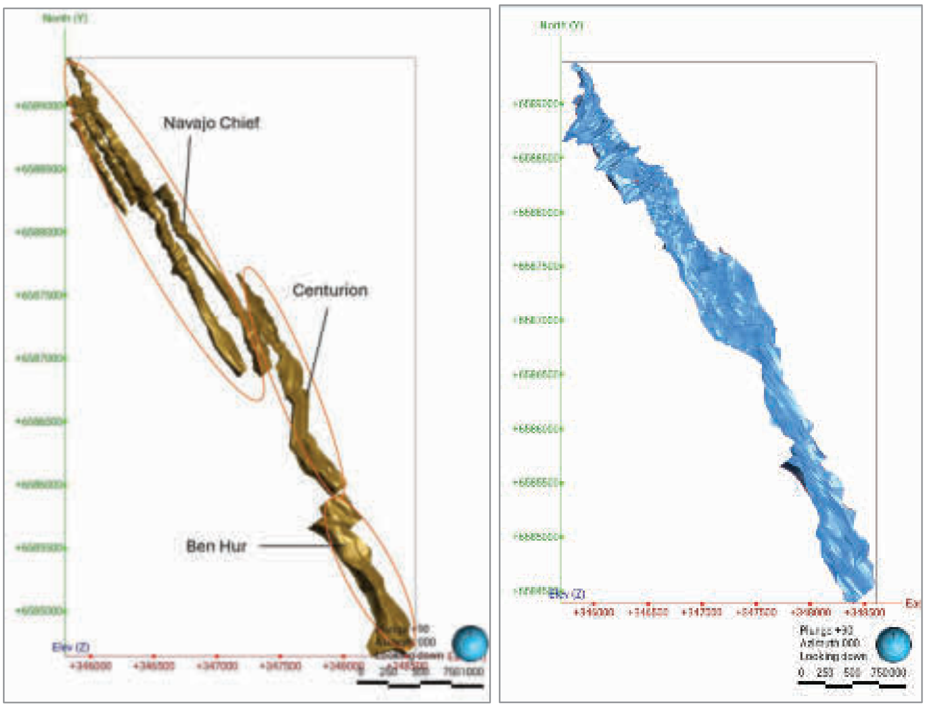


Source: SRK

Solid Body Modelling

Geological domains were based on the geological interpretation and mineralised trends. 3DM wireframes were created by sectional interpretation of the drilling dataset. Where there was geological uncertainty, domain boundaries were modelled to a 0.1 g/t Au lower cut. Domain boundaries were treated as soft boundaries. The location of the mineralised veins is shown in Figure 7-4. A summary of the dimension for the deposits is illustrated in Table 7-2.

Figure 7-4: Down View of the Mineralised Bodies of the Navajo Chief, Centurion and Ben Hur Deposits, Mineralised Bodies 2-6 (Left) and Supergene Body (Right)



Source: SRK

Figure 7-5: The Combined Map of the Mineralised Bodies and the Supergene Body

Table 7-2: Dimensions for the Navajo Chief-Centurion-Ben Hur Deposits

Deposit	Mineralisation Length	Primary Mineralisation Dip	Primary Horizontal Mineralisation Width	Vertical Depth Extents
Ben Hur	2,485 striking 335°	-50° to -85° towards 235°	Multiple lodes, 2m up to 20m	From 10m to 300m below surface
Centurion	1,310m striking 335°	-80 towards 235 and -80 towards 060		
Navajo Chief	1,950m striking 335°	-80 to vertical towards 235		

Specific Gravity

Bulk density values used in the resource estimation were determined through systematic test work on representative samples for specific lithologies, mineralisation types, and weathering states. These values are consistent with 476 bulk density measurements obtained from 29 diamond drill holes in the district, as well as historical and current production data from several pits within the regional district.

In-situ bulk densities were measured on a dry basis, using the water immersion technique, which accounts for void spaces (vugs, porosity, etc.), moisture, and variations between rock and alteration zones. Porous samples were sealed by various methods to ensure accuracy in the density calculations. These ISBD values were validated through reconciliation with production tonnages from both historical and ongoing mining operations in the project area.

The bulk density values applied in the evaluation process vary according to lithological and weathering states, as follows:

- Oxide: 1.8 g/cm³
- Transitional: 2.3 g/cm³
- Fresh/Primary: 2.70 g/cm³
- Dump/Fill Material: 2.1 g/cm³

This systematic approach ensures that density values adequately account for the variability in materials and provide reliable inputs for the resource model.

Compositing

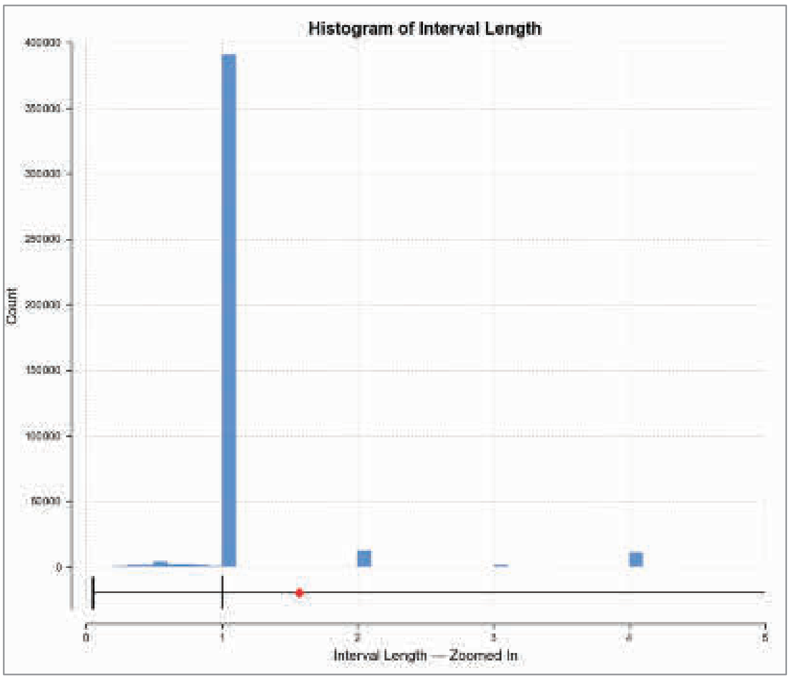
Sample intervals for the individual deposit are variable due to different drilling techniques. Throughout the Binduli Project, sample intervals for RC are generally 1 m to 4 m and DC from 0.2 m to 1 m. The statistical analysis of sample lengths in the database indicates that the majority of samples have a length of 1 m, as shown in Table 7-3 and Figure 7-6.

A 2 m length composite was applied for the Navajo Chief-Centurion-Ben Hur deposit to reduce variability and reflect the current smallest mining unit ("SMU"). The basic statistics for raw and composite values are shown in Table 7-4.

Table 7-3: Statistics of the Sample Length of the Navajo Chief-Centurion-Ben Hur Deposit

Deposit	Samples	Minimum value	Maximum value	Mean	Median	Standard deviation	Skewness
Ben Hur	17,901	0.1	92.9	1.23	1.0	1.29	28.77
Centurion	25,107	0.1	68.44	1.26	1.0	1.14	10.80
Navajo Chief	122,680	0.05	140	1.06	1.0	0.77	75.39
supergene	95,160	0.1	140	1.44	1.0	1.67	22.21

Figure 7-6: Histogram of Sample Length for the Navajo Chief-Centurion-Ben Hur Deposit



Source: SRK

Evaluation of Outliers

Under the MIK estimation method, individual high-grade gold values do not have a direct impact on the estimated block grades, but indicator threshold values play an important role in managing the distribution of the outliers.

Statistical Analysis and Variography

The domain wireframe was used to assign mineralisation domain code to the samples in the estimation dataset and statistical analyses were conducted for Au. Summary statistics for the raw samples and composite samples within the domain are presented in Table 7-4.

Table 7-4: Statistics of the Raw and Composite Samples

Deposit	Item	Raw Samples	Composites
Navajo Chief	Number of samples	113,944	62,779
	Minimum value	0	0.001
	Maximum value	352.00	156.74
	Mean	0.70	0.65
	Variance	3.75	1.89
	Standard Deviation	1.94	1.37
	Coefficient of variation	2.79	2.12
Centurion	Number of samples	21,178	13,806
	Minimum value	0	0
	Maximum value	276.00	149.27
	Mean	1.02	0.76
	Variance	19.38	9.35
	Standard Deviation	4.40	3.06
	Coefficient of variation	4.32	4.03
Ben hur	Number of samples	15,044	9,836
	Minimum value	0.001	0.001
	Maximum value	49.40	29.58
	Mean	0.44	0.35
	Variance	2.14	0.90
	Standard Deviation	1.46	0.95
	Coefficient of variation	3.35	2.71
supergene	Number of samples	82,129	56,944
	Minimum value	0	0
	Maximum value	352.00	211.03
	Mean	0.69	0.55
	Variance	7.99	3.74
	Standard Deviation	2.83	1.93
	Coefficient of variation	4.10	3.53

For datasets formed from each sub domains, indicator thresholds and the variogram models were defined using a consistent set of percentiles representing probability thresholds of 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.75, 0.8, 0.85, 0.9, 0.95, 0.97 and 0.99 for data in each data subset by NORTON in GS3 software, the conditional statistics is shown in Table 7-5.

Table 7-5: Conditional Statistics for the Navajo Chief, Centurion and Ben Hur Deposits

Navajo Chief			Centurion			Ben Hur		
Threshold (g/t)	Cum Prop	Class Mean (g/t)	Threshold (g/t)	Cum Prop	Class Mean (g/t)	Threshold (g/t)	Cum Prop	Class Mean (g/t)

24.46	1	1.579	212.00	1	12.272	145.50	1	18.399

Block Model and Grade Estimation

The block model sizes of the Navajo Chief-Centurion-Ben Hur deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with dimensions of 20m × 10m × 5m (North × Easting × Elevation). Block was rotated 36° to the parallel orientation of major mineralisation (see Table 7-6).

Table 7-6: Block Model Parameters of the Navajo Chief-Centurion-Ben Hur Deposit

Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
Northing	6582000	6592400	20	20	-36
Easting	349000	352600	20	20	0
Elevation	-200	400	5	5	0

Grade estimation for the Navajo Chief-Centurion-Ben Hur deposit were completed using a non-linear interpolation technique – Multiple Indicator Kriging (MIK). MIK is an interpolation method better suited to geological domains having a highly skewed composite dataset distribution.

The composite dataset for each deposit was divided into 14 indicator thresholds. Spatial continuity modelling was completed for each indicator threshold, within each deposit. Directions of continuity were similar to interpreted controls on mineralisation with varying degrees of anisotropy.

Sample search ellipses were set based on data spacing in similar orientation to the major mineralised orientation. Minimum and maximum samples were set for each sample search based on accepted levels of grade continuity. Search distances were based on sample spacing and spatial continuity. A total of 3 search passes were conducted with progressively relaxed search criteria to accommodate the data density from the closest to the widest spaced drilling at 80m x 80 m.

The basic parameters were used for the grade interpolation as following:

- Search sample definition: minimum sample 16, maximum sample 48
- Octant sector search: Minimum samples per section is of 4
- All the search Radius: X 20m, Y 25m and Z 10m

Model Validation

SRK undertook block model validation to confirm the reasonableness of the estimation parameters and estimation results. SRK adopted the following methods for the validation:

- Visual validation of block grades against drill hole grades; and
- Swath analysis.

SRK conducted visual validation of the longitudinal views and cross-section view of the drill holes and block model grades, which demonstrated good correlation between local block estimations and nearby samples, without excessive smoothing in the block model.

Figure 7-7 and Figure 7-8 shows the swath plots of the Navajo Chief and Centurion deposits and Ben Hur deposit in the east−north, north–south and elevation planes.

Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralisation exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, the Navajo Chief-Centurion-Ben Hur Deposit follows the JORC Code classification system with individual block classification being assigned using statistical methods and visually taking into account the following factors:

- Drill spacing and orientation
- Search parameters including search distance and number of informing samples
- Data quality, including the existence, availability and quality of QC
- Confidence of certain parts of the geological model.

And the distribution of Mineral Resource classification is presented in 3D view in Figure 7-9.

Figure 7-9: Mineral Resource Classification of the Navajo Chief and Centurion Deposits

Note: Navajo Chief deposit (on left) and Centurion deposit (on right)

Mineral Resource Statement

The 2012 Edition of the JORC Code defines a Mineral Resource as:

"(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories".

"All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…"

The "reasonable prospects for eventual economic extraction" requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Navajo Chief-Centurion-Ben Hur deposit are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the Navajo Chief-Centurion-Ben Hur deposit are summarised in Table 7-7.

Table 7-7: Assumptions Considered for the Navajo Chief-Centurion-Ben Hur Deposit

Parameter	Oxide	Transitional	Fresh	Unit
Gold Price	2,700	2,700	2,700	US$ per ounce

Parameter	Oxide	Transitional	Fresh	Unit
Mining Cost	-	-	-	US$ per tonne mined
Processing	12.0	12.0	12.0	US$ per tonne of feed
General and Administrative	2.0	2.0	2.0	US$ per tonne of feed
Mining Dilution	5	5	5	Percent
Mining Loss	5	5	5	Percent
Process Recovery	73	73	73	Percent
In Situ Cut-Off-Grade	0.2	0.2	0.2	grams per tonne

Note:
[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024.

As of 31 December 2024, and at a cut-off grade of 0.2g/t Au, the Mineral Resource of the Navajo Chief-Centurion-Ben Hur deposit is presented in Table 7-8.

Table 7-8: Mineral Resource Statement[1], the Navajo Chief-Centurion-Ben Hur Deposit, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Ben Hur	OX	Measured			
		Indicated	657	0.56	366
		Inferred	1,395	0.59	817

		Indicated	5,171	0.53	2,756
		Inferred	2,395	0.47	1,135
	FR	Measured			
		Indicated	15,563	0.65	10,132
		Inferred	11,954	0.65	7,710

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of 0.2g/t Au. The mined-out Mineral Resource was deducted during the Resources reporting.

Grade Sensitivity Analysis

The mineral resources of the Navajo Chief, Centurion and Ben Hur deposits are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources are presented in Table 7-9 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued as a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-10 presents this sensitivity as grade tonnage curves.

Table 7-9: Global Block Model Quantities and Grade Estimates[1], the Navajo Chief, Centurion and Ben Hur Deposits at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (kt)	Grade Gold (g/t)	Metal Content (kg)
Navajo Chief Deposit			
0.2	37,262	0.62	22,988

7.1.2 Janet Ivy Deposit

Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Janet Ivy Deposit in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Janet Ivy deposit at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Janet Ivy deposit Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The basic model was prepared by NORTON in GEOVIA Surpac software using conventional 3D block modelling and Multiple Indicator Kriging ("MIK") estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, geostatistics analysis, the grade interpolation as well as the resources classification, was completed by NORTON in 2024. An appropriate cut-off grade was selected by SRK, based on SRK's assumptions of the RPEEE which used a conceptual open pit to report the Mineral Resources.

Resource Estimation Procedures

Data provided by NORTON:

- Exploration Database, including collar, survey, assay (gold g/t), and lithological logs codes in Surpac format
- Composites, mineralised domains, weathering types, and topography in Surpac format
- Variogram models by GS3 format
- Mineral Resource model in Surpac format
- Mineral Resource model summary presentation

SRK major findings:

- The mineralised domain is constructed based on the geology and grade conditions; however, the deep extensions in certain areas are considered to have optimistic exploration potential, but these parts not defined resource categories
- According to SRK's visual checking, the gold mineralisation continuity is basically consistent with the block grade interpolation trend
- The variograms model used in the grade interpolation is reasonable
- The model validation gives an acceptable comparison between composites and block grades

Combining information provided by NORTON and SRK's findings, SRK chose the following data to form the basis for an independent review of the Mineral Resources.

- Current topography (jifpeomwk241231.dtm).
- Database provided by NORTON (DS_Binduli_North.mdb)
- Mineralised domain (dom_2.dtm)
- Variogram models
- Weathering type boundaries of oxide-transitional-fresh: Block model weathering type parameters, after validation based on the separation boundaries
- Block model (gc_v12_class.mdl)

The section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK, as the following procedures:

- Database compilation and validation
- Data conditioning (compositing and capping) for exploration data analysis
- Resource adjustment and validation.
- Assessment of "RPEEE" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

Resource Database

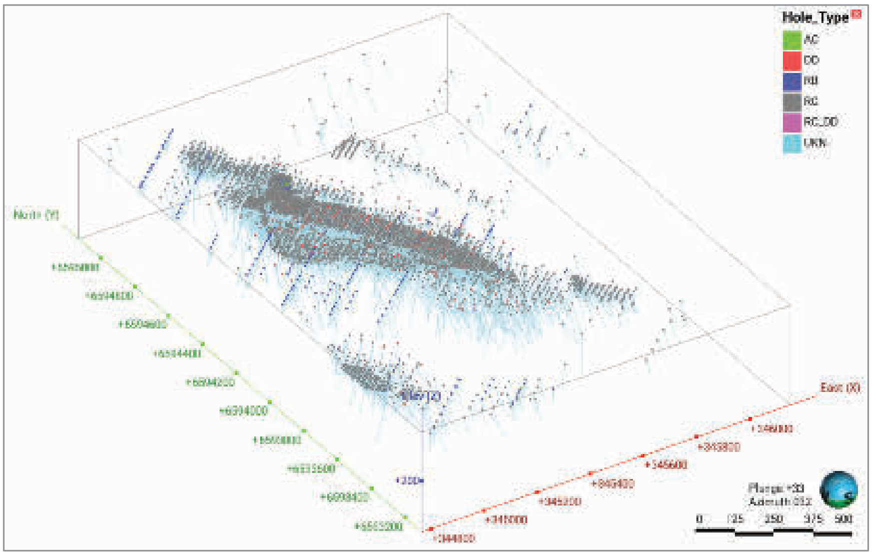
SRK reviewed the database provided by NORTON in Access format and conducted validation and removal of repeated samples. The database used for the resource estimation of the Janet Ivy deposit consists of 11,500 drill holes.

The Janet Ivy Deposit is part of the larger database DS_Binduli North and contains 447,658 gold sample records. The topographic map for the area is based on the MGA94_51 coordinate system, with a 1:1,000 scale and 2 m contour intervals. These three mines are included as a single entity in the database due to their close spatial proximity to each other. All drill hole’s location is shown in Figure 7-11, and the summary of the database is presented in Table 7-10.

Table 7-10: Summary of the Database Binduli North

Hole Type	Hole Number	Profiles (m)	Assay Records
AC	572	28,274	7,233
DD	116	20,108.19	17,496
RB	1,865	80,776	19,586
RC	8,575	497,356	396,745
RC_DD	16	5,697.52	6,428
GC	21	993	170

Figure 7-11: Drilling Hole Location of the Database Janet Ivy Deposit



Source: SRK

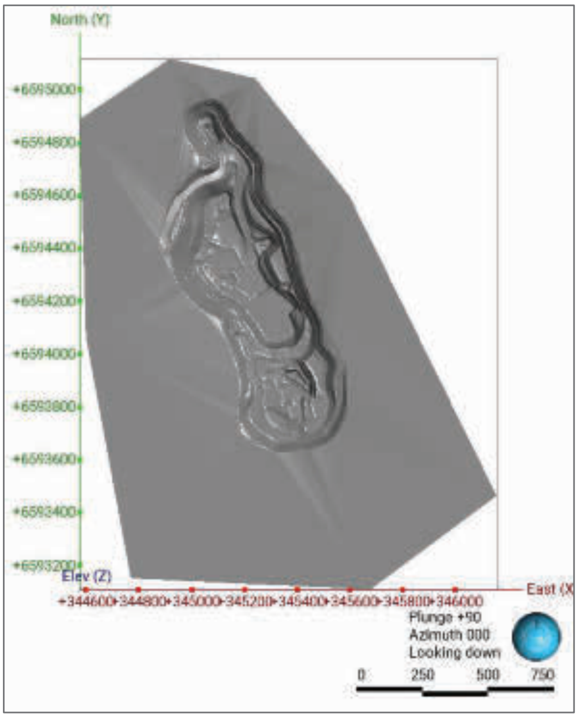
SRK checked the drillhole database of the Binduli North. The collar, assay, lithological logs, and downhole survey data and loaded into Leapfrog for validation, which included:

- Checks for holes without samples
- Checks for duplicated samples
- Checks for correct collar positions

- Checks and adjustments the missing intervals

The latest topographic map of the Janet Ivy deposit area is shown in Figure 7-12 below.

Figure 7-12: Current Topography of the Janet Ivy Deposit



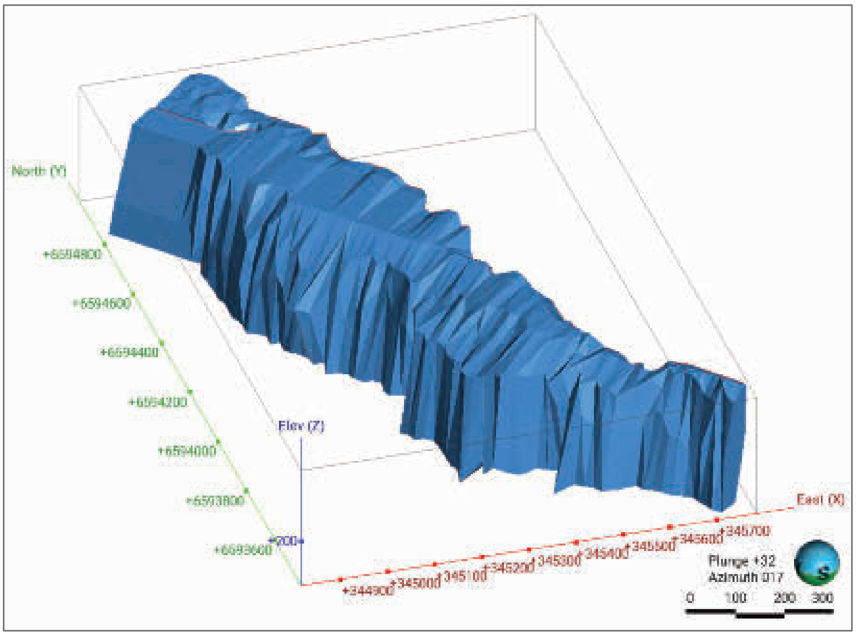
Source: SRK

Solid Body Modelling

Geological domains were based on the geological interpretation and mineralised trends. 3DM wireframes were created by sectional interpretation of the drilling dataset. Where there was geological uncertainty, domain boundaries were modelled to a 0.1 g/t Au lower cut. Domain boundaries were treated as soft boundaries. The location of the mineralised veins is shown in Figure 7-13.

A summary of the dimension for the deposits is illustrated in Table 7-11.

Figure 7-13: 3D View of the Mineralised Bodies of the Janet Ivy Deposit



Source: SRK

Table 7-11: Dimensions for the Janet Ivy Deposits

Deposit	Mineralisation Length	Primary Mineralisation Dip	Primary Horizontal Mineralisation Width	Vertical Depth Extents
Janet Ivy	1,350m striking 330°	-40° towards 240°	Broad zone up to 140m	Surface to 180m depth

Specific Gravity

Bulk density values used in the resource estimation were determined through systematic test work on representative samples for specific lithologies, mineralisation types, and weathering states. These values are consistent with 476 bulk density measurements obtained from 29 diamond drill holes in the district, as well as historical and current production data from several pits within the regional district.

In-situ bulk densities were measured on a dry basis, using the water immersion technique, which accounts for void spaces (vugs, porosity, etc.), moisture, and variations between rock and alteration zones. Porous samples were sealed by various methods to ensure accuracy in the density calculations. These ISBD values were validated through reconciliation with production tonnages from both historical and ongoing mining operations in the project area.

The bulk density values applied in the evaluation process vary according to lithological and weathering states, as follows:

- Oxide: 1.8 g/cm³
- Transitional: 2.3 g/cm³
- Fresh/Primary: 2.70 g/cm³
- Dump/Fill Material: 2.1 g/cm³

This systematic approach ensures that density values adequately account for the variability in materials and provide reliable inputs for the resource model.

Compositing

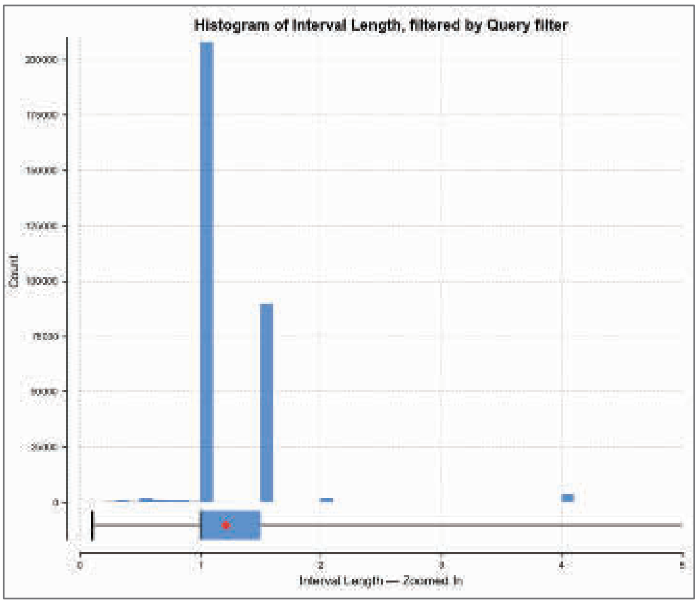
Sample intervals for the deposits are variable due to different drilling techniques. Throughout the Binduli Project, sample intervals for RC are generally 1 m to 4 m and DC from 0.2 m to 1 m. The statistical analysis of sample lengths in the database indicates that the majority of samples have a length of 1 m, as shown in Table 7-12 and Figure 7-14.

A 2 m length composite was applied for the Janet Ivy deposit to reduce variability and reflect the current smallest mining unit ("SMU"). The basic statistics for raw and composite values are shown in Table 7-4.

Table 7-12: Statistics of the Sample Length of the Janet Ivy Deposit

Deposit	Samples	Minimum value	Maximum value	Mean	Median	Standard deviation	Skewness
Janet Ivy	225,908	0.1	60.6	1.21	1.0	0.48	50.68

Figure 7-14: Histogram of Sample Length for the Janet Ivy Deposit



Source: SRK

Evaluation of Outliers

Under the MIK estimation method, individual high-grade gold values do not have a direct impact on the estimated block grades, but indicator threshold values play an important role in managing the distribution of the outliers.

Statistical Analysis and Variography

The domain wireframe was used to assign mineralisation domain code to the samples in the estimation dataset and statistical analyses were conducted for Au. Summary statistics for the raw samples and composite samples within the domain are presented in Table 7-13.

Table 7-13: Statistics of the Raw and Composite Samples

Deposit	Item	Raw Samples	Composites
Janet Ivy	Number of samples	197,933	130,536
	Minimum value	0.00	0.00
	Maximum value	288.00	133.99
	Mean	0.53	0.49
	Variance	4.13	2.16
	Standard Deviation	2.03	1.47
	Coefficient of variation	3.81	3.01

For datasets formed from each sub domains, indicator thresholds and the variogram models were defined using a consistent set of percentiles representing probability thresholds of 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.75, 0.8, 0.85, 0.9, 0.95, 0.97 and 0.99 for data in each data subset by NORTON in GS3 software, the conditional statistics is shown in Table 7-14.

Table 7-14: Conditional Statistics for the Janet Ivy Deposit

Domain 2			Domain 3		
Threshold (g/t)	Cum Prop	Class Mean (g/t)	Threshold (g/t)	Cum Prop	Class Mean (g/t)
0.003006	0.1	0	0.0133	0.1	0.004
0.020027	0.2	0.01	0.04	0.2	0.025
0.040005	0.3	0.03	0.070002	0.3	0.054

1.447	0.95	1.073	1.7967	0.95	1.388
2.07	0.97	1.7	2.49	0.97	2.1
4.04	0.99	2.68	4.7	0.99	3.293
107.95	1	6.273	107.95	1	10.784

Block Model and Grade Estimation

The block model sizes of the Janet Ivy deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with dimensions of 5m × 5m × 2.5m (North × Easting × Elevation). Block was rotated -40° to the parallel orientation of major mineralisation (see Table 7-15).

Table 7-15: Block Model Parameters of the Janet Ivy Deposit

Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
Northing	6591792	6595992	5	5	-40
Easting	345497	347997	5	5	0
Elevation	0	400	2.5	2.5	0

Grade estimations for the Janet Ivy deposit were done using MIK method by NORTON for all mineralised zones. The basic parameters were used for the grade interpolation as following:

- Search sample definition: minimum sample 16, maximum sample 56
- Octant sector search: Minimum samples per section is of 4
- All the search Radius: X 20m, Y 25m and Z 10m

Model Validation

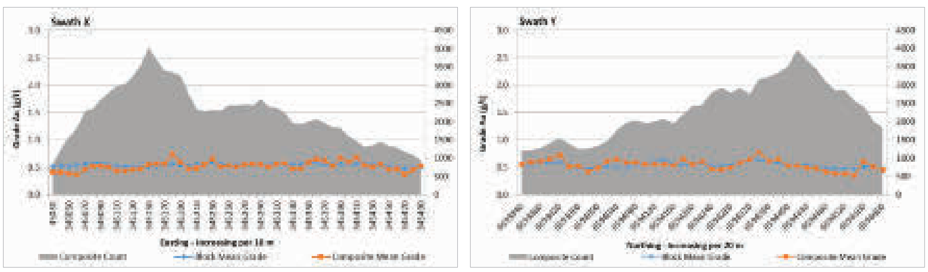
SRK undertook block model validation to confirm the reasonableness of the estimation parameters and estimation results. SRK adopted the following methods for the validation:

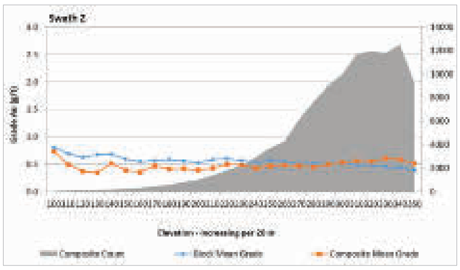
- Visual validation of block grades against drill hole grades; and
- Swath analysis.

SRK conducted visual validation of the longitudinal views and cross-section view of the drill holes and block model grades, which demonstrated good correlation between local block estimations and nearby samples, without excessive smoothing in the block model.

Figure 7-15 shows the swath plots of the Janet Ivy Deposit in the east−north, north–south and elevation planes.

Figure 7-15: Swath Plots of the Janet Ivy Deposit





Source: SRK

Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

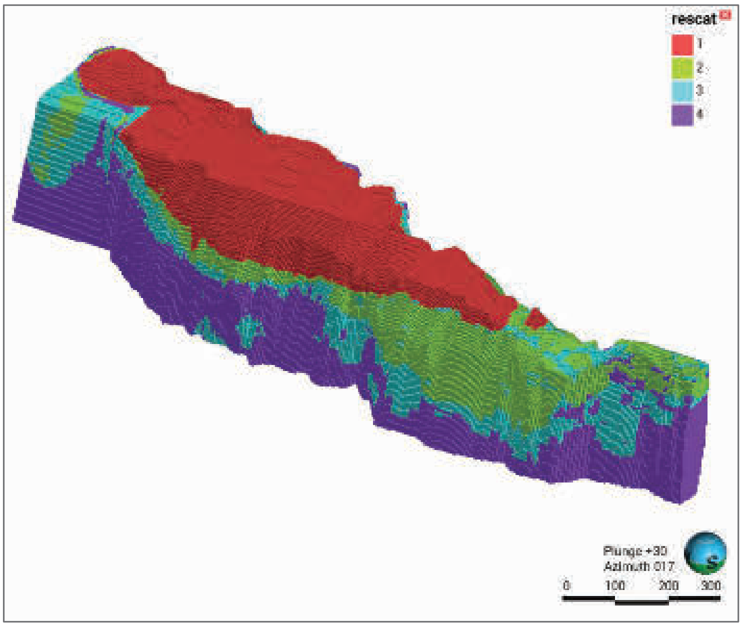
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralisation exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, the Janet Ivy Deposit follows the JORC Code classification system with individual block classification being assigned using statistical methods and visually taking into account the following factors:

- Drill spacing and orientation
- Search parameters including search distance and number of informing samples
- Data quality, including the existence, availability and quality of QC
- Confidence of certain parts of the geological model.

And the distribution of Mineral Resource classification is presented in 3D view in Figure 7-16.

Figure 7-16: Mineral Resource Classification of the Janet Ivy Deposit



Mineral Resource Statement

The 2012 Edition of the JORC Code defines a Mineral Resource as:

"(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories".

"All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…"

The "reasonable prospects for eventual economic extraction" requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Janet Ivy deposit are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the Janet Ivy deposit are summarised in Table 7-16.

Table 7-16: Assumptions Considered for the Janet Ivy Deposit

Parameter	Oxide	Transitional	Fresh	Unit
Gold Price	2,700	2,700	2,700	US$ per ounce
Mining Cost	-	-	-	US$ per tonne mined
Processing	12.0	12.0	12.0	US$ per tonne of feed
General and Administrative	2.0	2.0	2.0	US$ per tonne of feed
Mining Dilution	5	5	5	Percent
Mining Loss	5	5	5	Percent
Process Recovery	72	72	72	Percent
In Situ Cut-Off-Grade	0.2	0.2	0.2	grams per tonne

Note:
[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024

As of 31 December 2024, and at a cut-off grade of 0.2g/t Au, the Mineral Resource of the Janet Ivy deposit is presented in Table 7-17.

Table 7-17: Mineral Resource Statement[1], the Janet Ivy deposit, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Janet Ivy	OX	Measured			
		Indicated			
		Inferred			
	TR	Measured	94	0.40	38
		Indicated	2,546	0.38	957
		Inferred	253	0.30	76
	FR	Measured	6,954	0.44	3,046
		Indicated	32,685	0.48	15,623
		Inferred	3,509	0.45	1,572

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of 0.2g/t Au. The mined-out Mineral Resource was deducted during the Resources reporting.

Grade Sensitivity Analysis

The mineral resources of the Janet Ivy deposit are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources are presented in Table 7-18 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued as a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-17 presents this sensitivity as grade tonnage curves.

Table 7-18: Global Block Model Quantities and Grade Estimates1, the Janet Ivy at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (kt)	Grade Gold (g/t)	Metal Content (kg)
0.2	46,042	0.46	21,312
0.3	33,204	0.55	18,262
0.4	22,500	0.64	14,400
0.5	14,924	0.74	11,044
0.6	9,623	0.85	8,179
0.7	6,307	0.95	5,992
0.8	4,270	1.05	4,483
0.9	2,879	1.15	3,311
1.0	1,990	1.25	2,487
1.1	1,343	1.34	1,800
1.2	908	1.44	1,307

Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

7.1.3 Apache Deposit

Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Apache deposit in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Apache deposit at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Apache deposit Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The basic model was prepared by NORTON in GEOVIA Surpac software using conventional 3D block modelling and Multiple Indicator Kriging ("MIK") estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, geostatistics analysis, the grade interpolation as well as the resources classification, was completed by NORTON in 2024. An appropriate cut-off grade was selected by SRK, based on SRK's assumptions of the RPEEE which used a conceptual open pit to report the Mineral Resources.

Resource Estimation Procedures

Data provided by NORTON:

- Exploration Database, including collar, survey, assay (gold g/t), and lithological logs codes in Surpac format
- Composites, mineralised domains, weathering types, and topography in Surpac format
- Variogram models by GS3 format
- Mineral Resource model in Surpac format
- Mineral Resource model summary presentation

SRK major findings:

- The mineralised domain is constructed based on the geology and grade conditions; however, the deep extensions in certain areas are considered to have optimistic exploration potential, but these parts not defined resource categories
- According to SRK's visual checking, the gold mineralisation continuity is basically consistent with the block grade interpolation trend
- The variograms model used in the grade interpolation is reasonable
- The model validation gives an acceptable comparison between composites and block grades

Combining information provided by NORTON and SRK's findings, SRK chose the following data to form the basis for an independent review of the Mineral Resources.

- Current topography (nature_surface.dtm).
- Database provided by NORTON (DS_Apache.mdb)

- Mineralised domain (dom_2.dtm)
- Variogram models
- Weathering type boundaries of oxide-transitional-fresh: Block model weathering type parameters, after validation based on the separation boundaries
- Block model (apache_mik2024mar.mdl)

The section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK, as the following procedures:

- Database compilation and validation
- Data conditioning (compositing and capping) for exploration data analysis
- Resource adjustment and validation.
- Assessment of "RPEEE" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

Resource Database

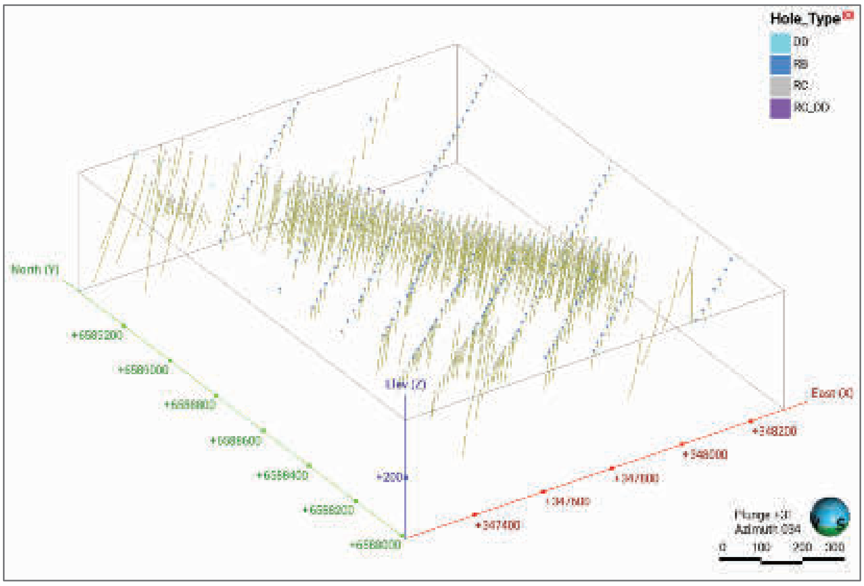
SRK reviewed the database provided by NORTON in Access format and conducted validation and removal of repeated samples. The database used for the resource estimation of the Apache mine consists of 630 drill holes.

The Apache database **DS_Apache** contains 40,353 gold sample records. The topographic map for the area is based on the MGA94_51 coordinate system, with a 1:1,000 scale and 2 m contour intervals. These three mines are included as a single entity in the database due to their close spatial proximity to each other. All drill hole's location is shown in Figure 7-18, and the summary of the database is presented in Table 7-19.

Table 7-19: Summary of the Database Apache Deposit

Hole Type	Hole Number	Profiles (m)	Assay Records
DD	26	4,726.3	3,841
RB	170	4,786	1,285
RC	431	41,289	34,612
RC_DD	3	580.7	615

Figure 7-18: Drilling Hole Location of the Database Apache



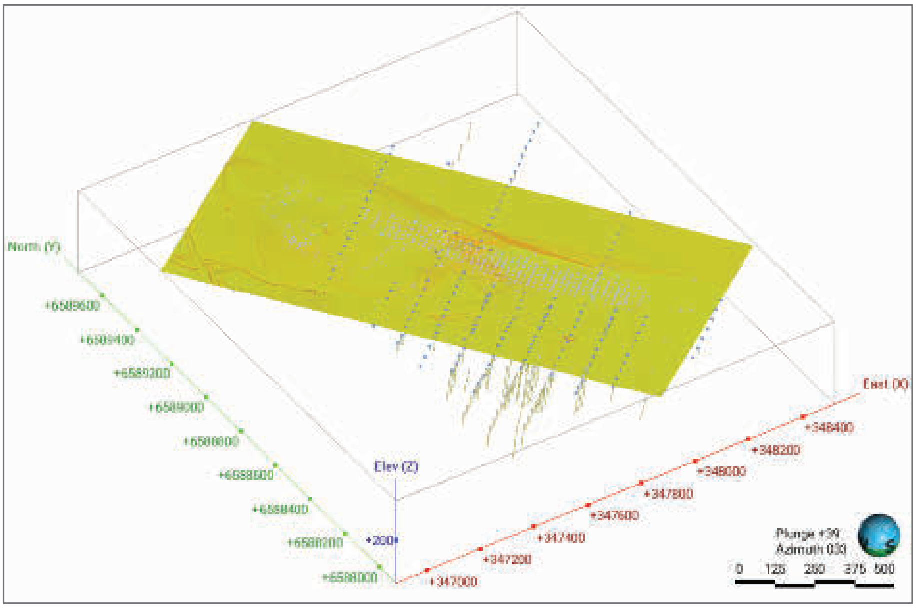
Source: SRK

SRK checked the drillhole database of the DS_Apache. The collar, assay, lithological logs, and downhole survey data and loaded into Leapfrog for validation, which included:

- Checks for holes without samples
- Checks for duplicated samples
- Checks for correct collar positions
- Checks and adjustments the missing intervals

The latest topographic map of the Apache deposit area is shown in Figure 7-19 below.

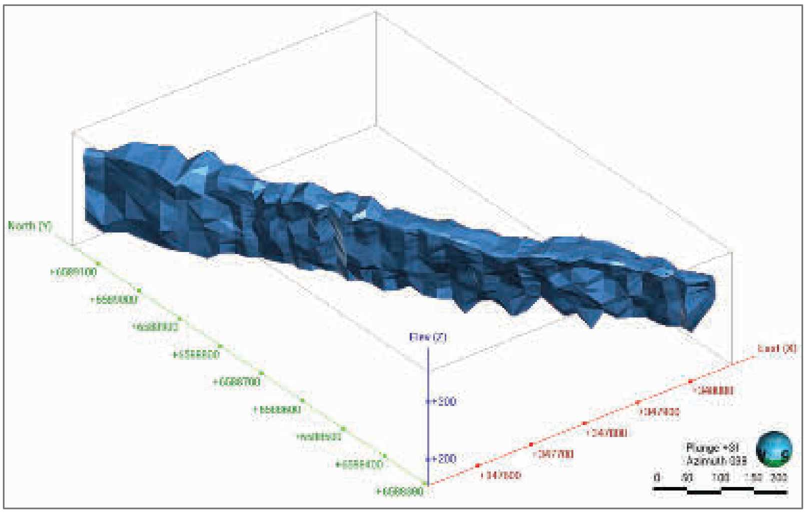
Figure 7-19: Current Topography of the Apache Deposit



Solid Body Modelling

Geological domains were based on the geological interpretation and mineralised trends. 3DM wireframes were created by sectional interpretation of the drilling dataset. Where there was geological uncertainty, domain boundaries were modelled to a 0.1 g/t Au lower cut. Domain boundaries were treated as soft boundaries. The location of the mineralised veins is shown in Figure 7-20. A summary of the dimension for the deposits is illustrated in Table 7-20.

Figure 7-20: 3D View of the Mineralised Bodies of the Apache Deposit



Source: SRK

Table 7-20: Dimensions for the Apache Deposits

Deposit	Mineralisation Length	Primary Mineralisation Dip	Primary Horizontal Mineralisation Width	Vertical Depth Extents
Apache	950m striking 326°	-65 towards 052°	Broad zone up to 100m	Surface to 200m depth

Specific Gravity

Bulk density values used in the resource estimation were determined through systematic test work on representative samples for specific lithologies, mineralisation types, and weathering states. These values are consistent with 476 bulk density measurements obtained from 29 diamond drill holes in the district, as well as historical and current production data from several pits within the regional district.

Insitu bulk densities (ISBD) were measured on a dry basis, using the water immersion technique, which accounts for void spaces (vugs, porosity, etc.), moisture, and variations between rock and alteration zones. Porous samples were sealed by various methods to ensure accuracy in the density calculations. These ISBD values were validated through reconciliation with production tonnages from both historical and ongoing mining operations in the project area.

The bulk density values applied in the evaluation process vary according to lithological and weathering states, as follows:

- Oxide: 1.8 g/cm³
- Transitional: 2.3 g/cm³
- Fresh/Primary: 2.70 g/cm³
- Dump/Fill Material: 2.1 g/cm³

This systematic approach ensures that density values adequately account for the variability in materials and provide reliable inputs for the resource model.

Compositing

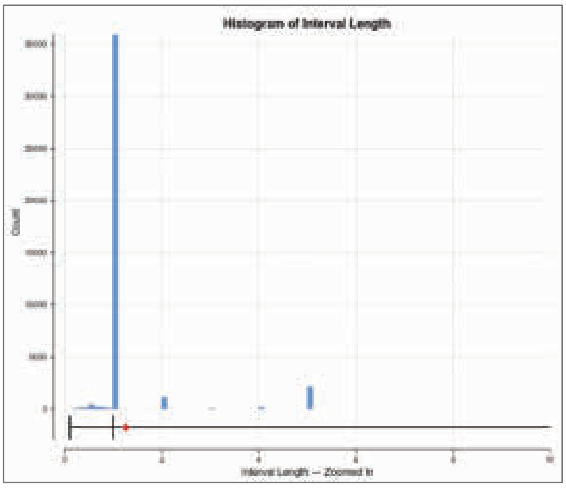
Sample intervals for the deposits are variable due to different drilling techniques. Throughout the Binduli Project, sample intervals for RC are generally 1 m to 4 m and DC from 0.2 m to 1 m. The statistical analysis of sample lengths in the database indicates that the majority of samples have a length of 1 m, as shown in Table 7-21 and Figure 7-21.

A 2 m length composite was applied for the Apache deposit to reduce variability and reflect the current smallest mining unit ("SMU"). The basic statistics for raw and composite values are shown in Table 7-21

Table 7-21: Statistics of the Sample Length of the Apache Deposit

Deposit	Samples	Minimum value	Maximum value	Mean	Median	Standard deviation	Skewness
Apache	15,324	0.1	6	1.04	1.0	0.44	8.25

Figure 7-21: Histogram of Sample Length for the Apache Deposit



Source: SRK

Evaluation of Outliers

Under the MIK estimation method, individual high-grade gold values do not have a direct impact on the estimated block grades, but indicator threshold values play an important role in managing the distribution of the outliers.

Statistical Analysis and Variography

The domain wireframe was used to assign mineralisation domain code to the samples in the estimation dataset and statistical analyses were conducted for Au. Summary statistics for the raw samples and composite samples within the domain are presented in Table 7-22.

Table 7-22: Statistics of the Raw and Composite Samples

Deposit	Item	Raw Samples	Composites
Apache	Number of samples	13,326	7,541
	Minimum value	0.004	0.004
	Maximum value	83.72	44.40
	Mean	0.69	0.63
	Variance	5.41	2.36
	Standard Deviation	2.33	1.54
	Coefficient of variation	3.36	2.44

For datasets formed from each sub domains, indicator thresholds and the variogram models were defined using a consistent set of percentiles representing probability thresholds of 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.75, 0.8, 0.85, 0.9, 0.95, 0.97 and 0.99 for data in each data subset by NORTON in GS3 software, the conditional statistics is shown in Table 7-23.

Table 7-23: Conditional Statistics for the Apache Deposit

Domain 1			Domain 2		
Threshold (g/t)	Cum Prop	Class Mean (g/t)	Threshold (g/t)	Cum Prop	Class Mean (g/t)
0.00001	0.1	0	0.005004	0.1	0.001
0.00002	0.2	0	0.025002	0.2	0.015
0.00003	0.3	0	0.055002	0.3	0.04
0.00004	0.4	0	0.105001	0.4	0.08
0.0025	0.5	0	0.165001	0.5	0.134
0.01	0.6	0.005	0.275	0.6	0.218
0.015001	0.7	0.01	0.42	0.7	0.341
0.020001	0.75	0.016	0.535	0.75	0.475
0.025001	0.8	0.021	0.69	0.8	0.609
0.035001	0.85	0.03	0.935	0.85	0.807
0.06	0.9	0.046	1.345	0.9	1.121
0.13	0.95	0.085	2.36	0.95	1.767
0.21	0.97	0.162	3.43	0.97	2.788
0.45	0.99	0.302	6.4075	0.99	4.658
12.275	1	1.063	44.375	1	11.878

Block Model and Grade Estimation

The block model sizes of the Apache deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with dimensions of 20m × 20m × 5m (North × Easting × Elevation). Block was rotated -40° to the parallel orientation of major mineralisation (see Table 7-24).

Table 7-24: Block Model Parameters of the Apache Deposit

Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
Northing	6588100	6589300	20	20	-40
Easting	347940	348600	20	20	0
Elevation	100	400	5	5	0

Grade estimation for the Apache deposit were completed using a non-linear interpolation technique – Multiple Indicator Kriging (MIK). MIK is an interpolation method better suited to geological domains having a highly skewed composite dataset distribution.

The composite dataset for each deposit was divided into 12 indicator thresholds. Spatial continuity modelling was completed for each indicator threshold, within each deposit. Directions of continuity were similar to interpreted controls on mineralisation with varying degrees of anisotropy.

Sample search ellipses were set based on data spacing in similar orientation to the major mineralised orientation. Minimum and maximum samples were set for each sample search based on accepted levels of grade continuity. Search distances were based on sample spacing and spatial continuity. A total of 3 search passes were conducted with progressively relaxed search criteria to accommodate the data density from the closest to the widest spaced drilling at 80m x 80 m.

The basic parameters were used for the grade interpolation as following:

- Search sample definition: minimum sample 16, maximum sample 48
- Octant sector search: Minimum samples per section is of 4
- All the search Radius: X 20m, Y 25m and Z 10m

Model Validation

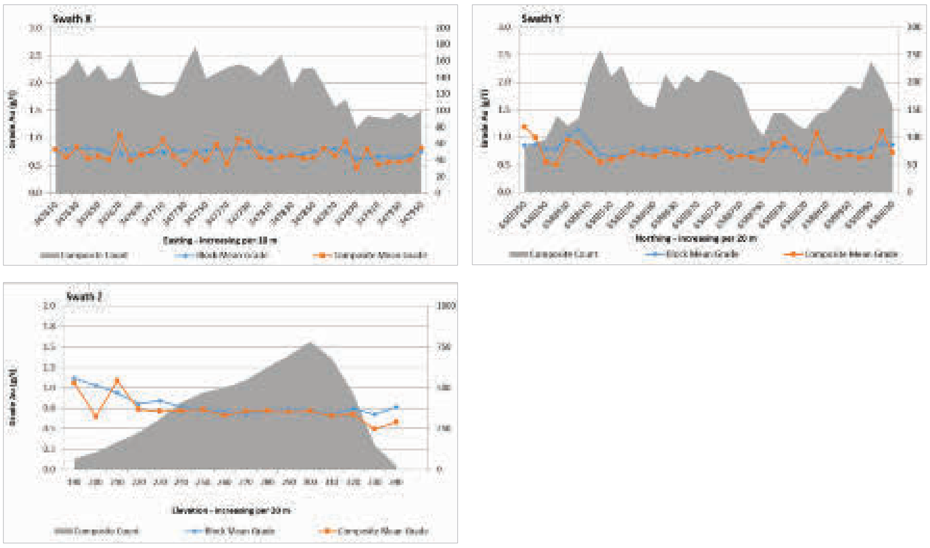
SRK undertook block model validation to confirm the reasonableness of the estimation parameters and estimation results. SRK adopted the following methods for the validation:

- Visual validation of block grades against drill hole grades; and
- Swath analysis.

SRK conducted visual validation of the longitudinal views and cross-section view of the drill holes and block model grades, which demonstrated good correlation between local block estimations and nearby samples, without excessive smoothing in the block model.

Figure 7-22 shows the swath plots of the Apache Deposit in the east−north, north–south and elevation planes.

Figure 7-22: Swath Plot of the Apache Deposit



Source: SRK

Mineral Resource Statement

The 2012 Edition of the JORC Code defines a Mineral Resource as:

"(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories".

"All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…"

The "reasonable prospects for eventual economic extraction" requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Apache deposit are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the Apache deposit are summarised in Table 7-25.

Table 7-25: Assumptions Considered for the Apache Deposit

Parameter	Oxide	Transitional	Fresh	Unit
Gold Price	2,700	2,700	2,700	US$ per ounce
Mining Cost	-	-	-	US$ per tonne mined
Processing	12.0	12.0	12.0	US$ per tonne of feed
General and Administrative	2.0	2.0	2.0	US$ per tonne of feed
Mining Dilution	5	5	5	Percent
Mining Loss	5	5	5	Percent
Process Recovery	73	73	73	Percent
In Situ Cut-Off-Grade	0.2	0.2	0.2	grams per tonne

Note:
[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024

As of 31 December 2024, and at a cut-off grade of 0.2g/t Au, the Mineral Resource of the Apache deposit is presented in Table 7-26.

Table 7-26: Mineral Resource Statement[1], the Apache Deposit, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Apache	OX	Measured			
		Indicated	37	0.92	34
		Inferred	101	0.66	66
	TR	Measured			
		Indicated	633	0.68	432
		Inferred	467	0.69	323
	FR	Measured			
		Indicated	7,705	0.68	5,270
		Inferred	6,002	0.76	4,538

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of 0.2g/t Au. The mined-out Mineral Resource was deducted during the Resources reporting.

Grade Sensitivity Analysis

The mineral resources of the Apache deposit are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources are presented in Table 7-27 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued as a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-23 presents this sensitivity as grade tonnage curves.

Table 7-27: Global Block Model Quantities and Grade Estimates[1], the Apache Deposit at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (kt)	Grade Gold (g/t)	Metal Content (kg)
0.1	15,400	0.71	10,934
0.2	14,945	0.71	10,671
0.3	13,677	0.77	10,532
0.4	11,589	0.84	9,735
0.5	9,639	0.92	8,868
0.6	7,741	1.01	7,818
0.7	6,258	1.10	6,884
0.8	4,985	1.19	5,933
0.9	3,853	1.29	4,971
1.0	2,995	1.39	4,163
1.1	2,337	1.48	3,459
1.2	1,823	1.58	2,880

Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

7.1.4 Mineral Resource Statement for the Binduli Project

The Mineral Resource Statement presented herein represents the Mineral Resource estimation prepared for the Norton Project in accordance with the JORC Code. The effective date of the Mineral Resource statement is 31 December 2024.

The database used to estimate the Norton Project Mineral Resources was audited by SRK. SRK is of the opinion that the current exploration information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

For each deposit model within the Binduli Project, a review process consistent with the methodology outlined in the preceding sections of this chapter has been applied. In assessing the "reasonable prospects for eventual economic extraction" for each deposit, assumptions were made based on actual production data, experience, and benchmarking against similar projects. An appropriate cut-off grades were selected, and pit shell optimization was undertaken where open pit mining is potentially applicable. Table 7-28 summarises the cut-off grades adopted for the various deposits within the Binduli Project.

Table 7-28: Summary of Cut-off Grades for Individual Deposits - Binduli Project

Project	Deposit	Mining Method	Cut-off Grade		
			Oxide	Transitional	Fresh
Binduli	Fort William	Open Pit	0.20	0.20	0.20
	Fort Scott		0.20	0.20	0.20

Notes:

1. All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.
2. The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a fellow of AusIMM and a Chartered Professional Geologist (CP.Geo). Both have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.
3. The mined-out Mineral Resource was deducted during the Resources reporting

7.2 Mt Pleasant Project

7.2.1 Racetrack OC and UG Deposit

Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Racetrack OC and UG deposit in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Racetrack OC and UG deposit deposit at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Racetrack OC and UG deposit Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The basic model was prepared by NORTON in GEOVIA Surpac software using conventional 3D block modelling and Ordinary Kriging ("OK") estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, geostatistics analysis, the grade interpolation as well as the resources classification, was completed by NORTON in 2024. An appropriate cut-off grade was selected by SRK, based on SRK's assumptions of the RPEEE which used a conceptual open pit to report the Mineral Resources.

Resource Estimation Procedures

Data provided by NORTON:

- Exploration Database, including collar, survey, assay (gold g/t), and lithological logs codes in Surpac format
- Composites, mineralised domains, weathering types, and topography in Surpac format
- Variogram models by Excel format
- Mineral Resource model in Surpac format
- Mineral Resource model summary presentation

SRK major findings:

- The mineralised domain is constructed based on the geology and grade conditions; however, the deep extensions in certain areas are considered to have optimistic exploration potential, but these parts not defined resource categories

- According to SRK's visual checking, the gold mineralisation continuity is basically consistent with the block grade interpolation trend
- The variograms model used in the grade interpolation is reasonable
- The model validation gives an acceptable comparison between composites and block grades

Combining information provided by NORTON and SRK's findings, SRK chose the following data to form the basis for an independent review of the Mineral Resources.

- Current topography (as_mined_mtp_mga2021.dtm).
- Database provided by NORTON (DS_Racetrack.mdb)
- Mineralised domain (rt_orewireframes_2024.dtm, min_ug_2024.dtm)
- Variogram models
- Weathering type boundaries of oxide-transitional-fresh: Block model weathering type parameters, after validation based on the separation boundaries
- Block model (rt_op_sep2024.mdl, rt_ug_dec2024.mdl)

The section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK, as the following procedures:

- Database compilation and validation
- Data conditioning (compositing and capping) for exploration data analysis
- Resource adjustment and validation.
- Assessment of "RPEEE" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

Resource Database

SRK reviewed the database provided by NORTON in Access format and conducted validation and removal of repeated samples. The database used for the resource estimation of the Racetrack OC and UG deposit consists of 10,326 drill holes.

The Racetrack OC and UG deposit database DS_Racetrack and contains 363,555 gold sample records. The topographic map for the area is based on the MGA94_51 coordinate system, with a 1:1,000 scale and 2 m contour intervals. These three mines are included as a single entity in the database due to their close spatial proximity to each other. All drill hole's location is shown in Figure 7-24, and the summary of the database is presented in Table 7-30.

Table 7-30: Summary of the Database Racetrack

Hole Type	Hole Number	Profiles (m)	Assay Records
AC	98	3,771	1,045
AU	5	37.5	40
BH	2,486	24,023.8	20,959

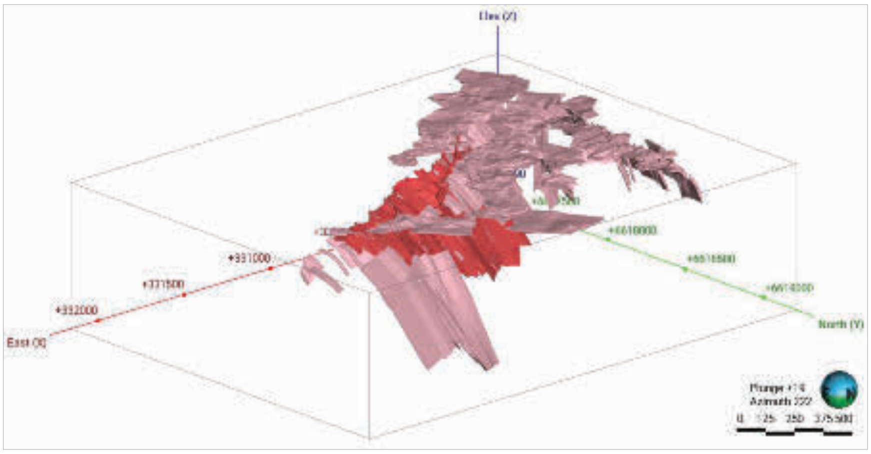
Solid Body Modelling

The mineralised domains were based on the geological interpretation and mineralised trends. 3DM wireframes created by 20m spacing sectional interpretation of the drilling dataset. Where there was geological uncertainty, domain boundaries were modelled nominal at a 0.2g/t Au lower cut for supergene mineralisation and 0.5 g/t Au for primary mineralisation, a minimum interval of 4m is applied. Domain boundaries were treated as hard boundaries. The 3D view of the open cast mineralised veins is shown in Figure 7-25.

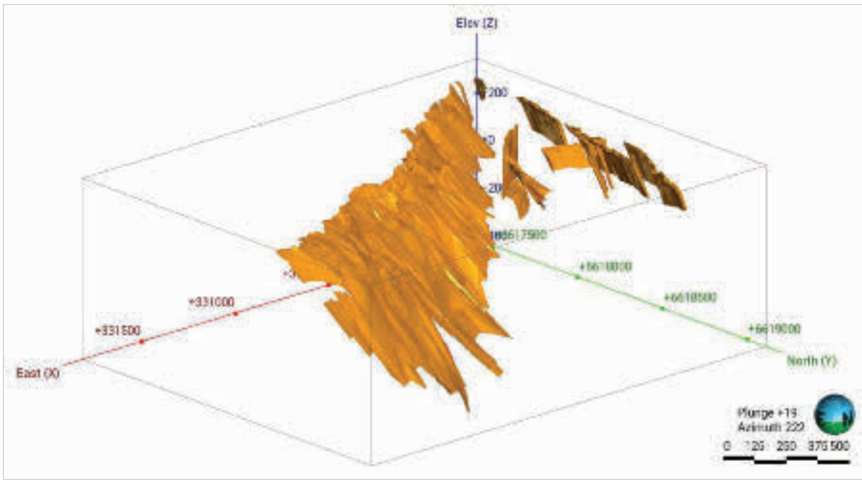
Figure 7-25: 3D View of the Mineralised Bodies of the Racetrack OC Deposit



Source: SRK

The mineralised domains were based on the geological interpretation and mineralised trends. 3DM wireframes created by 20m spacing sectional interpretation of the drilling dataset. Where there was geological uncertainty, domain boundaries were modelled nominal at a 1.0 g/t Au for primary mineralisation. Domain boundaries were treated as hard boundaries. The 3D view of the underground mineralised veins is shown in Figure 7-26.

Figure 7-26: 3D View of the Mineralised Bodies of the Racetrack UG Deposit



Source: SRK

Specific Gravity

The specific gravity values of the Racetrack OC and UG deposit were obtained from a statistical analysis of 680 measurements of 35 holes. Individual specific gravities are applied in accordance with specific lithology, mineralisation and weathering states (see Table 7-31). The SG values have been used to inform the bulk density for the resource model.

Table 7-31: Specific Gravity

Deposit	Weathering/Lithology	Specific Gravity
Racetrack OC and UG	Oxide	1.8
	Transitional	2.3
	Fresh/Primary	2.8
	Laterite/Alluvial	1.7
	Dump/Fill	1.6

Compositing

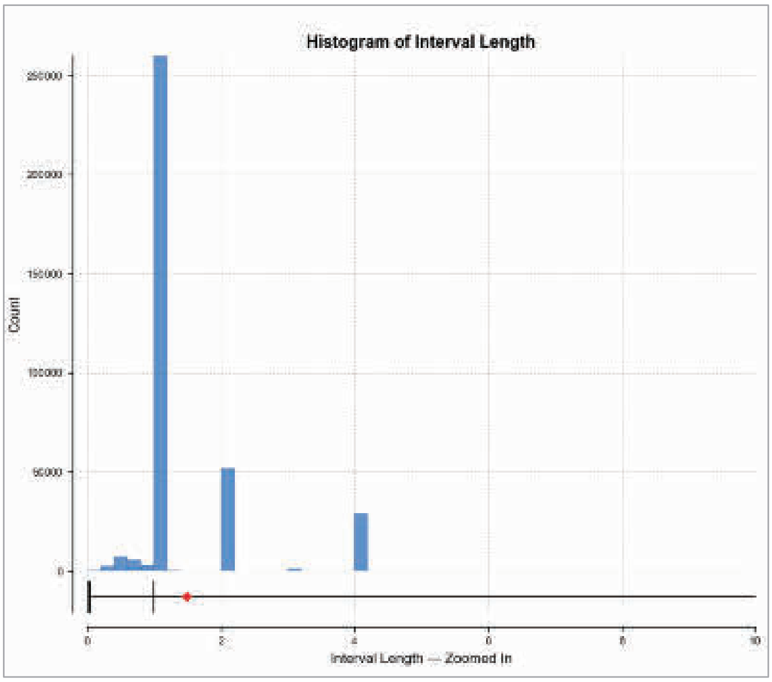
Sample intervals for the individual veins are variable due to different drilling techniques. Throughout the Racetrack deposit, sample intervals for RC are generally 1 m to 4 m and DC from 0.2 m to 1 m. The statistical analysis of sample lengths in the database indicates that the majority of samples have a length of 1 m, as shown in Table 7-32 and Figure 7-27.

A 2 m length composite was applied for the Racetrack OC and UG deposit to reduce variability and reflect the current smallest mining unit ("SMU").

Table 7-32: Statistics of the Sample Length of the Racetrack OC and UG Deposit

Deposit	Samples	Minimum value	Maximum value	Mean	Median	Standard deviation	Skewness
Racetrack	62,056	0.10	39.99	1.05	1.0	0.73	14.25

Figure 7-27: Histogram of Sample Length for the Racetrack OC and UG Deposit



Source: SRK

Evaluation of Outliers

The au composites were inspected for the presence of low-grade and high-grade outlier values that could adversely impact grade estimation, both bottom-cut and top-cuts were applied. 0.005g/t was used for bottom-cut.

Given the large number of domains involved across the deposits, SRK selected three representative domains for outliers' statistical analysis and graphical presentation. Figure 7-28 to Figure 7-30 shows the histogram and probability distribution of samples within Domain 115, Domain 111 and Domain 1012, respectively. The statistics of the capping values of those 3 domains is shown in Table 7-33.

Figure 7-28: Histograms and Probability Plot of the Domain 115

Statistical Analysis and Variography

The domain wireframe was used to assign mineralisation domain code to the samples in the estimation dataset and statistical analyses were conducted for Au. Summary statistics for the raw samples and composite samples within the domain are presented in Table 7-35.

Table 7-35: Basic Statistics of the Raw and Composite Samples

Deposit	Item	Raw	Composites
Racetrack	Number of samples	62,056	33,907
	Minimum value	0.005	0.005
	Maximum value	493.995	256.75

Deposit	Item	Raw	Composites
	Mean	0.93	0.91
	Variance	19.83	11.15
	Standard Deviation	4.45	3.34
	Coefficient of variation	4.80	3.68

Spatial continuity was examined for each domain. In general, the experimental variograms were robust and well defined. Directions of continuity were similar to interpreted controls on mineralisation with varying degrees of anisotropy. The exponential variogram modelling structure of each domain for Racetrack OC and UG Deposit of gold was shown in Table 7-36.

Table 7-36: Variogram Modelling Structures

Deposit	Domain	Bearing	Plunge	Dip	Major/Semi	Major/Minor	Nugget	Sill	Range
Racetrack OC	12	45	0	45	1.5	6	0.23	0.95	29

Block Model and Grade Estimation

The block model sizes of the Racetrack OC deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with dimensions of 10m × 5m × 2.5m (North × Easting × Elevation). Block was rotated 55° to the parallel orientation of major mineralisation (see Table 7-37).

Table 7-37: Block Model Parameters of the Racetrack OC Deposit

Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
Northing	6618300	6622000	10	1	55
Easting	328620	330980	5	2	0
Elevation	400	1150	2.5	1	0

The block model sizes of the Racetrack UG deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with dimensions of 10m × 4m × 10m (North × Easting × Elevation). Block was rotated 60° to the parallel orientation of major mineralisation (see Table 7-38).

Table 7-38: Block Model Parameters of the Racetrack UG Deposit

Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
Northing	6618210	6620860	10	2.5	60
Easting	329440	330440	5	0.5	0
Elevation	400	1200	2.5	1.25	0

Grade estimations for Racetrack OC and Racetrack UG were done using OK method for all mineralised zones by Norton. In all cases three passes were used for block estimation, and the search radius parameters used for each pass are listed in Table 7-39.

Table 7-39: Search Parameters of the Racetrack OC and UG Deposit

Deposit	Pass	Search Distance (m)	Minimum Samples	Maximum Sample
Racetrack OP	1	50	5	12
	2	90	4	10
	3	300	3	8
Racetrack UG	1	30	6	8
	2	30	4	8
	3	120	4	8
	4	500	2	6

Model Validation

SRK undertook block model validation to confirm the reasonableness of the estimation parameters and estimation results. SRK adopted the following methods for the validation:

- Visual validation of block grades against drill hole grades; and
- Swath analysis.

SRK conducted visual validation of the longitudinal views and cross-section view of the drill holes and block model grades, which demonstrated good correlation between local block estimations and nearby samples, without excessive smoothing in the block model.

Figure 7-31 shows the swath plots of the Racetrack OC and UG deposit in the east−north, north–south and elevation planes.

Figure 7-31: Swath Plots of the Racetrack OC and UG Deposit

Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralisation exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, the Racetrack OP and UG Deposit follows the JORC Code classification system with individual block classification being assigned using statistical methods and visually taking into account the following factors:

- Drill spacing and orientation
- Search parameters including search distance and number of informing samples
- Data quality, including the existence, availability and quality of QC
- Confidence of certain parts of the geological model.

The distribution of Mineral Resource classification of Racetrack OP and Racetrack UG is displayed in a 3D view in Figure 7-32 and Figure 7-33, respectively.

Mineral Resource Statement

The 2012 Edition of the JORC Code defines a Mineral Resource as:

"(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific

geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories".

"All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…"

The "reasonable prospects for eventual economic extraction" requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Racetrack OC deposit are amenable for open pit mining while the Racetrack UG are amenable for underground extraction.

The conceptual parameters used to estimate the cut-off grade for the Racetrack OC and UG deposit are summarised in Table 7-40.

Table 7-40: Assumptions Considered for the Racetrack OC Deposit

Parameter	Oxide	Transitional	Fresh	Unit
Gold Price	2,700	2,700	2,700	US$ per ounce
Mining Cost	-	-	-	US$ per tonne mined
Processing	11.0	25.0	25.0	US$ per tonne of feed
General and Administrative	5.0	5.0	5.0	US$ per tonne of feed
Mining Dilution	15	15	15	Percent
Mining Loss	5	5	5	Percent
Process Recovery	90	90	90	Percent
In Situ Cut-Off-Grade	0.2	0.55	0.55	grams per tonne

Note:

[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024.

Table 7-41: Assumptions Considered for the Racetrack UG Deposit

Parameter	Fresh	Unit
Gold Price	2,700	US$ per ounce
Mining Cost	125	US$ per tonne mined
Processing	25	US$ per tonne of feed
General and Administrative	5	US$ per tonne of feed
Mining Dilution	5	Percent
Mining Loss	5	Percent
Process Recovery	85	Percent
In Situ Cut-Off-Grade	2.65	grams per tonne

Note:

[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024.

As of 31 December 2024, and at a cut-off grade of 0.2g/t Au for the oxide, and 0.55g/t Au for the transitional and fresh, the Mineral Resource of the Racetrack OC deposit is presented in Table 7-42.

Table 7-42: Mineral Resource Statement[1], the Racetrack OC Project, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Racetrack OC	OX	Measured			
		Indicated	1,376	0.82	1,126
		Inferred	130	0.66	85
	TR	Measured	0		0
		Indicated	1,851	1.17	2,170
		Inferred	262	1.20	316
	FR	Measured	0		0
		Indicated	5,579	2.15	11,990
		Inferred	658	1.70	1,121

Notes:

1 All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

2 The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

3 The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of Au 0.2 g/t for OX, Au 0.5 g/t for TR and FR. The mined-out Mineral Resource was deducted during the Resources reporting.

As of 31 December 2024, and at a cut-off grade of 2.65 g/t Au, the Mineral Resource of the Racetrack UG deposit is presented in Table 7-43.

Table 7-43: Mineral Resource Statement[1], the Racetrack UG Project, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Racetrack UG	OX	Measured			
		Indicated	0	3.67	1
		Inferred	0	3.23	1
	TR	Measured			
		Indicated	10	4.55	45
		Inferred	2	4.17	8
	FR	Measured			
		Indicated	924	4.49	4,151
		Inferred	1,993	4.94	9,849

Notes:

1 All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

2 The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

3 The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of 2.65g/t Au. The mined-out Mineral Resource was deducted during the Resources reporting.

Grade Sensitivity Analysis

The mineral resources of the Racetrack OC and UG deposit are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources are presented in Table 7-44 and
Source: SRK

Table 7-45 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued as a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-34 and Figure 7-35 presents this sensitivity as grade tonnage curves.

Table 7-44: Global Block Model Quantities and Grade Estimates[1], the Racetrack OC Deposit (Oxide, Transitional and Fresh) at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (kt)	Grade Gold (g/t)	Metal Content (kg)

7.2.2 Tuart UG Deposit

Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Tuart UG deposit in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Tuart UG deposit at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Tuart UG deposit Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The basic model was prepared by NORTON in GEOVIA Surpac software using conventional 3D block modelling and Ordinary Kriging (OK) estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, geostatistics analysis, the grade interpolation as well as the resources classification, was completed by NORTON in 2024. An appropriate cut-off grade was selected by SRK to report the underground Mineral Resources.

Resource Estimation Procedures

Data provided by NORTON:

- Exploration Database, including collar, survey, assay (gold g/t), and lithological logs codes in Surpac format
- Composites, mineralised domains, weathering types, and topography in Surpac format
- Mineral Resource model in Surpac format
- Mineral Resource model summary presentation

SRK major findings:

- The mineralised domain is constructed based on the geology and grade conditions; however, the deep extensions in certain areas are considered to have optimistic exploration potential, but these parts not defined resource categories
- According to SRK's visual checking, the gold mineralisation continuity is basically consistent with the block grade interpolation trend
- The variograms model used in the grade interpolation is reasonable
- The model validation gives an acceptable comparison between composites and block grades

Combining information provided by NORTON and SRK's findings, SRK chose the following data to form the basis for an independent review of the Mineral Resources.

- Database provided by NORTON (DS_TuartUG-Resource.mdb)
- Mineralised domain (tuart_060_all_dtms.dtm, tuart_080_all_dtms.dtm, tuart_115.dtm and tuart_115_fw.dtm)
- Weathering type boundaries of oxide-transitional-fresh: Block model weathering type parameters, after validation based on the separation boundaries
- Block model (tuart_115_res_202410_v2.mdl, tuart_080_res_202407.mdl, tuart_060_res_202411.mdl).

The section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK, as the following procedures:

- Database compilation and validation
- Data conditioning (compositing and capping) for exploration data analysis
- Resource adjustment and validation.
- Assessment of "RPEEE" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

Resource Database

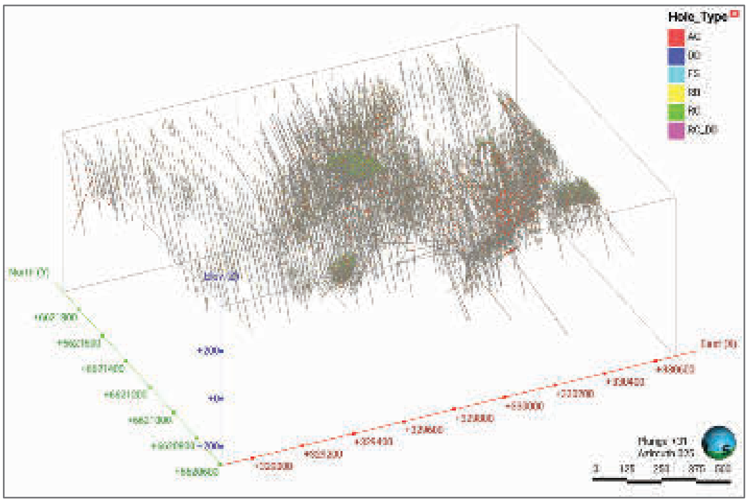
SRK reviewed the database provided by NORTON in Access format and conducted validation and removal of repeated samples. The database used for the resource estimation of the Tuart UG mine consists of 9,046 drill holes.

The Tuart UG deposit database DS_Tuart UG-Resource contains 288,733 gold sample records. The topographic map for the area is based on the MGA94_51 coordinate system, with a 1:1,000 scale and 2 m contour intervals. These three mines are included as a single entity in the database due to their close spatial proximity to each other. All drill hole's location is shown in Figure 7-36, and the summary of the database is presented in Table 7-46.

Table 7-46: Summary of the Database Tuart UG Deposit

Hole Type	Hole Number	Profiles (m)	Assay Records
AC	30	828	379
DD	1,195	207,637.56	103,620
RB	151	5,179.1	1,150
FS	4,653	23,571.85	30,072
RC	2,763	209,210.5	146,259
RC_DD	28	9,188.65	6,083
SH	57	710.8	1,170

Figure 7-36: Drilling Hole Location of the Database Tuart UG Deposit



Source: SRK

SRK checked the drillhole database of the Tuart UG deposit. The collar, assay, lithological logs, and downhole survey data and loaded into Leapfrog for validation, which included:

- Checks for holes without samples
- Checks for duplicated samples
- Checks for correct collar positions

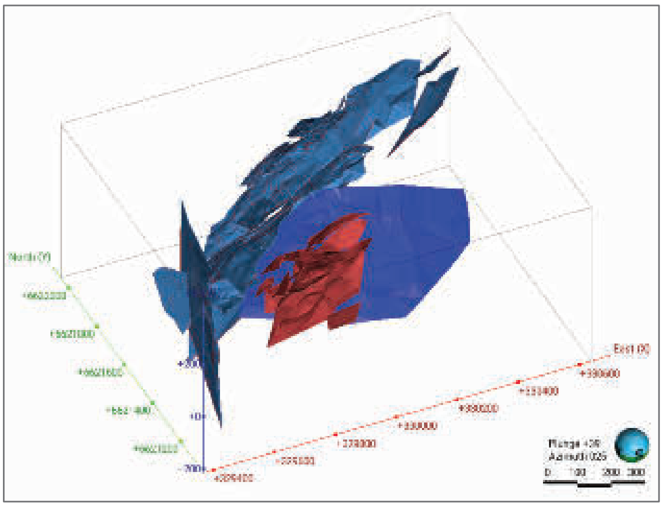
- Checks and adjustments the missing intervals

Solid Body Modelling

The geological model of the main mineralised vein system at Tuart was created in Surpac mining software. Solids representing mineralised veins were built from strings created on plan sections and from points snapped directly to drill hole intersections. The underground development mapping was also utilized to aid in understanding of veins structure.

The geological interpretation was based on identifying particular geological structures, associated alteration, veining and gold content. A gold grade cut off of 1g/t was used. In the absence of gold enrichment, the lithological codes determining vein boundaries were used instead. The location of the mineralised veins is shown in Figure 7-37. A summary of the dimension for the deposits is illustrated in Table 7-47.

Figure 7-37: 3D View of the Mineralised Bodies of the Tuart UG Deposit



Source: SRK

Table 7-47: Dimensions for the Tuart UG Deposits

Lode	Mineralisation Length	Primary Mineralisation Dip	Primary Horizontal Mineralisation Width	Vertical Depth Extents
060	1km strike and 150m known dip extent	-45° towards 330°	Each lode is typically 0.5 to 2m wide true width. High grade intercepts are up to 4m wide	15m-25m below the surface (supergene) and extends to below 0mRL – the extent of drilling
080	600m strike 250m known dip extent	sub-vertical dip and E-W strike		
115	500m strike and 250m known dip extent	-55° towards 295°		

Specific Gravity

In-situ bulk densities were measured on a dry basis, using the water immersion technique, which accounts for void spaces (vugs, porosity, etc.), moisture, and variations between rock and alteration zones. Porous samples were sealed by various methods to ensure accuracy in the density calculations. These ISBD values were validated through reconciliation with production tonnages from both historical and ongoing mining operations in the project area.

The bulk density values applied in the evaluation process vary according to lithological and weathering states, as follows:

- Oxide: 1.90 g/cm³
- Transitional: 2.30 g/cm³
- Fresh/Primary: 2.80 g/cm³

This systematic approach ensures that density values adequately account for the variability in materials and provide reliable inputs for the resource model.

Compositing

Sample intervals for the individual deposit are variable due to different drilling techniques. Throughout the Tuart UG deposit, sample intervals for RC are generally 1 m to 4 m and DC from 0.2 m to 1 m. The statistical analysis of sample lengths in the database indicates that the majority of samples have a length of 1 m, as shown in Table 7-48 and Figure 7-38.

A 2 m length composite was applied for the Tuart UG deposit to reduce variability and reflect the current smallest mining unit ("SMU").

Table 7-48: Statistics of the Sample Length of the Tuart UG Deposit

Deposit	Samples	Minimum value	Maximum value	Mean	Median	Standard deviation
Tuart UG 060	11,997	0.10	8.77	0.72	0.70	0.33
Tuart UG 080	612	0.10	3.89	0.98	1.00	0.38
Tuart UG 115	437	0.10	3.14	0.71	0.70	0.43

Evaluation of Outliers

The statistics for each domain were viewed and key univariate statistical indicators used to describe the nature of each. Each of the population of the composite data from the Tuart mineralised domains was positively skewed and showed number of high-grade outliers, which is typical of gold deposits.

Given the large number of domains involved across the deposits, SRK selected three representative domains for outliers' statistical analysis and graphical presentation. Figure 7-39 to Figure 7-41, Figure 7-42 to Figure 7-44 and Figure 7-45 to Figure 7-46 shows the histogram and probability distribution of samples within Domain 60, Domain 080 and Domain 115, respectively. The statistics of the capping values of those 3 domains is shown in Table 7-49.

Table 7-49: Capping Values Statistics

Deposit	Domain	Assay Cap Au (g/t)	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t) Before Capping	Au Mean (g/t) After Capping
Tuart UG 060	Dom601	35	17	1.22%	8.84	6.17
	Dom609	35	26	1.83%	5.32	4.86
	Dom621	35	12	1.03%	4.57	4.33
Tuart UG 080	Dom884	35	1	1.15%	4.60	4.33
	Dom885	35	0	0.00%	2.70	2.70
	Dom893	35	0	0.00%	2.18	2.18

Deposit	Domain	Assay Cap Au (g/t)	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t) Before Capping	Au Mean (g/t) After Capping
Tuart UG	Dom115	30	7	3.13%	4.51	3.89
115	Dom116	30	7	2.99%	4.46	3.86

Top-cut were determined by way of viewing grade distribution histograms and probability plots to determine what grade separated the outliers from the population. High-grade outliers were summary in Table 7-50.

Table 7-50: Top-cut Grade used in the Tuart UG Deposit

Domain	Top-Cut Grade (g/t Au)
Tuart UG 060	35
Tuart UG 080	35
Tuart UG 115	30

Statistical Analysis and Variography

The domain wireframe was used to assign mineralisation domain code to the samples in the estimation dataset and statistical analyses were conducted for Au. Summary statistics for the raw samples and composite samples within the domain are presented in Table 7-51.

Table 7-51: Basic Statistics of the Raw and Composite Samples

Domain	Item	Raw	Composites
Tuart UG 060	Number of samples	11,997	5,341
	Minimum value	0.001	0.001
	Maximum value	7284.06	3399.53
	Mean	6.83	6.50
	Variance	5935.85	3258.75
	Standard Deviation	77.04	57.09
	Coefficient of variation	11.28	8.78
Tuart UG 080	Number of samples	612	321
	Minimum value	0.001	0.001
	Maximum value	300.5	148.39
	Mean	3.75	3.98
	Variance	211.04	109.31
	Standard Deviation	14.53	10.46
	Coefficient of variation	3.87	2.63
Tuart UG 115	Number of samples	437	234
	Minimum value	0.001	0.001
	Maximum value	155.30	84.85
	Mean	5.07	4.46
	Variance	226.18	102.67
	Standard Deviation	15.04	10.13
	Coefficient of variation	2.96	2.27

Spatial continuity was examined for each domain. In general, the experimental variograms were robust and well defined. Directions of continuity were similar to interpreted controls on mineralisation with varying degrees of anisotropy. The exponential variogram modelling structure of each domain for the Tuart UG Deposit of gold was shown in Table 7-52, Table 7-53 and Table 7-54.

Table 7-52: Variogram Modelling Structures of the Domian 060

Block Model and Grade Estimation

The block model sizes of the Tuart UG deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with multiple dimensions (North × Easting × Elevation). And the different orientations of the lodes. The parameters of the lodes within the Tuart UG deposit are illustrate in Table 7-55.

Table 7-55: Block Model Parameters of the Tuart UG Deposit

Lode	Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
	Northing	6620990	6621582	4	0.5	-30
060	Easting	329390	331050	10	0.625	0
	Elevation	-200	400	5	1.25	0
	Northing	6621110	6621450	2	0.25	0
080	Easting	329580	330090	10	1.25	0
	Elevation	-30	350	5	1.25	0
	Northing	6621800	6622900	10	2.5	115
115	Easting	329500	330200	1	0.25	0
	Elevation	-100	360	5	1.25	0

Grade estimations for Tuart UG deposit were done using OK method by NORTON for all mineralised lodes. The basic parameters were used for the grade interpolation as following:

- Spatial continuity modelling was completed on the top-cut composite datasets for each domain. Directions of continuity were similar to interpreted controls on mineralisation with varying degrees of anisotropy.
- Sample search ellipses were set based on data spacing in similar orientations to the spatial continuity directions for each lode. Minimum and maximum samples were set for each sample search based on accepted levels of grade continuity. Search distances were based on sample spacing and spatial continuity. A total of 4 search passes were conducted with progressively relaxed search criteria to accommodate the data density

The search radius parameters used for each pass are listed in Table 7-56.

Table 7-56: Search Parameters for Each Domain of the Tuart UG Deposit

Domian	Pass	Search Distance (m)	Minimum Samples	Maximum Sample
	1	20	8	12
060	2	40	6	10
	3	80	4	8
	4	120	2	6

Domian	Pass	Search Distance (m)	Minimum Samples	Maximum Sample
080	1	20	6	12
	2	40	4	10
	3	80	4	8
	4	120	2	6
115	1	20	8	12
	2	40	6	10
	3	80	4	8
	4	120	2	6

Model Validation and Sensitivity

SRK undertook block model validation to confirm the reasonableness of the estimation parameters and estimation results. SRK adopted the following methods for the validation:

- Visual validation of block grades against drill hole grades; and
- Swath analysis.

SRK conducted visual validation of the longitudinal views and cross-section view of the drill holes and block model grades, which demonstrated good correlation between local block estimations and nearby samples, without excessive smoothing in the block model.

Figure 7-47 and Figure 7-48 shows the swath plots of the Tuart UG Deposit in the east−north, north–south and elevation planes.

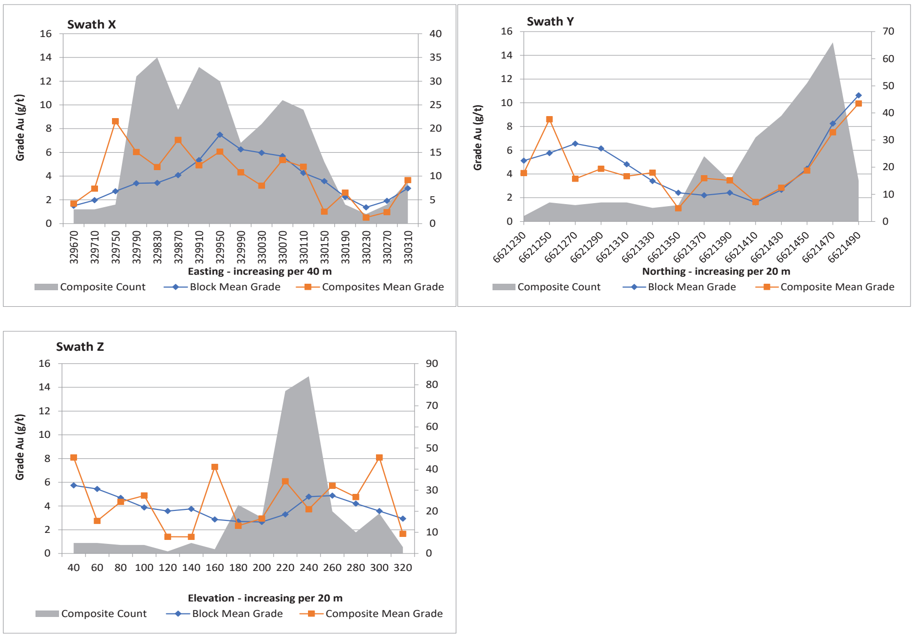
Note: Domain 060 on left hand and Domain 080 on right hand

Figure 7-48: Swath Plots of the Tuart UG Deposit Domain 115



Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralisation exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, the Tuart UG Deposit follows the JORC Code classification system with individual block classification being assigned using statistical methods and visually taking into account the following factors:

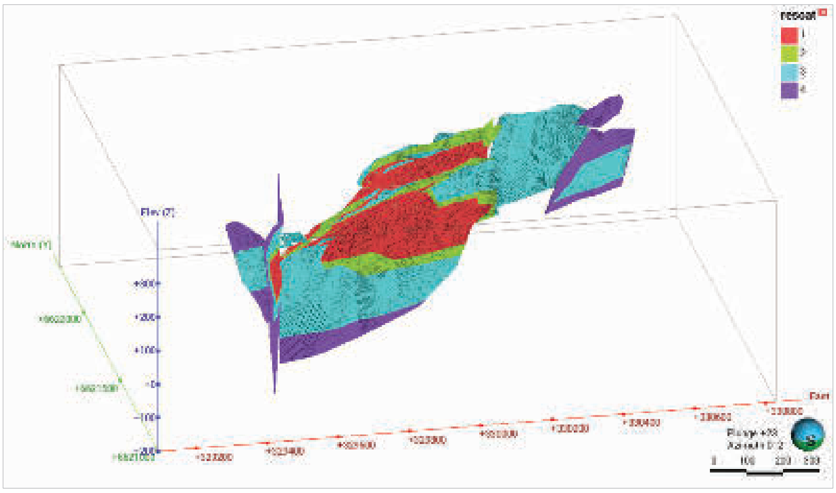
- Geological confidence and interpretation.
- Drill spacing and orientation.
- Spatial data and assay QAQC.
- Classification of surrounding blocks
- Portions of the deposit that are likely to be viably mined.

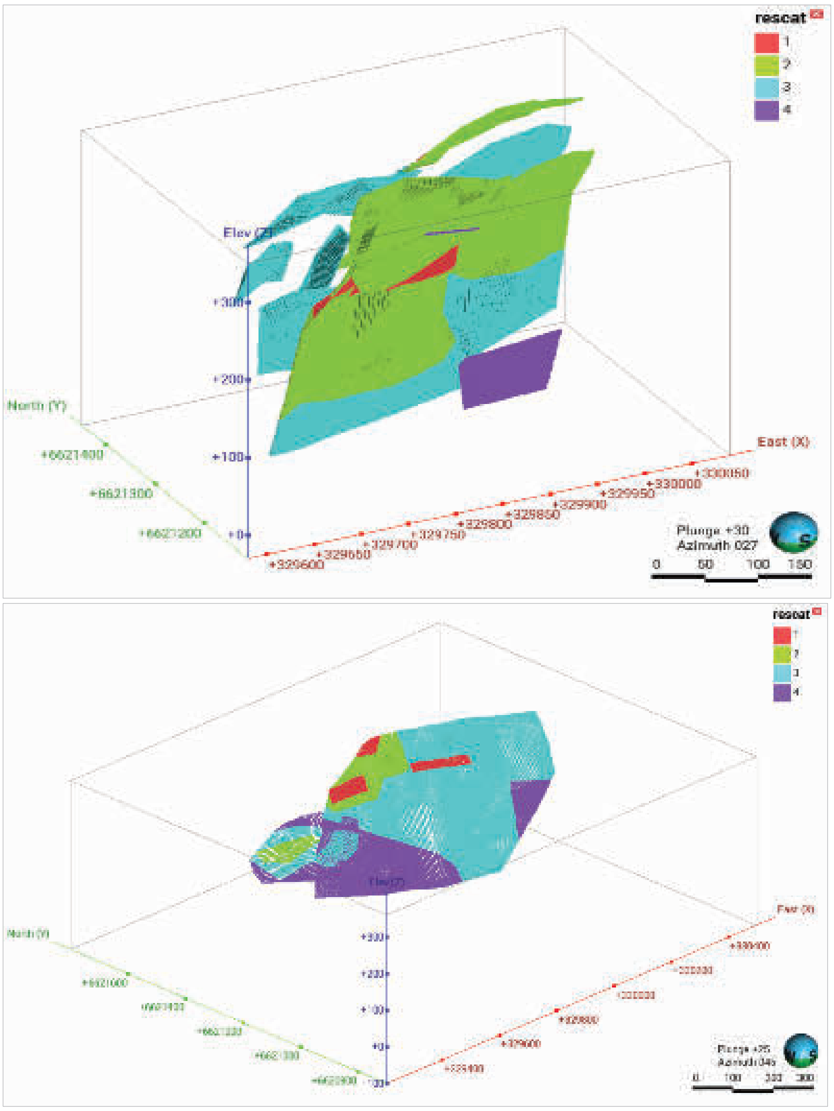
The Mineral Resource classification criteria as shown in Table 7-57, and the distribution of Mineral Resource classification is displayed in a 3D view in Figure 7-49.

Table 7-57: Resource Classification Criteria used in the Estimation

Category	Mineral Resource Classification Criteria
Measured (ResCat=1)	Measured category was assigned to resource within 10 m vertically from mine development.
Indicated (ResCat=2)	Indicated category to resource where distance between data points was not larger than 40 m
Inferred (ResCat=3)	Inferred category to resource estimated using a higher data points separation, estimated using a more relaxed estimation run

Figure 7-49: Mineral Resource Classification of the Tuart UG Deposit Domain 060





Source: SRK

Note: Domain 060 on top and Domain 080 in middle and Domain 115 on bottom.

Mineral Resource Statement

The 2012 Edition of the JORC Code defines a Mineral Resource as:

"(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other

geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories".

"All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…"

The "reasonable prospects for eventual economic extraction" requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Tuart UG deposit are amenable for underground mining.

The conceptual parameters used to estimate the cut-off grade for the Tuart UG deposit are summarised in Table 7-58.

Table 7-58: Assumptions Considered for the Tuart UG Deposit

Parameter	Fresh	Unit
Gold Price	2,700	US$ per ounce
Mining Cost	110	US$ per tonne mined
Processing	18	US$ per tonne of feed
General and Administrative	5	US$ per tonne of feed
Mining Dilution	5	Percent
Mining Loss	5	Percent
Process Recovery	93	Percent
In Situ Cut-Off-Grade	2.1	grams per tonne

Note:

[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024.

As of 31 December 2024, and at a cut-off grade of 2.1 g/t Au, the Mineral Resource of the Tuart UG deposit is presented in Table 7-59.

Table 7-59: Mineral Resource Statement[1], the Tuart UG Deposit, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Tuart UG	OX	Measured			
		Indicated	58	3.75	217
		Inferred	35	3.78	133
	TR	Measured	1	4.22	3
		Indicated	133	4.30	573
		Inferred	80	4.16	331
	FR	Measured	593	6.01	3,558
		Indicated	672	4.71	3,162
		Inferred	1,676	5.46	9,154

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of 2.1g/t Au. The mined-out Mineral Resource was deducted during the Resources reporting.

Grade Sensitivity Analysis

The mineral resources of the Tuart UG deposit are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources are presented in Table 7-60 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued as a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-50 presents this sensitivity as grade tonnage curves.

Table 7-60: Global Block Model Quantities and Grade Estimates[1], the Tuart UG Deposit at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (kt)	Grade Gold (g/t)	Metal Content (kg)

7.2.3 Mineral Resource Statement for the Mt Pleasant Project

The Mineral Resource Statement presented herein represents the Mineral Resource estimation prepared for the Norton Project in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

The database used to estimate the Norton Project Mineral Resources was audited by SRK. SRK is of the opinion that the current exploration information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

For each deposit model within the Mt Pleasant Project, a review process consistent with the methodology outlined in the preceding sections of this chapter has been applied. In assessing the "reasonable prospects for eventual economic extraction" for each deposit, assumptions were made based on actual production data, experience, and benchmarking against similar projects. An appropriate cut-off grades were selected, and pit shell optimization was undertaken where open pit mining is potentially applicable. Table 7-61 summarizes the cut-off grades adopted for the various deposits within the Mt Pleasant Project.

Table 7-61: Summary of Cut-off Grades for Individual Deposits – Mt Pleasant Project

Project	Deposit	Mining Method	Cut-off Grade		
			Oxide	Transitional	Fresh
Greater Mt Pleasant	Mt Pleasant	Open Pit	0.25	0.25	0.35

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a fellow of AusIMM and a Chartered Professional Geologist (CP. Geo). Both have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

[3] The mined-out Mineral Resource was deducted during the Resources reporting.

7.3 Carbine Project

7.3.1 Bullant UG Deposit

Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Bullant UG deposit in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Bullant UG deposit at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Bullant UG deposit Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The basic model was prepared by NORTON in GEOVIA Surpac software using conventional 3D block modelling and Ordinary Kriging (OK) estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, geostatistics analysis, the grade interpolation as well as the resources classification, was completed by NORTON in 2024. An appropriate cut-off grade was selected by SRK to report the underground Mineral Resources.

Resource Estimation Procedures

Data provided by NORTON:

- Exploration Database, including collar, survey, assay (gold g/t), and lithological logs codes in Surpac format
- Composites, mineralised domains, weathering types, and topography in Surpac format
- Variogram models by Excel format
- Mineral Resource model in Surpac format
- Mineral Resource model summary presentation

SRK major findings:

- The mineralised domain is constructed based on the geology and grade conditions; however, the deep extensions in certain areas are considered to have optimistic exploration potential, but these parts not defined resource categories
- According to SRK's visual checking, the gold mineralisation continuity is basically consistent with the block grade interpolation trend
- The variograms model used in the grade interpolation is reasonable
- The model validation gives an acceptable comparison between composites and block grades

Combining information provided by NORTON and SRK's findings, SRK chose the following data to form the basis for an independent review of the Mineral Resources.

- Current topography (topo.dtm).
- Database provided by NORTON (DS_BullantResource_UG.accdb)
- Mineralised domain (bullant_all_dtms.dtm)
- Variogram models
- Weathering type boundaries of oxide-transitional-fresh: Block model weathering type parameters, after validation based on the separation boundaries
- Block model (00_bullant_resource_202411.mdl)

The section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK, as the following procedures:

- Database compilation and validation
- Data conditioning (compositing and capping) for exploration data analysis
- Resource adjustment and validation.
- Assessment of "RPEEE" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

Resource Database

SRK reviewed the database provided by NORTON in Access format and conducted validation and removal of repeated samples. The database used for the resource estimation of the Bullant UG deposit consists of 18,066 drill holes.

The Bullant UG deposit database DS_Bullant Resources_UG contains 286,234 gold sample records. The topographic map for the area is based on the MGA94_51 coordinate system, with a 1:1,000 scale and 2 m contour intervals. These three mines are included as a single entity in the database due to their close spatial proximity to each other. All drill hole's location is shown in Figure 7-51, and the summary of the database is presented in Table 7-63.

Table 7-63: Summary of the Bullant UG Database

Hole Type	Hole Number	Profiles (m)	Assay Records
AC	176	8,330	2,938
BH	33	318	207
DD	1,632	218,913.34	98,532

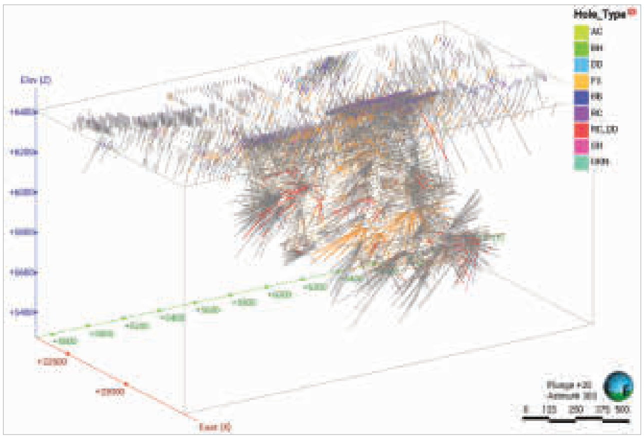
RB	658	27,329.3	7,732
RC	3,122	148,514.8	98,681
RC_DD	14	7,143.64	1,602
SH	118	1,554.86	1,473
UKN	92	702.2	621

Figure 7-51: Drilling Hole Location of the Bullant UG Deposit



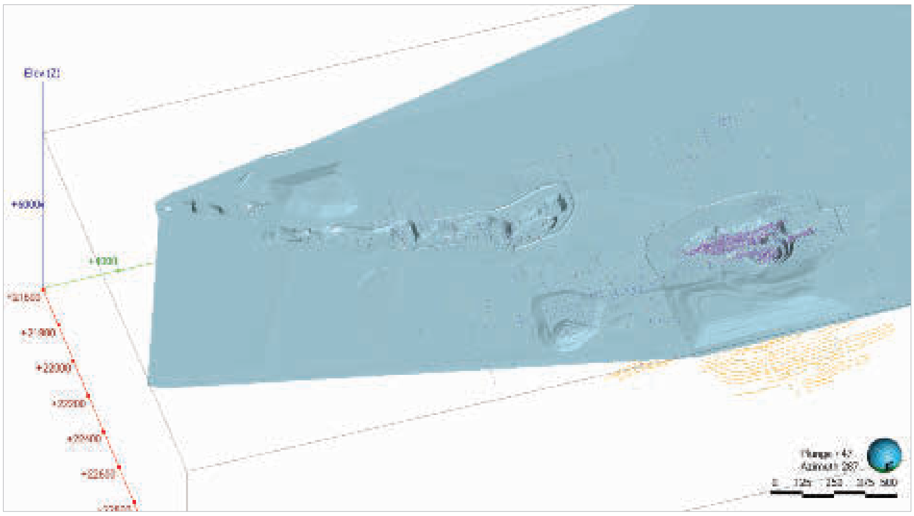
Source: SRK

SRK checked the drillhole database of the DS_Bullant Resource_UG. The collar, assay, lithological logs, and downhole survey data and loaded into Leapfrog for validation, which included:

- Checks for holes without samples
- Checks for duplicated samples
- Checks for correct collar positions
- Checks and adjustments the missing intervals

The latest topographic map of the Bullant UG deposit area is shown in Figure 7-52 below.

Figure 7-52: Current Topography of the Bullant UG Deposit

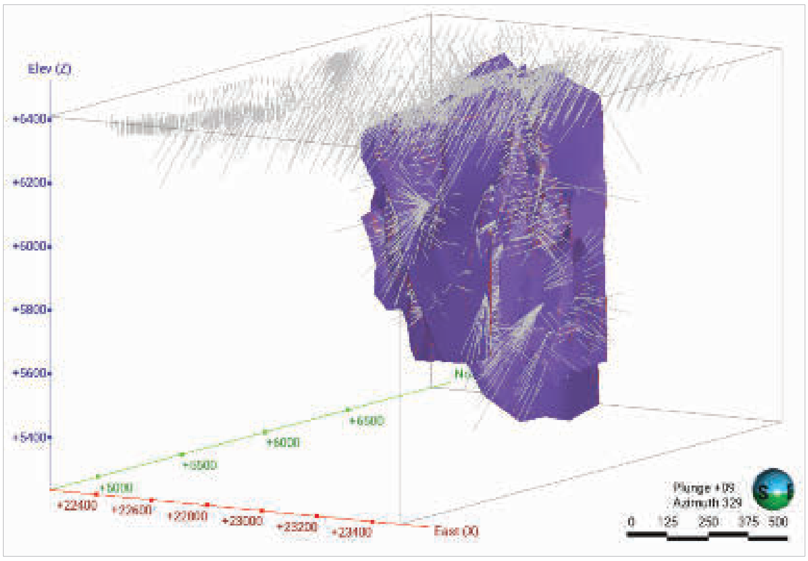


Solid Body Modelling

The high confidence of the geological interpretation is based on geological knowledge acquired from detailed geological DC and RC logging, assay data, underground development backs and face mapping and pit mapping.

The Bullant deposit has been interpreted by Norton to have seven mineralised zones which have been wireframed in Surpac software as closed solids. These zones were sometimes split by the west dipping fault and cross fault. Solids representing mineralised envelopes were built from points snapped directly to drill hole intersection. The underground development mapping was also utilized to aid in understanding of geometry of mineralised zones and faults. A down-hole gold grade cut off of 1 g/t was used for creating wireframes. The location of the mineralised veins is shown in Figure 7-53.

Figure 7-53: 3D View of the Mineralised Bodies of the Bullant UG Deposit



Source: SRK

Specific Gravity

In situ-bulk densities (dry basis) applied to the resource estimate were based on systematic test work completed on hand specimens and DC for selected material types. The ISBD determination method is based on a water immersion technique. The ISBD test work reconciles against production tonnages from historic and current mining operations within the project area. Samples porous were sealed by various methods and accounted for in the bulk density calculation.

The density data for Bullant deposit has been compiled by Placer Dome, Barrick and KMC (2010-2012) using diamond drilling and stockpile sampling.

To determine bulk density of each sample a gravimetric method (Archimedes Principal) has been used, where samples are first weighed in air, then in water and a bulk density is calculated. The moisture contains was also determined from stockpile sampling. Each sample, approximately 10kg was after collection sealed in a plastic bag before being sent to the laboratory. Collected information was used to confirm the density of fresh rock at Bullant being 2.78-2.8 t/m³.

The bulk density values applied in the evaluation process vary according to lithological and weathering states, as follows:

- Oxide: 1.85 g/cm³
- Transitional: 2.3 g/cm³
- Fresh/Primary: 2.80 g/cm³

This systematic approach ensures that density values adequately account for the variability in materials and provide reliable inputs for the resource model.

Compositing

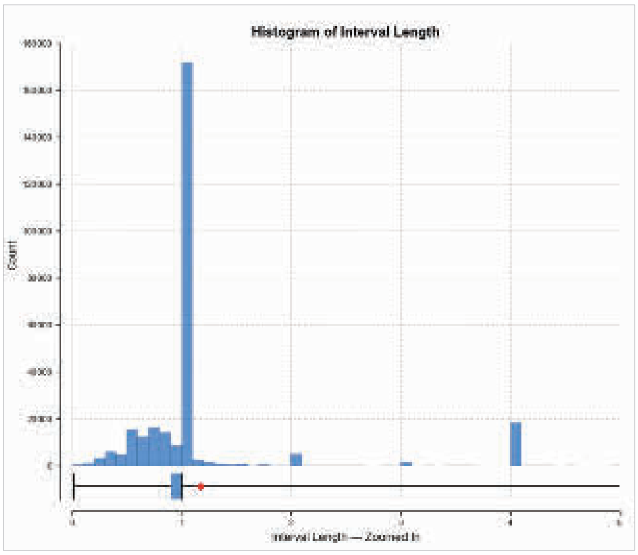
Sample intervals for the deposits are variable due to different drilling techniques. Throughout the Bullant UG deposit, sample intervals for RC are generally 1 m to 4 m and DC from 0.2 m to 1 m. The statistical analysis of sample lengths in the database indicates that the majority of samples have a length of 1 m, as shown in Figure 7-54.

A 2 m length composite was applied for the Bullant UG deposit to reduce variability and reflect the current smallest mining unit ("SMU"). The statistics for the sample length are shown in Table 7-64.

Table 7-64: Statistics of the Sample Length of the Bullant UG Deposit

Deposit	Samples	Minimum value	Maximum value	Mean	Median	Standard deviation	Skewness
Bullant UG	48,021	0.10	6.00	0.76	0.80	0.38	48,021

Figure 7-54: Histogram of Sample Length for the Bullant UG Deposit



Source: SRK

Evaluation of Outliers

The statistics for each domain were viewed and key univariate statistical indicators used to describe the nature of each. Each of the population of the composite data from the Bullant mineralised domains was positively skewed and showed number of high-grade outliers, which is typical of gold deposits.

Given the large number of domains involved across the deposits, SRK selected three representative domains for outliers' statistical analysis and graphical presentation. Figure 7-55 to Figure 7-57 shows the histogram and probability distribution of samples within Domain 20, Domain 40 and Domain 43, respectively. The statistics of the capping values of those 3 domains is shown in Table 7-65.

Figure 7-55: Histograms and Probability Plot of the Domain 20

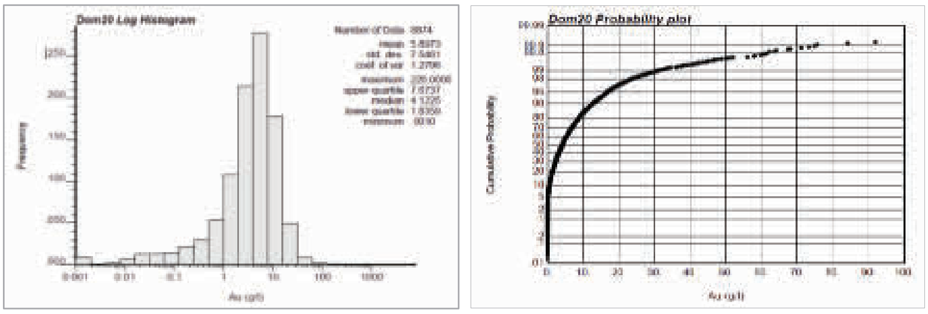


Figure 7-56: Histograms and Probability Plot of the Domain 40

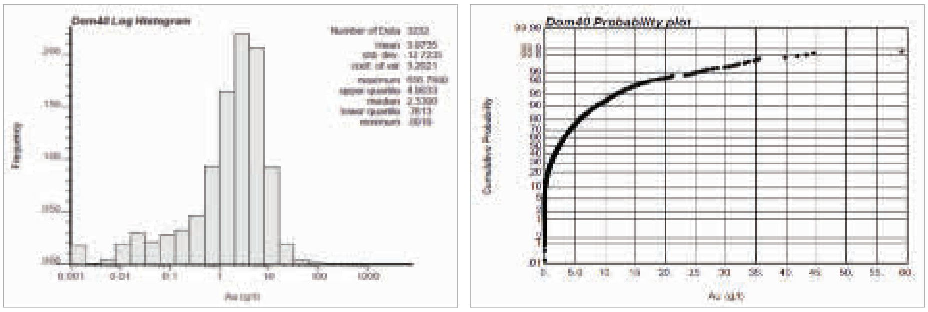

Figure 7-57: Histograms and Probability Plot of the Domain 43

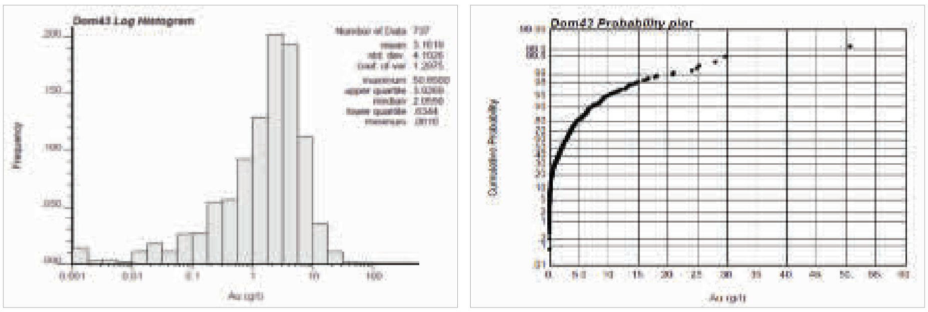

Table 7-65: Capping Values Statistics

Deposit	Domain	Assay Cap Au (g/t)	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t) Before Capping	Au Mean (g/t) After Capping
Bullant UG	Dom20	50	32	0.36%	5.89	5.79
	Dom40	35	11	0.34%	3.97	3.71
	Dom43	35	1	0.14%	3.16	3.14

Top-cut were determined by way of viewing grade distribution histograms and probability plots to determine what grade separated the outliers from the population. High-grade outliers were summary in Table 7-66.

Table 7-66: Top-cut Grade used in the Bullant UG Deposit

Domain	Top-Cut Grade (g/t Au)
20	50
21	50
30	35
40	41
41	31
42	41
43	50
70	50
80	50
82	50

Statistical Analysis and Variography

The domain wireframe was used to assign mineralisation domain code to the samples in the estimation dataset and statistical analyses were conducted for Au. Summary statistics for the raw samples and composite samples within the domain are presented in Table 7-67.

Table 7-67: Statistics of the Raw and Composite Samples

Deposit	Item	Raw Samples	Composites
Bullant UG	Number of samples	48,021	19,356
	Minimum value	0.001	0.001
	Maximum value	2128.68	656.78
	Mean	5.18	5.04
	Variance	220.37	63.82
	Standard Deviation	14.85	7.99
	Coefficient of variation	2.87	1.59

Spatial continuity was examined for each domain. In general, the experimental variograms were robust and well defined. Directions of continuity were similar to interpreted controls on mineralisation with varying degrees of anisotropy. The exponential variogram modelling structure of each domain for the Bullant UG Deposit of gold was shown in Table 7-68.

Table 7-68: Variogram Modelling Structures of the Bullant UG Deposit

Deposit	Domain	Bearing	Plunge	Dip	Major/Semi	Major/Minor	Nugget	Sill	Range
Bullant UG	20	185	40	85	2	5	0.25	0.75	40
	21	185	40	85	2	5	0.25	0.75	40
	30	185	40	85	1.1	5	0.25	0.75	20
	40	355	60	-85	1.6	5	0.25	0.75	20
	41	355	30	-85	1.6	5	0.25	0.75	20
	42	355	30	-85	1.6	5	0.25	0.75	20
	43	355	60	-85	1.6	5	0.25	0.75	20
	70	185	40	85	1.1	5	0.25	0.75	40
	80	210	40	85	1	5	0.25	0.75	40
	82	350	40	-85	1	5	0.25	0.75	40

Block Model and Grade Estimation

The block model sizes of the Bullant UG deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with dimensions of 5m × 4m × 10m (North × Easting × Elevation), see Table 7-69.

Table 7-69: Block Model Parameters of the Bullant UG Deposit

Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
Northing	5100	7700	5	2.5	0
Easting	22600	23200	4	0.25	0
Elevation	6500	8400	10	5	0

Sample search ellipses were set based on data spacing in similar orientation to the major mineralised orientation. Minimum and maximum samples were set for each sample search based on accepted levels of grade continuity. Search distances were based on sample spacing and spatial continuity.

Ordinary Kriging method of grade estimation was used utilising the variogram models. A total of 4 search passes were conducted with progressively relaxed search criteria to accommodate the data density from face sampling to the widest spaced drilling at 500m x 500m.

Grade estimations for Bullant UG were done using OK method for all mineralised zones by Norton. In all cases three passes were used for block estimation, and the search radius parameters used for each pass are listed in Table 7-70.

Table 7-70: Search Parameters for Each Domain of the Bullant UG Deposit

	3	80	4	8			
	4	120	2	6			

Model Validation

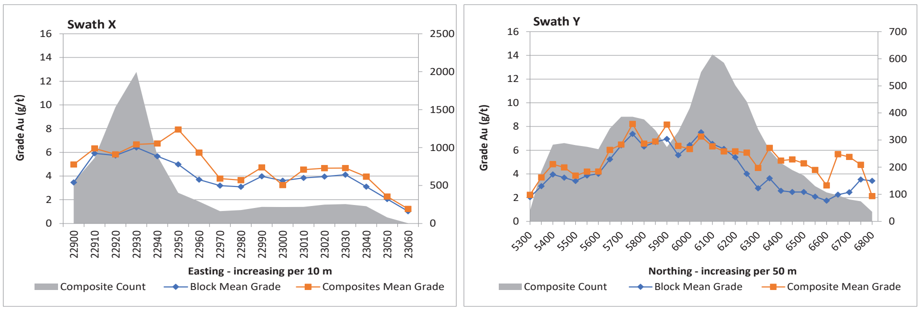
SRK undertook block model validation to confirm the reasonableness of the estimation parameters and estimation results. SRK adopted the following methods for the validation:

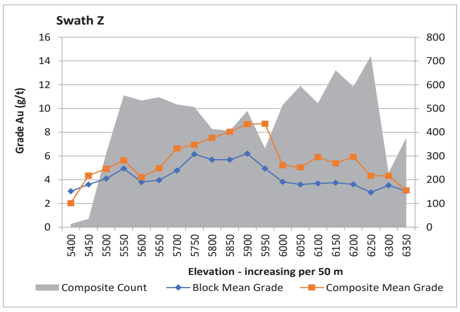
- Visual validation of block grades against drill hole grades; and
- Swath analysis.

SRK conducted visual validation of the longitudinal views and cross-section view of the drill holes and block model grades, which demonstrated good correlation between local block estimations and nearby samples, without excessive smoothing in the block model.

Figure 7-58 shows the swath plots of the Bullant UG Deposit in the east−west, north–south and elevation planes.

Figure 7-58: Swath Plot of the Bullant UG Deposit





Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralisation exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, the Bullant UG Deposit follows the JORC Code classification system with individual block classification being assigned using statistical methods .The Mineral Resource classification criteria is summarised in Table 7-71. And the distribution of Mineral Resource classification is presented in 3D view in Figure 7-59.

Table 7-71: Resource Classification Criteria used in the Estimation

Category	Variance	Drilling Density	Confidence
Measured (ResCat=1)	±10%	~20-25m spacing	High
Indicated (ResCat=2)	±20%	<40m x 40m spacing	High
Inferred (ResCat=3)	±40%-50%	40m x 40m to 100m x 100m	Moderate
Unclassified(ResCat=4)	>50%	>100m x 100m spacing	Low

Mineral Resource Statement

The 2012 Edition of the JORC Code defines a Mineral Resource as:

"(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories".

"All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…"

The "reasonable prospects for eventual economic extraction" requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Bullant UG deposit are amenable for underground mining.

The conceptual parameters used to estimate the cut-off grade for the Bullant UG deposit are summarised in Table 7-72.

Table 7-72: Assumptions Considered for the Bullant UG Deposit

Parameter	Fresh	Unit
Gold Price	2,700	US$ per ounce
Mining Cost	115	US$ per tonne mined
Processing	14	US$ per tonne of feed
General and Administrative	4	US$ per tonne of feed
Mining Dilution	5	Percent
Mining Loss	5	Percent
Process Recovery	95	Percent
In Situ Cut-Off-Grade	1.9	grams per tonne

Note:

[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024.

As of 31 December 2024, and at a cut-off grade of 1.9 g/t Au, the Mineral Resource of the Bullant UG deposit is presented in Table 7-73.

Table 7-73: Mineral Resource Statement[1], the Bullant UG Deposit, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Bullant UG	OX	Measured	6	6.49	38
		Indicated	57	3.77	214
		Inferred	32	5.92	189
	TR	Measured	4	4.92	17
		Indicated	80	3.54	282
		Inferred	13	3.22	43
	FR	Measured	997	4.95	4,934
		Indicated	1,786	3.59	6,411
		Inferred	2,141	3.62	7,749

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of 1.9g/t Au. The mined-out Mineral Resource was deducted during the Resources reporting

Grade Sensitivity Analysis

The mineral resources of the Bullant UG deposit are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources are presented in Table 7-74 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued as a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-60 presents this sensitivity as grade tonnage curves.

Table 7-74: Global Block Model Quantities and Grade Estimates[1], the Bullant UG Deposit Oxide Ore at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (kt)	Grade Gold (g/t)	Metal Content (kg)
1.2	6,715	3.33	22,363
1.3	6,511	3.39	22,074
1.4	6,241	3.48	21,720

7.3.2 Mineral Statement of the Carbine Project

The Mineral Resource Statement presented herein represents the Mineral Resource estimation prepared for the Norton Project in accordance with the JORC Code. The effective date of the Mineral Resource statement is 31 December 2024.

The database used to estimate the Norton Project Mineral Resources was audited by SRK. SRK is of the opinion that the current exploration information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

For each deposit model within the Carbine Project, a review process consistent with the methodology outlined in the preceding sections of this chapter has been applied. In assessing the "reasonable prospects for eventual economic extraction" for each deposit, assumptions were made based on actual production data, experience, and benchmarking against similar projects. An appropriate cut-off grades were selected, and pit shell optimization was undertaken where open pit mining is potentially applicable. Table 7-75 summarizes the cut-off grades adopted for the various deposits within the Carbine Project.

Table 7-75: Summary of Cut-off Grades for Individual Deposits – Carbine Project

Project	Deposit	Mining Method	Cut-off Grade		
			Oxide	Transitional	Fresh
Carbine	Wattlebird	Open Pit	0.20	0.30	0.30
	Bullant South	Open Pit	0.25	0.30	0.35
	Bullant West	Open Pit	0.25	0.30	0.35
	Breakaway Dam	Open Pit	0.20	0.30	0.30
	Bullant UG	Underground	1.90	1.90	1.90

As of 31 December 2024, the detail of Mineral Resource of the Carbine Project is presented in Table 7-76.

Table 7-76: Mineral Resource Statement [1] for the Carbine Project, as of 31 December 2024 by SRK Consulting China Ltd

7.4 Ora Banda Project

7.4.1 Gimlet South Deposit

Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Gimlet South deposit in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Apache deposit at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Gimlet South deposit Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The basic model was prepared by NORTON in GEOVIA Surpac software using conventional 3D block modelling and Multiple Indicator Kriging ("MIK") estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, geostatistics analysis, the grade interpolation as well as the resources classification, was completed by NORTON in 2024. An appropriate cut-off grade was selected by SRK, based on SRK's assumptions of the RPEEE which used a conceptual open pit to report the Mineral Resources.

Resource Estimation Procedures

Data provided by NORTON:

- Exploration Database, including collar, survey, assay (gold g/t), and lithological logs codes in Surpac format
- Composites, mineralised domains, weathering types, and topography in Surpac format
- Variogram models by GS3 format
- Mineral Resource model in Surpac format
- Mineral Resource model summary presentation

SRK major findings:

- The mineralised domain is constructed based on the geology and grade conditions; however, the deep extensions in certain areas are considered to have optimistic exploration potential, but these parts not defined resource categories

- According to SRK's visual checking, the gold mineralisation continuity is basically consistent with the block grade interpolation trend
- The variograms model used in the grade interpolation is reasonable
- The model validation gives an acceptable comparison between composites and block grades

Combining information provided by NORTON and SRK's findings, SRK chose the following data to form the basis for an independent review of the Mineral Resources.

- Current topography (gs_sg_mga_asmined_nat.dtm).
- Database provided by NORTON (gimlet_south_2020Nov.mdb)
- Mineralised domain (gimlet_south_2020nov.dtm)
- Variogram models
- Weathering type boundaries of oxide-transitional-fresh: Block model weathering type parameters, after validation based on the separation boundaries
- Block model (g_gimlet_mik2020nov_backfill_deplete_trim.mdl)

The section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK, as the following procedures:

- Database compilation and validation
- Data conditioning (compositing and capping) for exploration data analysis
- Resource adjustment and validation.
- Assessment of "RPEEE" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

Resource Database

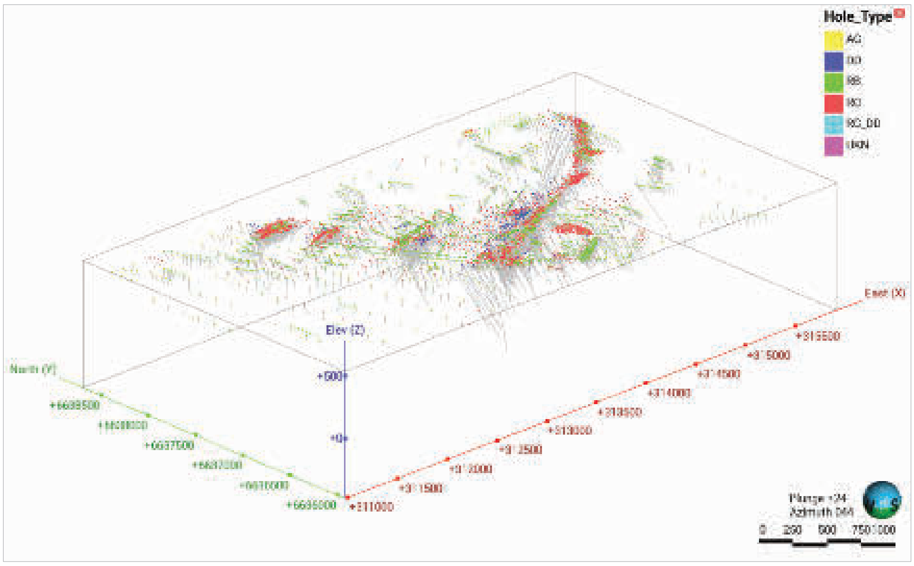
SRK reviewed the database provided by NORTON in Access format and conducted validation and removal of repeated samples. The database used for the resource estimation of the Gimlet South mine consists of 4,979 drill holes.

The Gimlet South database gimlet_south_2020 Nov contains 168,522 gold sample records. The topographic map for the area is based on the MGA94_51 coordinate system, with a 1:1,000 scale and 2 m contour intervals. These three mines are included as a single entity in the database due to their close spatial proximity to each other. All drill hole's location is shown in Figure 7-61, and the summary of the database is presented in Table 7-77.

Table 7-77: Summary of the Database Gimlet South

Hole Type	Hole Number	Profiles (m)	Assay Records
AC	33	920	399
DD	387	92,691.11	38,146
RB	2,427	88,355.74	40,518
RC	2,056	135,496	85,821
RC_DD	9	5354.53	3,277
UNK	4	333	4

Figure 7-61: Drilling Hole Location of the Database Gimlet South



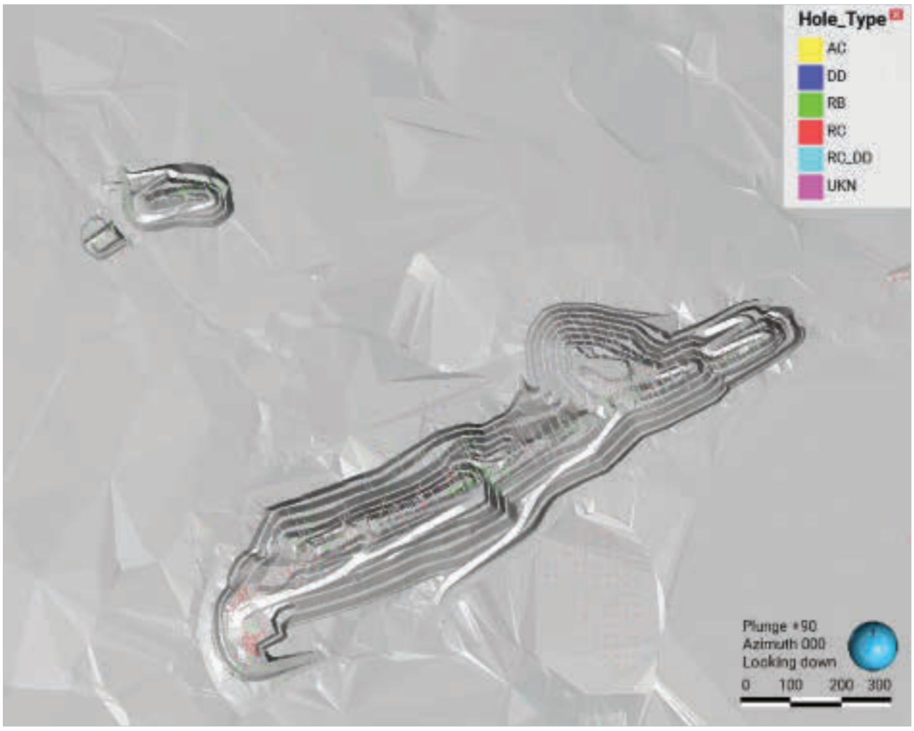
Source: SRK

SRK checked the drillhole database of the Gimlet South. The collar, assay, lithological logs, and downhole survey data and loaded into Leapfrog for validation, which included:

- Checks for holes without samples
- Checks for duplicated samples
- Checks for correct collar positions
- Checks and adjustments the missing intervals

The latest topographic map of the Gimlet South deposit area is shown in Figure 7-62 below.

Figure 7-62: Current Topography of the Gimlet South Deposit



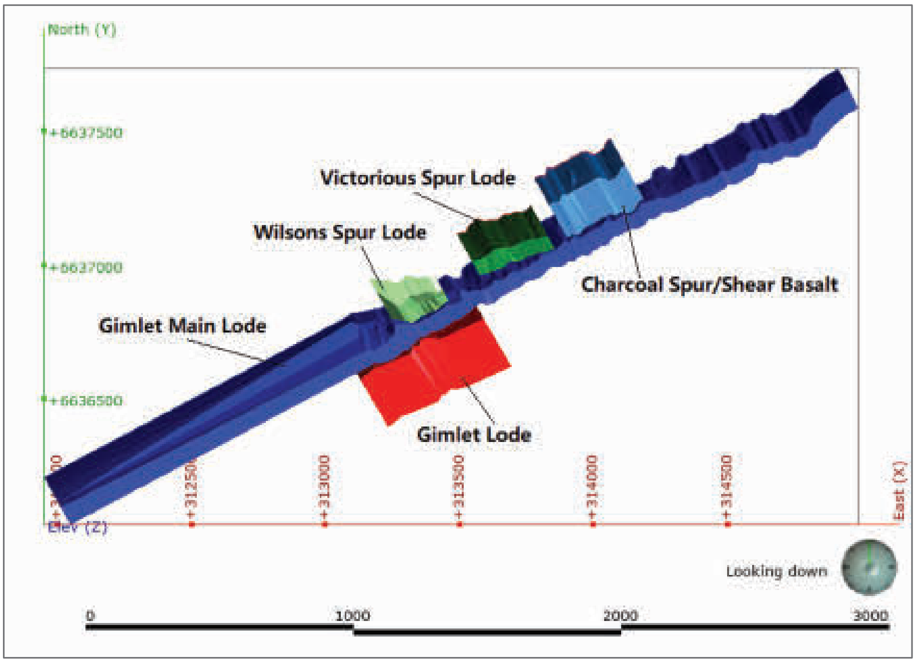
Source: SRK

Solid Body Modelling

The mineralised domain is a conceptual domain based on the geological interpretation and mineralised trends. 3D wireframes were created by sectional interpretation of the drilling dataset by Norton. Where there was geological uncertainty, domain boundaries were modelled to a 0.1 g/t Au lower cut. Domain boundaries were treated as soft boundaries.

Gold mineralisation at Gimlet South is hosted within a series of sub-parallel, steeply dipping structures, and generally orientated 65° dip -80° towards 315°. Mineralisation is predominantly developed within the geochemically favourable units of the pillowed VB and in some cases extends into the underlying BTB. The mineralisation has a strike extent of 3,300 m and a dip extent of 600 m, as shown in Figure 7-63.

Figure 7-63: 3D View of Mineralised Domains of the Gimlet South Deposit



Source: SRK

Specific Gravity

ISBD (dry basis) applied to the Mineral Resource estimate were based on systematic test work completed on hand specimens and DC for selected material types. The ISBD determination method is based on a water immersion technique. The ISBD test work reconciles against production tonnages from historic and current mining operations within the project area. Samples that were porous were sealed by various methods and accounted for in the bulk density calculation.

Individual bulk densities are applied in accordance with specific lithology, mineralisation and weathering states. The SG values used to inform the bulk density for the resource model are summarised in Table 7-78.

Table 7-78: Specific Gravity

Weathering/Lithology	Specific Gravity
Oxide	2.0
Transitional	2.4
Fresh/Primary	2.8
Dump/Fill	1.9

Compositing

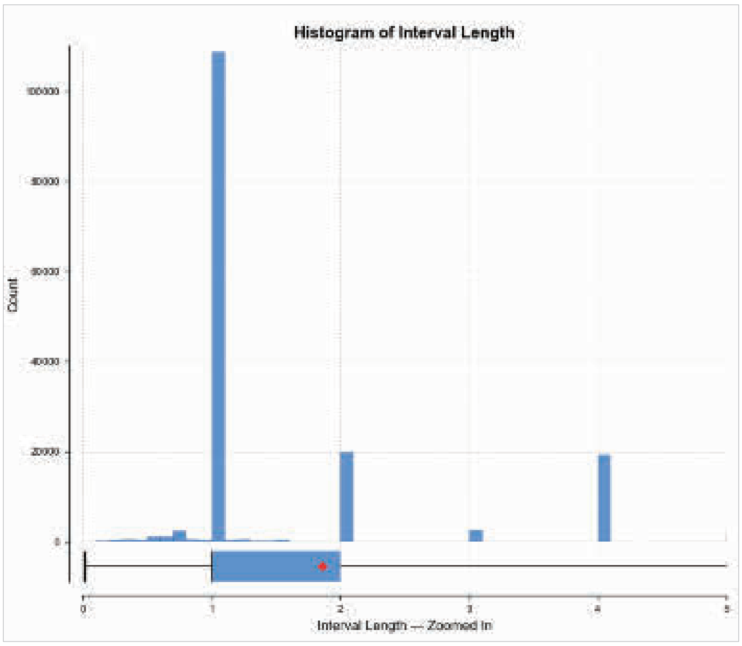
The distribution of core sample lengths is provided in Figure 7-64. The dataset indicates that about 70% of sample intervals are 1 m. Considering underground workings intercept 2.0 m downhole composites has been used for the estimation in Norton model to reduce variability and reflect current mining selective mining units ("SMU").

A 2 m length composite was applied for the Gimlet South deposit to reduce variability and reflect the current smallest mining unit ("SMU"). The basic statistics for raw and composite values are shown in Table 7-79.

Table 7-79: Statistics of the Sample Length of the Gimlet South Deposit

Deposit	Samples	Minimum value	Maximum value	Mean	Median	Standard deviation	Skewness
Gimlet South	55,905	0.05	279	1.98	1.0	6.35	18.93

Figure 7-64: Histogram of Core Length for the Gimlet South Deposit



Source: SRK

Evaluation of Outliers

Under the MIK estimation method, individual high-grade gold values do not have a direct impact on the estimated block grades, but indicator threshold values play an important role in managing the distribution of the outliers.

Statistical Analysis and Variography

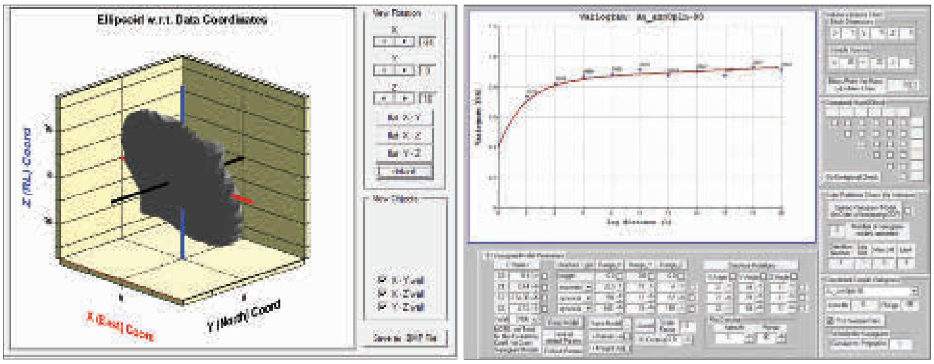
The domain wireframe was used to assign mineralisation domain code to the samples in the estimation dataset and statistical analyses were conducted for Au. Summary statistics for the raw samples within the domain are presented in Table 7-80.

Table 7-80: Statistics of the Raw and Composite Samples

Deposit	Item	Raw Samples	Composites
Gimlet South	Number of samples	55,905	34,649
	Minimum value	0	0
	Maximum value	358	154
	Mean	0.89	0.78
	Variance	16.36	9.35
	Standard Deviation	4.04	2.06
	Coefficient of variation	4.54	3.52

The Gimlet South composite dataset for each domain was divided into 14 indicator thresholds. The statistics for each indicator threshold were reviewed. Spatial continuity modelling was completed for each indicator threshold, within each domain, the typical variograms of total metal variogram is present in Figure 7-65. Directions of continuity were similar to interpreted controls on mineralisation with varying degrees of anisotropy.

Figure 7-65: The Variograms of the Total Metal for the Gimlet South Deposit



Source: SRK

Block Model and Grade Estimation

The block model sizes of the Gimlet South deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with dimensions of 20m × 20m × 5m (North × Easting × Elevation), the detailed parameters is presented in Table 7-81.

Table 7-81: Block Model Parameters of the Gimlet South Deposit

Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
Northing	6636000	6638500	20	20	0
Easting	311000	315500	20	20	0
Elevation	-200	520	5	5	0

Sample search ellipses were set based on data spacing in similar orientation to the major mineralised orientation. Minimum and maximum samples were set for each sample search based on accepted levels of grade continuity. Search distances were based on sample spacing and spatial continuity (see Table 7-82). A total of 3 search passes were conducted using GS3 resource modelling software with progressively relaxed search criteria to accommodate the data density from the closest to the widest spaced drilling at 80m x 80 m.

Table 7-82: Search Parameters for Each Domain of the Gimlet South Deposit

Domain	Search Radius (X)	Search Radius (Y)	Search Radius (Z)	Expansion Factor	Min DATA	Min Octants	Max DATA
2	25	15	20	0.9	16	4	48
3	25	20	20	0.9	16	4	48
4	25	20	20	0.9	16	4	48
5	25	20	20	0.9	16	4	48
8	50	50	10	0.3	16	4	48

Model Validation

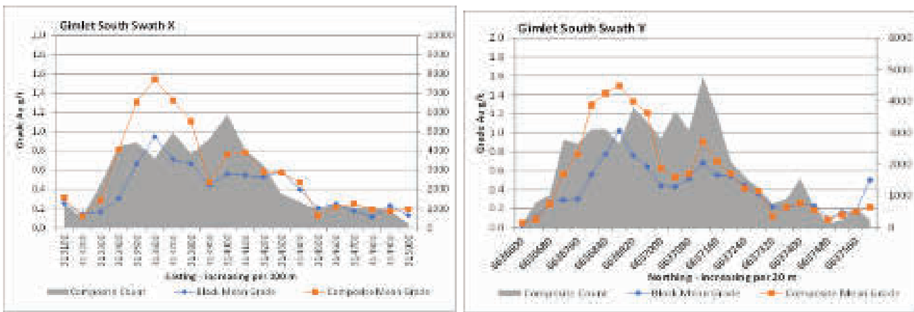
SRK undertook block model validation to confirm the reasonableness of the estimation parameters and estimation results. SRK adopted the following methods for the validation:

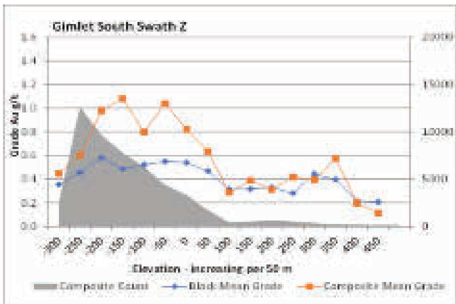
- Visual validation of block grades against drill hole grades; and
- Swath analysis.

SRK conducted visual validation of the longitudinal views and cross-section view of the drill holes and block model grades, which demonstrated good correlation between local block estimations and nearby samples, without excessive smoothing in the block model.

Figure 7-66 shows the swath plots of the Gimlet South Deposit in the east−west, north–south and elevation planes.

Figure 7-66: Swath Plots of the Gimlet South Deposit





Mineral Resource Classification

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

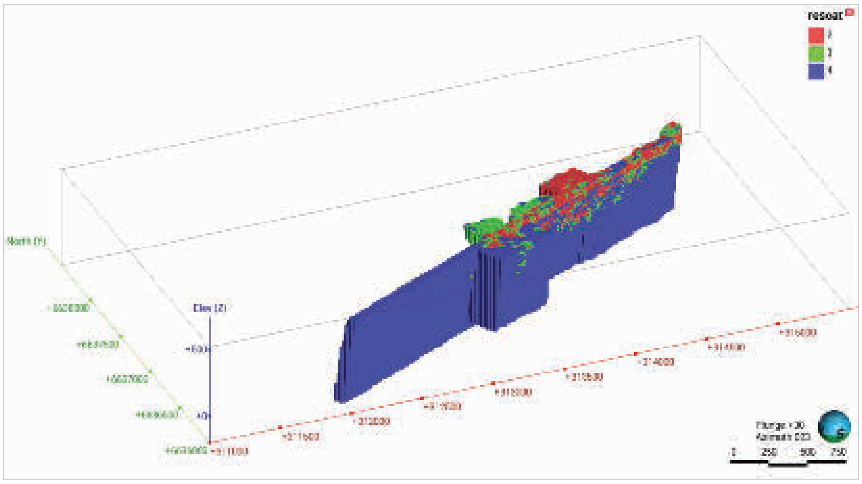
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralisation exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, the Gimlet South Deposit follows the JORC Code classification system with individual block classification being assigned using statistical methods and visually taking into account the following factors:

- Drill spacing and orientation
- Search parameters including search distance and number of informing samples
- Data quality, including the existence, availability and quality of QC
- Confidence of certain parts of the geological model.

THIS DOCUMENT IS IN DRAFT FORM, INCOMPLETE AND SUBJECT TO CHANGE AND THAT THE INFORMATION MUST BE READ IN CONJUNCTION WITH THE SECTION HEADED “WARNING” ON THE COVER OF THIS DOCUMENT.

Figure 7-67: Mineral Resource Classification of the Gimlet South Deposit



Source: SRK

Mineral Resource Statement

The 2012 Edition of the JORC Code defines a Mineral Resource as:

“(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth’s crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories”.

“All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…”

The “reasonable prospects for eventual economic extraction” requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Gimlet South deposit are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the Gimlet South deposit are summarised in Table 7-83.

Table 7-83: Assumptions Considered for the Gimlet South Deposit

Parameter	Oxide	Transitional	Fresh	Unit
Gold Price	2,700	2,700	2,700	US$ per ounce
Mining Cost	-	-	-	US$ per tonne mined
Processing	11.0	25.0	25.0	US$ per tonne of feed
General and Administrative	5.0	5.0	5.0	US$ per tonne of feed
Mining Dilution	15	15	15	Percent
Mining Loss	5	5	5	Percent
Process Recovery	90	90	90	Percent
In Situ Cut-Off-Grade	0.2	0.5	0.5	grams per tonne

Note:
[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024

As of 31 December 2024, and at a cut-off grade of 0.2g/t Au for the oxide, and 0.5g/t Au for the transitional and fresh, the Mineral Resource of the Gimlet South deposit is presented in Table 7-84.

Table 7-84: Mineral Resource Statement[1], the Gimlet South deposit, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Gimlet South	OX	Measured	453	0.52	237
		Indicated	320	0.51	162
		Inferred	0		0
	TR	Measured	1,120	1.16	1,303
		Indicated	376	1.05	394
		Inferred			
	FR	Measured	6,257	1.45	9,080
		Indicated	1,399	1.06	1,480
		Inferred	453	0.52	237

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of 0.2g/t Au for OX, 0.5 g/t Au for TR and FR. The mined-out Mineral Resource was deducted during the Resources reporting.

Grade Sensitivity Analysis

The mineral resources of the Gimlet South deposit are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources are presented in Table 7-85 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued as a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-68 presents this sensitivity as grade tonnage curves.

Table 7-85: Global Block Model Quantities and Grade Estimates[1], the Gimlet South Deposit at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (kt)	Grade Gold (g/t)	Metal Content (kg)

7.4.2 Mineral Resource Statement for the Ora Banda Project

The Mineral Resource Statement presented herein represents the Mineral Resource estimation prepared for the Norton Project in accordance with the JORC Code. The effective date of the Mineral Resource statement is 31 December 2024.

The database used to estimate the Norton Project Mineral Resources was audited by SRK. SRK is of the opinion that the current exploration information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

For each deposit model within the Ora Banda Project, a review process consistent with the methodology outlined in the preceding sections of this chapter has been applied. In assessing the "reasonable prospects for eventual economic extraction" for each deposit, assumptions were made based on actual production data, experience, and benchmarking against similar projects. An appropriate cut-off grades were selected, and pit shell optimization was undertaken where open pit mining is potentially applicable. Table 7-86 summarizes the cut-off grades adopted for the various deposits within the Ora Banda Project.

Table 7-86: Summary of Cut-off Grades for Individual Deposits – Ora Banda Project

Project	Deposit	Mining Method	Cut-off Grade		
			Oxide	Transitional	Fresh
Ora Banda	Enterprise West	Open Pit	0.20	0.30	0.30
	North Sandalwood	Open Pit	0.20	0.30	0.30
	Sleeping Beauty	Open Pit	0.20	0.30	0.30
	Tom Allen	Open Pit	0.20	0.30	0.30
	Enterprise UG	Underground	1.55	1.55	1.55
	Gimlet South	Open Pit	0.20	0.50	0.50
	Gimlet South UG	Underground	2.55	2.55	2.55

As of 31 December 2024, the detail of Mineral Resource of the Ora Banda Project is presented in Table 7-87.

Table 7-87: Mineral Resource Statement [1] for the Ora Banda Project, as of 31 December 2024 by SRK Consulting China Ltd

7.5 Golden Cities Project

7.5.1 Federal UG

Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Federal UG deposit in accordance with the JORC Code.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Apache deposit at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Federal UG deposit Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The basic model was prepared by NORTON in GEOVIA Surpac software using conventional 3D block modelling and Ordinary Kriging ("OK") estimation techniques.

The entire estimate procedure, consisting of database compilation, mineralised domains construction, geostatistics analysis, the grade interpolation as well as the resources classification, was completed by NORTON in 2024. An appropriate cut-off grade was selected by SRK, based on SRK's assumptions of the RPEEE which used a conceptual open pit to report the Mineral Resources.

Resource Estimation Procedures

Data provided by NORTON:

- Exploration Database, including collar, survey, assay (gold g/t), and lithological logs codes in Surpac format
- Composites, mineralised domains, weathering types, and topography in Surpac format
- Variogram models by Surpac format
- Mineral Resource model in Surpac format
- Mineral Resource model summary presentation

SRK major findings:

- The mineralized domain is constructed based on the geology and grade conditions; however, the deep extensions in certain areas are considered to have optimistic exploration potential, but these parts not defined resource categories

- According to SRK's visual checking, the gold mineralization continuity is basically consistent with the block grade interpolation trend
- The variograms model used in the grade interpolation is reasonable
- The model validation gives an acceptable comparison between composites and block grades

Combining information provided by NORTON and SRK's findings, SRK chose the following data to form the basis for an independent review of the Mineral Resources.

- Current topography (fedcpeomwk250201_2.dtm).
- Database provided by NORTON (DS_Federal.mdb)
- Mineralised domain (doms_all.dtm)
- Variogram models
- Weathering type boundaries of oxide-transitional-fresh: Block model weathering type parameters, after validation based on the separation boundaries
- Block model (fed_ug_feb2025.mdl)

The section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK, as the following procedures:

- Database compilation and validation
- Data conditioning (compositing and capping) for exploration data analysis
- Resource adjustment and validation.
- Assessment of "RPEEE" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

Resource Database

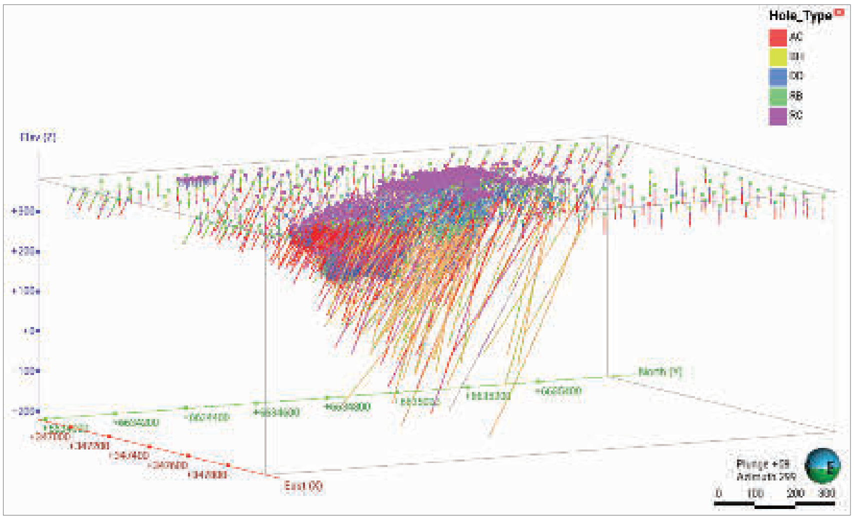
SRK reviewed the database provided by NORTON in Access format and conducted validation and removal of repeated samples. The database used for the resource estimation of the Federal UG mine consists of 3,373 drill holes.

The Federal UG database contains 155,621 gold sample records. The topographic map for the area is based on the MGA94_51 coordinate system, with a 1:1,000 scale and 2 m contour intervals. These three mines are included as a single entity in the database due to their close spatial proximity to each other. All drill hole's location is shown in Figure 7-69, and the summary of the database is presented in Table 7-88.

Table 7-88: Summary of the Database Federal UG

Hole Type	Hole Number	Profiles (m)	Assay Records
AC	5	02	56
BH	73	401.41	73
DD	155	46,295.38	25,691
RB	189	9,029	2,201
RC	2,866	159,182.4	127,599

Figure 7-69: Drilling Hole Location of the Database Federal UG



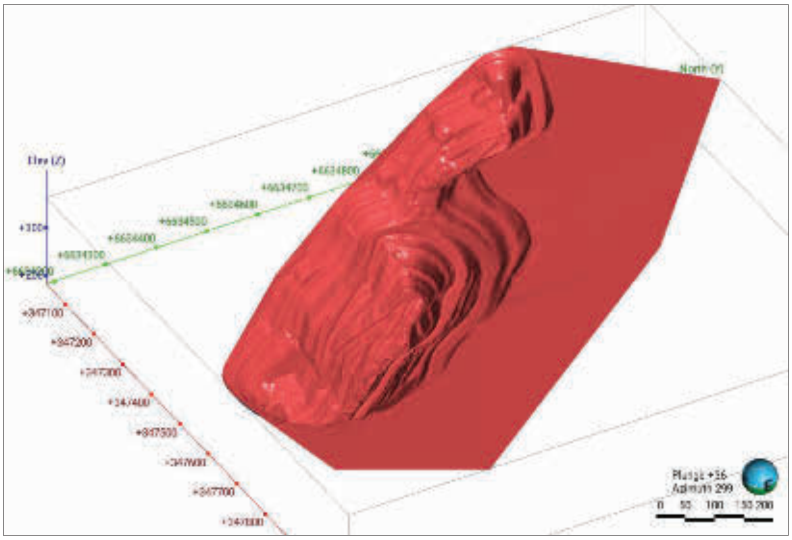
Source: SRK

SRK checked the drillhole database of the Federal UG deposit. The collar, assay, lithological logs, and downhole survey data and loaded into Leapfrog for validation, which included:

- Checks for holes without samples
- Checks for duplicated samples
- Checks for correct collar positions
- Checks and adjustments the missing intervals

The latest topographic map of the Federal UG deposit area is shown in Figure 7-70 below.

Figure 7-70: Current Topography of the Federal UG Deposit



Source: SRK

Solid Body Modelling

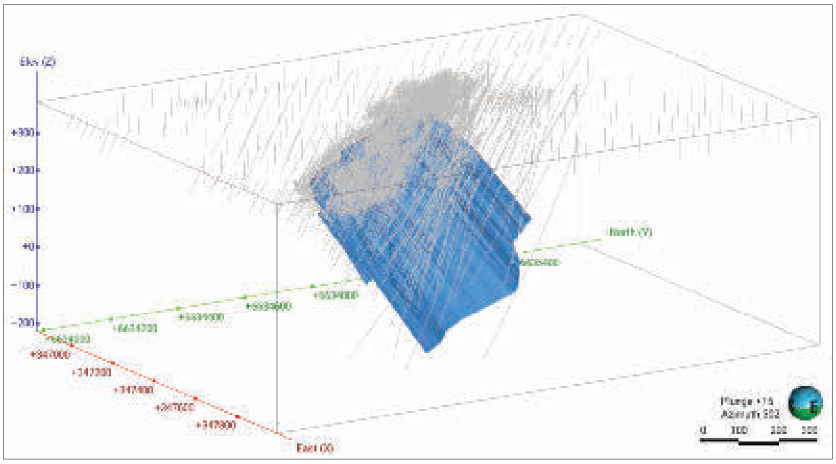
The geological interpretation is based on geological knowledge acquired from the open pit production data, detailed geological DC & RC logging, assay data & pit mapping.

The dataset (geological mapping, RC & DC logging, assays etc.) is considered acceptable for determining a geological model. Key interpretation assumptions made for this estimation are: (1) where geological relationships were interpreted but not observed; & (2) the interpretation of the mineralisation past known drilling limits (extrapolated a reasonable distance considering geological & grade continuity – not more than the maximum drill spacing).

The geological interpretation is specifically based on identifying alteration, sulphide mineralisation & quartz veining to define the mineralised envelope. The Tertiary boundary & regolith boundaries are also identified, assisting with interpreting secondary mineralisation processes.

The Federal gold mineralization is highly variable within three different mineralization styles observed: supergene gold enriched zones in the regolith and the primary mineralisation is localized within a NW-striking, NE dipping (315/60) shear zone, spatially located between 347,600mE & 349,050mE & 6,633,600mN to 6,635,800mN (MGA94 zone51). Gold variability within the lode is high. The deposit has a known strike length of 1400m & a dip extent of >450m (starting from 330mRL), as shown in Figure 7-71.

Figure 7-71: 3D View of Mineralized Domains of the Federal UG Deposit



Source: SRK

Specific Gravity

Total 1,745 density data point was collected which from 88 drill holes. These data return a both Mean and Median of 2.72 m^3/t. This density represents fresh granodiorite. For oxide, transitional Bulk Density values have been derived from empirical values.

ISBD (dry basis) applied to the Mineral Resource estimate were based on systematic test work completed on hand specimens and DC for selected material types. The ISBD determination method is based on a water immersion technique. The ISBD test work reconciles against production tonnages from historic and current mining operations within the project area. Samples that were porous were sealed by various methods and accounted for in the bulk density calculation.

Individual bulk densities are applied in accordance with specific lithology, mineralisation and weathering states. The SG values used to inform the bulk density for the resource model are summarised in Table 7-89.

Table 7-89: Specific Gravity

Weathering/Lithology	Specific Gravity
Oxide	2.0
Transitional	2.3 (Soft Trans), 2.5 (Hard Trans)
Fresh/Primary	2.7
Dump/Fill	2.0

Compositing

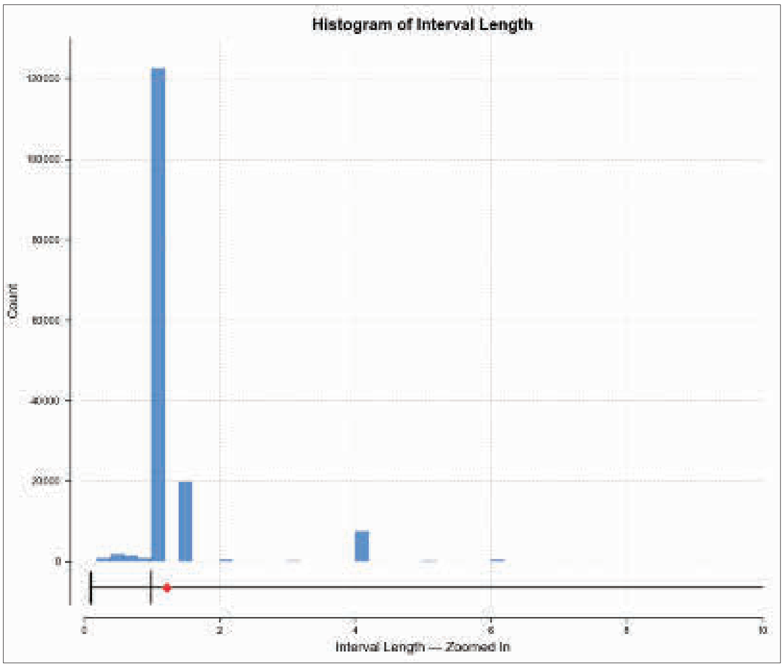
The distribution of core sample lengths is provided in Figure 7-72. The dataset indicates that about 70% of sample intervals are 1 m. Considering underground workings intercept 1.0 m downhole composites has been used for the estimation in Norton model to reduce variability and reflect current mining selective mining units ("SMU").

A 1 m length composite was applied for the Federal UG deposit to reduce variability and reflect the current smallest mining unit ("SMU"). The basic statistics for raw and composite values are shown in Table 7-90.

Table 7-90: Statistics of the Sample Length of the Federal UG Deposit

Deposit	Samples	Minimum value	Maximum value	Mean	Median	Standard deviation	Skewness
Federal UG	13,983	0.10	24.72	1.09	1.0	1.09	1.69

Figure 7-72: Histogram of Core Length for the Federal UG Deposit



Source: SRK

Evaluation of Outliers

The statistics for each domain were viewed and key univariate statistical indicators used to describe the nature of each. Each of the population of the composite data from the Federal UG mineralised domains was positively skewed and showed number of high-grade outliers, which is typical of gold deposits.

Given the large number of domains involved across the deposits, SRK selected three representative domains for outliers' statistical analysis and graphical presentation. Figure 7-73 to Figure 7-75 shows the histogram and probability distribution of samples within Domain 101, Domain 103 and Domain 104, respectively. The statistics of the capping values of those 3 domains is shown in Table 7-91.

Figure 7-73: Histograms and Probability Plot of the Domain 101

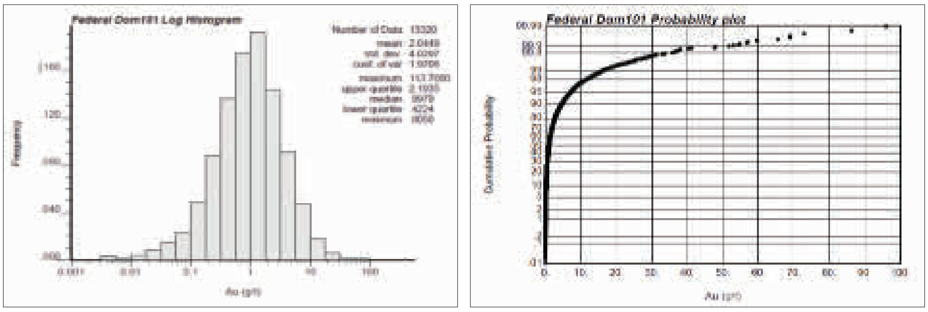


Figure 7-74: Histograms and Probability Plot of the Domain 103

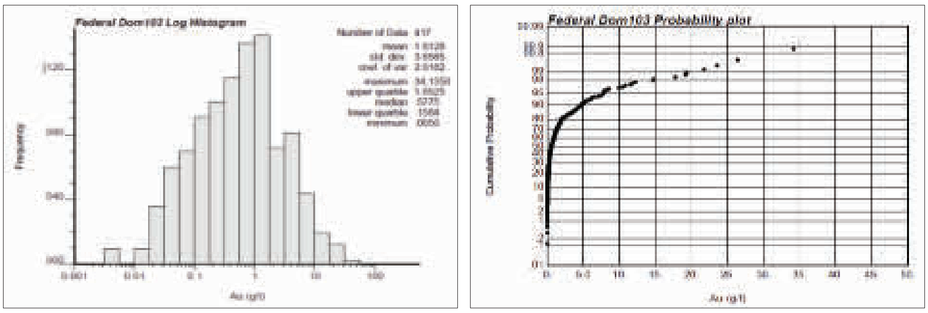

Figure 7-75: Histograms and Probability Plot of the Domain 104

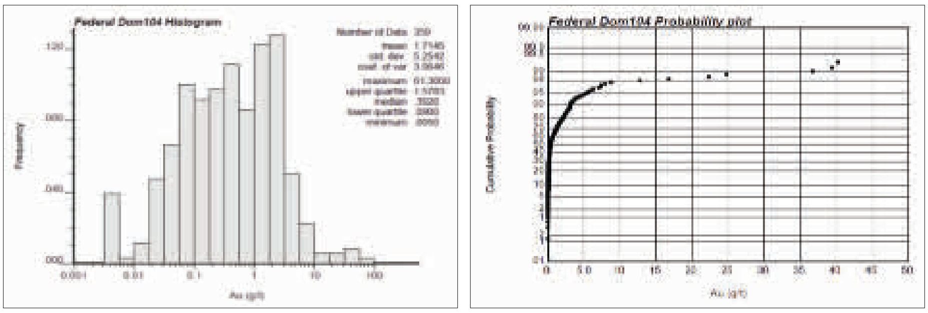

Table 7-91: Capping Values Statistics

Deposit	Domain	Assay Cap Au (g/t)	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t) Before Capping	After Capping
Federal UG	Dom101	20	89	0.67%	2.04	1.94

Deposit	Domain	Assay Cap Au (g/t)	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t) Before Capping	After Capping
	Dom103	10	14	2.97%	1.81	1.55
	Dom104	10	8	2.23%	1.71	1.23

Top-cut were determined by way of viewing grade distribution histograms and probability plots to determine what grade separated the outliers from the population. High-grade outliers were summary in Table 7-92.

Table 7-92: Top-cut Grade used in the Federal UG Deposit

Domain	Top-Cut Grade (g/t Au)
101	20
102	10
103	10
104	10
105	10
999	5

Statistical Analysis and Variography

The domain wireframe was used to assign mineralisation domain code to the samples in the estimation dataset and statistical analyses were conducted for Au. Summary statistics for the raw samples within the domain are presented in Table 7-93.

Table 7-93: Statistics of the Raw and Composite Samples

Deposit	Item	Raw Samples	Composites
Federal UG	Number of samples	13,829	14,306
	Minimum value	0	0.005
	Maximum value	187.06	113.7
	Mean	1.92	2.02
	Variance	19.84	17.03
	Standard Deviation	4.45	4.13
	Coefficient of variation	2.32	2.04

Spatial continuity was examined for each domain. In general, the experimental variograms were robust and well defined. Directions of continuity were similar to interpreted controls on mineralization with varying degrees of anisotropy. The exponential variogram modelling structure of each domain for the Federal UG Deposit of gold was shown in Table 7-94.

Table 7-94: Variogram Modelling Structures of the Federal UG

Deposit	Domain	Bearing	Plunge	Dip	Major/ Semi	Major/ Minor	Nugget	Sill	Range
Federal UG	all	320	0	-45	1.5	4	0.25	0.75	25

Block Model and Grade Estimation

The block model sizes of the Federal UG deposit chosen by NORTON to compromise between sample spacing and orientation of mineralisation were with dimensions of 10m × 4m × 10m (North × Easting × Elevation), the detailed parameters is presented in Table 7-95.

Table 7-95: Block Model Parameters of the Federal UG Deposit

Coordinate	Min	Max	User Block Size	Min Block Size	Rotation
Northing	6634220	6635460	10	2.5	-35
Easting	347990	348250	4	0.25	0
Elevation	-180	420	10	2.5	0

Sample search ellipses were set based on data spacing in similar orientation to the major mineralized orientation. Minimum and maximum samples were set for each sample search based on accepted levels of grade continuity. Search distances were based on sample spacing and spatial continuity (see Table 7-96). A total of 4 search passes were conducted using Surpac resource modelling software with progressively relaxed search criteria to accommodate the data density from the closest to the widest spaced drilling at 150m x 150 m.

Table 7-96: Search Parameters for Each Domain of the Federal UG Deposit

Domain	Pass	Search Distance (m)	Minimum Samples	Maximum Sample	Search Dir 1	Search Dir 2	Search Dir 3
101,102,103, 104,105,999	1	30	16	30	320	0	-45
	2	60	12	25			
	3	100	8	20			
	4	150	2	15			

Model Validation

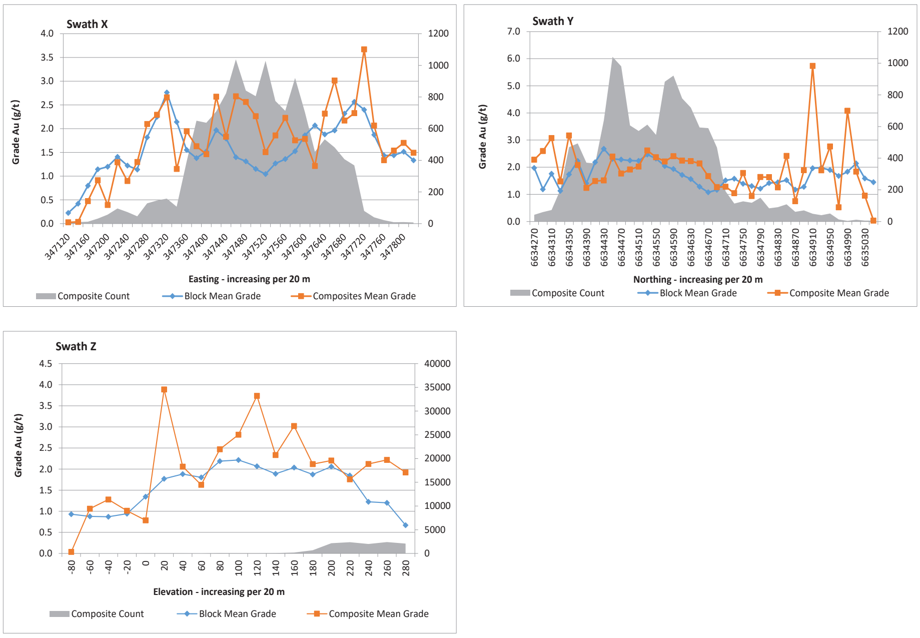
SRK undertook block model validation to confirm the reasonableness of the estimation parameters and estimation results. SRK adopted the following methods for the validation:

- Visual validation of block grades against drill hole grades; and
- Swath analysis.

SRK conducted visual validation of the longitudinal views and cross-section view of the drill holes and block model grades, which demonstrated good correlation between local block estimations and nearby samples, without excessive smoothing in the block model.

Figure 7-76 shows the swath plots of the Federal UG Deposit in the east−west, north–south and elevation planes.

Figure 7-76: Swath Plots of the Federal UG Deposit



Mineral Resource Classification

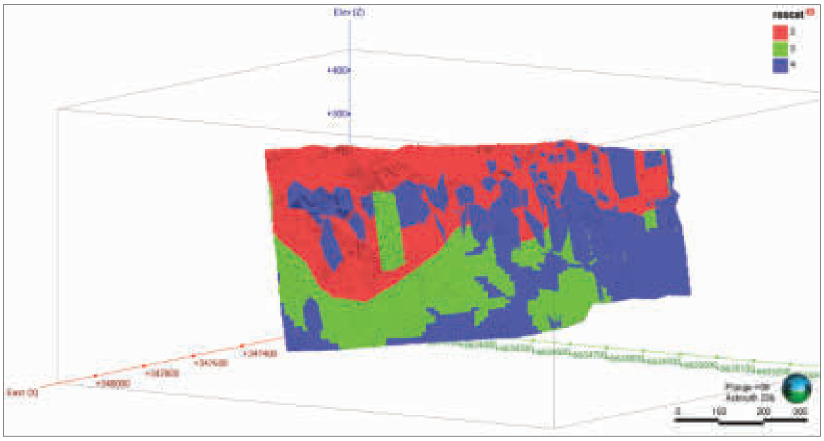
Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, the Federal UG Deposit follows the JORC Code classification system with individual block classification being assigned using statistical methods and visually taking into account the following factors:

- Drill spacing and orientation
- Search parameters including search distance and number of informing samples
- Data quality, including the existence, availability and quality of QC
- Confidence of certain parts of the geological model.

Figure 7-77: Mineral Resource Classification of the Federal UG Deposit



Source: SRK

Mineral Resource Statement

The 2012 Edition of the JORC Code defines a Mineral Resource as:

"(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories".

"All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…"

The "reasonable prospects for eventual economic extraction" requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Federal UG deposit are amenable for underground mining.

The conceptual parameters used to estimate the cut-off grade for the Federal UG deposit are summarised in Table 7-97.

Table 7-97: Assumptions Considered for the Federal UG Deposit

Parameter	Oxide	Transitional	Fresh	Unit
Gold Price	2,700	2,700	2,700	US$ per ounce

Parameter	Oxide	Transitional	Fresh	Unit
Mining Cost	110	110	110	US$ per tonne mined
Processing	18	18	18	US$ per tonne of feed
General and Administrative	5	5	5	US$ per tonne of feed
Mining Dilution	5	5	5	Percent
Mining Loss	5	5	5	Percent
Process Recovery	93	93	93	Percent
In Situ Cut-Off-Grade	2.1	2.1	2.1	grams per tonne

Note:

[1] The price refers to the long-term prediction published by Consensus Market Forecasts in Dec 2024

As of 31 December 2024, and at a cut-off grade of 2.1 g/t Au for the oxide, transitional and fresh, the mineral resource of the Federal UG deposit is presented in Table 7-98.

Table 7-98: Mineral Resource Statement[1], the Federal UG deposit, SRK Consulting China Limited, 31 December 2024[2]

Deposit	Ore Type	Category	Tonnage (kt)	Au (g/t)	Au Metal Contained (kg)
Federal UG	TR	Indicated	1	2.44	3
	FR	Indicated	1,226	3.2	3,928
		Inferred	147	2.74	404

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a Fellow of the AusIMM and a Chartered Professional Geologist (CP. Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported on an in-situ basis based typically on modelling cut-offs of Au 2.1 g/t for OX, TR and FR. The mined-out Mineral Resource was deducted during the Resources reporting.

Grade Sensitivity Analysis

The mineral resources of the Federal UG deposit are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the block model quantities and grade estimates within the conceptual pit used to constrain the mineral resources are presented in Table 7-99 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued as a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-78 presents this sensitivity as grade tonnage curves.

Table 7-99: Global Block Model Quantities and Grade Estimates[1], the Federal UG Deposit Fresh Ore at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (Mt)	Grade Gold (g/t)	Metal Content (t)
1.6	1.46	3.15	4.61
1.8	1.46	3.15	4.61
2.0	1.46	3.15	4.61
2.2	1.35	3.23	4.36
2.4	1.13	3.42	3.85
2.6	0.95	3.59	3.42
2.8	0.80	3.76	2.99

Cut-off Grade Gold (g/t)	Quantity (Mt)	Grade Gold (g/t)	Metal Content (t)
3.0	0.63	3.99	2.52
3.2	0.51	4.2	2.13
3.4	0.41	4.41	1.82
3.6	0.33	4.66	1.52
3.8	0.27	4.87	1.29
4.0	0.22	5.07	1.12

Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

7.5.2 Mineral Resource Statement for the Golden Cities Project

The Mineral Resource Statement presented herein represents the Mineral Resource estimation prepared for the Norton Project in accordance with the JORC Code. The effective date of the Mineral Resource statement is 31 December 2024.

The database used to estimate the Norton Project Mineral Resources was audited by SRK. SRK is of the opinion that the current exploration information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

For each deposit model within the Golden Cities Project, a review process consistent with the methodology outlined in the preceding sections of this chapter has been applied. In assessing the "reasonable prospects for eventual economic extraction" for each deposit, assumptions were made based on actual production data, experience, and benchmarking against similar projects. An appropriate cut-off grades were selected, and pit shell optimization was undertaken where open pit mining is potentially applicable. Table 7-100 summarizes the cut-off grades adopted for the various deposits within the Golden Cities Project.

Table 7-100: Summary of Cut-off Grades for Individual Deposits – Golden Cities Project

Project	Deposit	Mining Method	Cut-off Grade		
			Oxide	Transitional	Fresh
Golden Cities	Havana	Open Pit	0.20	0.20	0.30
	Hughes	Open Pit	0.25	0.30	0.40
	Tregurtha South	Open Pit	0.25	0.30	0.40
	Tregurtha	Open Pit	0.25	0.30	0.40
	Mulgarrie	Open Pit	0.20	0.30	0.30
	Federal UG	Underground	2.10	2.10	2.10

As of 31 December 2024, the detail of Mineral Resource of the Golden Cities Project is presented in Table 7-101.

Table 7-101: Mineral Resource Statement [1] for the Golden Cities Project, as of 31 December 2024 by SRK Consulting China Ltd

Notes:

1 All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

2 The information in this report which relates to Mineral Resource is based on information compiled by Mr. Zhuanjian Liu and Dr Yiefei Jia who are full time employees of SRK Consulting China Ltd. Mr. Liu is a member of AIG and Dr Jia is a fellow of AusIMM and a Chartered Professional Geologist. Both have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

3 The mined-out Mineral Resource was deducted during the Resources reporting.

7.6 Stockpile

NGF has reported multiple stockpiles. As of 31 December 2024, the estimated Mineral Resources for Stockpile are presented in Table 7-102.

Table 7-102: Stockpile Mineral Resource Statement, as of 31 December 2024

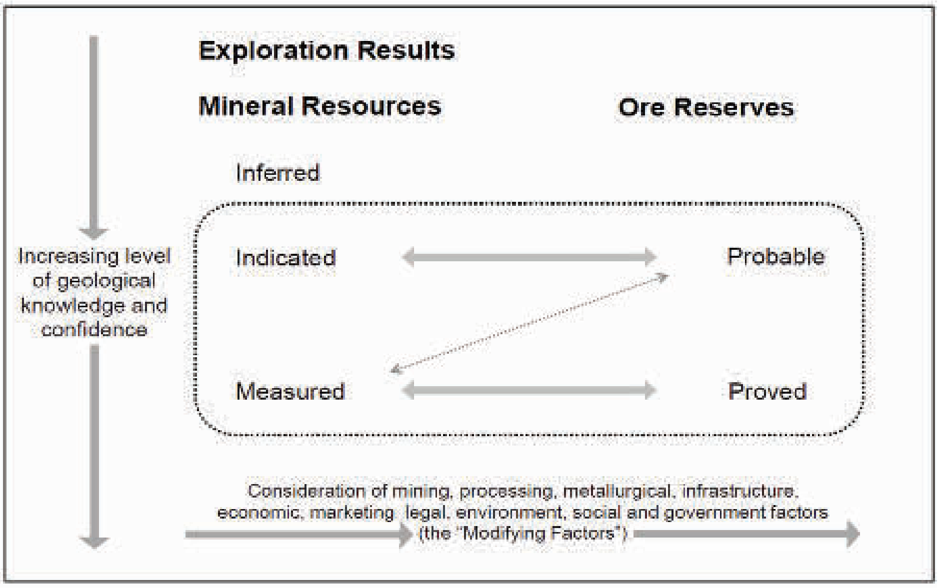
8 Ore Reserve Estimates

The definition of Ore Reserves in accordance with the JORC Code (2012) is as follows:

An 'Ore Reserve' is the economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.

The conversion from Mineral Resources to is Ore Reserves is presented in Figure 8-1.

Figure 8-1: General Relationship between Mineral Resources and Ore Reserves



Sources: JORC Code (2012)

The Ore Reserves for the Mines have been estimated by SRK in compliance with the JORC Code guidelines. These estimates are based on technical studies and operational data, with the work conducted to a pre-feasibility study standard, ensuring a reliable assessment of the project's economic and technical viability.

8.1 Open Pit Mining

8.1.1 Source of Information

The major files and information provided by NGF are listed below:

- Technical Studies and Business Case Assessment
  - Pre-Feasibility Study (PFS) for the Binduli Gold Mine Project, conducted by Zijin (Xiamen) Engineering CO., LTD in May 2025 (hereafter referred to as PFS Binduli 2025)
  - Pre-Feasibility Study (PFS) for the Paddington Gold Mine Project, conducted by Zijin (Xiamen) Engineering CO., LTD in May 2025 (hereafter referred to as PFS Paddington 2025)
  - Economic Assessment Report for the Binduli Gold Mine Heap Leach Project, conducted by Zijin (Xiamen) Engineering CO., LTD in Nov 2021 (hereafter referred to as EA Binduli 2021)
  - Feasibility Study (FS) for the Flotation in Paddington Gold Mine Project, conducted by Zijin (Xiamen) Engineering CO., LTD in Feb 2021 (hereafter referred to as FS Paddington 2021)
  - Business Case Assessment of Karren Louise Pit Mining, conducted by NGF in Dec 2024 (hereafter referred to as BC Karren Louise 2024)
  - Business Case Assessment of Janet Ivy Pit Mining, conducted by NGF in Feb 2025 (hereafter referred to as BC Janet Ivy 2025)
  - Business Case Assessment of Havana Pit Mining, conducted by NGF in Mar 2023 (hereafter referred to as BC Havana 2023)
  - Business Case Assessment of Apache Pit Mining, conducted by NGF in May 2024 (hereafter referred to as BC Apache 2024)
- Design and schedules
  - Open Pit Design and Schedule Version 1 in Deswik Software, conducted by NGF ("NGF Master Sched No Inferred Ore.duf" and "NGF Master Sched No Inferred Ore.dsf")
  - Open Pit Design and Schedule Version 2 in Deswik Software, conducted by NGF ("NGF MAY 13W LOA Integrated.duf" and "NGF MAY 13W LOA Integrated.dsf")
  - Blending Strategy in Excel Spreadsheet, conducted by NGF ("ENGF 13W LOA V5 BLEND OUTPUT.xlsx")
- Others
  - NGF Resource & Reserve Statement, conducted by NGF (hereafter referred to as R&R Statement 2024)
  - Cut-off Grade Calculation in Excel Spreadsheet, conducted by NGF
  - EOY 2024 Stockpile in Excel Spreadsheet, conducted by NGF
  - Equipment List in Excel Spreadsheet, conducted by NGF

SRK has reviewed the technical studies and all supportive data compiled for the Project. Based on the review, SRK considers the level of accuracy of the Modifying Factors, both as originally proposed within the various studies and/or as subsequently modified by NGF, to be akin to a PFS level. This established level of accuracy is considered suitable for the Ore Reserve Estimates.

8.1.2 Cut-off Grade

The Cut-off Grade ("COG") for gold in the Run-of-Mine ("ROM") feed has been calculated using the following formula by NGF based on the latest gold price.

$$COG = \frac{Mining\ Dilution \times Processing\ Cost}{Processing\ Recovery \times (Gold\ Price - Selling\ Cost)}$$

The parameters used in estimating the COG are detailed in Table 2-3. For practical application, the COG has been rounded up to the nearest 0.05.

It should be noted that the COG applied in the Ore Reserves statement is based on the LOM schedule conducted by NGF in July 2024, prior to the effective date of this report, 31 December 2024. SRK has reviewed the schedule against the current COG values presented in Table 8-1 and found no material differences.

Table 8-1: Cut-off Grade Estimate

Project	Deposit	Gold Price (USD/Oz)	Processing/ G&A/ Haulage Cost (USD/t)			Processing Recovery (%)			Selling Cost (USD/t)			Mining Dilution (%)	Cuf-off Grade (g/t)

8.1.3 Modifying Factors

In accordance with the JORC Code, the Measured and Indicated Mineral Resources are converted to Ore Reserves through the application of appropriate modifying factors. The primary factors considered in the Ore Reserve estimation include mining design, pit optimization, pit design, mining losses, and mining dilution. Additional parameters, such as processing capabilities, market conditions, and environmental, legal, and political constraints, are also taken into account, as these may impact the quantity and classification of the Ore Reserves.

The modifying factors applied to the Reserve estimates for the Binduli Project (Binduli area), Mt Pleasant Project (Greater Mt Pleasant area and Lady Bountiful area), Carbine Project (Carbine area), Ora Banda Project (Ora Banda area), and Golden Cities Project (Golden Cities area, Mulgarrie area, and Mt Jewell area) are listed as below:

- Mining Method:
  - The Ore Reserve is constrained within the boundaries of the mining license.
  - The Ore Reserve is based on open-pit mining methods.
  - Only Measured and Indicated Mineral Resources, along with ore in the stockpile, are included in the Ore Reserve estimate
- Pit Optimization:
  - Pit optimization incorporates mining costs, processing expenses, general and administrative costs, gold price, processing recovery rate, cost of sell, royalties, and overall slope angle.
  - The optimal pit shell is derived from the Measured and Indicated Resources to identify the economic surface mining potential.
- Pit Design:
  - Pit designs are guided by slope parameters, including bench height, batter face angle, berm width, minimum mining width, and haul road design, consistent with the results of optimization.
- Mining Dilution and Mining Loss:
  - Table 8-2 presents the dilution and ore loss for each project.

Table 8-2: Open Pit Mine Mining Dilution and Loss

Project	Deposit	Mining Dilution (%)	Mining Loss (%)
Binduli	Fort William	10%	5%

8.1.4 Open Pit Ore Reserve Estimation

SRK has estimated the Ore Reserves in compliance with the JORC Code guidelines. The Open Pit Ore Reserve Estimates in the NGF Project as of 31 December 2024, is in Table 8-3. The total Ore Reserve for Open Pit Mine in the NGF Project is estimated at 108,160 thousand tonnes ("kt") at an average grade of 0.77g/t Au, containing approximately 2,694 thousand ounces ("koz") of gold. This includes Proved Ore Reserve estimated at 3,692 kt with an average grade of 0.53 g/t Au, containing 62.40 koz of gold; and Probable Ore Reserve estimated at 104,468 kt at an average grade of 0.78 g/t Au, containing 2,632 koz of gold.

Table 8-3: Open Pit Ore Reserves Statement as of 31 December 2024

Project	Deposit	Category	Tonnage (kt)	Au Grade (g/t)	Contained Au Metal (koz)

Note:

[1] The information in this report which relates to Mineral Resource is based on information compiled by Ms. Tzuhsuan Chuang and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Ms Chuang is a member of AusIMM, Mr Falong Hu is a Fellow of AusIMM and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms Chuang, Mr Hu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

[2] The Ore Reserves for surface operations include open-pit mining and ROM pads.

[3] Proved and Probable Ore Reserves are reported on 100% basis.

[4] Total may not add due to rounding discrepancies

[5] The Ore Reserves are included in the Mineral Resources.

8.2 Underground Mining

8.2.1 Technical Studies and Data

The major files and information provided by NGF are listed below:

- Technical Studies
  - Pre-Feasibility Study (PFS) for the Binduli Gold Mine Project, conducted by Zijin (Xiamen) Engineering Co., Ltd. in May 2025 (hereafter referred to as PFS Binduli 2025)
  - Pre-Feasibility Study (PFS) for the Paddington Gold Mine Project, conducted by Zijin (Xiamen) Engineering Co., Ltd. in May 2025 (hereafter referred to as PFS Paddington 2025)
  - Economic Assessment Report for the Binduli Gold Mine Heap Leach Project, conducted by Zijin (Xiamen) Engineering., Ltd. in Nov 2021 (hereafter referred to as EA Binduli 2021)
  - Feasibility Study (FS) for the Flotation in Paddington Gold Mine Project, conducted by Zijin (Xiamen) Engineering Co., Ltd. in Feb 2021 (hereafter referred to as FS Paddington 2021)
  - Prefeasibility Geotechnical Study in Federal Underground Mine, conducted by Neotech Geotechnical Engineering in May 2024
- Design and schedules
  - Bullant Design and Schedule in Deswik Software, conducted by NGF ("Bullant_Live_Updated.dcf" and "Bullant_Live_Updated.dsf")
  - Enterprise Design and Schedule in Deswik Software, conducted by NGF ("UG_ENT_Live.duf" and "UG_ENT_Live.dsf")

- Tuart Design and Schedule in Deswik File, conducted by NGF ("Tuart_2+10.dcf" and "Tuart_2+10.dsf")
- Federal Design and Schedule in Deswik File, conducted by NGF ("Federal_1+11.duf" and "Federal_1+11.dsf")

- Others
  - NGF Resource & Reserve Statement, conducted by NGF (hereafter referred to as R&R Statement 2024)
  - Cut-off Grade Calculation in Excel Spreadsheet, conducted by NGF
  - EOY 2024 Stockpile in Excel Spreadsheet, conducted by NGF
  - Equipment List in Excel Spreadsheet, conducted by NGF
  - Ventilation Survey and Design in VentSim Software, conducted by NGF
  - Ground Control Management Plan ("GCMP") in Bullant Underground Mine, conducted by NGF in Feb 2025
  - GCMP in Enterprise Underground Mine, conducted by Twin Geotech in March 2023
  - GCMP in Tuart Underground Mine, conducted by NGF in March 2023

SRK has reviewed the technical studies and all supportive data compiled for the Project. Based on the review, SRK considers the level of accuracy of the Modifying Factors, both as originally proposed within the various studies and/or as subsequently modified by NGF, to be akin to a PFS level. This established level of accuracy is considered suitable for the Ore Reserve Estimates.

8.2.2 Cut-off Grade

The COG for gold in the ROM feed has been calculated using the following formula by NGF based on the latest gold price.

$$COG = \frac{Mining\ Cost + Non - Mining\ Cost}{Processing\ Recovery \times (Gold\ Price - Royalty\ Cost)}$$

The parameters used in estimating the COG are detailed in Table 2-3. For practical application, the COG has been rounded up to the nearest 0.05.

It should be noted that the COG applied in the Ore Reserves statement is based on the LOM schedule conducted by NGF in July 2024, prior to the effective date of this report, 31 December 2024. SRK has reviewed the schedule against the current COG values presented in Table 8-4 and found no material differences.

8.2.3 Modifying Factors

The following modifying factors are used to determine the Mineral Reserves.

- Mineable shapes for underground Ore Reserves were generated using the Deswik Stope Optimizer ("DSO") by NGF.
- Measured, Indicated Mineral and Inferred Resources were considered during Stope Optimization, but only Measured and Indicated Mineral Resource gold grade were considered as ROM, Inferred Resource gold grade was assigned as zero.
- Mining Dilution
  - Bullant Deposit: a minimum mining width ranging from 1.5 to 2.0 m, with a minimum stope pillar of 5 to 10 m. A dilution of 0.3 m is applied to each side of the stope.
  - Enterprise Deposit: a minimum mining width of 5 meters, with a minimum stope pillar of 10 m. A dilution of 0.3 m is applied to each side of the stope.
  - Tuart Deposit: a minimum mining width ranging from 1.5 to 2.0 m, with a minimum stope pillar of 6 to 10 m. A dilution of 0.3 m is applied to each side of the stope.
  - Federal Deposit: a minimum mining width of 2.0 m, with a minimum stope pillar of 10 m. A dilution of 0.3 m is applied to each side of the stope.
- Mining Ore Loss
  - Bullant Deposit: 10%

- Enterprise Deposit: 10%
- Tuart Deposit: 5% to 20%
- Federal Deposit: 10%

8.2.4 Underground Ore Reserve Estimation

SRK has estimated the Ore Reserves in compliance with the JORC Code guidelines. The Underground Ore Reserve Estimates in the NGF Project as of 31 December 2024 is in Table 8-5. The total Ore Reserve for Underground Mine in the NGF Project is estimated at 2,813 kt at an average grade of 2.81 g/t Au, containing approximately 254 koz of gold. This includes Proved Ore Reserve estimated at 1,182 kt with an average grade of 3.25 g/t Au, containing 123 koz of gold; and Probable Ore Reserve estimated at 1,631 kt at an average grade of 2.49 g/t Au, containing 130 koz of gold.

Table 8-5: Underground Ore Reserves Statement as of 31 December 2024

8.4 Combined Ore Reserves Statement

SRK has estimated the Ore Reserves for open pit and underground in compliance with the JORC Code guidelines. The Ore Reserve Estimates as of 31 December 2024 is in Table 8-7.

The total Ore Reserve for the NGF Project is estimated at 120,442 kt at an average grade of 0.79g/t Au, containing approximately 3,070 koz of gold. This includes Proved Ore Reserve estimated at 4,865 kt with an average grade of 1.19g/t Au, containing 186 koz of gold; and Probable Ore Reserve estimated at 115,577 kt at an average grade of 0.78g/t Au, containing 2,883 koz of gold.

Table 8-7: Ore Reserves Statement as of 31 December 2024

Hu is a Fellow of AusIMM and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms Chuang, Mr Hu and Dr Jia consents to the reporting of this information in the form and context in which it appears.

[2] The Ore Reserves for surface operations include open-pit mining and ROM pads.

[3] Proved and Probable Ore Reserves are reported on 100% basis.

[4] Total may not add due to rounding discrepancies

[5] The Ore Reserves are included in the Mineral Resources.

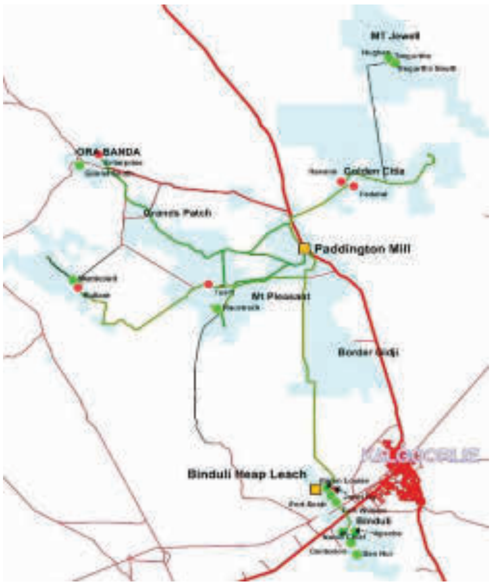
9 Mining Method

9.1 Introduction

The NGF Project encompasses eight distinct project areas, collectively comprising 24 deposits across both open pit and underground operations, which is shown in Figure 9-1. All deposits are underpinned by Pre-Feasibility Studies (PFSs), with some currently in production. For reporting purposes, SRK has grouped these into five primary projects: Binduli Project (Binduli area), Mt Pleasant Project (Greater Mt Pleasant area and Lady Bountiful area), Carbine Project (Carbine area), Ora Banda Project (Ora Banda area), and Golden Cities Project (Golden Cities area, Mulgarrie area, and Mt Jewell area).

The NGF Project utilizes two primary processing facilities: the Binduli Heap Leach and the Paddington Mill.

Figure 9-1: NGF Project Deposits and Processing Facilities Locations



Sources: NGF

Currently, the NGF Project operates as two distinct mining operations: the Binduli Mine and the Paddington Mine. The Binduli Mine, which encompasses the Binduli Project, directs all its Run-of-Mine ("ROM") material exclusively to the Binduli Heap Leach. Concurrently, the Paddington Mine, comprising the Mt Pleasant Project, Carbine Project, Ora Banda Project, and Golden Cities Project (collectively referred as the Paddington Mine), entirely processes its ROM material at the Paddington Mill Plant. At the Paddington Mill Plant, two distinct processing methods are employed: free milling, and refractory processing, which handles ROM material from the Gimlet South deposit (Ora Banda Project) and Racetrack deposit (Mt Pleasant Project).

Looking forward, NGF plans to integrate these two operations into a single, combined mining and processing complex. Under this proposed integrated strategy, ROM material from the Binduli Project area will be primarily processed at the Binduli Heap Leach; however, certain higher-grade ROM material will be directed to the Paddington Mill Plant. Conversely, ROM material from the Paddington Project areas will primarily be treated at the Paddington Mill Plant, with lower-grade ROM material being sent to the Binduli Heap Leach.

The Binduli Project comprises eight deposits, as illustrated in Figure 9-2.

- Fort William (Open Pit)
- Fort Scott (Open Pit)
- Karen Louise (Open Pit)
- Janet Ivy (Open Pit; in production)
- Navajo Chief (Open Pit; high-grade ROM planned for Paddington Mill)
- Centurion (Open Pit; high-grade ROM planned for Paddington Mill)
- Ben Hur (Open Pit; high-grade ROM planned for Paddington Mill)
- Apache (Open Pit; in production; high-grade ROM planned for Paddington Mill)

Figure 9-2: Binduli Project Deposit Locations - Plan View

Sources: NGF, summarized by SRK

The Greater Mt Pleasant and Lady Bountiful Project comprises four deposits, as illustrated in Figure 9-3.

- Racetrack (Open Pit)
- Black Flag (Open Pit; low-grade ROM planned for Binduli Heap Leach)

- Lady Bountiful (Open Pit; low-grade ROM planned for Binduli Heap Leach)
- Tuart (Underground; in production)

Figure 9-3: Greater Mt Pleasant and Lady Bountiful Project Deposit Locations - Plan View

Sources: NGF, summarized by SRK

The Carbine Project comprises three deposits, as illustrated in Figure 9-4.

- Wattlebird (Open Pit)
- Breakaway Dam (Open Pit)
- Bullant (Underground; in production)

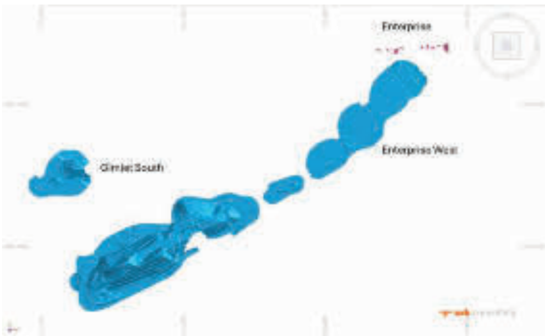
Figure 9-4: Carbine Project Deposit Locations - Plan View

Sources: NGF, summarized by SRK

The Ora Banda Project comprises three deposits, as illustrated in Figure 9-5.

- Gimlet South (Open Pit)
- Enterprise West (Open Pit; low-grade ROM planned for Binduli Heap Leach)
- Enterprise (Underground; in production)

Figure 9-5: Ora Banda Project Deposit Locations - Plan View



Sources: NGF, summarized by SRK

The Golden Cities, Mulgarrie and Mt Jewell Project comprises six deposits, as illustrated in Figure 9-6.

- Havana (Open Pit; in production; low-grade ROM planned for Binduli Heap Leach)
- Mulgarrie (Open Pit; low-grade ROM planned for Binduli Heap Leach)
- Hughes (Open Pit)

- Tregurtha South (Open Pit)
- Tregurtha (Open Pit)
- Federal (Underground)

Figure 9-6: Golden Cities, Mulgarrie and Mt Jewell Project Deposit Locations - Plan View

9.2 Open Pit Mining

9.2.1 Open Pit Status

The NGF Project currently utilizes both the Binduli Heap Leach plant and the Paddington Mill plant. ROM material from the Binduli Project is exclusively directed to the Binduli Heap Leach, while all ROM material from the Mt Pleasant Project, Carbine Project, Ora Banda Project, and Golden Cities Project is entirely processed at the Paddington Mill. Table 9-1 shows the historical three-year production in Binduli and Table 9-2 shows the historical three-year production in Paddington.

9.2.2 Geotechnical and Hydrological Considerations

Geotechnical Considerations

The rock mass in the NGF area is classified by degree of weathering into three zones: a completely weathered zone with a thickness of approximately 20 to 30 meters, a moderately weathered zone beneath it with a thickness of around 30 meters, and a slightly weathered to unweathered zone at greater depth. Based on previous mining experience, the completely weathered zone consists of weak and fractured rock, the moderately weathered zone is of moderate strength, and the slightly weathered to unweathered zone comprises strong and competent rock.

Ore bodies are distributed across oxidized, transitional, and primary zones. The oxidized and transitional zones have lower rock strength and may present localized geotechnical challenges during open pit mining. The primary zone consists of dense, hard rock with good physical and mechanical properties, limited water content, and generally stable conditions. Overall, the engineering geological conditions of the NGF area are considered to be of simple to moderate complexity.

Binduli Project

Geotechnical studies for the Binduli Project are conducted by Twins Geotech. The geotechnical domains are illustrated in Figure 9-7, and pit slope design parameters are summarized in Table 9-3. These parameters are derived from the following reports:

- Binduli South Project Geotechnical Study (Feb 2023).
- Geotechnical Assessment of Fort Scott and Karen Louise Pits (Nov 2021).
- Geotechnical Assessment of Fort William and Janet Ivy Pits (Oct 2021).

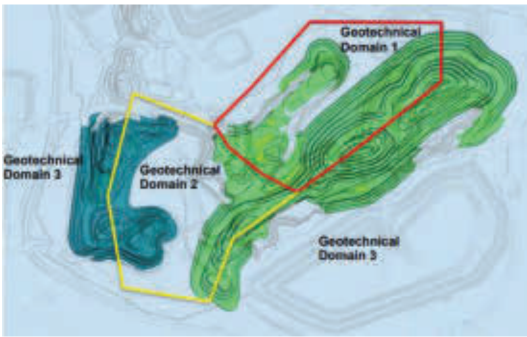
Mt Pleasant Project

A geotechnical study for the Racetrack deposit was completed by Twins Geotech in Nov 2021. Figure 9-8 shows the geotechnical domains of Racetrack deposit.

Figure 9-8: Geotechnical Domains – Racetrack (Mt Pleasant Project)



Sources: Twins Geotech, summarized by SRK

For the Black Flag and Lady Bountiful deposits, geotechnical studies have not been undertaken. However, given their relatively small scale and short life of mine (LOM), pit slope designs for these pits are established using conservative empirical methods. Specifically, Black Flag has a maximum pit height of approximately 110 m with a LOM of 2 years, and Lady Bountiful has a maximum pit height of approximately 130 m with a LOM of 3 years. The overall pit slopes for both these pits are designed to remain less than 45 degrees.

Table 9-4 shows the summary of pit slope design parameters.

Table 9-4: Summary of Pit Slope Design Parameter – Mt Pleasant Project

Mine	Domain	Vertical Depth Below Ground Surface (m)	Batter Face Angle (°)	Minimum Berm Width (m)	Maximum Batter Height (m)

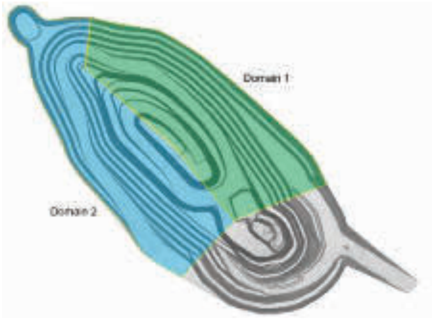
Carbine Project

A geotechnical study for the Wattlebird deposit was completed by Twins Geotech in May 2024. Figure 9-9 shows the geotechnical domains of Wattlebird deposit.

Figure 9-9: Geotechnical Domains – Wattlebird (Carbine Project)



Sources: Twins Geotech, summarized by SRK

For the Breakaway Dam deposit, geotechnical study has not been undertaken. However, given its relatively small scale (maximum pit height of approximately 130 m) and short LOM of 5 years, pit slope design is established using a conservative empirical method. The overall pit slope is designed to remain less than 45 degrees.

Table 9-5 shows the summary of pit slope design parameters.

Table 9-5: Summary of Pit Slope Design Parameter – Carbine Project

Mine	Domain	Vertical Depth Below Ground Surface (m)	Batter Face Angle (°)	Minimum Berm Width (m)	Maximum Batter Height (m)	Maximum Inter-ramp Angle (°)

Ora Banda Project

Geotechnical studies have not been undertaken for Ora Banda Project; however, pit slope designs are established using conservative empirical methods. Specifically, Gimlet South has a maximum pit height of approximately 230 m with a LOM of 6 years, and Enterprise West has a maximum pit height of approximately 130 m with a LOM of 3 years. The overall pit slopes for both pits are designed to remain less than 45 degrees.

Table 9-6 shows the summary of pit slope design parameters.

Table 9-6: Summary of Pit Slope Design Parameter – Ora Banda Project

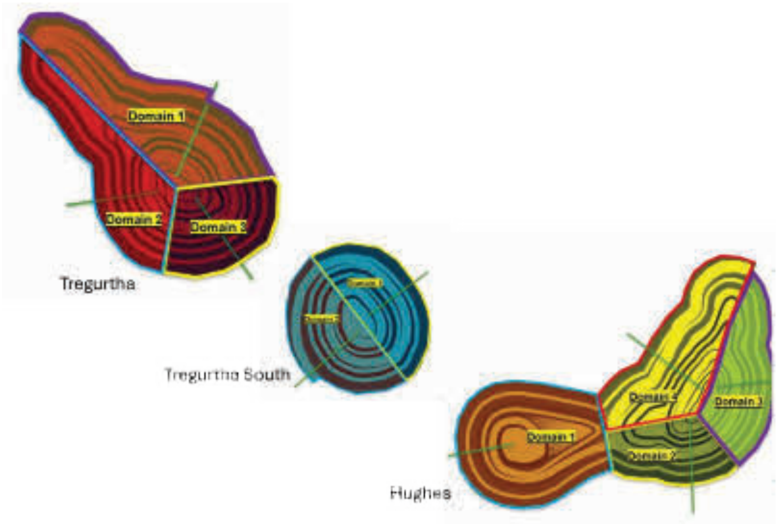
Golden Cities Project

Geotechnical studies have been completed for both the Mt Jewell deposits and the Havana deposit by Twins Geotech. Mt Jewell deposits geotechnical study was completed in April 2022 and Havana deposit was completed in January 2019. Figure 9-10 shows the geotechnical domains of Mt Jewell deposits (Tregurtha; Tregurtha South; Hughes). It should be noted that Figure 9-10 does not include the geotechnical domains for the Havana deposit, as these domains are summarized in tabular format within the study report rather than presented pictorially.

Figure 9-10: Geotechnical Domains – Mt Jewell area (Golden Cities Project)



Sources: Twins Geotech, summarized by SRK

Geotechnical study has not been undertaken for the Mulgarrie deposit. However, given its relatively small scale (maximum pit height of approximately 190 m) and short LOM of 4 years, pit slope design is established using a conservative empirical method. The overall pit slope is designed to remain less than 45 degrees.

Table 9-7 shows the summary of pit slope design parameters.

Hydrologic Considerations

The NGF Project is located west of Coolgardie in Western Australia, within a semi-arid region characterized by low annual rainfall and high evaporation. The terrain consists of gently undulating greenstone plains with limited surface water development. Surface runoff occurs only during storm events. Groundwater is recharged primarily by rainfall infiltration, with low overall recharge rates. Aquifers are mainly composed of weathered rock, fractured bedrock, and minor sheared zones. Groundwater generally flows toward paleo-drainage channels, with discharge occurring through evaporation and abstraction. Hydrogeological conditions are considered simple, and groundwater inflow to the deposit is primarily influenced by rainfall.

9.2.3 Pit Optimization

The Mineral Resource Model ("MRM") developed by NGF was reviewed by SRK. The model was provided in Surpac™ format (.mdl). Pit optimization, mine design, and mine planning were also completed by NGF. For mine planning purposes, NGF converted the MRM into a Mining Block Model ("MBM") in Block Geomodel (.gmdlb) format for use in Deswik™ software.

The first step in transforming a Mineral Resource into a mineable open pit Ore Reserves involves the process of open pit optimization. At this stage, the physical, technical, and economic parameters are applied to the deposit to determine the optimal geometry for the open pit excavation. If the economic assessment of this optimal pit shell is positive, the resulting pit shell can be used as a reference for the subsequent pit design process.

Pit optimization was undertaken by NGF using Whittle™ software for open pit optimization. In general terms, Whittle ™ adjusts the base input price by a range of revenue factors ("RF"), both above and below a base value of 1. For each RF, Whittle ™ generates a three-dimensional shape pit shell, that maximizes the value based on all input parameters and the adjusted price. Lower RF produce smaller shells, while higher RF result in larger shells. This approach creates a series of 'nested' shells, with each shell contained within the next larger one.

The pit optimization was completed prior to the effective date of this report (31 December 2024) and was based on input parameters and block model assumptions available at the time. As the optimization did not reflect current parameters or confirm alignment with the most recent resource model, SRK has not reviewed or validated the optimization results for the purposes of this report.

Dilution within the mineralised body typically arises from several factors, including excessive blasting, poor selectivity during loading operations, and the inadvertent mixing of waste and ore by operators. This results in an increase in the tonnage but a decrease in the grade of the ROM delivered as process feed. Ore loss often occurs because machinery may not be able to access all areas of the mineralised body or due to conservative blast designs that leave some ore unfragmented.

NGF has applied assumptions of 10% dilution and 5% ore loss in its mine planning. SRK considers these assumptions to be reasonable for an open pit operation of this scale and mining method..

Based on the current pit design provide by NGF, the design ramp parameter is as follow:

- Ramp Grade: 8.5-9%
- Ramp Width (single lane): 25 m
- Ramp Width (double lane): 30 m

Single-lane ramps are implemented at the pit bottom when the benches begin to narrow, and mining rates are significantly reduced.

9.2.4 Mining Operations

The NGF Project comprises multiple small-scale deposits with individual open pits typically separated by several kilometers. Each pit is relatively small in scale, with a typical life-of-mine of less than five years. A conventional top-down, bench-by-bench mining sequence is adopted.

Mining is conducted using a contractor-operated, conventional truck-and-shovel method, operating continuously on a 24-hour basis throughout the year, with two working shifts per day to maintain productivity and ensure operational efficiency.

Drilling is carried out using rigs with hole diameters ranging from 115 to 127 mm. Blasting is conducted using a non-electric delay initiation system and emulsion explosives. The pit design employs bench heights ranging from 5 to 15 m, with double benching forming overall bench heights of 10 to 30 m.

Bench face angles range from 55 to 80 degrees, with shallower angles applied in oxidized zones and steeper angles of 70 to 80 degrees used in fresh rock. The minimum working platform width is 35 m. Final pit wall heights range from 10 to 30 m and are typically achieved through stacked benching. Overall slope angles range between 36 and 50 degrees, depending on rock type and geotechnical conditions.

Mined material is transported via graded haul roads to either the ROM pad or the waste dump. Double-lane haul roads are constructed with a width of 30 m, and single-lane access roads to the pit bottom are 25 m wide. All haul roads are designed with gradients between 8.5% and 9% to ensure safe and efficient material movement.

9.2.5 Equipment

ROM material will be blasted and loaded using 17 m³, 18m³, and 22m³ hydraulic excavators, and hauled by trucks with payload capacities of 91 t, 140 t, and 194 t. Table 9-18 provides a summary of the primary and ancillary mining equipment.

Table 9-18: Primary and Ancillary Equipment List

9.2.6 Material Handling

The current material handling at the NGF Project is around two distinct mining operations. ROM material from the Binduli Mine (including the Binduli Project) is exclusively transported to the Binduli Heap Leach. Conversely, ROM from the Paddington Mine (including the Mt Pleasant, Carbine, Ora Banda, and Golden Cities Projects) is entirely directed to the Paddington Mill Plant. All waste material from both operations is sent to nearby waste dumps.

In the future, NGF plans to integrate these two mining operations into a single, combined complex to significantly streamline material handling. Under this proposed integrated strategy, ROM material from the Binduli Project area will be primarily routed to the Binduli Heap Leach, with certain higher-grade material designed for the Paddington Mill Plant. Conversely, ROM from the Paddington Project areas will predominantly be fed to the Paddington Mill Plant, while lower-grade material will be diverted to the Binduli Heap Leach. The plan is summarized as below:

- Binduli Project:
  - All ROM to Binduli Heap Leach: Fort William, Fort Scott, Karen Louise, and Janet Ivy.
  - ROM primarily to Binduli Heap Leach, with high-grade ROM to Paddington Mill Plant: Navajo Chief, Centurion, Ben Hur, and Apache.
- Mt Pleasant Project:
  - All ROM to Paddington Mill Plant: Racetrack and Tuart.
  - ROM primarily to Paddington Mill Plant, with low-grade ROM to Binduli Heap Leach: Black Flag and Lady Bountiful.
- Carbine Project:
  - All ROM to Paddington Mill Plant: Wattlebird, Breakaway Dam, and Bullant.
- Ora Banda Project:
  - All ROM to Paddington Mill Plant: Gimlet South and Enterprise.
  - ROM primarily to Paddington Mill Plant, with low-grade ROM to Binduli Heap Leach: Enterprise West.
- Golden Cities Project:
  - All ROM to Paddington Mill Plant: Hughes, Tregurtha South, Tregurtha, and Federal.

  – ROM primarily to Paddington Mill Plant, with low-grade ROM to Binduli Heap Leach: Havana and Mulgarrie.
- Waste Material: All waste material from all mining operations will be directed to nearby waste dumps.

9.2.7 Mine Production Plan

The LOM schedule has been developed using the Deswik suite software by NGF.

The LOM plan was completed prior to the effective date of this report, 31 December 2024, and was based on the input parameters, including cut-off grade, and block model assumptions available as of July 2024. As production activity has been limited to date, SRK reviewed the reported tonnage and grade against the latest block model and current cut-off grade. No material differences were found, with ROM tonnage differing by less than 1% and contained gold metal by less than 7%.

The production schedule is organized on yearly basis and the following assumptions were made during the production scheduling:

- Only blocks classified as Measured and Indicated Mineral Resources with a gold grade above cut-off grade were considered and considered as ROM.
- Blocks classified as Inferred Mineral Resource, unclassified material or material with a gold grade below cut-off grade were designated as waste.
- There are pushbacks planned to guarantee the supply of ROM and balance the stripping ratio.

The total LOM is 13 years, starting in January 2025, with a total ROM amount of 109,928 kt at an average gold grade of 0.76g/t, and the total Au contained metal of 2,674 koz. The total waste amount is 515,870 kt with the average stripping ratio of 4.69.

The total open pit mine production schedule is shown in Table 9-19 and Figure 9-23.

Mt Pleasant Project

The LOM of Mt Pleasant Project is 10 years, starting in 2027, with a total ROM amount of 8,798 kt at an average gold grade of 1.52g/t, and the total Au contained metal of 430 koz. The total waste amount is 97,561 kt with the average stripping ratio of 11.09.

The Mt Pleasant Project production schedule is shown in Table 9-21 and Figure 9-25.

Golden Cities Project

The LOM of Golden Cities Project is 11 years, starting in 2025, with a total ROM amount of 11,950 kt at an average gold grade of 0.98g/t, and the total Au contained metal of 375 koz. The total waste amount is 70,292 kt with the average stripping ratio of 5.88.

The Golden Cities Project production schedule is shown in Table 9-24 and Figure 9-28.

9.3 Underground Mining

9.3.1 Underground Mine Status

The NGF Project includes four underground operations: Bullant, Enterprise, Tuart, and Federal. The Bullant Underground Mine, located 40 km west of the Paddington Mill, is an owner-operated site acquired in 2013 and is using sublevel stoping with cemented rock fill. The Enterprise Underground Mine, situated 28 km northwest of the mill within the Ora Banda tenement, is the largest in terms of resources and is using contractor-led long-hole stoping with pastefill. The Tuart Underground Mine, part of the Mt Pleasant lease 12 km southwest of the mill, operates with contractor and in-house collaboration with sublevel stoping with cemented rock fill. The Federal Underground Mine, located 12 km northeast of the mill in the Golden Cities area, is transitioning from open pit to underground following the completion of its open pit operation in 2024, with underground mining scheduled to begin in 2025.

The ROM material from the underground mine is entirely processed at the Paddington Mill. Table 9-28 shows the historical three-year production in Paddington.

9.3.2 Carbine – Bullant

The Carbine-Zuleika mining lease is located 40km west of the Paddington Processing Plant and includes the Bullant Underground deposit, which is shown in Figure 9-29. The Bullant underground project was acquired from KMC in 2013.

The Bullant operation is an owner-operated underground mine, with in-house production and engineering teams collaborating to extract over 0.3 Mtpa of ore from the Bullant deposit using sublevel stoping techniques.

Figure 9-29: Location of Bullant Underground Mine

Reference: NGF Website

Hydrology Condition

The Mine is located in a relatively dry region, with minimal water ingress into the underground workings. Water ingress primarily occurs due to development activities or diamond drilling that intercepts water-bearing structures within the rock mass. However, water inflow is generally low and manageable, characteristic of the nature of the underlying rock.

The primary sources of water at the mine are those used in routine mining operations, including drilling, dust suppression, and watering down. In addition, water may occasionally be encountered during mining activities, primarily through diamond drilling intercepts of water-bearing geological structures. The water quality in the mine is relatively good, with moderate salinity, and it meets the required standards for its intended uses in mining operations.

Geotechnical Condition

Geotechnical Domains

The geotechnical domain model was developed using data from geological logging, core drilling, and pit wall mapping. Seven distinct geotechnical domains were defined based on lithology, structure, alteration, and geotechnical parameters:

- Hanging Wall Basalt (HWB): This domain is characterized by a solid, well-bonded rock mass with minimal weathering. Typically stable with few significant structural failures.
- Footwall Basalt (FWB): Similar to the Hanging Wall Basalt, this domain presents solid rock conditions, but there may be variations due to faulting or shearing.
- Decline Basalt (DB): The area around the decline, showing minor fractures and weathering that could influence mining stability.
- Shear Zones (Main, East, West): These areas are controlled by structural weaknesses, including faulting and shearing, which significantly affect rock mass stability.
- West Dipping Fault
- Cross Fault
- Cross Shear

Rock Mass Characterizations

Material properties for the Bullant Mine were obtained through laboratory testing of representative diamond-drilled core samples from the HWB, FWB, DB, and Shear Zone domains. Key parameters describing rock strength and deformation behavior include Uniaxial Compressive Strength (UCS), Uniaxial Tensile Strength (UTS), Young's Modulus (E), and Poisson's ratio (v). Density measurements were also taken during laboratory testing.

Historical laboratory testing for Bullant Mine was carried out periodically in July 2003, August 2003, December 2003, and August 2004 by the West Australian School of Mines (WASM). The results from these tests were compiled and the summary statistics are presented in Table 9-27.

FW Basalt shows the highest strength, making it ideal for high-load structural applications. HW Basalt offers moderate strength with variability, suitable for general use. Mineralised Shear Zones are the weakest, unsuitable for high-load applications due to instability. Decline Basalt has consistent strength, ideal for applications requiring uniform performance

Table 9-27: Summary of UCS Results at Bullant Underground Mine

Type		UCS (MPa)	UTS (MPa)	E (GPa)	Poisson Ratio	Density (kg/m^3)
FW Basalt	Average	264.0	27.0	93.0	0.29	30.00
	Std Deviation	92.0	8.4	4.7	0.02	0.02
	Maximum	390.0	38.0	99.0	0.34	30.00
	Minimum	79.0	14.0	87.5	0.27	29.90
HW Basalt	Average	181.0	22.2	93.0	0.29	29.50
	Std Deviation	92.0	8.4	4.7	0.02	0.02
	Maximum	312.0	28.1	99.0	0.34	30.00
	Minimum	57.0	8.7	87.5	0.27	29.90

Rock Mass Classifications

Table 9-28 presents the Barton's Q values for the various geotechnical domains at the mine. The Q system, an empirical method, is based on several parameters, including Rock Quality Designation (RQD), joint condition (Jn), joint roughness (Jr), joint alteration (Ja), joint water inflow (Jw), and the Stress Reduction Factor (SRF).

The Q values across the different domains at the mine indicate varying rock mass qualities:

- Good rock mass quality is observed in the Hanging Wall Basalt, Footwall Basalt, and Decline Basalt domains, with Q values ranging from 10.7 to 27.0. These domains are considered suitable for stable mining operations with minimal ground support requirements.
- Poor rock mass quality is found in the Main Lode Shear Zone and East Lode Shear Zone, with Q values of 1.33. These zones are expected to require additional support and monitoring during mining to maintain stability.
- Very Poor rock mass conditions are present in the West Dipping Fault and Cross Fault domains, with Q values as low as 0.3. These areas may require significant ground support and additional safety measures to mitigate stability risks during mining.

Table 9-28: Summary of Q Value in Geotechnical Domains at Bullant Underground Mine

#	Domain	Strength	RQD	Jn	Jr	Ja	Jw	SRF	Q	Class	Q'
1	Hanging Wall Basalt	181	80	9	3	1	1	2.5	10.7	Good	27
2	Footwall Basalt	265	80	9	3	1	1	2.5	10.7	Good	27
3	Decline Basalt	96	80	9	3	1	1	2.5	10.7	Good	27

#	Domain	Strength	RQD	Jn	Jr	Ja	Jw	SRF	Q	Class	Q'
4	Main Lode Shear Zone	76	60	12	2	3	1	2.5	1.33	Poor	3.3
5	East Lode Shear Zone	76	60	12	2	3	1	2.5	1.33	Poor	3.3
6	West Lode Shear Zone	76	60	12	2	3	1	2.5	1.33	Poor	3.3
7	West Dipping Fault	<5	20	15	1	5	1	2.5	0.11	Very Poor	0.3
8	Cross Fault	<50	50	15	1	4	1	2.5	0.33	Very Poor	0.8
9	Cross Shear	<50	50	15	1	4	1	2.5	0.33	Very Poor	0.8

Stope Stability

Stope designs will be developed collaboratively by the Geology, Production, and Geotechnical Departments. Geotechnical input will include recommendations on stable stope dimensions, minimum ground support requirements, and other key geotechnical considerations related to stoping.

For open stopes, brow cable bolting is designed based on rock mass conditions and brow dimensions. All uphole stopes with widths greater than 6 meters will require brow cable bolts, with twin cable bolts used as the standard support configuration. Typically, only the final brow is supported with cable bolts; however, for stopes less than 6 meters wide or for interim brows, cable bolt support may be provided subject to geotechnical assessment. Table 9-29 shows the Stope dimensions.

Table 9-29: Stope Dimensions at Bullant Underground Mine

Parameters	Size
Span (m)	1.5-10.0
Height (m)	20.0
Hanging wall Dip (°)	70-90
Hanging wall Dip Direction (°)	350-360
Footwall Dip (°)	70-90
Footwall Dip Direction (°)	350-360

Ground Support

Development at the Bullant mine utilizes a combination of square backs in stockpiles and both semi-arched and arched profiles in all other development headings. The decline, return airways, and associated stockpiles are located within fresh Footwall Basalt, while stope access drives and internal stockpiles are positioned in fresh Hanging Wall Basalt. At the planned excavation dimensions, overall rock mass failure of the full span is unlikely; however, discrete blocks or wedges may detach due to intersecting structural defects and must be controlled through scaling, support, and reinforcement.

Permanent and semi-permanent development headings are supported with 2.4 m split sets, with ore drives (considered temporary) similarly supported. Minor loose rock generated by blasting is managed with mechanical or hydro scaling and appropriate surface support. Development intersections are reinforced using standardized cable bolt patterns tailored to the unsupported span. All cable bolts are fully grouted and plated to ensure installation and grouting quality.

The minimum ground support and reinforcement design at Bullant is based on the following principles:

- Support systems are designed to eliminate the risk of rock falls from backs and walls of development workings.
- A systematic support approach is adopted to manage typical unstable wedge occurrences and to control near-opening rock movement.
- Additional cable bolt reinforcement is employed where block sizes exceed the capacity of standard support.
- Except for temporary face meshing, all split sets are galvanized for corrosion resistance and enhanced holding capacity.
- Excavation sizes are minimized, and excavation profiles are designed for functionality and maximum stability.
- Support systems are selected for durability and to withstand the effects of blasting during the excavation's service life.

Ground Support Details:

- Friction Bolts:
  - Friction bolts (split sets) are used in moderate to low stress environments for static support.
  - 2.4 m SS47 bolts are installed for drive widths over 4 m.
  - 1.5 m SS40/47 bolts are used for drives under 4 m wide.
  - 0.9 m SS39 bolts (insert bolts) overlap mesh sheets and are installed into existing split sets.
  - Ungrouted friction bolts have an expected capacity of 4 t/m embedment (i.e. 10 t for a 2.4 m bolt).
  - Grouted bolts can achieve up to 10 t/m capacity.
  - Grouting is required in intersections, prior to stripping cuts, in access or decline drives wider than 6 m, in wet ground, and in poor rock conditions.
- Solid Bar Bolts:
  - Resin-anchored solid bar bolts are used where adverse ground conditions are encountered, paired with fibrecrete surface support.
- Cable Bolts:
  - Cable bolts are installed to reinforce wide spans and are typically 6 m long, using twin-strand bulbed cable (15.2 mm diameter) with bulbs spaced every 1.0 m.

  - Minimum ultimate tensile load for single strand is ≥250 kN, with 3.5% minimum elongation at rupture.
  - Bolts are post-tensioned to 15–25 tonnes using barrel and wedge anchors made from high-tensile steel.
  - All cable bolts are fully grouted (0.3–0.35 W/C mix), checked for cleanliness and proper bulb formation; non-conforming cables are rejected.
- Mesh:
  - Galvanized weld mesh is applied up to 3.0 m above floor level, with 5.6 mm wires and 100 mm square apertures.
  - Mesh sheets are overlapped by three squares and pinned with bolts at least two squares from the edge.
  - Mesh may be fixed to existing bolts using stub bolts and full-sized plates.
- Fibrecrete:
  - Fibrecrete is applied at a minimum thickness of 50 mm in schemes as specified, used primarily in poor ground or wet areas.
  - Required compressive strength is ≥32 MPa for 28-day core samples.
  - Panels should yield three 75 mm × 150 mm cores.
  - Required energy absorption is 400 J (0–40 mm deflection) and 150 J (20–40 mm deflection).

Mining Method

The Bullant deposit is a steeply dipping, narrow orebody located at considerable depth. Due to the significant depth of the mining operations, the deeper stopes and underground workings are subject to high in-situ stress conditions. These elevated stress levels have led to challenges such as stope drillhole blockages and deformation of development headings. As a result, the voids left after ore extraction cannot remain stable for extended periods. To ensure safe stoping operations, Cemented rockfill (CRF) was introduced, with cement content typically set at 2% when not rising against fill and increased to 5% if the fill would later be undermined. A 1% cement content was found inadequate due to lift during bogging.

Stope Optimization

Stope optimization was carried out by NGF using Deswik™ software prior to the effective date of this report, 31 December 2024. The optimization was based on input parameters, including cut-off grade and block model assumptions available at the time. Stope design parameters are summarised in Table 9-30, and the resulting optimized stope are illustrated in Figure 9-32.

Table 9-30: Stope Optimization Parameter at Bullant Underground Mine

Item	Unit	Value
Minimum Width	m	1.5-2.0
Minimum Stope Pillar	m	5-10
Dilution	m	0.3 each side

Item	Unit	Value

Development System

The Bullant underground mine is accessed via a main decline and utilizes a trackless haulage system. The main decline is centrally positioned within the orebody and features a spiral configuration. The portal is located at the 320m level within the upper open pit, and the decline is constructed at a 10% gradient, currently extending to the -400m level. Ore is hauled to the surface using 40-tonne trucks and temporarily stockpiled at a surface storage facility. Waste rock is transported by loaders to mined-out stopes for backfilling. Truck haulage is restricted to the main decline and level access drives, while sub-level development drives are accessed exclusively by smaller equipment.

The mine is divided into three mining blocks (zones), each with 100-meter vertical intervals and comprising multiple sublevels as follows:

- BL-I Zone: 0 m, 100 m, 200 m, and 300 m levels
- BL-II Zone: -300 m, -200 m, and -100 m levels
- BL-III Zone: -600 m, -500 m, and -400 m levels

The primary development type and dimensions are shown in Table 9-31.

Table 9-31: Development Type and Dimensions at Bullant Underground Mine

Development	Development Size (W x H)
Declines, Level Access (Capital and operating)	5.2m x 5.8m
Decline Intersections	5.5m x 5.8m
Ore Drives	4.5m x 4.3m
Level Drives	4.5m x 4.3m
Stockpiles	5.7m x 5.5m
Sumps	4.5m x 5.5m
Return Air Drives	4.5m x 4.3m
Return Air Rises	4.0m x 4.0m
Brow Support	5.0m x 5.0m
Escapeway Rise	2.0m dia. Raisebored ladderways

Mining Equipment

Table 9-32 outlines the key underground mining equipment used at the Bullant Mine.

Excavation and loading are carried out using loaders and excavators. Jumbo drills and longhole drills are used for production drilling, creating blast holes in the orebody. The dump trucks transport both ore and waste material from underground to the surface.

Mine Service

Ventilation

The mine operates a centralized split ventilation system to manage airflow. Fresh air is supplied through the main decline and intake ventilation shafts, distributed to level access drives. The airflow moves through the ore loading face and continues directly to the upper ore drives. Exhaust air is routed through the level drives and return air drives, which connect to return air shafts in the mining zone, before being discharged to the surface via the return air shaft.

Airflow Quantity Requirements:

- Based on Diesel Equipment Ventilation Standards:
  - Airflow requirements are calculated using a unit standard of 4.08 $m^3/(kW \cdot min)$ for diesel-powered machinery. The total airflow required for diesel equipment operations is 130 m^3/s.
- Based on Operational Workplace Ventilation Standards:
  - Ventilation assessments for underground operational faces indicate a total airflow requirement of 127 m^3/s. The mine's ventilation system is designed to accommodate a total airflow of 130 m^3/s.

Ventilation Resistance:

- At the -300m level (favorable ventilation conditions), the total ventilation resistance is calculated at 1,320 Pa.
- At the -600m level (challenging ventilation conditions), the total ventilation resistance increases to 1,695 Pa.

Ventilation Infrastructure:

The current ventilation infrastructure is insufficient to meet the demands of deep orebody extraction and requires upgrading. The mine has selected the FKCDZ(B)-10-NO.30 axial flow fan for installation in the return air shaft. The specifications and operational conditions of the fan are as follows:

- For favorable ventilation conditions: Designed airflow capacity is 138 m^3/s, with a static pressure of 1,457 Pa and an efficiency of 75%.
- For challenging ventilation conditions: Designed airflow capacity remains 138 m^3/s, with a static pressure increased to 1,809 Pa and an efficiency of 80%.

The fan is powered by two 200 kW motors, with an additional motor of identical specification kept on standby as a backup.

Dewatering

In the first year of production, a dewatering pump station will be established near the main decline access, with dedicated pump rooms located at the -500 m and -600 m levels. The system is designed to efficiently pump and discharge mine inflow water to the surface.

-600 m Pump Station:

The dewatering lift from the -600 m level is 100 meters. Predicted normal water inflow is 30 m^3/day, increasing up to 300 m^3/day under peak inflow conditions, in addition to 300 m^3/day of mining production wastewater. The pump station is equipped with three MD25-50×3(P) horizontal abrasion-resistant, self-balancing centrifugal pumps, each with a capacity of 30 m^3/h, a total head of 139.5 meters, and driven by a 22 kW motor.

- Under normal inflow conditions, one pump operates for 11 hours to complete the dewatering.
- Under maximum inflow conditions, two pumps operate simultaneously for 10 hours.
- Water is discharged via two seamless steel pipes (φ76×5 mm) installed along the main decline.

-500 m Pump Station:

The dewatering lift from the -500 m level is 889 meters. Predicted normal water inflow is estimated at 30 m^3/day, with a maximum inflow of 300 m^3/day, plus 300 m^3/day of mining production wastewater. This pump station is equipped with three MD25-80×12(P) horizontal abrasion-resistant, self-balancing centrifugal pumps, each rated at 25 m^3/h, with a head of 954 meters, powered by a 200 kW motor.

- Under normal inflow, a single pump operates for 13.2 hours.
- Under maximum inflow, two pumps operate simultaneously for 12 hours daily.
- Water is discharged through two φ76×6.5 mm seamless steel pipes installed along the main decline.

Maintenance

Maintenance workshops for trackless equipment are established at the -500 m level to support routine servicing and minor repairs of underground mining equipment. These workshops are equipped with essential machinery and tools, including AC arc welders, oxy-hydrogen cutting machines, drilling machines, portable air compressors, cleaning equipment, and tire patching facilities. Each workshop is fitted with a 10-ton electric overhead crane with a track height of 5.5 meters. The maintenance rooms have dimensions of 26 meters in length and 8 meters in width.

Mine Production Plan

The Bullant underground mine production schedule is shown in Table 9-33 and Figure 9-33.

9.3.3 Ora Banda – Enterprise

The Ora Banda Mining Tenement is located 28km northwest of the Paddington Processing Plant. The tenement includes the Enterprise Underground deposits, which hold the largest resources in the region, as shown in Figure 9-34.

Each year, the contractor production team, alongside both in-house and external engineering teams, collaborates to extract over 0.65 Mtpa of ore from the Enterprise deposit using long-hole sublevel stoping techniques.

Figure 9-34: Location of Enterprise Underground Mine

Reference: NGF Website

Hydrology Condition

The Mine is located in a relatively dry region, with minimal water ingress into the underground workings. Water ingress primarily occurs due to development activities or diamond drilling that intercepts water-bearing structures within the rock mass. However, the water inflow is generally low and manageable, characteristic of the nature of the underlying rock.

The primary sources of water at the mine are those used in routine mining operations, including drilling, dust suppression, and watering down. In addition, water may occasionally be encountered during mining activities, primarily through diamond drilling intercepts of water-bearing geological structures. The water quality in the mine is relatively good, with moderate salinity, and it meets the required standards for its intended uses in mining operations.

Geotechnical Condition

Geotechnical Domains

The geotechnical domains for the Enterprise underground mine were identified using the 2018 core logging program, historical data from the Norton database, and 2017 face mapping data from the open pit. These data sources were used to create a geotechnical database, which includes rock mass strength, lithology, alteration, and fracture frequency. Six geotechnical domains are shown in Figure 9-35 and listed as follows:

- Domain 1: Mt Pleasant Sill – Unaltered

  - Ultramafic rock with widely spaced joints and no weathering. The domain extends from the weathered zone to the top of Domain 2.
- Domain 2: Mt Pleasant Sill-Talc Altered
  - Altered ultramafic rock with low RQD values and weak rock mass strength, characterized by talc and minor pyrite.
- Domain 3: Cashman Shale / Quartz-Feldspar Porphyry
  - Sedimentary layers around feldspar-porphyry rock, with weak rock mass strength.
- Domain 4: Dolerite – Ore Zone
  - Dolerite rock associated with two major faults and hydrothermal mineralization. The rock mass is weak.
- Domain 5: Dolerite – Unmineralized
  - Fresh dolerite rock with a blocky structure and very strong rock mass strength.
- Domain 6: Basalt
  - Basalt at the base of Domain 5, with very strong rock mass and minimal ground defects.

<u>Rock Mass Characterizations</u>

Uniaxial Compressive Strength (UCS)

The UCS of rock samples was tested in 2018, and the results were normalized to a sample diameter of 50 mm in accordance with ISRM (1981) standards. This normalization accounts for the scale effect in the UCS measurements.

The UCS test results for each domain are summarized in Table 9-34. The mean UCS values range from 86 MPa in Domain 2 to 158 MPa in Domain 1, with the maximum UCS observed in Domain 1 at 244 MPa and the minimum in Domain 2 at 22 MPa.

Table 9-34: Summary of UCS Results at Enterprise Underground Mine

UCS	Domain 1	Domain 2	Domain 3	Domain 4	Domain 5	Domain 6
Mean	158	86	144	72	139	152
Minimum	103	22	22	52	102	152
Maximum	244	187	241	111	186	152

Rock Quality Designation ("RQD")

The RQD values were logged during core logging activities, and the statistical analysis for the available data was performed. The data were normalized per meter of core for consistency. Historical data was used for Domains 1 and 4 due to drill hole locations.

The average RQD values range from 82 in Domain 2 to 99 in Domain 6, with Domain 1 exhibiting a mean RQD of 92, as summarized in Table 9-35. The range in RQD values across the domains suggests variability in the quality of the rock mass, with Domain 1 showing the most consistent quality and Domain 5 exhibiting more variability.

Table 9-35: Summary of Q Value at Enterprise Underground Mine

RQD	Domain 1	Domain 2	Domain 3	Domain 4	Domain 5	Domain 6
Mean	92	82	86	93	96	99
Minimum	0	0	0	0	15	96
Maximum	100	100	100	100	100	100

RMR

RMR values were calculated for each geotechnical domain at the Enterprise mine using the RMR 1989 classification system. The parameters used include UCS, RQD, joint spacing, joint condition, groundwater conditions, and joint orientation, as summarized in Table 9-37.

The RMR values range from 42 to 82 across the domains, with Domain 6 exhibiting the highest rock mass quality and Domain 2 the lowest. The Ground Support Index (GSI) also varies between 37 and 77, reflecting the rock mass quality in each domain.

Table 9-37: Rock Mass Rating (RMR89) at Enterprise Underground Mine

Parameters	Domain 1	Domain 2	Domain 3	Domain 4	Domain 5	Domain 6
UCS	12	7	12	7	12	12
RQD	20	17	17	20	20	20
Joints Spacing	15	8	8	10	10	10

MRMR

The Mining Rock Mass Rating ("MRMR") system, developed by Laubscher, is a modification of the Rock Mass Rating (RMR) system to specifically assess the rock mass for cavability, which is important for domains that need to be caved.

MRMR values have been calculated based on parameters including UCS, RQD, joint spacing, joint condition, blasting, stress, and joint orientation. These values, updated with data from the 2018 core logging program, are summarized in Table 9-38. The MRMR values for the Enterprise mine range from 36 in Domain 2 to 68 in Domain 1.

Table 9-38: Calculated Mining Rock Mass Rating Values for Enterprise Underground Mine

MRMR	Domain 1	Domain 2	Domain 3
UCS	16	10	14
RQD	14	12	14
Spacing	19	16	13
Joint Condition	26	7	17
RMR	75	45	58
Blasting	1	0.94	0.94
Stress	1	1	1
Joint Orientation	0.90	0.84	0.90
MRMR	68	36	49

Stope Stability

Stope design was guided by the Mathews-Potvin Stability Graph Method, incorporating Q' values and modifying factors:

- Longitudinal Stope Wall
  - Factor A: 1
  - Factor B: 0.5 (Critical Joint Set: 44°→176)
  - Factor C: 6.5 (Failure Mode: Sliding)
- Longitudinal Stope Crown
  - Factor A: 0.1
  - Factor B: 0.3 (Critical Joint Set: 35°→110)
  - Factor C: 2 (Failure Mode: Gravity Fall/Slabbing)
- Transverse Stope Wall
  - Factor A: 0.4
  - Factor B: 0.4 (Critical Joint Set: 40°→253)
  - Factor C: 7 (Failure Mode: Sliding)
- Transverse Stope Crown
  - Factor A: 0.3
  - Factor B: 0.3 (Critical Joint Set: 35°→110)
  - Factor C: 2 (Failure Mode: Gravity Fall/Slabbing)

The calculated Modified Stability Number and hydraulic radius are shown as below:

- Longitudinal Stope Wall
  - Modified Stability No. (N') = 37.4
  - Hydraulic Radius = 12.7
- Longitudinal Stope Crown
  - Modified Stability No. (N') = 0.7
  - Hydraulic Radius = 3.3
- Transverse Stope Wall
  - Modified Stability No. (N') = 12.9
  - Hydraulic Radius = 8.9
- Transverse Stope Crown
  - Modified Stability No. (N') = 2.1
  - Hydraulic Radius = 4.8

The stope dimension is shown in Table 9-39.

Table 9-39: Stope Dimensions at Enterprise Underground Mine

Method	Stope Wall		Stope Crown	
	Stope Height	Strike Length	Stope Width	Strike Length
Longitudinal	10m	220m	15m	12m
	50m	51m	20m	10m
	80m	37m	25m	9m
Transverse	25m	61m	15m	26m
	50m	27m	20m	18m
	80m	23m	25m	16m

Reference: Geotech PFS by Twins Geotech in October 2019

Numerical modelling (RS2 and Map3D) was used to validate empirical assumptions and assess stress redistribution, particularly around stope abutments and rib pillars.

Ground Support

Ground support is designed to ensure stability and control rock movement in various development areas. The primary ground support systems used include:

- Friction bolts (split sets): Used for the majority of development, with a capacity of 3-4 tonnes per meter of embedment length. These are supported by UNWEDGE analysis, which confirms their adequacy for controlling potential wedge formations.
- Cable bolts: Installed in areas with large block sizes, such as intersections and wide drives, where friction bolts would not provide sufficient support. Twin-strand cable bolts with a capacity of 50 tonnes are utilized.

- Welded wire mesh: Applied for surface support to manage small wedges and loose blocks between bolts. This mesh works effectively in areas with expected displacement.
- Stiff split sets: Used in poor ground conditions, these are preloaded with cement cartridges to provide additional stiffness and resistance to the bolts.
- Fibre-Reinforced Shotcrete (FRS): Applied intermittently for rehabilitation and where mesh alone is insufficient. The early strength of FRS (1 MPa) is adequate to contain larger expected wedges.
- Non-galvanised (black) support: Used in temporary access areas with non-corrosive conditions. Non-galvanised support must have the same capacity as galvanized components and requires assessment by the Senior Geotechnical Engineer.

Mining Method

The primary extraction method employed is Sublevel Long-hole Stoping, utilizing either up-hole or down-hole drilling method, as shown in Figure 9-38.

The mining sequence follows a two-stage process. Initially, primary stoping blocks are extracted and subsequently backfilled with cemented tailings. Once the paste fill has cured and achieved its designed strength, the adjacent or remaining ore blocks are then recovered, leveraging the support provided by the consolidated backfill. The tailings are from the nearby old processing plant.

Figure 9-38: Stope Optimization Result at Enterprise Underground Mine

Reference: NGF

Stope Optimization

Stope optimization was carried out by NGF using Deswik^{TM} software prior to the effective date of this report, 31 December 2024. The optimization was based on input parameters, including cut-off grade and block model assumptions available at the time. Stope design parameters are summarised in Table 9-40, and the resulting optimized stope are illustrated in Figure 9-39.

Table 9-40: Stope Optimization Parameter at Enterprise Underground Mine

Item	Unit	Value
Minimum Width	m	5
Minimum Stope Pillar	m	10
Dilution	m	0.3 each side
COG	g/t	1.4

Development System

<u>Horizontal Development</u>

Horizontal development is performed with conventional Jumbo equipment. Standard development profiles are used for different purposes, including ore drives, capital declines, and infrastructure. The dimensions and specific purposes are summarized in Table 9-41.

Table 9-41: Standard horizontal development profiles at Enterprise Underground Mine

Excavation Type	Development Size (W x H)
Declines, Level Access (Capital and operating)	5.5m x 5.8m
Decline Intersections	5.5m x 5.5m
Ore Drives	5.0m x 5.0m
Escape ways, Escapeway Drive Transverse drive	5.0m x 5.0m
Stockpiles	5.5m x 6.0m

Excavation Type	Development Size (W x H)
Sumps	4.5m x 4.5m
Return Air Drives	5.5m x 5.5m
Return Air Rises	5.0m x 6.0m
Brow Support	5.0m x 5.0m
Escapeway Rise	1.5m dia. Raisebored ladderways

Reference: Ground Support Design Memo by Twins Tech in 2020

Intersection Development

Intersection layouts follow standard dimensions, with a maximum span of 8.5 meters for 3-way intersections and 11 meters for 4-way intersections. Designs exceeding these parameters are assessed individually during the M.A.P process, potentially requiring additional cable bolting or re-design.

Vertical Development

Vertical development is carried out using raise boring techniques or conventional long hole drill and blast. Geotechnical investigation holes are drilled as necessary to assess raise bore stability. If no investigation hole exists, mapping of surrounding resource drill holes is used.

Mining Equipment

Table 9-42 outlines the key underground mining equipment used at the Enterprise Mine (or share with other underground mine), provided by the suppliers Byrnecut and Hampton.

Excavation and loading are carried out using loaders and excavators. Jumbo drills and longhole drills are used for production drilling, creating blast holes in the orebody. The dump trucks transport both ore and waste material from underground to the surface.

Mine Service

Ventilation

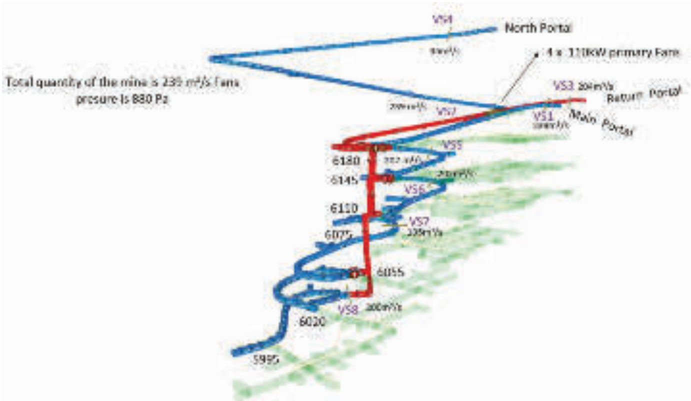
The mine's ventilation system is designed to provide a continuous supply of fresh air and remove harmful gases from underground workings. According to the latest survey report, the system operates with the following key parameters:

- Four Twin 110 kW secondary fans and four primary fans are currently operational, maintaining airflow throughout the mine.
- The total airflow in the mine is measured at 239 m^3/s, with the main fan pressure recorded at -880 Pa, confirming adequate airflow to all active mining areas.
- The VentSim model airflow prediction is 235 m^3/s, which closely matches the actual measured quantity.
- Fan vibrations are monitored and remain below 1.5 mm/s, indicating minimal mechanical disturbance.

Ventilation surveys have been conducted at several locations throughout the mine to ensure that each section receives the necessary airflow to meet operational requirements, which is shown in Figure 9-40. The airflow at key locations, such as the Main Intake Below Main Portal (VS1) with 238.9 m^3/s and the Return Air Portal (VS3) with 203.8 m^3/s, meets the required standards for maintaining a safe working environment.

The mine's ventilation infrastructure is well-established, with the primary and secondary systems working in tandem to ensure sufficient airflow to all sections of the mine, including those that are under development and operational. The ventilation system continues to be monitored and maintained to address any operational demands and maintain safe air quality standards across the mine.

Figure 9-40: Ventilation System at Enterprise Underground Mine



Reference: Ventilation survey report

<u>Dewatering</u>

Based on the FS 2021, the dewatering system consists of two main pump stations. These pump stations are connected by a series of pumps that discharge water through a combination of pipelines and gravity-fed channels. Water is pumped out and transported via pipelines to surface collection points, where it is stored in external water reservoirs.

For normal water inflow conditions, the system uses a set of three 100MD16×3 pumps capable of handling 36 m³/h per pump, with a total discharge capacity of 108 m³/h. The system is designed to complete the dewatering process in approximately 13 hours under typical conditions. In the event of maximum water inflow, two pumps operate simultaneously, completing the dewatering task in approximately 16.11 hours.

The water pumps are powered by 15 kW motors and are equipped with 60m head capabilities. The pipelines used for water transportation consist of two φ89×4mm seamless steel pipes along the decline. In addition, for higher discharge requirements, a set of three 100MD16×6 pumps with 120m head capacity and 22 kW motors are used. This configuration handles maximum water inflow, with two pumps operating simultaneously to handle the peak discharge.

<u>Maintenance</u>

The maintenance stations are equipped with essential tools, including arc welding machines, oxy-hydrogen cutting equipment, drill presses, mobile compressors, and tire vulcanizing machines.

Each maintenance station features a 10-ton electric overhead crane with a track surface height of 5.5 meters. The maintenance rooms are 26 meters in length and 8 meters in width.

Mine Production Plan

The Enterprise underground mine production schedule is shown in Table 9-43 and Figure 9-41.

9.3.4 Greater Mt Pleasant – Tuart

The Mt Pleasant Mining Lease is located 12km southwest of the Paddington Processing Plant and comprises 21 deposits. The Mt Pleasant operation currently includes 17 projects, one of which is the Tuart Underground deposit, as shown in Figure 9-42.

The contractor production team, along with both in-house and external engineering teams, collaborates each year to extract over 0.6 Mtpa of ore from the Tuart deposit using sublevel stoping techniques.

Figure 9-42: Location of Tuart Underground Mine

Reference: NGF Website

Hydrology Condition

The Mine is located in a relatively dry region, with minimal water ingress into the underground workings. Water ingress primarily occurs due to development activities or diamond drilling that intercepts water-bearing structures within the rock mass. However, water inflow is generally low and manageable, characteristic of the nature of the underlying rock.

The primary sources of water at the mine are those used in routine mining operations, including drilling, dust suppression, and watering down. In addition, water may occasionally be encountered during mining activities, primarily through diamond drilling intercepts of water-bearing geological structures. The water quality in the mine is relatively good, with moderate salinity, and it meets the required standards for its intended uses in mining operations.

Geotechnical Condition

<u>Geotechnical Domains</u>

The geotechnical domains at Tuart mine were identified using three main data sources: core logging, pit wall mapping, and scanline mapping data collected from the current decline. A comprehensive geotechnical database was created by incorporating these sources, which include structural data, rock strength, lithology, alteration, and fracture frequency. Seven geotechnical drill holes were logged, sampled, and tested for geomechanical properties. The primary host rock in the hanging wall and footwall is Bent Tree Basalt. Based on the results, no significant geotechnical differences were observed between the hanging wall and footwall, leading to the identification of two geotechnical domains: Bent Tree Basalt and Ore Basalt.

Rock Mass Characterizations

Uniaxial Compressive Strength ("**UCS**")

The UCS of rock samples was tested in 2018, and the results were normalized to a sample diameter of 50 mm in accordance with ISRM (1981) standards. This normalization accounts for the scale effect in the UCS measurements.

The UCS results are summarized in Table 2, with key metrics as follows:

- Bent Tree Basalt has an average UCS of 187 MPa, with a range from 92 MPa to 348 MPa. The standard deviation is 62 MPa, indicating variability in the rock's strength across different samples.
- Ore Basalt has a lower average UCS of 85 MPa, with a range from 17 MPa to 200 MPa, and a standard deviation of 60 MPa.

Table 9-44: Summary of UCS Results at Tuart Underground Mine

UCS	Bent Tree Basalt	Ore Basalt
Mean	187	85
Minimum	92	17
Maximum	348	200
Standard Deviation	62	60
Median	184	73
Range	256	183
Count	24	10

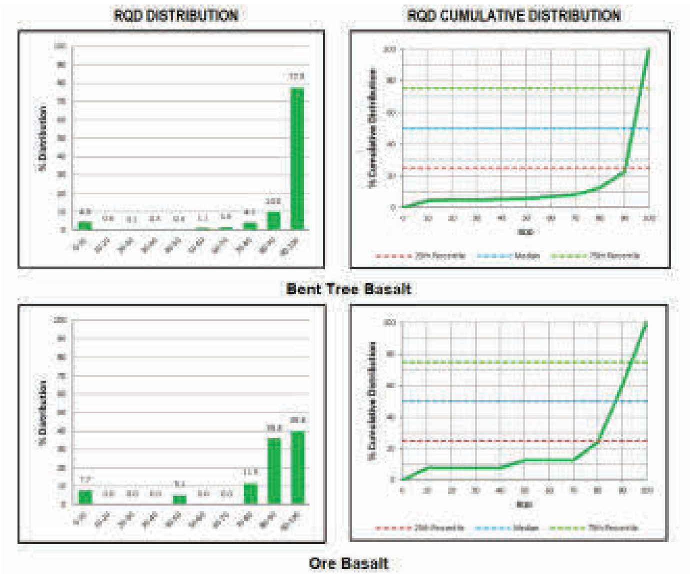
Reference: GCMP 2025

Rock Quality Designation ("**RQD**")

Logged RQD values from core logging were normalized for each meter of the core, and statistical analysis was performed on all available data. The RQD distribution for the Bent Tree Basalt and Ore Basalt domains is summarized in the graphical representations presented in Figure 9-43.

The distribution shows that RQD values for Bent Tree Basalt are predominantly in the 90-100% range, representing 77.5% of the distribution, with a cumulative distribution sharply increasing past 70 RQD. In contrast, the Ore Basalt has a slightly broader distribution, with 39.8% of the RQD values between 90-100%, suggesting variability in the rock quality. The median and percentile values for both rock types are illustrated, with Bent Tree Basalt showing a higher consistency in rock quality compared to Ore Basalt.

Figure 9-43: Location of Tuart Underground Mine



Reference: GCMP 2025

<u>Rock Mass Classifications</u>

Q-System

The Q values for each geotechnical domain are summarized in Table 9-45 and Figure 9-44. The distribution shows that RQD values for Bent Tree Basalt are predominantly in the 90-100% range, representing 77.5% of the distribution, with a cumulative distribution sharply increasing past 70 RQD. In contrast, the Ore Basalt has a slightly broader distribution, with 39.8% of the RQD values between 90-100%, suggesting variability in the rock quality. The median and percentile values for both rock types are illustrated, with Bent Tree Basalt showing a higher consistency in rock quality compared to Ore Basalt (Figure 9-45).

Table 9-45: Tunnelling Quality Index Q Values at Tuart Underground Mine

Parameters	Bent Tree Basalt	Ore Basalt
RQD	90-100	80-100
Jn	12	12
Jr	3-4	1.5-4

RMR

RMR values were calculated for each geotechnical domain at the Tuart mine using the RMR 1989 classification system. The parameters used include UCS, RQD, joint spacing, joint condition, groundwater conditions, and joint orientation, as summarized in Table 9-46.

For the Bent Tree Basalt domain, the RMR is 82, indicating a good rock mass quality, while the Ore Basalt domain has a slightly lower RMR of 74, reflecting a less favorable rock mass quality. The key parameters contributing to these RMR values include UCS values of 12 MPa for Bent Tree Basalt and 7 MPa for Ore Basalt, as well as the joint spacing and joint condition factors. The ground water condition for both domains is rated as 10, indicating a stable environment for mining operations. The

GSI values for Bent Tree Basalt and Ore Basalt are 78 and 69, respectively, providing further insight into the overall rock mass quality at Tuart.

Table 9-46: Rock Mass Rating (RMR89) at Tuart Underground Mine

Parameters	Bent Tree Basalt	Ore Basalt
UCS	12	7
RQD	20	17
Joints Spacing	20	15
Joints Condition	25	30
Ground water condition	10	10
Orientation of joints	-5	-5
RMR	82	74
GSI	78	69

Stope Stability

Stope design was guided by the Mathews-Potvin Stability Graph Method, incorporating Q' values and modifying factors:

- Factor A
  - Hanging Wall and Footwall: 1.0 (due to high material strength and low stress)
  - Backs: 0.15 (due to higher stress and lower stability)
- Factor B
  - Ore Lode 601/603:
    - Joint set 1: HW/FW = 0.34, Backs = 0.98
    - Joint set 2: HW/FW = 0.88, Backs = 0.20
    - Joint set 3: HW/FW = 0.25, Backs = 0.64
    - Joint set 4: HW/FW = 0.23, Backs = 0.44
  - Ore Lode 609:
    - Joint set 1: HW/FW = 0.20, Backs = 0.98
    - Joint set 2: HW/FW = 0.99, Backs = 0.20
    - Joint set 3: HW/FW = 0.64, Backs = 0.20
    - Joint set 4: HW/FW = 0.49, Backs = 0.44

- Factor C is shown in Table 9-47.

Table 9-47: Calculated Factor C at Tuart Underground Mine

Parameters	Ore Lode 601/603		Ore Lode 609	
	HW/FW	Backs	HW/FW	Backs
Joint set 1	4.14	2.00	5.95	2.00
Joint set 2	8.00	2.00	8.00	2.00

Reference: Stope Stability Assessment of Tuart Underground Mine in 2021

Ground Support

The primary method for stabilizing the ground involves the use of pre-tensioned, single strand 250 kN cable bolts installed immediately above the portal excavation. These cable bolts are arranged in a staggered pattern with a horizontal spacing of 2.0 meters and vertical spacing of 2.0 meters to provide deeper stabilization and active surface pressure to the stope face.

Minimal ground support was required for the portal area to stabilize potential minor rock slaps and wedges. Most of the ground support focuses on surface support and rockfall protection, particularly to prevent any minor rockfalls from impacting personnel, equipment, or infrastructure.

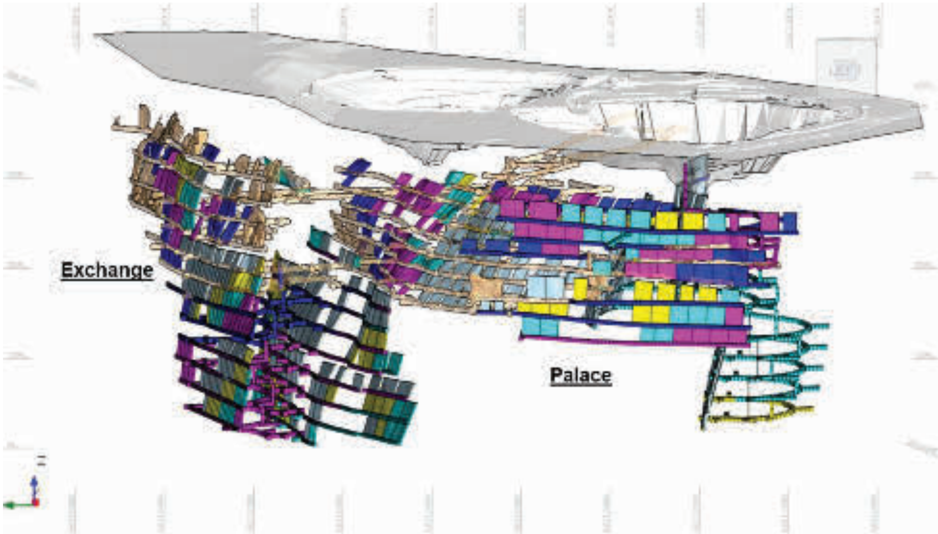
The detailed ground support and rock reinforcement requirements are as follows:

- Mining welded mesh or equivalent mesh will be installed over the face with a width of 7.75 meters from the centerline of the portal (15.5 meters in total).
- Fibre reinforced shotcrete, 50 mm in thickness, will be applied to a 1.5-meter perimeter around the portal.
- 6.0-meter long single strand or stronger cable bolts will be installed horizontally on a staggered 2.0 x 2.0-meter pattern, pre-tensioned to 10 tonnes.
- 2.4-meter long friction bolts (e.g., Split Set) will be installed on a staggered 2.0 x 2.0-meter pattern from the crest down to the pit floor.
- 50 mm of 32 MPa fibrecrete will be sprayed on the excavation to improve the energy absorption of the rock.

Mining Method

The Tuart orebody is comprised of two distinct components: the Palace orebody and the Exchange orebody, as illustrated in Figure 9-46. The Palace orebody is characterized by a shallower dip, ranging from 35 to 45 degrees, and an average true width of 1.5 to 3.5 meters. Conversely, the Exchange orebody presents a steeper dip, varying from 70 to 90 degrees, with an average true width of 2 to 3.5 meters.

Figure 9-46: Orebody at Tuart Underground Mine



Reference: NGF

The primary mining method employed is sub-level open stoping, utilizing either a bottom-up or top-down sequencing approach (Figure 9-47). This method is typically complemented using Cemented Rock Fill ("**CRF**") for backfilling. Stope extraction is designed to proceed in blocks spanning 3 to 4 vertical levels, with mining advancing from the end of the orebody and retreating towards the primary level access. For shallow-dipping zones, the mining method transitions to hand-held (airleg) mining, with reinforcement measures implemented progressively as stoping operations advance.

Figure 9-47: Mining Method at Tuart Underground Mine

Decline/Incline/Vent Drive	5.5mW x 5.8mH
Stockpile/Truck Tip	5.5mW x 7.5mH

Reference: GCMP 2023

Intersection Development

Intersection layouts follow standard dimensions, with a maximum span of 9.5 meters for 3-way intersections and 11 meters for 4-way intersections. Designs exceeding these parameters are assessed individually during the M.A.P process, potentially requiring additional cable bolting or re-design.

Vertical Development

Vertical development is carried out using raise boring techniques or conventional long hole drill and blast. Geotechnical investigation holes are drilled as necessary to assess raise bore stability. If no investigation hole exists, mapping of surrounding resource drill holes is used.

Mining Equipment

Table 9-52 outlines the key underground mining equipment used at the Tuart Mine (share with other underground mine), provided by the suppliers Byrnecut and Hampton.

Excavation and loading are carried out using loaders and excavators. Jumbo drills and long hole drills are used for production drilling, creating blast holes in the orebody. The dump trucks transport both ore and waste material from underground to the surface.

Table 9-52: Equipment List at Tuart Underground Mine

Mine Service

Ventilation

The Tuart Underground mine employs a single-wing diagonal ventilation system utilizing a mechanical exhaust ventilation method. Fresh air enters the underground workings via the intake shaft and main adit. This fresh air then flows through the main level haulage drifts and sub-level haulage drifts to reach the active stoping areas. After ventilating the working faces, the air moves into the upper-level return air drifts and is subsequently discharged to the surface through the return air shafts.

Dewatering

Total ground water flow at the Tuart Underground Mine is estimated to be 10L/s, based on the current underground operations. Dewatering of the underground work areas will be managed through an underground pumping network, which will include the following components:

- **Pumping at underground development faces**: 8-20kW flygt pumps will be used to pump water to level sumps positioned off the declines in the level accesses.
- **Level sumps**: These will be linked by drainholes where practical, or equipped with 8-20kW flygt pumps to transfer water to either travelling mono pumps or pump stations.
- **Mono pumps**: Pumps with a capacity to pump up to 20L/s or more will be installed at optimal static and friction head spacing. These pumps will stage the water out of the mine and direct it to the base of the Quarters pit.
- **Water transfer to surface**: Water from the base of the Quarters pit will be transferred by bore and/or pontoon-mounted flight pumps to the Rose Dam East Pit.

Mine Production Plan

The Tuart underground mine production schedule is shown in Table 9-53 and Figure 9-49.

9.3.5 Golden Cities – Federal

The Federal deposit is located 12km northeast of the Paddington mill, within the Golden Cities camp area, which also includes the previously mined Havana deposit, as shown in Figure 9-50.

The Federal operation is owner-operated, employing optimized scheduling techniques and modern truck-and-shovel fleets to mine over 1 Mtpa of ore.

As part of the Paddington Gold Operations Centre, the Federal Open Pit Operation was concluded in late 2024. All necessary approvals have been obtained for the Federal Underground Operation, which is planned to commence in 2025.

Figure 9-50: Location of Bullant Underground Mine

Reference: NGF Website

Hydrology Condition

The Mine is located in a relatively dry region, with minimal water ingress into the underground workings. Water ingress primarily occurs due to development activities or diamond drilling that intercepts water-bearing structures within the rock mass. However, the water inflow is generally low and manageable, characteristic of the nature of the underlying rock.

The primary sources of water at the mine are those used in routine mining operations, including drilling, dust suppression, and watering down. In addition, water may occasionally be encountered during mining activities, primarily through diamond drilling intercepts of water-bearing geological structures. The water quality in the mine is relatively good, with moderate salinity, and it meets the required standards for its intended uses in mining operations.

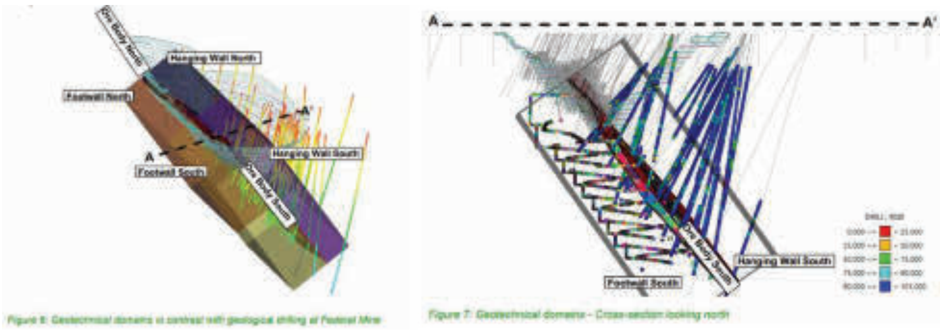
Geotechnical Condition

Geotechnical Domains

The geotechnical domain model was developed using data from geological logging, core drilling, and pit wall mapping. Six distinct geotechnical domains were shown in Figure 9-51 and were defined based on lithology, structure, alteration, and geotechnical parameters:

- Hanging Wall South (HWS): Fresh granodiorite with widely spaced joints, minor shears, and no weathering.
- Ore Body South (OBS): Sheared granodiorite with low RQD and higher fracturing. Represents structurally weaker ground.
- Footwall South (FWS): Competent granodiorite with moderate joint spacing and good rock quality.
- Hanging Wall North (HWN): Similar to HWS, comprising fresh rock with limited defecting.
- Ore Body North (OBN): Structurally affected but stronger than OBS, with moderate RQD.
- Footwall North (FWN): Fresh, competent rock suitable for infrastructure development.

Figure 9-51: Geotechnical domains at Federal Mine



Reference: Geotech Study by Neotech in 2024 May

Rock Mass Characterizations

Core logging and lab testing indicated a comprehensive rock mass characterization:

- RQD: High in hanging wall and footwall domains (>90), lower in central domains due to shearing.
- FES: Limited data, most logged material rated medium to strong (25–50 MPa). Lab results showed wider UCS range (91–210 MPa).
- Joint Conditions: Jn, Jr, and Ja values were available primarily for southern domains, indicating one to two dominant joint sets.
- Fracture Frequency: Higher in central zones; hanging wall and footwall domains show lower frequency and better continuity.
- Structural Orientation: Two dominant defect sets identified—41°/311° and 85°/029°—with short persistence (<30 m), suggesting localized instability risks.

Laboratory UCS and modulus data confirmed strong, brittle behavior, particularly in the footwall domains.

Rock Mass Classifications

The rock mass was classified using Barton's Q-system and Rock Mass Rating (RMR_{89}) and were applied across all six geotechnical domains.

- Q-System:
  - Q-values ranged from 3.2 (OBS) to 10.1 (HWS and HWN).
  - Ore body domains (OBS, OBN) exhibited lower Q-values due to shearing and alteration.
  - Hanging wall and footwall domains exhibited higher Q-values.
- RMR:
  - RMR values ranged from 55 (OBS) to 62 (HWS, HWN).

These classification results are shown in Table 9-54 and Table 9-55 and indicate that the orebody zones require enhanced support, while the hanging wall and footwall domains are generally competent.

Table 9-54: Summary of Q Value in Geotechnical Domains

Parameters	*Domain HWS*	*Domain OBS*	*Domain FWS*	*Domain HWN*	*Domain OBN*	*Domain FWN*

Stope Stability

Stope design was guided by the Mathews-Potvin Stability Graph Method, incorporating Q' values and modifying factors:

- Factor A (stress condition): 1.0
- Factor B (structural control): 0.37, based on a critical joint orientation (85°/029°)
- Factor C (geometry/failure mode): 3.3, assuming gravity-driven failure of hanging wall surfaces

As shown in Figure 9-52, the calculated Modified Stability Number (N' ≈ 18.5) and hydraulic radius (~6.3 m) for key geotechnical domains plot well within the Stable Zone. This supports the proposed use of 20 m × 25–26 m single-lift stope dimensions under unsupported conditions. For double-lift stopes, a reduced strike length of 16–17 m is recommended. The stope dimension is shown in Table 9-56.

Figure 9-52: Mathews Stability Graph

Table 9-56: Stope Dimensions

Method	HWS		HWN	
	Stope Height	Strike Length	Stope Height	Strike Length
Single Lift	20	26m	20m	25m
Double Lift	40m	17m	20m	16m

Reference: Geotech Study by Neotech in 2024 May

Numerical modelling (RS2 and Map3D) was used to validate empirical assumptions and assess stress redistribution, particularly around stope abutments and rib pillars. Results indicated that echelon retreat sequences (lead-lag of one stope) provided more uniform stress distribution and reduced the likelihood of overstressed pillars or infrastructure impacts.

Seismic risk is considered low to moderate, with potential for minor seismic events during abutment yielding in highly stressed zones. Remote bogging and sequencing adjustments are recommended to manage this risk. Water inflow is expected to be moderate based on open pit history. Although hydrogeological data is limited, its impact has been conservatively accounted for in support design and stope layout planning.

Ground Support

Ground support has been designed using a combination of empirical methods (Q-system and Potvin's GSSO chart) and numerical modelling (RS2).

Primary development support consists of:

- 2.4 m split set bolts, installed shoulder-to-shoulder
- Welded wire mesh applied to backs and walls, terminating approximately 1.8–1.9 m from the floor
- Bolt spacing: 1.2 m (lateral) × 1.5 m (along drive)

Ore drives and intersections are designed for higher demand ground, incorporating:

- 6.5 m twin-strand cable bolts, arranged in a 2.0 m × 2.0 m pattern
- Cable bolts embedded a minimum of 5.8 m into competent rock
- Support based on dome-arch design principles to manage wider excavation spans

Stope brows will be supported with:

- Two rows of 6.5 m twin-strand cable bolts (three bolts per row)
- Spacing of 2.0 m × 2.0 m to manage backbreak and blast-induced damage

All support elements are specified to be galvanised to provide corrosion resistance and long-term performance.

Mining Method

The proposed mining method is long-hole open stoping with cemented paste backfill. The stopes will be developed vertically in lifts of approximately 20 meters, with strike lengths ranging from 25 to 26 meters in competent ground. In areas where geotechnical conditions are more variable, shorter strike lengths and modified stope shapes may be employed.

The mining sequence will follow a center-out, echelon retreat pattern, advancing with a lead-lag offset of one stope. This approach minimizes stress build-up across stope abutments, reduces seismic potential, and allows for safer working conditions.

Paste fill will be placed following stope extraction and will act as both a structural and safety control measure. It provides confinement to adjacent stopes, reduces the exposure of unsupported backs, and limits the risk of backbreak or sloughing.

Stope Optimization

Stope optimization was carried out by NGF using Deswik^{TM} software prior to the effective date of this report, 31 December 2024. The optimization was based on input parameters, including cut-off grade and block model assumptions available at the time. Stope design parameters are summarised in Table 9-57, and the resulting optimized stope are illustrated in Figure 9-53.

Table 9-57: Stope Optimization Parameter

Item	Unit	Value
Minimum Width	m	2
Minimum Stope Pillar	m	10
Dilution	m	0.3 each side

Item	Unit	Value

Development System

Access to the orebody will be achieved via a main decline. Level accesses will be driven off the decline at regular vertical intervals to enable staged top-down extraction. Development locations have been selected to prioritise geotechnical stability, utilizing the more competent hanging wall and footwall domains to reduce exposure to structurally complex central zones.

The primary development type and dimensions are shown in Table 9-58.

Table 9-58: Development Type and Dimensions

Development	Development Size (W x H)
Declines, Level Access (Capital and operating)	5.5m x 5.8m
Decline Intersections	5.5m x 5.5m
Ore Drives	5.0m x 5.0m
Escape ways, Escapeway Drive, Transverse drive	5.0m x 5.0m
Stockpiles	5.7m x 5.5m
Sumps	4.5m x 5.5m
Return Air Drives	5.5m x 5.0m
Return Air Rises	5.0m x 5.0m

Mining Equipment

Table 9-59 outlines the key underground mining equipment used at the Federal Mine or share with other underground mine.

Excavation and loading are carried out using boggers. Jumbo drills and long hole drills are used for production drilling, creating blast holes in the orebody. The dump trucks transport both ore and waste material from underground to the surface.

Mine Service

Ventilation

The underground ventilation system at Federal employs a diagonal configuration with a forced exhaust arrangement. Fresh air is delivered through the main decline and distributed into level haulage drives. After ventilating the working stopes, air flows into the upper drill drives and then exhausts through the sublevel drill drive, connecting raise, and return air raises before exiting to surface through the return air drive.

Dewatering

Dewatering is achieved through a main underground pump station, which lifts mine inflow to surface via staged pumping. The system is designed for a normal inflow of 20 m^3/day, with a maximum capacity of 250 m³/day, plus an additional 300 m³/day of process water. The station is equipped with three MD25-50×7(P) horizontal abrasion-resistant multistage self-balancing centrifugal pumps.

Mine Production Plan

The Federal underground mine production schedule is shown in Table 9-60 and Figure 9-54.

9.3.6 Mine Production Plan

The LOM schedule has been developed using the Deswik suite software by NGF.

The LOM plan was completed prior to the effective date of this report, 31 December 2024, and was based on the input parameters, including cut-off grade, and block model assumptions available at the time. As production activity has been limited to date, SRK reviewed the reported tonnage and grade against the latest block model and current cut-off grade. No material differences were found, with ROM tonnage differing by less than 10% and contained gold metal by less than 10%.

The production schedule is organized on monthly basis and the following assumptions were made during the production scheduling:

- Only material in stope classified as Measured and Indicated Mineral Resources with a gold grade above stope cut-off grade were flagged and considered the stope as ROM, otherwise the stopes would be deleted.
- The gold grade of material classified as Inferred Mineral Resource and unclassified material were designated as zero.

The LOM is 5 years, starting in January 2025, with a total ROM amount of 2,813 kt at an average gold grade of 2.81 g/t, and the total Au contained metal of 254 koz. ROM from the Paddington Gold Mine will be sent to the free milling plant. The stope amount is 2,559 kt at an average gold grade of 2.85 g/t, and the total Au contained metal of 234 koz. The development amount is 254 kt at an average gold grade of 2.85 g/t, and the total Au contained metal of 20 koz.

The total underground mine production schedule is shown in Table 9-61 and Figure 9-55.

10 Processing and Metallurgical Assessment

10.1 Processing and Metallurgical Testwork

Norton has various gold deposits, which can be broadly categorized into two technological types: cyanidation amenable ore and refractory ore. The refractory ore can be further divided into two categories based on the reasons for its refractory nature: ores in which gold is encapsulated by pyrite and arsenopyrite (S-As type), and ores exhibits preg-robbing behavior (PR type).

In production practice, Norton employs different processing methods to recover gold based on ore grade and type:

- Low-grade cyanidation amenable ore: The agglomeration heap leaching process.
- High-grade cyanidation amenable ore: The gravity and carbon-in-pulp (CIP) process.
- Sulphur-arsenic contained refractory ore: The gravity-flotation-CIP process.
- Preg-robbing refractory ore: need further technical and economic studies.

10.1.1 Amenability Tests to Process of Paddington Processing Plant

The Paddington processing plant employs a gravity-CIP process to treat ore from various deposits. Ores suitable for this process are referred to as "free milling". Since the 1990s, extensive testing has been conducted on ores from numerous deposits within the Norton Gold Fields to determine the amenability of the ore to processing through the Paddington circuit. Due to the large number of deposits, a significant volume of testing has been carried out. The comprehensive test results of various deposits are summarized in Table 10-1. The characteristics of some deposits are described below.

Fort Scott

The gravity recovery for fresh ore is 23.7%, the cyanide leaching rate for gravity tailings is 86.0%, and the overall recovery rate using the gravity-CIL process reaches 92.8%, indicating that the ore is well-suited to the Paddington Plant's flowsheet.

Blue Gum

The hanging wall and footwall of the deposit are both composed of carbonaceous shale, which can easily mix with the ore during mining, imparting a certain degree of preg-robbing behaviour to the ore. Test samples exhibited slight preg-robbing behaviour, with a gravity recovery of 30.9% and an overall recovery of 92.4% using the gravity-CIL process.

Natal

The wall rock of the ore deposit is carbonaceous shale, which has a significant preg-robbing behavior. The overall recovery for the gravity and carbon-in-leach (CIL) process ranges from 78.7% to 85.3%, indicating moderate amenability.

Table 10-1: Metallurgical Test Results of Paddington Free Milling Deposit Samples

Notes:

[1] Cyanidation recovery is stage leaching rate against gravity feed.

Havana

No test data was observed, but in 2024, the Paddington processing plant treated a total of 6,577 tons of ore with an average grade of 0.72 g/t, producing 4.45 kg of gold and achieving an actual recovery of 93.6%, indicating the Havana ore is amenable to the process of Paddington processing plant.

Homestead

The average grade of two samples was 3.39g/t, with the gravity recovery of 71.9%, CIL recovery of gravity tailings of 82%, and overall recovery of 93.5%.

Breakaway Dam

The ore was processed using the gravity and whole ore cyanidation (WOCN) method, resulting in a tailings grade of 0.02 g/t and a total gold recovery of 92.4%, indicating that the ore is amenable to the Paddington Plant's flowsheet.

Enterprise

Enterprise ore has moderate processability, with gravity-CIL recovery ranging from 82.5% to 87.5%, making it suitable for processing at the Paddington Plant.

Rose Dam

The ore contains very fine free gold and has a low Gravity Recoverable Gold (GRG) content of 4.1%, with an average head grade of 6.05 g/t. The average cyanidation recovery of 91.7%, with rapid leaching achieving over 80% recovery within 2 hours.

Tom Allen

Amalgamation-WOCN tests were conducted on eight samples at a grinding fineness of P_{80}=75μm, with an average sample grade of 2.28 g/t. Results showed the average amalgamation recovery of 30%, and the average total recovery of 88.6%.

Tuart

Gravity-CIL test was carried out on a composite sample with a grade of 3.74 g/t. The results showed that the gravity recovery rate was 74.9%, the CIL leaching rate of the gravity tailings was 87.6%, and the overall recovery was 97.2%. This indicates that the ore is suitable for processing at the Paddington Plant.

10.1.2 Racetrack

Gold in the Racetrack ore is primarily encapsulated in pyrite and arsenopyrite in fine-grained and sub-microscopic forms, making it a refractory ore for cyanidation. Since the 1990s, extensive process mineralogy studies and metallurgical testing have been conducted. The main research contents are summarized in Table 10-2.

Table 10-2: Processing and Metallurgical Test Study on Racetrack Ore

Direct Cyanidation

Three samples from Racetrack (CML, EML, and SPL) were ground to 80% passing 74 μm and ultrafine ground to 80% passing 10 μm, followed by 24-hour cyanidation with carbon-in-leach (CIL). The results, as shown in Table 10-3, indicate very low gold leaching rates, confirming that Racetrack ore is refractory to leaching. Studies have shown that the gold leaching rate is closely and positively correlated with the arsenic content in the ore, as illustrated in Figure 10-1.

Table 10-3: Whole Ore Cyanidation Test Results of Racetrack Samples

Sample	Grind Size (P_{80},μm)	Grade (g/t)		Au Leaching rate (%)	Consumption (kg/t)	
		Calc head	Residue		Lime	NaCN
CML	74	1.76	1.14	35.5		0.69

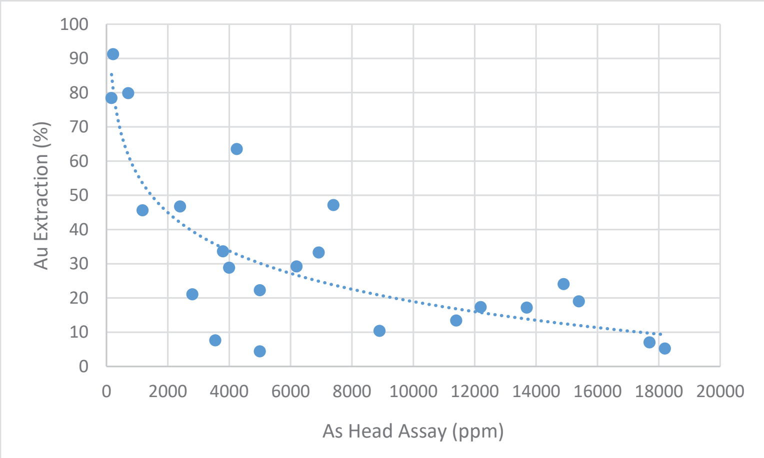
EML	74	3.97	3.61	9.0		0.68
	10	3.78	3.01	20.3		1.16
SPL	74	8.08	6.32	21.6		0.75
	10	7.35	5.10	30.5		0.97

Figure 10-1: The Relationship Between Gold Leaching rate and Arsenic Content



Flotation

Open-circuit flotation tests and gravity-flotation open-circuit tests were conducted on three samples with different grades. The results indicated that both single flotation and gravity-flotation processes achieved high recovery of approximately 90%. However, gravity separation did not contribute to further recovery improvements. Therefore, closed-circuit flotation test was carried out on a composite sample of the three samples. The process and conditions are shown in Figure 10-2, and the results are presented in Table 10-4. An overall recovery of 84.48% was achieved, but the tailings grade (including cleaning tailing and roughing tailing) remained relatively high, at 0.47 g/t.

Table 10-4: Flotation Test Results of Racetrack Composite Sample

Product	Yield (%)	Grade (Au, Ag g/t; As, S %)				Recovery (%)			
		Au	Ag	As	S	Au	Ag	As	S
Concentrate 1	3.11	58.44	28.90	9.19	20.95	62.98	45.03	58.31	70.82

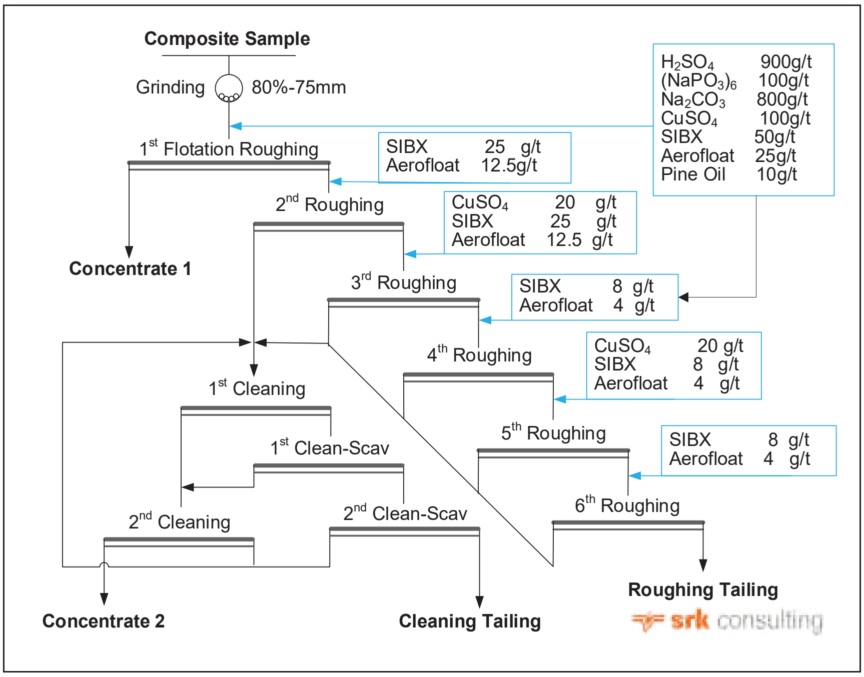
Figure 10-2: Flotation Test Flowchart of Racetrack Composite Sample



Cyanidation of Flotation Tailings

WOCN leaching tests were conducted on flotation tailings at the original grind size of P_{80}=74µm. Result is shown in Table 10-5. The tests indicated that gold leaching rate varied significantly depending on the water type used for slurry preparation. The high salinity of the Site water negatively impacted leach efficiency.

Table 10-5: WOCN Test Results for Flotation Tailings

Sample	Water	Grade (g/t)		Au Leaching rate (%)	Consumption (kg/t)	
		Calc head	Residue		Lime	NaCN

CML	Site Water	0.44	0.27	30.9	6.7	1.14

Cyanidation of Flotation Concentrates

Cyanidation leaching tests were conducted on flotation concentrates from three samples using different pretreatment methods, including ultrafine grinding-cyanidation leaching, POX-cyanidation leaching, AOX-cyanidation leaching, and BOX-cyanidation leaching. The results are summarized in Table 10-6. The tests indicate that both POX-cyanidation leaching and BOX-cyanidation leaching achieved higher gold leaching rate. Furthermore, the gold leaching results showed no significant difference when POX residues were prepared using either tap water or saline brine. In BOX tests, gold recovery rates were similar under oxidation durations of 7 days and 10 days, respectively.

Table 10-6: Gold Cyanidation leaching results for flotation concentrates under different pretreatment methods

Sample	Water	Grade (g/t)		Au Leaching rate (%)	Consumption (kg/t)

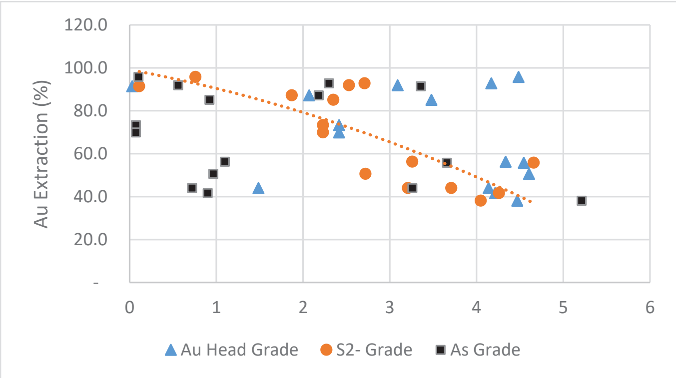
[3] Atmospheric oxidation condition: ultra-fine grading and strong alkali treated for 24 hours at 95℃-100℃

10.1.3 Gimlet South

Direct Cyanidation

In November 2020, Bureau Veritas Minerals Pty Ltd ("BVM") performed tests of WOCN in 15 drilling samples, producing a gold leaching rate rate of 38%-96% with huge variation. There is no clear relation between the gold leaching rate with grades of gold and arsenic. However, it is related inversely to the grade of sulfide (S^{2-}), as shown in Figure 10-3, suggesting the gold leaching rate is greatly influenced by the degree of ore oxidation. The averaged leaching rate of 15 samples is 67.9%, indicating that the ore of Gimlet South is refractory to cyanidation. The averaged gold leaching rate for another 15 samples WOCN is only 38.4%.

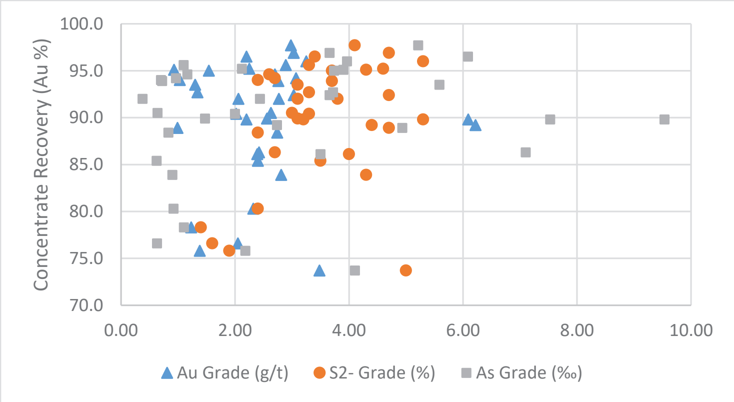
Figure 10-3: Cyanidation Leaching rate Vs Gold Grade, Sulfide Grade and Arsenic Grade



Flotation

Flotation testing was conducted on 34 samples all by one stage rougher, the relations between gold recovery and samples grade of gold, sulphide (S^{2-}) and arsenic is shown in Figure 10-4. The gold recoveries were discrete between 74% and 98%, averaging 89.7%. Gimlet South ore has moderate floatability.

Figure 10-4: Flotation Recovery Vs Gold Grade, Sulfide Grade and Arsenic Grade



Flotation and Tailings Cyanidation

Flotation-cyanidation tests were conducted on three composite samples representing the East, Central, and West zones of Gimlet South (OP1, OPM, OP2). The results are shown in Table 10-7. The gold flotation recovery ranged from 71.2% to 85.6%, the cyanide leaching recovery of the flotation tailings ranged from 62.5% to 82.6%, and the total recovery from flotation and tailings cyanidation ranged from 94.3% to 97.5%. The combined flotation and tailings cyanidation process can achieve ideal recovery and is suitable for processing Gimlet South ore.

Table 10-7: Flotation - Cyanidation Test Result on Three Gimlet South Composite Samples

Description	Unit	OP1	OPM	OP2
Feed Grade	g/t	1.48	1.76	2.36
Concentrate Grade	g/t	19.9	10.9	16.7

Concentrate Recovery	%	71.2	85.6	84.7
Tailings Grade	g/t	0.45	0.29	0.41
Cyanide Residue Grade	g/t	0.1	0.052	0.19
Cyanidation Leaching rate	%	82.6	82.3	62.5
Overall Recovery (Flot+CN)	%	95.0	97.5	94.3

10.1.4 Binduli

Binduli encompasses multiple gold deposits. Norton Gold Fields conducted mining operations in the area from 2010 to 2018. Ore with grade above 0.7g/t was the main target for mining. It was transported by truck to Paddington Processing Plant 40km away. Due to the low ore grade and long transport distance, multiple laboratory-scale column leach tests and high-pressure grinding roll (HPGR) crushing trials were carried out to evaluate the feasibility of heap leaching and determine the technical parameters for the heap leach plant. Heap leaching offers the benefits of low capital investment, low operating costs, and operational flexibility; however, its gold recovery rate is relatively lower compared to conventional methods. The metallurgical test results for the Binduli deposits are documented in the following reports:

- Koeppern Machinery Australia Pty Ltd, April 2012, High Pressure Comminution Test Work Report for Processing of Gold Ore for Paddington Gold (Janet Ivy, Navajo Chief)
- ALS AMMTEC, June 2012, Report No. A14015, Heap Leach Amenability Testwork conducted upon A ROM Crushed Gold Ore Sample from the Janet Ivy Gold Project for Paddington Gold Pty Ltd
- Xiamen Zijin Mining Technology Co., Ltd., May 2013, Norton Low-Grade Gold Ore and High-Salt Mine Pit Water Treatment Process Test Research Report.
- ALS Metallurgy, March 2014, Report No. A14588, Metallurgical Testwork Conducted upon Several Gold Ore Samples from the Navajo Chief and Janet Ivy Gold Projects for Paddington Gold Pty Ltd.
- ALS AMMTEC, August 2015， Report No. A16359, Metallurgical Testwork Conducted upon Gold Samples from the Navajo Chief Project for Paddington Gold Pty Ltd.
- ALS Metallurgy, June 2015, Report No. A16437, Metallurgical Testwork Conducted upon Gold Samples from the Janet Ivy Project for Paddington Gold Pty Ltd.
- Weifeng Jian, July 2020, Binduli North Gold Mine Column Leach Test Report
- JK Tech, August 2023, JKTech Job No. 23003/P13, SMC Test Report

These tests primarily focused on ore samples from the Navajo Chief and Janet Ivy deposits. Table 10-8 presents the bottle roll test results for ores with different particle sizes, illustrating the significant influence of ore particle size and leaching duration on gold recovery rates. Table 10-9 summarizes the results of column leach tests with agglomeration, showing that finer crushed particle sizes combined with agglomeration can achieve higher gold recovery.

The test results are summarized as follows:

- The Binduli ores are amenable to cyanide leaching. WOCN achieves gold leaching rate exceeding 90% when the ore is ground to a fineness of 90% passing 75μm.
- Particle size is the primary factor influencing gold leaching, followed by leach time.
- Ores crushed using high-pressure grinding rolls (HPGR) demonstrate higher column leach leaching rate compared to those processed with conventional crushing equipment.
- Finer crushing may compromise heap permeability. Agglomeration effectively addresses this issue by improving permeability.
- Agglomeration heap leaching is a viable process option for ores subjected to finer crushing.

Table 10-8: Bottle Roll Cyanidation Test Results of Binduli Ore Samples

Feed Size	Leaching Time (h)	Feed Grade (g/t)		Residue Grade (g/t)	Gold Leaching rate (%)	NaCN Consumption (kg/t)

Note:

1. Cone crusher Product

10.2 Paddington Processing Plant

10.2.1 Overview

Paddington Processing Plant was put into operation in 1985. It has undergone multiple rounds of upgrading and transformation. The current process and equipment were finished in 2003. Gravity –

CIP process was adopted to process the ores from multiple mines. The product is gold doré bars. The actual throughput is above 3.5Mtpa.

Among all the deposits, Racetrack and Gimlet South are refractory to cyanidation. Zijin (Xiamen) Engineering Design Limited prepared a feasibility study report for the refractory resource development dated April 2021(2021 FSR). The 2021 FSR designed a flotation circuit to be added in Paddington Processing Plant to process the refractory ore. The gold concentrate produced from flotation circuit will be sold directly, and the flotation tailings will be subject to the existing CIP circuit. The processing tonnage of the refractory ore is scheduled to 1 Mtpa. The flotation project has not yet been implemented. The flotation project construction was 97%completed.

Figure 10-5 is a distant view photograph of the Paddington Processing Plant. Multiple open pit and underground deposits located within 40km from Paddington Processing Plant.

Figure 10-5: Distant View Photograph of Paddington Processing Plant

10.2.2 Current Processing Flowsheet

Figure 10-6 shows the current process of Paddington Processing Plant, which is composed of the followings.

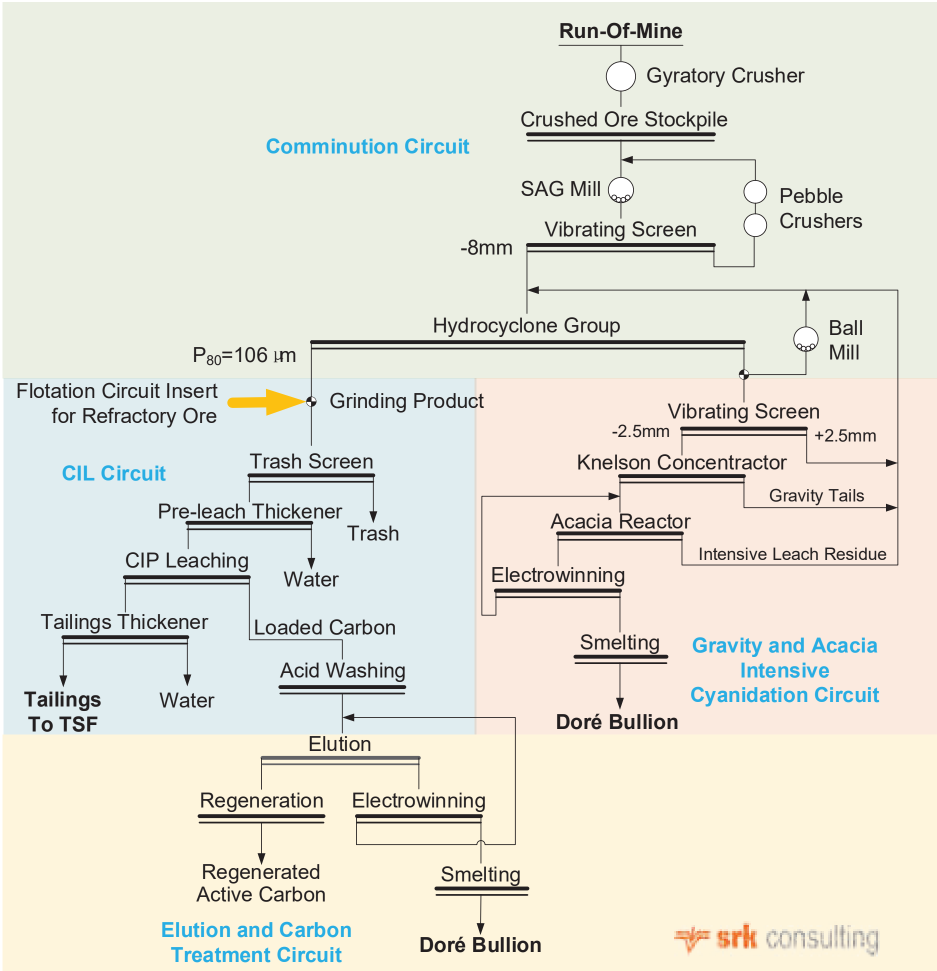
- Primary crushing: gyratory crusher
- Grinding: semi-autogenous mill + ball mill + pebble crusher (SABC)
- Gravity separation: Knelson concentrator in grinding circuit recover liberated gold grains
- Intensive cyanide leaching: Acacia reactor unit extract gold from gravity concentrates
- CIP process: cyanide leaching and carbon adsorption
- Elution: gold loaded carbon desorption and electrowinning
- Smelting: gold sludge smelting and doré bullions casting
- Tailings disposal: tailings thickening and deposited in the TSF

The comminution circuit of the plant consists of a 300kw gyratory crusher, feeding 110mm product into the SAG mill. From there the +6mm material is crushed by a pebble crusher and fed back into the SAG mill, while the –6mm material is pumped to a cyclone cluster. The underflow from the cyclones feeds the ball mill, with one third of this stream split out and sent to the gravity circuit; the cyclone overflow is pumped to the pre-leach thickener.

The gravity circuit contains four Knelson Concentrators used to recover liberated gold; the underflow from the Knelsons is the gravity concentrate. The concentrate is then posed to intensive cyanidation by an Acacia reactor and electrowinning cells.

The cyclone overflow feeds the pre-leach thickener, which is a high-rate thickener designed to increase the pulp density to approximately 50% solids before entering the leaching circuit. The leaching circuit consists of four 3000m3 tanks running approximately 300ppm CN^-. Carbon is now added to leach tanks 3 and 4 as well as the 10,360m3 adsorption tanks, which have carbon running counter current to pulp flow. Retention times average around 25hrs for leaching and 20hrs for adsorption considering that two of the leach tanks also act as adsorption tanks. The carbon is eluted via a Pressure Zadra process, and from there electrowinning and smelting refine the gold into a saleable product.

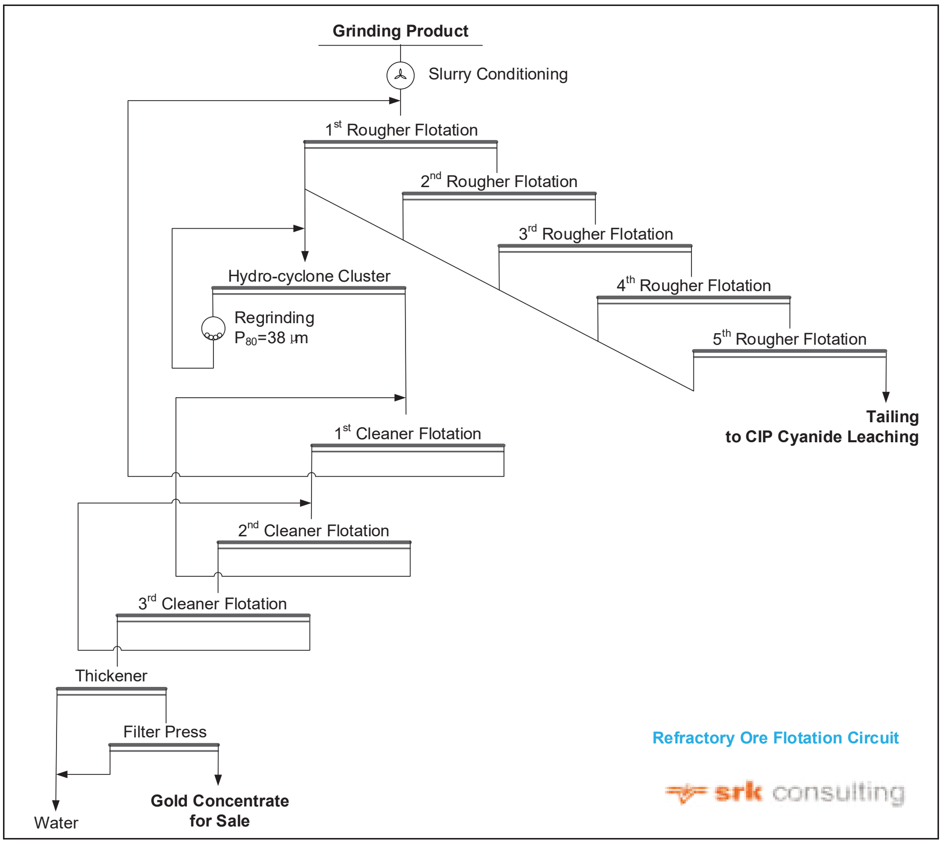
Figure 10-6: Current Flowsheet of Paddington Processing Plant



10.2.3 Proposed Refractory Ore Flowsheet

It is designed to adopt the combined process of gravity - flotation - cyanidation, and the products are flotation concentrate and gold doré bullions. The gravity separation and cyanidation systems utilize the existing processes and equipment, while adding a flotation circuit between the gravity and CIP circuits. Flotation circuit adopts a flowsheet of five roughers and three cleaners with the roughing concentrate reground to 80% minus 38μm (P_{80}=38μm). The flotation gold concentrate is dehydrated through two stages of thickening and filtration, reducing the moisture less than 10%, and stored for sale. Flotation tailings are reported into the CIP circuit. The designed flotation flowsheet is shown as Figure 10-7.

Figure 10-7: Flotation Circuit for Refractory Ore



10.2.4 Processing Facilities and Main Equipment

Paddington Processing Plant mainly utilizes the original facilities and equipment which includes the ROM ore stockpile, primary crushing station, intermediate ore pile, grinding workshop, CIL workshop, carbon treatment workshop, PSA oxygen Plant and laboratory, etc. Additional facilities and equipment of flotation for refractory materials has not yet been built, which will include flotation workshop, concentrate dewatering workshop and other supporting facilities. The main processing and metallurgical equipment on service are shown in Table 10-10.

10.2.5 Historical Production Performance

The production performance of Paddington Processing Plant in recent years is listed in Table 10-11. Figure 10-8 shows the relationship between recoveries and feed grade, data from the monthly production report from January 2021 to February 2025. The gravity recovery is obvious in direct proportion to the feed grade, but the overall recovery (gravity and CIP) is stable, varying from 89.1% to 94.3%, averaging 92.1%.

Table 10-11: Historical Production Performance of Paddington Processing Plant

Description	Unit	2021	2022	2023	2024
Dry Tonnes Milled	kt	3,939	3,658	3,636	3,968
Bullion Calc Mill Feed	g/t	1.20	1.64	1.76	1.83
Gold in Feed Ore	kg	4,738	5,998	6,382	7,243
Gravity Recovered Gold	kg	894	1,485	1,714	1,860
Calc Gravity Recovery	%	18.86	24.75	26.85	25.68
Leach Feed Grade	g/t	0.98	1.23	1.28	1.36
Leach Tail Solid Assay	g/t	0.08	0.12	0.12	0.13

Description	Unit	2021	2022	2023	2024
Gold Leaching rate	%	91.97	89.95	90.39	90.61
Solution Loss	%	1.35	1.04	1.15	1.14

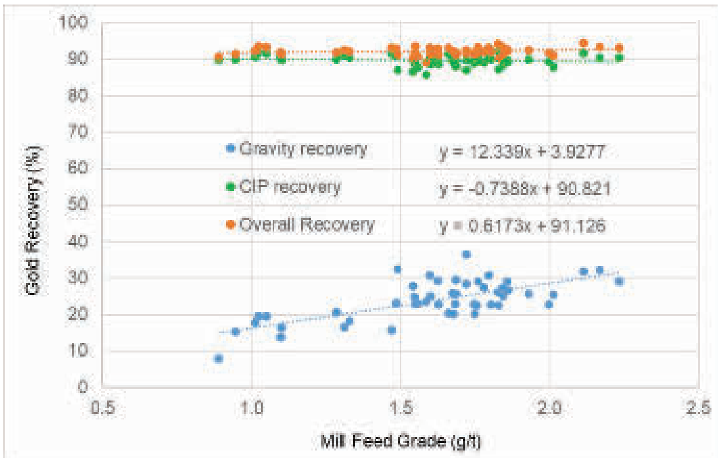
Figure 10-8: Feed Grade and Recoveries



10.2.6 Designed Refractory Recovery

The feasibility study on refractory ore (2021 FSR) design to process 1 million tons from Racetrack and Gimlet South per year in Paddington Processing Plant. The designed index are as in Table 10-12.

Table 10-12: The designed Metallurgical Indicators of Refractory Ore

Product	Weight (t)	Weight (%)	Grade (g/t)	Gold (kg)	Recovery (%)
Racetrack Mine					
Ore Milled	1,000,000	100.00	2.28	2,280	100.00
Flotation Concentrate	29,020	2.90	55.0	1,596	70.00
Gravity Concentrate	228	0.02	1,000	228	10.00
Gold Loaded Carbon	17,290	0.02	1,000	173	7.58
Tailings	970,752	97.08	0.29	283	12.42
Gimlet South Mine					
Ore Milled		100.00	1.62		100.00
Flotation Concentrate		3.78	30.0		70.00
Gravity Concentrate		0.02	1,000		10.00
Gold Loaded Carbon		0.01	1,000		7.58

Product	Weight (t)	Weight (%)	Grade (g/t)	Gold (kg)	Recovery (%)
Tailings		96.20	0.21		12.42

10.2.7 Tailings Storage Facility

The Paddington processing plant has historically utilized multiple tailings storage facilities (TSFs), most of which are exhausted open-pit mines. Currently, only the Paddington open-pit TSF, located 5km west of the processing plant, remains in use, while the others have been decommissioned. Table 10-13 outlines the status of these TSFs.

The Paddington in-pit TSF has a minimum surface elevation of 361 meters and a total capacity of 60,177,789 cubic meters. The supernatant water from the TSF is pumped back to the processing plant for recycling using a barge pump station. By the end of December 2024, the TSF's water level will be 24.73 meters below the surface, with a remaining storage capacity of 19,704,042 cubic meters and an estimated remaining service life of approximately 10 years. Figure 10-9 is the photo of the Paddington in-pit TSF.

Table 10-13: Paddington TSFs Statues

TSF Name	Mine Leases	Status
Paddington In-Pit TSF	M24/20 and M24/181	Active
Corlac In-Pit TSF	M24/20, M24/180, M24/716	Inactive - currently used for water storage
Panglo In-Pit TSF	M24/239	Inactive - under rehabilitation
Baseline In-Pit TSF	M24/183	Inactive - rehabilitation work completed January 2020, including ripping and seeding
Paddington TSF3	M24/422	Inactive
Black Lady Sands TSF	M24/187 and M24/234	Inactive - surface cover of hard rock completed in 2020 and seeding executed in 2021
Mt Pleasant TSF2	M24/234	Inactive - under rehabilitation
Mt Pleasant TSF3	M24/234	Inactive - under rehabilitation
Mt Pleasant TSF6	M24/234, M24/80, M24/82	Inactive - northern and western sides battered down and covered with hard rock in 2020
Ora Banda TSF1	M24/29	Inactive - under rehabilitation
Ora Banda TSF2	M24/29	Inactive - under rehabilitation
Ora Banda TSF3	M24/194	Inactive - under rehabilitation

10.3 Binduli Heap Leaching Plant

10.3.1 Introduction

Zijin (Xiamen) Engineering Design Co., Ltd. completed the feasibility study for the heap leaching project in February 2021 and designed the Binduli Heap Leach Plant. The Binduli Heap Leach Plant is designed to process 5 million tonnes of ore per year using an agglomeration heap leaching process to treat ore from Binduli North and South. There are also plans to send high-grade ore from Binduli to the Paddington processing plant for treatment.

The Binduli Heap Leach Plant was completed and began stacking in 2022. It is located west of the Fort Scott open-pit mine and includes facilities such as the leaching pad, crushing line, solution ponds, adsorption area, and smelting workshop. These facilities are arranged in a decentralized manner. The crushing system is located between the Karen Louise and Fort Scott open-pit mines, while the solution ponds, adsorption area, and smelting workshop are located approximately 1 km west of the crushing line. The heap leach plant covers an area of approximately 125,000 m².

The leaching pad is situated on a flat plain about 600 m southwest of the crushing line, covering an area of approximately 974,400 m². Due to the large area of the leaching pad, it is being constructed in phases. Phase I was built during the plant construction period, covering an area of 405,500 m², while Phase II will be constructed in the fourth year of production, covering an additional 405,500 m². The solution ponds are located on the northern side of the leaching pad, in a relatively lower area. Figure 10-10 provides a panoramic view of the Binduli Heap Leach Plant.

Zijin (Xiamen) Engineering Design Co., Ltd. completed a prefeasibility study for the expansion of Binduli heap leaching project in May 2025 (Expansion PFS). It designed to build another heap leaching plant (No. 2 plant) adjacent to the existing plant (No.1 plant) for processing the ore of Binduli South and mineralized waste rock. The leaching pad of No.2 plant covers an area of 1,100,000 m2 with standalone solution ponds and active carbon adsorption unit. A dedicated mobile crushing and agglomeration line for auriferous waste rock with 2 Mtpa capacity is designed to be built. The No.2 heap leaching plant is planned to treat 2 Mtpa of mineralized waste rock using new equipment and 6 Mtpa of Binduli south ore using the equipment of No.1 plant.

Figure 10-10:A Panoramic View of Binduli Heap Leach Plant

10.3.2 Heap Leach Process and Facilities

The heap leaching process is relatively simple, as shown in Figure 10-11. After the ore is crushed and agglomerated, it is stacked on an impermeable liner pad. An alkaline sodium cyanide solution is sprayed over the ore heap, and as the solution percolates downward, it leaches gold from the ore. The gold-bearing solution (pregnant leach solution, PLS) is collected in a pregnant solution pond. The PLS is then pumped through a bank of active carbon adsorption tanks, and gold is adsorbed onto activated carbon. The barren solution, after gold adsorption, is replenished with sodium cyanide and reused for heap leaching. The gold-loaded carbon is processed in a desorption-electrowinning unit, where gold is desorbed and deposited as gold sludge. The gold sludge is then dried, smelted, and cast into bullion, resulting in gold doré bars.

The facilities and equipment for gold ore heap leaching are also relatively simple, including the leaching pad, solution ponds, crushing equipment, agglomeration equipment, stacking equipment, leaching solution sprinkler distribution pipe net, adsorption equipment, and gold-loaded carbon processing equipment. Table 10-14 lists the main facilities and equipment.

- **Leach Pad:** Covers an area of approximately 938,000m². The structure, from bottom to top, consists of a base layer, a 400g/m² geotextile protective layer, and a 1.5 mm thick HDPE membrane impermeable layer.
- **Solution Ponds:** Includes a pregnant solution pond, barren solution pond, intermediate pond, and emergency flood pond.
- **Crushing:** Two-stage closed-circuit crushing combined with high-pressure grinding rolls (HPGR) is used to crush the ore to 80% passing 7mm.
- **Agglomeration:** Crushed ore is mixed with cement and lime, and sodium cyanide solution is sprayed during the rolling process in a drum pelletizer to improve heap permeability. Lime also acts as a protective alkali to prevent sodium cyanide decomposition, maintaining the pH of the leaching solution above 9.5.

- **Stacking:** A series of belt conveyors transport the agglomerated ore to the leaching pad, where it is stacked into heaps. The designed heap height is 10m, and new heap is stacked on top of the heap after the leaching process is completed.
- **Leaching Solution Sprinkling Distribution:** A leaching solution distribution network and sprinklers are installed on top of the heap. A low-concentration sodium cyanide solution, prepared in the barren solution pond, is evenly sprayed over the heap. As the solution percolates downward, it leaches gold from the ore, and the PLS is collected in the pregnant solution pond via channels.
- **Adsorption:** A series of adsorption tanks loaded with activated carbon are arranged in a stepped configuration. PLS is continuously pumped from the pregnant solution pond into the adsorption system, where gold is adsorbed onto the activated carbon. Once the carbon reaches the target gold loading, it is removed from the adsorption system and sent to the desorption-electrolysis system.
- **Sprinkling-Adsorption Cycle:** The barren solution, after adsorption, flows back to the barren solution pond, where sodium cyanide is replenished to the required concentration. The solution is then pumped back to the leaching solution distribution network for sprinkling over the heap. This sprinkling-adsorption-sprinkling cycle continues until the designed leaching recovery rate or leaching duration is achieved. The designed leaching duration is 90 days.
- **Elution-Electrowinning Cycle:** Gold-loaded carbon is processed in the elution-electrowinning unit under high-temperature conditions, where gold is desorbed and electrolytically deposited as elemental gold. The gold is periodically removed from the electrowinning cell as a sludge, referred to as gold sludge.
- **Smelting and Casting:** The gold sludge is washed, dried, mixed with flux, and loaded into a crucible. It is melted in a furnace and poured into molds to cast gold doré bars.
- **Regeneration of Barren Carbon:** During the gold adsorption process, the activated carbon is contaminated by inorganic and organic substances, reducing its gold adsorption capacity. The barren carbon, after desorption, is washed with dilute hydrochloric acid to remove inorganic substances and calcined in a rotary kiln to remove organic substances, restoring its gold adsorption capacity. The regenerated carbon is reintroduced into the adsorption system.

Figure 10-11:Binduli Heap Leach Process Flow Diagram

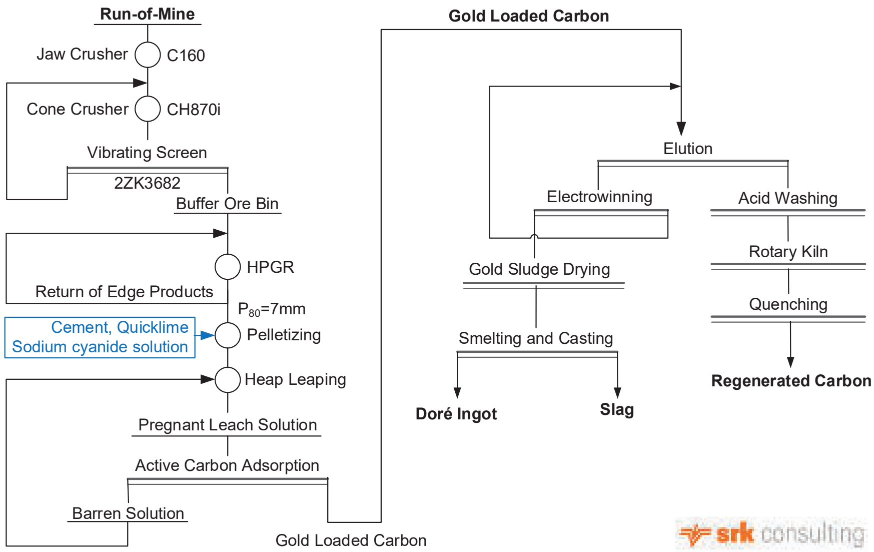

Table 10-14: Main Facilities and Equipment of Binduli Heap Leach Plant

No	Equipment	Specification	Power (kW)	Qty
1	Leach pad	405,500m^2		2
2	PLS pond	12,000m^3		1
3	Intermediate pond	12,000m^3		1
4	Barren solution pond	12,000m^3		1
5	Flood control pond	100,000m^3		1
6	Primary crusher-jaw crusher	C160	250	1
7	Secondary crusher-cone crusher	CH890i	750	1

12	Thor stacker	LPT130×36-0900M	22	1
13	Adsorption tank	Φ3m×6m		36
14	Elution-electrowinning unit	5 t		1
15	Smelting furnace	A300 ISO Universal		1

10.3.3 Production Performance

The Binduli Heap Leach Plant was constructed and commenced ore stacking operations in 2022, transitioning to the solution irrigation and leaching phase in 2023. It should be noted that the heap leaching process involves an extended production cycle, typically requiring several months from ore stacking to the completion of leaching. Therefore, short-term recovery rate metrics may not accurately represent the actual leaching performance, and longer-term monitoring is required for a comprehensive evaluation.

Given the current high gold price environment and the lower recovery of heap leaching compared to the CIP process at the Paddington Plant, a plan is being considered to transport high-grade ore to the Paddington Plant for treatment. The Binduli Heap Leach Plant will focus on processing low-grade ore to enhance overall resource utilization efficiency.

Table 10-15: Binduli Heap Leach Plant Production Records

Description		Unit	FS Design	2023	2024	Total
Crushed Ore (Stacked ore)	Tonnes	kt	5,000	3,006	4,097	7,989
	Grade	g/t	0.62	0.51	0.56	0.53
	Gold	kg	3,100	1,530	2,314	4,244

	Gold	OZ	99,667	46,258	73,026	125,859
Actual Recovered Gold		kg	2,310	845.6	1,596.8	2,760.2
		OZ	74,268	27,188	51,339	88,743
Heap leach recovery		%	74.51	58.78	70.30	70.51

11 Workforce Assessment

11.1 Workforce Numbers

Workforce numbers at the Norton, as of 31 December 2024, are shown in Table 11-1. The total workforce number was 728, which includes 399 for the Paddington Operations and 199 for the Binduli Operations, and the rest were located in different departments, such as the management, geology and exploration, project development, environment, safety, and business support and etc.

Table 11-1: Workforce Number Statistics in Paddington Mining Area

Department/Operation Centre	Numbers
Paddington Operation Centre	399
Binduli Operation Centre	170
Administration	5
Business Services Support	18
Environment	8
Executive	8
Finance	19
Geology and Exploration	24
Human Resources	11
IT	5
Project Development	16
Safety	37
Technical Services	8
Grand Total	**728**

Source: NGF

11.2 Assessment of Workforce

Based on the labour law of the Western Australia, all employees of NGF, including local people and foreigners holding working visas, have signed labour contracts with Norton. After completing a twelve (12) week-probationary period, the employees of NGF, besides having their basic annual salary, will enjoy residential allowance, death & TPD insurance allowance, and superannuation, and may enjoy short-term incentive bonus and additional superannuation.

As of 31 December 2024, the total number of employees is 728, including 700 local staff and 28 expatriates. SRK believes that the workforce number for both Binduli and Paddington operations centres, and other departments listed in the Table 11-1 is sufficient to match the current mining and processing capacity of both the Binduli heap leaching plant and the Paddington processing plant.. The annual staff turnover was estimated at 27.9% of the workforce, including 25.5% for technical, management and/ or professional and 31,0% for others.

12 Project Infrastructure

12.1 Paddington Mining Area

12.1.1 Access

Paddington Mining Area is located in the world-renowned gold mining belt—the Kalgoorlie Goldfield in Western Australia. The flotation projects of the Norton consist of the Racetrack Mine, Gimlet South Mine, Enterprise Mine, Tuart Mine, and Bullant Mine. The Racetrack Mine is located approximately 19 km southwest of the Paddington processing plant. The Gimlet South Mine is located 2 km southwest of the Enterprise Mine, about 38 km from the Paddington processing plant. The Tuart Mine is located about 18 km southwest of the Paddington processing plant, and the Bullant Mine is about 40 km southwest of the Paddington processing plant. The Paddington Plant is located approximately 35 km northwest of the city of Kalgoorlie, with geographic coordinates of 121°20'58" E and 30°29'15" S. The Racetrack, Gimlet South, Enterprise, Tuart, and Bullant mining areas are all connected to the processing plant via roads, providing convenient transportation within the mining area, with close proximity to the Goldfields Hwy Road, which runs south to the city of Kalgoorlie and north to the town of Menzies. The mining area is adjacent to the Kalgoorlie-Leonora railway.

12.1.2 Power Supply

Power Supply for Paddington Plant

Power for production including both the mining operations and the Paddington Plant, and domestic use is supplied by the Westen Power Grid. Based on the power supply agreement signed between Alinta Energy WA Pty Ltd. And Norton Goldfields Pty Ltd. on 30 August 2024 (start date 1 September 2024 – end date 30 June 2026), the Western Power Company can provide 20 MW to the Paddington Plant at prices of A$125.95/MWh exclusive of GST.

12.1.3 Water Supply

Water Supply for Paddington Plant

Norton will adopt the approach of building earth-rock dams in low-lying areas, or use closed mine open pits to collect surface rainwater as a water source for production. The Racetrack open pit currently has 4 Mm^3 of water in storage (maximum 7.7 Mm^3). It is currently used as a source of process water for the Paddington Plant (annual water withdrawal of approximately 1.11 Mm^3) with a production water consumption of 0.3 cubic meters per tonne ("**m^3/t**").

Poor quality local hypersaline water is used directly for processing / dust suppression, other better quality water sources are used preferential when available (ie after periods of high rainfall). If the Racetrack open pit is subsequently developed, a new water supply solution will need to be found to replace the Racetrack open pit. There are several similar open pits on the site to choose from, and combination of the Woolshed and Victory open pits would be the preferred option, providing a total capacity of 8.12 Mm^3 to meet the on-site production water supply for the project.

12.1.4 External Available Resources

Communication is very convenient with mobile phones and wireless network at mine site.

The mine site is located in a mining town with certain capabilities of machining, auto repair and automobile maintenance. Materials such as wood, sandstone, fuel, limestone, quartz stone, and some daily necessities for construction and production can be supplied locally. Cement, steel, steel balls, flotation chemicals, etc. are mainly supplied from other places.

12.2 Binduli Mining Area

12.2.1 Access

Binduli Gold Mine is located 10 km west of Kalgoorlie in Western Australia, and 40 km from Norton Goldfields' Paddington processing plant. The mining area is crossed by railways and roads, dividing it into southern and northern parts. Although the southern and northern mining areas are separated by roads and railways, there is a 6.6km long link road between them, which has an intersection with the highway, and there is also a underpass tunnel beneath the railway. Both of these locations allow for the passage of mining trucks, with a road throughput capacity of 2.5Mt/a

12.2.2 Power Supply

The Binduli Mining Area is located 10 km west of Kalgoorlie, and 40 km from the Paddington Plant.

There is a 145 MW substation of the Western Power Grid at the Binduli Mining area in Kalgoorlie, and there is also a 220 kV overhead line running from Muja substation to Kalgoorlie substation nearby. Additionally, the Parkeston Power Station are close to the mining area. However, there are many limiting factors in the power supply network in the eastern part of the goldfield, and the nearby substations and multiple 132 kV transmission lines are all limited by their own capacity, which cannot provide sufficient power supply for mining and processing plant.

Currently, Norton is communicating with Western Power to discuss solutions for the electricity issues related to the mining activity and the Binduli Plant. At the same time, Norton plan to build an 11kV diesel generator station on the processing site according to production scheduling requirements, to meet the electricity needs for production and domestic use.

12.2.3 Water Supply

Water Supply System in Binduli North and Binduli South:

According to the Feasibility Study (Heap Leach Project) dated February 2021, the water will be drawn from Woolshed, using a floating boat pressurized water pumping station. The floating boat is equipped with two D220-85×10 type pumps (one in use, one as a backup), with individual pump parameters of $Q=265m^3/h$, H=770m, N=1,000kW. A welded steel pipe with a diameter of DN250 will be buried about 41km from the water pumping station to transport water to the new water pond for mining production and the new water pond for the processing plant, with a cover depth of 0.7m over the pipe. The water intake facilities can simultaneously meet the consumption of new water for both the northern and southern Binduli projects, with the addition of tees on the water intake pipeline to supply new water to the newly established water ponds in both northern and southern Binduli.

13 Environmental Studies, Permitting, Social or Community Impact

13.1 Environmental, Permitting, and Social or Community Review Process, Scope, and Standards

The process for verifying the environmental permitting and licensing compliance and operational conformance for the Norton Projects comprised a review and inspection of the projects' environmental management performance against:

- Western Australian environmental regulatory requirements; and
- World Bank/International Finance Corporation (IFC) environmental standards and guidelines, and internationally recognised environmental management practices.

The methodology applied for this environmental and social review of the project consisted of a combination of documentation review, site visit, and interviews with Norton technical representatives.

13.2 Environmental Legal Framework

In Western Australia, the Department of Mines, Industry Regulation and Safety (DMIRS) is the lead regulatory and decision-making authority for mining projects under the *Mining Act 1978*. DMIRS is responsible for regulating mining activities throughout the project life cycle, including oversight of mine closure conditions and implementation of environmental and operational commitments. Historically, operators submitted a Notice of Intent; this has since evolved into a Mining Proposal, which includes the mine closure obligations. These commitments are incorporated into the mining tenement conditions and are enforceable for the project life cycle.

In parallel, the Department of Water and Environmental Regulation (DWER) plays a critical role in regulating environmental impacts associated with mining activities. DWER is responsible for administering key environmental legislation, including the *Environmental Protection Act 1986 (EP Act)*, and is the primary authority for issuing Works Approvals and Environmental Licences under Part V of EP Act. These approvals regulate emissions and discharges to the environment and are essential for the construction and operation of prescribed premises, including processing plants, tailings storage facilities, and dewatering infrastructure.

Protection of the environment is covered by a number of pieces of legislation in Western Australia, some of which have overlapping roles. Any matters relating to the environmental legal obligations of Norton's operations, should be directed to the Environmental Department. Table 13-1 identifies the key pieces of legislation that should be considered and catered for through the implementation of the Norton Projects. Regulations have not been included in the table but should also be considered.

Table 13-1: Environmental Legislative Framework

Legislation	Agency	Factor Summary
Aboriginal Heritage Act 1972	DPLH[1]	Protection of Aboriginal Cultural Heritage.
Biodiversity and Conservation Act 2016	DWER	Protection of flora, fauna and ecological communities.

Legislation	Agency	Factor Summary
Carbon Rights Act 2003	DWER	Management of carbon sequestration and release.
Conservation and Land Management Act 1984		Protection and management of certain public lands and waters, and the flora and fauna within.
Contaminated Site Act 2003	DWER	Provides for the identification, recording and management of contaminated sites.
Dangerous Goods Safety Act 2004	DEMIRS	Prescribes the manner in which dangerous goods are stored, handled and transported.
Environmental Protection Act 1986	DWER	Key environmental protection legislation in WA establishing the framework for project approvals and environmental management.
Environmental Protection and Biodiversity Conservation Act 1999	DCCEEW[2]	Key national environmental legislation providing means to protect and manage matters of national environmental significance.
Land Administration Act 1997	DPLH	Administration of land tenure.
Mining Act 1978	DEMIRS	Provides for the establishment of mining tenure and governs mining activities and requirements.
Native Title Act 1993	AGD[3]	Establishes Native Title claimants' rights and interests in land and waters.
Rights in Water and Irrigation Act 1914	DWER	Management of natural water resources including licencing requirements.
Waste Avoidance and Resource Recovery Act 2007	DWER	Management of waste.
Work Health and Safety Act 2020	DEMIRS	Provisions regarding the health and safety of workers and the management of workplace risks.

Note:

[1] DPLH: Department of Planning, Lands and Heritage;

[2] DCCEEW: Department of Climate Change, Energy, the Environment and Water; and

[3] AGD: Attorney-General's Department.

13.3 Permitting

Mining projects that may have a significant effect on the environment are referred to the Environmental Protection Authority under Part IV of the Environmental Protection Act 1986 (EP Act). The Binduli North Project (BNP) was referred to EPA in January 2021 and on the 10 May 2021 the decision not to assess the BNP was published. Accordingly, no approvals have been granted under Part IV for the BNP. No other parts of the Projects have ever been referred to the EPA during the approvals process and there are therefore no approvals are granted pursuant to Part IV of the EP Act. Accordingly, no public Environmental Impact Assessment (EIA) has been required as of the effective date of this report. However, any future project expansions or modifications may be subject to referral and potential assessment by the EPA, depending on their environmental significance.

In contrast, Works Approvals and Environmental Licences pursuant to Part V of EP Act are issued by DWER for the Norton Projects. SRK has viewed all available copies of these approvals, and a summary is provided in Table 13-2.

Table 13-2: Works Approvals and Environmental Licences

Permit / Licence	No. / Project	Holder	Effective Duration
Paddington			
DWER Operating Licence	Paddington Exemption	Paddington Gold Pty Ltd	Commencement: 30/11/1992 (No expiry)
Ora Banda			
DWER Works Approvals	W6279/2019/1 Enterprise Mine Site	Paddington Gold Pty Ltd	25/11/2019 - 24/11/2026 Last Amended: 05/10/2023

Groundwater abstraction requires a Groundwater Licence (GWL) as issued by DWER under the *Rights in Water and Irrigation Act 1914 (RIWI Act)*. Norton has provided the copies of GWL160697(4), GWL160697(4), and GWL167686(6) for dewatering for mining purposes, dust suppression for mining purposes, mineral ore processing and other mining purposes, and treatment of tailings. All licences are currently valid and within their effective periods.

13.4 Flora and Fauna

Multiple Mine Closure Plans (MCPs) for the Project have provided summarized descriptions of the baseline conditions of flora and fauna in the respective areas. The Project's Environmental Management Plan also includes the identification of ecological impacts, the assessment of their risk levels, and the corresponding conceptual management measures.

Due to the heavily disturbed condition of the sites and the limited presence of fauna, no habitats of conservation significance have been identified in the Mount Pleasant area. The existing degraded fauna habitats, combined with the availability of higher-quality similar habitats nearby, mean that the loss of individual animals from land clearing is not considered significant to the region's biodiversity. The fauna observed within the Mount Pleasant project area is characteristic of the Eastern Goldfields region. Ongoing disturbances from tracks, exploration drilling, grazing, and mining activities have significantly impacted the area, making it unlikely to support any notable fauna populations. Mining activities have led to the loss of sedentary species, while more mobile species have likely relocated to surrounding areas. Given the frequent human activity and noise from trains and vehicles, it is expected that only the hardiest animals remain. Observations of kangaroos and rabbits have been recorded.

No threatened flora species have been identified within the Binduli area. Database searches indicate that up to 29 conservation-significant fauna species may potentially occur in the region, including three mammals, 22 birds, one reptile, and three invertebrates. Given Binduli's proximity to both the City of Kalgoorlie and the Lake Douglas Recreation Reserve, measures should also be taken to prevent the relocation of feral cats and dogs into the project area.

Surveys undertaken within the Golden Cities project area have not recorded any Declared Rare, Threatened, or Priority Flora species, nor identified any vegetation communities of conservation significance. The absence of significant habitats is attributed to the highly disturbed condition of the area and the low abundance of fauna. Nonetheless, despite the lack of recognized conservation-significant habitat, the area is known to support the Malleefowl (Leipoa ocellata), with several nests, tracks, and sightings documented during flora and fauna surveys. Leipoa ocellata is listed as a conservation-significant species under both the Biodiversity Conservation Act 2016 and the Environment Protection and Biodiversity Conservation Act 1999. Furthermore, the project area contains no Environmentally Sensitive Areas (ESAs), wetlands, permanent watercourses, riparian vegetation, or conservation reserves.

The Lady Bountiful area has been heavily disturbed by historical mining activities, resulting in a very low likelihood of occurrence for any threatened or priority flora species, ecological communities, or species protected under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act). Additionally, no fauna species listed as rare under the EPBC Act were recorded during surveys.

The natural vegetation surrounding Ora Banda is characterized by open Eucalypt woodlands over Chenopods, interspersed with ridge system vegetation. No Threatened Flora taxa listed under the Biodiversity Conservation Act 2016 or the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) were identified within the survey area, and no Priority species are known to occur within the Project Area. Across all assessments, no fauna habitats of conservation significance were recorded, with all observed habitats being widespread throughout the region. Overall, the fauna surveys indicated a low diversity of habitats, primarily due to significant degradation associated with a long history of mining, exploration, and pastoral activities within the Project Area.

The Paddington mining area has been significantly degraded due to previous mining exploration and pastoral activities. At a local scale, vegetation clearing and mining development have led to the loss of a limited number of individual plants and species. No habitats of conservation significance have been identified within the Paddington project area, as the sites are highly disturbed and fauna presence is minimal. All observed habitats are widespread throughout the region, and any species of birds, reptiles, amphibians, and mammals that are present or likely to visit the area are also expected to be found in other similarly vegetated areas within the region. Several fauna surveys have been conducted as part of the approvals process for the Paddington projects. These surveys generally revealed a low diversity of habitats, and no fauna species of conservation significance, as outlined in the second schedule of the Biodiversity Conservation Act 2016, have been recorded as inhabiting the Paddington project area.

Several flora and fauna surveys have been conducted throughout the mining activities in the Carbine Project area. No Threatened Flora taxa, as defined under the Biodiversity Conservation Act 2016 or the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act), were identified within the survey area. Similarly, no Priority Flora taxa were recorded in the area. The fauna surveys recorded twenty-six bird species and one native mammal species within the survey area. No frogs or reptiles were observed. None of the bird species or mammals recorded during the survey are listed as specially protected under either State or Commonwealth legislation. The Project area does not contain any Environmentally Sensitive Areas (ESAs), wetlands, permanent watercourses, riparian vegetation, or conservation reserves. The nearest ESA, associated with Lake Marmion, is located more than 10 kilometers to the north of Mount Jewell.

13.5 Water Resources

The main groundwater resources in the Kalgoorlie region are located in palaeochannels, which were formed along ancient river systems during earlier geological periods. Groundwater typically exists as a regional water table that roughly follows surface topography, with a poorly defined lower boundary occurring at depths between approximately 30 and 100 meters. It is commonly found in fracture-controlled aquifers within fresh basement rock, within the weathered zone near the interface with unweathered rock, and in alluvial sediments—especially those linked to old palaeochannel drainage systems. Rainfall recharge is generally minimal, representing only a small fraction of total rainfall due to high evaporation rates, dense soils, extensive vegetation cover, and effective internal drainage. The majority of recharge likely takes place during intense rainfall events, when surface runoff and localized flooding significantly enhance infiltration.

Surface water resources in this area are extremely limited, with surface flows typically observed only after prolonged and intense rainfall events. The region is drained by a network of creeks that generally flow southward into major drainage channels, which traverse floodplains and ultimately discharge into regional salt lake systems. The surface drainage is internally contained, characterized by significant sheet and rill flow immediately following rainfall. Localized flooding can occur, particularly in response to summer thunderstorms. There are no naturally occurring fresh water sources in the immediate vicinity of the area.

The groundwater table across the Binduli area generally ranges between 10 and 80 metres below ground level. All mining pits at Binduli are developed below the groundwater table, leading to the formation of pit lakes. Water extracted through pit dewatering is reused on site primarily for dust suppression purposes. Groundwater in Binduli region, sourced primarily from paleochannel drainage systems, is characteristically hypersaline and non-potable. Pit water chemistry varies from slightly acidic to slightly alkaline, with sodium chloride and calcium sulphate (gypsum) identified as the dominant solutes. A progressive increase in salinity has been observed in all pits following the cessation of mining operations. Concentrations of heavy metals remain low and are not considered environmentally significant. According to the mine closure plan of Binduli operations, It is considered unlikely that dewatering will have any impact on the surrounding environment or groundwater users.

The majority of pits within the Golden Cities area were excavated below the groundwater table and have since accumulated water, resulting in the formation of pit lakes. Groundwater quality within these lakes has been documented and is subject to annual monitoring in accordance with Norton's Groundwater Operating Strategy. The water in the pit lakes generally exhibits a neutral pH, ranging from 5.20 to 9.05, with an average of 7.67, and is characterised by moderate to high salinity. Across all sampled locations, barium and boron are the predominant metals, with concentrations ranging from 0.02 mg/L to 20 mg/L for barium and from 1.6 mg/L to 19 mg/L for boron. Other metals including aluminium, arsenic, cobalt, copper, iron, manganese, nickel, and zinc are present only in low amounts.

Most of the pits and all underground (UG) operations in the Mt Pleasant area have been excavated below the groundwater table, resulting in the formation, or potential formation, of pit lakes once dewatering activities cease at closure. Dewatering has been carried out throughout the mining operations within the Mt Pleasant project area and also to supply water for the Paddington processing facility. Currently, water is extracted from the underground operations and discharged into the Quarters pit, which in turn flows into the Violet pit. Water from the Rose South and Violet pits is also used to supply the Paddington Mill. In the event of significant storm conditions, water from the Racetrack pit is still utilized to support mill operations. Additionally, several standpipes are present in the area to assist with dust suppression efforts. The concentrations of heavy metal contaminants in all pits are generally low. Annual metal analyses show that many of the analytes are below detectable limits. The only exception is cadmium, which slightly exceeded the relevant guideline concentrations. Overall, the concentrations fall within the historical range of variation and are likely reflective of the regional water quality.

Groundwater levels across the Ora Banda area range from approximately 43 to 110 metres below ground surface. Among the pits, only Slippery Gimlet and Enterprise have been mined beneath the groundwater table, leading to the formation of permanent pit lakes. During Enterprise pit operations, groundwater is extracted and transferred via pipeline to the Gimlet South Pit. The water abstracted through Enterprise dewatering is retained within the Ora Banda site and utilised for dust suppression and other operational purposes. The groundwater chemistry is predominantly characterised by sodium and chloride salts, with lower concentrations of sulphate, magnesium, and calcium. Other ionic species are present at comparatively low total concentrations.

Most pits within the Paddington area were originally mined below the groundwater table. However, following their backfilling and conversion into in-pit tailings storage facilities (TSFs), only Leeks Pit currently contains a combination of groundwater and surface water, resulting in the formation of a pit lake. Water quality in both the pits and surrounding monitoring bores near the Paddington and Corlac in-pit TSFs is generally neutral to slightly alkaline, with heavy metal concentrations remaining relatively low. Cyanide concentrations, measured as weak acid dissociable cyanide (WAD-CN), are typically below detection limits in monitoring bores around the Paddington, Corlac, and Baseline in-pit TSFs. Nonetheless, slightly elevated levels exceeding 0.5 mg/L WAD-CN have been detected in some bores located in the northern section of TSF3. Dewatering has been routinely conducted across the Paddington project area. Depending on the potential risk to environmental receptors, water may be recovered from the Paddington and Corlac in-pit TSFs for seepage control. Additionally, water from these in-pit TSFs can be recycled for use at the Paddington Mill in mineral ore processing operations.

Historically, groundwater abstraction in the Carbine area was undertaken to facilitate open pit mining. However, only limited groundwater inflows were encountered during operations. Currently, small volumes of water are extracted from the San Peblo Pit for reuse in the underground mining activities at Bullant. Additionally, minor quantities are drawn from standpipes at the Wattlebird Pit to support dust suppression efforts.

Elevated metal concentrations in groundwater, exceeding ANZECC 95% species protection guidelines, are common and expected in mineralised areas due to naturally high background levels. Consistently elevated metals include aluminium, boron, cadmium, chromium, cobalt, copper, nickel, and zinc, though concentrations vary across monitoring bores.

SRK has reviewed Annual Environmental Report for Binduli North in 2024. Norton undertook monitoring of the nine (9) groundwater monitoring bores surrounding the heap leach in February, May, August, and November of 2024. The monitoring data from the nine monitoring bores indicates that:

- MBH01 has the lowest variety and concentrations of metals, with undetectable aluminium and generally stable levels, except for increasing iron and manganese since September 2022.
- MBH02 shows stable concentrations over time, with aluminium, boron, and strontium as dominant metals.
- MBH03 remains stable, though iron levels declined in 2024; aluminium levels have stabilised since 2023.
- MBH04 and MBH05 have the highest aluminium concentrations among all bores (2024 means: 76.55 and 429.6 mg/L respectively), though levels have stabilised in 2024.
- MBH06 has consistently high manganese (15.07 mg/L in 2024), along with elevated strontium and boron.
- MBH07 shows notable increases in boron, iron, and manganese since 2023, with iron reaching 19.6 mg/L by December 2024.
- MBH08 is characterised by high manganese, strontium, and boron, though with little fluctuation over time.
- MBH09 records the most metals at elevated levels. Aluminium and boron remain stable, while manganese increased (14.43 mg/L in 2024), and iron decreased significantly over the year.

Overall, 2024 monitoring results are consistent with trends observed in 2022 and 2023. Some changes may be attributed to a shift in sampling method (from static to pump-based collection). Ongoing monitoring in 2025 is expected to further clarify long-term trends. No cyanide was detected in any bore samples.

13.6 Waste Rock and Tailings Management

In 2001, Graeme Campbell and Associates Pty Ltd conducted geochemical testing on waste rock samples from the Bullant deposit ore zone, focusing on acid generation potential and multi-element composition. The study found the waste rock unlikely to cause acid rock drainage or significant minor element enrichment, deeming it suitable for long-term exposure uses such as safety bunds and rock armouring. At Wattlebird, 38 waste samples were tested, with six showing minor total sulphur levels (>0.3%, up to 1.31%), but all exhibited high neutralising capacity.

Graeme Campbell and Associates characterised waste rock and tailings samples across the Paddington project area in 1994 and 2000, with additional work by Golder Associates in 2009. Tested samples, including weathered rock and Black Flag Shale typical of the region, were found to be mildly acidic (pH 4.0–5.0) and saline to hypersaline. The acidity of weathered rocks reflects intense regolith weathering, while that of Black Flag Shale results from trace sulphide oxidation. Although no specific waste characterisation data exists for the Paddington and Corlac pits, Paddington 2 Waste Rock Dump (WRD) is known to contain small amounts of Potentially Acid Forming (PAF) material, which was typically encapsulated and capped with fresh rock. Ore processed at the mill has varied between 30–40% soft oxide and 60–70% hard sulphide ores. Tailings characterisation under various scenarios, including a worst-case 100% sulphide composition, indicated all samples were classified as Non-Acid Forming (NAF), suggesting acidification from sulphide oxidation is not a concern.

Geochemical analysis of waste rock from the Enterprise deposit showed low levels of sulphide-sulphur in all samples from the oxidised and transitional zones, classifying the material as NAF. However, one rock type—the Cashman Slate Unit—was identified as PAF, comprising about 2% of the total waste rock. Tailings characteristics in the Ora Banda area are well-documented, with key geochemical data presented in Campbell (1995). The report concluded that the tailings are expected to remain neutral to alkaline over time, with minimal risk of acid generation from sulphide oxidation.

No waste characterisation studies have been completed for the Lady Bountiful area. As mining activities were carried out within the weathered zone, the presence of PAF material is considered highly unlikely. Consequently, PAF and Acid Rock Drainage (ARD) are not regarded as risks for this area.

Detailed analysis of waste rock characteristics in the Mt Pleasant area has been limited for past mining operations. Approval documentation indicates that most of the waste rock generated in the area is NAF, mildly alkaline, and displays a range of sodicity and dispersive properties. Potentially PAF materials have been found in three deposits: Natal, Racetrack, and Golden Flag. Testing of tailings materials has shown that conditions within the tailings storage facilities are expected to remain neutral to alkaline, and therefore the development of ARD is not considered a significant risk.

Waste characterisation and geochemical investigations on waste rock from the Federal deposit were undertaken by Woodward-Clyde (1998) and more recently from Federal exploration drilling samples in 2018. The investigations undertaken revealed that the majority of the waste rock was non-acid producing. This is particularly the case for material excavated in the weathered zone to depths of less than 70m. Some minor PAF material was identified at depth, however the quantity was considered low. The Havana Suva deposit contains small amounts of pyrite which may produce drainage waters which are acidic and brackish due to pyrite weathering. The pyrite was located mainly in granite from the transition and primary zone, but no concerns were foreseen for placement of waste rock materials. Data and historical evidence demonstrate that the Golden Cities area has a low propensity for acid rock drainage and other adverse geochemical properties. In addition, there are significant quantities of fresh durable rock such that stable batters can be constructed to minimise sediment release, however, waste characterisation at Norton is an ongoing process from exploration, resource definition and throughout the physical mining regime.

Recent material characterisation studies have been undertaken on waste rock from the Navajo Chief, Fort William, Fort Scott, Karen Louise, and Janet Ivy deposits. Felsic porphyries are expected to make up a significant portion (approximately 42%) of the total waste volume from Janet Ivy and are also present in waste from the other deposits. At Fort William, Fort Scott, and Karen Louise, sedimentary rocks represent the predominant fresh rock type, accounting for up to 33% of the total waste, and these rock types will also be encountered at Janet Ivy. Across all samples tested, total sulphur content was relatively low, and the materials were classified as NAF. In 2009, MBS Environmental conducted physical and chemical assessments on 49 samples collected from fresh, transitional, and weathered waste rock from the Navajo Chief deposit. Of these, 47 were classified as NAF, one as PAF, and one as uncertain.

13.7 Air and Noise Emissions

The dust emission sources of the Project mainly come from open pit mining, blasting, loading and unloading, ore stockpile, crusher, waste dump, topsoil dump, TSF, and movement of vehicles and mobile equipment. Based on the Mining Proposals, water carts are utilised to spray saline water onto the surface of haulage roads to supress dust as required basis. Dust will be visually monitored from the ROM/laydown area including the pit and blasting activities. The shift supervisor will record visual measurements of dust at least once per day (however generally undertake routine 3 hourly site inspections). Any reports of excessive dust levels will be investigated and resolved promptly. During periods of high winds, clearing activities, topsoil handling will be restricted if dust cannot be adequately controlled. However, SRK did not view any air quality monitoring data of the project. According to the Mining Proposals, the effect of the particulates released from the combustion of fuel is expected to be negligible given the location of the project area.

The main noise emissions of the Project are from mining equipment, blasting, crushing and screening equipment, various types of pumps, fans, vehicles and mobile machinery equipment. Based on the Mining Proposals, all mining operations will comply with the noise regulations under the Mines Safety and Inspection Act 1994, Mines Safety and Inspection Regulations 1995 and the Environmental Protection Act (Noise) Regulations 1997. Norton implements measures to address noise, in accordance with their Noise Management Plan, which include but may not be limited to regular maintenance of equipment, periodical haulage of materials, restrict dozer operations to dayshift, etc. Upon receiving complaints, the responsible manager will promptly assess ongoing activities, and if mining-related noise is found to exceed acceptable levels, significant sources will be suspended. However, SRK did not view any noise monitoring data of the project.

Based on the *Mining Proposal on Binduli North Heap Leach Project V 6.0*, Norton intends to reduce the Binduli Project's reliance on diesel generated power by installing up to 8MWac of Cambridge single-axis tracking solar PV technology. The installation will be staged: 2MW will be installed in the northeast, another 2MW in the northwest, and the final 4MW in the southern area. The solar farm will be connected to the Binduli power switchboard via 1.7km of 11kV transmission cable. All solar modules are pre-fabricated and relocatable, and the contractor will be responsible for removing them at the end of the project. Remaining power needs will be supplied by Western Power. SRK considers that the solar farm project reflects strong alignment with broader industry trends toward decarbonization and energy cost optimization in the mining sector.

The *FY2024 Section 19 National Greenhouse and Energy Reporting (NGER) Report* for NGF (ABN: 23112287797), submitted on 29 October 2024, outlines NGF's greenhouse gas emissions and energy performance for the period from 1 July 2023 to 30 June 2024. As required under the *National Greenhouse and Energy Reporting Act 2007 (the NGER Act)*, the report covers Scope 1 and Scope 2 greenhouse gas (GHG) emissions, as well as energy production and consumption across all facilities under Norton's operational control. During the reporting year, NGF recorded total Scope 1 emissions of 103,962 t CO_2-equivalent (e) and Scope 2 emissions of 65,694 t CO_2-e, resulting in a combined total of 169,656 t CO_2-e. The dominance of Scope 1 emissions (61%) suggests high onsite fuel combustion, particularly from diesel. NGF consumed a total of 2,024,613 gigajoules (GJ) of energy, with net energy consumption of 1,957,968 GJ and onsite energy production of 66,645 GJ, indicating a substantial dependency on external energy sources. SRK believes that the data provides a baseline for future emissions reduction planning and aligns with sector norms, but there is room for improvement through enhanced energy management or decarbonization initiatives.

13.8 Hazardous Substances Management

Hazardous materials have the characteristics of corrosive, reactive, explosive, toxic, flammable and potentially biologically infectious, which pose a potential risk to human and/or environmental health. The hazardous materials will be generated mainly by the project's construction, mining, processing and include of hydrocarbons (i.e. fuels, waste oils, and lubricants), processing reagent, chemical and oil containers, batteries, medical waste, and paint.

Based on the Mining Proposals, all chemicals and hydrocarbons are transported, stored and disposed of in accordance with Norton's Environmentally Hazardous Substances Management Plan. Chemicals and hydrocarbons are stored within bunds. Bunding is designed to minimise the risk of contamination to the surrounding environment by containing any spilled products. In addition to storage bunding, portable pallet bunds are also utilised. Norton engages suppliers certified to transport dangerous goods and undertakes periodical dangerous goods audits across site.

Diesel will be stored within double lined, self-bunded fuel tanks. Bulk explosives will be transported to site and stored in a licenced magazine.

Spill response equipment will be available on each maintenance/service vehicle throughout the project. In the event of a hydrocarbon spill, the product will be contained by earthen bunds. The product will then be collected and recycled if practicable or disposed of via waste hydrocarbon collection. Any contaminated soil will be removed and taken to the bioremediation pad for treatment.

13.9 Occupational Health and Safety

A well developed and comprehensive safety management system comprises site inductions, site policies, safe work procedures, training, risk/hazard management (including signage), use of personal protective equipment (PPE) emergency response process, incident/accident reporting, an onsite first aid/medical centre, designated safety responsibilities for site personnel, regular safety meetings and a work permit/tagging system.

SRK has reviewed the Crisis and Emergency Management Plan (CEMP) for Norton Goldfields Kalgoorlie Operations which is designed to provide a structured approach for managing emergencies and incidents that may impact operations. The plan outlines four key phases: preparation, emergency response, business continuity, and recovery, and emphasizes the importance of managing these phases concurrently to minimize the impact of incidents and ensure a swift return to normal operations. It offers guidance on pre-planning, risk assessment, and incident management, with the goal of containing incidents, reducing impacts, and protecting both people and property.

The CEMP also defines the roles and responsibilities of key teams, including the Emergency Response Team (ERT), Incident Management Team (IMT), and Crisis Management Team (CMT). It highlights the need for clear direction in managing incidents, assessing risks, and avoiding escalation, while also focusing on business continuity by implementing strategies to meet critical business objectives. Additionally, the plan details administrative processes, such as action logs, and outlines the process for business recovery. It ensures that stakeholders' interests are considered and compliance with legal requirements is maintained. SRK also reviewed multiple duty cards that provide clear guidance to each Incident Management Team (IMT) member on their specific roles and tasks before, during, and after an incident, ensuring consistent and effective response actions.

A number of safety-related policies, management plans, and standards have been provided by the company. These documents cover areas such as the occupational health and safety policy, mental health policy, risk management policy, occupational health and safety management plan, incident reporting and investigation procedure, induction safety training procedure, processing plant safety operating procedures, and open-pit mining operating procedures. SRK considers the above-mentioned safety management plans, procedures, policies, and management systems to be consistent with general industrial practices in Australia.

The company has provided a statistical record of recordable injuries from 2023 to April 2024, with a total of 41 reported incidents. among them, there were 7 lost time injuries, 28 modified work injuries, and 6 medical treatment injuries. Under the Australian Work Health and Safety Act 2020, a person conducting a business or undertaking must ensure that the regulator is notified immediately after becoming aware that a notifiable incident has occurred in connection with the conduct of the business or undertaking. This provision aims to ensure prompt reporting of incidents that could pose risks to health and safety, allowing the appropriate regulatory actions to be taken without delay. The company reported these incidents to the Western Australian Department of Energy, Mines, Industry Regulation and Safety and SRK has sighted the company's Notifiable Incidents records from 2021 to 2025.

13.10 Mine Closure Plan and Rehabilitation

Norton provided SRK with the Mine Closure Plans (MCP) for Carbine (V3.1), Paddington (V4), Ora Banda (V3), Lady Bountiful (V2), Mt Pleasant (V4), Golden Cities (V6.2), and Binduli (V3.3) operations, all prepared in accordance with the DEMIRS *Statutory Guidelines for Mine Closure Plans 2020*, to ensure all operations are closed, decommissioned, and rehabilitated in an ecologically sustainable manner and leave no unacceptable liability on the State of Western Australia. SRK has reviewed all the available MCPs, which include the components of identification of closure obligations and commitments, stakeholder engagement, baseline and closure data and analysis, post mining land use, risk assessment, closure outcomes and completion criteria, closure implementation, closure monitoring and maintenance, financial provision for closure, etc, and SRK considered that the preparation of the MCPs is aligned with DEMIRS' expectations and best practice closure planning standards. It should be noted that the MCPs will remain dynamic and will be updated as new information is received, mining operations are modified and/or new mining operations within these tenements are submitted for approval.

Throughout the life of mine, environmental performance and closure progress should be documented and reported through the Annual Environmental Report (AER) submitted to DEMIRS. NGF provided SRK with the 2021-2025 DEMIRS AERs, including information on environmental monitoring, progress of rehabilitation activities, rehabilitation and closure planning, research and trials, etc. While the Mine Closure Plans (MCPs) for Carbine, Ora Banda, and Lady Bountiful are still under assessment, the MCPs for all other operations have been approved. No bond is required for any of the operations. Additionally, financial provisioning for mine closure is secured through the Mining Rehabilitation Fund (MRF), a compulsory contribution system for all tenement holders, ensuring that sufficient funds are available for rehabilitation. NGF provided several MRF Payment Notices for the projects, totaling AU$1,260,043.78 with varying due dates; however, SRK has not received any corresponding payment certificates for verification.

NGF has requested Mike Slight and Associates to undertake a review of the "End of Year" (EOY) closure costs for their Paddington operations as a part of their requirements for financial reporting for the 2024 year. SRK reviewed this *Report on NGF Closure Cost Update End of Year 2024*. The closure cost was estimated to encompass the activities related to closure, decommissioning, demolition, and rehabilitation, along with the associated support costs for new and existing operational areas that were established and continued during the year. As of the end of 2024, the total disturbance area reached 7,781.8 hectares. The total closure liability estimate is AU$ 145.92 million—an increase of 4.3% from 2023—driven primarily by expanded development at Binduli project, inflationary adjustments, and higher labour rates, partially offset by a 30% reduction in diesel fuel prices. The updated closure cost model aligns with regulatory expectations and NGF's internal requirements, and improved data reconciliation enhances the confidence in its accuracy.

13.11 Social Aspects

The Project area is located near the City of Kalgoorlie-Boulder, within the Goldfields region of Western Australia. The Company holds a tenement package of more than 1,000km² surrounding the Paddington Mill, 35km north of Kalgoorlie-Boulder in the Eastern Goldfields region. The project area is largely disturbed as a result of historic mining operations.

The mine closure plans provided by the company outlines key aspects of stakeholder engagement, including stakeholder identification, communication processes, communication strategies, and stakeholder engagement register. According to records, the project's stakeholder consultation includes Indigenous groups, local government, regulatory bodies, surrounding landholders, third-party infrastructure providers, and others.

Given Norton's substantial mining operations in the region, the company adopts a strategic approach to comprehensive stakeholder engagement, addressing issues related to both active operations and mine closure across multiple sites concurrently. Norton maintains regular communication with all stakeholders to discuss mine planning, ongoing activities, and closure-related matters. While Norton engages with stakeholders consistently, some have indicated a preference for consultation to occur on an as-needed basis. This engagement process reflects Norton's dedication to continuous and appropriate consultation, aiming to understand and respond to stakeholder needs. As the outlook for either resuming operations or completing rehabilitation becomes clearer, stakeholder engagement will continue and become increasingly targeted, particularly as the sites move toward final closure and relinquishment. In addition, the company has provided a Stakeholder Communications Register, which documents the content, methods, and follow-up actions of stakeholder communications conducted in 2022.

Stakeholder engagement plays a critical role in mining development in Australia. SRK is of the opinion that the above stakeholder engagement process helps build trust and transparency between Norton, local communities, Indigenous groups, and government authorities. By actively involving stakeholders throughout the project lifecycle, Norton can identify and address concerns early, reduce the risk of conflict or project delays, and ensure that social, environmental, and cultural values are respected. Effective engagement also supports regulatory compliance and enhances Norton's social license to operate, which is increasingly important for long-term project success.

SRK reviewed the 2021 Sustainability Report for the Binduli Gold Project, which highlighted several community engagement and local collaboration initiatives. The project established the "Binduli North Social Club" to foster community involvement, organizing charitable events such as a wine tasting fundraiser that raised AUD 8,000, and providing support to an Indigenous youth football team. In 2022, the project aimed to continue its community support by sponsoring local sporting events, family activities, and nonprofit organizations. Additionally, the project engaged 11 local contractors, including the Aboriginal owned company Karlkurla Pty Ltd, generating over 200 jobs and awarding contracts totalling AUD 10.5 million.

Based on the information currently provided, a number of Aboriginal Heritage sites or European Heritage sites have been identified within the tenements of Carbine, Paddington, Ora Banda, Mt Pleasant, Golden Cities and Binduli. Norton will ensure the sites are not disturbed during any closure activities that occur. Consultation with the relevant Native Title Groups is ongoing to ensure that mining operations do not disturb any significant sites and that the final land use of the mining areas and associated objectives are achievable.

14 Capital Expenditures and Operating Expenses

The NGF Project are strategically allocated across the Binduli operations (encompassing the Binduli Project area) and the Paddington operations, which include the Mt Pleasant Project (covering the Greater Mt Pleasant and Lady Bountiful areas), the Carbine Project (Carbine area), the Ora Banda Project (Ora Banda area), and the Golden Cities Project (encompassing the Golden Cities, Mulgarrie, and Mt Jewell areas).

Currently, the NGF Project functions as two distinct mining operations: the Binduli operations and the Paddington operations.

However, a future blending strategy is planned to optimize ROM material flow between the Binduli Heap Leach and the Paddington Mill Plant. This strategy will involve certain higher-grade ROM from the Binduli Mine being sent to the Paddington Mill Plant, and conversely, lower-grade ROM from the Paddington Mine being sent to the Binduli Heap Leach. Consequently, while capital expenditures may be delineated by the individual Binduli and Paddington projects, the detailed economic analysis for the Project's future operations will be conducted and analysed on a combined, integrated material flow basis, with the full analysis presented in the subsequent chapter.

14.1 Sunk Capital Expenditures

For the Paddington operations, total capital expenditure was AUD192.66 million in 2022, AUD107.56 million in 2023, and AUD134.47 million in 2024. These investments cover capital development for underground and open pit, exploration, rehabilitation, and general capital works.

For the Binduli operations, total capital expenditure was AUD269.63 million in 2022, AUD110.56 million in 2023, and AUD161.82 million in 2024. These expenditures were primarily for open pit capital development and capital works.

A detailed breakdown of these sunk capital expenditures is presented in Table 14-1.

Table 14-1: NGF Sunk Capital Expenditure (2022-2024) (Unit: AUD '000)

Item	Unit	2022	2023	2024

Total Capital Expenditure	**A$'000**	**269,629**	**110,562**	**161,820**

Sources: NGF

14.2 Expansion Capital Expenditures

The expansion capital expenditure associated with the Paddington operations is estimated at approximately US$103.79 million. This capital is planned across two distinct phases. The first phase primarily supports the development of the Federal underground mine infrastructure, with expenditures projected to be distributed evenly across the initial two years of the project (2025 and 2026), which is shown in Table 14-2. The subsequent phase, scheduled for 2028, allocates capital expenditure for the Paddington Mill, primarily targeting upgrades and expansion designed to enhance the mill's processing capacity, which is shown in Table 14-3.

For the Binduli operations, the expansion capital expenditure is estimated at approximately US$60.97 million. These costs are similarly planned for even distribution across the first two years of the project, in 2025 and 2026. A comprehensive breakdown of these expenditures, principally allocated to mining equipment and the development of the new heap leach pad, which is shown in Table 14-4.

Table 14-2: Paddington Mill Expansion in 2025 and 2026 (Unit: USD '000)

14.3 Sustaining Capital Costs

Sustaining capital expenditures are investments required to maintain current operational capacity, replace aging assets, and ensure ongoing efficiency and safety of the mining and processing operations throughout the LOM.

For the Paddington operations, NGF's plan includes an investment of US$16.17 million in 2025, US$1.99 million in 2026, and US$0.48 million in 2027. This initial sustaining capital primarily focuses on the underground mine and the processing plant. For future sustaining capital, SRK has applied a three-year average of US$6.17 million annually for 2028 and 2029. Following the completion of underground operations, SRK has then applied a three-year average (without underground expenditure) of US$3.05 million annually from 2030 to 2035. For the last year the LOM (year 2036) with reduced ore processing, SRK has applied 20% of the preceding annual sustaining capital.

Similarly, for the Binduli operations, NGF's plan incorporates sustaining capital investments of US$2.78 million in 2025, US$0.59 million in 2026, and US$2.31 million in 2027. This capital is predominantly allocated towards open pit mine equipment and the heap leach pad. For future sustaining capital, SRK has applied a three-year average of US$1.89 million annually from 2028 to 2037. For the last year of the LOM (year 2038) with reduced ore processing, SRK has applied 20% of the preceding annual average sustaining capital.

The sustaining capital plan, incorporating both NGF's proposed investments and SRK's estimation, is detailed in Table 14-5.

Table 14-5: Sustaining Capex Plan (Unit: USD '000)

14.4 Historical Operating Costs

Historical operating costs for the NGF Project are presented together for the Binduli and Paddington operations. These costs are categorized by key operational areas.

SRK has summarized the historical operating cost, which is shown in Table 14-6.

The All-in Sustaining Cost ("AISC") was USD1,604 per ounce in 2022, USD2,112 per ounce in 2023, and USD2,047 per ounce in 2024. A comprehensive summary of historical AISC is presented in Table 14-7.

Table 14-6: Historical Operating Cost (Unit: USD '000)

Item	Unit	2022	2023	2024

14.5 Future Operating Costs

SRK has estimated future OPEX based on a combination of factors, including the average cost from Paddington operations in years 2022 to 2024, unit costs derived from cut-off grade assumptions, and budget data provided by NGF. All forecast unit costs are presented in US Dollars.

Mining Costs: A general unit cost of US$3.73 per ton of total material moved (t-TMM) is applied for Paddington deposits in open pit mining. For Havana, the historical operating cost of US$2.98 per t-TMM is utilized as it is already in operation. For the Binduli deposits, the open pit mining cost is set at US$4.00 per t-TMM. For underground mining costs, the unit costs are based on cut-off grade assumptions.

Haulage Costs: Haulage costs are differentiated by destination based on cut-off grade assumptions. For material hauled specifically between the Binduli and Paddington operations, the haulage unit cost is estimated at US$2.50, as provided by NGF.

Processing Costs: Processing costs are estimated per ton of ore processed. Free Milling is cost at US$14.39, based on historical processing costs. Refractory ore processing is estimated at US$21.45, based on the cut-off assumption. Heap Leach processing has a unit cost of US$9.75, based on the budget estimation.

General & Administrative (G&A) and Selling Expenses: These costs are derived from the budget estimation provided by NGF.

The forecast unit OPEX over the LOM is shown in Table 14-8, the forecast operating cost over the LOM is shown in **Table** 14-9, and the forecast AISC over the LOM is shown in Table 14-10.

Note:

[1] Total number may not be added due to rounding errors.

[2] These costs are fixed during full-production period and varied during ramp-down period.

15 Economic Analysis

The economic analysis presented in this section is based purely on the results of the technical review provided above and some key assumptions and is provided for technical evaluation and Mineral Reserve estimation purposes only. The economic analysis of the Project was conducted using conventional Discounted Cash Flow ("DCF") techniques. The Net Present Value ("NPV") was determined from the project's cash flow using a discount rate range of 5% to 15%. Additionally, a sensitivity analysis was performed to assess the impact of variations in capital cost, operating cost, and pricing.

15.1 Principal Assumptions

The cash flow estimate includes only the revenue, costs, taxes, and other factors directly associated with NGF project. The assumptions are as follows:

- The ROM material production and final gold product are based on the LOM schedule.
- The local currency for the analysis is the Australian Dollar ("AUD"). A fixed exchange rate of AUD 0.65 per US Dollar ("USD" or "US$") has been applied by SRK in the technical economic analysis.
- Annual gross revenue is calculated by applying the forecasted metal prices.
- SRK does not consider future inflation or currency and cost fluctuations; the cost remains constant over the LOM.
- Financing is assumed to be on a 100% equity basis; no debt or related financing costs have been included in the technical economic analysis.
- Exploration Capex, which is aimed at discovering more Mineral Resources that is outside the Mineral Reserves estimates, is not considered during this analysis.
- No salvage value has been included in the technical economic analysis.
- Working capital is assumed to be 30% of the Opex in the technical economic analysis and is fully recovered at the end of LOM.
- The reference date or effective date is 31 December 2025.

15.1.1 LOM Physical

The mine production and blending physical inputs are shown in Table 15-1and Table 15-2.

Table 15-1: Mining LoM Physical Inputs for Economic Analysis

Mining Method	Item	Unit	LOM
Open Pit	Ore Tonnes	kt	109,928
	Au Grade	g/t	0.76
	Au Metal	koz	2,674
	Waste	kt	515,870
	Total Material Movement	kt	625,798
	Strip Ratio	t/t	4.69
Underground	Ore Tonnes	kt	2,813
	Au Grade	g/t	2.81
	Au Metal	koz	254

15.1.2 Pricing Assumptions

The gold price assumptions utilized in this report are presented in Table 15-3. As of December 2024, these prices are dynamic and are derived from broker consensus forecasts.

Table 15-3: Pricing Assumptions for Economic Analysis

Commodity	Units	2025E	2026E	2027E	2028E	2029E	2030E	LT
Gold	US$/oz	3,016	3,000	2,800	2,751	2,500	2,500	2,275

Source: Broker Consensus,. December 2024

15.1.3 Tax and Royalties

Income Tax

An income tax rate of 30% is applied in accordance with Australian tax regulations.

Royalty

Norton Group is typically subject to three primary categories of royalties: the Western Australian Government Royalty, Native Title Royalties, and Third-Party Production Royalties.

The Government Gold Royalty is levied at a rate of 2.5% on gold sales revenue. In addition to this, an additional royalty of 0.6% on gold sales revenue is also incurred.

15.1.4 Depreciation

The initial Capex and sustaining Capex have been depreciated over the LoM. The assumed depreciation follows the straight-line method over a period of 10 years.

15.2 DCF Projection

The projection for the Project operation shows a positive economic prospect. The annual cash flows are presented graphically in Figure 15-1. The sensitivity of NPV against discount rate is presented in Figure 15-2 and in tabular form in Table 15-4.

15.3 Sensitivity Analysis

SRK conducted a single-factor sensitivity analysis for the Project to determine which factors most significantly impact its economics when considered independently. The analysis focused on metal prices, Capex, and Opex, each tested within a ±30% range. The results showed that the Project is most sensitive to changes in price and least sensitive to capital costs. Results of the sensitivity tests are presented in Table 15-5 and Figure 15-3.

Table 15-5: Sensitivity Analysis Result (@10% Discount Rate)

Variance	OPEX	CAPEX	Price
	NPV @ 10% annual discount rate (US$ Millon)		
-30%	1,075	565	-370
-25%	981	555	-213

5%	406	494	635
10%	304	484	765
15%	195	474	894
20%	84	464	1,023
25%	-29	454	1,153
30%	-145	443	1,282

Sources: SRK

Figure 15-3: Sensitivity Spider Chart (10% Discount Rate)

Sources: SRK

Sensitivity analysis indicates that changes in commodity prices exert the most significant impact on the Project's NPV, followed by operating expenditures ("OPEX") with the second greatest effect, while capital expenditures ("CAPEX") demonstrate a comparatively smaller influence.

To clarify the effects of gold price and OPEX on the Project's NPV, SRK estimated the break-even gold price and OPEX (where NPV equals zero at a 10% discount rate). For the gold price, this break-even point occurs with a decrease of approximately 18.00% from the prices utilized in the economic analysis. In other words, should the gold price decline by 18.00% from the forecast, the Project's NPV would become negative. For OPEX, should OPEX increase by 23.73% from the forecast, the Project's NPV would become negative.

16 Risk Assessment

This section presents risks that were identified and described in sections above. Risks have been classified from major to minor, defined as follows:

- **Major risk**: The factor poses an immediate danger of a failure which, if uncorrected, will have a material effect (>15% to 20%) on the project cash flow and performance and could potentially lead to project failure.
- **Moderate risk:** The factor, if uncorrected, could have a significant effect (10% to 15–20%) on the project cash flow and performance unless mitigated by some corrective action.
- **Minor risk:** The factor, if uncorrected, will have little or no effect (<10%) on project cash flow and performance.

In addition to the risk factor, the likelihood of risk must also be considered. Likelihood of occurrence within a 7-year timeframe can be considered as:

- likely: will probably occur.
- possible: may occur.
- unlikely: unlikely to occur.

Table 16-1: Risk assessment Matrix

Likelihood	Consequence		
	Minor	Moderate	Major
Likely	Medium	High	High
Possible	Low	Medium	High
Unlikely	Low	Low	Medium

SRK completed a risk assessment of the specific risks identified for the Norton Project in relation to their likelihood of occurrence within the LoM and consequence in accordance with the listing rules of the Stock Exchange and the HKEx.

In general, the risk of a project decreases from exploration, through development, to the production stage. The Norton Project is an advanced project.

SRK considered various technical aspects which may affect the feasibility and future cash flow of the Norton Project. SRK's final Risk Assessment is presented in the following Table 16-2.

Table 16-2: Risk Assessment for Norton Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource and Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Major	Low
Lack of Significant Ore Reserves	Unlikely	Major	Low
Unexpected Groundwater Ingress	Possible	Moderate	Medium
Significant Unexpected Geological Faulting	Possible	Moderate	Medium

Risk Source/Issue	Likelihood	Consequence	Risk
Mining			
Significant Production Shortfalls	Possible	Moderate	Medium
Significant Geological Structure	Unlikely	Moderate	Low
Poor Underground/Slope Condition	Possible	Moderate	Medium
Poor Mine Plan	Possible	Moderate	Medium
Significant Lacking Ore Reserves	Unlikely	Major	Medium
Ore Processing and Metallurgy			
Process Adaptability	Unlikely	Moderate	Low
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Possible	Moderate	Moderate
Low Plant Reliability	Unlikely	Moderate	Low
Environmental and Social			
Lack of Environmental Permits	Unlikely	Moderate	Low
Impact on Flora and Fauna	Possible	Minor	Low
Poor Water Management	Unlikely	Moderate	Low
Poor Waste Rock and Tailings Management	Possible	Moderate	Medium
Poor Hazardous Materials Management	Unlikely	Moderate	Low
Capital and Operating Costs			
Project Timing Delay	Possible	Minor	Low
Capital Cost Increases	Possible	Moderate	Medium
Capital Costs- Ongoing	Possible	Moderate	Medium
Operating Cost Underestimated	Possible	Moderate	Medium

Source: SRK

17 Conclusions and Recommendations

17.1 Geology and Mineral Resources

- The Norton Gold Projects are situated within a geologically favourable and structurally complex region, characterised by multiple greenstone-hosted gold systems. Mineralisation is primarily controlled by shear zones, faults, and lithological contacts, with gold occurring in vein-like, lens-shaped, or strata bound bodies.
- Current exploration has typically tested to depths exceeding 400 m, yet comparative evidence from adjacent operating mines confirms the continued presence of mineralisation at greater depths. This indicates significant exploration upside remains at depth across several deposits.
- Geological drilling, core logging, sampling, and assay procedures have been conducted to a high standard consistent with accepted industry protocols. QA/QC practices are in place and effective.
- The geological database is well-managed and structured, with 3D geological and mineral resource models have been developed using conventional block modelling approaches, based on validated drilling, sampling, and assay datasets.
- Reconciliation in some areas between modelled grades and historical production data indicates variability in local grade continuity, suggesting scope for model refinement.
- The total mineral resource for the NGF Project is estimated at 311,486 kt at an average grade of 0.92 g/t Au, containing approximately 9,245 koz of gold, comprising Measured Mineral Resource of 17,470 kt at 1.23 g/t Au for 690 koz, Indicated Mineral Resource of 193,733 kt at 0.84 g/t Au for 5,222 koz, and Inferred Mineral Resource of 100,283 kt at 1.03 g/t Au for 3,333 koz.
- Infill drilling is recommended in areas with sparse data or structurally complex settings to improve the resolution of geological models. Additionally, targeted deep drilling should be undertaken in high-grade or structurally open zones to test the down-dip and down-plunge continuity of mineralisation.
- Broader application of 3D geological modelling tools is encouraged to improve spatial understanding, visualisation, and communication of complex geological structures, especially in areas with limited control at depth.
- A reconciliation study should be performed comparing block model outputs with historical and current production data to assess estimation accuracy. The modelling approach should increasingly integrate geological controls—such as structural frameworks and lithological boundaries—to enhance model robustness.
- Resource classification should continue to follow established criteria—including data spacing, QA/QC performance, and geological continuity—and should also address the elimination of geologically unsupported "spot dog" features. For areas advancing to pre-feasibility or feasibility stages, upgrading Indicated to Measured Resources through closer-spaced drilling is recommended to ensure a reliable basis for mine planning and economic evaluation.

17.2 Mining and Ore Reserves

- The total Ore Reserve for the NGF Project is estimated at 120,442 kt at an average grade of 0.79g/t Au, containing approximately 3,070 koz of gold. This includes Proved Ore Reserve estimated at 4,865 kt with an average grade of 1.19g/t Au, containing 186 koz of gold; and Probable Ore Reserve estimated at 115,577 kt at an average grade of 0.78g/t Au, containing 2,883 koz of gold.

- NGF incorporates numerous small-scale satellite open pits. To consistently ensure a stable mill feed to the processing plant, it is recommended to further optimize the mine schedule, which focus on achieving a dynamic balance ore mining and waste stropping to prevent instances of over-stripping in certain years while ensuring sufficient ore supply in others.
- NGF has already planned an optimized ore blending strategy for future operations. To ensure a consistent and stable feed amount and grade to the processing plant, it's recommended to dynamically update this blending strategy, including the routing of higher-grade ore to the Paddington Mill and lower-grade material to the Binduli Heap Leach.
- Some mined-out pits are currently utilized as water storage; however, with rising gold prices, these submerged pits may still hold significant economic value. Therefore, during pit optimization, it's recommended to re-evaluate whether current open pit designs have reached their economic limits.
- If re-entry into long-term submerged pits be considered for future mining, it will require dewatering operations and a potential re-assessment of rock mechanics properties due to water saturation. While the impact is anticipated to be minor with efficient dewatering, these pits should be integrated into long-term mining plans to ensure the maximization of potential resources.
- Mining equipment is generally aged, and its reliability and efficiency may not fully meet future production requirements. A detailed equipment modernization plan is recommended to ensure operational continuity and enhance overall production efficiency.
- The local supply of skilled technical operators in Australia is currently insufficient. This could lead to discrepancies between actual production and planned schedules. It is recommended to proactively implement robust talent acquisition, training, and retention strategies to mitigate risks associated with labor shortages.
- With the Enterprise mine nearing the end of life of mine, there are plans to extract the crown pillar. It's recommended that this extraction be deferred until further exploration definitively confirms the absence of additional economic mineralization at deeper levels.
- Cemented rock fill is being mixed underground, and the degree of mixing at the underground site can impact the final quality and strength of the fill. To ensure consistent and adequate mixing, it is recommended to regularly evaluate the stability and support of the backfill.

17.3 Mineral Processing and Metallurgy

- Norton's gold ores can be categorized into four types: high-grade cyanidation amenable ores, low-grade cyanidation amenable ores, sulfide-encapsulated refractory ores, and preg-robbing refractory ores. Each type is suitable for a special metallurgical process.
- High-grade cyanidation amenable ores are well-suited to the gravity-CIP process applied at the Paddington processing plant. Historical performance indicates average gold recovery rate can reach to over 92%. Since these ores come from multiple sources with varying properties, SRK recommends conducting metallurgical tests on the ores from each planned deposit to guide the adjustment of operating parameters at the Paddington plant and achieve optimal recovery rates.

- Low-grade cyanidation amenable ores are suitable for the ultra-fine crushing-agglomeration heap leaching process. The Binduli heap leaching plant has a designed processing capacity of 5 Mtpa. The ores are crushed to 80% passing 7mm, followed by agglomeration and heap leaching. Since heap leaching production began at the end of 2002, the gold recovery rate has increased to 70.5%. With extended leaching time, the designed recovery rate of 74.5% can likely be achieved. The crushed ore size and heap permeability are the two dominant factors affecting gold recovery rates, and strict control over ore size and agglomeration quality is essential.
- The classification of cyanidation amenable ores into high-grade and low-grade categories should be adjusted based on changes in market gold prices. SRK recommends conducting regular technical and economic evaluations to determine whether these type ores should be sent to the Paddington processing plant or the heap leaching plant. Additionally, considering the transportation costs of low-grade ores, SRK suggests studying the feasibility of constructing heap leaching plants near multiple mining sites.
- Sulfide-encapsulated refractory ores are suitable for flotation recovery due to the good floatability of both gold and sulfide minerals. Plans are in place to add a flotation circuit to the existing gravity-CIP process at the Paddington plant, enabling the use of a combined gravity-flotation-CIP process to treat these ores. The products will include directly marketable gold concentrates and gold doré bars. SRK considers this approach feasible and recommends making reasonable arrangements for construction and production.
- Gold preg-robbing refractory ores are primarily caused by the inclusion of carbonaceous shale wall rock during mining. Treatment methods include kerosene/diesel passivation-CIL and flotation-concentrate pre-oxidation-CIL. SRK recommends controlling the amount of wall rock mixed during mining of such deposits. Additionally, further testing and research should be conducted to develop suitable metallurgical processes for these resources, along with feasibility studies.

17.4 Environmental and Social

- No EIAs have been required for the project operations. However, any future project expansions or modifications may be subject to referral and potential assessment by the EPA, depending on their environmental significance.
- Norton undertook monitoring of the nine (9) groundwater monitoring bores surrounding the heap leach of Binduli North Operations. Overall, 2024 monitoring results are consistent with trends observed in 2022 and 2023. No cyanide was detected in any bore samples. It is recommended to install groundwater monitoring bores upstream and downstream of all operational areas of the project, including the TSFs and WRDs, to regularly monitor changes in groundwater quality and reduce the risk of water contamination.
- In the waste characterization studies conducted so far, most of the waste rock has been identified as non-acid-forming. However, some areas have not yet undergone geochemical analysis to assess their potential for acid mine drainage. It is recommended to carry out waste characterization for these areas, as well as for regions planned for future development.
- It is recommended that NGF implement and maintain an environmental monitoring program that includes ambient air quality monitoring for particulate matter of size 2.5um·($PM_{2.5}$), 10um·(PM_{10}), and total suspended particulates (**"TSP"**), as well as ambient noise and vibration monitoring at sensitive receptors.

- There are Aboriginal heritage sites within certain tenement areas of the project. These sensitive areas should be avoided or left undisturbed during the course of project development. It is also recommended to utilize the grievance mechanism to promptly address stakeholder concerns and reduce the social risks associated with project development.

Appendix A JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Sampling including drill core sampling and channel sampling, geologists will perform geological logging, then mark the sample intervals before sampling to ensure appropriate sampling. • Mainly use tape meters for measurement. • Based on geologists' observation. • Sampling is mainly based on the sample mark made by geologists, trying to take unbiased samples.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• All assays used for resource estimation were collected from Reverse Circulation (RC) and Diamond Core (DC or DD) drilling conducted by a range of contractors between 1985 and 2024. The drilling activities were undertaken across various deposits by companies including Centaur Mining, Aurion Gold, Placer Dome Asia Pacific, Barrick, Norton Gold Fields and others. • RC drilling employed face sampling hammers using drill bit diameters ranging from 4.25" (105 mm) to 5.5" (140 mm). Face sampling hammer techniques became standard post-1996 with rigs generally equipped with booster compressors. Earlier drilling (1980s–early 1990s) used crossover sub systems, blade bits, tricone or roller cone bits, and Mole Pioneer rigs, which sometimes introduced sample contamination due to sidewall contact. • Recent RC campaigns standardised the use of 5.25" to 5.5" bits with 5" bottom face sampling hammers. RC rigs were equipped with rig-mounted cone or riffle splitters (e.g., Metzke M3CSPLT) to produce split

Criteria	JORC Code explanation	Commentary
		samples. Sampling intervals were typically 1m with composite spear sampling up to 4m conducted as a first-pass in historical programs. • RC was predominantly employed for open pit drilling, grade control, and shallow mineralisation definition. In multiple programs, RC pre-collars (ranging from 20m to 300m) were used in combination with diamond tails to effectively reach deeper mineralised zones. • Diamond drilling was performed using triple-tube wireline drilling techniques, primarily HQ (63.5mm), HQ3 (61.1mm), NQ (47.6mm), NQ2 (50.5mm), NQ3 (45mm), and LTK60 (44mm) core diameters. Surface holes were generally collared in HQ to improve recovery in fractured zones before reducing diameter. • Core orientation was carried out using various systems over time including bottom-of-hole spear, EZI-Mark, ACE, TruCore™, and more recently the SPRINT IQ system. Drill core was routinely placed into trays at the rig and transported for geological logging, geotechnical assessment, and sampling • Sludge drilling using top hammer rigs was mentioned for operational guidance in some underground mines but was not included in final resource estimation datasets. Aircore and RAB drilling were employed historically (1980s–1990s) but are not included in current resource estimation. • In general, the RC drilling accounts for the majority of drilling datasets in most deposits (up to 99%), while DD comprises a smaller proportion but is heavily relied upon in underground or structurally complex zones.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• RC drillers were consistently briefed by supervising geologists regarding the expected lithological conditions for each drill hole, and instructed to adopt drilling strategies that maximise sample recovery, reduce contamination, and ensure accurate spatial positioning. • All RC samples were collected at 1m intervals using UV-resistant sample bags. Visual logging of each sample for moisture content, recovery estimates, and contamination was routinely conducted at the rig. Sample splitting was performed using cone or riffle splitters, with wet samples either dried prior to splitting or sampled by scoop methods where necessary. • In early campaigns prior to 2000, recovery data were recorded qualitatively, while post-2000 programs implemented consistent recording of sample quality and moisture content.

Criteria	JORC Code explanation	Commentary
		• A study of RC sample weights and gold grades (e.g., 2012–2013, 2000 campaigns) indicated no significant bias or correlation between sample mass and grade, confirming effective sample recovery procedures. • DC samples were recovered using triple-tube core barrels and wireline systems, with drillers instructed to adapt techniques to ground conditions (e.g., adjusting bit type and drilling speed in broken or fractured zones). Core recovery was routinely measured by comparing actual core lengths to depth markers on core blocks provided by the contractor. Recovery values were logged and reconciled in geological, geotechnical, and lithological databases (e.g., Datashed). Where recoveries were recorded, average core recovery exceeded 96%, with recent drilling often achieving higher rates. • Core presentation, cleanliness, and integrity were regularly reviewed onsite and during mark-up. Feedback loops between geologists and drillers ensured continuous improvement in recovery practices. All samples sent to the laboratory were weighed to verify representativity. Since 2019, in some grade control programs, whole-core sampling was implemented for operational efficiency, particularly where sampling confidence was high.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• All drillholes, including Reverse Circulation (RC), Diamond Core (DC), and underground face samples, were geologically logged by qualified geologists. Logging was conducted to industry standards with procedures evolving over time to improve data quality and consistency. • RC drilling was logged at 1m intervals, with observations recorded for lithology, weathering, alteration, veining, mineralisation and structural features. Where samples were not recovered due to voids or low recovery, this was clearly noted in the logging sheets. • Earlier RC programs (especially those conducted before 2000) sometimes relied on more qualitative observations or partial logging. However, more recent campaigns employed structured code libraries, with all observations digitally captured using standardised logging templates to ensure consistency and data quality. • Diamond core holes were logged from collar to end-of-hole. Logging included detailed lithological descriptions, mineralisation style and intensity, alteration characteristics, and weathering profiles. Where possible, oriented core was used for structural logging. Core recovery, RQD, and fracture frequency were recorded as part of routine

Criteria	JORC Code explanation	Commentary
		geotechnical logging. • Core orientation data were obtained using a variety of tools over time, including EZI-Mark, ACE, TruCore™, and SPRINT IQ. All core was placed into trays, clearly marked with depth intervals, and photographed (wet and/or dry) prior to sampling and storage. • In underground settings, face mapping was routinely carried out on exposed development headings. Geologists recorded lithology, structures, mineralisation zones, and sampling locations on face maps, which were later digitised and uploaded into the database. Photographs of faces were also taken systematically for reconciliation and modelling purposes
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Core were sawn half for sample and the other half stored. • N/A. • Sample preparation in Norton project is considered at industry good practice. • Core duplicates, coarse duplicates and pulp duplicates have been applied to maximise representivity of samples. • QAQC results were monitored by QAQC geologists, QAQC database was established. • Sample size is always the larger the better, the core samples and channel are appropriate to the grain size of the material being sampled.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Check samples have been taken during SRK site visit, the samples were re-numbered and sent to Jinning laboratory in Kalgoorlie for re-analysis. • QAQC Database was established.

Criteria	JORC Code explanation	Commentary
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Check samples have been taken during SRK site visit, the samples were re-numbered and sent to Jinning laboratory in Kalgoorlie for re-analysis. • QAQC Database was established.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• All drillhole collar positions used in the resource estimation have been surveyed for easting, northing, and reduced level. Surveying was performed by site-based or contract surveyors using differential GPS, Leica Total Station (TS15), or conventional surveying techniques. These methods provide positional accuracy typically better than ±0.005 m for collar locations. • Collar locations were initially validated against planned coordinates using 3D software such as Surpac and then incorporated into the Datashed database. From 2019 onward, collar uploads and coordinate transformations were automated, with the responsible geologist completing site-level verification. • Topographic control was derived from detailed site surveys conducted over the past 15 to 30 years. These data were used to construct a high-resolution Digital Terrain Model (DTM), supporting the accuracy of collar elevation data across all projects. • Coordinate systems varied between programs, with data historically collected in AMG84 Zone 51, MGA94 Zone 51, and various local mine grids (e.g., Zuleika Grid, Enterprise Grid). All legacy datasets have been transformed to MGA94 Zone 51 and Australian Height Datum (AHD) to ensure consistency for resource modelling. • For underground development, FS collar positions were digitised in 3D using laser distance measurements and survey pick-ups taken every 3 cuts. This method ensured accurate spatial alignment with underground mine workings. • Downhole surveys for historic drilling used magnetic-based methods such as Eastman single-shot and DEMS multi-shot cameras, typically spaced at intervals less than 30 metres. Since 2020, downhole surveys for RC and diamond core holes have been completed using north-seeking gyroscopic tools such as Reflex Gyro SPRINT-IQ™, providing high-resolution orientation data. Surveys are collected continuously and in both single- and multi-shot modes, typically at 3 m or 5 m intervals. • Survey results are validated through the IMDEX HUB or similar QA

Criteria	JORC Code explanation	Commentary
		workflows before being automatically integrated into Datashed via API connections. Where necessary, azimuth and dip corrections have been applied for magnetic declination. • For unsurveyed holes or early programs with incomplete downhole data, drillhole orientations were estimated from planned designs, with their limitations acknowledged in the interpretation and classification process.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Across the various deposits, drilling programs have adopted different nominal drill spacings based on geological complexity, mineralisation style, and data requirements. The most common resource definition drilling pattern is 20m x 20m, applied across major mineralised lodes. In areas with higher geological complexity or intended for Indicated classification, this has been reduced to 10m x 10m or 10m x 20m spacing. • In distal or less mineralised zones, broader drill patterns such as 40m x 40m or 80m x 80m have been applied. In some deeper domains below 0mRL or 150mRL, spacing expands up to 80m, where Inferred classification is still supported by structural and geological continuity. • Grade control (GC) drilling was typically conducted on tighter spacing, ranging from 5m x 5m to 10m x 10m depending on mine design. For underground areas or paleochannel domains, spacing could be as tight as 10m x 5m. • The distribution of drillholes is considered sufficient to establish both geological continuity and grade variability for the purpose of Mineral Resource classification. Sampling strategies ensured appropriate spatial coverage across all major lithologies and mineralisation styles. • Downhole sample intervals used for estimation were generally 1m for RC and geologically constrained intervals for diamond core. Historical RC programs sometimes used composite sampling (e.g., 2–4m) in barren zones, with mineralised composites re-split and assayed at 1m resolution where required.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Drilling programs were generally designed to intersect the main mineralised structures at high angles to minimise sampling bias and to approximate true thickness. Most holes were oriented to be sub-perpendicular to the dominant mineralisation trends, with adjustments made where topography, infrastructure, or access constraints limited optimal alignment.

Criteria	JORC Code explanation	Commentary
		• In the Liberty Granodiorite and surrounding domains, gold mineralisation occurs within brittle-ductile shear zones and quartz veining. To accurately define these features, diamond and RC drilling was typically aligned orthogonally to known structural trends. For example, drillholes targeting the 085° and 055° trending vein sets were planned with NE or SE azimuths and moderate dips to intersect the structures as close to perpendicular as possible. • In paleochannel-hosted systems, such as those observed in the LBE area, vertical RC holes were used due to the flat-lying nature of mineralisation. The close spacing of vertical holes, often on 10m x 10m patterns, was sufficient to delineate the dendritic geometry of channel deposits. • At sites like Black Flag and Tuart, drillholes were angled based on the known strike and dip of mineralised faults and vein breccias. For example, steeply dipping lodes at Tuart required drilling at moderate to steep dips, with orientations varying from -45° to -60°, depending on the target lode's plunge. • In underground environments, face sampling was conducted orthogonal to mineralised structures, typically across the exposed backs and walls, to ensure consistency and spatial reliability in data acquisition.
Sample security	• *The measures taken to ensure sample security.*	• Samples were marked and sealed after sampling. then shipped to laboratory by dedicated staff.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Internal reviews have been routinely conducted on sampling techniques, assay quality, geological logging, and database management as part of Norton Gold Fields' continuous improvement practices. These reviews are typically led by senior geological staff and include cross-validation of assay data, collar locations, QAQC performance, and reconciliation with production records where available. • All geologists involved in data collection and interpretation are required to attend Sample Theory and Best Practice QAQC training courses, typically run annually or biennially by internal or third-party consultants. These sessions cover industry standards and aim to ensure consistency in sampling and data handling procedures. • In 2020 and 2022, an independent technical review was jointly undertaken by SRK Consulting teams from China and Australia. The review covered geological modelling, data integrity, QAQC

Criteria	JORC Code explanation	Commentary
		implementation, estimation methodology, and compliance with the JORC Code. SRK's findings confirmed the robustness of the data handling and resource estimation processes and provided a series of recommendations, most of which have since been implemented to further enhance technical confidence and consistency across the project.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• All reported Mineral Resources are located within granted Mining Leases and associated tenements in the Kalgoorlie region of Western Australia. These include licenses such as M24/616 (Federal), M24/155, M24/234, M24/266, M24/265, M24/302 (Tuart), M24/564 and M24/56 (Rose and Rose Dam), M16/58 and M16/106 (Breakaway Dam), M16/44 and M16/45 (Bullant and Wattlebird), as well as numerous others forming part of the Mt Pleasant, LBE, and Ora Banda project areas. • All leases are 100% held by Paddington Gold Pty Ltd or its wholly owned subsidiaries, under the ownership of Norton Gold Fields Pty Ltd. Kalgoorlie Mining Company Pty Ltd, which holds the Bullant and Wattlebird tenements, was fully acquired by Norton in 2013 and is now managed by Paddington. • All mining and miscellaneous leases were granted prior to the enactment of the Native Title Act. Where heritage sites exist, such as at Tuart or Mt Pleasant, they are either registered and managed in accordance with regulatory frameworks, or confirmed absent based on surveys. No known heritage or environmental constraints currently impede access or exploration activities. • Third-party royalties apply to several tenements, generally based on production tonnage ($/t) or a share of net profit. In addition, all production from these tenements is subject to a Western Australia State Government Net Smelter Return (NSR) royalty of 2.5%. • The tenements are in good standing, with active compliance to conditions of grant, including reporting, rehabilitation, and rent

Criteria	JORC Code explanation	Commentary
		payments. There are no known legal or regulatory impediments that could materially affect the security of tenure or the right to operate across the reported project areas.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• A significant proportion of exploration, resource development, and mining activities across the current project areas were undertaken by a range of companies prior to Norton Gold Fields' ownership. These efforts have contributed substantially to the present understanding of geology, mineralisation controls, and drilling coverage. • At Lady Bountiful Extended, exploration was undertaken by a succession of companies including Maitland Mining NL, Southern Resources Ltd, Phoenix Dualflex (UK) Pty Ltd, BHP-Utah Minerals International (1988–1989), Western Mining Corporation Ltd (1971–1972, 1985–1988), Great Central Mines NL, Consolidated Exploration Pty Ltd, Centaur Mining and its subsidiary Astro Mining N.L. (1989–1996), Aurion Gold (2001–2002), and Placer Dome (2002–2005). These campaigns employed geophysics, geochemistry, trenching, and extensive RC and diamond drilling, particularly targeting palaeochannel-hosted and granodiorite-hosted gold mineralisation. • In the Enterprise deposit, extensive work was conducted between 1990 and the early 2000s by BHP Gold Mines, Newcrest Mining, Centaur, Goldfields Group, Aurion Gold, Placer Dome, and Barrick. These companies contributed the bulk of the RC and DD data still used today. Over 78% of the current drillhole database comprises legacy data collected before the underground operation began in 2019. • For the Mt Pleasant district, including deposits such as Golden Kilometre, Black Flag, and Tuart, exploration began in the mid-1990s by Centaur Mining, followed by Auriongold, Placer Dome Asia Pacific, and Barrick Kanowna. They completed systematic RC drilling, pit development, and early block modelling efforts that inform current interpretations. • At Federal and Tuart, tenure from 1994 to 2007 was held by Centaur Mining, Aurion Gold, Placer Dome, and Barrick. Historical data includes geophysics, geochemical sampling, detailed structural interpretation, and RC drilling that assisted in delineating supergene and primary mineralisation. • In the Ora Banda area, prior work was carried out by Broken Hill Proprietary (pre-1991), Newcrest Mining (1992–1997), Centaur Mining

Criteria	JORC Code explanation	Commentary
		(1997–2001), Goldfields Exploration, and Placer Dome/Barrick (2002–2007). These efforts included open pit mining, regional structural mapping, and the generation of key resource models for Sandalwood, Tom Allen, and Enterprise West deposits. • The Bullant deposit was previously explored and mined by BHP Gold, Newcrest, Centaur, Goldfields, Aurion, Placer Dome, Barrick, and Kalgoorlie Mining Company. In total, over three decades of activity preceded Norton's acquisition in 2013, and roughly 78% of data used in current models derives from those campaigns. • Across all these areas, legacy data has been rigorously validated and integrated into Norton Gold Fields' central SQL database and forms a key input into current geological modelling, Mineral Resource estimation, and mine planning.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The gold deposits covered in this report are typical of Archaean orogenic gold systems within the Eastern Goldfields Superterrane of the Yilgarn Craton, Western Australia. Mineralisation occurs within a range of geological settings that can be broadly classified into the following types: 1. Shear Zone–Hosted Mineralisation in Granodiorite and Tonalite Intrusions: This is the most prevalent style of mineralisation across the project portfolio. Gold occurs within brittle to brittle-ductile shear zones hosted by granodioritic to tonalitic intrusions. Alteration typically includes muscovite, biotite, epidote, sericite, and haematite, with mineralisation often associated with quartz-pyrite veining and disseminated sulphides. Representative deposits include: ○ Federal: Mineralisation is hosted within hornblende-biotite granodiorite of the Kanowna-Scotia Complex. ○ Lady Bountiful Extended: Gold occurs within the Liberty Granodiorite, associated with NNW-trending ductile shear zones and quartz-pyrite vein arrays. ○ Hughes and Tregurtha: Hosted in the Rainbow Dam Granodiorite, with mineralisation localised along altered shear planes dipping 45°–70°. 2. Greenstone-Hosted Structurally Controlled Lodes: These deposits occur within basaltic sequences of the Kalgoorlie Group, including Victorious and Bent Tree Basalts. Mineralisation is generally associated

Criteria	JORC Code explanation	Commentary
		with shearing, veining, and competency contrasts within the mafic volcanic stratigraphy. Representative deposits include: ○ Enterprise and Enterprise West: Gold is hosted within north-plunging shear lodes and quartz vein systems. Enterprise West also includes mineralisation developed near the regolith-fresh rock interface. ○ Breakaway Dam and Wattlebird: Hosted in high-Mg basalts and associated tuffs along the Zuleika and Carbine Shear Zones. 3. Sediment–Volcaniclastic–Intrusive Hybrid Settings: These deposits are hosted in complex lithological packages that include felsic to intermediate volcaniclastics, porphyritic intrusives, and sedimentary rocks such as shales or siltstones. Gold is controlled by brittle faulting and quartz-sulphide veining, with alteration assemblages including silica, sericite, and haematite. Representative deposits include: ○ Black Flag and Tuart: Associated with the Black Flag Fault zone, hosted in porphyry–volcaniclastic sequences. ○ Mt Pleasant (Golden Kilometre area): Displays a range of intrusive and volcaniclastic host rocks with extensive fault-related veining. 4. Palaeochannel and Supergene Gold Systems: Some deposits exhibit strong supergene gold enrichment related to palaeochannel development or weathering horizons, often overprinting primary mineralisation. Gold is hosted within lateritic gravels, ferruginous saprolite, or clay-rich zones, with enrichment at the redox boundary. Representative areas include: ○ LBE area and Enterprise West: Notable for flat-lying or gently dipping supergene blankets that overly primary lodes. ○ Portions of Bullant and Rose Dam: Exhibit enrichment zones aligned with base-of-oxidation surfaces. • While supergene systems often display broader, lower-grade profiles, they are important for near-surface extraction and resource definition.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:*	• Drill hole data used in the Mineral Resource estimations include a combination of historical and recent Reverse Circulation (RC) and Diamond Core (DD or DC) drillholes, as well as underground face

Criteria	JORC Code explanation	Commentary
	○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	sampling (FS). All material exploration and grade control drilling campaigns have been recorded and validated in the Datashed SQL database. The dataset includes detailed collar coordinates, downhole survey data, sampling intervals, assay results, and geological logs. • Drill hole collar positions have been surveyed using Leica Total Station (TS15) or differential GPS to a horizontal and vertical accuracy of ±0.005 m. Data prior to 2012 originally recorded in AMG84 Zone 51 have been transformed to MGA94 Zone 51 and AHD vertical datum. • All relevant collar and downhole survey data for RC and DD holes are included in the appendices of the Resource and Reserve Statement, including orientation (dip and azimuth), total depth, and significant intersection intervals. Downhole surveys were collected using Eastman single-shot, DEMS multi-shot, and Reflex Gyro SPRINT-IQ™ tools depending on the campaign period.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Assay results have been aggregated using length-weighted averaging to reflect the contribution of each sampled interval. This method is standard practice across all Norton projects and is appropriate for the narrow vein and shear-related mineralisation styles present. • Downhole compositing is routinely applied to standardise input data for resource estimation. The majority of deposits use 2m downhole composites, which strike a balance between reducing sample variance and preserving geological resolution. • In domains with high variability or positively skewed grade distributions, top cuts have been applied based on statistical review of composite grade histograms and probability plots. • For estimation inputs, geological boundaries are treated as hard domain limits. Composites are clipped or truncated at domain boundaries using either the "inside 3DM" or "inside/outside" rule depending on estimation methodology. • No metal equivalent values have been used.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Drillhole orientations across the Norton projects were designed to intersect the mineralised structures at as high an angle as practicable. However, due to site access constraints, pit geometry, and underground infrastructure, many holes intercept the orebody at moderate to acute angles rather than being perfectly perpendicular. • For RC and DC drilling, all reported intercepts are presented as downhole lengths. True widths are not always reported unless

Criteria	JORC Code explanation	Commentary
		specifically modelled or measured via structural logging and orientation data. In areas where lode geometry is well constrained, such as Tuart, Enterprise, and Black Flag, intercepts are described as *approximately true width* where justified by geometry and drill orientation. • FS conducted in underground development is typically taken orthogonal to the exposed mineralised zones, generally at 1.2–1.5 m above floor level. These samples are considered to represent the true width of mineralisation in underground settings. • In some deposits, such as LBE and palaeochannel systems, vertical holes intersect sub-horizontal or gently dipping mineralisation zones, and thus the reported downhole intervals are often closely aligned with true thickness. Conversely, in steeply dipping, narrow vein systems such as at Wattlebird or Racetrack UG, downhole intercepts may significantly exceed true widths if not corrected. • Reported results consistently identify whether intercepts are true widths or downhole intervals. Where true width is unknown or not applicable, the intercept is explicitly noted as *"true width not known"*.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Representative diagrams have been included in the body and appendices of the report to illustrate the spatial distribution of drilling, geological interpretations, and modelled mineralised domains. These include plan view maps of collar locations, long sections showing vertical continuity and drill density, and cross sections highlighting orebody geometry and assay distribution. • Due to the number and geographic spread of projects, diagrams for individual deposits are not reproduced in this Table 1 section. Detailed figures and geological sections for each major deposit can be found in Chapter 7 of this report, which includes selected plan views, long sections, cross sections, and 3D visualisations. • All diagrams were prepared using current geological models, validated drill data, and are referenced using a consistent MGA94 Zone 51 coordinate system. Where relevant, oblique and perspective views are also provided to support understanding of deposit geometry and structural controls.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• The reporting of exploration results across the Norton project areas has been undertaken in a balanced and transparent manner, consistent with the requirements of the JORC Code (2012 Edition). All material results—whether considered economically significant or not—have

Criteria	JORC Code explanation	Commentary
		been assessed and disclosed where relevant to the understanding of the geology, mineralisation, or the basis of Mineral Resource estimation. • For recent drill programs conducted by Norton Gold Fields, representative results have been disclosed either in summary form within the main body of the report. • Where mineralised intervals are reported, standardised intersection criteria are applied, typically including grade thresholds, minimum widths, and internal dilution constraints. In cases where true width cannot be confidently determined, results are clearly stated as downhole intervals. • Given the number and spatial extent of projects covered under this report, individual assay tables, cross sections, and summary diagrams are referenced in the chapters of each deposit, which together provide a comprehensive overview of drilling results across all key deposits. • Historical results previously disclosed in public reports or statutory filings have not been duplicated in this document, but have been reviewed and, where appropriate, incorporated into current interpretations.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Across the Norton project areas, a range of additional datasets have been collected during exploration and development activities. These include geotechnical logging, basic metallurgical testwork, environmental surveys, portable XRF measurements, and underground face mapping. • Geotechnical information has been recorded for selected diamond core drillholes, particularly within underground development areas such as Enterprise and Bullant. Parameters such as RQD, fracture frequency, and rock strength have been logged and stored in Datashed and used to support mine design and stability assessments. • Basic metallurgical testwork has been conducted historically for several deposits, including Breakaway Dam, Tuart, and Enterprise, using fire assay recovery checks, bottle roll tests, and screen fire assays. Where relevant, domains identified as potentially refractory or carbonaceous have been flagged within the resource models. • Environmental baseline studies, including heritage surveys, flora/fauna assessments, and surface hydrology reviews, have been completed for all areas under active mining or development consideration. These

Criteria	JORC Code explanation	Commentary
		studies support tenement maintenance and mine approvals but are not directly related to resource estimation. • No geophysical datasets (e.g., gravity, EM, IP) or remote sensing data are currently used for reporting or interpretation of gold mineralisation in the deposits covered by this report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Further work is planned across multiple Norton Gold Fields projects, with activities tailored to the development stage and geological understanding of each deposit. • At advanced projects such as Bullant, Enterprise, Tuart, and Lady Bountiful Extended, further work will focus on resource development drilling, updating geological models, and conducting mining studies to assess the economic potential for larger scale open pit or underground operations. • For deposits with open questions regarding structural controls or grade continuity—such as Breakaway Dam and Matt's Dam—additional drilling, pit mapping, and metallurgical testwork may be required to clarify ore controls and assess processing characteristics. • Several palaeochannel or regolith-dominated systems such as those in the LBE area are undergoing ongoing geological reinterpretation, and targeted drilling campaigns are planned to test for remnant mineralisation near historical open pits or along interpreted mineralised trends. • In the Hughes, Tregurtha, and Tregurtha South areas, re-estimation of resources is planned, incorporating new drilling data and mine design parameters aligned with NGF's open cut mining strategy. • In general, across the project, further work will involve: ○ Step-out and infill drilling to improve classification confidence. ○ Structural and lithological model updates. ○ Structural and lithological model updates. ○ Refinement of estimation domains. • Mining and economic studies to support potential reactivation of mining.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• All geological and assay data used for Mineral Resource estimation are stored in a structured SQL database, managed centrally by Norton Gold Fields. • Primary geological and sampling data are collected in the field using pre-defined data templates with embedded lookup tables and fixed formatting, typically on field laptops. These templates reduce the potential for data entry errors at the source. Once completed, data are uploaded into the central database, where validation routines, relational integrity constraints, and stored procedures are executed. Any data failing to meet these validation criteria is rejected or quarantined until corrected. • The database is overseen by a dedicated Database Manager, who is responsible for the integrity, validation, and development of the database, as well as the execution of specialist queries and audit processes. A standard suite of rigorous validation checks is in place to ensure ongoing QA/QC compliance. • The database is updated regularly with newly received assay results. For example, all drilling completed since the previous model has been incorporated into the current dataset. Where assay data were missing or incomplete, background values were assigned for the purposes of volumetric estimation, and corrections were made to ensure consistency with mineralisation lode updates. • Since 2012, Norton has implemented daily QAQC checks and quarterly QAQC reporting, which includes database audits and verification of assay and collar records. Face sampling data collected prior to 2014 has been incorporated, where relevant, after review and digitisation. • The current resource models were constructed using MS Access data subsets extracted from the SQL database, which were validated through on-screen inspection for positional accuracy, missing values, and anomalous records prior to estimation.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• A site visit was conducted between 16 and 19 June 2025. • SRK communicated all modification factors with technicians.

Criteria	JORC Code explanation	Commentary
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• The geological interpretations underlying the Mineral Resource estimates are considered to be robust and based on multiple lines of evidence, including extensive RC and diamond core drilling, detailed geological and structural logging, assay datasets, open pit and underground face mapping, and reconciliation with historical production data. • Across the Norton project areas, the interpreted mineralised envelopes are strongly guided by structural controls such as shear zones, fault offsets, lithological contacts, and veining systems. In some deposits—particularly those hosted within granodiorite or tonalite—the mineralisation is further delineated by alteration halos (e.g., biotite-silica-pyrite or sericite-pyrite zones) and geochemically favourable host rocks. Key geological assumptions include: ○ Interpolation of mineralisation beyond drillhole control over limited distances (typically within maximum drill spacing) where grade and geology are interpreted to be continuous; ○ The recognition of supergene enrichment or weathering profiles (e.g., in LBE, Tuart, and Federal) to constrain near-surface mineralisation; ○ Domain boundaries are defined using consistent lithological and geochemical criteria, often supported by sharp litho-structural breaks visible in section and plan. • Where cross-cutting or post-mineralisation structures exist, they have been considered during interpretation but may result in localised offsets or truncations in grade continuity. Such complexities are mitigated through close-spaced drilling and use of high-resolution mapping data where available. • Geological framework is well-established in most deposits, the grade distribution within mineralised envelopes can be variable. This reflects the nuggety nature of gold mineralisation and the structural complexity common to orogenic gold systems. Accordingly, geological interpretation is regularly updated as new data are collected.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The Norton Gold Fields Mineral Resources span a wide range of deposit styles and geometries. To facilitate consistency and understanding, the mineralised systems are grouped into four major categories based on structural and geological features: 1. Steeply Dipping Shear-Hosted Systems in Mafic Volcanic: These

Criteria	JORC Code explanation	Commentary
		deposits are the most structurally continuous and typically form lode-style gold systems within the Victorious or Bent Tree Basalts. Mineralisation is hosted in ductile to brittle-ductile shear zones with strong lithological and structural controls. Representative deposits: ○ Enterprise: 1,540m strike, up to 1,000m plunge extent, ~150m wide shoots dipping -22°W, hosted in mafic stratigraphy. ○ Enterprise West: 2,250m strike, 250m dip, lateritic cap over shear zone. ○ Bullant (Main/East Lodes): >1,000m strike and >1,000m vertical extent; lodes average 1.5–6m in width with high continuity. ○ Hughes: 650m strike, -25° to -55° dip, 3–15m lodes, from 20–200m depth. ○ Tregurtha: 600m strike, -70°W dip, similar geometry to Hughes. 2. Fault/Vein Arrays in Granodiorite and Porphyritic Intrusives: Mineralisation occurs in brittle fractures, quartz vein networks and foliated granodiorite or tonalite. These systems tend to show moderately variable lode geometry, with moderate widths and excellent surface continuity. Representative deposits: ○ Federal: ~900m strike, 418m dip, multi-style (replacement, disseminated, vein-hosted) mineralisation within granodiorite. ○ Lady Bountiful: 1,500m+ strike (combined), steep-dipping en-echelon quartz veining with true widths from 0.5–5m; depth to 190m. ○ Sandalwood, Tom Allen, Sleeping Beauty: Strike 350–750m, dips ~180–250m, widths 2–8m, hosted in structurally favourable contacts. 3. Regolith-Associated and Palaeochannel Systems: These are flat-lying or gently dipping mineralised zones associated with weathering profiles or palaeo-drainage channels, commonly overlying bedrock mineralisation. Supergene enrichment is typical. Representative deposits: ○ LBE Palaeochannel: ~7km long by 100–250m wide, vertical thickness 30–60m; mineralisation follows paleochannel incisions.

Criteria	JORC Code explanation	Commentary
		○ Rose Dam: 30–100m depth, supergene and channel-hosted Au in Tertiary sediments over Archaean basement. ○ Breakaway Dam: Shallow saprolitic supergene enrichment, typically 5–25m thick zones. 4. Broad Disseminated and Breccia-hosted Systems: Some deposits (especially in Mt Pleasant and Black Flag areas) contain gold in broad, stockwork-style zones within breccias or highly fractured intrusive units, often with steep dips and stacked lodes. Representative deposits: ○ Black Flag (OC/UG): ~700m strike, 290m dip, multiple breccia-hosted veins, lodes 1–4m wide; starts from surface. ○ Grand Tuart / Golden Swan: Complex geometry, strike from 500–1,000m per lode, 150–350m dip extents, dips -45° to -80°. ○ Racetrack UG/OP: Combined strike >1,200m, dip >600m, lode widths 0.5–8m; includes both supergene and high-grade primary lodes. • In summary, the Norton Gold Project encompasses a diverse range of deposit geometries, reflecting variations in geological setting and mineralisation style. Strike lengths range from less than 200 metres in smaller lode systems to over 2,000 metres in large-scale shear-hosted deposits. Vertical extents typically vary from shallow oxide zones to depths exceeding 1,000 metres in underground targets. Mineralised widths span from narrow, high-grade quartz veins less than 1 metre wide to broad, laterally extensive supergene and disseminated zones exceeding 100 metres in width.
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.*	• Mineral Resource estimates across the Norton Gold Fields project areas were generated using industry-standard 3D geological modelling and grade interpolation techniques, adapted to reflect the geological setting, mineralisation style, and data density of each deposit. All estimations comply with the guidelines set out in the JORC Code. • Mineralised domains were interpreted using geological logging, assay data, alteration signatures, and structural trends. Wireframes were constructed in section and validated in 3D to define mineralisation envelopes. These domains typically honour lithological contacts and structural features, with separate domains constructed for oxide,

Criteria	JORC Code explanation	Commentary
	• *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	transitional, and fresh zones where applicable. Domains are treated as hard boundaries for estimation purposes. • Drill assay data were composited to uniform downhole lengths—commonly 1 metre or 2 metres—depending on the sampling resolution and mineralisation style. Residual intervals at the end of holes were either merged or excluded if too short. Statistical analysis of grade distributions was conducted by domain, and top-cuts (grade caps) were applied where required to reduce the influence of extreme high-grade values. These caps were determined using histograms, log-probability plots, and review of the coefficient of variation, with values ranging from 4.8 g/t to over 40 g/t Au depending on the deposit. • Grade interpolation was carried out using a combination of: ○ Ordinary Kriging (OK) for well-drilled deposits with robust variogram models; ○ Inverse Distance Squared (ID^2) for less densely drilled or geologically simple domains; ○ Multiple Indicator Kriging (MIK) for deposits exhibiting strong grade variability and high nugget effect. • Estimation was performed in GEOVIA Surpac using rotated block models aligned to deposit geometries. Parent block sizes of most projects ranged from 5 m to 20 m (X and Y) and 2.5 m to 10 m (Z), with sub-blocking enabled to accurately reflect complex geometries and narrow vein structures. • Multi-pass search strategies were employed to reflect confidence in geological control and data density: Pass 1: tight ellipsoid using octant constraints (e.g., 3–8 samples from 3 octants) Passes 2–4: progressively relaxed criteria (e.g., fewer samples, broader range) to fill gaps. • Model Validation were through: ○ Visual checks comparing block grades to composite data in section and plan. ○ Swath plots comparing block and composite mean grades along strike, dip, and depth. • Global statistical comparison of composite vs estimated grades
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural*	• All tonnage estimates reported for the Norton Gold Fields project areas

Criteria	JORC Code explanation	Commentary
	moisture, and the method of determination of the moisture content.	are based on dry tonnage. No moisture corrections have been applied during the estimation process, and no adjustments were made for potential in-situ moisture content in the block model outputs.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• Cut-off grades applied to Mineral Resource and Ore Reserve estimates across Norton Gold Fields' operations are based on current and projected mining, processing, and administrative costs, as well as expected gold recoveries and prevailing gold prices. Cut-off values are determined separately for open pit and underground mining scenarios and differ by material type (oxide, transitional, fresh). • Cut-off grades are calculated as break-even values incorporating: ○ Mining costs based on current equipment fleet and geotechnical constraints. ○ Processing costs ranging from A$17.76/t to A$45.08/t, depending on plant and ore type. ○ Metallurgical recoveries from 72% to 93%, depending on ore complexity. ○ Gold price assumptions between US$2,700/oz. • For most deposits intended for open cut extraction reporting cut-off grades range from 0.25 g/t to 0.8 g/t Au, depending on deposit, depth, oxidation state, and study stage. • For deposits considered for underground development or currently mined as underground operations reporting cut-offs are generally between 1.5 g/t and 3.0 g/t Au.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• Mining methods across the Norton Gold Fields project portfolio reflect both current operational practices and mine planning assumptions for undeveloped resources. Assumptions are based on feasibility studies, pit optimisations, underground design evaluations, and operational experience within the Kalgoorlie region. • Open Pit Mining Most shallow and laterally extensive resources are assumed to be mined by conventional open pit mining using drill-and-blast methods, followed by load and haul with diesel truck and shovel fleets. ○ Pit optimisation and design were completed using Whittle software, applying realistic economic inputs including processing costs, recovery factors, and minimum mining widths. ○ Flitch heights of 2.5m or 5m are typically assumed depending on the ore body geometry and fleet configuration.

Criteria	JORC Code explanation	Commentary
		○ Selective Mining Units (SMUs) generally range from 5m x 5m x 2.5m to 10m x 10m x 5m, depending on the deposit and pit shell geometry. ○ Open pit dilution factors typically range between 5% and 20%, with mining recovery between 90% and 95%, based on historical reconciliation and performance from similar geological settings. • Underground Mining Resources with significant depth or narrow, high-grade lodes are evaluated for underground mining using mechanised or selective mining techniques. ○ Typical methods include Long-hole Open Stoping, Sublevel Open Stoping (SLOS), and Airleg Stoping, with stoping supported by Cemented Rock Fill (CRF), paste fill, or rock fill as appropriate. ○ Minimum mining widths range from 1.5–2.0m, with stope heights generally spaced at 15–25m between levels. ○ Dilution is estimated based on design method and ground conditions. Mechanised stopes assume 10–30% dilution, while airleg stoping assumes 10–15%. Ore loss is typically assumed between 5–10%. • Mining factors have also been calibrated through reconciliation against historical production data where applicable, particularly in operating mines.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• Low-grade cyanidation amenable ore is processed by heap leach process, with designed recovery rate of 74.5%. • High-grade amenable ore is processed at the Paddington processing plant, with gold recovery rates ranging from 88% to 94% averaging 92%. • Sulfide-encapsulated refractory ore requires the addition of a flotation circuit to the existing gravity-CIL (carbon-in-leach) process at the Paddington processing plant. The comprehensive gold recovery rate for this type of ore is 85% to 88% (design target: 87.58%). • For preg-robbing refractory ore, the gravity-CIL recovery rate varies significantly across different deposits. Further metallurgical testing is still required to determine the appropriate processes, parameters, products, and recovery rates for each deposit.

Criteria	JORC Code explanation	Commentary
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Based on the Mining Proposals, all chemicals and hydrocarbons are transported, stored and disposed of in accordance with Norton's Environmentally Hazardous Substances Management Plan. Chemicals and hydrocarbons are stored within bunds. • In the waste characterization studies conducted so far, most of the waste rock has been identified as non-acid-forming. However, some areas have not yet undergone geochemical analysis to assess their potential for acid mine drainage.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• Bulk density values used in the Mineral Resource estimates are based on in situ dry bulk density (ISBD), determined through systematic test work on diamond core and hand specimens, using the Archimedes principle (water immersion method). All tonnages are reported on a dry basis. • Bulk density test results have been cross-validated against historical and current production tonnages from nearby or same-deposit mining operations, providing confidence in the representativeness of the values used. • Typical values applied across different weathering zones Oxide: 1.8 – 2.1 t/m^3 Transitional: 2.2 – 2.5 t/m^3 Fresh rock: 2.75 – 2.85 t/m^3 Dump/fill (where applicable): 2.1 t/m^3 • For some deposits, such as Bullant and Enterprise, bulk density databases compiled by previous operators (Placer Dome, Barrick, KMC) were used, supplemented with Norton's QA-verified test results. • Where density data was unavailable for specific lithological units or weathering zones (e.g., saprolite, transported cover), average values from similar host rocks within the Eastern Goldfields region were applied, consistent with local geological understanding. • Density values were assigned in the block model by lithology, weathering state, and mineralisation domain, ensuring consistency with geological and estimation boundaries.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie*	• The Mineral Resource classification reflects the level of geological confidence, drill density, continuity of mineralisation, and the reliability of input data used in the estimation.

Criteria	JORC Code explanation	Commentary
	relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data). • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• Resource classification was applied using a combination of: Drill spacing and orientation: Measured Resources are typically assigned where drilling is within ~10m of development or grade control data; Indicated where spacing is ≤40m; and Inferred where spacing exceeds 40m but mineralisation continuity is supported. Geological and grade continuity: Interpretation confidence was assessed for each domain and included consideration of host lithology, alteration, structure, and mineralisation style. Estimation performance and block location: Consideration was given to search pass number, kriging variance, slope of regression, and proximity to mined or developed areas. Surrounding block classification: Local classification smoothing was applied in some cases to avoid unrealistic transitions between categories. • The resulting classifications are consistent with geological confidence and are deemed appropriate by the Competent Person.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal peer reviews of the Mineral Resource estimates have been routinely conducted by Norton as part of its standard resource reporting and continuous improvement process. These reviews include assessment of sampling practices, database integrity, geological modelling, estimation methods, classification logic, and reconciliation with production data. • The internal review process at NGF is considered robust, and the Competent Person has reviewed and endorsed the classification and estimation outcomes based on these established internal procedures. • This report was internally peer reviewed by Pengfei Xiao, FAusIMM and MAIG, a Principal Consultant (Geology), and Alexander Thin, FAusIMM (CP min), a Corporate Consultant (Project Evaluation and Mining).
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and*	• The Mineral Resource estimates have been prepared and reported in accordance with the guidelines of the JORC Code. The Competent Person considers the estimation procedures, geological interpretation, classification, and validation methods to be consistent with current industry standards for gold resource estimation. • Confidence in the estimates varies by deposit and classification category:

Criteria	JORC Code explanation	Commentary
	confidence of the estimate. • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	Measured and Indicated Resources are supported by close-spaced drilling, strong geological continuity, and reconciliation with historical production where available. Inferred Resources are based on more widely spaced data and interpreted continuity; these estimates are appropriate for high-level mine planning but not for reserve conversion without further drilling. • Resource models were validated using a combination of: Visual checks (e.g. comparison of block grades to raw assay and composite data in section/plan), Statistical comparisons (e.g. mean grade of blocks vs. composites), Swath plots, and In some cases, comparison to historical production data, particularly for operating mines. • The confidence statements refer to global estimates of tonnes and grade for both open pit and underground mining scenarios. Where appropriate, reconciliations to production have confirmed the reliability of the estimates within acceptable statistical error limits (typically ±10–15% for Indicated or Measured classifications).

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• The NGF Project encompasses eight distinct project areas, collectively comprising 24 deposits across both open pit and underground operations, which is shown in Figure 9 1. All deposits are underpinned by Pre-Feasibility Studies (PFSs), with some currently in production. For reporting purposes, SRK has grouped these into five primary projects: Binduli Project (Binduli area), Mt Pleasant Project (Greater Mt Pleasant area and Lady Bountiful area), Carbine Project (Carbine area), Ora Banda Project (Ora Banda area), and Golden Cities Project (Golden

Criteria	JORC Code explanation	Commentary
		Cities area, Mulgarrie area, and Mt Jewell area). • Reported Mineral Resource is inclusive of potential reserve material. • The Ore Reserves estimate is derived from pit/ stope designs and technical and economic feasible checking, accounting for mining dilution and loss. The reference point for the Ore Reserves estimates is the Run-of-Mine (ROM) Pad before the primary crusher and/or stockpiles at the processing and/or hydrometallurgy plant.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• A site visit was conducted between 16 and 19 June 2025. • SRK communicated all modification factors with technicians.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	Main technical studies are available to review: • Pre-Feasibility Study (PFS) for the Binduli Gold Mine Project, conducted by Zijin (Xiamen) Engineering CO., LTD in May 2025 • Pre-Feasibility Study (PFS) for the Paddington Gold Mine Project, conducted by Zijin (Xiamen) Engineering CO., LTD in May 2025 • Economic Assessment Report for the Binduli Gold Mine Heap Leach Project, conducted by Zijin (Xiamen) Engineering CO., LTD in Nov 2021 • Feasibility Study (FS) for the Flotation in Paddington Gold Mine Project, conducted by Zijin (Xiamen) Engineering CO., LTD in Feb 2021
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Table 8-1 listed the parameters used in estimation of the COG for Open Pit Mining. • Table 8-4 listed the parameters used in estimation of the COG for Underground Mining.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.*	Open Pit Mining • The detailed open-pit design provided by the Company was utilized as the pit limit for the estimation. • The dilution factor is 10%-15% depends on the deposit. • The recovery factor is 5%. • Inferred Mineral Resources are not included in the Ore Reserves. • The primary zone consists of dense, hard rock with good physical and mechanical properties, limited water content, and generally stable conditions, the maximum inter-ramp angel is from 35-59 degrees. Underground Mining • A dilution of 0.3 m is applied to each side of the stope.

Criteria	JORC Code explanation	Commentary
	• *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• An ore loss of 5% to 20% is applied on different deposit. • Inferred Mineral Resources are not included in the Ore Reserves. • Underground Mine mainly adopted the sublevel open stoping method with backfill, and for shallow-dipping zones, the mining method transitions to hand-held (airleg) mining.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.* • *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Based on the adaptability of the ore to the Paddington processing plant, Ores of Norton Gold Field can be classified into two categories: amenable ore and refractory ore. Extensive metallurgical test results indicate the following: • Low-grade amenable ore can be treated at the Paddington processing plant. However, considering cost factors, this type of ore is processed using heap leaching, achieving a recovery rate of only 74.5%. • High-grade amenable ore is processed at the Paddington processing plant, with gold recovery rates ranging from 88% to 94% averaging 92%. • Sulfide-encapsulated refractory ore requires the addition of a flotation circuit to the existing gravity-CIL (carbon-in-leach) process at the Paddington processing plant. The comprehensive gold recovery rate for this type of ore is 85% to 88% (design target: 87.58%). • For preg-robbing refractory ore, the gravity-CIL recovery rate varies significantly across different deposits. Further metallurgical testing is still required to determine the appropriate processes, parameters, products, and recovery rates for each deposit.
Environmen-tal	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• In the waste characterization studies conducted so far, most of the waste rock has been identified as non-acid-forming. However, some areas have not yet undergone geochemical analysis to assess their potential for acid mine drainage.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Yes and please see Section 12 "Project Infrastructure"
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The source of exchange rates used in the study.*	• The initial capital expenditure associated with the Paddington operations is estimated at approximately US$103.79 million. • For the Binduli operations, the initial capital expenditure is estimated at approximately US$60.97 million. • Mining Costs: A general unit cost of US$3.73 per ton of total material

Criteria	JORC Code explanation	Commentary
	• *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	moved (t-TMM) is applied for Paddington deposits in open pit mining. For Havana, the historical operating cost of US$2.98 per t-TMM is utilized as it is already in operation. For the Binduli deposits, the open pit mining cost is set at US$4.00 per t-TMM. For underground mining costs, the unit costs are based on cut-off grade assumptions. • Haulage Costs: Haulage costs are differentiated by destination based on cut-off grade assumptions. For material hauled specifically between the Binduli and Paddington operations, the haulage unit cost is estimated at US$2.50, as provided by NGF. • Processing Costs: Processing costs are estimated per ton of ore processed. Free Milling is costed at US$14.39, based on historical processing costs. Refractory ore processing is estimated at US$21.45, based on the cut-off assumption. Heap Leach processing has a unit cost of US$9.75, based on the budget estimation. • General & Administrative (G&A) and Selling Expenses (TC/RC): These costs are derived from the budget estimation. • The Government Gold Royalty is levied at a rate of 2.5% on gold sales revenue. In addition to this, an additional royalty of 0.6% on gold sales revenue is also incurred.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• The final product is doré, the selling price (TC/RC) is $0.05/t-ore processed for Paddington operation and $0.01/t-ore processed for Binduli operation. • For economic analysis, gold price was dynamic and was derived from consensus market forecasts provided by the Energy and Metals Consensus Forecast, published by Consensus Economics Inc., to which SRK subscribes annually.
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• See Section "15.1.2 Pricing Assumption"
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic*	• The discount rate used for NPV calculation ranges from 5% to 15%, with increments of 1%. All results indicate a positive NPV.

Criteria	JORC Code explanation	Commentary
	inputs including estimated inflation, discount rate, etc. • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• The Capex, Opex, along with gold prices, were selected as the essential variable factors affecting cash flow. These essential factors were analysed within a ±30% range for their impact on NPV, using a 10% discount rate. • The NPV is most sensitive to changes in the gold price. Should the gold price decline by 16.53% from the forecast, the Project's NPV would become negative.
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• Based on the information currently provided, a number of Aboriginal Heritage sites or European Heritage sites have been identified within the tenements of Carbine, Paddington, Ora Banda, Mt Pleasant, Golden Cities and Binduli. Norton will ensure the sites are not disturbed during any closure activities that occur. • Norton adopts a strategic approach to comprehensive stakeholder engagement, addressing issues related to both active operations and mine closure across multiple sites concurrently. Norton maintains regular communication with all stakeholders to discuss mine planning, ongoing activities, and closure-related matters.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• See Section "16 Risk Assessment"
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• See Sections "8.1.4 and 8.2.4 Ore Reserve Estimation"

Criteria	JORC Code explanation	Commentary
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• This Report has been peer reviewed by Alexander Thin, FAusIMM (CP Min), a Corporate Consultant (Mining and Project Evaluation)
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• See Section "16 Risk Assessment" • See Sections "8 Ore Reserve Estimates"

Appendix B Compliance with Chapter 18

Chapter 18				Sections in SRK's Report
18.01	**DEFINITIONS AND INTERPRETATION**			
18.02-18.04	**CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES**			
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.			
18.03	A Mineral Company must:—			
	(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—		3.1
		(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or	
			Note: 'control over a majority' means an interest greater than 50%.	
		(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which gives it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
	(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—		7.1.4, 7.2.3, 7.3.2, 7.4.2, 7.5.2;
		(a)	Indicated Resources; or	
		(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
	(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—		14.4, 14.5
		(a)	workforce employment;	
		(b)	consumables;	
		(c)	fuel, electricity, water and other services;	
		(d)	on and off-site administration;	
		(e)	environmental protection and monitoring;	
		(f)	transportation of workforce;	
		(g)	product marketing and transport;	
		(h)	non-income taxes, royalties and other governmental charges; and	
		(i)	contingency allowances;	
		Note:	*A Mineral Company must:* *• set out the components of cash operating costs separately by category;* *• explain the reason for any departure from the list of items to be included under cash operating costs; and* *• discuss any material cost items that should be highlighted to investors.*	

Chapter 18				Sections in SRK's Report
	(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—		14.5, 15.1
		(a)	general, administrative and operating costs;	
		(b)	property holding costs; and	
		(c)	the cost of any proposed exploration and/or development; and	
		Note:	*Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.*	
	(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has sufficient available working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.		14.5, 15.1
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.			
	Note: A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.			
18.05-18.08	**CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS**			
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—			
	(1)	a Competent Person's Report;		Whole report
	(2)	a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;		2.4
	(3)	the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;		3, 3.1
	(4)	a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;		3, 3.1

Chapter 18				Sections in SRK's Report
	(5)	disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and		16
	(6)	if relevant and material to the Mineral Company's business operations, information on the following:—		13
		(a)	project risks arising from environmental, social, and health and safety issues;	
		(b)	any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	
		(c)	compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	
		(d)	sufficient funding plans for remediation, rehabilitation and closure and removal of facilities in a sustainable manner;	
		(e)	environmental liabilities of its projects or properties;	
		(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	
		(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	
		(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	
18.06-18.08	***Additional disclosure requirements that apply to certain new applicant Mineral Companies***			
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.			14.4, 14.5
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.			
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.			
18.09-18.13	**RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS**			**not applicable**

Chapter 18			Sections in SRK's Report
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—		
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;	
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;	
		Note: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.	
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and	
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.	
	Note: Material liabilities that remain with the issuer on a disposal must also be discussed.		
18.10-18.11	***Requirements that apply to listed issuers***		**not applicable**
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.		
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.		
18.12-18.13	***Requirements that apply to Mineral Companies and listed issuers***		**not applicable**
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.		
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.		
18.14-18.17	**CONTINUING OBLIGATIONS**		**not applicable**

Chapter 18			Sections in SRK's Report
18.14	***Disclosure in reports***		
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.		
18.15-18.17	***Publication of Resources and Reserves***		
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.		
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.		
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18.		
	Note: Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.		
18.18-18.27	**STATEMENTS ON RESOURCES AND/OR RESERVES**		
18.18	***Presentation of data***		
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.		7.1.4, 7.2.3, 7.3.2, 7.4.2, 7.5.2; 8.1.4, 8.2.4, 8.3, 8.4
18.19	***Basis of evidence***		
18.19	All statements referring to Resources and/or Reserves:—		
	(1)	in any new applicant listing document or circular relating to a Relevant Notifiable Transaction must be substantiated in a Competent Person's Report which must form part of the document; and	Whole report
	(2)	in all other cases, must at least be substantiated by the issuer's internal experts.	
18.20	***Petroleum Competent Persons' Reports***		**not applicable**
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.		

Chapter 18			Sections in SRK's Report
18.21-18.22	***Competent Person***		
18.21	A Competent Person must:—		2.7
	(1)	have a minimum of five years' experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	
	(2)	be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	
	(3)	take overall responsibility for the Competent Person's Report.	
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—		2.10
	(1)	have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2)	not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3)	in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4)	in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
18.23	***Additional requirements of Competent Evaluators***		**not applicable**
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—		
	(1)	have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2)	have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3)	hold all necessary licences.	
	Note:	*A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.*	

Chapter 18			Sections in SRK's Report
18.24	***Scope of Competent Persons' Reports and Valuation Reports***		
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—		1, 2.2
	(1)	be addressed to the Mineral Company or listed issuer;	2.1
	(2)	have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	2.4
	(3)	set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	2.2
18.25-18.26	***Disclaimers and Indemnities***		
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.		2.3
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.		2.9
18.27	***Obligations of sponsor***		
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.		
18.28-18.34	**REPORTING STANDARD**		1, 2.2
18.28-18.30	***Mineral reporting standard***		
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.		

Chapter 18				Sections in SRK's Report
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—			
	(1)	under:		
		(a)	the JORC Code;	1, 2.2
		(b)	NI 43-101; or	
		(c)	the SAMREC Code,	
		as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		
	Note:	*The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.*		
18.30	A Mineral Company must ensure that:—			
	(1)	any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;		8.2.1
	(2)	estimates of mineral Reserves and mineral Resources are disclosed separately;		7.1.4, 7.2.3, 7.3.2, 7.4.2, 7.5.2; 8.1.4, 8.2.4, 8.3, 8.4
	(3)	Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;		8, 15
	(4)	for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—		7.1.4, 7.2.3, 7.3.2, 7.4.2, 7.5.2; 8.1.2, 8.2.2, 15.1.2
		(a)	the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	
		(b)	if a contract for future prices of mineral Reserves exists, the contract price is used; and	
	(5)	for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.		15.3

Chapter 18			Sections in SRK's Report
18.31-18.33	***Petroleum reporting standard***		**not applicable**
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.		
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—		
	(1)	under PRMS as modified by this Chapter; or	
	(2)	under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	Note: A Reporting Standard applied to specific assets must be used consistently.		
18.33	A Mineral Company must ensure that:—		
	(1)	where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;	
	(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
	(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	
	(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	
		Note: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.	

Chapter 18			Sections in SRK's Report
	(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
		Note: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.	
	(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
	(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	
18.34	***Mineral or Petroleum Asset Valuation Reports***		**not applicable**
18.34	A Mineral Company must ensure that:—		
	(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
	(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
	(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
	(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

Appendix C Chapter 2.6 of the Guide for New Listing Applicants

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	7.1.4, 7.2.3, 7.3.2, 7.4.2, 7.5.2; 8.1.2, 8.2.2
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	**N/A**
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	10.1
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	4.1
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	8.1.4, 8.2.4, 8.3, 8.4
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	15.1, 15.2
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/ oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	**N/A**
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	16

Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

Term / Abbreviation	Meaning / Definition
%	percent
′	Minute(s)
″	Second(s)
°	degree, angle of inclination
°C	degrees of temperature
3D	Three-dimensional
AAS	atomic absorption spectrometry
ACF	Akyem Carbon Fault
AMS	African Mining Services
AN/FO	Ammonium nitrate / fuel oil
ARD	Acid rock drainage
asl	above sea level
Au	the element symbol of gold
AusIMM	Australasian Institute of Mining and Metallurgy
B.Sc.	Bachelor of science
BLY	Boart Longyear
Capex	capital expenditure(s)
CIL	carbon-in-leach
CIM	Canadian Institute of Mining, Metallurgy, and Petroleum
CIT	corporate income tax
cm	centimetres
COG	cut-off grade
Company or Zijin Gold International	Zijin Gold International Company Ltd
CPR	Competent Person's Report
CRM	Certified reference materials
Cu	Copper
CV	Coefficient of variation
DCF	discounted cash flow
E	East
EIA	Environmental Impact Assessment
EPMP	Environmental Protection and Management Plan
Exploration Results	Data and information generated by mineral exploration programs that might be of use to investors, but which do not form part of a declaration of Mineral Resources or Ore Reserves
Exploration Target	A statement or estimate of the exploration potential of a mineral deposit in a defined geological setting where the statement or estimate, quoted as a range of tonnes and a range of grade (or quality), relates to mineralisation for which there has been insufficient exploration to estimate a Mineral Resources
FAusIMM	Fellow of the Australasian Institute of Mining and Metallurgy
Form 43-101F1	Form 43-101F1 Technical Report and Related Consequential Amendments

FS or Feasibility Study	A Feasibility Study is a comprehensive technical and economic study of the selected development option for a mineral project that includes appropriately detailed assessments of applicable Modifying Factors together with any other relevant operational factors and detailed financial analysis that are necessary to demonstrate at the time of reporting that extraction is reasonably justified (economically mineable). The results of the study may reasonably serve as the basis for a final decision by a proponent or financial institution to proceed with, or finance, the development of the project. The confidence level of the study will be higher than that of a Pre-Feasibility Study
FY	financial year
G&A	general and administration
g	gram
g/cm^3	gram(s) per cubic centimetre
g/t	gram per tonne
Ga	billion years
GED	Newmont's proprietary Global Exploration Database
GIS	Geographic information system
GNC	Ghana National Grid
GRAP	the Graphitic Shear Breccia
ha	hectare(s)
HG	High grade domain
HKEx	Hong Kong Exchanges and Clearing Ltd
HQ	63.5 mm core diameter
Indicated Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit
Inferred Mineral Resource	That part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
JORC Code	2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves prepared by the Joint Ore Reserves Committee of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
JORC Committee	Joint Ore Reserves Committee
K	the element symbol of potassium
Koz	thousand troy oz
kg	kilogram, equivalent to 1,000 grams
km	kilometres, equivalent to 1,000 metres
km^2	square kilometres
kt	thousand tonnes
ktpa	thousand tonnes per annum
kV	kilovolts, equivalent to 1,000 volts
kVA	kilovolt ampers
kW	kilowatt, equivalent to 1,000 watts
kWh	kilowatt hours
Kyrgyz Gold	Kyrgyz Gold Company Limited
L	litres
LG	Low grade domain
Li	the element symbol of lithium
LHD	load-haul-dump

L/s	litres per second
LoM	life-of-mine
M	million
Ma	Million years
m	metres
m^2	square metre
m^3	cubic metre
MAusIMM	member of the Australasian Institute of Mining and Metallurgy
m asl	metres above sea level
m/s	metres per second
Measured Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit.
Mineral Resource	A concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.
ML	megalitres (million metres); Mining Licence
mg	milligram
mm	millimeter(s)
Moz	Million troy oz
MRE	Mineral Resource estimate
Mt	million tonnes
Mtpa	million tonnes per annum
MW	megawatts
MWh	megawatts hours
N	North
NE	Northeast
NGRL	Newmont Golden Ridge Limited
NI 43-101	National Instrument 43-101, Standards of Disclosure for Mineral Projects
NPV	net present values
NQ	47.6 mm core diameter
NSR	net smelter return
OK	Ordinary Kriging
OP	Open Pit
oz	troy ounce(s)
Opex	operating expenditure(s)/cost(s)
Ore Reserve	The economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified
ORM	Ore Reserves Model
PC	RC pre-collared
PQ	85 mm core diameter

PFS	A Preliminary Feasibility Study (Pre-Feasibility Study) is a comprehensive study of a range of options for the technical and economic viability of a mineral project that has advanced to a stage where a preferred mining method, in the case of underground mining, or the pit configuration, in the case of an open pit, is established and an effective method of mineral processing is determined. It includes a financial analysis based on reasonable assumptions on the Modifying Factors and the evaluation of any other relevant factors which are sufficient for a Competent Person, acting reasonably, to determine if all or part of the Mineral Resources may be converted to an Ore Reserve at the time of reporting. A Pre-Feasibility Study is at a lower confidence level than a Feasibility Study
PPE	Personal protective equipment
ppm	parts per million, equivalent to gram(s) per tonne (g/t)
Probable Ore Reserve	the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve
Proved Ore Reserve	the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors
QA/QC	quality assurance/quality control
RC	reverse circulation
Report	Independent technical report
ROM	run-of-mine
RPEEE	reasonable prospects for eventual economic extraction
RQD	Rock Quality Designation
S	South, also the element symbol of sulphur
SD	Standard deviation
SE	Southeast
SG	specific gravity
SRK	SRK Consulting China Ltd
Stock Exchange	The Stock Exchange of Hong Kong Ltd, a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("HKEx")
t	tonnes
t/d or tpd	tonnes per day
t/m^3	tonnes per cubic metre
TSF	tailings storage facilities
UG	Underground
US$	United States dollar

WRD	waste rock dump
VAT	value-added tax
ZGRL	Zijin Golden Ridge Limited
Zijin Gold International	Zijin Gold International Company Ltd (紫金黄金国际有限公司)
Zijin MEI	Zijin Mining Group Company Limited Mineral Exploration Institute

Executive Summary

Introduction

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Limited ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of the Ghana Akyem Gold Project ("**Akyem Project**" or the "**Project**") which is located in Birim North District, Akyem, Ghana and operated by Zijin Golden Ridge Limited **("ZGRL")**, a subsidiary company of Zijin Gold International. The Akyem Project includes the Ghana Akyem gold mine ("**Akyem Mine**") and associated one ore processing and metallurgical plant ("**Akyem Plant**"). Newmont Golden Ridge Limited **("NGRL")** was later acquired by Zijin Mining and renamed as Zijin Golden Ridge Limited**.**

It is SRK's understanding that the independent technical assessment on the Akyem Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Company on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEx**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on the Stock Exchange including the Chapter 18 requirements and other relevant regulations of the Stock Exchange and HKEx.

Summary of Principal Objectives

The principal objective of this Report is to provide Zijin Gold International and potential equity investors and future shareholders of the Company with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserves, mining methodologies, processing and metallurgical technologies, environmental and social aspects, and etc of the Project based on all available technical data. It is understood that the aim of this Report will be used by the Company for the proposed listing on the Stock Exchange and HKEx.

Outline of Work Programme

The work program for this project consisted of:

- review of dataset and resource models provided by ZGRL and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection.
- a site visit between 10 and 14 June 2025, to the Akyem Project, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.

- review of all available documents, including operating licenses and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.
- discussion with ZGRL and Zijin Gold International management and technical personnel, as well as the professionals of Zijin (Xiamen) Engineering Co., Ltd ("**Zijin Xiamen**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Akyem Project.
- preparation of a draft report in accordance with the JORC Code and the requirements of the Chapter 18 on the Stock Exchange and other regulations of the HKEx (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- submission of the draft to Zijin Gold International and ZGRL and the related third party for comments and finalise the draft based on the feedback.

Results

Overall

Operational Licences and Permits

Mineral tenure within the Akyem Gold Project area comprises two mining leases (Akyem East and Akyem West) and 4 prospecting licenses, covering an aggregate area of approximately 143.85 km^2 (~14,385 ha), as listed in table below.

Table ES-1: Mineral Tenures

Name	Type	No.	Expiry Date	Area (km^2)
Akyem West	Mining Lease	1777/2010	January 2030	16.59
Akyem East	Mining Lease	1778/2010	January 2037	47.67We
Abirem	Prospecting Licence	PL5/160/LVB3084/05	June 2027	31.5
Abodom	Prospecting Licence	PL5/135/LVB7171/02	September 2027	9.87
Kenbert	Prospecting Licence	PL5/3/LVB9428/2000	September 2027	14.7
Mamam River	Prospecting Licence	PL5/134/LVB14070/2001	June 2027	23.52

Geology and Mineralogy

The West African Craton is divided into two major geological domains: the Archean Reguibat Shield in the north (Mauritania) and the Paleo-Proterozoic Man Shield in the south (spanning Ghana and Senegal). The Man Shield consists of two sectors—the western sector comprises Liberian-age rocks (3.0–2.5 Giga annum ("**Ga**")), while the eastern sector is characterized by Paleoproterozoic Birimian rocks, which include five northeast–southwest trending volcanic belts of tholeiitic to acidic composition. The Akyem gold deposit is situated within the Ashanti Gold Belt, one of these volcanic belts.

Geologically, the Akyem deposit is defined by its association with the Akyem Shear Zone system, where the Akyem Carbon Fault ("**ACF**") serves as the primary structural feature controlling mineralization. The periodic reactivation of the fault system, coupled with structural intersections and dilation events, facilitated the development of high-grade ore shoots, which are key to the deposit's economic significance.

Mineralization within the deposit is structurally controlled, primarily localized along fault zones such as the Akyem Carbon Fault and its associated brittle fractures in the hanging wall. The interplay of ductile deformation from earlier events and subsequent brittle fracturing created conduits for gold-rich hydrothermal fluids, concentrating mineralization in zones of enhanced fracture permeability. The deposit's structural geometry, including steeply dipping faults and low-angle extensional structures, defines the spatially predictable high-grade ore shoots. Alteration patterns and structural complexity further reflect the critical role of fault systems in the localization and distribution of the deposit's gold resources.

The Akyem deposit extends over a strike length of more than 2,500 metres ("**m**"), with mineralization delineated to a depth of approximately 900 m down-dip on its southeast-dipping fault structure. Mineralized zones vary significantly in true thickness, ranging from 10 m to as much as 100 m. Gold grades exceeding 0.5 g/t are observed across widths of 10 to 150 m, while zones of higher-grade (>4 g/t Au) mineralization are predominantly hosted in intensely altered silica-carbonate-sericite breccias adjacent to the Akyem Carbon Fault, with widths ranging between 5 and 50 m.

Deposit Type

The Akyem deposit is classified as an orogenic gold deposit. Orogenic gold deposits are found in deformed metamorphic terranes ranging from the Middle Archean to the Precambrian and stretching continuously into the Phanerozoic. These deposits are typically hosted in volcano-plutonic or clastic sedimentary terranes, though they can occur in any rock type. There is a consistent spatial and temporal association with granitoids of varying compositions. Host rocks are commonly metamorphosed to greenschist facies but can locally reach amphibolite or granulite facies.

Gold mineralisation occurs near first-order, deep-crustal fault zones. Economic mineralization typically forms as vein fill within second- and third-order shears and faults, particularly at jogs or changes in strike along these crustal fault zones. Mineralization styles vary, including stockworks and breccias in shallow, brittle environments; laminated crack-seal veins and sigmoidal vein arrays in brittle-ductile crustal regions; and replacement- and disseminated-type orebodies in deeper, ductile settings.

Quartz is the primary component of the veins, with lesser amounts of carbonate and sulfide minerals. Sulfide minerals may include pyrite, pyrrhotite, chalcopyrite, galena, sphalerite, and arsenopyrite. Gold is commonly associated with sulfide minerals but can also occur as native gold.

Exploration and Drilling

Prior to 2011, a number of Reverse Circulation ("**RC**") and RC pre-collared ("**PC**") holes were drilled and currently reside within the Akyem database. All drilling conducted within the Akyem Project area currently employs diamond core drilling methods. In 2022 and 2023, drilling activities were carried out by Boart Longyear ("**BLY**") and African Mining Services ("**AMS**"). Drill holes typically begin with PQ-sized core (85 millimetres ("**mm**") diameter), followed by reductions to HQ-sized core (63.5 mm diameter) and eventually NQ-sized core (47.6 mm diameter) as drilling progresses.

Table ES-2: Summary of Akyem Database

Holes	Depth (m)	Samples	Lith Logging	Survey
1,430	445,298	325,111	271,886	50,597

Quality Assurance and Quality Control

Core samples were sawn in half, with one half retained as a character specimen and the other half sent for laboratory analysis. The primary laboratory for analysis was ALS Kumasi Laboratory, with ALS Vancouver conducting umpire analyses for exploration projects.

Certified Reference Materials ("**CRMs**"), blanks and duplicates are used as quality control samples in Akyem project, umpire analyses were conducted at ALS Vancouver.

The QAQC samples' performance are generally within expectations, demonstrating good accuracy and precision of the analysis. The assay data are considered with sufficient confidence to support mineral resource estimate.

QAQC raw data are not available to SRK which need to be reviewed. Validation sampling is also necessary to further verify the performance of main laboratory.

Mineral Resource Estimation

The Mineral Resource Statement presented herein represents a Mineral Resource evaluation for the Akyem Project, prepared in accordance with the JORC Code guidelines. SRK has reviewed the Mineral Resource models, which were prepared by Zijin Mining Group Company Limited Mineral Exploration Institute ("**Zijin MEI**"), but has not re-modeled or re-estimated them.

SRK has reviewed the drillhole database, mineralization domain definitions, and grade estimation parameters based on the provided data and information for the Akyem Project. The validated Mineral Resource models were reported by SRK. Through cross-checking and validation of procedures and key parameters, SRK has determined that the reviewed models and Mineral Resource estimates were prepared using standard approaches that align with internationally accepted practices.

The estimation of the Mineral Resources documented in this Report is informed by data from 1,430 drillholes for a combined drilling meter of 445,298 m with 325,111 samples.

The wireframe modelling was carried out by Zijin MEI using explicit modelling method. The mineralisation wireframes were constrained within two mineralisation envelopes (High Grade at a cut-off of 1.0 g/t Au and Low Grade at a cut-off of 0.1 g/t Au). Grade capping was conducted by Zijin MEI based on Au distribution characteristics within the mineralized bodies, followed by sample length compositing. HG mineralized bodies were composited to the length of 1 m, while LG bodies were composited to 2 m.

Variograms were modeled, and the ordinary kriging ("**OK**") method was applied for Au grade estimation by Zijin Gold International. SRK performed a thorough validation of the model, including visual inspection and swath plot analysis. These validations indicate that the block model constructed by Zijin MEI is acceptable.

The quality of the data, drillhole spacing, and continuity of mineralized domains allowed Zijin MEI to classify portions of the blocks into the Measured, Indicated, and Inferred Mineral Resource categories.

Tabel ES-3 is a summary of Akyem's Mineral Resource Statement as of 31 December 2024, in accordance with JORC Code guidelines.

Table ES-3: Mineral Resource Statement[1], Akyem Project, SRK Consulting China Limited, 31 December 2024[2, 3, 4, 5, 6, 7, 8]

	Class	Tonnes(Mt)	Au(g/t)	Au(Kg)	Au(Koz)
OP	Measured	97.2	1.4	137,958	4,435
	Indicated	5.9	1.3	7,459	240
	Measured and Indicated	103.1	1.4	145,417	4,675
	Inferred	2.5	1.2	3,130	101
	Sub-Total	105.7	1.4	148,547	4,776
UG	Measured	22.3	2.7	59,537	1,914
	Indicated	26.1	2.6	67,544	2,172
	Measured and Indicated	48.4	2.6	127,081	4,086
	Inferred	8.7	2.4	21,075	678
	Sub-Total	57.0	2.6	148,156	4,763
Total	Measured	119.5	1.7	197,495	6,350
	Indicated	32.0	2.3	75,003	2,411
	Measured and Indicated	151.5	1.8	272,499	8,761
	Inferred	11.2	2.2	24,204	778
	Total	162.7	1.8	296,703	9,539

Notes:

1 The Mineral Resources are reported in accordance with the JORC Code guidelines.

2 All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

3 The information in this report which relates to Mineral Resource is based on information compiled by Mr Mingyan Wang, Mr Huaixiang Li and Mr Pengfei Xiao who are all full-time employees of SRK Consulting. Mr Li is a Member of the Australian Institute of Geoscientists (the "AIG") and Mr Xiao is a Fellow of the Australasian Institute of Mining and Metallurgy (the "AusIMM") and a Member of the Australian Institute of Geoscientists (the "AIG"). Mr Li and Mr Xiao have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the "Competent Persons" as defined in JORC (2012). Mr Wang, Mr Li and Mr Xiao consent to the reporting of this information in the form and context in which it appears.

4 OP Mineral resources are reported at a cut-off grade is 0.3 g/t.

5 UG Mineral resources are reported at a cut-off grade is 1.5 g/t.

6 Mt – million tonnes (metric tons), oz- ounce; Koz – thousand ounces.

7 The conversion between ounce and gram used herein is 1 oz = 31.1035 g.

8 Mineral Resources are inclusive of Ore Reserves that have been converted from Measured and Indicated Mineral Resources.

As of 31 December 2024 and at a cut-off grade of 0.3 g/t Au for OP mining and 1.5 g/t Au for UG mining, the Akyem Project is estimated to contain 119.5 million tonnes ("**Mt**") of Measured Mineral

Resources with an average grade of 1.7 g/t Au, 32.0 Mt of Indicated Mineral Resources with an average grade of 2.3 g/t Au, and 11.2 Mt of Inferred Mineral Resources with an average grade of 2.2 g/t Au.

Exploration Potential

Significant intercepts from recent drilling along strike and down-dip across multiple zones highlight the potential for further resource expansion. The strike length of the system along the Akyem Carbon Fault now extends over 3 km, stretching from the West Zone (at surface) and Piet (underground) in the west to Ogyefuo in the east. While most of the current deposit is in the hanging wall of the ACF, multiple intercepts in the footwall suggest additional resource potential in that area.

Mining and Ore Reserves

SRK has estimated the Ore Reserves for the Akyem Gold Mine open pit and the underground deposits in accordance with the guidelines outlined in the JORC Code. These Ore Reserve estimates are supported by Modifying Factors derived from technical studies and ongoing operational records, which are considered to meet the confidence level of a Pre-Feasibility Study.

Key factors applied in the estimation process include design scope, pit optimization, pit design, mining losses, and dilution. Additional factors, such as processing capabilities, market conditions, environmental considerations, legal and political constraints, and other elements that may influence the quantity and classification of the Ore Reserves, were also taken into account.

The portions of Measured and Indicated Mineral Resources within the designed open pits and underground stopes, inclusive of diluting materials and allowances for losses, have been classified as Proved Ore Reserves and Probable Ore Reserves, respectively.

Table ES-4: Ore Reserve Statement for the Akyem Gold Mine as of 31 December 2024 by SRK Consulting China Ltd

Category	Tonnes (Mt)	Grade (g/t Au)	Contained Au Metal (kg)	Contained Au Metal (koz)
Open Pit				
Proven	96	1.36	130,705	4,202
Probable	6	1.20	7,066	227
Sub-total open pit	102	1.35	137,770	4,429
Underground				
Proven	11	2.34	26,830	863
Probable	19	2.24	42,288	1,360
Sub-total underground	30	2.28	69,118	2,222
Stockpile

Probable	26	1.95	50,048	1,609.09
Total Mineral Reserves	**133**	**1.56**	**207,583**	**6,674**

Sources: SRK

Notes:

[1] The information in this report which relates to Ore Reserve is based on information compiled by Rui Shen and Pengfei Xiao who is a full-time employee of SRK Consulting China Ltd. Pengfei Xiao is a member/fellow of AusIMM. Pengfei Xiao has sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Rui Shen and Pengfei Xiao consents to the reporting of this information in the form and context in which it appears.

[2] Number was rounded to the second significant digit to reflect the uncertainties in estimate.

[3] Total may not add due to rounding discrepancies

[4] For Akyem Open Pit Mining dilution (waste rock and inferred Mineral Resources) rate is 5%. Mining loss rate is 5%.

[5] For Akyem Underground Mining dilution (waste rock and inferred Mineral Resources) rate is 10%. Mining loss rate is 10%.

[6] The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

Mining Assessment

The Akyem Gold Mine includes both open-pit and underground mining operations.

Open-pit Operations

Akyem have the main pit and west pit, the west pit is expected to be depleted by 2026,while the main pit have an estimated remaining life of approximately 14 years. The open-pit operations are designed as a conventional truck-and-shovel system managed by contractors. The bench height is 8 meters, with tribble benching extending to 24 meters where applicable. Haul roads are designed with a maximum gradient of 10%, featuring double-lane roads 25 meters wide and single-lane roads 32 meters wide, providing efficient access to the pit bottom.

Underground Operations

The Akyem Gold Mine features a strike length of over 2,500 meters, with mineralization extending to a depth of 900 meters. The mineralized zones vary in thickness, ranging from 10 meters to 100 meters. The ore body strikes at N70E, dips to the S-SE at 60°-65°, and is generally parallel to the foliation of the host rock sequence.

Underground development is scheduled to begin in 2026, employing a dual-shaft and ramp system. The mining sequence will follow a bottom-up approach, with operations extending from a relative elevation of 110 meters to -610 meters RL. The two shafts are designated for specific tasks: one for fresh air intake and personnel transportation, and the other for hoisting. Ventilation shafts will be constructed near the main shafts to ensure adequate airflow, dilute diesel emissions, and regulate temperatures in deeper mining zones.

The mine is set to adopt sub-level open stoping method and open stoping method, complemented by cemented tailings backfilling to ensure geotechnical stability. Each stope is designed with dimensions of 15-60 meters in length, 5 to 30 meters in width, and 20 meters in height. To achieve the daily production target of 10,606 tonnes, multiple stopes will be operated concurrently across different mining levels. Additionally, a 30-meter crown pillar is incorporated into the design to ensure stability between open-pit and underground operations.

Mining activities will be conducted in a phased manner, following a staggered sequence to enhance safety and minimize surface disruption. Adjacent stopes are categorized into primary and secondary types, with secondary stopes extracted only after the primary stopes have been completely mined and backfilled. This systematic approach not only maximizes production efficiency but also mitigates geotechnical risks and reduces environmental impacts.

Mineral Processing and Metallurgy

The Akyem Processing Plant was put into operation in 2013 with a designed capacity of 7.6 Mtpa when processing 100% primary ore, and up to 8.5 Mtpa when treating a blend of 30% oxide ore and 70% primary ore.

In the future, the processing plant will undergo technological upgrades and expand its production capacity to 12.0 Mtpa, processing both open-pit (OP) and underground (UG) mixed ores. The expansion pre-feasibility study (PFS) has been completed by Zijin (Xiamen) Engineering Design Co., Ltd.. The plant utilizes the carbon-in-leach (CIL) process to recover gold and the final product is gold doré bullions.

Table ES- 5 summarized the historical production data from 2022 to 2024. The data indicated that over the past four years, the annual production throughput has ranged between 7.6 Mt and 8.3 Mt with recovery rates ranging between 88% and 90%. The gold output in 2022, 2023, and 2024 was 12.84 t, 9.02 t, and 6.32t, respectively.

Table ES- 5: Historical Production Data of Akyem Processing Plant

Items	Unit	2022	2023	2024
Processed Tonnes	kt	8,195	7,646	8,287
Feed Grade	g/t	1.750	1.317	0.857
Gold Recovery	%	89.50	89.52	89.00
Gold Metal Output	t	12.84	9.02	6.32
Gold Metal Output	koz	413	290	203

Source: SRK collected.
Note: 1 oz=31.1035 g.

Environmental and Social Impacts

The Akyem Mine has obtained relevant environmental permits for its operations, including the environmental permit, environmental certificate, water use permits for dewatering and water abstraction for domestic purposes, mining, processing and dust suppression activities, as well as discharge. However, the environmental certificates for the Environmental Management Plans (EMPs) related to the Akyem Mine, Akyem MWTP, Pit Layback, and WRDF Expansion projects are still pending issuance. Of the 10 Water Resources Commission (WRC) permits reviewed by SRK, only three water abstraction permits remain valid through 31 December 2025, while the others have expired. According to discussions with NGRL's technical representatives, the pending Certificates and water use permit approvals are not expected to impact ongoing mine operations. The *Environmental Impact Statement on Akyem Gold Mining Project* ("2008 EIS") dated November 2008 and its approval is reviewed by SRK. NGRL committed to implement a threefold reforestation program to offset the impact of mining 101 hectares within the 568.56-hectare Adjenjua Bepo Forest

Reserve. The main water sources for the processing plant are from stored water in the mined out open pit and the TSF. The TSF is a zero-discharge facility, with all water returned for use in the ore processing circuit and no process water is discharged to the environment. Rock characterization studies at the Akyem Mine indicate that waste materials are non-acid generating due to high pH levels, low pyrite content, and abundant carbonates, with ongoing column leach testing in place to simulate long-term weathering and confirm the absence of acid rock drainage risks. The project conducts comprehensive environmental monitoring regularly, covering water quality, cyanide content, noise, and dust emissions. NGRL implements cyanide management practices derived from continued compliance with the International Cyanide Management Code ("ICMC").

NGRL conducted cultural heritage studies to identify and protect community shrines, sacred grooves, royal mausoleum and cemeteries as well as individual and family shrines. NGRL has paid pacification fees for their relocation from the mining area. According to 2024 AESR, NGRL actively pursued a range of social responsibility initiatives, including stakeholder engagements, social investments facilitated by the Newmont Akyem Development Foundation (NAKDEF) across seven thematic areas, youth capacity-building support in mine host communities, community development projects, establishment of complaints and grievances resolution mechanisms, and the implementation of human rights and voluntary principles programs.

Capital Expenditures and Operating Costs

Historically capital expenditures ("Capex") refer to those invested into the Project that have been provided by the Company. The total capital invested on the Project by 31 December 2024 is about US$356,790,000.

New Capex required for sustain the open pit mining and commence underground operation to archive the designed capacity. The Sustaining Capex was 560,015 thousand US dollars (including the closure expenditure of 258,100 thousand US dollars), while the Expansion Capex was 573,671 thousand US dollars, and the total Capex was 1,133,686 thousand US dollars.

All-in sustaining costs (AISC) for the Project in 2022, 2023 and 2024 are US$ 965/oz gold, US$ 1,245/oz gold and US$ 1,816/oz gold respectively. The historical and forecasted cash operating cost and AISC is shown in Table 14-2 and Table 14-3 respectively.

Economic Analysis

SRK estimated the NPV in a range of US$ 1,493 million (at 12% discount rate) to US$ 2,281 million (at 6% discount rate), with a base case of US$ 1,832 million using a discount rate of 9.0%. The positive NPVs indicate that the Project is economically viable.

Risk Assessment

Risk Assessment for Akyem Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Possible	Moderate	Medium
Lack of Significant Ore Reserves	Possible	Moderate	Medium
Unexpected Groundwater Ingress	Unlikely	Moderate	Low

Risk Source/Issue	Likelihood	Consequence	Risk
Significant Unexpected Geological Faulting	Possible	Moderate	Medium
Mining			
Significant Production Shortfalls	Unlikely	Moderate	Low
Pumping System Adequacy	Unlikely	Moderate	Low
Significant Geological Structure	Unlikely	Moderate	Medium
Excessive Surface Subsidence	Unlikely	Moderate	Medium
Crown Pillar Failure	Unlikely	Moderate	Medium
Poor Underground Condition	Possible	Moderate	Medium
Poor Mine Plan	Possible	Moderate	Medium
Poor Road Transportation/Safety	Unlikely	Moderate	Low
Ore Processing			
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Possible	Moderate	Medium
Higher Production Cost	Possible	Moderate	Medium
Environmental and Social			
Lack of Environmental Permits	Possible	Moderate	Medium
Impact on Flora and Fauna	Possible	Moderate	Medium
Poor Water Management	Possible	Moderate	Medium
Poor Waste Rock and Tailings Management	Possible	Moderate	Medium
Poor Hazardous Materials Management	Unlikely	Moderate	Low
Social Licensee to Operate	Possible	Moderate	Medium
Capital and Operating Costs			
Project Timing Delay	Possible	Moderate	Medium
Capital Cost Increases	Possible	Moderate	Medium
Capital Costs- Ongoing	Possible	Moderate	Medium
Operating Cost Underestimated	Possible	Moderate	Medium

Recommendations

Exploration and Mineral Resources

SRK identified the twin drill holes, KP350 and KP350A, in the database, with notable discrepancies in Au grades within the 430m-630m depth. Furthermore, the background Au grade for assay results in the database has been assigned to 0.001 g/t.

For the solid model, SRK recommends delineating the mineralized body based on geological domains to ensure the model accurately reflects the spatial distribution and geological controls of the mineralization.

For estimation parameters, SRK suggests that the estimation parameters should refer to the variogram, as utilizing variogram-based values ensures that spatial continuity and variability are appropriately incorporated into the resource estimation process.

Additionally, SRK considers the classification of Measured Mineral Resources with a 50m × 50m drill spacing and Indicated Mineral Resources with a 100m × 100 m drill spacing to be overly optimistic. A tighter drill spacing is typically required for Measured and Indicated Mineral Resources to achieve a higher level of confidence in the geometry, grade distribution, and continuity of the deposit. This recommendation aims to enhance the reliability and accuracy of the resource classification.

QAQC raw data are not available to SRK which need to be reviewed. Validation sampling is also necessary to further verify the performance of main laboratory.

Ore Reserves have been estimated for two open-pit deposit and underground deposits, with the majority of the reserves hosted in the Akyem Gold Mine.

As of December 31, 2024, the total Mineral Reserves at the mine are as follows:

- Proven: 107,401 kt grading 1.46 g/t Au, containing 157,135 kg of gold.
- Probable: 25,319 kt grading 1.96 g/t Au, containing 49,574 kg of gold.
- Proven and Probable: 132,719 kt grading 1.56 g/t Au, containing 206,708 kg of gold.

Open-Pit Operations:

- Akyem open pit has a remaining life of approximately 14 years.
- The pit operates using a conventional truck-and-shovel method, managed by contractors.
- Bench height is designed at 8 meters, with tribble benching extending to 24 meters.
- Mined materials are transported along haul roads with a maximum gradient of 10%.
- Double-lane haul roads are designed to be 32 meters wide, while single-lane roads are 25 meters wide, ensuring efficient access to the pit bottom.

Underground Operations:

- Underground operations at Akyem underground began in 2026 and are expected to conclude by 2039.
- Akyem underground employs a modified sub-level stoping method with tailings paste backfill to maintain geotechnical stability and achieve a production rate of 10,606 tonnes per day (tpd).
- The main development system at Akyem consists of shafts and ramps.

In the future, the processing plant will process blended ore from OP and UG sources, with an expanded capacity of 12 Mtpa. SRK recommends collecting representative ore samples based on the LOM plan and conducting test work with varying blend ratios of OP to UG ore to determine the optimal process parameters.

Rock characterization studies at the Akyem Mine have confirmed that waste materials are non-acid generating; however, with the progress of underground mining, ongoing geochemical analysis is recommended to assess the potential for acid mine drainage under new geochemical and hydrological conditions.

It is recommended that the environmental monitoring programme be expanded to include GHG emissions, with a baseline established to support future decarbonisation planning.

1 Introduction and Scope of Report

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Limited ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of the Ghana Akyem Gold Project ("**Akyem Project**" or the "**Project**") which is located in Birim North District, Akyem, Ghana and operated by Zijin Golden Ridge Limited ("ZGRL"), a subsidiary company of Zijin Gold International. The Akyem Project includes the Ghana Akyem gold mine ("**Akyem Mine**") and associated one ore processing and metallurgical plant ("**Akyem Plant**"). Newmont Golden Ridge Limited **("NGRL")** was later acquired by Zijin Mining and renamed as Zijin Golden Ridge Limited **("ZGRL").**

It is SRK's understanding that the independent technical assessment on the Akyem Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Company on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEx**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on the Stock Exchange including the Chapter 18 requirements and other relevant regulations of the Stock Exchange and HKEx.

2 Program Objectives and Work Program

2.1 Purpose of the Report

The purpose of this Report is to provide an independent technical assessment for inclusion in a prospectus to be issued by Zijin Gold International to support the proposed listing on the Stock Exchange and the HKEx. The SRK's report is proposed to provide an unbiased technical assessment of the risk and opportunities associated with the reviewed project.

2.2 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "**Valmin Code**"). The Valmin Code incorporates the JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy ("**AusIMM**") members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the JORC Code.

2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that the Client has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Client has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Client and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

2.4 Effective Date

The effective date for this CPR is deemed to be 31 May 2025 (the "Effective Date"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as of 31 December 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK. No material changes have occurred between the Mineral Resource and Ore Reserve reporting date and the Effective Date, other than normal production depletion.

2.5 Work Program

- review of dataset and resource models provided by ZGRL and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection.
- a site visit between 10 and 14 June 2025, to the Akyem Project, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.
- review of all available documents, including operating licenses and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.
- discussion with ZGRL and Zijin Gold International management and technical personnel, as well as the professionals Zijin (Xiamen) Engineering Co., Ltd ("**Zijin Xiamen**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Akyem Project.
- preparation of a draft report in accordance with the JORC Code and the requirements of the Chapter 18 on the Stock Exchange and other regulations of the HKEx (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- submission of the draft to Zijin Gold International and ZGRL and the related third party for comments and finalise the draft based on the feedback.

2.6 SRK Experience

The SRK Consulting Group ("SRK Consulting") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK China was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience in providing Independent Expert Reports to mining companies for successfully listing on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-1.

Table 2-1: SRK's Reports for Listing on the HKEx

Company	Year	Nature of Transaction
Yanzhou Coal Limited (listed in HKEx)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on the HKEx and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on the HKEx
Lingbao Gold Limited	2005	IPO Listing on the HKEx
Yue Da Holdings Limited (listed in HKEx)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on the HKEx
Sino Gold Mining Limited	2007	Dual Listing on the HKEx
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on the HKEx
Kiu Hung International Holding Limited	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Limited	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Limited	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Limited	2009	Acquisition of a molybdenum mining project in Shaanxi, China
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on the HKEx
Citic Dameng Holdings Limited	2010	IPO Listing on the HKEx
China Hanking Holdings Limited	2011	IPO Listing on the HKEx
China Daye Non-Ferrous Metal Mining Limited	2012	Very Substantial Acquisition on the HKEx
China Nonferrous Mining Corporation Limited	2012	IPO Listing on the HKEx
Hengshi Mining Investments Limited	2013	IPO Listing on the HKEx
Future Bright Mining Holdings Limited	2014	IPO Listing on the HKEx
King Stone Energy Group Limited	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte LTD	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Limited	2016	IPO Listing on the HKEx
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Limited	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Limited	2022	IPO Listing on the HKEx
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on HKEx
Chifeng Jilong Gold Mining Co., Ltd	2025	IPO Listing on HKEx

2.7 Project Team

The SRK project team and responsibilities are shown in Table 2-2.

Table 2-2: SRK Project Team

Consultant	Title	Discipline and Task
Pengfei Xiao	Principal Consultant (Geology)	Project Manager, Overall Responsibility
Huaixiang (Hubert) Li	Senior Consultant (Geology)	Geology, Mineral Resource Review
Mingyan Wang	Consultant (GIS)	Geology, Mineral Resource Review
TzuHsuan (Shan) Chuang	Senior Consultant (Mining)	Mining and Ore Reserve Review
Rui Shen	Assistant Consultant (Mining)	Mining and Ore Reserve Review
Xiangfeng Yang	Senior Consultant (Processing)	Processing and Metallurgical Review
Hongchen (Cynthia) Huang	Consultant (Environment)	Environment, Social, and Permitting
Liyuan (Teresa) Luo	BD and Project Coordinator	Project Coordination and Translation
Falong Hu	Principal Consultant (Mining)	Internal Peer Review and Quality Control

Pengfei Xiao, *BSc., MSc, FAusIMM, MAIG,* is the Managing Director of SRK China. He is a Principal Consultant (Geology) with a specialty in mineral exploration applying comprehensive geological and geophysical methods; and his expertise also includes resource modelling and estimation. He is familiar with both theory and practice in sampling, sample preparation and chemical analysis. As a consulting geoscientist, he has been active in mining projects including due diligence reviews, exploration design, data verification and resource estimation in China, Mongolia, Africa, America, Southeast and Central Asia. His experience relates precious metal (Au, Ag, PGE), base metal (Cu, Ni, Pb, Zn) and other metal deposits (Fe, Mn, V, Mo, Co), and also includes a few non-metal projects (phosphorite, potash, gypsum). In the past ten years he has been working in geology and resource assessment with SRK, and co-authored dozens of technical reports aiding clients in successful property transactions; and more than half of them are published in stock exchanges.

Huaixiang（Hubert) Li, *MEng, MAIG,* is a Senior Consultant (geology) with SRK China. He graduated from the China University of Geosciences (Beijing) and used to work in a geological exploration company for more than 6 years and gained lots of experiences and expertise in geological and mineral resources exploration. As a consulting geologist, he has participated a number of metal mineral projects, including exploration design review, data verification, due diligence reviews and mineral resource estimation. He is familiar with the principles and methods for metal ore deposits prospecting and exploration including lithium, gold, silver, PGE, REE, copper, lead, zinc, molybdenum, bauxite, etc. He is proficient in geological modelling, resources estimation, data processing and GIS/RS application.

Mingyan Wang, ***BMgt***, a GIS Engineer (Geology) in SRK China, Prior to joining SRK, He worked in China Geological Engineering Group Co., LTD., where he participated in the integrated protection and restoration project of Erhai Mountain, Water, Forest, Field, Lake and grass, engaged in ecological restoration design, comprehensive land improvement, etc. He joined SRK in 2022 and is mainly responsible for drawing and data processing. He is proficient in using Arcgis, ENVI, AutoCAD and other specialised software packages.

TzuHsuan (Shan) Chuang, *M.Eng.*, *MAusIMM,* is a Senior Consultant (Mining) at SRK China. She has experience in consulting and operation management. After graduating from Colorado School of

Mines, she conducted scoping studies, pre-feasibility, feasibility studies, and project valuation in Zijin mining design company, with projects in China, Serbia, Tajikistan, Australia, Colombia, and Guyana. She then worked at Buritica underground gold mine of Continental Gold in Colombia, and was responsible for LOM plan, production operation, and grade control optimization. Her expertise includes pit optimization, mine design, and scheduling in metal mine, and is skilled in using Deswik, Whittle, Surpac, Minesched, and AutoCAD.

Shen Rui, *BEng*, is an Assistant Consultant (Mining) at SRK China. He obtained his bachelor's degree in mining engineering from Central South University, demonstrating outstanding academic performance along with solid professional knowledge and skills during his studies. After graduation, he joined SRK, where he has participated in various projects, including technical due diligence for the Indonesian laterite nickel project and the Shanxi coal mine project. He possesses expertise in both underground and open-pit mining research, reflecting his versatility and deep professional knowledge in the mining field. His strong capabilities in both underground and open-pit mining further underscore his proficiency in the profession.

Xiangfeng Yang*, MEng; MAusIMM, Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Certified Cost Engineer,* is a Senior Consultant (Mineral Processing) with SRK Consulting China Ltd. She has over 12 years' experience in processing Feasibility Study, processing design and technical consultancy service, especially in industrial minerals including gold, silver, lead, zinc, copper as well as phosphate. She obtained bachelor's degree and master's degree in mineral processing engineering from Jiangxi University of Science and Technology and Wuhan University of Science and Technology, during which she systematically studied the processing flowsheet and plant design on nonferrous metals ore and non-metallic ores. Before joining SRK, she engaged in ore Feasibility Study, Preliminary design, Construction drawing design and equipment procurement evaluation in Bluestar Lehigh Engineering Institute Co., Ltd and Nanchang Mineral Systems Co. Ltd. She has published several journal papers and utility models. She has conducted and participated in the plant design of many medium and large phosphate ore, potash salt, sulfide ore, iron ore and other projects.

Hongchen (Cynthia) Huang, *B.A.,* is a senior project executive / consultant (ESG) at SRK China, possessing nearly 10 years of expertise in marketing, technical translation and project management within the mining industry. Currently she is transitioning her focus towards environmental, social, and governance aspects, actively contributing to environmental and social assessments while playing a key role in supporting SRK's carbon accounting program. Since joining SRK, Cynthia has provided project co-ordination and management, technical translations, and environmental review for a diverse range of projects, including Guizhou Union Coal Project, Hanking Indonesian Nickel Project, Mongolian Sujishan Graphite Project, Australian Greenbushes Lithium Project, Chilean Salar Project, Angola Binga Copper Project, and Zijin Group Tajik Gold Project.

Falong Hu, *MBA, B.Eng, FAusIMM, Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Chinese Certified Consulting Engineer (Investment),* is a Principal Consultant (Mining). He obtained his Bachelor's degree in mining engineering from Central South University and Master of Business Administration (MBA) in China University of Geosciences (Beijing). Before joining SRK he worked as an on-site and head office mining engineer in 2 different international mining companies which were called Sino Gold Mining Limited (later merged with Eldorado Gold Corp.) and Silvercorp Metals Inc. He is familiar with underground and open pit mines' production systems and has been involved in mining engineering and development design, scheduling, long-hole blasting and production operation, rock mechanics, ventilation, back-fill; and cost accounting. After take part in SRK, he accumulated extensive experience in ore reserve estimation, economic analysis, project valuation, mining assessment, scoping/pre-feasibility/feasibility studies and so on. Minerals include gold, silver, lead, zinc, copper, iron, bauxite, laterite-nickel, sylvine, phosphate and graphite, as well as quartzite, marble, bentonite and so on. He is a modeler on both technical and economic and also proficient in digital modeling by using Surpac, Whittle, Minesched, Datamine and AutoCAD.

2.8 Warranties

Zijin Gold International has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

2.9 Indemnities

As recommended by the VALMIN Code, Zijin Gold International has provided SRK with an indemnity under which SRK is to be compensated for any liability and/or any additional work or expenditure resulting from any additional work required:

- Which results from SRK's reliance on information provided by Zijin Gold International or to Zijin Gold International not providing material information; or
- Which relates to any consequential extension workload through queries, questions or public hearings arising from this Report.

2.10 Compliance Statement

The information in this report that relates to Mineral Resources/Ore Reserves is based on information compiled by Mr Pengfei Xiao, a Competent person who is a Fellow of Australasian Institute of Mining & Metallurgy ("FAusIMM") and a Member of Australian Institute of Geoscientists ("MAIG"), and Mr Huaixiang Li, a Competent Person who is a Member of the Australian Institute of Geoscientists. Both are full-time employees of SRK.

This Report is a Competent Person's Report in line with the Listing Rules of the Stock Exchange and HKEX.

Mr Pengfei Xiao and Mr Huaixiang Li have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code.

Mr Pengfei Xiao and Mr Huaixiang Li consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Falong Hu, *FAusIMM*, a Principal Consultant (Mining).

2.11 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Zijin Gold International or Zijin Gold International's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

2.12 Consent

SRK consents to this Report being included, in full, in the Zijin Gold International prospectus, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

2.13 Forward Looking Statement

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

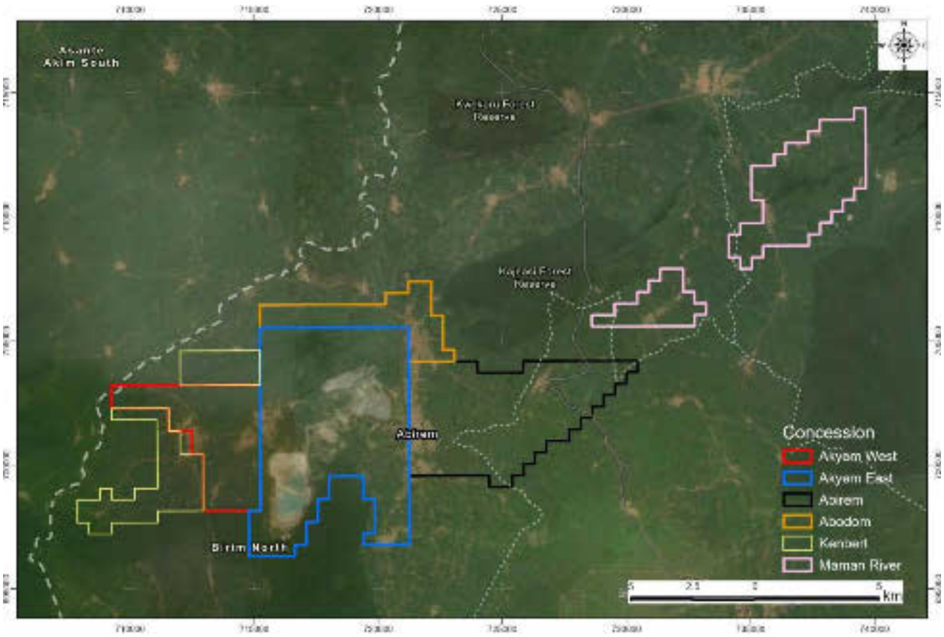
3 Operating Licenses and Permits

SRK relied on the information provided by the Client and SRK understands that a legal due diligence review of this project has been undertaken by the Client's legal advisors.

3.1 Mining Licenses

The Akyem property is located in the Birim North District of the Eastern Region of Ghana and is 124 km northwest of the capital, Accra. The Project is 86 km northwest of Koforidua, the regional administrative center, and 3 km west of New Abirem, the district capital. The location of Akyem mineral properties is shown in Figure 3-1.

Figure 3-1: NGRL's Mineral Properties Location in Ghana



Source: NGRL

Mineral tenure within the Akyem Gold Project area comprises two mining leases (Akyem East and Akyem West) and 4 prospecting licenses, , covering an aggregate area of approximately 143.85 km^2 (~14,385 ha), as listed in Table 3-1

Table 3-1: Mineral Tenures

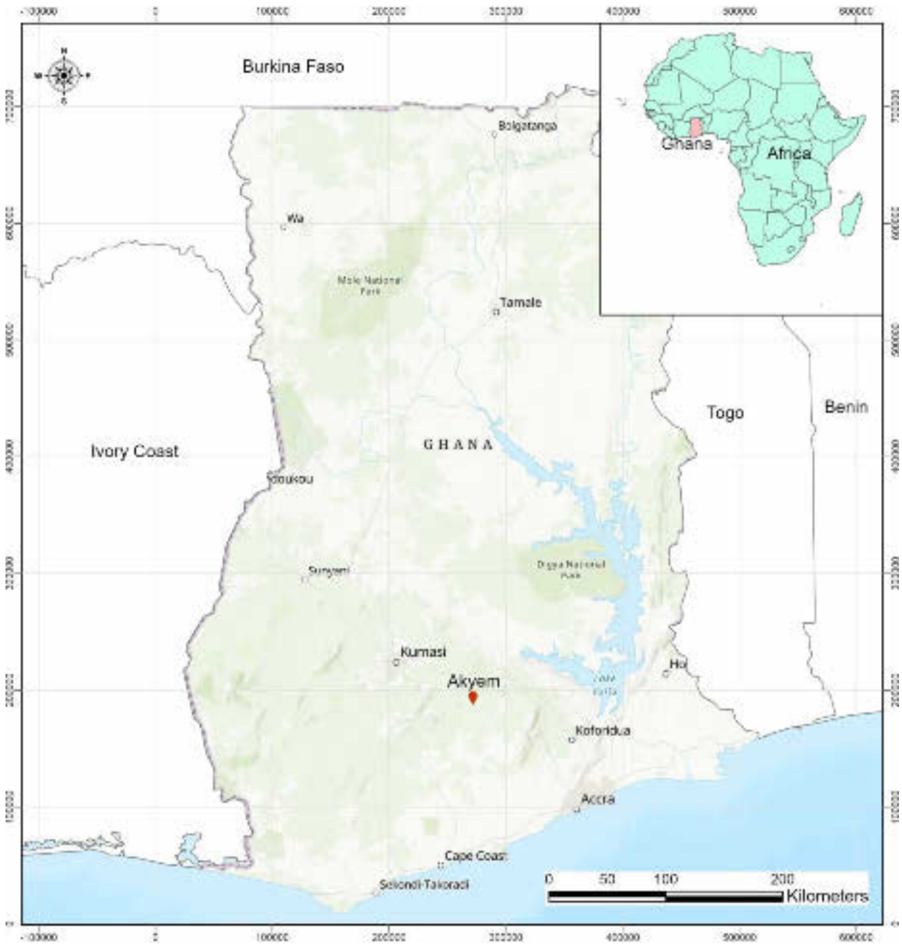
Name	Type	No.	Expiry Date	Area (km^2)
Akyem West	Mining Lease	1777/2010	January 2030	16.59
Akyem East	Mining Lease	1778/2010	January 2037	47.67We
Abirem	Prospecting Licence	PL5/160/LVB3084/05	June 2027	31.5
Abodom	Prospecting Licence	PL5/135/LVB7171/02	September 2027	9.87
Kenbert	Prospecting Licence	PL5/3/LVB9428/2000	September 2027	14.7
Mamam River	Prospecting Licence	PL5/134/LVB14070/2001	June 2027	23.52

4 Regional Description

4.1 Property Location

The Akyem Project is situated in Ghana's Eastern Region, within the Birim North District (Figure 4-1). The centroid for Akyem is about 1°1'25" longitude and 6°21'33" latitude.

Figure 4-1: Location of the Akyem Project

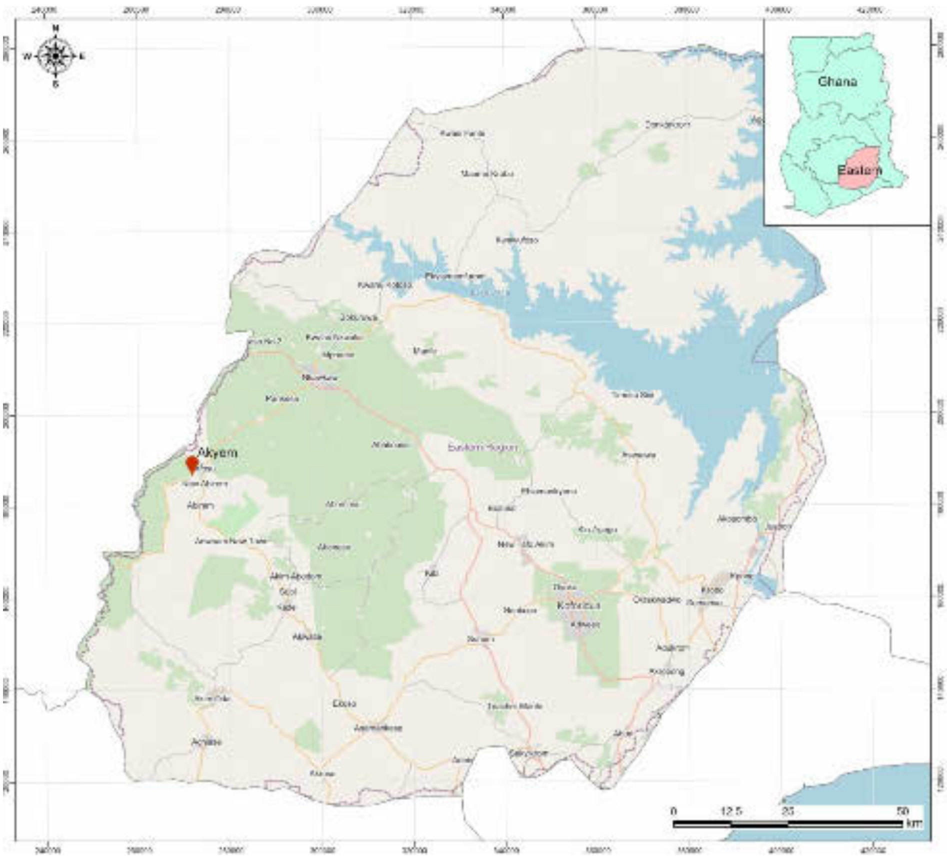


Source: SRK.

4.2 Accessibility

The Akyem Project lies approximately 130 kilometers northwest of Accra (Figure 4-1), the nation's capital, and can be reached via a combination of paved roads and improved dirt tracks. The mine is located around 45 kilometers southwest of Nkawkaw and about 3 kilometers west of New Abirem (Figure 4-2).

Figure 4-2: Map Showing the Akyem Project



Source: SRK.

4.3 Country/Region Infrastructure

Compared to other low-income countries in Africa, Ghana boasts relatively advanced infrastructure. The country has extensive coverage of rural water supply, electricity, and telecommunication networks. Additionally, a significant portion of its road network is in good or fair condition, with railroads and river transport available in certain regions.

In the project area, essential infrastructure such as rural water, electricity, telecommunication networks, and road access is readily available. However, the road network is in poor condition and continues to deteriorate. To address this issue, Newmont has collaborated with the Ghanaian government to repair major public roads leading to the project area. This initiative not only aims to enhance transportation but also stimulates the local economy by creating job opportunities and facilitating the movement of goods and services in and out of the area.

New Abirem serves as the administrative and commercial hub of the Birim North District. Several government ministries maintain offices in New Abirem, including the District Assembly, Town and Country Planning, Post Office, Information Services, National Mobilisation Programme, Electoral Commission, Electricity Company, and Food and Agriculture. Additionally, the District Police Office is in New Abirem, with police stations also present in Afosu and Ntronang.

According to the most recent census conducted by the Ghana Statistical Service (2013), the population of the Birim North District grew at an annual rate of 3.6% between 2000 and 2010, reaching 78,907 people by 2010. TUAL (2020) estimates that the district's population has since increased to approximately 113,100, based on a calculated annual growth rate of 4%. This projection accounts for a significant influx of migrants attributed to the presence of NGRL in the district since 2011.

Ethnically, the Birim North District is predominantly composed of Akan (51.1%), followed by Ewe (18.9%), Ga-Adangbe (17.0%), and Guan (5.3%) groups. The cultural landscape of the Akyem Mine area is rich and diverse, with a mix of ethnic groups such as Ewes, Akuapims, Fantes, and Asantes, though the Akyem group remains the largest. Akans historically represented an estimated 75% of the population in 2006. However, the decline in their proportional representation by 2010 may reflect either an earlier overestimation of the Akan population or a notable influx of other ethnic groups into the district during this period, significantly altering its demographic composition.

4.4 Climate

The Akyem area lies within Ghana's wet semi-equatorial climatic zone, characterized by a dual rainy season each year. The wet seasons typically occur from March to July and from September to mid-November, driven by the movement of the Inter-Tropical Convergence Zone. This zone oscillates annually around the equator, pulling in distinct air masses from both the north and the south (NGRL 2008). Cool, moist southern air masses originate from the St. Helena anticyclone in the South Atlantic, while the northern air masses, known as "Harmattan," come from the subtropical Azores anticyclone and its extension over the Sahara Desert, delivering hot, dry weather between December and February.

The major rainy season spans late March through July and accounts for roughly 55% to 60% of the project site's total annual rainfall. A secondary peak occurs in October during the minor rainy season, which extends from late September to mid-November. Between December and February, the area experiences minimal rainfall (NGRL 2018a). Data gathered from the mine's meteorological stations between January 2007 and June 2020 show consistent average temperatures of 25.9°C throughout the year. Average monthly precipitation ranges from 20 mm in January to 224 mm in June. Winds on the Akyem site predominantly blow from the southwest. These findings align with historical data collected from nearby communities, confirming the established seasonal patterns.

Over the past three decades, Ghana has exhibited a slight increase in total annual precipitation (Ghana Climate Service Center 2015). However, this has been accompanied by erratic rainfall patterns, such as extended Harmattan periods and evidence of desertification—clear signs of the impacts of climate change. Average temperatures have also risen over the years, with mean annual temperatures increasing by +0.4°C over the last century to as much as +1°C over the past 50 years, with the steepest rise of +0.27° C per decade occurring between April and July. The frequency of hot days and hot nights has risen significantly across all seasons—by 13.2% and 20%, respectively, between 1960 and 2003—while the occurrences of cold days and cold nights have declined by 3.3% and 5.1%, respectively, over the same period (McSweeney et al. 2010).

5 Geological Setting and Mineralisation

The following descriptions in this chapter were summarized from the 2023 Newmont Qualified Persons Report and 2024 Newmont Project Prime Information Report.

5.1 Regional Geology

The West African Craton is subdivided into two distinct geological domains: the Archean Reguibat Shield in the north, located in Mauritania, and the Paleo-Proterozoic Man Shield in the south, spanning areas between Ghana and Senegal. The Man Shield itself consists of two sectors—its western portion is characterized by rocks of Liberian age (3.0–2.5 Ga), while its eastern terrain features Paleoproterozoic Birimian rocks.

The Birimian rocks comprise five northeast–southwest trending volcanic belts, which range in composition from tholeiitic to acidic. These belts are intruded by three successive phases of granitic bodies. The basins between the volcanic belts are predominantly filled with turbiditic sedimentary rocks, while the transitional zones between the volcanic and sedimentary rocks are marked by chemical sedimentary deposits. All these geological units are contemporaneous and may represent laterally equivalent facies.

The Akyem gold deposit is situated within the Ashanti Gold Belt, one of the five Birimian volcanic belts. The volcanic rocks in this belt are predominantly basaltic and show varying degrees of metamorphism, ranging from lower greenschist to lower amphibolite facies. These volcanic units are intruded by elongate hornblende-bearing granite plutons belonging to the Dixcove suite. The sedimentary succession of the belt is composed mainly of fine- to medium-grained lithologies, including argillites and wackes, with variable amounts of volcaniclastic material. Two-mica granites of the Cape Coast type intrude the associated metasedimentary rocks.

The region's structural framework is complex, with faults and associated structures displaying a history of multiple movements, including thrust faulting and shearing, as well as both normal and strike-slip motions. These structural features have played a crucial role in the emplacement of mesothermal gold mineralization. Regional structural control is dominated by the Akyem Carbon Fault, a major northeast–southwest trending regional thrust fault.

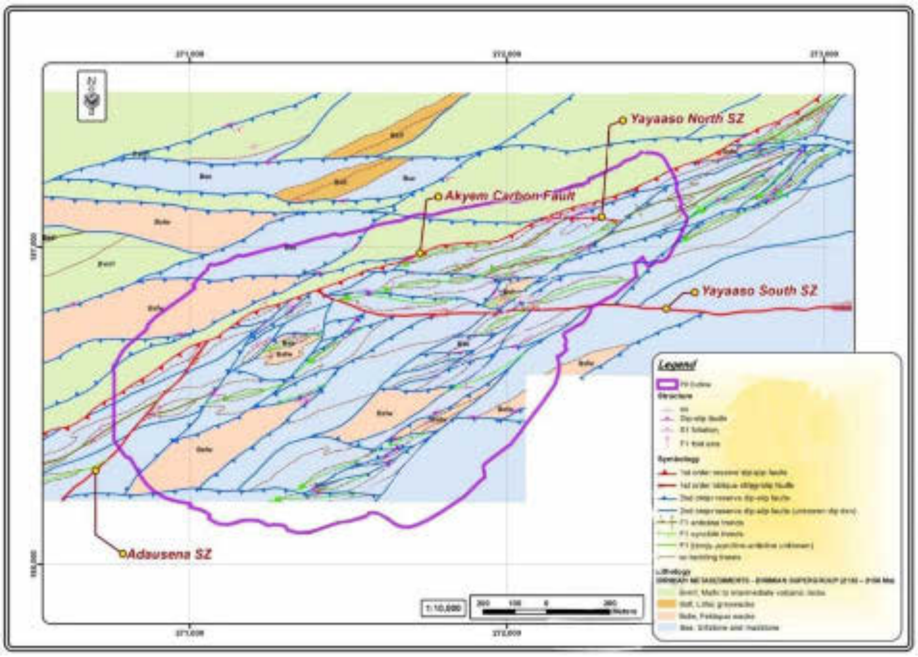
5.2 Property Geology

The Akyem deposit is located within the crustal-scale Akyem Shear Zone system, a northeast–southwest (NE–SW) trending regional thrust fault that juxtaposes greenschist-facies turbiditic sedimentary rocks of the Birim Basin over greenschist-facies intermediate to mafic volcano-sedimentary rocks of the Ashanti Belt. This key structural contact marks a significant lithological boundary and provides a favorable environment for gold mineralization. The dominant structural feature controlling the deposit's mineralization is the Akyem Carbon Fault (Figure 5-1), which separates the Akyem Belt from the Birim Basin and plays a central role in the deposit's formation and geometry.

Gold mineralization at the Akyem deposit is structurally controlled by interactions between the principal Akyem Carbon Fault and a network of subsidiary thrust faults and shear zones. This fault system's periodic reactivation, coupled with dilation at structural intersections, created pathways for mineralizing fluids and facilitated the localization of ore zones. The footwall of the mineralization is defined by the near-planar Akyem Carbon Fault, which strikes N70E and dips south-southeast (S-SE) at 60°–65°, parallel to the foliation of the host rock sequence. The Graphitic Footwall Shear Breccia (GRAP), which includes a 0–15 m thick graphitic mylonite and narrow (<1 m) zones of graphitic rubble, delineates the fault zone and indicates intense deformation associated with mineralization.

Kinematic analysis from drill cores suggests that movement along the Akyem Carbon Fault and associated northeast-striking sub-parallel faults generated southeast-dipping extensional fault dilations, resulting in pull-apart and step-over fault systems. These low-angle structures intersect the steeper graphitic footwall shear zone, creating shallowly southwest-plunging high-grade ore shoots. These ore shoots plunge approximately 25° to the southwest and dip around 55° to the southeast, underscoring the structural complexity of the system and its role in controlling mineralization.

Figure 5-1: Geology of the Akyem Deposit



Source: Newmont Project Prime Information Report, 2024.

5.3 Mineralisation

The Akyem deposit extends over a strike length of more than 2,500 m, with mineralization delineated to a depth of approximately 900 m down-dip on its southeast-dipping fault structure. Mineralized zones vary significantly in true thickness, ranging from 10 m to as much as 100 m. Gold grades exceeding 0.5 g/t Au are observed across widths of 10 to 150 m, while zones of higher-grade (>4 g/t Au) mineralization are predominantly hosted in intensely altered silica-carbonate-sericite breccias adjacent to the Akyem Carbon Fault, with widths ranging between 5 and 50 m.

Gold mineralization within the deposit is confined to two primary structural orientations:

Sub-parallel zones associated with the Akyem Carbon Fault.

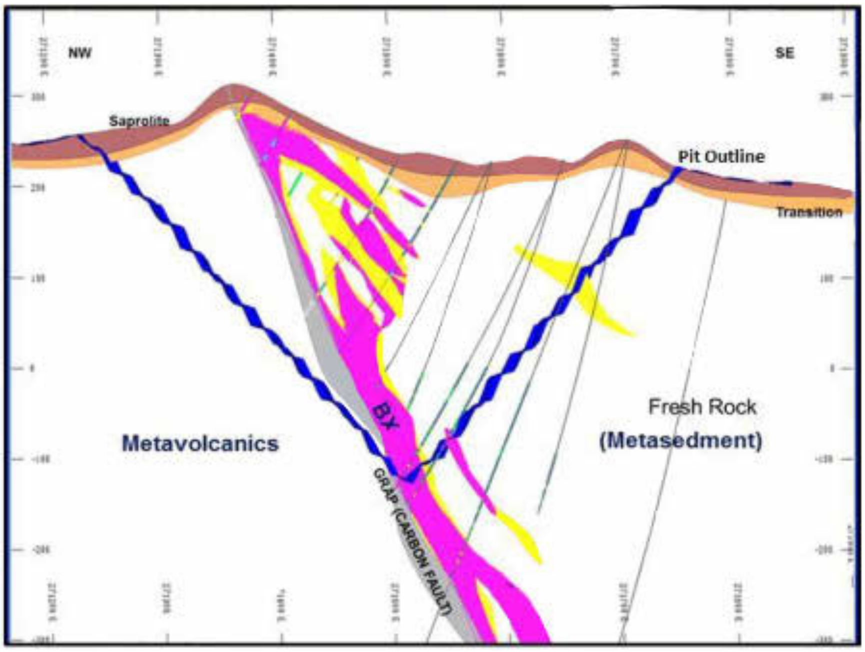
Low- to moderate-dipping zones extending away from the fault into the hanging wall.

These structural orientations reflect the interplay between steep thrust faulting and low-angle extensional fault mechanisms, which together define the deposit's high-grade ore shoots.

Gold emplacement was facilitated by a series of brittle fracture zones in the hanging wall block of the Akyem Carbon Fault. These brittle fractures are interpreted to result from the reactivation of older ductile deformation zones under left-lateral strike-slip movement, a characteristic feature of many Birimian-age deposits in Ghana. The fractures acted as conduits for gold-rich hydrothermal fluids, enabling fluid flow into host lithologies with enhanced fracture permeability (Figure 5-2).

Mineralization is accompanied by a distinct alteration halo in the hanging wall units, which broadly corresponds to gold grade. Alteration is marked by pervasive carbonization, sulfidization, quartz veining, and silicification, alongside the development of phyllosilicate minerals such as chlorite, sericite, and green mica. Drill hole intersections at predicted structural locations confirm the continuity of mineralization across the deposit.

Figure 5-2: Simplified Geological Cross Section (Pink-Breccia, Yellow-Halo)



Source: Newmont Project Prime Information Report, 2024.

5.4 Deposit Type

The Akyem deposit is an orogenic gold deposit. Such deposits have many synonyms including mesothermal, mesozonal and hypozonal deposits, lode gold, shear zone-related quartz–carbonate deposits, or gold-only deposits (Groves et al., 1998).

Orogenic gold deposits occur in variably deformed metamorphic terranes formed during Middle Archean to younger Precambrian, and continuously throughout the Phanerozoic. The host geological environments are typically volcano–plutonic or clastic sedimentary terranes, but gold deposits can be hosted by any rock type. There is a consistent spatial and temporal association with granitoids of a variety of compositions. Host rocks are metamorphosed to greenschist facies but locally can achieve amphibolite or granulite facies conditions.

Gold deposition occurs adjacent to first-order, deep-crustal fault zones. Economic mineralization typically formed as vein fill of second- and third-order shears and faults, particularly at jogs or changes in strike along the crustal fault zones. Mineralization styles vary from stockworks and breccias in shallow, brittle regimes, through laminated crack-seal veins and sigmoidal vein arrays in brittle-ductile crustal regions, to replacement- and disseminated-type orebodies in deeper, ductile environments.

Quartz is the primary constituent of veins, with lesser carbonate and sulfide minerals. Sulfide minerals can include pyrite, pyrrhotite chalcopyrite, galena, sphalerite, and arsenopyrite. Gold is usually associated with sulfide minerals, but native gold can occur.

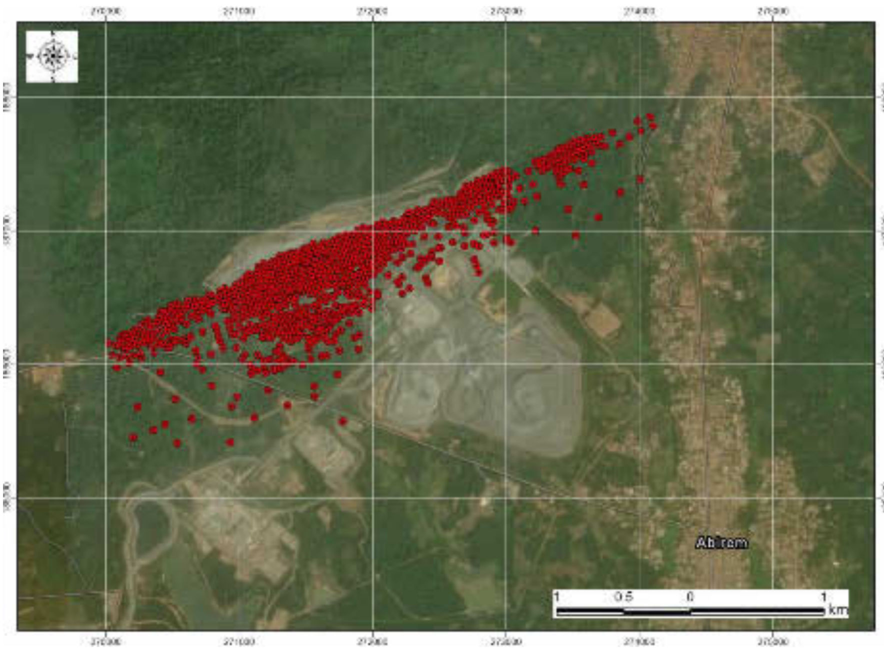
6 Exploration

6.1 Exploration History

The Akyem deposit was first identified in 1994, with open-pit (OP) mining operations commencing in September 2013. In 2011, a reconnaissance drilling program was initiated to evaluate the underground potential of the deposit, leading to a Stage 0 level study and subsequently a Stage 1 study in 2012. However, declining gold prices and associated budget constraints resulted in the suspension of the Stage 1 study later that same year.

Drilling and exploration activities resumed in 2015, and as of now, approximately 445,300 meters of core drilling (detailed in Figure 6-1 and Table 6-1) has been conducted within and around the pit. This extensive drilling program has successfully delineated mineralization to a depth of 900 meters below the surface.

Figure 6-1: Map Showing the Holes Location



Source: SRK.

Table 6-1: Summary of Akyem Drilling Database

Deposit	Collar	Depth(m)	Au Samples
Akyem	1,430	445,298	325,111

6.2 Drilling Exploration

Prior to 2011, a number of Reverse Circulation (RC) and RC pre-collared (PC) holes were drilled and currently reside within the Akyem database. All drilling conducted within the Akyem Project area currently employs diamond core drilling methods. In 2022 and 2023, drilling activities were carried out by Boart Longyear (BLY) and African Mining Services (AMS). Drill holes typically begin with PQ-sized core (85 mm diameter), followed by reductions to HQ-sized core (63.5 mm diameter) and eventually NQ-sized core (47.6 mm diameter) as drilling progresses.

To mitigate hole deviation, directional drilling (also known as navi drilling) was introduced in 2016. This advanced technique has improved the accuracy of deep exploration holes. All core is oriented to facilitate geological and structural analysis, with core recovery rates generally exceeding 99%, ensuring high-quality sampling. However, in zones adjacent to the graphitic shear, Rock Quality Designation (RQD) values may decrease to less than 60%, due to the localized structural and lithological complexity.

Upon completion of a drill plan, the geologist sends a survey request form to the survey team. On the request form, the geologist provides the attributes of the hole to be drilled, including the collar coordinates (Northing, Easting & Elevation) and the azimuth.

The survey team then stakes out the collar position on the drill platform underground and marks the fore and back site for the azimuth.

The driller will set up the rig by aligning the rig to the azimuth marked out by the surveyor, with the help of Reflex TM 14 Azi Aligner® (a gyro compass) mounted on the rig to set-up a hole for drilling.

Once a hole is completed, another request is sent to the survey team to go and pick up the collar coordinates of the hole. After the pick-up is done, the surveyor will send the actual collar coordinates to the Geology team, which is visualized in Vulcan® software and then recorded on the master collar survey tracker and loaded into the GED.

Downhole surveys readings were taken by drillers using the Reflex tool as either single shot at the hole collar depth of 12 m and 30 m intervals, and thereafter, as the hole progressed and multi-shots were taken at 6 m intervals at hole completion (bottom-up). At hole completion, the downhole survey data on the Reflex ezy-track tablet or pad are synced to the Reflex hub (cloud-based database managed by Reflex®). The survey data is validated by the project Geologist on the Reflex Hub before the final extraction is done. The azimuth and inclination are cross-checked against what was submitted to the drillers, by reviewing other datasets (e.g., magnetic strength, magnetic dip, gravity, temperature and roll-angle). The survey data for single shot and multi-shot surveys are plotted using Vulcan software and visualized to determine any variance or not. Once the data passes the validation test, it is loaded into the GED.

Detailed logging of drill core is carried out by Newmont geologists, utilizing industry standard practices. All holes are digitally logged using tablet computers and Newmont digital logging Visual Logger software; data is then electronically transferred to the GED. Geological logging is conducted using a standard set of pull-down fields in each column for structure, lithology, and characterization codes for alteration. The logging form contains fields for hole number, project name, date, geologist, azimuth, inclination, and total depth at the top of each page.

6.3 Sampling, Sample Preparation and Analyses

6.3.1 Sampling

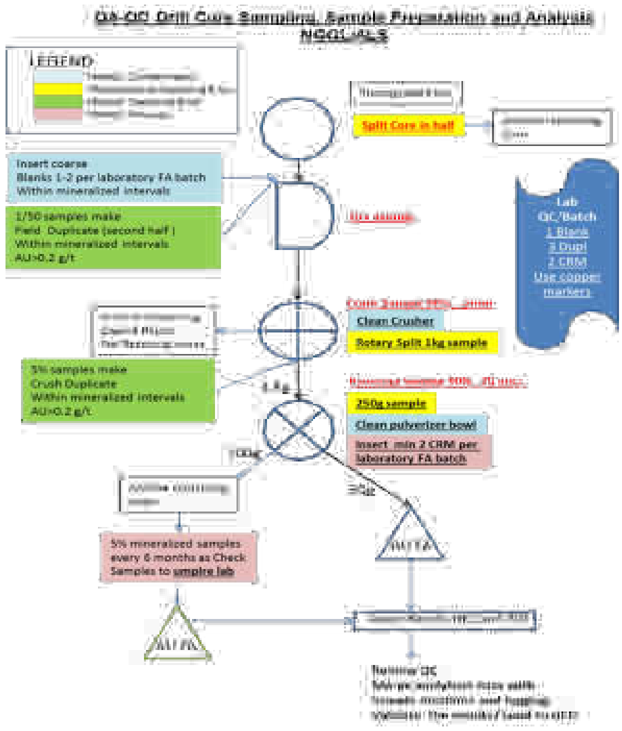
The sampling of core drilling samples at Akyem was conducted by logging geologists, who prepared sampling sheets after completing core logging for each drill hole. Samples were obtained by sawing the core longitudinally along projected orientation lines, with one half retained in the core tray as a character specimen and the other half placed in plastic bags for laboratory analysis. Sampling was consistently performed on the side of the core axis. Standardized procedures were based on heterogeneity studies and duplicate data analysis, with sample intervals designated by logging geologists based on geological and alteration boundaries. Typical sample intervals ranged from 0.5 meters to 1.5 meters, though intervals less than 0.5 meters were selected in zones of core loss. While the document does not specify sample weight, it corresponds to the half-core size and designated interval. All assay data was checked against QA/QC standards before being captured in the database.

6.3.2 Sample Preparation and Analyses

The sample preparation and analysis procedures at Akyem followed standardized workflows to ensure accuracy and reliability. Core samples were sawn in half, with one half retained as a character specimen and the other half sent for laboratory analysis. The primary laboratory for analysis was ALS Kumasi Laboratory, with ALS Vancouver conducting umpire analyses for exploration projects. The on-site mine laboratory managed by SGS is in charge of grade control and metallurgical sample preparation and analysis. Both laboratories are accredited to ISO/IEC 17025 for selected sample preparation and analytical techniques. Assay data was electronically sent to project geologists and database administrators, who checked results against QA/QC standards before capturing them in the database. Remaining pulp and selected coarse reject samples were returned to the site for safe storage. Gold assays were conducted for all drill holes, while multi-element analysis was performed for selected holes.

Strict protocols were implemented to ensure sample security throughout the process. Core samples were consistently taken from the western side of the core axis to maintain uniformity. Samples were placed in plastic bags and shipped securely to the laboratory for analysis. Remaining pulp and selected coarse reject samples were returned to the site for safe storage. QA/QC procedures included monitoring failed standard samples, blanks, and duplicates, with suspect samples re-assayed as needed. Failed jobs were marked as "invalid" in the database until rectified. Umpire analyses were conducted monthly to verify the reproducibility of results and identify potential biases or sample mix-ups. These procedures ensured the integrity and security of the samples throughout the preparation and analysis process.

Figure 6-2: Sample Preparation in Akyem Project



Source: Akyem 2023 Qualified Person Report

6.3.3 Specific Gravity Data

Specific Gravity (SG) samples at Akyem were collected following standardized protocols to ensure representativeness and reliability. At the initiation and identification stages of any project, a minimum of 30 SG samples per material type (domain) were collected. For more advanced projects, SG samples were typically collected at intervals of 10–20 meters, except in oxide zones where a higher frequency of measurements was conducted to adequately represent the weathering profile. SG values were determined using water displacement methods by site technicians. At least 5% of the original SG determinations conducted in the field or core shed were submitted for repeat analysis at external laboratories, with good agreement observed between the two sets of results.

The SG sampling methodology ensured that the collected data was representative of the material types and domains across the project. The higher sampling frequency in oxide zones addressed the variability in the weathering profile, while the repeat analyses at external laboratories validated the reliability of the SG determinations. The consistent agreement between field and laboratory results further confirmed the adequacy of the SG samples for resource estimation and mine planning purposes. Overall, the SG sampling and analysis procedures were robust and provided sufficient representative data for the project.

6.4 Quality Assurance and Quality Control Programs

The Akyem project implemented rigorous Quality Assurance and Quality Control (QA/QC) protocols to ensure the accuracy, precision, and reliability of assay data and other analytical results. These protocols were applied throughout the sampling, analysis, and data verification processes, and included the following key measures summarised in Table 6-2 and described below.

Table 6-2: QAQC Procedures applied in Akyem Project

QC Type	QC Implement	ALS Chemex– FA	SGS Ahafo 50–FA
CRM (standards)	Min two per laboratory batch	2 per batch	2 per batch
Blanks	Min one per laboratory batch	1 per batch	2 per batch
Field duplicates (2nd half of core/RC split at rig)	1/50 of all samples submitted 5/100 of all suspected mineralized samples	N/A	N/A
Crush duplicates	1/50 of all samples submitted 5/100 of all suspected mineralized samples	N/A	N/A
Independent checks analysis (umpire analysis)	5% of all mineralized samples every six months. CRMs are added to this re-testing	N/A	N/A
Laboratory duplicates	Reported by laboratory on a monthly basis in their QA/QC report	1 PPEP, 2 PULP per batch	3 PPEP, 1 PULP per batch
Assays vs. logging	All received assays checked by geologist against logging data to identify inconsistencies	N/A	N/A

Standards exceeding ±3 standard deviation (SD) limits were re-assayed, while suspect samples exceeding ±2 SD limits were investigated for potential discrepancies. Blank samples were deemed failed if gold (Au) concentrations exceeded eight times the detection limit.

Failed standards or blanks were flagged as "invalid" in the database, prompting the generation of a report by the database administrator. This report was forwarded to the lead project geologist, who analyzed the issues and identified samples requiring re-assay. Revised assay results were verified against QA/QC standards before being re-entered into the database.

Umpire Analyses were conducted monthly since 2022 (previously biannual), pulp samples analyzed by the primary laboratory were re-numbered and submitted to a secondary "umpire" laboratory. These checks identified variations in analytical procedures, potential sample mix-ups, and biases. Results confirmed reproducibility, with precision and bias within acceptable limits.

Database administrators and geologists completed monthly QA/QC reports, which included analyses of duplicates, blanks, and certified standards. Analytical laboratories also performed their own QA/QC testing and reported results monthly.

Routine laboratory audits were conducted quarterly by site geologists. Annual audits and Round Robin tests were performed by Newmont's Chief Geochemist or delegate to ensure laboratory compliance with internal standards.

A minimum of 5% of bulk density data collected in-house was verified using external laboratories, with no major variations observed between field and laboratory results.

SRK has reviewed the 2023 and 2024 annual report and monthly QAQC report in 2023, the QA/QC protocols applied in the Akyem project were comprehensive and aligned with industry best practices. They ensured the reliability of assay data, minimized errors, and validated the reproducibility of results across laboratories. The monthly reporting, umpire analyses, and laboratory audits provided continuous oversight, while the rigorous checks for standards, blanks, and duplicates ensured the integrity of the data used for resource estimation and mine planning.

QAQC raw data are not available to SRK which need to be reviewed. Validation sampling is also necessary to further verify the performance of main laboratory.

6.5 Site Visit

SRK team, consisting of Principal Consultants Pengfei Xiao (Geology) and Falong Hu (Mining), Senior Consultant Xiangfeng Yang (Processing), Consultants Mingyan Wang (Geology), Rui Shen (Mining), Hongchen Huang (Environmental Engineering), and Project Coordinator Liyuan Luo, conducted a site visit from June 10 to 14, 2025.

SRK carried out the following validation work on site:

- Inspection of the open pit;
- Inspection of the core warehouse;
- Inspection of core splitting workshop.

Figure 6-3: Core store During SRK Site Visit

7 Mineral Resource Estimates

7.1 Introduction

The Mineral Resource Statement presented herein represents a Mineral Resource evaluation prepared for the Akyem Project in accordance with the JORC Code guidelines. SRK has reviewed, but not re-modelled or re-estimated the Mineral Resources and the mineral resource models were prepared by Zijin Gold International.

Surpac and Snowden Supervisor were used by Zijin MEI to construct the mineralized domains, prepare assay data for geostatistical analysis, construct the block model, geostatistical analysis, and variography, estimate metal grades. SRK was provided with borehole database, mineralized domains, composites, variogram models, resource classification footprints and block models.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Akyem Project at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Akyem Project Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling and tunnelling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

SRK has reviewed the databases, wireframes, grade estimation parameters, resource classification footprints, calculated an appropriate cut-off, reported and tabulated the Mineral Resources.

7.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures.

- Database compilation and verification
- Review of the definition of the mineralized domains
- Review of data conditioning (compositing and capping) for geostatistical analysis and Variography
- Review of block modelling and grade interpolation
- Mineral Resource classification review and validation
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades
- Preparation of the Mineral Resource Statement

7.3 Resource Database

The database SRK received consist of assay, collar, lithological, and downhole survey data etc. They were loaded into Leapfrog software by SRK for the following validations.

- Checks for holes without samples
- Checks for duplicate samples
- Checks and adjusts the missing or wrong intervals

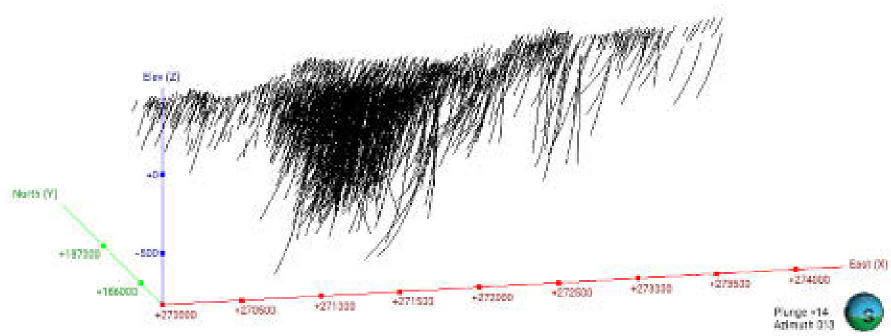
The resource database was verified, and no major issues were found. But SRK identified the twin drill holes, KP350 and KP350A, in the database, with notable discrepancies in Au grades within the 430m-630m depth. Furthermore, the background Au grade for assay results in the database has been assigned to 0.001 g/t.

Table 7-1Table 6-1 summarises the resource database covering the Akyem Project area, with assays of Au, detailed in Figure 7-1. The coordinate system is the Ghana National Grid ("**GNG**") unit system.

Table 7-1: Summary of Akyem Database

Holes	Depth (m)	Samples	Lith Logging	Survey
1,430	445,298	325,111	271,886	50,597

Figure 7-1: 3D Map Showing the Distribution of Holes



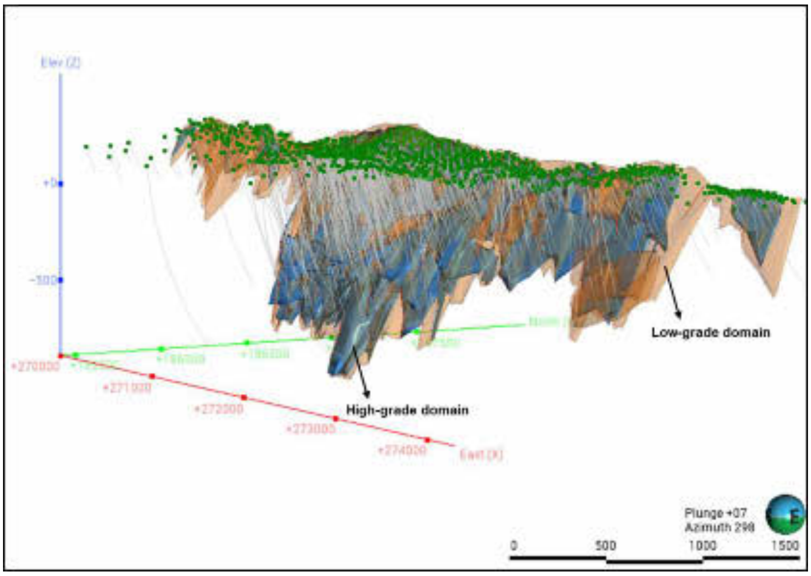
Source: SRK.

In summary, the estimation of the Mineral Resources documented in this Report is informed by data from 1,430 drillholes for a combined drilling meter of 445,298 m with 325,111 samples.

7.4 Solid Body Modelling

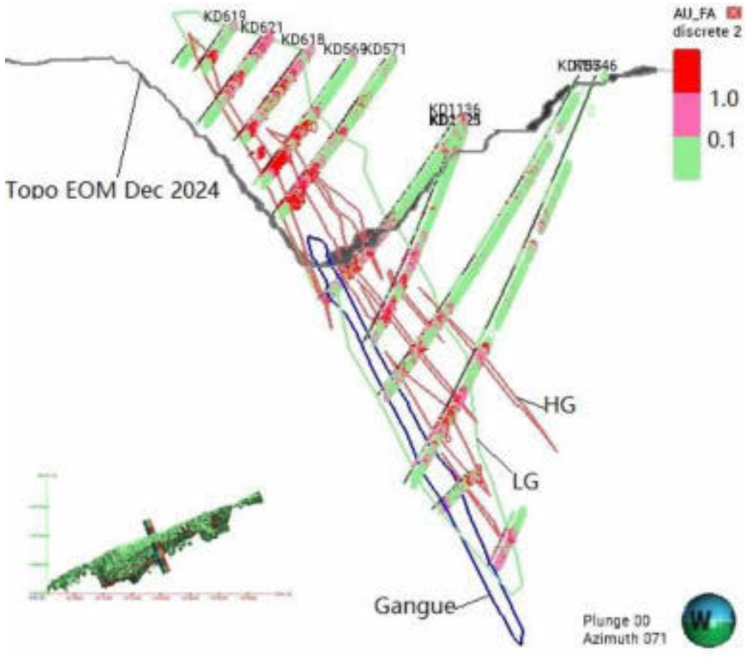
The wireframe modelling was carried out by Zijin MEI using explicit modelling method. The mineralisation wireframes were constrained within two mineralisation envelopes (High Grade and Low Grade). The Low Grade ("**LG**") domain was constructed at cut-off of 0.1 g/t Au grade, whiled the High Grade ("**HG**") domain at a cut-off of 1.0 g/t Au, detailed in Figure 7-2 and Figure 7-3. The construction of the mineralisation domains had referenced the structural trends.

Figure 7-2: HG and LG Domains of Akyem Project



Source: SRK.

Figure 7-3: Section Map of Akyem Project



Source: SRK.

SRK has reviewed the grade shells and found that the HG domain exceeded the LG domain in both strike and dip directions. In some areas, the drill hole distance along the dip direction was approximately 400 meters. Approximately 37% of the sample intervals within the LG domain were below the cutoff grade of 0.1 g/t, while approximately 32% of the sample intervals within the HG domain were below the cutoff grade of 1.0 g/t. Drill hole KD871 was included in the LG domain with a length of 134.2 meters with the grade of 0.001 g/t. Drill hole KD1020W3 was included in the LG domain with a length of 36.5 meters with the grade of 0.001 g/t, etc. Some mined-out areas were not included in the HG model. SRK believes that constructing a comprehensive model for the entire area is a more reasonable approach.

7.5 Specific Gravity

The data was subdivided by weathering into 3 types: Oxide, Transitional, Fresh/Primary. Table 7-2 shows the distribution of specific gravity data by weathering zone.

Table 7-2: Specific Gravity Summary

Deposit	Weathering	Specific Gravity
	Oxide	1.823
Akyem	Transitional	2.123
	Fresh/Primary	2.778

7.6 Compositing

statistics of geological sampling length of raw samples in high-grade and low-grade domains are carried out. The database indicates that most of the sample intervals are 1 m, and for the high-grade domain, a 1 m interval composite length was selected for compositing; For the low-grade domain, a 2 m interval composite length was selected by Zijin Gold International. All raw samples were composited to 1m or 2 m downhole lengths, and was applied by Zijin MEI for subsequent statistic, and grade interpolation.

SRK has reviewed the raw sample length statistics Table 7-3 and Figure 7-4 and summarised statistics of composites against raw samples for each domain as listed in Source: SRK.

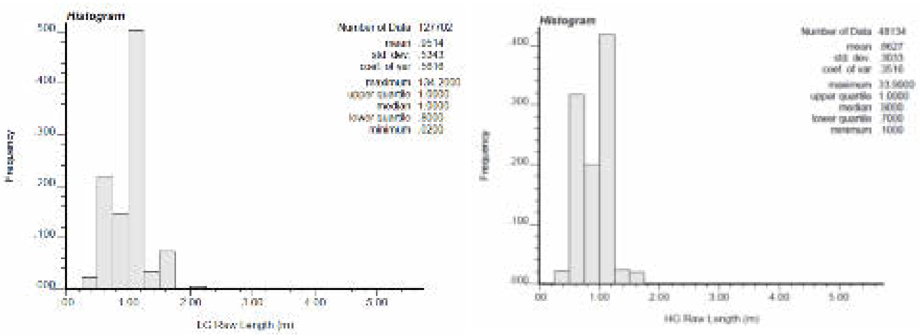
Table 7-4.

Table 7-3: Statistics of Raw Sample Length

Domain	Samples	Minimum	Maximum	Mean	Median	SD
LG	127,702	0.02	134.2	0.95	1.0	0.53
HG	48,134	0.1	33.9	0.8627	0.9	0.30

Source: SRK.

Figure 7-4: Histogram of Raw Sample Length



Source: SRK.

Table 7-4: Summary Statistics of Composites against Raw Samples

	LG		*HG*	
	Raw	*Composites*	*Raw*	*Composites*
Mean	0.77	0.73	2.82	2.84
Median	0.21	0.31	1.90	2.01
Mode	0.01	0.01	0.02	0.00
SD	1.98	1.39	3.41	3.18
Variance	3.92	1.93	11.60	10.13
Kurtosis	4,632.00	530.38	438.57	642.95
Skewness	38.63	12.82	10.35	12.54

	LG		HG	
	Raw	*Composites*	*Raw*	*Composites*
Range	304.00	97.14	222.00	219.78
Minimum	0.001	0.001	0.001	0.001
Maximum	304.00	97.14	222.00	219.78
Count	127,702	60,282	48,134	37,208

Source: SRK.

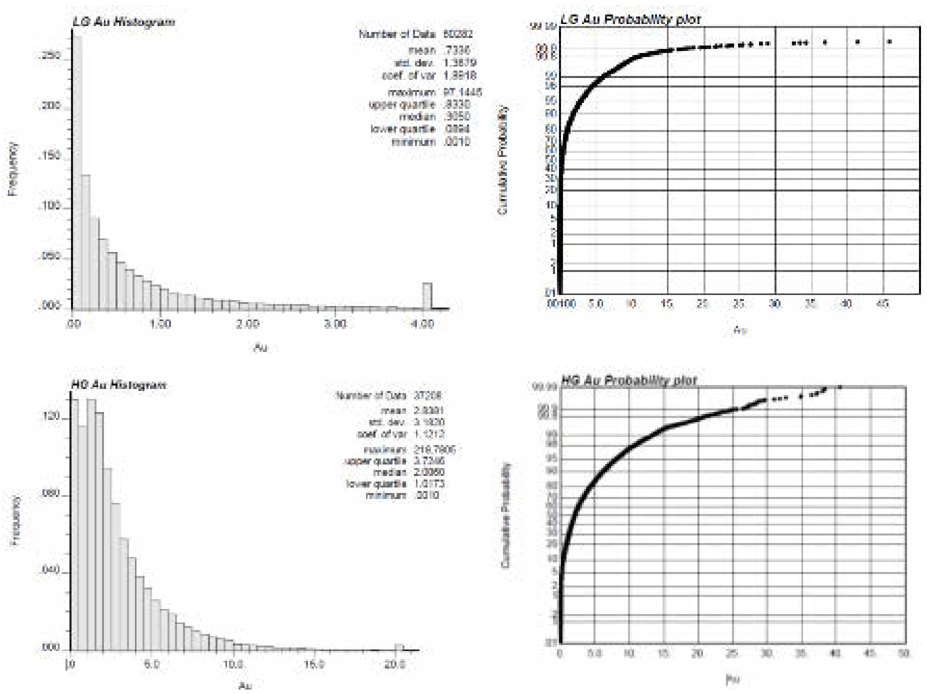
Based on the above results, SRK notes that there is a good correspondence in the basic statistics between the raw assay dataset and composites.

7.7 Evaluation of Outliers

Outliers of pre mineralised domain were determined using statistical tool by Zijin Gold International. The histograms and probability plots were analysed carefully to select the appropriate top cuts for both domains.

SRK has reviewed the sample outliers used for the grade estimation by Zijin Gold International. The histograms and probability plots were listed in Figure 7-5.

Figure 7-5: Histogram and Probability Plots of Au in Each Domain



Source: SRK.

Table 7-5: Statistics of Outliers

Domain	Assay Cap Au (g/t)	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t)	
				Before Capping	After Capping
High-grade domain	41.03	14	0.0004	2.84	2.83
Low-grade domain	15.55	37	0.0006	0.73	0.72

In SRK's opinion, the grade capping is appropriate.

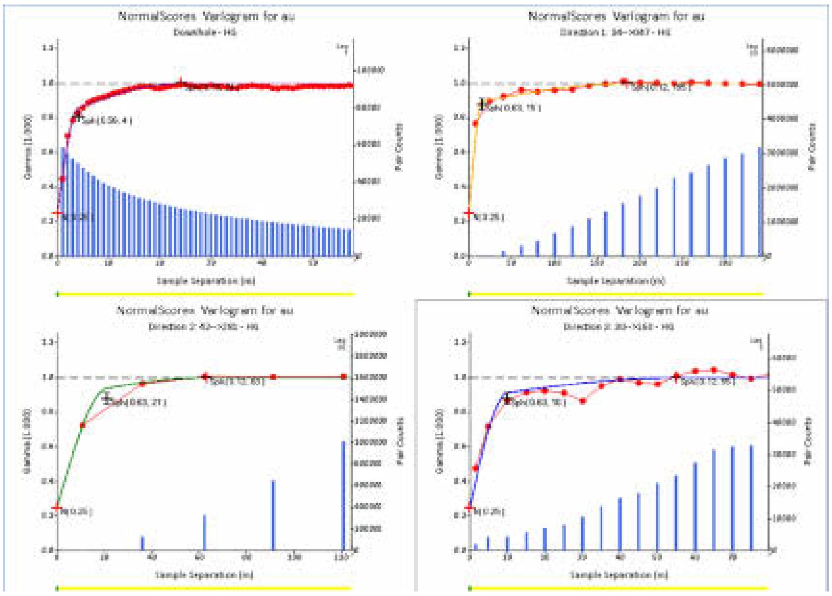
7.8 Statistical Analysis and Variography

Zijin MEI analysed both composites of Au in high-grade and low-grade domains respectively. Table 7-6 shows the parameters of the variogram in each mineralized domain, and Figure 7-6 and Figure 7-7 show the variogram.

Table 7-6: Parameters of the variogram of Au in High-grade and Low-grade domains

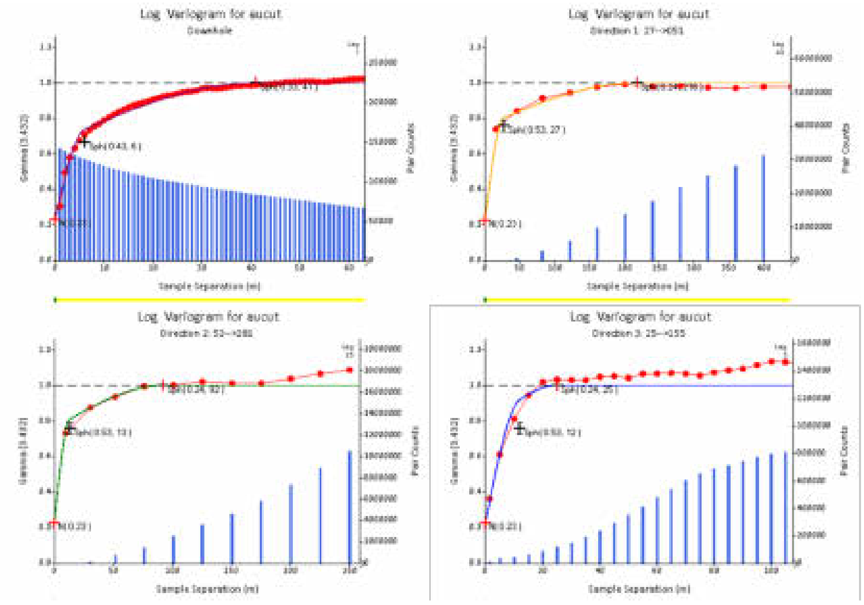
Domain	Variable	Bearing (°)	Dip(°)	Plunge (°)	Nugget	Structure 1				Structure 2			
						Sill	Major	Int	Minor	Sill	Major	Int	Minor
High-grade	Au(g/t)	47.24	-41.56	33.83	0.25	0.63	15	21	10	0.12	185	63	55
Low-grade	Au(g/t)	51.29	-51.71	26.95	0.23	0.53	27	13	12	0.24	218	92	25

Figure 7-6: Semi-variogram of Au in High-grade domain



Source: Zijin Gold International.

Figure 7-7: Semi-variogram of Au in Low-grade domain



Source: Zijin Gold International.

7.9 Block Model and Grade Estimation

Zijin MEI generated a rotated model of Akyem Deposit by Surpac software for grade and tonnage estimation. A suitable block size was adopted to build a block model which was able to contain the mineralized zones. The bock size was set to 4 m × 4 m × 4 m (East × North × Elevation), and the sub bock size was set to 2 m × 2 m × 2 m (East × North × Elevation). The block model used the same coordinate system as data collection, Ghana National Grid ("**GNG**"). Table 7-7 summaries the block model specifications. The attribute and description of the block model were presented in Table 7-8.

Table 7-7: Summary of the Block Model

Area	Coords	Min	Max	Block Size	Sub Block Size	Rotation
	N	184,355.51	186,863.51	4	2	-20
Akyem deposit	E	270,544.51	274,888.51	4	2	0
	Z	-1,032	368	4	2	0

Table 7-8: Attribute and Description of the Block Model

Attribute	Description
Au	Estimated Au Grade.
Class	Measured, Indicated, Inferred
Ore Type	0=Air, 1=Oxide, 2=Trans, 3=Fresh

Attribute	Description
SG	Oxide=1.823, Trans=2.123, Fresh=2.788
Run	1, 2, 3
Domain	HG, LG

For the High-grade and Low-grade domains, Au was estimated by using Ordinary Kriging method ("**OK**"). Grade interpolation was performed in three runs.

The specific search parameters are detailed in Table 7-9 and the ellipsoid directions refer to the variogram in Table 7-6.

Table 7-9: Summary of the search parameters

Domain	Pass	Major/ Semi Major	Major/ Minor	Search distance (m)	Min Samples	Max Samples	Max samples per drillhole
High-grade	Pass 1	1	1.5	50	6	16	2
	Pass 2			100	6	16	2
	Pass 3			200	2	6	-
Low-grade	Pass 1	1	1.5	50	6	16	2
	Pass 2			100	6	16	2
	Pass 3			200	2	6	-

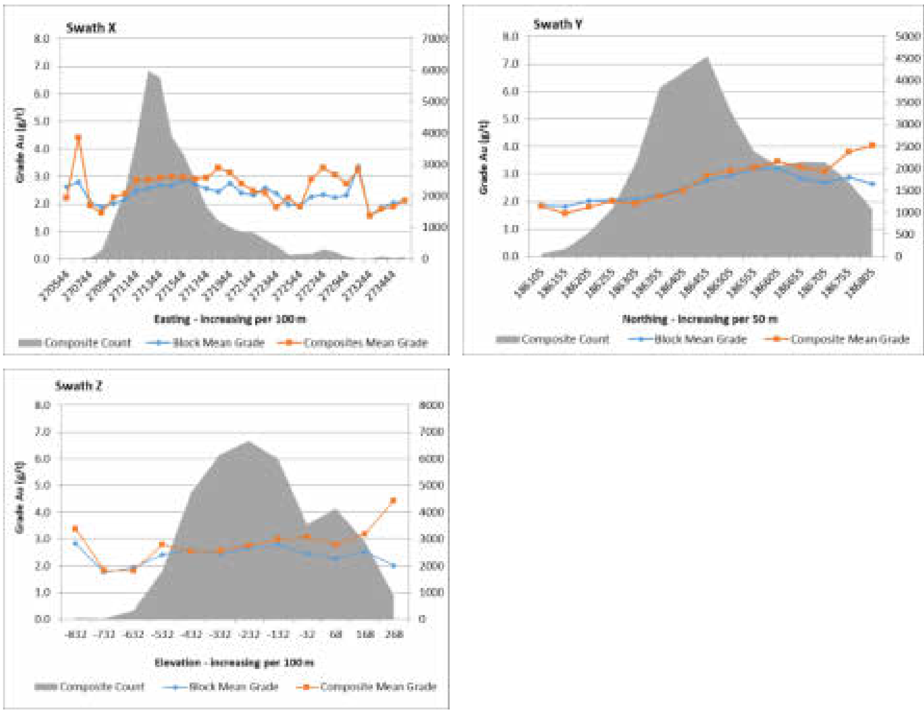
SRK found that the ratios of the search ellipsoid were not related to the variogram and approximate a spherical shape.

7.10 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the Mineral Resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the Mineral Resource estimate.

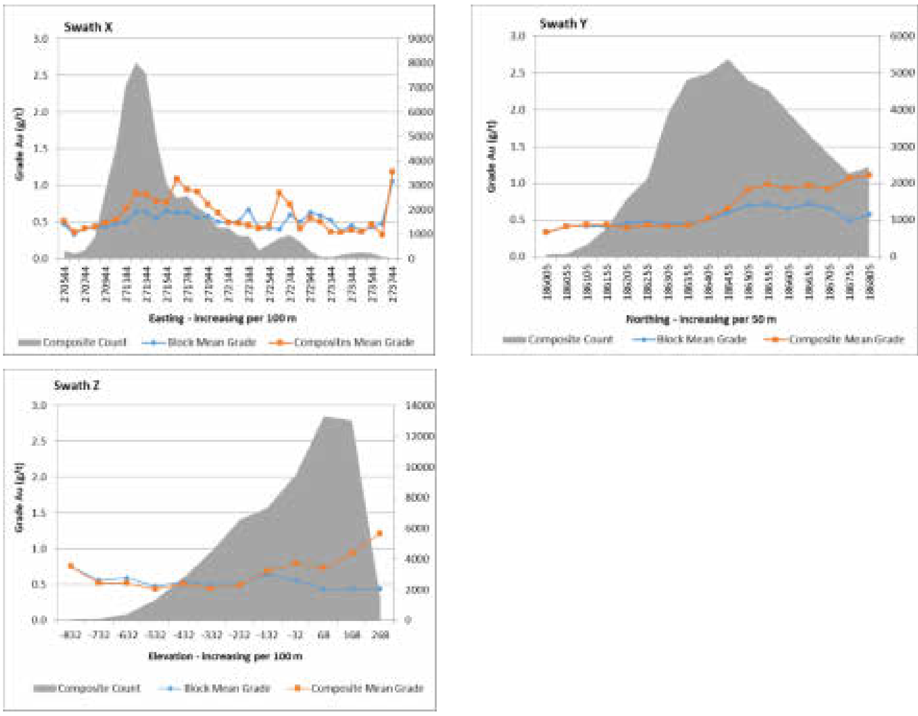
SRK adopts Swath plots to validate the grade distribution of interpolation and composites. Figure 7-8 and Figure 7-9 are the Swath plots along X-Y-Z direction.

Figure 7-8: Swath Plots of Au in High-grade Domain



Source: SRK.

Figure 7-9: Swath Plots of Au in Low-grade Domain



Source: SRK.

The Swath plots along X-Y-Z direction show that the grade distribution of block is consistent with grade distribution of composites, thus, the grade interpolation is well validated.

7.11 Mineral Resource Classification

Block model quantities and grade estimates for the Akyem Project were classified according to the JORC Code guidelines.

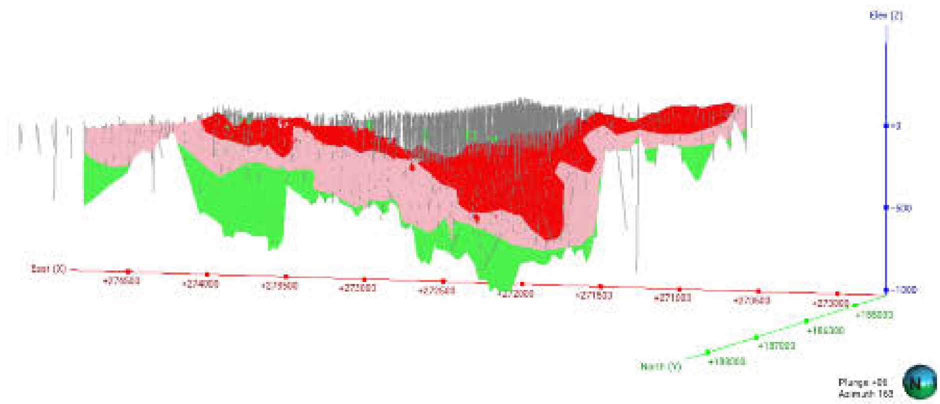
Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data by drill holes are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, Zijin MEI considers that blocks in the areas with drill hole spacing not more than 50 m were classified as Measured Mineral Resources, blocks in the areas with drill hole spacing not more than 100 m were classified as Indicated Mineral Resources, and the rest portion of both LG and HG domains were classified as Inferred Mineral Resources.

Figure 7-10 shows the resource classification of the Akyem Project.

Figure 7-10: Akyem Mineral Resource Classification Distribution



Source: SRK.
Notes: Red-Measured, Pink-Indicated, Green-Inferred.

7.12 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

Mineral Resources are reported inclusive of Ore Reserves.

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Akyem are amenable for open pit and underground mining.

The parameters used to estimate the cut-off grade for the OP and UG Mineral Resources are summarised in Table 7-10: Assumptions Considered for the and Table 7-11: Assumptions Considered for the UG Mineral Resources.

Table 7-10: Assumptions Considered for the OP Mineral Resources

Parameter	Value	Unit
Gold Price	2700	US$ per ounce
Mining Cost	4.5	US$ per tonne mined
Processing	12.7	US$ per tonne of feed
General and Administrative	5.3	US$ per tonne of feed
Mining Dilution	5	Percent
Mining Loss	5	Percent
Process Recovery	89.5	Percent
In Situ Cut-Off-Grade	0.3	grams per tonne

Table 7-11: Assumptions Considered for the UG Mineral Resources

Parameter	Value	Unit
Gold Price	2700	US$ per ounce
Mining Cost	72	US$ per tonne mined
Processing	12.7	US$ per tonne of feed
General and Administrative	9	US$ per tonne of feed
Mining Dilution	10	Percent
Mining Loss	10	Percent
Process Recovery	89.5	Percent
In Situ Cut-Off-Grade	1.5	grams per tonne

The OP Mineral Resources are listed in Table 7-12.

Table 7-12: OP Mineral Resources (Cut-off Au 0.3 g/t)

	Class	Tonnes(Kt)	Au(g/t)	Au(Kg)	Au(Koz)

As of 31 December 2024 and at a cut-off grade of 0.3 g/t Au for OP ming and 1.5 g/t Au for UG mining, the Akyem Project is estimated to contain 119.5 million tonnes ("**Mt**") of Measured Mineral Resources with an average grade of 1.7 g/t Au, 32.0 Mt of Indicated Mineral Resources with an average grade of 2.3 g/t Au, and 11.2 Mt of Inferred Mineral Resources with an average grade of 2.2 g/t Au (see Table 7-14: Mineral Resource Statement1, Akyem Project, SRK Consulting China Limited, 31 December 20242) .

Table 7-14: Mineral Resource Statement[1], Akyem Project, SRK Consulting China Limited, 31 December 2024[2, 3, 4, 5, 6, 7, 8]

	Class	Tonnes(Mt)	Au(g/t)	Au(Kg)	Au(Koz)
	Measured	97.2	1.4	137,958	4,435

Notes:

[1] The Mineral Resources are reported in accordance with the JORC Code guidelines.

[2] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[3] The information in this report which relates to Mineral Resource is based on information compiled by Mr Mingyan Wang, Mr Huaixiang Li and Mr Pengfei Xiao who are all full-time employees of SRK Consulting. Mr Li is a Member of the Australian

Institute of Geoscientists (the "**AIG**") and Mr Xiao is a Fellow of the Australasian Institute of Mining and Metallurgy (the "**AusIMM**") and a Member of the Australian Institute of Geoscientists (the "**AIG**"). Mr Li and Mr Xiao have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the "Competent Persons" as defined in JORC (2012). Mr Wang, Mr Li and Mr Xiao consent to the reporting of this information in the form and context in which it appears.

[4] OP Mineral resources are reported at a cut-off grade is 0.3 g/t.

[5] UG Mineral resources are reported at a cut-off grade is 1.5 g/t.

[6] Mt – million tonnes (metric tons), oz- ounce; Koz – thousand ounces.

[7] The conversion between ounce and gram used herein is 1 oz = 31.1035 g.

[8] Mineral Resources are inclusive of Ore Reserves that have been converted from Measured and Indicated Mineral Resources.

7.13 Grade Sensitivity Analysis

The mineral resources of the Akyem Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Table 7-15 and Table 7-16 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-11 and Figure 7-12 present this sensitivity as grade tonnage curves.

Table 7-15: Global Block Model Quantities and Grade Estimates[1], OP Mineral Resource at Various cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (Mt)	Grade Gold (g/t)
0.00	123.28	1.23
0.05	123.12	1.23
0.10	122.30	1.24
0.15	120.38	1.26
0.20	116.78	1.29
0.25	111.77	1.34
0.30	105.67	1.41
0.35	98.91	1.48
0.40	92.07	1.56
0.45	85.45	1.65
0.50	79.23	1.74
0.55	73.72	1.83
0.60	68.85	1.92

Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

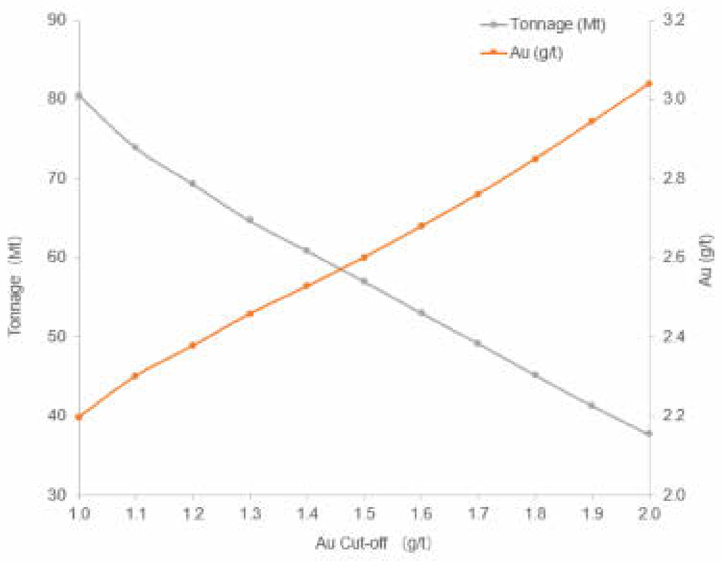
Figure 7-12: Akyem UG Mineral Resource Grade Tonnage Curve



Source: SRK.

7.14 Exploration Potential and Recommendations

Significant intercepts from recent drilling along strike and down-dip across multiple zones highlight the potential for further resource expansion. The strike length of the system along the Akyem Carbon Fault ("**ACF**") now extends over 3 km, stretching from the West Zone (at surface) and Piet (underground) in the west to Ogyefuo in the east. While most of the current deposit is in the hanging wall of the ACF, multiple intercepts in the footwall suggest additional resource potential in that area.

For the solid model, SRK recommends delineating the mineralized body based on geological domains to ensure the model accurately reflects the spatial distribution and geological controls of the mineralization.

For estimation parameters, SRK suggests that the estimation parameters should refer to the variogram, as utilizing variogram-based values ensures that spatial continuity and variability are appropriately incorporated into the resource estimation process.

Additionally, SRK considers the classification of Measured Resources with a 50m*50m drill spacing to be overly optimistic. A tighter drill spacing is typically required for Measured Resources to achieve a higher level of confidence in the geometry, grade distribution, and continuity of the deposit. This recommendation aims to enhance the reliability and accuracy of the resource classification.

8 Ore Reserve Estimates

8.1 Technical Studies

SRK has received the following technical studies:

- Mining One 3D Geotech Num Modelling Akyem UG Stage 2A on Akyem underground mine, conducted by Newmont in September 2023.
- Akyem 2022 QP Report Open Pit Section on Akyem open pit mine, conducted by Newmont in September 2022.
- Akyem GW Model on the Akyem Gold Mine on hydrogeology, conducted by Newmont in September 2022.

8.2 Open Pit Ore Reserve Estimates

8.2.1 Cut-off Grade

The Akyem Gold Mine open pit has been studied and designed using a steep-slope surface mining method. The marginal Cut-off Grade (COG) for gold in the Run-of-Mine feed has been calculated using the following formula.

$$COG = \frac{C_p + C_g}{P * P_a * (1 - R_t) * P_r}$$

The cut-off grade estimation is based on a gold price of US$2,200 per ounce and preliminary unit operating costs. The economic cut-off grade for the resource block model in the open pit mine planning process of the Akyem Gold Mine, was estimated by SRK based on the following data. The open pit cut-off grades used for the Mineral Reserve estimation are presented in Table 8-1.

Table 8-1: Akyem Open Pit Cut-off Grade Estimate

Parameters	Item	Units	SRK
Gold Price	P	US$/oz	2,200
Doré Gold Payable	Pa	%	99.9
Royalty	Rt	%	4.9
Process Recovery	Pr	%	89.50
Mining Cost		US$/t mined	4.5
Processing Cost	Cp	US$/t feed	12.65
G&A Cost	Cg	US$/t feed	5.3
COG	**COG**	**g/t**	**0.3**

Sources: SRK

8.2.2 Modifying Factors

The following modifying factors are used to determine the Mineral Reserves.

- Optimization: Pit optimization incorporates mining costs, processing expenses, general and administrative costs, gold price, processing recovery rate, payability, royalties, and overall slope angle.
- Pit design: Pit designs are guided by slope parameters, including bench height, batter face angle, berm width, minimum mining width, and haul road design, consistent with the results of optimization.
- Dilution and Loss: Mining dilution is estimated at 5% and ore loss is estimated at 5% by Zijin.

8.2.3 Ore Reserve Statement

SRK Consulting has estimated the open-pit Ore Reserves for the Akyem Gold Mine in accordance with the guidelines outlined in the JORC Code. The Ore Reserve estimates are based on technical studies and operational records deemed to meet the standards of a Pre-Feasibility Study.

The economically mineable portions of Measured and Indicated Mineral Resources within the designed open pits and stopes have been classified as Proved and Probable Ore Reserves, respectively. These estimates include allowances for dilution and mining losses. The reference point for the Ore Reserve estimation is the stockpile preceding crusher feed, consistently applied in alignment with best practices under the JORC Code framework.

As of 31 December 2024, the Akyem Gold Mine main pit Ore Reserves are estimated at 100.35 mt, with an average grade of 1.36 g/t Au, containing 136,264 kg of gold (Au).

As of 31 December 2024, the Akyem Gold Mine west pit Ore Reserves are estimated at 1.74 mt, with an average grade of 0.87 g/t Au, containing 1,509 kg of gold (Au).

As of 31 December 2024, the stockpile Ore Reserves are estimated at 0.94 mt, with an average grade of 0.74 g/t Au, containing 695 kg of gold (Au).

Table 8-2: Ore Reserve Statement for Akyem Main Open Pit as of 31 December 2024

Deposit	Tonnes (Mt)	Au Grade (g/t)	Contained Au Metal (kg)	Contained Au Metal (koz)
Proved Ore	94.50	1.37	129,213	4,154
Probable Ore	5.86	1.2	7,051	227
Total	**100.35**	**1.36**	**136,264**	**4,381**

Notes:

1. Mineral Reserves are reported at the point of delivery to the processing plant, using the 2019 CIM Definition Standards, with an effective date of 31 December 2024. The Qualified Person for the estimate is Pengfei Xiao, an SRK employee.
2. The mined stockpile contains the mined ore of OP.
3. The information in this Report which relates to the Stockpile Ore Reserve is based on information provided by the Client.

8.3 Underground Ore Reserve Estimation

The Akyem Gold Mine will commence underground development in 2026, with access to the deposits provided through a shaft and a decline. The development reaches the lowest level at -610 mRL. The mining method for the underground operations at Akyem Gold Mine is modified sub-level open stoping with subsequent paste tailings fill.

8.3.1 Cut-off Grade

The Akyem Gold Mine underground has been studied and designed using a modified sub-level open stope mining method. The marginal Cut-off Grade (COG) for gold in the Run-of-Mine feed has been calculated using the following formula.

$$COG = \frac{C_p + C_g + C_m}{P * P_a * (1 - R_t) * P_r}$$

The cut-off grades for the Akyem Gold Mine are presented in Table 8.5. Key considerations include:

- Price: The gold prices are dynamic and are derived from consensus market forecasts (CMF) provided by the Energy and Metals Consensus Forecast, published by Consensus Economics Inc., to which SRK subscribes annually.
- Cost: mining, processing, general/administrative (G&A) are based on design report by Newmont and Zijin Design Institute.

Table 8-5: Underground Mineral Reserve Cut-Off Grade

Parameters	Item	Unit	SRK
Gold Price	P	US$/oz	2,200
Doré Gold Payable	Pa	%	99.9

Source: SRK

8.3.2 Modifying Factors

Underground Stope Optimization

The Deswik Shape Optimizer™ ("SO") module was used on the Mineral Resource block model to generate mineable shapes. These shapes were subsequently used to refine and enhance the proposed design. Once the preliminary stopes were generated, an economic assessment was performed to eliminate any uneconomical ones, based on factors such as development and mining costs. The parameters used in the SO module are summarized in Table 8-6 and Table 8-7, which provides additional key design parameters.

Table 8-6: SO Parameters for Underground Mining

Parameters	Units	Value
Default Density	g/t	2.78
COG	g/t	1.5
Default Dip	°	120
Strike azimuth	°	330

Underground Dilution and Extraction

Dilution

Stope dilution includes both planned and unplanned dilution. At Akyem Gold Mine, where the deposit is currently not in production, the dilution is derived from Newmont feasibility study (2022), indicating a total dilution of approximately 10%. The hanging wall was set at 1.5 and the footwall was set at 0.5 meters.

Mining Loss

The estimated mining loss for Akyem Gold Mine, where the deposit is currently not in production, a total loss of 10% is derived from Zijin. The total loss includes planned ore loss and unplanned ore loss.

8.3.3 Ore Reserve Statement

SRK Consulting has estimated the underground Ore Reserves for Akyem Gold Mine in accordance with the JORC Code guidelines. These Ore Reserve estimates are supported by technical studies and operational data, which are considered to meet the standards of a Pre-Feasibility Study.

The economically mineable portions of Measured and Indicated Mineral Resources within the designed underground stopes have been classified as Proved and Probable Ore Reserves, respectively, including allowances for mining dilution and losses. The reference point for the Ore Reserve estimation is the stockpile preceding crusher feed, in compliance with best practice under the JORC Code framework.

As of 31 December 2024, the underground Ore Reserves for the Akyem Gold Mine deposit is estimated at 30.3 mt, with an average grade of 2.28 g/t Au, containing 69,118kg of gold (Au).

Table 8-8: Ore Reserve Statement of Akyem UG Gold Mines as of 31 December 2024

Deposit	Tonnes (Mt)	Au Grade (g/t)	Contained Au Metal (kg)	Contained Au Metal (koz)
Proved Ore	11.45	2.34	26,830	863
Probable Ore	18.85	2.24	42,288	1,360
Total	**30.30**	**2.28**	**69,118**	**2,222**

Sources: ZIJIN

8.5 Combined Ore Reserves Statement

SRK has estimated the Ore Reserves for open pit and underground in compliance with the JORC Code guidelines. The Ore Reserve Estimates as of 31 December 2024 is in Table 8-.

The total Ore Reserve for the Akyem Gold Mine Project is estimated at 133 mt at an average grade of 1.56g/t Au, containing approximately 6,674 koz of gold. This includes Proved Ore Reserve estimated at 108 mt with an average grade of 1.46g/t Au, containing 5065 koz of gold; and Probable Ore Reserve estimated at 26 mt at an average grade of 1.95g/t Au, containing 1,609 koz of gold.

Table 8-10: Ore Reserves Statement as of 31 December 2024

Category	Tonnes (Mt)	Grade (g/t Au)	Contained Au Metal (kg)	Contained Au Metal (koz)

Note:

[1] The information in this report which relates to Ore Reserve is based on information compiled by Rui Shen and Pengfei Xiao who is a full time employee of SRK Consulting China Ltd. Pengfei Xiao is a member/fellow of AusIMM. Pengfei Xiao has sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian

Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Rui Shen and Pengfei Xiao consents to the reporting of this information in the form and context in which it appears.

[2] The Ore Reserves for surface operations include open-pit mining and ROM pads.

[3] Proved and Probable Ore Reserves are reported on 100% basis.

[4] Total may not add due to rounding discrepancies

[5] The Ore Reserves are included in the Mineral Resources.

9 Mining and Assessment

9.1 Mine Operating Status

The Akyem Gold Mine ("AGM"), operated by Newmont Golden Ridge Ltd ("NGRL"), commenced commercial production in October 2013. The processing plant utilizes conventional carbon-in-leach technology and has a designed processing capacity of 8.5 million tonnes per year. Gold production from 2021 to 2023 was 13.3M tonnes, 12.6M tonnes, and 7.3M tonnes, respectively. A summary of the historical production data is provided in Table 9-1.

In October 2024, Zijin Mining acquired a 100% interest in the Akyem Gold Mine in Ghana from Newmont through its wholly owned overseas subsidiary. The transaction was successfully completed on April 16, 2025. Akyem Gold Mine is currently an open pit mine, and underground mining is expected to commence three years after construction.

Table 9-1: Akyem Gold Mine Historical Production

Item	Unit	2021	2022	2023	2024-YTD
Ore Mined	Mt	7.52	6.26	3.52	0.51
Waste Mined	Mt	18.68	22.82	20.97	6.15

Strip ratio	Mt	26.20	29.08	24.49	6.66

Source: Akyem

9.2 Hydrogeology

The conceptual and 3D numerical groundwater model for the Akyem Mine has been developed in alignment with previous technical reports. (Piteau Hydro,2022) These models were utilized to predict future mine dewatering rates and assess potential groundwater impacts. The following are the key findings and recommendations from the updated groundwater studies:

Conceptual Groundwater Model

The updated conceptual groundwater model was developed using available site data, including geological, meteorological, hydrogeological, dewatering, and mine planning information. Key characteristics of the groundwater system include:

- Low Recharge and Groundwater Flow: Regional river flow data, site observations, and monitoring results suggest very low regional groundwater recharge and low "true" groundwater flow.

- In-Pit Water Balance: Inflows to the pit generally occur at rates of less than 10 L/s. Temporary water storage in the shallow overbreak zone plays a significant role in the in-pit water balance.

Numerical Groundwater Model

The numerical groundwater model, based on the conceptual model, provides key predictions about future groundwater behaviour:

- Long-Term Inflows: Predicted inflow rates are low, ranging from 5 to 8 L/s for the open pit and 3 to 5 L/s for the underground mine workings.
- Potential High Inflows: During underground development, conductive fractures or fracture zones may be intercepted, resulting in temporarily high inflows lasting a few days to weeks. These can be mitigated using cover drilling or probe holes for early identification.
- Drawdown Extent: The maximum simulated drawdown from mine dewatering is estimated to extend:
  - Up to 1,250 meters northwest of the pit.
  - Up to 1,000 meters southwest of the pit.
  - Minimal drawdown is expected southeast of the pit, due to constant recharge from seepage originating at the Waste Rock Storage Facility (WRSF).
- Community Well Protection: Simulations confirm that the extent of drawdown does not reach within 1 km of identified community wells and typically occurs at much greater distances.

Groundwater Levels and Tailings Storage Facility (TSF)

The study observed a rising groundwater level trend surrounding the TSF, attributed to a combination of hydrogeological processes, including:

- Modification of natural shallow groundwater flow paths.
- "Damming" caused by the TSF liner and the emplacement of tailings mass.
- Diversion of the original natural stream channel to the west of the TSF

9.3 Open pit

9.3.1 Geotechnical Conditions

Main Pit

The geotechnical assumptions applied to the 2024 Ore Reserve estimates remain unchanged from the previous year. Mining at the Akyem Main Pit is currently focused on primary rock at bench elevations of 250mRL. The pit's long axis is aligned with the Akyem Carbon Fault (ACF) and measures approximately 2,100 meters in length and 1,130 meters in width. In its ultimate configuration, the pit deepens from the northeast to the southwest, reaching a maximum depth of approximately 600 meters at its central portion.

Mining activities have progressed below the Oxide Sequence and into unweathered Primary Rock. In the Oxide Sequence, the design Inter-Ramp Angle (IRA) was set at 27°. While the south wall and end wall exposures have demonstrated good performance, instability was an ongoing issue along much of the north wall at the same IRA. Achieving the current stable conditions in the north wall required implementing several mitigation measures, including flattening slopes, buttressing, re-mining, surface water control, and controlled blasting. Remediation steps include cleaning loose or unstable blocks and draping the area with mesh.

For the Primary Rock in the Life-of-Mine (LoM) Pit, the pit slope design features a 53° IRA throughout, supplemented by three 15m-wide geotechnical benches on the north wall. These benches are incorporated into the design at specific elevations but are intended to address slope performance issues within the primary rock, regardless of elevation.

Primary Rock is mined using a triple-stack bench configuration, with the following specific design parameters:

- Vertical separation between catch benches: 24 meters (8-meter-high production benches).
- Upper flitch bench face angle: 70°
- Vertical face angles for the lower two flitches.
- Nominal catch bench width: 9.5 meters.

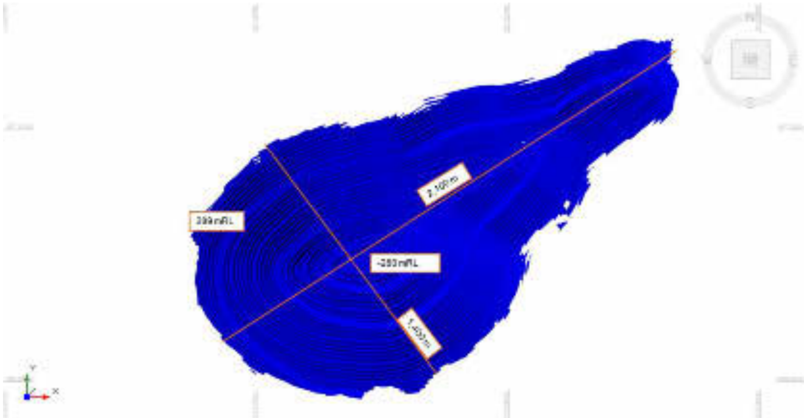
The detailed pit slope design parameters for the Akyem Main Pit are presented in Table below.

Table 9-2: Akyem Main Pit Slope Design Parameters

Domain	Inter-ramp Angle (°)	Bench Face Angle (°)	Bench Height (m)	Berm Width (m)
Saorilite	27	55	8	10
Footwall	53	70	24	9.5
Hanging wall	53	70	24	9.5

Source: Akyem

Figure 9-1: Akyem Main Pit Design

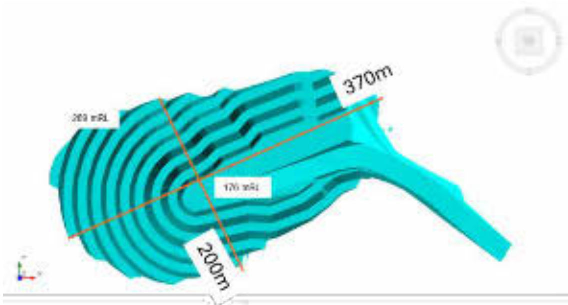


Source: Akyem

West Pit

Geotechnical drilling and sampling were conducted in 2021 to support bench height design and stability analysis, contributing to mine design in the area. A total of 30 samples were collected from six drill holes for geotechnical testing. Due to the relatively smaller size of the pit, the results align with geotechnical test results obtained from the Akyem Main Pit. The current deposit is shallower compared to the Main Pit.

Figure 9-2: Akyem West Pit Design



Source: Akyem

9.3.2 Mine Design and Planning

Pit Optimization

Block Model

The mine design and resource estimation within the pit design were based on mineral resource model ("MRM") developed by Zijin, with an effective date of 31 December 2024. The model was provided in Surpac (.mdl) format.

Key parameters of the block model are outlined in Table 9-3Table 10-3 below.

Table 9-3: Resource Block Model Parameters

Range	Min	Max	Z
Easting	270,544	274,888

Optimization Inputs Parameters

The transformation of a Mineral Resource into a mineable open pit Ore Reserve begins with the process of open pit optimization. During this stage, physical, technical, and economic parameters are applied to the mineralized area to determine the optimal geometry for open pit excavation. If the economic evaluation of the resulting optimal pit shell is positive, this shell serves as a reference for subsequent pit design.

Zijin employed Whittle software with the Pseudoflow algorithm to conduct the open pit optimization. Whittle adjusts the base input price using a range of revenue factors (RF), both above and below the base value of 1. For each RF value, the software generates a three-dimensional pit shell that maximizes the intrinsic value based on all input parameters and the adjusted price. Lower RF values produce smaller pit shells, while higher RF values generate larger ones. This methodology results in a series of 'nested' pit shells, with each shell entirely contained within the next larger one.

A summary of the pit optimization parameters for Akyem Gold Mine are presented in Table 9-4Table 10-4.

Table 9-4: Pit Optimization Parameters

Item	Unit	ZIJIN
Overall Slope Angle	Degree	46

Optimization Results

A series of nested pit shells were generated using Whittle software based on a range of revenue factors (RF) applied to gold prices. Preliminary cash flows were estimated using a 10% discount rate and the nominal commodity prices of $2,200/oz for gold. It is important to note that while relative values are useful for selecting the optimal pit shell, absolute values have no significance during this evaluation stage.

Whittle automatically generated three pit optimization scenarios as follows:

Best Case: Pit shells are mined sequentially, one after the other.

Worst Case: The final pit is mined bench by bench.

Specified Case: Predefined pushback geometries are applied to guide pit sequencing.

The results of the pit optimization for the Akyem Gold Mine are summarized in Table 9.3. Based on the maximum Net Present Value (NPV) in the Specified Case, an RF of 0.58 was selected as the final pit design limit. This RF of 0.58 corresponds to gold prices of approximately $1,276/oz respectively.

A pit-by-pit graph illustrating the preliminary cash flows for Akyem Gold Mine is also presented in Figure 9-3.

Table 9-5: Whittle Pit Optimization Results for Akyem Gold Mine Pit

Pit Shell	Best Case (US$M)	Worst Case (US$M)	Specified Case (US$M)	Total (kt)	Ore (kt)	Waste (kt)	Strip Ratio (t/t)

Mining Design

The detailed mine design was carried out by Newmont Corporation then updated in 2025 by ZIJIN, using the selected LG 3D pit shell (RF 0.58) as a guide, which inputs are based on the updated assumptions in 2025. The basic gold price is 2200US$/oz assumed by ZIJIN. The proposed pit design includes the practical geometry required in a mine, including pit access and haulage ramp to all pit benches, pit slope design, benching configurations, smoothed pit walls and catch berms.

SRK has compared the final pit design prepared by ZIJIN with the Whittle optimal pit shell, as shown in Figure 9-4.

The major design parameters used are described in Table 9-6 below. The designed pit results are summarised in Table 9-5 below.

The pit location map is shown in the Figure 9-5 and Figure 9-4 below.

Table 9-6: Mine Design Parameter of Akyem Gold Mine

Mining Methods

The mining sequence is carried out in phases from top to bottom, with a working flitch of 8 meters. Three benches will be combined into one final bench.

The usual procedure includes drilling, blasting, loading, and haulage. Drilling operations use EPIROC DML drills with a hole diameter of 165 mm. Drill patterns are 4.8 m × 4.8 m for ore mining and 5.3 m × 5.3 m for waste stripping.

Material haulage will be conducted using trucks. The main haul roads are double-lane with a width of 32 meters, while single lane roads, 25 meters in width, provide access to the pit bottom. The maximum road gradient is set at 10% to ensure safety and haulage efficiency.

Mining Equipment

Akyem Gold Mine has purchased mining equipment as presented in Table 9.5 below. The existing equipment could maintain a TMM of about 850 million tonne per annum as stated by the mine management. Blasted material will be loaded into trucks using 22 m³ hydraulic shovel and transported using haul trucks with a capacity of 142 tonnes.

9.3.3 Mine Production Plan

Operating Schedule and Production Capacity

The production schedule has been designed on an annual basis, and the following key assumptions were applied during production planning:

- Only blocks classified as Measured and Indicated Mineral Resources with a gold grade above 0.3 g/t were considered and considered as ROM.
- Blocks classified as Inferred Mineral Resource or those with a gold grade below 0.3 g/t were designated as waste.
- A single cutback strategy is implemented to ensure a stable supply of ROM material throughout the mine's life.
- The maximum annual total material movement is capped at 850 Mtpa.
- The vertical lag between mining phases is restricted to a maximum of 3 benches.

Production Plan and LOM

The results of the production scheduling are summarized in Table 9.6 and Figure 9-4. The LOM is estimated at 14 years, commencing in January 2025. The total ROM tonnage is 102,090 kt, with an average gold grade of 2.21, yielding a contained gold metal total of 137,773 kg. The total waste material is estimated at 376,029 kt, resulting in an average stripping ratio of 3.68.

9.4 Underground

9.4.1 Geotechnical Conditions

SRK received a geotechnical study conducted by Newmont Corporation, addressing hydraulic radius, dilution, and the dimensions of rib pillars and crown pillars for the Akyem underground deposit. Below is a summary of the study, with geotechnical considerations aligned with JORC standards.

Geology of Akyem Deposit

The geology of the Akyem deposit comprises metavolcanics and turbiditic metasediments. The primary structural control governing mineralization is the NE-SW trending Akyem Carbon Fault (CF), which strikes at 70° and dips 60° to the southeast. Mineralization is associated with brecciation and alteration zones on the immediate hangingwall side of the CF (footwall breccia zones) as well as shear veins and stockworks located further into the hangingwall (hangingwall breccia zones).

Mineralized zones vary in true thickness, with the main lens located in the immediate hangingwall of the CF alongside isolated subparallel lenses further into the hangingwall. The CF contact, ore width, and stoping depth are the primary controls defining stable stope spans and pillar sizing.

The deposit features mineralization with a strike length of over 2,500 meters and extends to a depth of 900 meters down-dip. True thickness varies from 10 meters to 100 meters. The mineralization strikes N70E and dips south-southeast at 60°–65°, closely paralleling the lithological foliation. The primary mining methods under consideration are modified sublevel open stoping method with subsequent backfilling.

Stress Environment

Using the WASM Acoustic Emission (AE) method, stress conditions at the Akyem underground deposit were measured at three locations. Key findings:

- k-ratio: Varies between 1.5 and 1.7 at the proposed stoping depth range.
- σ 1: σ3 ratio: Approximately 2.0.

Rock Mass Properties

Rock Quality Designation (RQD):

- Hangingwall metasediments exhibit RQD values consistently above 90%, largely unaffected by the Carbon Fault (CF).
- Footwall metavolcanics show reduced RQD values near the CF, improving progressively with distance from the hangingwall contact, eventually exceeding 90% beyond a 10-meter standoff.

Discontinuity Sets (Jn):

- Hangingwall metasediments feature joint sets predominantly sub-parallel to the CF. Joint sets strike NE-SW and generally dip southeast, occasionally dipping in the opposite direction. For assessments, two-plus-random joint sets (Jn = 6) were assumed.

- Footwall metavolcanics exhibit more variable joint sets with greater scatter. For assessments, two-plus-random joint sets (Jn = 6) were also assumed.

Discontinuity Wall Properties (Jr and Ja):

Discontinuities in metasediment and metavolcanic units are generally undulating, with micro-scale rough and smooth surfaces. For assessments, "Undulating" and "Smooth" were assumed.

Groundwater Conditions (Jw):

Groundwater flow is largely confined to saprock levels above planned underground mining depths. Fresh rock in both footwall and hangingwall zones features low hydraulic conductivity. Dry conditions (Jw = 1.0) were assumed.

Stress Reduction Factor (SRF):

SRF values vary with depth and were calculated based on:

- UCS: 180 MPa for metasediments; 165 MPa for metavolcanics.
- Rock density: 2.7 t/m³ for metasediments; 2.9 t/m³ for metavolcanics.
- Depth below surface influences calculations for $\sigma 3$.

Modified Rock Quality Index (Q')

When stress and groundwater influence are removed, Q-values represent Modified Rock Quality Index (Q'). Values assumed were:

- Metasediments: Q' of 33.
- Metavolcanics: Q' of 27.

Stoping Design and Dilution

Hydraulic Radius (HR):

The viable hydraulic radius decreases with depth due to increasing stress conditions. Cable bolting is recommended for stope backs to improve stability at greater depths. Geotechnical assessments followed the guidance provided in Table 5.

Stress Conditions at Depth:

Stress conditions at the Akyem deposit were high-level estimates based on Sigma1 and the Disturbance Index (Di). Key findings:

- Light spalling begins at depths of 350–400 meters below surface.
- Severe spalling begins at depths of 550–600 meters.
- Seismic activity begins at depths of 750–800 meters below surface.

Pillar Design

Crown Pillars

Recommendations are based on mining methods:

- Modified sublevel open stoping with subsequent backfilling: Minimum crown pillar of 25 meters, increasing to 2.5x orebody width for ore thicknesses >10 meters. Crown pillars may be partially recovered after open pit completion.

Rib Pillars

Rib pillar sizing followed industry standards, with guidance derived from Map3D modeling, stress calculations, and the Tributary Area Theory.

Inter-Lens Pillars

Extraction design is based on vein spacing:

- Veins <5 meters apart can be mined as a single stope.
- Veins 5–15 meters apart require footwall extraction first, supported by backfill.
- Veins >15 meters apart may be extracted independently.

9.4.2 Mine Design and Planning

The Akyem deposit has a strike length of over 2,500 m, and mineralisation delineated to a depth of 900 m down-dip on the southeast-dipping fault structure. Mineralised zones vary in true thickness from 10 m to as much as 100 m. It strikes at N70E and dips S-SE at approximately 60°- 65°, generally parallel to the foliation of the lithological host sequence.

The UG development system consists of shafts and declines, with shaft development scheduled to begin in 2026 and a construction period of 3 years. The mining sequence will follow a bottom-up approach, with mining levels ranging from a relative elevation of 110 m to -610 m Relative Level (RL).

Development

The underground mine's shaft development consists of a dual-shaft system. One shaft is designated for early-stage fresh air intake and personnel transportation, while the other shaft is used for ore and waste rock hoisting. The mining area is divided into two panels, one of the decline is connected to various levels and transport equipment and another one is for transporting equipment and get into stope. A ventilation shaft will be excavated near the shafts, serving as an intake channel for fresh air. The ventilation infrastructure is designed to ensure adequate airflow to dilute emissions from diesel equipment and regulate the thermal environment in the deeper mining zones.

The dimensions of the underground development, as outlined in Table 9-9:

Table 9-9: Development Dimensions

TYPE	Dimensions W*H
Decline	4.5*4.2
Level access	4.5*4.2
Hangingwall drift	4.5*4.2
Footwall drift	4.5*4.2
Ventilation drift	4.5*4.2
Cross-cut	4.2*3.9
Converybelt drift	4.0*3.9
Return air shaft	4.5m D
Ore pass	4.0m D
Shaft	6.4m D
Fresh air raise	4.5m D

Source: SRK

Mining Methods

Based on the orebody geometry and mining technical conditions, different mining methods are selected to optimize recovery and ensure operational safety and stope stability:

- For ore bodies less than 8 meters thick, the cut-and-fill mining method is employed.
- For ore bodies between 8 and 20 meters thick, a modified sub-level stoping method with tailings paste backfill is utilized.
- For ore bodies greater than 20 meters thick, a modified open stoping method with tailings paste backfill is applied.

As thin ore bodies (less than 8 meters thick) represent only a small proportion of the deposit, this report primarily focuses on the application of modified sub-level stoping with tailings paste backfill for medium-width ore bodies (8–20 meters thick) and modified open stoping with tailings paste backfill for thicker ore bodies (greater than 20 meters). The selection of these mining methods is based on optimizing ore recovery while maintaining safe and stable mining operations.

Modified sub-level stoping mining method

Ore blocks are delineated along the strike of the orebody, with each block measuring 60 meters in length and having a width equivalent to the orebody thickness. The vertical extent of each block is set at 60 meters, divided into three sublevels of 20 meters each. Principal development includes the internal decline, ore vein drifts, draw points, crosscuts, slot raises, and bottom sills.

Footwall drifts are located outside the orebody and are vertically connected via internal declines, ensuring access between sublevels. From the footwall drifts, crosscuts are developed toward the orebody, followed by the development of ore vein drifts. Bottom sills and slot raises are constructed at the lowest sublevel's extremities to establish working faces, which serve as the initiation points for lateral ore extraction.

The stope design employs a flat-bottom configuration, with no crown or sill pillars left in situ. Blasting is conducted using explosives charged with charging vehicles and initiated by digital electronic detonators.

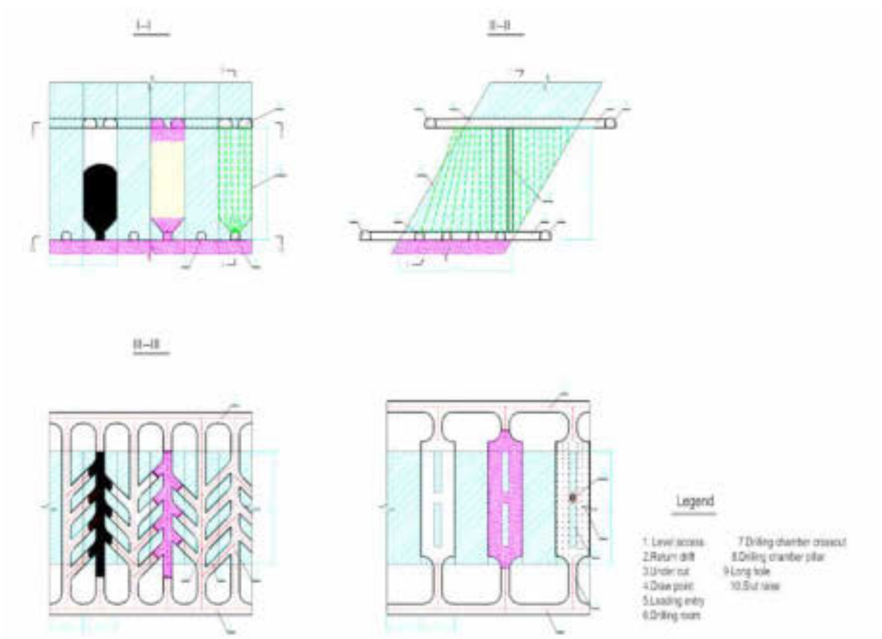
Ore Extraction and Handling

Broken ore is collected using 5 m³ loaders operating at the draw points of the flat-bottom stope. The ore is then loaded into 30-tonne dump trucks in remuck chambers adjacent to the stope, and transported via the internal decline to the main ore pass.

Ground Support

Ground support is selectively installed in unstable areas of ore extraction and drill drifts. Support measures include the use of rock bolts or shotcrete with mesh, and in critical areas, the installation of long cable bolts for additional reinforcement. After each blast, supplemental support is applied as necessary, based on observed ground conditions, to maintain continued stability of both the stoping area and associated infrastructure.

Figure 9-7: Schematic View of Sub-level Stoping Mining Method



Source: ZIJIN

Modified Open Stoping Method

Ore blocks are oriented vertically along the strike of the orebody, each with a width of 30 meters and a length equivalent to the orebody thickness. Within each block, stopes and pillars alternate, both having widths of 15 meters. No crown or sill pillars are left in place, and the stope floor incorporates trench storage areas to facilitate efficient ore handling. Each mining level is developed to a vertical height of 60 meters.

Primary development for ore extraction includes crosscuts, draw points, bottom sills, drilling chambers, and slot raises. Blast holes are charged using a dedicated charging vehicle and initiated with a non-electric detonator system. Ventilation is provided after each blast to safely remove fumes from the working area.

Ore Handling

On each level, 5 m^3 loaders are utilized to recover broken ore from the draw points and load it onto 30-tonne trucks. The trucks then transport the ore to the ore pass for further handling and processing.

Mining Sequence

A bottom-up mining sequence is employed to ensure safe extraction and maintain ground stability. Primary stopes are extracted first, targeting areas with higher ore grades, greater thickness, or more favorable geological conditions. Upon completion, backfilling is carried out immediately to restore ground stability, prevent wall collapse, and create a secure environment for mining adjacent secondary stopes. Secondary stopes are mined only after the associated primary stopes have been backfilled. This staggered extraction and backfilling approach minimizes ground disturbance and reduces the risk of geotechnical hazards, such as rock bursts or roof falls.

Isometric views of Akyem Gold Mine are presented are shown in Figure 9-9, respectively.

Figure 9-8: Schematic View of Open Stoping Mining Method

Mining Service

Material Handling

The underground haulage system is divided into decline haulage and shaft haulage. The shaft has two ore-loading levels at -310 mRL and -550 mRL. After being transferred through ore passes, the ore is transported via a conveyor decline to the shaft loading levels and then hoisted to the surface. For decline haulage, loaders load the ore onto 30-ton trucks, which transport it to the surface via the decline.

Backfill

The mine utilizes fully cemented tailings backfill as the primary backfilling material, supplemented with waste rock from underground development to enhance the strength of the stope floor backfill. The backfill plant is located adjacent to the auxiliary shaft at an elevation of 204 meters.

The backfill slurry is prepared with a solids concentration of 70–74%, using full tailings from the processing plant, ordinary Portland cement, and water. While project-specific backfill testing is yet to be conducted, benchmarking with similar operations suggests that the target slurry concentration of 70–74% is achievable.

The backfilling system comprises a material preparation station and an integrated network of backfill pipelines. The designed mixing ratios are as follows:

- Primary phase stope backfill: Cement-to-tailings ratio of 1:8
- Secondary phase stope backfill: Cement-to-tailings ratio of 1:15

Power

The electric power design is only one centralized surface substation is used. This entails longer runs of 11kV overhead lines and cables from the Central substation to the points of consumption. The power line diagram is shown in the Figure 9-10.

Figure 9-10: Electric Power

Sources: Newmont

Maintenance

Trackless equipment maintenance workshops are established at the -310 m and -610 m levels to facilitate equipment servicing and repair activities. Each workshop measures 50 meters in length, 8 meters in width, with a rail height of 9 meters, and is equipped with a 20/5-ton electric overhead crane to assist with heavy lifting and equipment handling.

The workshops are designed with dedicated areas for specialized functions, including a tool room, spare parts storage, tire room, battery charging area, lubrication room, welding shop, grinding room, and electrical distribution room. Standard repair and maintenance equipment available in these workshops includes AC arc welders, oxy-hydrogen cutting machines, drilling machines, milling and drilling machines, bench-mounted drills, and grinding machines.

These facilities and equipment are designed to ensure efficient, safe, and reliable maintenance and servicing of trackless mining equipment in the underground environment.

Dewatering

The mine employs a single-stage mechanical dewatering system, with the main pump station located at the -610m level. Water inflow from all upper levels above -610m flows by gravity to the -610 m pump station sump, where it is then pumped directly to the surface.

The -610m pump station is equipped with three MD150-100×9 multi-stage abrasion-resistant centrifugal pumps. Each pump has a capacity of 150 m^3/h, a lift of 900 meters, and is powered by a 630 kW motor. Under normal conditions, one pump is operated, the second remains on standby, and the third is allocated for maintenance. Dewatering tasks are completed within 18.3 hours under standard inflow rates. Two φ194×10 mm seamless steel pipes are installed along the auxiliary shaft and serve as the primary dewatering pipelines.

In addition, two SQ35-50 sand pumps are installed at the base of the auxiliary shaft to transfer water collected at the shaft bottom up to the -610m level. Each sand pump has a flow capacity of 35 m^3/h, a lift of 50 meters, and is powered by a 15 kW motor. The corresponding pipeline system consists of φ89×4.0 mm seamless steel pipes.

Ventilation

Fresh air is supplied to the underground workings via the fresh air raise, auxiliary shaft, main shaft, and decline. The air is distributed through the footwall drifts and crosscuts into the stopes. Exhaust air is collected from the stopes and routed to ventilation drifts on the upper levels, then directed into the main return air pathway and ultimately expelled to the surface through the return air shaft.

The ventilation system employs a mechanically induced exhaust method.

The fresh air raise, auxiliary shaft, and main shaft are all located on the western side of the mining area, while the return air shaft is positioned on the eastern side.

A main axial flow ventilator is installed at the wellhead of the return air shaft. Based on air leakage and resistance losses, one FCZNo36 model mine axial flow fan has been selected for the return air shaft. This fan is capable of providing an air volume of 595.7 m^3/s, with total pressures of 3,544 Pa under normal conditions and up to 4,594 Pa under more challenging conditions. Each fan is powered by a 3,800 kW motor and is equipped with a standby motor of the same model and specification, along with facilities that enable rapid motor replacement.

The system is designed to enable reversal of mine airflow within 10 minutes, with the reverse air volume reaching more than 60% of normal operational airflow.

In addition, where airflow is insufficient—for example, in the crusher system, loading pocket chambers, or other isolated or high-resistance zones—auxiliary fans are deployed to supplement ventilation. This method is also applied to active development faces and drilling locations where maintaining effective ventilation is challenging. The underground ventilation system includes 30 JK58-1NO4.5 auxiliary fans, of which 25 are operational and 5 are maintained as standby units. The number of auxiliary fans may be increased as necessary to meet production requirements and ensure comprehensive ventilation coverage throughout the mine.

Mining Equipment

9.4.3 Underground Development Schedule

For levels above -130m, ore from each level is hauled by truck through the ramp to the run-of-mine stockpile at the open pit access trench and then transferred via the open pit belt conveyor system to the processing plant.

For the -610m to -130m levels, ore is transferred down to the -610m level crushing station through two main ore passes. Ore passes and transfer chambers are set at the -130m to -190m, -190m to -490m, and -490m to -610m sections, respectively. After crushing, the ore is lifted via the No.1 feeder belt and No.1 convertbelt drift to the -520m elevation, where it enters the finished ore bin. Finally, from the bottom of the ore bin at -550m elevation, the ore is loaded onto a transfer belt and transported to the main skip shaft, and hoisted to the surface through the main shaft.

Since the Akem Gold Mine has not yet obtained the underground mining license, this may impact the planned development of underground mining infrastructure scheduled to begin in 2026.

The Table 9-11 shows the production rate in schedule.

Table 9-11: Production rate in Akyem Gold Mine

Type	Unit	Production rate

Notes:

1. SRK applies a 30% factor for ramp development.
2. For ore lateral development, SRK applies a 447% factor.

9.4.4 Mine Production Plan

The Life of Mine (LOM) production schedule for Akyem Gold Mine has been developed using Deswik software, based on the underground mining design provided by Zijin. The Deswik software suite facilitates detailed production planning by aggregating the pit inventory according to stages, benches, and predefined grade bins, enabling the prioritization of early gold production to optimize economic returns.

Operating Schedule and Production Capacity

The schedule is organized on an annual basis, and the following key assumptions were applied during production planning:

- Only blocks classified as Measured and Indicated Mineral Resources, with an overall stope gold grade exceeding 1.5 g/t for the Akyem Gold Mine deposit were considered as ROM.
- Blocks classified as Inferred Mineral Resources or those located outside the defined stope areas were categorized as waste material.
- The maximum annual production rate is limited to 3,500 ktpa.
- The Life of Mine (LOM) is estimated at 13 years.

Production Plan and LOM

9.5 Combined Production Plan

The Akyem Gold Mine has a processing plant with an annual capacity of 850 wt, which will be expanded to an annual processing capacity of 1,200 wt in 2029. Table 9-14 and figure 9-9 shows the production schedule of the Akyem Gold Mine.

In the final year of LOM, since the underground mining sequence is from bottom to top, underground mining will be extracting the uppermost level while open-pit mining is simultaneously extracting the lowest bench. This may pose a threat to the stability of the crown pillar.

10 Mineral Processing and Metallurgy

10.1 Overview

The Akyem Processing Plant was put into operation in 2013 with a designed capacity of 7.6 Mtpa when processing 100% primary ore, and up to 8.5 Mtpa when treating a blend of 30% oxide ore and 70% primary ore.

In the future, the processing plant will undergo technological upgrades and expand the production capacity to 12.0 Mtpa, processing both open-pit (OP) and underground (UG) mixed ores. The expansion pre-feasibility study (PFS) has been completed by Zijin (Xiamen) Engineering Design Co., Ltd.

The plant utilizes the carbon-in-leach (CIL) process to recover gold and the final product is gold doré bullions. Over the past four years, the annual production throughput has ranged between 7.6 Mt and 8.3 Mt with recovery rates ranging between 88% and 90%.

10.2 Metallurgical Test

This section presents a summary of metallurgical test results performed on samples from Akyem OP Layback, UG and D1/D2 Saddle. The program included mineralogy, comminution test, and cyanidation leach testwork. The metallurgical test reports reviewed to prepare the Report are summarized as follows:

- *Akyem Layback Stage 2B/3 Metallurgical Report,* dated May 2021 by Newmont Metallurgical Services (NMS);
- *Akyem UG Growth Stage 1 Metallurgical Report,* dated June 2021 by NMS; and
- *Akyem Underground Update and D1/D2 – Stage 2A Process & Metallurgy Report,* dated May 2023 by NMS.

Furthermore, each year, samples are selected to represent the anticipated production for the next three years. This ensures that adequate and up-to-date testwork is conducted to maintain a thorough understanding of the mill feed materials and to validate the process assumptions.

10.2.1 Mineralogy

The variability samples from the OP Layback, prior UG ore sources, and the D1/D2 UG saddle area exhibit a range of head assays summarized in Table 10-1. In general, the chemical composition of the D1/D2 intervals closely resembles that of both the OP Layback and the prior UG samples. The gold grade of UG samples is higher than that of OP Layback, which is average of 4.19 g/t. Elements with potential environmental and health impacts, such as arsenic and selenium, were detected at low levels, consistent with findings from previous analyses.

Table 10-1: Summary of Chemical Analysis of OP Layback, UG, and D1/D2

Item	Unit	Average – OP Layback	Average - UG	D1/D2 Average

Source: Akyem Underground Update and D1/D2– Stage 2A Process & Metallurgy Report, dated May 2023 by NMS.
Note: AuCN for cyanide soluble gold, AuFAA for gold determination by Fire Assay with Atomic Absorption (AA) Spectroscopy.

The mineralogical composition analysis results are summarized in Table 10-2. No significant differences in composition were observed among the three ore sources. The primary mineral phases identified in the samples included plagioclase, quartz, dolomite/ankerite, sericite and chlorite, collectively accounting for over 94% of the total composition. Additionally, minor to trace amounts of pyrite, siderite, rutile and biotite were detected.

SRK has noted that all the reviewed test reports lack studies on the gold distribution characteristics, particle size, and occurrence state.

Table 10-2: Summary of Composition Analysis of OP Layback, UG, D1/D2 (Unit: %)

Mineral Name	OP Layback Average	UG Average	D1/D2 Average
Plagioclase	31.6	37.3	29.5
Muscovite/Sericite	17.4	8.8	19.2
Chlorite	11.7	3	3.1
Dolomite/Ankerite	11.8	16.3	12.7
Quartz	26.1	32.8	29.5
Calcite	<1	0.9	0
Pyrite	1	1.5	1.7
Siderite	3.5	2.6	3.5
Rutile	0.4	0.4	0.6
Biotite	-	-	2.7

10.2.2 Comminution Test

The purpose of this test is to provide technical parameters for the design of the grinding process and mill selection, especially the energy consumption of closed-circuit grinding.

A series of comminution tests including Steve Morrel Comminution Test (SMC), Abrasion Index (Ai) and Bond Ball Mill Work Index (BWi) analysis were conducted on all the selected samples of OP Layback, UG, and D1/D2, with the test results summarized in Table 10-3. The value Axb is a measure of resistance to impact breakage, and low values are indicative of hard ores, while high values indicate soft ores.

Table 10-3: Summary of Comminution Test Results for OP Layback, UG and D1/D2

Samples	Dwi (kWh/m^3)	A*b	Bwi (kWh/t)	Ai	SG	Samples No.
OP Layback	7.83	35	14.01	0.4	2.8	25
UG	7.13	39	14.01	0.7	2.8	32
D1/D2	6.3	44	13.01	0.5	2.8	12

The BWi test values ranged between 13.01 kWh/t and 14.01 kWh/t with an average of 13.7 kWh/t for the samples, indicating middle hardness for all these samples. Additionally, the data indicated that the UG and OP Layback material are slightly harder than D1/D2 ore and lower mill throughput rates could therefore be expected. The UG ore is also seen to have higher Ai values suggesting increased wear rates and steel consumption in the plant.

10.2.3 Metallurgical Test and Results

All variability samples from the OP Layback, UG, and D1/D2 ore sources underwent cyanidation leach testwork, with some master composites derived from these samples for optimization purposes. Table 10-4 summarized the laboratory leach test results for the UG intervals and D1/D2, along with data on laboratory reagent consumption. Layback results are included for comparison. The transition to higher-grade UG ores is distinctly linked to increased cyanide consumption and decreased lime usage. The D1/D2 results demonstrated a strong correlation with the UG ores. Furthermore, variability leach testwork conducted across a range of grind sizes revealed that gold extraction improved with finer grinding.

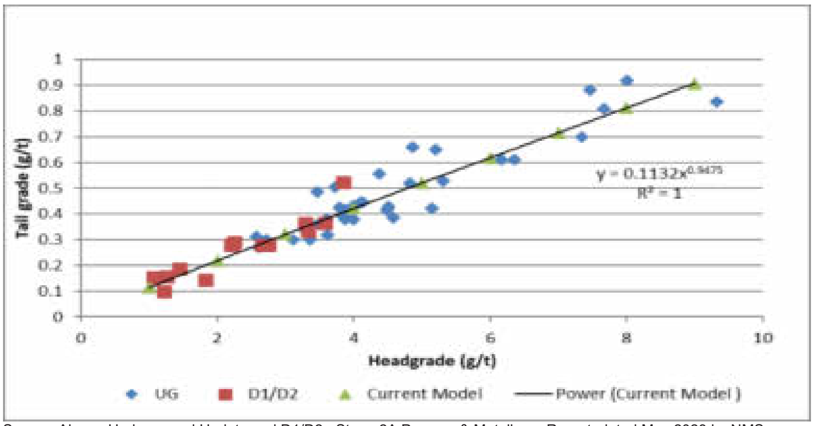
Table 10-4: Metallurgical Test Results for Akyem Testwork (P_{80} =75µm)

Item	Units	OP Layback	UG (> 2.5 g/t)	D1/D2
No. Test	No.	74	37	13
Avg Head	g/t Au	1.99	4.66	2.36
Avg Tail	g/t Au	0.24	0.5	0.27
Avg Extraction	%	88.36	89.26	88.69
Median Extraction	%	88.53	89.53	88.97
NaCN, avg.	kg/t	0.28	0.33	0.29
$Ca(OH)_2$, avg.	kg/t	0.82	0.72	0.75

Source: Akyem Underground Update and D1/D2– Stage 2A Process & Metallurgy Report, dated May 2023 by NMS.

Figure 10-1 presents a Headgrade vs. Tailgrade comparison of the Akyem UG/Layback and D1/D2 leach results at 80% passing 75 µm. The data set from D1/D2 aligns closely with the previous underground findings detailed in the Akyem UG Growth Metallurgical Stage 1 report from 2021.

Figure 10-1: Headgrade Vs. Tailgrade Relationship All UG data > 2.5g/t and D1/D2



Source: Akyem Underground Update and D1/D2– Stage 2A Process & Metallurgy Report, dated May 2023 by NMS.

The testwork concluded that:

- The metallurgical testwork on samples from Akyem OP Layback, Underground and D1/D2 Saddle consisted of mineralogy, standard comminution, variability cyanidation leach testwork, and leach optimization testwork.
- The gold grade of UG samples is higher than that of OP Layback, which is average of 4.19 g/t. Elements with potential environmental and health impacts, such as arsenic and selenium, were detected at low levels, consistent with findings from previous analyses.
- No significant differences in composition were observed among the three ore sources. The primary mineral phases identified in the samples included plagioclase, quartz, dolomite/ankerite, sericite and chlorite, collectively accounting for over 94% of the total composition.

- Comminution testwork indicates that both the UG and OP Layback material are slightly harder than D1/D2 ore and lower mill throughput rates could therefore be expected. The UG ore is also seen to have higher Ai values suggesting increased wear rates and steel consumption in the plant.
- Overall, the gold recoveries ranged from 88% to 89.0% in cyanidation leach tests. The shift to higher-grade UG ores is clearly associated with increased cyanide consumption and reduced lime usage.
- The testwork indicated that all the underground ore sources evaluated are amenable to processing in the existing Akyem process plant.

10.3 Processing Practice

10.3.1 Production Flowsheet

The processing plant flowsheet consists of crushing, semi-autogenous grinding & ball milling & pebble crushing (SABC) and a carbon-in-leach (CIL) circuit. Additionally, the plant is equipped with elution and smelting facilities, as well as a tailings storage facility. The process is traditional and mature, which is considered to be relatively reasonable for treating the ore from Akyem mine.

The production process flowsheet is shown in Figure 10-2, and specified as follows:

Crushing and Grinding

The process commences with a single-stage primary crushing operation, where primary ores are delivered either by direct truck dumping or using a front-end loader. The crushed material is deposited onto a live ore stockpile. From this stockpile, the material is transferred via an apron feeder directly onto the feed conveyor of the semi-autogenous grinding (SAG) mill. Previously, an MMD-sizer was used for processing oxide ore, which was fed by a front-end loader and delivered directly onto the SAG mill feed conveyor. However, this equipment is no longer in operation.

The SAG mill discharge will be screened on a single deck vibrating screen. Oversize from the screen deck will be conveyed to the pebble crusher feed bins. Screen undersize will flow to the common mill discharge hopper. The ball mill will operate in closed circuit with hydrocyclones. Cyclone overflow will gravitate through trash screens for grit and woodchip removal. Pebbles discharged from the SAG mill will be recycled to the pebble crushing facility. Crushed pebbles will be recycled to the SAG mill feed conveyor. The final grinding fineness is P_{80}=74 μm.

Pre-Leach Thickening

Trash is removed from the cyclone overflow ahead of the pre - leach thickener by a vibrating screen. The trash is discharged into a bin for disposal. The screen underflow gravitates to the pre - leach thickener feed. The thickener underflow (pulp concentration of about 50%) is pumped to the pre-leaching tank of the CIL circuit.

CIL Process

The pre-leach- thickener underflow is pumped through 11 CIL tanks. Cyanide and oxygen are added to the leach feed for leaching with gold recovery from solution using activated carbon. Pulp will flow from one CIL tank to another via interstage screen. The active carbon is injected into the last CIL tank and operates against the direction of the pulp. The gold-loaded carbon is hydraulically delivered onto a carbon recovery screen. The screen oversize (gold-loaded carbon) is sent to elution circuit acid wash hopper. The CIL tailings are directed to the carbon safety screens.

Elution and Carbon Regeneration

The gold - loaded carbon enters to the acid treatment vessel and is washed with hydrochloric acid （3%）to remove inorganic impurities and then transferred to the elution column. An 18-ton Anglo American Research Laboratory (AARL) method elution process is employed and sodium cyanide and NaOH aqueous solution （4.5% NaOH and 2% NaCN）are used as elution liquid. The pregnant solution from the CIL elution circuit will be collected in an elution pregnant solution tank.

Barren carbon will be regenerated in a horizontal kiln (650 -750 ºC). Carbon is returned to the CIL tanks by pumping from the quench hopper over the sizing screen. The quench hopper is also used for adding fresh carbon to the circuit with the facility for mild conditioning before sizing.

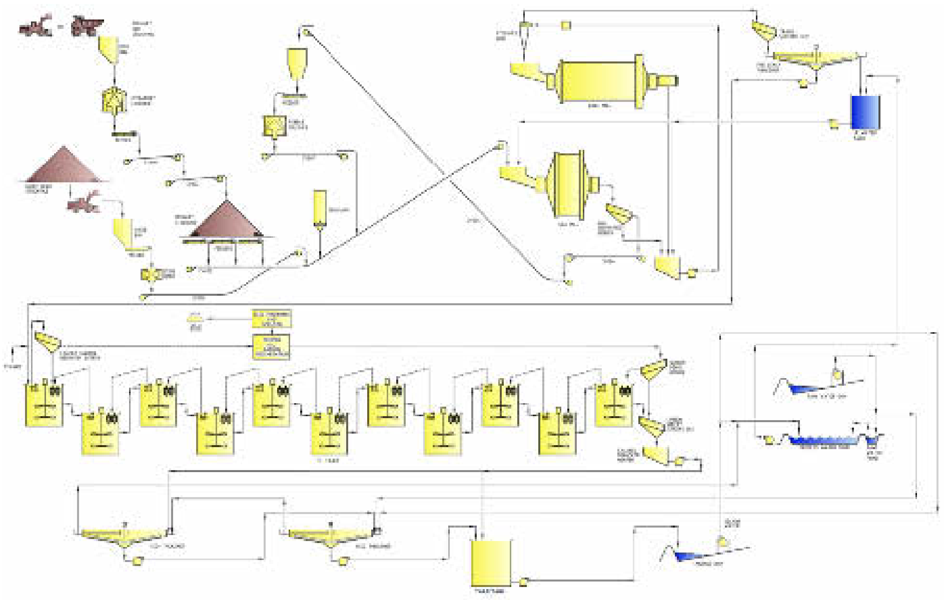
Electrowinning and Smelting

The gold pregnant solution is passed through two electro-winning cells equipped with stainless steel cathodes. The cathodes steel wool containing gold are periodically removed from the cell. The gold sludge will be treated in a drying oven and then smelted to produce gold doré bullions.

Tailings Disposal

The underflow from the carbon safety screens will be directed to the counter-current decantation (CCD) feed pump hopper. A two-stage CCD circuit is employed to recover cyanide from the CIL tailings before they are discharged to the tailings storage facility (TSF). The recovered cyanide is efficiently recycled back into the CIL circuit, and the levels of Weak Acid-Dissociable cyanide (CN_{WAD}) in the plant tailings are carefully managed to ensure compliance with the legal discharge limit of 50 ppm CN_{WAD}.

Figure 10-2: Current Production Flowsheet of the Akyem Processing Plant



10.3.2 Main Facilities and Equipment

SRK conducted a site visit to the Akyem Processing Plant from June 10th to 14th, with an overview photo provided in Figure 10-3. The processing plant is an open-air layout (except for the gold room) and primarily includes the following sections: crushing, SABC, leaching and adsorption, elution and carbon regeneration, tailings CCD, electrowinning and smelting etc. Auxiliary facilities include a laboratory and maintenance workshop. Up to now, the plant has been in operation for over 12 years. SRK has observed that most of the facilities are in good condition overall, although some steel and pipes show minor rusting, which does not affect normal production.

Figure 10-3: Overview Photo of Akyem Plant

Source: Site visit

The main equipment of the Akyem processing plant primarily includes the crusher, SAG mill, ball mill, and hydrocyclones for the crushing and grinding processes. In the CIL circuit, the key equipment includes leaching tanks, adsorption tanks, carbon recovery screens, carbon safety screens, acid wash and elution columns, among others. The main processing equipment is detailed in Table 10-5, which does not include belt conveyors, slurry pumps, and other auxiliary equipment.

Table 10-5: Main Equipment of Akyem Processing Plant

No.	Equipment	Specifications	QTY.	Remark
1	Gyratory Crusher	54-inch x 75-inch	1	/

10.3.3 Material Consumption

The material, reagent, and power consumptions of the processing plant from 2021 to May 2024 are shown in Table 10-6 and Figure 10-4. The data indicated that the power cost is the highest, accounting for about 55%, followed by the cost of grinding media, lime and sodium cyanide.

Table 10-6: Material, Reagent, and Power Consumptions of Processing Plant

Item	Unit	2021	2022	2023	2024.MAY
Processed Tonnes	Mt	7.96	8.19	7.65	3.21
Ball Mill Grinding Media	Costs (US$ M)	6.45	7.85	6.56	2.93
	Cosumption (tonnes)	4,160	4,426	3,606	1,592

10.4 Historical Production Index

Table 10-7 summarized the historical production data from 2022 to 2024. The data indicated that over the past four years, production throughput has ranged between 7.6 Mtpa to 8.30 Mtpa, with a recovery rate between 88% and 90%, averaging 89.3%. Overall, the indicators have remained stable. The gold output in 2022, 2023, and 2024 was 12.84 t, 9.02 t, and 6.32t, respectively.

Table 10-7: Historical Production Data of Akyem Processing Plant

Items	Unit	2022	2023	2024
Processed Tonnes	kt	8,195	7,646	8,287

Gold Metal Output	koz	413	290	203

Source: SRK collected.
Note: 1 oz=31.1035 g.

10.5 Expansion Plan

In the future, the processing plant will process both OP and UG mixed ores, expanding the production capacity to 12.0 Mtpa. The expansion pre-feasibility study (PFS) has been completed by Zijin (Xiamen) Engineering Design Co., Ltd..

To meet the requirements for capacity expansion, based on the PFS, an additional grinding and classification system will be added to the existing processing plant. Specifically, the grinding and classification system will include an additional set of φ660 mm × 9 (6 in use, 3 standby) cyclones for classification. The underflow from the cyclones will flow by gravity to a newly added φ6.2 m×11.5 m ball mill for grinding. The ball mill discharge will be pumped back to the cyclones, forming a closed-circuit loop. The cyclone overflow (P_{80}=74 μm), will flow by gravity to a newly added φ30 m high-efficiency thickener for pre-leach thickening. The thickener underflow will be pumped to the CIL system.

To ensure sufficient leaching retention time, the existing leaching system will be expanded with the addition of 5 new 3,250 m^3 CIL tanks. The CIL tailings will undergo cyanide detoxification via the existing CCD counter-current washing system before being pumped to the TSF. The gold-loaded carbon will utilize the existing elution and electrowinning system to produce gold doré bullions.

10.6 Tailings Storage Facilities

The tailings storage facility (TSF) consists of two cells (Cell 1 and Cell 2), constructed as downstream rock-fill storage facilities located approximately 1 km southwest of the Akyem processing plant. The TSF has been classified as Class A under Ghana's L.I. 2182, 2012 Regulations.

Cell 1 was commissioned in 2013 with an initially permitted storage capacity of 46 Mt and ceased operations in April 2019. The embankment elevation of Cell 1 is 196.6 mRL. During the site visit, construction of Cell 1 Stage 4 was observed to be in progress, with 62% completion. Cell 2 was commissioned in 2019, and Stage 3 is currently operational, with the embankment elevation at 202.8 mRL.

SLR Consulting (Ghana) Limited (SLR) conducted a "TSF Updated Deposition Modelling" in March 2025. The modelling indicates that approximately 89.4 Mt of tailings had been deposited across the two cells by the end of 2024, and Cell 2 Stage 3 is projected to reach capacity by the end of February 2026.

In the future, Cell 1 and Cell 2 will be combined into a single dam and constructed from Stage 4 to Stage 6. The Engineer of Record has finalized the raising design for the combined facility, which will have a total capacity of 131 Mt with embankment elevation of 211.7 mRL. As of December 2024, the remaining capacity of the combined TSF is approximately 40.6 Mt. The currently designed storage capacity is insufficient to meet the tailings storage requirements for LOM, and further expansion is necessary. The current situation of existing TSF is shown in Figure 10-5.

Figure 10-5: Aykem Gold Mine TSF

Source: Site visit.

10.7 Conclusions and Recommendations

Based on the review of the metallurgical tests and processing plant practice, SRK has reached the following conclusions and recommendations:

- Comprehensive and systematic metallurgical testing has been conducted on different ore deposits, indicated that all the UG ore sources evaluated are amenable to processing in the existing Akyem process plant.
- Leaching tests were conducted on samples from Akyem OP Layback, UG, and D1/D2 Saddle. Results indicated that the gold recovery rate ranged between 88% and 89%, which is almost consistent with the recovery in the historical three-year production practice.
- In the future, the processing plant will process blended ore from OP and UG sources, with an expanded capacity of 12 Mtpa. SRK recommends collecting representative ore samples based on the LOM plan and conducting test work with varying blend ratios of OP to UG ore to determine the optimal process parameters.

11 Workforce Assessment

11.1 Workforce Numbers

The Akyem project has a total of 781 employees, including 178 technical specialists, 498 daily operation and maintenance personnel, 34 management personnel, 16 senior management personnel, 2 dispatched employees (expats), 20 national service members, and 35 others.

11.2 Assessment of Workforce

SRK is of opinion that with the underground development and mining commenced, the structure and numbers of workforce will be changed significantly.

Current designed workforce is based on an assumption of 330 days per year, and 2 shifts per day.

12 Project Infrastructure

12.1 Access

The Akyem project site is accessible via a network of roads designed to support both construction and operational phases of the mine. The primary access road connects the mine site to the public roadway linking New Abirem to Pramsakuma. The main access road is constructed to accommodate a traffic volume of approximately 500 vehicles per day and is designed to handle 19-meter semi-trailers with a two-lane width of 10 meters and a maximum gradient of 8.3%. Service roads are also established to provide access to remote infrastructure, such as overland conveyors and pipelines, with a design capacity for light-duty vehicles (LDVs). These roads are 7 meters wide with a maximum gradient of 10%. All access roads and intersections are constructed in compliance with Ghanaian standards and are equipped with drainage systems to prevent erosion and sedimentation.

Additionally, a dedicated parking area for heavy-duty vehicles (HDVs) and LDVs has been established near the workshops, providing space for at least 20 mining vehicles, including dump trucks, loaders, and drill rigs.

12.2 Power Supply

Power for the Akyem operations is supplied via a 43-kilometer 161-kilovolt (kV) transmission line connecting the mine to the national power grid at the Nkawkaw substation. The existing infrastructure includes two 45MVA transformers, which provide sufficient capacity to meet the mine's forecasted power demand of 38.8MVA. The project also includes an emergency diesel backup power generation system consisting of seven 1.4MW units (9.8MW total) to ensure uninterrupted power supply during grid outages.

A solar energy system with a capacity of 110kW has been installed at the mine's Camp A accommodations and is currently operational. Future plans include evaluating the feasibility of integrating additional renewable energy sources, such as solar, to reduce carbon emissions and operational costs.

12.3 Water Supply

The water supply infrastructure for the Akyem project is designed to meet both operational and potable water requirements. Process water is sourced from a 15,000m³ capacity process water pond, which receives overflow solution from the counter-current decantation (CCD) circuit and raw water pond. The water is distributed to various facilities using high-pressure and low-pressure pumps.

Potable water is supplied via a dedicated system that includes boreholes, pump stations, and storage tanks. A new potable water tank with a capacity of 850m³ has been installed, and water is pumped using centrifugal pumps with capacities of 16m³/h and 120m head. The potable water system complies with Newmont's piping design standards and is constructed using PN10 piping.

A reverse osmosis water treatment plant with a capacity of 75 liters per second was commissioned in 2022 to ensure compliance with Ghanaian EPA discharge standards. Additionally, a sewage treatment plant (STP) with a capacity of 60m³/day has been installed to treat wastewater from surface offices, workshops, and change houses. The treated effluent meets stringent environmental standards and is used for irrigation or discharged safely.

12.4 Workshops and Repair Facilities

The Akyem project includes well-equipped workshops for the maintenance and repair of both heavy-duty and light-duty vehicles. The HDV workshop features two service bays with removable grating, sumps, and oil-water separators. It also includes storage areas for tires, hoses, and spare parts. The LDV workshop is designed with a similar layout but scaled for smaller vehicles.

A wash bay facility is provided for both HDVs and LDVs, equipped with silt traps to manage runoff. The workshops are strategically located near the main access road and parking areas to facilitate efficient vehicle movement and minimize downtime.

12.5 Office Buildings and Accommodation

The main office building at the Akyem site serves as the administrative hub for both Newmont and contractor personnel. It has a capacity for 441 people and includes offices, meeting rooms, and common areas. The building is situated south of the portal access and close to the change house and maintenance facilities.

The change house is designed to accommodate 360 workers (60% male and 40% female) and includes lockers, showers, and laundry facilities. Hot water is supplied via energy-efficient heat pumps integrated with the ventilation system.

Camp A serves as the primary accommodation facility for the workforce, covering approximately eight hectares. It includes residential units, a medical clinic, and recreational facilities. The accommodations are powered by a combination of grid electricity and a 110kW solar energy system.

13 Environmental Studies, Permitting, and Social or Community Impact

13.1 Environmental, Permitting, and Social or Community Review Process, Scope, and Standards

The process for verifying the environmental permitting and licensing compliance and operational conformance for the Akyem Projects comprised a review and inspection of the projects' environmental management performance against:

- Ghanian national environmental regulatory requirements;
- World Bank/International Finance Corporation (IFC) environmental standards and guidelines, and internationally recognised environmental management practices; and
- Environmental and social considerations relevant to the Modifying Factors described in the JORC Code (2012).

The methodology applied for this environmental and social review of the project consisted of a combination of documentation review, site visit, and interviews with NGRL technical representatives.

13.2 Environmental Legal Framework

The mineral and mining sector between 1986 and 2005 was governed by the *Minerals and Mining Law, 1986 (P.N.D.C.L. 153)* and this was the basic mining legislation in Ghana. While it was regarded as the trendsetter in terms of mining legislation in Sub-Saharan Africa, major changes in the international mining sector led to its revision. After a protracted review in the early 2000s, the current *Minerals and Mining Act, Act 703 of 2006* became the governing legislation for the country's minerals and mining sector.

The Minerals and Mining Act, 2006 (Act 703), and its related mining regulations and other relevant regulations such as the *Environmental Assessment Regulations, 1999, L.I 1652* and mining–related guidelines and standards constituted the legal framework and regulations for the mining sector.

Environmental Assessment Requirements

The Environmental Protection Agency ("EPA") Act, 1994 (Act 490) established the authority, responsibility, structure and funding of the EPA. Part 2 of the Act mandates the EPA, with the formulation of environmental policies, issuing of environmental permits and pollution abatement notices and prescribing standards and guidelines. The Act defines the requirements and responsibilities of the environmental protection inspectors and empowers the EPA to request that the EIA process be undertaken. The EIA process is legislated through the *Environmental Assessment Regulations, 1999 (L.I. 1652)*, which is the main legal framework used by the EPA, for regulating and monitoring mineral operations which cover requirements for:

- Environmental Impact Assessment (EIA);
- Preparation of Environmental Impact Statements (EIS);
- Environmental permitting;

- Environmental Management Plan (EMP); and
- Reclamation bonding.

The EPA grants environmental approval to all undertakings through an Environmental Permit, which is issued subject to the submission of a well-documented Environmental Impact Statement (EIS). For a mine, an EIS must include a reclamation plan and a provisional EMP. Prior to formal review by the EPA, the EIS may be subject to public exhibition and hearing, with responses from regulators and community to be incorporated into the EIS before an Environmental Permit is granted.

Two years from receipt of an Environmental Permit, an Environmental Certificate is required from the EPA to confirm:

- Acquisition of all permits and approvals;
- Compliance with mitigation commitments in the EIS and/or EMP; and
- Submission of Annual Environmental Reports.

Within 18 months of commencement of work, an EMP is to be submitted to and approved by the EPA. The provisional EMP in the EIS is updated and incorporated into the mine's active EMP which is scheduled for update every three years as part of its renewal process. A reclamation plan is a necessary document for all mines in Ghana (*Regulation 14 of L.I. 1652*) and mining operations submit annual environmental reports (*Regulation 25 of L.I. 1652*) and monthly environmental quality monitoring results to EPA, with notes where values exceed thresholds and response plans as required.

Minerals and Mining Requirements

Act 703 establishes laws on the process for obtaining mineral rights, the administration and management of these rights and protection of the environment. Supporting *Act 703* are the *Minerals and Mining Regulations, 2012* which cover:

- General aspects (L.I. 2173);
- Compensation and resettlement (L.I. 2175);
- Explosives (L.I. 2177);
- Support services (L.I. 2174); and
- Health, safety and technical requirements (L.I. 2182).

Water Resource Legislation Requirements

The Water Resources Commission Act, 1996 (Act 552) establishes the Water Resources Commission as a body corporate, responsible for the regulation, management, and coordination of policies related to water resources. Key functions include developing water use and conservation plans, granting water rights, coordinating water resource development and utilisation, and advising on water pollution control. Additionally, the *Water Use Regulations, 2001 (L.I. 1692)*, and *Drilling Licence and Groundwater Development Regulations, 2006 (L.I. 1827)*, complement the Act by specifying the requirements for obtaining permits for water use, water rights, and priorities for water use; and water drilling licences, and well construction requirements; respectively.

13.3 Permitting

In November 2008, NGRL completed an EIS for the Akyem Mine (NGRL 2008) under the direction of the EPA and received the Environmental Permit No. EPA/EIA/281 on 2 February 2009. In accordance with EPA permit requirements and Regulation 24 of LI 1652, NGRL submitted the 2011-2014 Akyem Mine EMP within 18 months of commencement of construction of the mine infrastructure. Since then, NGRL has updated its EMP every three years. The 2023–2026 EMP for Akyem Mine was submitted to the EPA on 15 May 2023. The EPA issued review comments on 23 November 2023, and the processing and permit fee was paid on 15 February 2024. The updated EMP was submitted to EPA on 28th March 2024 after incorporating EPA's comments and making all required payments. NGRL is awaiting the EPA's issuance of the Environmental Certificate. In 2024, NGRL also received invoices for the stand-alone 2023-2026 EMPs for Pit Layback and WRDF Expansion Project and Mine Water Treatment Plant ("MWTP"), awaiting the Certificate from the EPA. According to discussions with NGRL's technical representatives, the pending Certificate approvals are not expected to impact ongoing mine operations.

In accordance with the *Environmental Assessment Regulations, 1999 (LI 1652)*, Regulation 25, as well as Articles 28 to 30 of the *Minerals and Mining (Health, Safety and Technical) Regulations, 2012 (LI 2182)* and the conditions of the NGRL Environmental Certificate and various Environmental Permits, NGRL is required to submit an Annual Environmental Report initially twelve months after the start of operations in 2012 and thereafter, every calendar year.

Based on the *2023-2026 EMPs* and *Annual Environmental and Social Responsibility Report 2024*, the key environmental approvals held by NGRL are summarized in Table 13-1.

Table 13-1: Key Environmental Approvals Obtained for Akyem Mine

Approval	Permit No.	Issue Date	Expiry Date
Environmental Permit to commence and pursue operations	EPA/EIA/281	2-Feb-2009	N/A
Environmental Permit for Akyem Cell 1 TSF	EPA/EIA/349	4-Apr-2012	N/A
Environmental Permit for Akyem Cell 2 TSF	EPA/EIA/500	7-May-2018	N/A
Environmental Permit for Construction and Operation of the MWTP	EPA/EIA/536	9-Nov-2020	N/A
Environmental Permit for Akyem Pit Layback and WRD Expansion	EPA/EIA/581	22-Jun-2022	N/A
Environmental Permit for TSF Expansion (131Mt raise)	EPA/EIA/629	2024	N/A

SRK also reviewed 10 water use permits issued by the Water Resources Commission (WRC), covering activities such as water abstraction, pit dewatering, rainfall-runoff harvesting, water discharge, etc. Of these, only three water abstraction permits remain valid through 31 December 2025, while the remaining permits have expired. NGRL has submitted renewal applications for the expired permits; however, as of SRK's site visit, no response has been received from the WRC. According to discussions with NGRL's technical representatives, the current status of the permit renewals is not expected to impact ongoing mine water use.

In this environmental and social review, SRK viewed the following project documents:

- Environmental Impact Statement on Akyem Gold Mining Project ("2008 EIS") dated November 2008 and its approval;
- Summary of Environmental Impact Statement on Propose TSF Expansion ("2023 TSF Expansion EIS") dated June 2023;
- 2023-2026 Environmental Management Plans for Akyem, Akyem MWTP, Pit Layback and WRDF Expansion projects ("2023-2026 EMPs");
- 2022, 2023, and 2024 Annual Environmental and Social Responsibility Reports ("AESR");
- Summary of Qualified Person's Report for Akyem Operations in Ghana dated 31 December 2023 ("2023 QPR");
- Project Prime Information Report dated March 2024 ("2024 Information Report"); and
- Other related documents.

SRK viewed the 2008 EIS report, which presents the comprehensive baseline information, a detailed project description, an impact assessment, management and mitigation plans, monitoring programmes, reclamation and mine closure plan, and public consultation. Based on this review, SRK concludes that the Akyem Mine prepared the EIS report in accordance with the relevant laws, regulations and decrees of Ghana. In the following sections, SRK provides comments in respect to the study and management measures from the EIS report and other related documents.

13.4 Flora and Fauna

Based on the 2008 EIS, the baseline biodiversity studies conducted in the Study Area surveyed a wide range of flora and fauna species and their habitats (Ghana Wildlife Society 2007; Geomatrix 2008a and 2008b; SGS 1998, 2004a and 2004b). Within the Study Area, the Mamang River Forest Reserve, which would not be affected by the proposed Project, and portions of the Ajenjua Bepo Forest Reserve outside the Proposed Mining Area exhibit the greatest biodiversity. The portions of the Ajenjua Bepo Forest Reserve that are impacted by open pit development, as well as other portions of the Proposed Mining Area outside the Forest Reserves, exhibit relatively lower biodiversity values because of the presence of a matrix of farm and fallow land, low forest condition class, smaller forest patch size and poor connectivity to other forest communities. Several investigators have classified the condition of the forests in the portion of the Ajenjua Bepo Forest Reserve within the Proposed Mining Area as well as the balance of the Proposed Mining Area as "degraded".

No "Critically Endangered" or "Endangered" plants were identified in the Study Area based on the International Union of Conservation of Nature (IUCN) Red List. Seven tree species-Awiemfosemina (Albizia ferruginea), Edinam (Entandrophragma angolense), Penkwa (Entandrophragma cylindricum), Kusia (Nauclea diderrichii), Danta (Nesogordonia papaverifera), Kyere (Pterygota macrocarpa) and Emire (Terminalia ivorensis) that occur in the Study Area are ranked as "Vulnerable" although these species are common and widespread throughout Ghana. No "Critically Endangered" animals were detected in the Study Area, but several species that are present have been ranked as being of conservation concern, including Maxwell's duiker (Near Threatened), black duiker (Near Threatened), royal antelope (Near Threatened), Zenker's fruit bat (Near Threatened), horseshoe bat

(Near Threatened), Pel's flying squirrel (Near Threatened), green-tailed bristle-bill (Vulnerable), hinged tortoise (Vulnerable), most of which were located in the Mamang River Forest Reserve.

According to the 2024 AESR, NGRL committed to implement a threefold reforestation program to offset the impact of mining 101 hectares within the 568.56-hectare Adjenjua Bepo Forest Reserve. In collaboration with the Forest Services Division (FSD), NGRL established a total of 317 hectares of plantation: 60 hectares in 2014 (Phase 1) near the Mamang River Forest Reserve, and 257 hectares in 2017 (Phase 2) on degraded land within the Kweikaru Forest Reserve. Ongoing maintenance, including weed control, pruning, singling, bushfire prevention, and road clearing, has continued since establishment. In addition, to address the indirect residual environmental impacts of mining in the Ajenjua Bepo Forest Reserve, NGRL committed to a Biodiversity Offset Programme at the southern portions of the Atewa Range and Atewa Extension Forest Reserves. Following the completion of pre-feasibility studies in 2021, feasibility studies were conducted in 2022 and 2023 with field data collection for the biological and the socioeconomic aspects. The feasibility study was completed resulting in the finalisation of the Biodiversity Offset Management Plan (BOMP) including implementation cost, which has been submitted to the Forestry Commission for approval.

13.5 Water Management

The Akyem Mine is located in the Pra River basin which flows south to the Gulf of Guinea in the Atlantic Ocean. The Pra River is the second largest river in Ghana. Most of the mine facilities (with the exception of the Pra River pumping station and a portion of the water pipeline) are located in the Mamang River drainage which joins the Pra River near the community of Kotokuom. Streams and rivers in the Baseline Study Area are generally seasonal, surface water use is limited.

Groundwater quantity, including flow from some springs/seeps, could be affected by removal of groundwater via pumping wells for mine potable supply and open pit dewatering. Based on the 2023 QPR, groundwater studies at the Akyem site indicate low regional recharge and minimal drawdown around the Akyem Main and East open pits, supporting the conclusion that historical and ongoing groundwater inflow to the pits is low. A calibrated MODFLOW-USG numerical model predicts average groundwater inflows of 3–5 L/s for the underground mine (from fractures in competent bedrock) and 5–8 L/s for the open pit (from saprock and weathered bedrock). Although development of the underground mine may intersect conductive fractures causing short-term spikes in inflow, these are expected to depressurize quickly. Long-term inflows are projected to remain low. Simulated drawdown is limited in extent, reaching up to 1,250 m northwest and 1,000 m southwest of the pit, but remains over 1 km from any identified community wells, which are typically located at even greater distances. Recharge from the WRD helps prevent drawdown to the southeast.

The Akyem project's potable water comes from boreholes, and three boreholes supply water to the potable water treatment plant for domestic use. The main water sources for the processing plant are from stored water in the mined out open pit and the TSF. The TSF is a zero-discharge facility, with all water returned for use in the ore processing circuit and no process water is discharged to the environment. The processing plant also requires raw water, which is supplied from the Water Storage Dam ("WSD"). The WSD is replenished by precipitation, runoff generated from catchment areas and un-impacted runoff from the plant site.

According to the 2024 AESR, the total water consumption in 2024 was approximately 1.92 Mm^3 with the sources mainly being from pit dewatering, waste rock dump seepage, sediment control structures (SCS-5) and potable boreholes. The water is used for mining operations which includes gold processing, dust suppression, construction, exploration drilling and domestic purposes. NGRL has put in place various mine impact water ponds for storage and transfer of water to the process plant for mine use. The mine water impact ponds include the Pit Dewatering Ponds ("PDP") and the Impact Water Pond ("IWP") which is adjacent to the existing WSD. The mine operated a mobile MWTP and discharged about 1.64 Mm^3 of treated water through the WSD discharge point to the Mamang River in 2024 with discharge permit from Water Resources Commission. The MWTP discharged through the WSD spillway. NGRL completed construction of a 60L/s cyanide destruction pre-treatment facility for the treatment of TSF supernatant water. The cyanide detox plant contributed to reduction in the TSF pond volume enhancing capacity, improved tails density and dam stability.

The main wastewater pollution of the Akyem Project may be derived from open pit dewatering water, processing wastewater, TSF return water, WRD/ ore stockpile leaching water, machine repair wastewater, industrial site rainwater, and domestic sewage. Raw sewage generated from process-related facilities, administrative buildings, mine camps, contractor areas, and ancillary maintenance and operations zones will be treated at the Sewage Treatment Plant located east of the WSD. The plant has a treatment capacity of up to 430 m^3/day. Treated effluent is not discharged directly into the environment; instead, it is discharged and recycled through the TSF. Sewage sludge is used for composting. Effluent is tested to demonstrate the treatment system is functioning as designed and meets applicable discharge requirements. NGRL controls runoff water to avoid contamination through contact with disturbed mine areas and ensures stormwater runoff from these areas is not discharging pollutants to waterbodies during construction activities and normal mine operations. Ongoing practices at the Akyem Mine include construction of ditches, sediment traps or ponds, installation of water bars, straw bales, silt fences, and rip rap.

The 2024 AESR stated that the comprehensive programme implemented for surface water, groundwater and potable water monitoring continued throughout 2024. Monitoring points are classified into Compliance, Surveillance and Control points based on the EPA AKOBEN criteria. Reportedly, effluent water quality at monitoring points (SCS-1 to SCS-5 and WSD) generally complied with Ghana Standards (GS 1212:2019) for parameters such as arsenic, cadmium, copper, cyanide, mercury, pH, and colour. However, Total Suspended Solids ("TSS") was occasionally elevated due to sediment load flow from suspected illegal mining activities upstream.

Groundwater in the Akyem area showed low pH consistent with baseline values. In sulphide-bearing Birimian rock formations, groundwater was slightly acidic to neutral with elevated arsenic. In contrast, groundwater in Greywacke and meta-volcanic lithologies showed elevated or high pH of basic nature. The WAD Cyanide monitoring results for the TSF spigots were all in compliance with the International Cyanide Management Institute's code guideline of 50mg/L. The TSF decant return water WAD Cyanide were all in compliance with the EPA permit limit of 5mg/L.

13.6 Waste Rock and Tailings Management

The WRDF at the Akyem Mine is located east of the mine pit. Based on the *2024* AESR, The existing WRDF is currently permitted to accommodate placement of an additional 313Mt of waste rock material. The permitted surface disturbance associated with the full build-out of the WRDF is 205 ha. Waste rock is placed in the facility by trucks end-dumping down an advancing face in successive horizontal lifts of 16 m. The maximum permitted height of the facility is approximately 360 m amsl at the end of the operational phase. In November 2022, NGRL submitted notification letters to EPA and sought a variation to the permitted Akyem WRDF as specified in the Akyem Pit layback and WRDF

Expansion Project Permit no. EPA/PR/PN/581. NGRL is awaiting feedback from the EPA. However, the WRDF extension project progressed in 2024 including construction of two new toe drain sumps to capture seepages from the facility. For specific information on waste rock output and the waste dump, please refer to the mining chapter.

Two tailings storage cells, Cell 1 & Cell 2, have been constructed at Akyem. Cell 1 is storing tailings its current design storage capacity of 45.9 Mt. Cell 2 was designed to be constructed in three stages, with a total expected capacity of 43.3 Mt. Cell 2 Stage 2 is currently operational. In 2024, NGRL completed the 89 Mt Cell 2 Stage 3 construction. Additionally, early works in preparation towards the 115 Mt combined TSF Cell 1 and Cell 2 raise (Stage 4) were undertaken. Tailings are delivered from the processing plant via the tailing delivery pipeline which feeds the distribution pipelines on the embankment crests. The tailings deposition is achieved using the Sub-aerial spigotting technique or method. The tailings delivery and decant return pipelines are contained in a trench lined with 1.5mm thick high density poly-ethylene (HDPE) liner. The pipeline will be raised at each stage throughout the TSF operation as the elevation of tailings increases. For specific information on waste rock output and the waste dump, please refer to the TSF chapter. The *2023 QPR* states that the Newmont Tailings Management system is aligned with the *Global Industry Standard on Tailings Management (GISTM)* and an *Operations, Maintenance & Surveillance (OMS) Manual* are in place to guide operations of the facility, detect any problems, and describe operations procedures, maintenance, and contingency plans. According to the *2024 AESR*, The Tailings Storage Facility (TSF) was operated and managed throughout 2024 as per the TSF management plan and TSF Operations, Maintenance and Surveillance (OMS) manual. A total of 8.1 Mt of tailings were produced and deposited into the TSF. all quarterly and annual third-party audits were conducted, and all the reports submitted. The TSF area groundwater and surface water quality, WAD cyanide results for the spigot and decant return water as well as the TSF embankment piezometer measurement were reported as part of the third-party audit reports.

One potential risk to the environment from waste rock and TSF is acid rock drainage ("ARD"), that is created when reducing sulphide minerals are exposed to air, precipitation and bacteria and, through an oxidation reaction, produce sulphuric acid, during mining, transportation, processing, waste rock discharge, and tailings storage, etc. ARD has the potential to introduce acidity and dissolved metals into water, which can be harmful to surface and groundwater. A comprehensive ARD experiment can help the Company predict problems and avoid long-term environmental risks.

Based on the 2023 QPR, NGRL has conducted rock characterization studies to evaluate the potential for acid generation and metal leaching from the WRD and ore stockpiles at the Akyem Mine. Results from static, specialized, and kinetic tests indicate that the materials are non-acid generating, with bedrock samples classified as basic to highly basic and saprolite as inert. High pH values (8.9–9.4 for bedrock, 6.8 for saprolite) and the presence of abundant carbonate minerals with low pyrite content support this conclusion. Although some specialized tests (e.g., peroxide acid generation ("PAG") and Synthetic Precipitation Leachate Procedure ("SPLP")) showed exceedances for metals such as aluminum, iron, and manganese, as well as elevated pH levels above Ghana Standards. Analysis conducted to date indicates that waste rock samples tested are non-potentially acid generating; therefore, no acid rock drainage is expected to occur at the Akyem Mine. To simulate long-term weathering conditions, NGRL has also implemented ongoing column leach testing at the Integrated Waste Management Facility (IWMF) since 2013, which will continue throughout the mine's operation phase.

13.7 Air and Noise Emissions

The dust emission sources of the Project mainly come from open pit mining, blasting, loading and unloading, ore stockpile, crusher, waste dump, topsoil dump, TSF, and movement of vehicles and mobile equipment. Particulate matter of size 2.5μm ($PM_{2.5}$), 10μm (PM_{10}), total suspended particulates (TSP), nitrogen oxides (NOx) and sulphur oxides (SOx) were also monitored near the boundary of Mine area and the closest communities.

PM_{10}, $PM_{2.5}$, and TSP were measured twice per month over 24-hour period and compared with Ghana Standards for Environment and Health Protection – Requirements for Ambient Air Quality and Point Source/ Stack Emission (GS 1236:2019). In 2024, the compliance monitoring stations achieved 81% compliance for $PM_{2.5}$, 83% compliance for PM_{10} and 92% for TSP. The control monitoring station achieved 50% compliance for $PM_{2.5}$, 58% compliance for PM_{10} and 92% for TSP compared to the Ghana Standards (GS 1236:2019). The elevated trend of dust levels during the dry season from January through March are consistent with the baseline and influenced by the dust-laden harmattan season. NOx and SOx were monitored once per month by exposing radiello cartridges for seven (7) days and the three monitoring stations were 100% compliant against the Ghana Standard. All the three monitoring stations were fully compliant with the Ghana Standard in 2024.

The main noise emissions of the Project are from mining equipment, blasting, crushing and screening equipment, various types of pumps, fans, vehicles and mobile machinery equipment. Based on the 2008 EIS, the baseline study area has few existing industrial noise sources, with light traffic along two main roads and background noise primarily from natural sources and community activities. However, measured noise levels often exceeded the EPA's residential guidelines, with daytime levels surpassing the 55-decibel limit and nighttime levels frequently exceeding the 48-decibel threshold.

In 2024, Mine pit blast monitoring was conducted at three locations near the closest communities. There was a total of 383 blasts in 2024, and the average blast air overpressure and ground vibration measured were compliant with EPA AKOBEN Guidelines of 120dBL and 5mm/s for air blast overpressure and ground vibration respectively. Noise levels monitored at New Abirem, Afosu, and Hweakwae/Adausena was within Ghana Standards for Ambient Noise (GS 1222, 2018) residential daytime [55 dB(A)] and night-time [48 dB(A)]. NGRL has established and implemented an air quality and noise monitoring plan. SRK considers the air quality and noise management measures outlined in the EIS and EMPs to be reasonable and feasible and recommends their continued implementation during project operation.

According to the *2024 Information Report*, NGRL aligns with Newmont's global energy and climate change strategies, which aim to ensure reliable and cost-effective energy supply, improve efficiency, reduce carbon emissions through renewables and offsets, and support a transition to a low-carbon economy. At the Akyem Mine, energy efficiency is a key focus, demonstrated through continuous improvement initiatives such as the installation of a 120 kWh solar pilot plant and practical measures like promoting energy-saving among employees and replacing traditional bulbs with LED lighting. SRK recommends that the environmental monitoring programme be expanded to include GHG emissions, with a baseline established to support future decarbonisation planning.

13.8 Hazardous Substances Management

Hazardous materials have the characteristics of corrosive, reactive, explosive, toxic, flammable and potentially biologically infectious, which pose a potential risk to human and/or environmental health. The hazardous materials will be generated mainly by the project's construction, mining, processing and include of hydrocarbons (i.e. fuels, waste oils, and lubricants), processing reagent, chemical and oil containers, batteries, medical waste, and paint.

Based on the *2024 AESR*, Hazardous/Chemicals materials were managed by ensuring that only approved chemicals and hazardous materials that have material safety data and management plans were procured, stored and used on site. These materials are stored in secondary containments with the capacity being 110% of the largest container stored in the secondary containment. Secondary containments are constructed with impervious materials capable of preventing seepage to the natural environment and areas of use. As part of NGRL's stewardship of the environment, Job Hazard Analysis (JHA) are completed prior to work, inspection and/or auditing work areas are part of the management systems for pollution prevention and control. Non-conformities are prioritized and corrected immediately using our inspections, audits and event management system – Enablon database system. Employees were also routinely given awareness, and refresher training on the management of hazardous materials such as usage, labelling, containment for chemical/hazardous materials and spill response.

NGRL continued to implement Cyanide Management Plan to minimize risks to employees, communities, and the environment from use of cyanide associated with processing activities at Akyem Mine. The plan also includes procedures for cyanide management during transport, storage and handling, processing operations, spill prevention and containment, monitoring, decommissioning, worker safety, stakeholder interaction, training, and emergency preparedness and response. NGRL continued to implement cyanide management practices derived from continued compliance with the International Cyanide Management Code ("ICMC").

13.9 Occupational Health and Safety ("OHS")

A well-developed and comprehensive safety management system comprises site inductions, site policies, safe work procedures, training, risk/hazard management (including signage), use of personal protective equipment ("PPE"), emergency response process, incident/accident reporting, an onsite first aid/ medical centre, designated safety responsibilities for site personnel and regular safety meetings, and a work permit/ tagging system, etc. SRK reviewed the Occupational Health and Safety Action Plan in EMPs and Emergency Response Plan, and concluded that the development of both plans complies with relevant Ghanaian requirements.

During SRK's site visit, it was observed that safety signs were in place and safety provisions and rules were also displayed within the work areas, moving machinery parts were appropriately protected and covered, guard railings were installed on all gantries, and proper PPE was provided and being used by the workers, such as hardhats, reflective safety vest, dust masks, earplugs, and steel-toed shoes. The company has provided SRK with a *Monthly Health and Safety Performance Report* covering the period from March 2023 to March 2024, during which no fatal accidents were reported.

13.10 Environmental Management Plan ("EMP")

The purpose of an operational Environmental Management Plan ("EMP") is to direct and coordinate the management of the project's environmental risks. The EMP documents the establishment, resourcing, and implementation of the project's environmental management programs. The site environmental performance should be monitored and feedback from this monitoring could then be utilized to revise and streamline the implementation of the EMP.

SRK notes that EMPs for Akyem Mine, Pit Layback and Waste Rock Dump Facility Expansion, and Mine Water Treatment Plant (MWTP) were developed for 2023-2026 and the processing and permit fee was paid with received invoices, however, the corresponding Environmental Certificates are still pending issuance. The EMPs include the legal requirements and corporate policies, environmental impact and management, environmental action plan with a monitoring program, occupational health and safety action plan, programs for meeting environmental requirements, potential economic benefits of the action plan, and reclamation and decommissioning plan. Based on the *2024 AESR*, the monitoring of surface water, ground water, air quality, waste, aquatic, wildlife, biodiversity, meteorological, noise, blast vibration and air overpressure was carried out for the Akyem project in 2024.

13.11 Mine Closure Plan and Rehabilitation

A detailed closure and decommissioning plan is required to be submitted to the Inspectorate Division of Minerals Commission and the EPA no later than two years before mine closure, and earlier conceptual closure plan is typically submitted at the feasibility and permitting stages.

SRK reviewed the *Akyem Sustainable Closure and Reclamation Plan* by Newmont Golden Ridge Limited Akyem, dated March 2021. The plan outlines reclamation objectives and specific reclamation/closure activities for the two open pits, one waste rock disposal facility, ROM zone, mill and processing plant, haul & access roads, sediment control structures and process water ponds, TSF, accommodation sites and water storage facilities. The total estimated closure and reclamation cost presented in the plan is US$258.1 million. This estimate excludes approximately US$2.6 million associated with reshaping waste rock dump slopes and reapplying topsoil, as NGRL classifies these as operational costs rather than post-mining reclamation.

Based on the *2024 AESR*, a total of 38.46 hectares of operational areas at the Akyem Mine have been reclaimed since 2013. As of December 2024, an approximate footprint of 1315.4 hectares have been disturbed. The EPA requires a Reclamation Bond to be posted as part of any mine permitting process. The bond is required to provide financial surety against non-compliance under the approved Closure and Reclamation Plan and is required within six months after the start of operations.

The mine from start of project to end of 2022/2023, has posted a Reclamation Security Bond of US$ 39,375,083.20 covering the surface operations and Forestry Reserve Fund of US$ 151,532,972.53 covering waste rock dump, ROM pad and pit backfill.

13.12 Social Considerations

The primary communities located within a 5-km radius of the Akyem Mine include Afosu, New Abirem, Mamanso, Adausena, Hweakwae, Ntronang, and New Yayaaso. New Abirem is the administrative capital and commercial center of the Birim North District. Based on the 2008 EIS, agriculture is the predominant activity in the local economy. Farming is commonly done on a small-scale, designed to meet local food needs rather than for commercial purposes. Some farmers engage in charcoal burning, gari and oil palm processing and distillation of local gin as additional self-support or income generating activities. Other agricultural-related activities conducted in the Study Area include livestock production and harvesting of medicinal plants. The estimated income of households surveyed in the Study Area ranges from 37.26 GH¢ annually to 4,057.74 GH¢ (~US$3.03 to US$329.84).

A total of 46 heritage sites were identified in the 2008 Baseline Study Area, including 18 community sacred sites, 12 individual sacred sites, 6 royal cemeteries, and 10 public cemeteries. Of these, 15 are located within the Proposed Mining Area and may be affected by planned mine developments such as the open pit and WRD during the assessment period. A Level 1 archaeological survey identified 9 sites of archaeological significance within the Proposed Mining Area—5 abandoned settlements, 2 religious or sacred sites, and 2 of prehistoric significance. Six of these are situated within or near areas likely to be disturbed by mining activities.

The *2023-2026 Akyem EMP* states that all artifacts within the planned footprints of the TSF, WRD, WSD, and pit area were recovered through Level II archaeological surveys and are now held by the Department of Archaeology and Heritage Studies at the University of Ghana, representing the Ghana Museums and Monuments Board (GMMB). NGRL has paid pacification fees for the relocation of the Yayaaso royal mausoleum and cemetery, the Sumanmura Shrine, and the Akwasi-Akwasi Shrine. The company also trains employees and contractors on local cultural practices, including managing chance finds and relocating sacred sites. Cultural awareness training is included in the induction program for all new staff, contractors, and visitors, based on the Cultural Resources Management Plan.

The 2023 QPR stated that prior to development of the Akyem Mine, NGRL was involved in relocation and resettlement of one settlement (Yayaaso), eight hamlets (Nyamebekyere, Kerenkeren, Kwasi Kpofor, Badu, Kofi Aklo, Ayesu Zigah, Yaw Tano and Metemano) and a number of individual residences located within the mining area. Land assets were surveyed following declaration of Moratorium on 29th January 2010. In total, an estimated 1,700 households were compensated for loss of crops, buildings, and/or income. Resettlement was conducted according to the *Final Resettlement Action Plan* (NGRL 2011a). The resettlement of New Yayaaso, located west of Hweakwae and Adausena, consisted of 223 residences and community structures including educational facilities and teacher's bungalows, three churches, a modern cemetery, a community center, and eight shops. SRK did not review the Resettlement Action Plan as part of this assessment.

According to 2024 AESR, NGRL utilised its complaints and grievance mechanism to address/resolve all stakeholder complaints and grievances. A total of forty-four (44) complaints were received in 2024. All complaints were resolved within a 30-day period from the day of receipt. Resolution of complaints within 30 days is Newmont's established standard based on international best practise. This indicates 100% resolution rate. Complaints received were categorized into Compensation (Crop and Deprivation of Land Use), Environment, and Others.

NGRL actively pursued a range of social responsibility initiatives, including stakeholder engagements, social investments facilitated by the Newmont Akyem Development Foundation (NAKDEF) across seven thematic areas, youth capacity-building support in mine host communities, community development projects, establishment of complaints and grievances resolution mechanisms, and the implementation of human rights and voluntary principles programs throughout 2024. An integral part of NGRL's efforts involved the Akyem Social Protection Program (ASoPP), which aimed to enhance the well-being and livelihoods of 190 households identified as vulnerable by the Project Vulnerability Assessment Committee.

NGRL consistently engaged with various stakeholders, including the paramountcy, traditional leaders of mine host communities, regulatory agencies, government officials, youth groups and maintained regular communication with Project Affected Persons (PAPs), and Farmers' Association.

These engagements served to provide operational information, address stakeholder concerns, provide updates on the status of livelihood re-establishment programs such as the Agricultural Improvement Program (AIP), the Alternative Livelihood Program (ALP), and the Akyem Social Protection Program (ASoPP).

14 Capital Expenditures and Operating Expenses

14.1 Capital Expenditures

Historically capital expenditures ("Capex") refer to those invested into the Project that have been provided by the Company. The total capital invested on the Project by 31 December 2024 is about US$356,790,000.

New Capex required for sustain the open pit mining and commence underground operation to archive the designed capacity. The sustaining capital expenditures (Sustaining Capex) and Expansion Capex provided by the mine are summarized in Table 14-1. Among them, the Sustaining Capex was 560,015 thousand US dollars (including the closure expenditure of 258,100 thousand US dollars), the Expansion Capex was 573,671 thousand US dollars, and the total Capex was 1,133,686 thousand US dollars.

Table 14-1: Forecasted Sustaining Capex and Expansion Capex for the Project

Item	Unit	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	Total
Sustaining Capex	US$ '000	30,138	22,104	9,741	3,123	1,321	25,345	55,497	47,170	66,042	25,973	10,998	2,655	1,808	258,100	560,015

14.2 Historical Cash Operating Cost and All-in Sustaining Costs

The cash operating cost mainly includes mining costs, processing costs, and other costs. It should be noted that other costs primarily consist of general and administrative (G&A) costs, refining and sales costs, taxes & surcharges, and royalties, among others. The all-in sustaining cost (AISC) includes the cash operating cost and Sustaining Capex. The historical cash operating cost and AISC are summarized in Table 14-2 and Table 14-3.

The data indicated that cash operating cost and AISC have increased year by year over the past three years. SRK has learned from the mine that the main reason is that the gradual decline in the gold grade of the ore being processed and the severe aging of equipment, which has led to continuously rising maintenance costs.

Table 14-2: Operating Costs in Years 2022 to 2024 by Cost Categories

Item	Unit	2022	2023	2024
Mining cash cost	US$	111,912,367	102,135,142	95,494,086

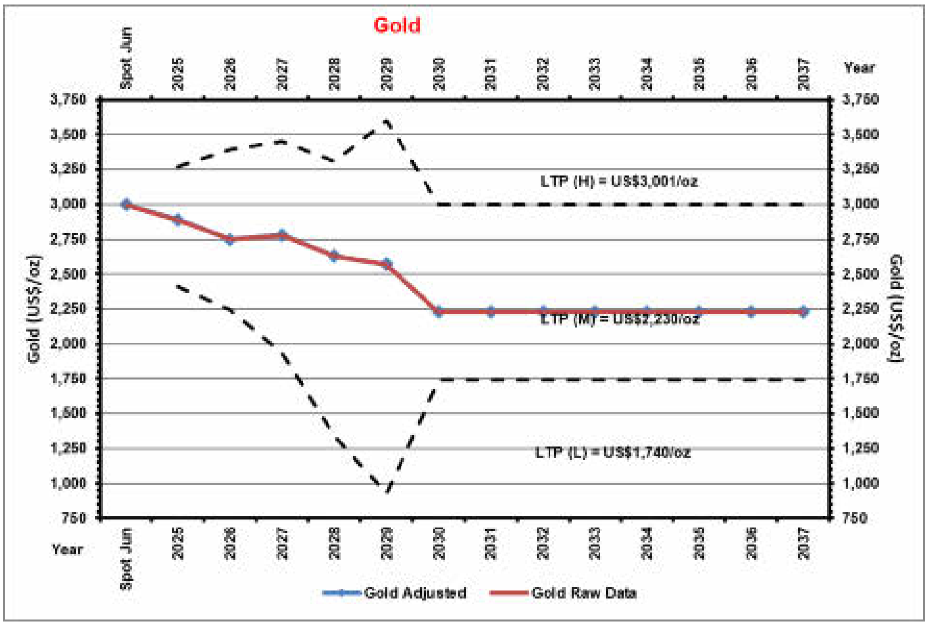
15 Economic Analysis

15.1 Price Forecast

The gold price forecast of Consensus Market Forecast ("**CMF**") published in March 2025 is shown in Figure 15-1 and Table 15-1. SRK was also provided with forecasts in Table 15-2, which sourced from the Zijin Gold International.

Figure 15-1: Gold Price Forecasts of CMF



Sources: CMF forecasts in March 2025

Notes: Gold price in real US$.

Table 15-1: Gold Price Forecasts of CMF

Price Level	Unit	2025	2026	2027	2028	2029	Post-2029
High	US$/oz	3,270	3,390	3,453	3,311	3,600	3,001
Middle	US$/oz	2,890	2,750	2,780	2,630	2,570	2,230
Low	US$/oz	2,414	2,243	1,933	1,339	927	1,740
High	US$/g	105.1	109.0	111.0	106.4	115.7	96.5
Middle	US$/g	92.9	88.4	89.4	84.6	82.6	71.7
Low	US$/g	77.6	72.1	62.2	43.0	29.8	55.9

Sources: CMF forecasts in March 2025

Notes: Gold price in real US$.

Table 15-2: Gold Price Forecast of Zijin Gold International

Commodity	Unit	2025	2026	2027	2028	2029	2030	Post-2030
Gold	US$/oz	3,016	3,000	2,800	2,751	2,500	2,500	2,275
Gold	US$/g	97.0	96.5	90.0	88.4	80.4	80.4	73.1

Sources: Zijin Gold International
Notes: Gold price in real US$.

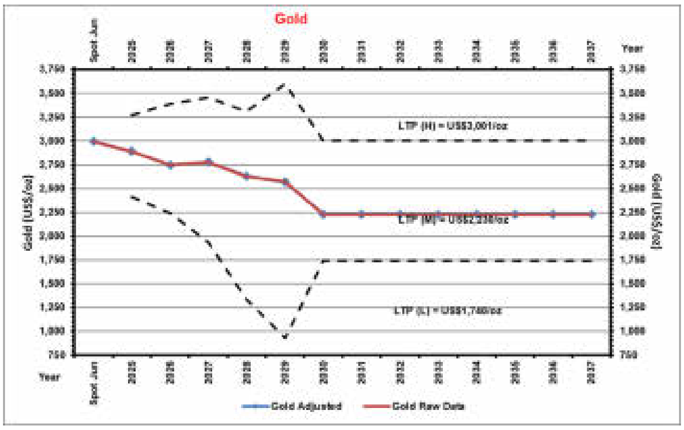
At the Effective Date, Zijin Gold International suggested that the long-term forecast of CMF was rounded to the second significant figure to estimate Ore Reserves, while the price forecasts of Zijin Gold International were used for economic analysis post year 2024. Comparison of Table 15-1 and Table 15-2 indicates that the long-term forecast of Zijin Gold Internation is about 2.0% higher than that of CMF, and that Zijin Gold International's forecasts are generally near to those of CMF's at the middle level. SRK accepted the suggestions due to similar forecasts of gold prices.

Valuable metallic element for the Project is predominately gold. Gold price trend in history is shown in Figure 15-2. Price forecast of Consensus Market Forecast ("CMF") is shown in Figure 15-3.

Figure 15-2: Gold Price Trend in History

Sources: goldprice.org

Figure 15-3: Gold Price Forecast



Sources: CMF on 17 March 2025

15.2 Sales Contracts

There is no specific concern around sales contracts as gold bullion is the final product. A sales cost of US$0.2/t ROM is presumably assigned in the Project.

15.3 Tax Obligations

A royalty of 4.6% and an extra of Social Contribution Royalty are charged on the basis of revenue, with the details shown in Table 15-3.

Table 15-3: Royalty and Tax Obligations

Item	Unit	Amount	Remarks
Corporate Income Tax (CIT)	%	35	On taxable income, a preferred rate of 32.5% applicable prior to 2032
Royalty	%	4.6	On total revenue from the metals
Extra Royalty (Social Contribution)	%	1%	On total revenue, plus US$1 per ounce

15.4 Technical and Economic Analysis

It should be emphasised that the economic analysis presented in this section is based purely on the results of the technical review provided in previous sections and some key assumptions. It is mainly provided for Mineral Reserve estimation/ reporting purposes as required by JORC Code.

15.4.1 Principal Assumptions

As discussed in previous sections, various technical and economic parameters have been reviewed. The discount cash flow ("DCF") model has been used in the economic analysis of the Akyem Project and the following simplifications and assumptions are made:

- The production rates are as planned on a yearly basis and ore quality are evenly distributed over a production year (average grades were used).
- The final product will be gold doré.
- US dollar (US$) is used as the currency and inflation is not considered in the model (real-term model).
- Unit cash costs are also considered constants over a year; and the cash costs do not include depreciation and amortization.
- The base price is shown in Table 15-2.
- Previous capital investment and newly investments have been considered as capital costs.
- The net value of the sunken Capex will be considered for depreciation and amortization; and the newly investment will be fully depreciated and amortized.
- The Capex will be depreciated and/or amortized evenly over a 10-year period, and
- Discount rate of 9% will be used in base case, and the WACC assumptions are given in Table 15-4.

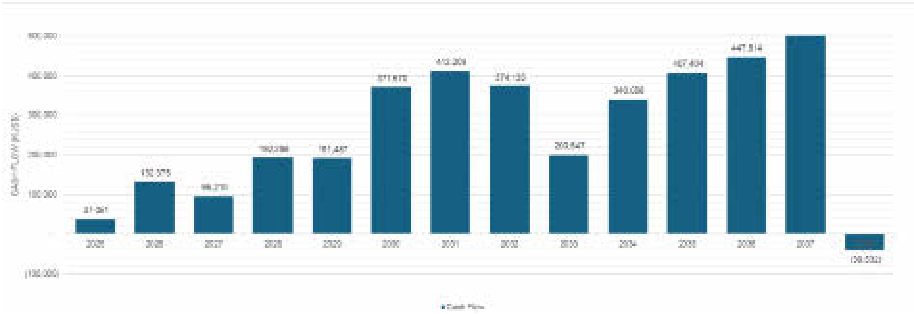
Table 15-4: Discount Rate Calculation (WACC Method)

Item	Unit	Value	Remarks
Risk Free Rate	%	2.55%	Treasury bonds rate
Market and Country Risk Premium	%	2.0%	
Beta of the Investment	/	1.5	
Cost of Equity	%	24.0%	
Debt Margin	%	5.0%	Policy rate
Cost of Debt	%	5.4%	
CIT	%	35.0%	
Post-tax Cost of Debt	%	6.3%	
Target Debt Equity Ratio	%	30.0%	
WACC	%	11.0%	
Inflation Rate	%	5.0%	
WACC in Real Terms	%	8.9%	9% used in the DCF model

15.4.2 Net Cash Flow

For the economic analysis of the Akyem Project, SRK adopted a discount cashflow analysis based on previous assumptions and parameters as discussed in previous sections. Figure 15-4 shows the Net Cash Flow ("NCF") for the LOM.

Figure 15-4: LOM NCF



15.4.3 Net Present Value Result

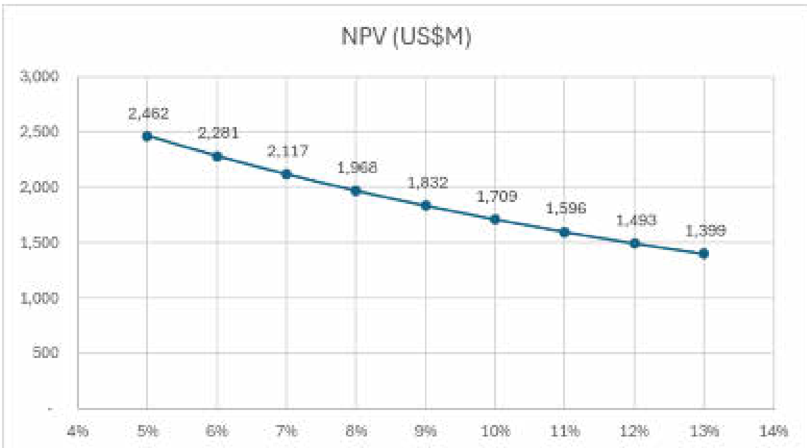
Table 15-5 below presents the net present value ("NPV") for the Akyem Project as calculated using SRK's discount cash flow ("DCF") analysis. SRK estimated the NPV in a range of US$ 1,493 million (at 12% discount rate) to US$ 2,281 million (at 6% discount rate), with a base case of US$ 1,832 million using a discount rate of 9.0%. The positive NPVs indicate that the Project is economically viable.

Table 15-5: NPV Projections

Item	Upper Case	Base Case	Lower Case
Discount Rate	6.0%	**9.0%**	12.0%
NPV (US$ Million)	2,281	**1,832**	1,493

Figure 15-5 shows the NPV varies with the discount rate.

Figure 15-5: NPV Vs Discount Rate



15.4.4 Sensitivity Analysis

SRK applied a single factor method for the sensitivity analysis. Many parameters can affect the Rosebel Project's NPV. To simplify the calculations, and the products' prices or income, Opex, and Capex were selected as the essential variable factors on cash flow. The effects of these essential factors on the NPV were analysed within a ±30% range. The corresponding results for the Project are presented in Table 15-6 and **Figure 15-6** respectively. The result indicates that the NPV is most sensitive to price, followed by Opex and Capex.

Table 15-6: Sensitivity Study of NPV (at 9% Discount Rate, in US$M)

Factors	Changes								
	-30%	-20%	-10%	0%	10%	20%	30%	average+1%	average-1%
Price	396	875	1,353	1,832	2,311	2,790	3,268	2.61	-2.61
Opex	2,543	2,306	2,069	1,832	1,595	1,358	1,121	-1.29	1.29
Capex	2,033	1,966	1,899	1,832	1,765	1,698	1,631	-0.37	0.37

Figure 15-6: Univariate Sensitivity Analysis of NPV (9% Discount)

The analysis above shows that the project is economically viable, and the Mineral Reserves statement can satisfy with the requirements of JORC Code.

16 Risk Assessment

SRK completed a risk assessment of the specific risks identified for the Akyem Project in relation to their likelihood of occurrence within the LoM and consequence in accordance with the listing rules of the Stock Exchange and the HKEx.

In general, the risk of a project decreases from exploration, through development, to the production stage. The Akyem Project is an advanced project.

SRK considered various technical aspects which may affect the feasibility and future cash flow of the Akyem Project. SRK's final Risk Assessment is presented in the following table.

Risk Assessment for Akyem Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Possible	Moderate	Medium
Lack of Significant Ore Reserves	Possible	Moderate	Medium
Unexpected Groundwater Ingress	Unlikely	Moderate	Low
Significant Unexpected Geological Faulting	Possible	Moderate	Medium
Mining			
Significant Production Shortfalls	Unlikely	Moderate	Low
Pumping System Adequacy	Unlikely	Moderate	Low
Significant Geological Structure	Unlikely	Moderate	Medium
Excessive Surface Subsidence	Unlikely	Moderate	Medium
Crown Pillar Failure	Unlikely	Moderate	Medium
Poor Underground Condition	Possible	Moderate	Medium
Poor Mine Plan	Possible	Moderate	Medium
Poor Road Transportation/Safety	Unlikely	Moderate	Low
Ore Processing			
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Possible	Moderate	Medium
Higher Production Cost	Possible	Moderate	Medium
Environmental and Social			
Lack of Environmental Permits	Possible	Moderate	Medium
Impact on Flora and Fauna	Possible	Moderate	Medium
Poor Water Management	Possible	Moderate	Medium
Poor Waste Rock and Tailings Management	Possible	Moderate	Medium
Poor Hazardous Materials Management	Unlikely	Moderate	Low
Social Licensee to Operate	Possible	Moderate	Medium
Capital and Operating Costs			
Project Timing Delay	Possible	Moderate	Medium
Capital Cost Increases	Possible	Moderate	Medium
Capital Costs- Ongoing	Possible	Moderate	Medium
Operating Cost Underestimated	Possible	Moderate	Medium

17 Conclusions and Recommendations

17.1 Exploration and Mineral Resources

The Akyem gold deposit is situated within the Ashanti Gold Belt, one of the five Birimian volcanic belts. Gold mineralization at the Akyem deposit is structurally controlled by interactions between the principal Akyem Carbon Fault and a network of subsidiary thrust faults and shear zones. This fault system's periodic reactivation, coupled with dilation at structural intersections, created pathways for mineralizing fluids and facilitated the localization of ore zones.

The Akyem deposit extends over a strike length of more than 2,500 m, with mineralization delineated to a depth of approximately 900 m down-dip on its southeast-dipping fault structure. Mineralized zones vary significantly in true thickness, ranging from 10 m to as much as 100 m. Gold grades exceeding 0.5 g/t Au are observed across widths of 10 to 150 m, while zones of higher-grade (>4 g/t Au) mineralization are predominantly hosted in intensely altered silica-carbonate-sericite breccias adjacent to the Akyem Carbon Fault, with widths ranging between 5 and 50 m.

The estimation of the Mineral Resources documented in this Report is informed by data from 1,430 drillholes for a combined drilling meter of 445,298 m with 325,111 samples.

As of 31 December 2024 and at a cut-off grade of 0.3 g/t Au for OP ming and 1.5 g/t Au for UG mining, the Akyem Project is estimated to contain 119.5 Mt of Measured Mineral Resources with an average grade of 1.7 g/t Au, 32.0 Mt of Indicated Mineral Resources with an average grade of 2.3 g/t Au, and 11.2 Mt of Inferred Mineral Resources with an average grade of 2.2 g/t Au.

SRK identified the twin drill holes, KP350 and KP350A, in the database, with notable discrepancies in Au grades within the 430m-630m depth. Furthermore, the background Au grade for assay results in the database has been assigned to 0.001 g/t.

For the solid model, SRK recommends delineating the mineralized body based on geological domains to ensure the model accurately reflects the spatial distribution and geological controls of the mineralization.

For estimation parameters, SRK suggests that the estimation parameters should refer to the variogram, as utilizing variogram-based values ensures that spatial continuity and variability are appropriately incorporated into the resource estimation process.

Additionally, SRK considers the classification of Measured Mineral Resources with a 50m×50m drill spacing density and Indicated Mineral Resources with a 100m × 100 m drill spacing to be overly optimistic. A tighter drill spacing is typically required for Measured and Indicated Mineral Resources to achieve a higher level of confidence in the geometry, grade distribution, and continuity of the deposit. This recommendation aims to enhance the reliability and accuracy of the resource classification.

17.2 Quality Assurance and Quality Control

SRK has reviewed the historical QAQC performance for the Akyem project, which opines them align with industry best practices, demonstrating strong accuracy and precision. SRK is confident that the data quality is sufficient to support reliable and meaningful mineral resource estimates.

QAQC raw data are not available to SRK which need to be reviewed. Validation sampling is also necessary to further verify the performance of main laboratory.

17.3 Mining and Ore Reserves

Ore Reserves have been estimated for two open-pit deposit and underground deposits, with the majority of the reserves hosted in the Akyem Gold Mine.

As of December 31, 2024, the total Mineral Reserves at the mine are as follows:

- Proven: 108 mt grading 1.46 g/t Au, containing 157,535 kg of gold.
- Probable: 26 mt grading 1.95 g/t Au, containing 50,048 kg of gold.
- Proven and Probable: 133 mt grading 1.56 g/t Au, containing 207,583 kg of gold.

Open-Pit Operations:

- Akyem open pit has a remaining life of approximately 14 years.
- The pit operates using a conventional truck-and-shovel method, managed by contractors.
- Bench height is designed at 8 meters, with tribble benching extending to 24 meters.
- Mined materials are transported along haul roads with a maximum gradient of 10%.
- Double-lane haul roads are designed to be 32 meters wide, while single-lane roads are 25 meters wide, ensuring efficient access to the pit bottom.

Underground Operations:

- Underground operations at Akyem underground began in 2026 and are expected to conclude by 2038.
- Akyem underground employs a modified sub-level stoping method with cemented tailings backfill to maintain geotechnical stability and achieve a production rate of 10,606 tonnes per day (tpd).
- The main development system at Akyem consists of shafts and declines.

17.4 Mineral Processing and Metallurgy

Comprehensive and systematic metallurgical testing has been conducted on different ore deposits, indicated that all the UG ore sources evaluated are amenable to processing in the existing Akyem process plant.

Leaching tests were conducted on samples from Akyem OP Layback, UG, and D1/D2 Saddle. Results indicated that the gold recovery rate ranged between 88% and 89%, which is almost consistent with the recovery in the historical three-year production practice.

In the future, the processing plant will process blended ore from OP and UG sources, with an expanded capacity of 12 Mtpa. SRK recommends collecting representative ore samples based on the LOM plan and conducting test work with varying blend ratios of OP to UG ore to determine the optimal process parameters.

17.5 Capital Expenditures and Operating Costs

Historically capital expenditures ("Capex") refer to those invested into the Project that have been provided by the Company. The total capital invested on the Project by 31 December 2024 is about US$356,790,000.

New Capex required for sustain the open pit mining and commence underground operation to archive the designed capacity. Zijin Institute proposed additional Capex of US$ 1,074.73 million for the Project, and working capital of US$89.06 million.

All-in sustaining costs (AISC) for the Project in 2022, 2023 and 2024 are US$ 965/oz gold, US$ 1,245/oz gold and US$ 1,816/oz gold respectively. The historical and forecasted cash operating cost and AISC is shown in Table 14-2 and Table 14-3 respectively.

17.6 Economic Analysis

SRK estimated the NPV in a range of US$ 1,493 million (at 12% discount rate) to US$ 2,281 million (at 6% discount rate), with a base case of US$ 1,832 million using a discount rate of 9.0%. The positive NPVs indicate that the Project is economically viable.

17.7 Environmental and Social

Rock characterization studies at the Akyem Mine have confirmed that waste materials are non-acid generating; however, with the progress of underground mining, ongoing geochemical analysis is recommended to assess the potential for acid mine drainage under new geochemical and hydrological conditions.

It is recommended that the environmental monitoring programme be expanded to include GHG emissions, with a baseline established to support future decarbonisation planning.

Closure

This report, Competent Person's Report of the Akyem Gold Project in the Birim North District, Ghana, was prepared by

____

Pengfei Xiao, Principal Consultant

and reviewed by

Appendix B JORC Code Table 1

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Recent sampling mainly including drill core sampling, geologists will perform geological logging, then mark the sample intervals before sampling to ensure appropriate sampling. • Measurements are taken to ensure sample representivity. • Based on geologists' observation. • Sampling is mainly based on the sample mark made by geologists, trying to take unbiased samples.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• All samples were collected by site geologists. Sample intervals are defined during logging, with typical lengths of 0.5m to 1.5m.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Core length was measured against the core run to assess the core recovery. • Short runs to reduce drilling time was applied to maximise sample recovery. • Core recovery in broken/fault zones are normally lower, however, still higher than 90% in general.

Criteria	JORC Code explanation	Commentary
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• core and channel samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • All intervals were logged.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Core were sawn half for sample and the other half stored. • N/A. • N/A. • Core duplicates, coarse duplicates and pulp duplicates have been applied to maximise representivity of samples. • Duplicates results were monitored by QAQC geologists, QAQC database was established, QAQC monthly reports were prepared. • Sample size is always the larger the better, the core samples and channel are appropriate to the grain size of the material being sampled.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The assaying and laboratory procedures is at industry good practice. • N/A. • Standards, blanks, duplicates, external laboratory checks have been applied in Akyem project, above QAQC samples have shown good performance.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• QAQC Database was established, QAQC protocol were established, QAQC performance were reported annually.

Criteria	JORC Code explanation	Commentary
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Survey information are good enough to support mineral resource estimation. • Survey equipment are well operated and calibrated by professional surveyors.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• See section 7.11. • Data spacing and distribution is sufficient to establish the degree of geological and grade continuity. • Sample compositing has been applied to equal lengths for constant sample volume, in keeping with industry theories of sample support.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Boreholes and channels were designed considering the possible structures and mineralisation. • N/A.
Sample security	• *The measures taken to ensure sample security.*	• Safe sampling and transportation
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• The results are generally acceptable with some outstanding samples to be re-analysed.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Mineral tenure within the Akyem Gold Project area comprises two mining leases (Akyem East and Akyem West) and four prospecting licenses, covering an area of about 139.86 km2.

Criteria	JORC Code explanation	Commentary
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• The Akyem deposit was first identified in 1994, with open-pit (OP) mining operations commencing in September 2013. • BLY and AMS conducted drilling for the Akyem Project in 2022 and 2023. • Prior to 2011, a number of RC and RC pre-collared (PC) holes were drilled.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The West African Craton is divided into two major geological domains: the Archean Reguibat Shield in the north (Mauritania) and the Paleo-Proterozoic Man Shield in the south (spanning Ghana and Senegal). The Man Shield consists of two sectors—the western sector comprises Liberian-age rocks (3.0–2.5 Ga), while the eastern sector is characterized by Paleoproterozoic Birimian rocks, which include five northeast–southwest trending volcanic belts of tholeiitic to acidic composition. The Akyem gold deposit is situated within the Ashanti Gold Belt, one of these volcanic belts. • Geologically, the Akyem deposit is defined by its association with the Akyem Shear Zone system, where the Akyem Carbon Fault serves as the primary structural feature controlling mineralization. The periodic reactivation of the fault system, coupled with structural intersections and dilation events, facilitated the development of high-grade ore shoots, which are key to the deposit's economic significance. • Mineralization within the deposit is structurally controlled, primarily localized along fault zones such as the Akyem Carbon Fault and its associated brittle fractures in the hanging wall. The interplay of ductile deformation from earlier events and subsequent brittle fracturing created conduits for gold-rich hydrothermal fluids, concentrating mineralization in zones of enhanced fracture permeability. The deposit's structural geometry, including steeply dipping faults and low-angle extensional structures, defines the spatially predictable high-grade ore shoots. Alteration patterns and structural complexity further reflect the critical role of fault systems in the localization and distribution of the deposit's gold resources.

Criteria	JORC Code explanation	Commentary
		• The Akyem deposit extends over a strike length of more than 2,500 m, with mineralization delineated to a depth of approximately 900 m down-dip on its southeast-dipping fault structure. Mineralized zones vary significantly in true thickness, ranging from 10 m to as much as 100 m. Gold grades exceeding 0.5 g/t Au are observed across widths of 10 to 150 m, while zones of higher-grade (>4 g/t Au) mineralization are predominantly hosted in intensely altered silica-carbonate-sericite breccias adjacent to the Akyem Carbon Fault, with widths ranging between 5 and 50 m. The Akyem deposit is classified as an orogenic gold deposit. Orogenic gold deposits are found in deformed metamorphic terranes ranging from the Middle Archean to the Precambrian and stretching continuously into the Phanerozoic. These deposits are typically hosted in volcano-plutonic or clastic sedimentary terranes, though they can occur in any rock type. There is a consistent spatial and temporal association with granitoids of varying compositions. Host rocks are commonly metamorphosed to greenschist facies but can locally reach amphibolite or granulite facies.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Drill holes typically begin with PQ-sized core (85 mm diameter), followed by reductions to HQ-sized core (63.5 mm diameter) and eventually NQ-sized core (47.6 mm diameter) as drilling progresses. • The driller will set up the rig by aligning the rig to the azimuth marked out by the surveyor, with the help of Reflex TM 14 Azi Aligner® (a gyro compass) mounted on the rig to set-up a hole for drilling. • Downhole surveys readings were taken by drillers using the Reflex tool as either single shot at the hole collar depth of 12 m and 30 m intervals.

Criteria	JORC Code explanation	Commentary
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Exploration data is reported as the average sample grade. Top cutting was used report the exploration results.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Mineralisation intercept lengths were reported. • Drill dip varies by location within the deposit and the dip azimuth is Northwest.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Appropriate maps and typical sections were reported in this report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Reporting was fully representative of the data collected at this stage.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• No additional information was provided.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Further drilling program is recommended.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Digitalized Mineral Resource databases were provided to SRK, and SRK conducted crossing-checking against logging data and typical interpretation. All relevant data was imported to Leapfrog™, and validation routines were run to confirm validity of all data. • Checks for holes without samples. • Checks for duplicate samples. • Checks and adjusts the missing or wrong intervals.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• Mr Pengfei Xiao and Mr Mingyan Wang from SRK team visited the Akyem Mine from 10 to 14 June 2025.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• The wireframe modelling was carried out by Zijin MEI using explicit modelling method. • The mineralisation wireframes were constrained within two mineralisation envelopes (High Grade at a cut-off of 1.0 g/t Au and Low Grade at a cut-off of 0.1 g/t Au).
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The Akyem deposit extends over a strike length of more than 2,500 m, with mineralization delineated to a depth of approximately 900 m down-dip on its southeast-dipping fault structure. Mineralized zones vary significantly in true thickness, ranging from 10 m to as much as 100 m. • Gold grades exceeding 0.5 g/t Au are observed across widths of 10 to 150 m, while zones of higher-grade (>4 g/t Au) mineralization are predominantly hosted in intensely altered silica-carbonate-sericite breccias adjacent to the Akyem Carbon Fault, with widths ranging between 5 and 50 m.

Criteria	JORC Code explanation	Commentary
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	• Mineral Resource estimation was undertaken in Surpac software with the following key assumptions and parameters by Zijin Gold International. • Ordinary Kriging interpolation has been applied for the estimation of Au. • Extreme grade values were managed by upper grade capping. • HG 1 m composites, LG 2 m composites. • The estimates were predominantly undertaken using hard domain boundaries and a series of elliptical search passes orientated in the plane of mineralisation. • No assumptions were made regarding recovery of by-products. • No assumptions were made about modelling of selective mining units. • A parent block size of 4 m easting (X) by 4 m northing (Y) by 4 m vertically (Z) was used, with sub-cells of 2 m easting (X) by 2 m northing (Y) by 2 m vertically (Z). • SRK has validated both block models by swath plot and visual inspection, indicating that the models were validated.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• The tonnages are estimated on a dry basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• OP Mineral Resource were reported at a cut-off Au grade of 0.3 g/t based on an Au metal price of US$ 2,700/oz, mining and processing cost of 17.2 US$ per tonne, G&A 5.3 US$ per tonne and process recovery was 89.5%. • UG Mineral Resource were reported at a cut-off Au grade of 1.5 g/t based on an Au metal price of US$ 2,700/oz, mining and processing cost of 84.7 US$ per tonne, G&A 9 US$ per tonne and process recovery was 89.5%.

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	•
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• Metallurgical tests have been performed on samples from Akyem OP Layback, UG and D1/D2 Saddle, including mineralogy, comminution test, and cyanidation leach testwork. • The gold recovery rate ranged from 88% to 89.0% in cyanidation leach tests on different samples. • The Akyem Processing Plant was put into operation in 2013, and the recovery rates ranged between 88% and 90% over the past four years. • The test details are summarized in Section 10.2.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Hazardous materials at the Akyem Mine are managed through the use of approved substances with safety data and management plans, secure secondary containment systems, routine inspections and audits via the Enablon system, staff training, and strict adherence to a comprehensive Cyanide Management Plan aligned with the International Cyanide Management Code to ensure safe handling, storage, usage, and spill response. • Rock characterization studies at the Akyem Mine indicate that waste materials are non-acid generating due to high pH levels, low pyrite content, and abundant carbonates, with ongoing column leach testing in place to simulate long-term weathering and confirm the absence of acid rock drainage risks.

Criteria	JORC Code explanation	Commentary
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• Oxide, SG 1.823. • Transitional, SG 2.123. • Fresh, SG 2.778.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• Zijin Gold International considers that blocks in the areas with drill hole spacing not more than 50 m were classified as Measured Mineral Resources. • Blocks in the areas with drill hole spacing not more than 100 m were classified as Indicated Mineral Resources. • The rest portion of both LG and HG domains were classified as Inferred Mineral Resources.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• The input data, including geological mapping and drillhole data are comprehensive in their coverage of the mineralisation. • The Mineral Resource estimate appropriately reflects the view of the Competent Person.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the JORC Code. • The statement relates to global volumetric estimates.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• the Mineral Resource Estimate ("MRE") was reviewed by SRK in-house geologist(s) which is the basis of Ore Reserve Estimate dated 31 December 2024 • Reported Mineral Resource is inclusive of potential reserve material.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• Mr. Falong Hu, the Competent Person for this Ore Reserve statement is a full-time employee of SRK Consulting (China) Ltd. • SRK team, consisting of Principal Consultants Pengfei Xiao (Geology) and Falong Hu (Mining), Senior Consultant Xiangfeng Yang (Processing), Consultants Mingyan Wang (Geology), Rui Shen (Mining), Hongchen Huang (Environmental Engineering), and Project Coordinator Liyuan Luo, conducted a site visit from June 10 to 14, 2025.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• This project is an operating mine with a processing plant, fed from 2 open pits. • The technical study was updated by Zijin Xiamen in 2025. • SRK reviewed technical studies, as well as the current mining plan and actual operation data, and supportive studies, the level of accuracy of the Modifying Factors proposed in the studies and/or modified by the Company, are considered by SRK to be akin to a pre-feasibility level study ("PFS"), which are suitable for the Ore Reserve Estimates.

Criteria	JORC Code explanation	Commentary
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Due to the differences in mineralization types and processing methodologies applied at the Taror and Jilau mines, separate input parameters were used for the cutoff grade (COG) estimates at each operation. • Open Pit COG

Parameters	Item	Units	SRK
Gold Price	P	US$/oz	2,200
Doré Gold Payable	Pa	%	99.9
Royalty	Rt	%	4.9
Process Recovery	Pr	%	89.5
Mining Cost		US$/t mined	4.5
Processing Cost	Cp	US$/t feed	12.65
G&A Cost	Cg	US$/t feed	5.3
COG	**COG**	**g/t**	**0.3**

• Underground COG

Parameters	**Item**	**Unit**	**SRK**
Gold Price	P	US$/oz	2,200
Doré Gold Payable	Pa	%	99.9
Royalties	Rt	%	4.9
Mining Cost	Cm	US$/t	70.7
Processing Cost	Pr	US$/t	12.5
G&A Cost	Cp	US$/t	4.6
COG	**COG**	**g/t**	**1.5**

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• An open-pit mining method has been applied at the Akyem Mine. The mine plan incorporates open-pit optimization, detailed design, and scheduling processes. • Zijin Xiamen conducted pit shell optimization to support the mine design review, utilizing the Whittle software package. Optimized pit shells were generated using the Lerchs-Grossman 3D or Pseudoflow algorithms, with pit designs guided by the optimization parameters and input criteria and subsequently refined by engineers. All input parameters have been reviewed. • Slope parameters were based on the previous geotechnical study conducted by Newmont in September 2022, with no material changes noted since then, as confirmed by Zijin Xiamen. The overall pit wall slope angle is approximately 46 degrees. • Based on operational practice review, SRK has applied mining dilution factors of 5% for the Akyem Pit and 10% for underground stopes in the Ore Reserve estimation. • Similarly, mining loss factors of 5% for the Akyem Pit and 10% for underground stopes have been applied in the Ore Reserve estimation, reflecting operational practices. • The end-of-month survey dated 31 December 2024 serves as the latest data source for the cutoff date. • Inferred Mineral Resources have been excluded from pit shell and stope generation and are not converted to Ore Reserves.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.* • *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• The Akyem Processing Plant was put into operation in 2013, and the recovery rates ranged between 88% and 90% over the past four years. • The plant utilizes the carbon-in-leach (CIL) process to recover gold. • Metallurgical tests have been performed on samples from Akyem OP Layback, UG and D1/D2 Saddle, including mineralogy, comminution test, and cyanidation leach testwork. • The gold recovery rate ranged from 88% to 89.0% in cyanidation leach tests on different samples. • The details are summarized in Section 10.

Criteria	JORC Code explanation	Commentary
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Rock characterization studies at the Akyem Mine indicate that waste materials are non-acid generating due to high pH levels, low pyrite content, and abundant carbonates, with ongoing column leach testing in place to simulate long-term weathering and confirm the absence of acid rock drainage risks.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• The Akyem project is an operating project with well established infrastructure, including road network, water supply, electricity supply, as well as supportive facilities for production.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• The invested capital expenditure (Capex) has been used to establish production and supporting facilities, and the proposed sustaining Capex for technical upgrades and tailings storage facility (TSF) expansions is considered reasonable. • Historical operating expenditure (Opex) records have been reviewed and form the basis for future Opex estimates. • Sales contracts and historical transaction records have been reviewed, confirming that the final products meet contract specifications and are salable. • All applicable royalties, resource taxes, and other relevant fees have been appropriately considered.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Sensitivity analysis has been conducted against the changes of production prices (or incomes), Opex and Capex.
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	•

Criteria	JORC Code explanation	Commentary
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	•
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• NGRL conducted cultural heritage studies to identify and protect community shrines, sacred grooves, royal mausoleum and cemeteries as well as individual and family shrines. NGRL has paid pacification fees for their relocation from the mining area. • According to 2023 AESR, NGRL actively pursued a range of social responsibility initiatives, including stakeholder engagements, social investments facilitated by the Newmont Akyem Development Foundation (NAKDEF) across seven thematic areas, youth capacity-building support in mine host communities, community development projects, establishment of complaints and grievances resolution mechanisms, and the implementation of human rights and voluntary principles programs.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	•
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	•

Criteria	JORC Code explanation	Commentary
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	•
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	•

Appendix C Compliance with Chapter 18

Chapter 18				Sections in SRK's Report
18.01	**DEFINITIONS AND INTERPRETATION**			
18.02-18.04	**CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES**			
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.			
18.03	A Mineral Company must:—			
	(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—		3
		(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or	
			Note: 'control over a majority' means an interest greater than 50%.	
		(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which gives it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
	(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—		7.12
		(a)	Indicated Resources; or	
		(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
	(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—		14
		(a)	workforce employment;	
		(b)	consumables;	
		(c)	fuel, electricity, water and other services;	
		(d)	on and off-site administration;	
		(e)	environmental protection and monitoring;	
		(f)	transportation of workforce;	
		(g)	product marketing and transport;	
		(h)	non-income taxes, royalties and other governmental charges; and	
		(i)	contingency allowances;	
		Note:	*A Mineral Company must:* *• set out the components of cash operating costs separately by category;* *• explain the reason for any departure from the list of items to be included under cash operating costs; and* *• discuss any material cost items that should be highlighted to investors.*	
	(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—		14
		(a)	general, administrative and operating costs;	
		(b)	property holding costs; and	
		(c)	the cost of any proposed exploration and/or development; and	
		Note:	*Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.*	

Chapter 18				Sections in SRK's Report
	(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has sufficient available working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.		14
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.			
	Note: A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.			
18.05-18.08	**CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS**			
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—			
	(1)	a Competent Person's Report;		Whole report
	(2)	a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;		2.4
	(3)	the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;		3.1
	(4)	a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;		3.1
	(5)	disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and		16
	(6)	if relevant and material to the Mineral Company's business operations, information on the following:—		13
		(a)	project risks arising from environmental, social, and health and safety issues;	
		(b)	any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	
		(c)	compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	
		(d)	sufficient funding plans for remediation, rehabilitation and closure and removal of facilities in a sustainable manner;	
		(e)	environmental liabilities of its projects or properties;	
		(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	
		(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	

Chapter 18				Sections in SRK's Report
		(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	
18.06-18.08	***Additional disclosure requirements that apply to certain new applicant Mineral Companies***			
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.			14
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.			9
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.			8
18.09-18.13	**RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS**			**Not applicable**
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—			
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;		
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;		
		Note: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.		
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and		
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.		
	Note: Material liabilities that remain with the issuer on a disposal must also be discussed.			
18.10-18.11	***Requirements that apply to listed issuers***			**Not applicable**
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.			
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.			
18.12-18.13	***Requirements that apply to Mineral Companies and listed issuers***			**Not applicable**
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.			

Chapter 18			Sections in SRK's Report
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.		
18.14-18.17	**CONTINUING OBLIGATIONS**		**Not applicable**
18.14	***Disclosure in reports***		
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.		
18.15-18.17	***Publication of Resources and Reserves***		**Not applicable**
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.		
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.		
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18.		
	Note: Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.		
18.18-18.27	**STATEMENTS ON RESOURCES AND/OR RESERVES**		
18.18	***Presentation of data***		
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.		7.12, 8.5
18.19	***Basis of evidence***		
18.19	All statements referring to Resources and/or Reserves:—		
	(1)	in any new applicant listing document or circular relating to a Relevant Notifiable Transaction must be substantiated in a Competent Person's Report which must form part of the document; and	Whole report
	(2)	in all other cases, must at least be substantiated by the issuer's internal experts.	
18.20	***Petroleum Competent Persons' Reports***		**Not applicable**
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.		
18.21-18.22	***Competent Person***		
18.21	A Competent Person must:—		2.7
	(1)	have a minimum of five years' experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	

Chapter 18			Sections in SRK's Report
	(2)	be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	
	(3)	take overall responsibility for the Competent Person's Report.	
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—		2.11
	(1)	have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2)	not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3)	in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4)	in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
18.23	***Additional requirements of Competent Evaluators***		**Not applicable**
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—		
	(1)	have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2)	have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3)	hold all necessary licences.	
	Note: A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.		
18.24	***Scope of Competent Persons' Reports and Valuation Reports***		
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—		1, 2.2
	(1)	be addressed to the Mineral Company or listed issuer;	2.1
	(2)	have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	2.4
	(3)	set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	1, 2.2
18.25-18.26	***Disclaimers and Indemnities***		
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.		2.3

Chapter 18				Sections in SRK's Report
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.			2.9
18.27	***Obligations of sponsor***			**2.7**
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.			
18.28-18.34	**REPORTING STANDARD**			**1, 2.2**
18.28-18.30	***Mineral reporting standard***			
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.			
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—			
	(1)	under:		
		(a)	the JORC Code;	1, 2.2
		(b)	NI 43-101; or	
		(c)	the SAMREC Code,	
		as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		
	Note:	*The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.*		
18.30	A Mineral Company must ensure that:—			
	(1)	any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;		8.1
	(2)	estimates of mineral Reserves and mineral Resources are disclosed separately;		7.12, 8.5
	(3)	Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;		8.2.2, 8.3.2, 15.4
	(4)	for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—		15.1
		(a)	the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	
		(b)	if a contract for future prices of mineral Reserves exists, the contract price is used; and	
	(5)	for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.		15.4.4

Chapter 18			Sections in SRK's Report
18.31-18.33	***Petroleum reporting standard***		**Not applicable**
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.		
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—		
	(1)	under PRMS as modified by this Chapter; or	
	(2)	under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	Note: A Reporting Standard applied to specific assets must be used consistently.		
18.33	A Mineral Company must ensure that:—		
	(1)	where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;	
	(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
	(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	
	(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	
		Note: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.	
	(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
		Note: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.	
	(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	

Chapter 18			Sections in SRK's Report
	(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	
18.34	***Mineral or Petroleum Asset Valuation Reports***		**Not applicable**
18.34	A Mineral Company must ensure that:—		
	(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
	(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
	(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
	(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

Appendix D Chapter 2.6 of the Guide for New Listing Applicants

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	7.12, 8.2, 8.3, 6.3, 15.1
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	Not Applicable
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	10.2
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	4.1
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	8
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	15.4.1, 15.4.2
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	Not Applicable
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	16

This Appendix contains a summary of the articles of association of our Company (the "Articles"). As the information set out below is in summary form, it does not contain all of the information that may be important to potential investors. As stated in "Appendix V — Documents delivered to the Registrar of Companies and Available on Display" in this Document, a copy of the Articles is available for inspection.

The Articles were adopted by our Shareholders on [•]and will become effective on the [REDACTED]. The following is a summary of certain provisions of the Articles. The powers conferred or permitted by the Articles are subject to the provisions of the Companies Ordinance, the Companies (Winding Up and Miscellaneous Provisions) Ordinance and other ordinances, subsidiary legislation and the Listing Rules.

ALTERATION OF CAPITAL

Our Company may from time to time by ordinary resolution alter its share capital in any one or more of the ways set out in section 170 of the Companies Ordinance, including but not limited to:

(a) increasing its share capital by allotting and issuing new shares in accordance with the Companies Ordinance;

(b) increasing its share capital without allotting and issuing new shares, if the funds or other assets for the increase are provided by the members of our Company;

(c) capitalising its profits, with or without allotting and issuing new shares;

(d) allotting and issuing bonus shares with or without increasing its share capital;

(e) converting all or any of its share into a larger or smaller number of shares;

(f) cancelling shares:

   (i) that, at the date of the passing of the resolution for cancellation, have not been taken or agreed to be taken by any person; or

   (ii) that have been forfeited; or

(g) dividing its shares into several classes and attaching to it respectively any rights, (including preferred, deferred, qualified or other special rights or privileges) or conditions or restrictions, provided always that where our Company issues shares which do not carry voting rights, the words "non-voting" shall appear in the designation of such shares and where the equity capital includes shares with different voting rights, the designation of each class of shares, other than those with the most favourable voting rights, must include the words "restricted voting" or "limited voting" or other warning language as may be required by the Listing Rules.

Subject to the provisions of the Companies Ordinance and the Articles, our Company may by special resolution reduce our share capital in any way.

PURCHASE OF OWN SHARES AND WARRANTS

Our Company may exercise any powers conferred or permitted by the Companies Ordinance or any other ordinance from time to time to purchase our own shares of any class in the capital of our Company (including any redeemable shares) or to give directly or indirectly by means of a loan, guarantee, the provision of security or otherwise, financial assistance for the purpose of or in connection with a purchase made or to be made by any person of any share in our Company. Should our Company purchase our own shares, neither our Company nor the Directors shall be required to select the shares to be acquired rateably or in any other particular manner as between the holders of shares of the same class or as between them and the holders of shares of any other class or in accordance with the rights as to dividends or capital conferred by any class of shares provided that any such purchase or other acquisition or financial assistance shall only be made or given in accordance with any relevant rules or regulations issued by the Stock Exchange or the SFC from time to time in force.

In the case of purchases of redeemable shares, purchases not made through the market or by tender shall be limited to a maximum price and if purchases are by tender, tenders shall be available to all shareholders holding redeemable shares of our Company alike.

"Shares" referred to above include shares, warrants and any other securities carrying a right to subscribe for or purchase shares of our Company which are issued from time to time by our Company.

VARIATION OF RIGHTS

Subject to the provisions of the Companies Ordinance, if at any time the capital of our Company is divided into different classes of shares, the rights attached to any class (unless otherwise provided by the terms of issue of the shares of that class) may be varied or abrogated, either with the consent in writing of holders representing at least seventy-five per cent. of the total voting rights of holders of shares in that class or with the sanction of a special resolution passed at a separate general meeting of the holders of the shares of that class, and may be so varied or abrogated either whilst our Company is a going concern or during or in contemplation of a winding up.

To every such separate meeting the provisions of the Articles relating to general meetings shall *mutatis mutandis* apply, except that:

(a) the necessary quorum at such meeting (other than an adjourned meeting) shall be two persons present in person or by proxy holding at least one-third of the total voting rights of holders of the shares in that class;

(b) at any adjourned meeting the necessary quorum shall be one person present in person or by proxy holding any shares in that class; and

(c) any holder of shares in that class whether present in person or by proxy may demand a poll.

TRANSFER OF SHARES

The instrument of transfer of any share shall be in writing and in any usual form or in any other form which the Board may approve. The transferor shall be deemed to remain the holder of the share concerned until the name of the transferee is entered in the register of members in respect of the shares. Shares of different classes shall not be comprised in the same instrument of transfer.

The Board may, in its absolute discretion, refuse to register the transfer of a share which is not fully paid or on which our Company has a lien. The Board may also refuse to register a transfer of a share unless:

(a) the instrument of transfer is in respect of only one class of share and is properly stamped;

(b) in the case of a transfer to joint holders, the number of joint holders to whom the share is to be transferred does not exceed four;

(c) subject to the Companies Ordinance, the instrument of transfer is lodged with our Company accompanied by the certificate for the shares to be transferred and such other evidence (if any) as the Board may reasonably require to prove the title of the intending transferor or his right to transfer the shares; and

(d) the instrument of transfer is accompanied by payment of such fee, not exceeding the maximum amount prescribed by the Stock Exchange from time to time, as the Board may from time to time require.

If the Board refuse to register a transfer of a share, it shall within two months after the date on which the instrument of transfer was lodged with our Company send to the transferor and transferee notice of the refusal. Upon request by the transferor or transferee, the Board must, within twenty-eight days after receiving such request, (a) send to the transferor or transferee (as the case may be) a statement of the reasons for the refusal or (b) register the transfer.

GENERAL MEETINGS

The Board shall convene and our Company shall hold annual general meetings in accordance with the requirements of the Companies Ordinance. Subject to such requirements, the Board shall determine the date, time and place at which each annual general meeting shall be held. General meetings include other meetings of members which are not annual general meetings.

The Board may convene a general meeting whenever it thinks fit. General meetings shall also be convened by the Board on the requisition of members pursuant to the provisions of the Companies Ordinance.

NOTICE OF GENERAL MEETINGS

Subject to section 578 of the Companies Ordinance, an annual general meeting shall be called by notice in writing of at least twenty-one clear days (or such longer period as may be required by the Listing Rules), and every other general meeting shall be called by notice in writing of at least fourteen clear days (or such longer period as may be required by the Listing Rules), and such notice shall be given in the manner mentioned in the Articles to all members, Directors and auditors.

The notice shall specify the place, the date and the time of meeting and the general nature of such business to be dealt with at the meeting. If the meeting is to be held in two or more places, the notice of meeting shall specify the principal place of the meeting and the other place of the meeting.

The Board shall comply with the Companies Ordinance and the Listing Rules regarding the giving and the circulation, on the requisition of members, of notices of resolutions and of statements with respect to matters relating to any resolution to be proposed or business to be dealt with at any general meeting of our Company. Every notice of meeting shall also state with reasonable prominence that a member entitled to attend and vote at the meeting may appoint one or more proxies to attend and vote instead of him and that a proxy need not also be a member.

The accidental omission to give such notice of a general meeting or (in cases where instruments of proxy are sent out with the notice) the accidental omission to send an instrument of proxy to, or the non-receipt of either or both by, any person entitled to receive such notice shall not invalidate any resolution passed or proceeding had at that meeting.

Subject to compliance with any provisions of the Companies Ordinance, notwithstanding that a meeting of our Company is convened by shorter notice than that specified in the Articles, it shall be deemed to have been duly convened if it is so agreed:

(a) in the case of an annual general meeting, by all the members entitled to attend and vote at the meeting; and

(b) in the case of any other general meeting, by a majority in number of the members having a right to attend and vote at the meeting, being a majority together representing at least ninety-five per cent. of the total voting rights at the meeting of all the members.

VOTING AT GENERAL MEETINGS

Subject to the Listing Rules, any vote of shareholders at a general meeting shall be taken by poll except where the chairman, in good faith, decides to allow a resolution which relates purely to a procedural or administrative matter to be voted on by a show of hands. On any resolution where a vote is not required under the Companies Ordinance, the Listing Rules, the Articles or such other laws or regulations as applicable to our Company, if any, to be held on a poll, a poll may be demanded before or on the declaration of the result of the show of hands:

(a) by the chairman of the meeting; or

(b) by at least five members present in person or by proxy having the right to vote at the meeting; or

(c) by a member or members present in person or by proxy representing in aggregate at least five per cent. of the total voting rights of all the members having the right to attend and vote at the meeting.

Subject to the Articles and the Companies Ordinance and to any special rights or restrictions as to voting for the time being attached to any shares of our Company:

(a) on a show of hands, every member who is present in person or by proxy shall have one vote; and

(b) on a poll, every member who is present in person or by proxy shall have one vote for every share of which he is the holder.

Where any shareholder is, under the Listing Rules, required to abstain from voting on any particular resolution or restricted to voting only for or only against any particular resolution, any votes cast by or on behalf of such shareholder in contravention of such requirement or restriction shall not be counted.

Any corporation which is a member of our Company may, by resolution of its directors or other governing body, authorise such person to act as its representative at any general meeting or meeting of the holders of shares of any class of our Company, and the person so authorised shall be entitled to exercise the same powers on behalf of the corporation which he represents as that corporation could exercise as if it were an individual member.

Where a member is a recognised clearing house (within the meaning of the SFO) or its nominee, it may authorise any person or persons as it thinks fit to act as its proxy (or proxies) or representative (or representatives) at any general meeting of our Company or any separate meeting of any class of members of our Company provided that, if more than one person is so authorised, the instrument of proxy or authorisation must specify the number and class of shares in respect of which each such person is so authorised. Notwithstanding anything contained in the Articles, each person so authorised, and any instrument of proxy or authorisation signed by any officer of the recognised clearing house, shall be deemed to have been duly authorised without further evidence of the facts. The person so authorised will be entitled to exercise the same rights and powers on behalf of the recognised clearing house (or its nominee) as if such person was the registered holder of the shares of our Company held by that recognised clearing house (or its nominee), including the right to vote individually on a show of hands or on a poll and to demand or concur in demanding a poll.

APPOINTMENT, ROTATION AND REMOVAL OF DIRECTORS

Subject to the Articles, our Company may by ordinary resolution appoint any person to be a Director, either to fill a casual vacancy or as an additional Director. No person (other than a Director retiring in accordance with the Articles) shall be so appointed or re-appointed a Director at any general meeting unless:

(a) he is recommended by the Board; or

(b) he is nominated by notice in writing by a member (other than the person to be proposed) entitled to attend and vote at the meeting, and such notice of nomination shall be given to the Joint Company Secretaries at the office of our Company during a period of not less than seven days, commencing no earlier than the day after the dispatch of the notice of such meeting and ending no later than seven days prior to the date fixed for such meeting (or a longer period as may be determined and announced by the Board from time to time) and the notice of nomination shall be accompanied by a notice signed by the proposed candidate indicating his willingness to be appointed or re-appointed.

Without prejudice to the power of our Company in general meeting in accordance with any of the provisions of the Articles to appoint any person to be a Director, the Board may, at any time, and from time to time, appoint any person to be a Director, either to fill a casual vacancy or by way of addition to their number. Any Director so appointed by the Board shall hold office only until the first annual general meeting of our Company after his appointment, and shall then be eligible for re-appointment.

Subject to the provisions of the Companies Ordinance and of the Articles and until otherwise determined by our Company by ordinary resolution, the Directors to retire in every year shall be the Directors who have been longest in office since their last election or appointment. As between Directors of equal seniority, the Directors to retire shall be selected from among them by lot. Every Director, including those appointed for a specific term, shall subject to retirement at least once every three years.

Notwithstanding the Articles or any agreements entered into between our Company and the Directors may provide otherwise, a Director shall vacate his office even before the expiration of his term:

(a) if he ceases to be a Director by virtue of any provision of the Companies Ordinance or the Companies (Winding up and Miscellaneous Provisions) Ordinance or he becomes prohibited by law or court order from being a Director; or

(b) if he becomes bankrupt or a receiving order is made against him or he makes any arrangement or composition with his creditors generally; or

(c) if he is, or may be, suffering from mental disorder and an order is made by a court claiming jurisdiction in that behalf (whether in Hong Kong or elsewhere) in matters concerning mental disorder for his detention or for the appointment of a receiver, *curator bonis* or other person by whatever name called to exercise powers with respect to his property or affairs; or

(d) if for more than six consecutive months both he and any alternate director appointed by him are absent, without special leave of absence from the Board, from meetings of the Board held during that period, and the Board resolves that his office be vacated; or

(e) if he gives to our Company notice of his wish to resign, in which event he shall vacate office on the delivery of that notice to our Company or such later time as is specified in such notice; or

(f) if he is removed by ordinary resolution of our Company in accordance with the Companies Ordinance or in the manner under the Articles; or

(g) if he is removed from office by notice in writing served upon him by all other Directors; or

(h) if he is convicted of an indictable offence.

If the office of a Director is vacated for any reason, he shall cease to be a member of any committee or sub-committee appointed by the Board.

QUALIFICATION OF DIRECTORS

A Director need not be a member of our Company.

BORROWING POWERS

The Board may exercise all the powers of our Company to borrow money, and to mortgage or charge the whole or any part of its undertaking, property and assets (both present and future) and uncalled capital, or any part thereof, and (subject, to the extent applicable, to the provisions of the Companies Ordinance) to issue debentures and other securities, whether outright or as collateral security for any debt, liability or obligation of our Company or of any third party.

DIRECTORS' REMUNERATION AND EXPENSES

Each of the Directors shall be entitled to be paid by our Company such remuneration as may be proposed by the Board and determined by our Company in general meeting. The Directors shall also be paid out of the funds of our Company all their travelling, hotel and other expenses reasonably and properly incurred by them in and about the discharge of their duties, including their expenses of travelling to and from meetings of the Board, or committee meetings, or general meetings (subject always to the provisions of any agreement between our Company and any Director).

The Board may grant special remuneration to any Director who, being called upon, shall perform any special or extra services to or at the request of our Company. Such special remuneration may be made payable to such Director in addition to or in substitution for his ordinary remuneration (if any) as a Director, and may, without prejudice to the payment of ordinary remuneration, be made payable by a lump sum or by way of salary, commission, participation in profits or otherwise as the Board may decide.

DIRECTORS' INTERESTS

Subject to the Companies Ordinance, no Director or intending Director shall be disqualified by his office from entering into any contract with our Company, either with regard to his tenure of any office or position in the management, administration or conduct of the business of our Company or as vendor, purchaser or otherwise, nor (subject to the interest of the Director being duly declared) shall any contract or arrangement entered into by or on behalf of our Company in which any Director is in any way interested, be liable to be avoided, nor shall any Director so interested be liable to account to our Company for any benefit resulting from the contract by reason of such Director holding that office or of the fiduciary relationship established by his holding that office.

A Director or an entity connected with the Director who is, in any way, whether directly or indirectly, interested in a transaction, arrangement or contract or a proposed transaction, arrangement or contract with our Company shall, if such transaction, arrangement or contract is significant in relation to our Company's business and the Director's interest or the interest of the entity connected with the Director (as applicable) is material, declare the nature and extent of his interest or the interest of the entity connected with the Director (as applicable) at the meeting of the Board at which the question of entering into the transaction, arrangement or contract is first taken into consideration or in any other case by notice in writing and sent to other Directors, or by general notice sent to the Board or our Company, in each case in accordance with the Companies Ordinance and the Articles and any requirements prescribed by our Company for the declarations of interests of Directors in force from time to time.

A Director shall not vote (or be counted in the quorum at a meeting) in respect of any resolution concerning his own appointment (including fixing or varying its terms), or the termination of his own appointment, as the holder of any office or place of profit with our Company or any other company in which our Company is interested but, where proposals are under consideration concerning the appointment (including fixing or varying its terms), or the termination of the appointment, of two or more Directors to offices or places of profit with our Company or any other company in which our Company is interested, those proposals may be divided and a separate resolution may be put in relation to each Director and in that case each of the Directors concerned (if not otherwise debarred from voting under the Articles) shall be entitled to vote (and be counted in the quorum) in respect of each resolution unless it concerns his own appointment or the termination of his own appointment.

Subject to the Listing Rules and save as otherwise provided by the Articles, a Director shall also not vote (or be counted in the quorum at a meeting) in relation to any resolution relating to any transaction, arrangement or contract or other proposal in which he or any of his close associates has a material interest and, if he purports to do so, his vote shall not be counted (nor shall he be counted in the quorum for that resolution), but this prohibition shall not apply and a Director may vote (and be counted in the quorum) any or more of the following matters:

(a) the giving of any security or indemnity either:

   (i) to the director or his close associate(s) in respect of money lent or obligations incurred or undertaken by him or any of them at the request of or for the benefit of our Company or any of its subsidiaries; or

   (ii) to a third party in respect of a debt or obligation of our Company or any of its subsidiaries for which the director or his close associate(s) has himself/themselves assumed responsibility in whole or in part and whether alone or jointly under a guarantee or indemnity or by the giving of security;

(b) any proposal concerning an offer of shares or debentures or other securities of or by our Company or any other company which our Company may promote or be interested in for subscription or purchase where the director or his close associate(s) is/are or is/are to be interested as a participant in the underwriting or sub- underwriting of the offer;

(c) any proposal or arrangement concerning the benefit of employees of our Company or its subsidiaries including:

   (i) the adoption, modification or operation of any employees' share scheme or any share incentive or share option scheme under which the director or his close associate(s) may benefit; or

(ii) the adoption, modification or operation of a pension fund or retirement, death or disability benefits scheme which relates both to the director, his close associate(s) and employee(s) of our Company or any of its subsidiaries and does not provide in respect of any director, or his close associates(s), as such any privilege or advantage not generally accorded to the class of persons to which such scheme or fund relates; and

(d) any contract or arrangement in which the director or his close associate(s) is/are interested in the same manner as other holders of shares or debentures or other securities of our Company by virtue only of his/their interest in shares or debentures or other securities of our Company.

DIVIDENDS

Subject to the provisions of the Companies Ordinance, our Company may, from time to time, by ordinary resolution, declare a dividend to be paid to the members, according to their respective rights and interests in the profits, and may fix the time for payment of such dividend, but no dividend shall exceed the amount recommended by the Board.

Except insofar as the rights attaching to, or the terms of issue of, any share otherwise provide (a) all dividends shall be declared and paid according to the amounts paid up on the shares in respect of which the dividend is paid, but no amount paid up on a share in advance of calls shall be treated as paid up on the share, and (b) all dividends shall be apportioned and paid *pro rata* according to the amounts paid up on the shares during any portion or portions of the period in respect of which the dividend is paid.

The Board may pay such interim dividends as appear to the Board to be justified by the financial position of our Company and may also pay any dividend payable at a fixed rate at intervals settled by the Board whenever the financial position of our Company, in the opinion of the Board, justifies its payment. If at any time the share capital of our Company is divided into different classes, the Board may resolve to pay such interim dividends in respect of those shares in the capital of our Company which confer on the holders thereof deferred or non-preferred rights as well as in respect of those shares which confer on the holders thereof preferential or special rights in regard to dividend. If the Board acts in good faith, none of the Directors shall incur any liability to the holders of shares conferring preferred rights for any loss such holders may suffer in consequence of the payment of an interim dividend on any shares having deferred or non-preferred rights.

Whenever the Board or our Company in general meeting have resolved that a dividend be paid or declared, the Board may further resolve that such dividend be satisfied wholly or in part by the distribution of specific assets or rights of any kind and in particular of paid up shares, debentures or warrants to subscribe securities of our Company or any other company, or in any one or more of such ways, with or without offering any rights to members to elect to receive such dividend in cash. Where any difficulty arises in regard to the distribution, the Board may settle the same as they think expedient, and in particular may issue fractional certificates, disregard fractional entitlements or round the same up or down, and may fix the value for distribution of such specific assets or rights, or any part thereof, and may determine that cash payments shall be made to any members upon the footing of the value so fixed in order to adjust the rights of all parties, and may determine that fractional entitlements shall be aggregated and sold and the benefit shall accrue to our Company rather than to the members concerned and may vest any such specific assets or rights in trustees as may seem expedient to the Board. The Board may appoint any person to sign any requisite instruments of transfer and other documents on behalf of the persons entitled to the dividend, and such appointment shall be effective.

Whenever the Board or our Company in general meeting have resolved that a dividend be paid or declared on the share capital of our Company, the Board may further resolve: (a) that such dividend be satisfied wholly or in part in the form of an allotment of shares credited as fully paid, provided that the members entitled to it will be entitled to elect to receive such dividend (or part thereof) in cash in lieu of such allotment; (b) that the members entitled to such dividend be entitled to elect to receive an allotment of shares credited as fully paid in lieu of the whole or such part of the dividend as the Board may think fit.

All unclaimed dividends, interest or other sums payable may be invested or otherwise made use of by the Board for the benefit of our Company until claimed. Any dividend unclaimed after a period of six years from the date it became due for payment shall be forfeited and shall revert to our Company. The payment of any unclaimed dividend, interest or other sum payable by our Company on or in respect of any share into a separate account shall not constitute our Company a trustee in respect of it.

INDEMNITY

Subject to the provisions of the Companies Ordinance, every Director, every Joint Company Secretary or other officer of our Company shall be entitled to be indemnified by our Company against all costs, charges, losses, expenses and liabilities incurred by him in the execution and discharge of his duties or in relation to it.

WINDING UP

If our Company is in liquidation, the liquidator (whether voluntary or official) may, with the sanction of a special resolution of our Company and any other sanction required by law:

(a) divide among the members in specie the whole or any part of the assets of our Company and for that purpose, value any assets and determine how the division shall be carried out as between the members or different classes of members; or

(b) vest the whole or any part of the assets of our Company in trustees upon such trusts for the benefit of the members or any of them as the liquidator, with the like sanction, shall think fit but no member shall be compelled to accept any asset upon which there is any liability.

UNTRACEABLE SHAREHOLDERS

Without prejudice to the rights of our Company and in accordance with the Listing Rules, our Company may cease to send any cheque or warrant or order through the post for any dividend payable on any shares in our Company which is normally paid in that manner on those shares if in respect of at least two consecutive dividends payable on those shares the cheques or warrants or orders remain uncashed or after the first occasion when the cheques or warrants or orders have been returned undelivered.

Our Company shall be entitled to sell, in such manner as the Board thinks fit, any share of a member, or any share to which a person is entitled by transmission, if:

(a) during a period of twelve years at least three cash dividends or other distributions have become payable in respect of the share to be sold and have been sent by our Company in accordance with the Articles;

(b) during that period of twelve years no dividend or other distribution payable in respect of the share has been claimed, no cheque, warrant, order or other payment for a dividend has been cashed, no dividend sent by means of a funds transfer system has been paid and no communication has been received by our Company from the member or the person entitled by transmission to the share;

(c) on or after the expiry of that period of twelve years our Company has published advertisements in at least one English language newspaper and one Chinese language newspaper circulating in Hong Kong giving notice of its intention to sell the share;

(d) during the period of three months following the publication of those advertisements or of the first of the advertisements if they are published on different dates, our Company has not received any communication from the member or the person entitled by transmission to the share; and

(e) our Company has given notice to the Stock Exchange of its intention to sell the share.

To give effect to any sale, the Board may authorise some person to transfer the share to, or as directed by, the purchaser, who shall not be bound to see to the application of the purchase money; nor shall the title of the new holder to the share be affected by any irregularity in, or invalidity of, the proceedings relating to the sale.

The following sets out a summary of the significant laws and regulations that affect our businesses in Colombia, Kyrgyzstan, Guyana, Suriname, Ghana, Tajikistan and Australia. Information contained below shall not be construed as a comprehensive summary of all the laws and regulations applicable to us.

LAWS AND REGULATIONS RELATED TO OUR COLOMBIA OPERATIONS

Mining Matters

In Colombia, mineral rights — with limited exceptions — are owned by the State, as established in the Political Constitution, regardless of who owns the land where the minerals are located. Currently, the only mechanism through which private parties may obtain the right to explore and exploit State-owned mineral resources is the mining concession contract (the "**Mining Title**"). A Mining Title does not transfer ownership of the minerals but grants a temporary and exclusive right to explore and/or extract them in exchange for royalty payments, provided the Mining Title remains in good standing. Importantly, under Colombian mining law, foreign individuals and entities have the same rights as Colombian nationals and cannot be subject to additional or different requirements.

To be valid, these Mining Titles must be formally granted by the competent authority, the National Mining Agency ("**ANM**", for its acronym in Spanish), and registered with the National Mining Registry. The applicable legal framework is primarily set out in Law 685 of 2001, the Colombian Mining Code. However, before the enactment of the current Mining Code, other types of mining titles existed. Some of these mining titles are still in force and continue to be governed by the previous legal framework due to acquired rights.

Regarding institutional responsibilities, the ANM is the entity responsible for administering mining law regarding Mining Titles. Moreover, until January 1, 2024, the Government of the Department of Antioquia also exercised authority over certain aspects of Mining Title administration.

Under Colombian mining law, the first applicant for a given area is granted priority to obtain a mining title. To be awarded the Mining Title, the applicant must pass a legal, technical, economic, and environmental evaluation. The legal evaluation confirms that the applicant has no restrictions on contracting with the State. The technical and economic evaluations assess the proposed exploration activities and the applicant's financial capacity to carry them out. The environmental evaluation verifies whether the requested area overlaps with zones of environmental interest.

As part of the environmental evaluation, ANM requires submitting an environmental certification issued by the competent environmental authority. For applications submitted after January 24, 2023, ANM has further requested that this certification be dated before or on the same date as the filing of the Mining Title application. This requirement has significantly complicated the process of obtaining new Mining Titles due to administrative delays and how the application process functions.

Concerning the timeline of mining activities, Mining Titles in Colombia consist of three stages: (i) an exploration stage lasting three years, extendable for eight additional years; (ii) a construction and assembly stage lasting three years, extendable for an additional year; and (iii) an exploitation stage covering the remaining term of the Mining Title. The total duration of the Mining Title may not exceed thirty years.

Additionally, holders of Mining Titles have different obligations at each stage, including the payment of surface fees, the submission of the annual Basic Mining Format ("**FBM**", for its acronym in Spanish), the acquisition of an environmental mining policy, the preparation of a Work Plan ("**PTO**", for its acronym in Spanish), obtaining an environmental license, paying royalties, implementing a social management plan, and adopting a production control methodology.

Finally, an important aspect to consider regarding mining in Colombia is the extremely high level of informality, particularly in gold production. This involves not only subsistence mining but also the presence of illicit groups engaged in illegal mining activities. While subsistence mining is being addressed through public policies that promote formalization, the involvement of criminal organizations presents more complex challenges for the State. In this context, some of the formalization efforts have been designed to operate within the framework of existing mining titles.

Among the formalization mechanisms available in Colombia, several involve direct participation by existing mining titleholders. These include formalization subcontracts, whereby an informal miner is authorized to operate legally within the boundaries of a registered title through an agreement with the concession holder. Additionally, titleholders may facilitate formalization by assigning part of their area or rights to a third party. These collaborative tools aim to promote legal access to mineral resources. Nevertheless, interference or unauthorized occupation of mining titles remains a common issue.

Environmental and Community Participation Matters

From an environmental perspective, the mining sector is subject to comprehensive regulatory oversight. The regulatory framework includes both national and regional regulations that govern, among others, licenses aimed at managing the projects' potential environmental impacts, permits for the use of renewable natural resources, a broad system of environmentally protected areas, social participation mechanisms and other requirements such as waste management. Further details are presented below.

The Ministry of Environment and Sustainable Development ("**MADS**") is the head of the environmental sector, and is responsible for issuing relevant regulations, whilst the National Licensing Agency ("**ANLA**") and the regional environmental corporations (*Corporaciones Autonomas Regionales*, in Spanish) authorize and surveil projects and activities. Moreover, according to recent regulations issued by the MADS, indigenous communities may appoint bodies that act also as environmental authorities within their territories.

Licenses and permits

As a general rule, exploration activities are not subject to an environmental license, but the titleholder shall request and obtain the environmental permits for the use of the renewable natural resources (e.g., water collections, wastewater discharge, tree cutting) required for such activities. Also, the titleholder shall abide by the mining-environmental guidelines for exploration, which are considered a tool of mandatory consultation and orientation.

In turn, for conducting mining construction, exploitation and closure activities, the titleholder must obtain an environmental license before ANLA or the regional environmental corporations, depending on the size of the exploitation. The request for environmental licensing must be supported by an environmental and social impact study, and must include measures for preventing, mitigating, correcting or compensating such impacts.

The environmental license comprises all activities and permits required for the mining project and may be modified or transferred with the previous authorization of the environmental authority. The environmental authority periodically — usually on an annual basis — surveys the titleholder's compliance with the terms and conditions of the environmental license and may make additional requirements or even initiate investigations in case of identifying breaches of the obligations under the environmental license.

Environmentally protected areas and areas of environmental significance

Under current regulations, mining activities are prohibited within national and regional natural parks (44 and 60, respectively), protective forest reserves (57), moorlands (*paramos*), RAMSAR wetlands (11), coral reefs and mangroves.

Moreover, mining activities may be restricted by the environmental authority within areas declared as national and regional integrated management districts (5 and 130, respectively), soil conservation districts (22), recreation areas (12), among others. In such a case, as well as in case of overlap with forest reserves declared by Law 2 of 1959, the titleholder must request the extraction of the area of interest from the respective protection category, prior to undertaking exploration and exploitation activities.

In 2022, the Council of State ordered the MADS, among others, to clearly identify the environmentally protected areas and other areas of environmental significance in which mining activities are prohibited or restricted, as well as those in which the environmental authority has not established whether mining can be undertaken or not. MADS has not complied with such orders yet.

Community's participation in environmental matters

Prior consultation for ethnic communities

Under the Colombian Political Constitution, Convention 169 of the International Labour Organization and the rulings of the Constitutional Court, indigenous, black and rom communities are entitled to decide on the future of their lives and territories through prior, free and informed consultation, whenever a project or activity may directly affect them. As a general rule, ethnic communities may not hold veto power over the project, conducting the prior consultation process, with or without reaching an agreement with the community, is a requisite for requesting the environmental license.

Other participation mechanisms

Without prejudice of the need for prior consultation, current regulations establish a few mechanisms for guaranteeing citizen participation in environmental proceedings.

On one hand, the Attorney General of the Nation or the Delegate for Environmental Affairs, the Ombudsman, the Minister of the Environment, other environmental authorities, governors, mayors, or at least one hundred (100) persons or three (3) non-profit entities, may request a public hearing to be held before the environmental authority decides on the granting or modification of an environmental permit or license. Although during the hearing no decisions will be made, the interventions of the participants must be considered by the environmental authority when deciding on the granting or modification of the license or permit.

On the other hand, any citizen may request the environmental authority to intervene in the procedures for the granting, modification or termination of environmental licenses or permits, or in environmental investigations. Recently, ANLA has indicated that interventions may also be requested during the surveillance and control of projects subject to environmental license.

Escazu Agreement

On August 28, 2024, the Constitutional Court issued its decision regarding the constitutionality of Law 2273 of 2022, which approved the Regional Agreement on Access to Information, Public Participation, and Access to Justice in Environmental Matters in Latin America and the Caribbean, commonly known as the Escazú Agreement. This agreement aims at ensuring access to environmental information, promoting public participation in environmental decision-making processes and guaranteeing access to justice in environmental matters, among others.

As a result, it is likely that the requests for information related to specific projects and for intervening in environmental procedures may increase. Also, environmental authorities such as ANLA have been prone to broaden the spaces for participation in the different stages of the environmental license based on the Agreement.

Environmental liabilities

Environmental offenses may give rise to administrative, civil and/or criminal liabilities, as described below.

(a) Administrative liability

Laws 1333 of 2009 and 2387 of 2024 govern the administrative liability for environmental offenses in Colombia. Under such laws, the breach of environmental regulations and/or causing environmental damage may give rise to an administrative investigation, which can result in:

(i) preventive measures, including the preventive seizure of products used to commit the offense; the suspension of the project, work or activity; or the order to conduct assessments for establishing the nature of the damage or impacts, and the required measures to mitigate or compensate them; and/or

(ii) penalties, which consist of fines of up to 100,000 monthly minimum wages (i.e., approximately USD$33,000,000)[1], temporary or definitive closure of the project or activity; termination of the license or permit; and demolition of the works, among others. The environmental authority shall consider the severity of the offense when determining the penalty(ies) to be imposed.

The statute of limitations of environmental liability is 20 years.

(b) Criminal liability

Under current regulations, companies are not subject to criminal liability. Accordingly, only individuals may be prosecuted for the commission of environmental crimes such as pollution, damage to the or illegal use of renewable natural resources, among others. Although uncommon, there are precedents of criminal investigations against company officials involved in the commission of an environmental crime in the performance of their jobs.

(c) Civil liability

Environmental offenses may also give rise to civil liabilities for environmental damage, either individually or collectively (class action), as well as constitutional actions seeking the protection of collective rights (e.g., the environmental) (*acción popular*).

1 For offenses committed before July 25, 2024, the maximum daily fine is of up to 5,000 monthly minimum wage (i.e., approximately USD$1,700,000).

Labour Matters

Key labour laws and regulations

The labour regulatory framework in Colombia comprises (a) the Political Constitution, (b) the Colombian Labor Code, (c) the Social Security Regime, (d) Regulations and decisions issued by the Ministry of Labor, the Labor Courts, and the Constitutional Court, and (e) safe and occupational safety at work regulations.

The foregoing regulations govern employment contracts, working hours, wages, terminations, social security contributions, and occupational safety. As an employer in the mining sector, Continental Gold Limited Sucursal Colombia must comply with strict obligations related to working conditions, benefits, and termination procedures; failure to comply with such regulations may result in fines or judicial proceedings.

Collective bargaining rights

The right to unionize and engage in collective bargaining is a fundamental constitutional guarantee in Colombia, enshrined in Article 39 of the Colombian Constitution and further regulated by the Colombian Labour Code. These rights are reinforced by international treaties ratified by Colombia, including ILO Conventions 87 and 98, which protect freedom of association and the right to organize.

Under this legal framework, employees are entitled to form or join trade unions and to negotiate collectively with their employers over employment conditions, including wages, working hours, occupational safety, and other terms of employment. Employers are obligated to engage in good-faith negotiations and to respect any resulting collective bargaining agreements ("**CBA**").

CBA are material to the company's operations for several reasons:

(a) The CBA may introduce structured wage increases and other financial benefits that may impact labour costs and shall be further analysed.

(b) Non-compliance with the agreement or breakdowns in negotiations could lead to legal claims as well as reputational harm.

(c) Colombian labour law permits strikes under regulated conditions. As such, the existence of a CBA heightens the need for continuous union engagement to avoid disruptions such as strikes or work stoppages.

Occupational Health and Safety (OHS) regulations

Colombian law imposes comprehensive obligations on employers to safeguard the health, safety, and wellbeing of employees, particularly in high-risk sectors such as mining. The regulatory framework is primarily established under Resolution 0312 of 2019 and Decree 1072 of 2015, which mandate the implementation of an Occupational Health and Safety Management System (*Sistema de Gestión de la Seguridad y Salud en el Trabajo — SG-SST*).

(a) This system must be risk-based, preventive in nature, and integrated into the company's overall management practices. It requires employers to:

(b) Conduct formal risk assessments across all operational areas.

(c) Establish policies and procedures to mitigate occupational hazards.

(d) Provide ongoing training, protective equipment, and health monitoring for workers.

(e) Maintain accident and incident records and report them to authorities.

Given the inherently hazardous nature of underground mining, the Buriticá mine is subject to enhanced scrutiny from the Colombian Ministry of Labour. Non-compliance may lead to administrative sanctions, temporary suspension of operations, labour liability for workplace injuries.

Faults and sanctions

Faults and sanctions are listed in the Colombian Labor Code and in the employer's Internal Work Regulation. The severity of sanctions will vary depending on the nature of the employee's fault. Under Colombian labor laws, the following sanctions may be imposed on employees:

(a) Suspension of the employment contract without payment, in certain situations specified by law.

(b) Imposition of fines of up to one-fifth of the employee's daily salary. The money shall be used for awards and recognition of employees' good performance.

(c) Termination of the employment contract with legal cause. The causes must be invoked in writing at the time of termination.

(d) Disciplinary memorandums to be kept in the employees' permanent records.

According to Article 105 of the Colombian Labor Code, before imposing a sanction to an employee, it is mandatory to have an audience in which the employee is guaranteed to use his/her right of defense.

Termination with legal cause

In every employment relationship, any of the parties may terminate the labour contract unilaterally, without cause and without prior notice. However, the terminating party will be responsible for indemnifying damages.

In general, under Colombian law, employment contracts may be terminated without notice by either of the parties. However, if the employer terminates the contract, the effects of the termination will vary depending on whether the contract is terminated with legal cause or not, and on the type of contract.

A contract may be terminated by the employer with legal cause in the event of an employee's violation of legal and/or contractual obligations or internal regulations. In any other event, the agreement will be considered as terminated without legal cause, and the employer will be liable to pay a legal compensation and/or severance payment.

When the employee terminates unilaterally the employment contract, without any breach by the employer, their resignation must be freely and voluntarily made, and it does not require prior notice.

Non-compliance could result in reinstatement orders and retroactive payments.

Restrictions on terminations, including authority approval for collective dismissal

Employers have limits regarding the termination of employment contracts. Current employment regulations have established a limit on the number of employees that may be dismissed without being considered as a Collective Dismissal.

When an employer needs to exceed the limit on employment contracts termination, it is necessary to request a special authorization before the Ministry of Labor. If the employer exceeds such limit without due authorization, the termination will not have any legal effects, and the employees shall be reinstated.

A massive dismissal will be considered as a Collective Dismissal for legal purposes when it surpasses the prescribed percentages depending on the number of the employees of the entity within a period of six (6) months.

Notwithstanding the foregoing, it is important to mention that the employment contracts that are terminated unilaterally by the employer arguing a legal cause attributable to the employee, by mutual agreement or by resignation of employees, are not considered in the percentage to assess if a Collective Dismissal took place.

Labour liabilities

Continental Gold Limited Sucursal Colombia may be subject to a range of potential labour-related liabilities that may arise from breaches of statutory duties, collective bargaining obligations, or failures in labour management practices.

These liabilities may materialize through administrative sanctions, or judicial claims.

Courts may impose monetary compensation, interest, and penalties, and enforce injunctive measures, such as reinstating dismissed employees or halting specific employment practices.

Compliance obligations

Foreign mining branches operating in Colombia may be subject to compliance obligations set forth by the Superintendence of Companies, particularly those related to the prevention of money laundering, terrorist financing, and transnational bribery.

Two key programs are the System for Self-Control and Risk Management of Money Laundering, Terrorist Financing, and Financing of the Proliferation of Weapons of Mass Destruction (SAGRILAFT) and the Business Transparency and Ethics Program (PTEE). The applicability of these programs depends on the financial thresholds and business activities of the company.

Sagrilaft

Under Chapter X of the Basic Legal Circular issued by the Superintendence of Companies, companies are required to implement SAGRILAFT if, as of December 31 of the preceding year, they meet the following criteria:

- Are subject to the surveillance or control of the Superintendence of Companies; and
- Have obtained total income or held total assets equal to or greater than 40,000 Monthly Legal Minimum Wages (MLMW).

Companies meeting these conditions are obligated to adopt the full scope of the SAGRILAFT, including risk identification, assessment, control mechanisms, internal procedures, and reporting duties.

PTEE

Supervised companies must implement a PTEE where, as of December 31 of the immediately preceding year, they meet one or more of the following conditions:

(a) *Transnational transactions requirement*

- Have carried out international transactions of any nature, either directly, through intermediaries, contractors, subsidiaries, or branches, with foreign public or private legal or natural persons;
- The value of such transactions (individually or jointly) is equal to or exceeds 100 MLMW; and
- Have obtained total income or held total assets equal to or greater than 30,000 MLMW.

Companies meeting this threshold must adopt a PTEE and are required to identify and assess the risks of transnational bribery.

(b) Public sector contracting requirement

- Have entered, directly or indirectly (including via consortiums, temporary unions, or similar structures), into contracts with State entities for an amount equal to or greater than 500 MLMW (individually or in aggregate); and

- Have obtained total income or held total assets equal to or greater than 30,000 MLMW.

Companies under this scenario must also implement the PTEE and are required to identify and assess the risks of corruption.

While the current regulatory regime is well-defined, Colombian authorities have demonstrated a continued commitment to strengthening compliance requirements, particularly in line with international best practices recommendations. Consequently, it is anticipated that further updates to these regulations may be introduced in the near future. Continental Gold should closely monitor developments in this area to ensure ongoing compliance and to mitigate any potential material impacts on its operations in Colombia.

Customs Matters and Foreign Exchange Regime

Importation of Goods

According to Decree 1165 of 2019, the entry of foreign goods into the National Customs Territory ("**TAN**", by its acronym in Spanish) requires the submission of an import declaration and the payment of applicable customs duties (tariff and VAT).

For tariff purposes, Colombia uses the Harmonized Commodity Description and Coding System approved by the World Customs Organization (Decree 1881 of 2021). Tariffs in Colombia generally range from 0% to 5% and 10% to 15%.

It is worth noting that a 0% tariff applies in Colombia to import machinery and equipment not produced in the country, according to the tariff subheadings approved by the Ministry of Commerce, Industry, and Tourism under Decree 272 of 2018. This benefit aims to support the productivity and competitiveness of various sectors, including mining.

The general value-added tax ("**VAT**") rate in Colombia is 19%.

Regarding import procedures, Colombia offers different import modalities, which importers may use depending on the type of transaction with their supplier, the duration of goods' stay in the country, and, in general, the importer's needs in each case.

As a general rule, goods are freely importable into Colombia, meaning they do not require prior authorization unless they are expressly prohibited, restricted, or subject to prior requirements for reasons related to health, safety, the environment, or national defense. These include, for example, narcotics, controlled chemical substances, waste or hazardous materials, used or refurbished equipment, among others. Such goods require an import license or registration, which the importer must obtain through the "Single Window for Foreign Trade" ("**VUCE**" by its acronym in Spanish), managed by the Ministry of Commerce, Industry, and Tourism.

Under current regulations, goods imported into Colombia may be stored in authorized warehouses for one month, extendable by an additional month, counted from the unloading date. If the goods are not cleared up or re-exported within that time, they will be considered legally abandoned in favor of the Nation. However, there are cases in which the submission of an advance import declaration is mandatory.

Exportation of goods

The export process begins with submitting and accepting a shipping authorization request and ends with submitting an Export Declaration through the Customs Authority's electronic systems.

Generally, exports from Colombia are not subject to customs duties.

Foreign exchange regime

Colombia has a clear and reasonably stable foreign exchange regime.

Although the foreign exchange market operates freely, exchange regulations establish certain operations that must be channeled and reported to the Central Bank of Colombia (Banco de la República), along with the procedures to be followed and the penalties applicable in case of non-compliance.

The following operations are subject to mandatory channeling through the foreign exchange market, (a) import and export of goods, (b) foreign debt operations by residents, including associated financial costs, (c) foreign capital investments in Colombia and their returns, (d) Colombian capital investments abroad and their returns, (e) financial investments in securities issued and assets located abroad, including related returns, (f) guarantees and sureties in foreign currency, and (g) derivatives transactions.

The declarant of the foreign exchange transaction may fulfill the obligation to channel foreign currency through the exchange market using one of the following mechanisms: a) buying/selling foreign currency through authorized Foreign Exchange Market Intermediaries; or b) using a foreign bank account registered under the compensation mechanism with the Central Bank of Colombia.

Foreign investment

Registering a foreign investment with the Central Bank of Colombia requires the submission of an exchange declaration and grants the investor "foreign exchange rights," such as the ability to receive dividend payments abroad and to transfer the registry of foreign investment to another foreign investor in the event of the sale of the shares.

Taxation on Mining Companies

From a tax perspective, the obligations of mining branches of foreign companies operating in Colombia are governed by a broad set of national and local regulations. The following section outlines the key tax obligations that are materially relevant to their business operations.

Income tax

Branches of foreign companies operating in Colombia are subject to the general corporate income tax regime. To comply with this requirement, branches must maintain separate accounting records that clearly distinguish the income, costs, and expenses attributable to their operations in Colombia.

The tax is levied on the net profit generated by the branch's economic activity, based on the income earned and the costs and expenses incurred to generate that income.

As of 2025, the standard corporate income tax rate is 35%. The taxable period for income tax purposes is the calendar year, which begins on January 1 and ends on December 31. However, the tax return must be filed in the following year, in accordance with the deadlines set by the applicable tax calendar issued by the Colombian tax authority.

Capital gains

Capital gains tax applies to specific types of income arising from transactions deemed extraordinary by the Colombian legislation, as they do not originate from regular business operations, including (a) gains from the disposal of fixed assets held for two years or more; (b) the excess of capital returned upon the liquidation of a company over the amount originally contributed or invested; (c) income from donations; and (iv) income from lotteries, prizes, raffles, bets, and similar extraordinary winnings.

Capital gains are subject to separate taxation from ordinary income and are not eligible for deductions related to the taxpayer's ordinary costs and expenses.

As a general rule, capital gains in Colombia are subject to a tax rate of 15%. However, an exceptional rate of 20% applies to capital gains derived from lotteries, raffles, bets, prizes, and similar types of windfall income, as specifically provided by law.

Capital gains tax is calculated and filed simultaneously with the corporate income tax return.

Value-added tax (VAT)

Value-Added Tax (VAT) in Colombia is a national-level indirect tax applicable to the transactions mentioned in Article 420 of the Tax Code, unless expressly excluded by law. The general VAT rate is 19%, though certain goods and services are subject to a 5% rate or except (0% rate).

As a general rule, VAT paid by the company on the acquisition of goods and services may be offset against the VAT collected from clients, to determine the net VAT payable to the Colombian Tax Authority in the corresponding tax return.

Dividends

From a tax perspective, the transfer of profits attributed to a foreign entity's branch in Colombia to its related companies abroad is permitted and will be subject to the tax rules applicable to dividend distributions.

Pursuant to Article 245 of the Colombian Tax Code, distributions of dividends to foreign entities will be taxed as follows:

- If the profits have already been taxed at the standard 35% corporate income tax rate, the dividend distributed will be subject to an additional 20% withholding tax.

- If all or part the profits were not taxed at the corporate level, they will be subject to the 35% corporate income tax, and on the remaining 65% of such profits, a 20% income tax withholding shall also be applicable.

Stamp tax

The National Stamp Tax was reintroduced by Decree 0175 of 2025, as a result of the modification of the applicable rate from 0% to 1%, and applies to the execution, acceptance, or issuance of public instruments and private documents, provided that all the requirements established in Article 519 of the Tax Code are met and the document is not exempt pursuant to Article 530 of the same code. Transactions that do not qualify for an exemption may be subject to a 1% tax on their gross value. The economic burden of the tax may be contractually allocated between the parties as they deem appropriate. However, if both parties to the agreement are legal entities, the party making the payment is legally responsible for collecting and paying the tax to the Colombian tax administration.

Property tax

The Unified Property Tax is a local, annual tax levied on the ownership or possession of real estate located within the jurisdiction of a particular municipality.

The administration, collection, and oversight of this tax are the responsibility of each individual municipal or district government. The tax base is generally the cadastral appraisal value of the property, or the self-assessed value.

The applicable tax rate is determined by the respective local regulations and may range from 5 to 16 per 1,000.

Local industry and commerce tax

The Industry and Commerce Tax (ICA for its acronym in Spanish) is a local tax imposed by municipalities on all commercial, industrial, or service activities carried out directly or indirectly within their jurisdiction. This tax applies to legal entities, including branches, regardless of whether their operations are permanent or occasional, and whether or not conducted from a physical commercial establishment.

The tax is generally assessed on gross income generated within each municipality, with rates ranging from 4 to 14 per 1,000, depending on the type of activity and local regulations.

Financial transaction tax

The Financial Transactions Tax (GMF for its acronym in Spanish) applies financial transactions in which funds are withdrawn or transferred from checking or savings accounts, deposit accounts at Banco de la República, or when cashier's checks are issued.

The applicable rate is 4 per 1,000 of the value of each taxable transaction. This tax is withheld by the financial institutions, which are responsible for collecting and paying the tax to the Colombian Tax Authority.

LAWS AND REGULATIONS RELATED TO OUR KYRGYZSTAN OPERATIONS

Main laws and regulations on mining

Legal framework

The legislation of the Kyrgyz Republic in the field of subsoil use is based on the provisions of the Constitution of the Kyrgyz Republic and consists of the Law "On Subsoil" No. 49 dated 19 May 2018 (the "**Subsoil Law**"), and other normative legal acts of the Kyrgyz Republic adopted in accordance with it.

Subsoil is defined as the part of the earth's crust located beneath the soil layer, or in its absence, beneath the earth's surface and the beds of water bodies and watercourses. It extends to depths accessible for geological exploration and development, and includes placer occurrences of mineral resources.

Granting of subsoil use rights

Subsoil use rights may be granted for geological mapping and research, exploration, and extraction of minerals/groundwater, as well as for construction and operation of underground facilities not related to mineral extraction, and for establishing protected sites of scientific, cultural, environmental or other importance.

The right to use subsoil may be provided on the basis of (i) a license, (ii) state registration, (iii) a concession agreement, (iv) a production sharing agreement.

The right to use subsoil on the basis of a license may be granted through (i) tender, (ii) auction, (iii) application of the "first-come, first-served" principle, (iv) decision of the Cabinet of Ministers of the Kyrgyz Republic.

Licenses for the development of mineral deposits are issued up to 20 years, with the possibility of extension until the depletion of mineral reserves.

Licenses for the extraction and use of groundwater are issued up to 10 years with the possibility of further extension. This type of licenses may be extended upon the licensee's application if submitted before expiry, accompanied by a positive hydrogeological assessment, a report on work performed during the current year, and the well owner's consent if the well is privately owned.

Holders of the subsoil use rights

The right to use subsoil may be provided only to legal entities established in accordance with the Kyrgyz Law, as well as individuals (including foreign citizens) registered as individual entrepreneurs under the Kyrgyz Law.

Since 22 June 2022, a legal entity or individual recognized as the winner of an auction or tender for the right to use large or medium-sized gold and silver deposits is required to establish a legal entity in the Kyrgyz Republic, with a mandatory state participation share of not less than 30%, for the purpose of obtaining a subsoil use license. The Taldybulak Levoberezhny Gold Mine is medium-sized. This norm has no retrospective force, though our Company already has a 40% state participation share.

Suspension and termination of the subsoil use rights

Suspension of the subsoil use rights

The right to use subsoil may be suspended by the authorized state body for subsoil use for a period of up to three months, with an indication of the reasons for the suspension and an order to remedy the identified violations. Such license suspension may be in the following cases:

(a) violation of subsoil protection, environmental, or industrial safety requirements established by the legislation of the Kyrgyz Republic, creating an immediate threat to the life or health of individuals working or residing within the area affected by subsoil use activities;

(b) failure to submit reports on geological and mining operations or reports on the movement of mineral reserves within the deadlines established by the legislation of the Kyrgyz Republic;

(c) submission of reports on geological and mining operations or reports on the movement of mineral reserves containing inaccurate information;

(d) failure to comply with requirements on the accumulation of funds for land reclamation;

(e) violation of the deadlines for payment of the bonus and/or license fees;

(f) failure to notify the authorized state body for subsoil use within the prescribed period about a change in the participants (shareholders) of the licensee legal entity, if such a change results in a bonus payment under the tax legislation of the Kyrgyz Republic.

If the subsoil areas are included in the Register of subsoil plots of national importance then, in the event of failure or improper fulfillment by the licensee of the obligations set out in the terms of the social package, the right to use subsoil may be suspended by the authorized state body for subsoil use for a period of three months. The Taldybulak Levoberezhny Gold Mine included in the Register of subsoil plots of national importance; therefore, this norm is applicable to our Company. The deadline for the elimination of violations maybe extended by the authorized state body for subsoil use, upon a reasoned request from the subsoil user which shall be submitted no later than five days prior to the expiration of the license suspension period.

Termination of the subsoil use rights

The right to use subsoil may be terminated on the following grounds:

(a) voluntary waiver of subsoil use rights by the subsoil user;

(b) expiration of the license term without a timely application by the licensee for its renewal or transformation;

(c) conducting operations without an approved technical project that has passed all required expert reviews and/or without a license agreement for the planned works;

(d) failure to eliminate, within the established timeframe, the causes that led to the suspension of subsoil use rights;

(e) carrying out subsoil use activities during a period in which such rights were suspended;

(f) failure to disclose, or the discovery of false information regarding, the company's beneficial owners;

(g) failure to fulfill the design obligations under the license agreement for more than two years, except for licenses issued through tenders for subsoil areas of national significance.

Laws and regulations on export of gold

The regulation governing the export and import of ores, concentrates, and waste containing precious and associated extractable metals in the Kyrgyz Republic establishes a mandatory accounting control system. This system applies to all foreign economic activities involving such raw materials. Exporters must undergo a classification and accounting process, which includes laboratory sampling and testing. These tests determine the composition and quantity of valuable metals, and the results are used for calculating taxes and issuing export licenses. The applicant must provide a comprehensive set of documents, including proof of subsoil use rights, ownership documents, and foreign trade contracts. Based on the results, the authorized body issues an expert opinion confirming the quantity of metals and the feasibility of processing the materials domestically. This opinion is used both for licensing and taxation purposes.

State laboratory assessments

On 15 July 2022, the Cabinet of Ministers of the Kyrgyz Republic adopted Resolution No. 384, introducing amendments to the Regulation on Export and Import of Precious Metal-Containing Materials (as defined in footnote 23). The amendments transferred the full responsibility for sampling inspections and laboratory analysis to the state enterprise "Central Laboratory under the Ministry of Natural Resources, Ecology and Technical Supervision of the Kyrgyz Republic" (the "**Central Laboratory**") to strengthen government oversight of precious metal content. Previously, the Central Laboratory functioned primarily in a supervisory capacity, conducting sample analyses on selected batches of concentrates and ores. It had the authority to carry out either selective or continuous monitoring of sample inspections. Following the amendments, the Central

Laboratory became the exclusive entity authorized to perform the entire process of sample inspection and testing, thereby enhancing the regulatory framework and state control over the export and import of precious metal-containing materials.

State's Priority Right to Purchase Gold

The Cabinet of Ministers and the National Bank of the Kyrgyz Republic hold a priority right to purchase refined precious metals and precious stones derived from domestically mined ores and intermediate refining products, whether refined in Kyrgyzstan or abroad. These purchases are made at world market prices, minus transportation and sales-related costs.

The Cabinet of Ministers' priority rights are exercised through an authorized state body. Sales to the Cabinet of Ministers and the National Bank are carried out in accordance with procedures established by each respective authority.

If the Cabinet of Ministers or the National Bank decline to exercise their priority right, the refined precious metals and precious stones may be sold to third parties.

Laws and regulations on financial obligations

Tax payments

Taxation in the Kyrgyz Republic is regulated by the Tax Code of the Kyrgyz Republic No. 3 dated 18 January 2022 (the "**Tax Code**") and other legal acts. For tax purposes, Kyrgyz law classifies legal entities as domestic or foreign. Domestic entities are established under Kyrgyz law, while foreign entities are those formed under foreign laws or as international organizations.

General tax regime

To date, in the Kyrgyz Republic, the following taxes are chargeable from relevant taxpayers under the general tax regime.

National taxes	**Local taxes**
Profit tax Income tax Value added tax (VAT) Excise tax Mining taxes (bonuses and royalties) Sales tax	Property taxes (e.g. for a land, buildings, vehicles, etc.)

As a rule, the mining industry in the Kyrgyz Republic is subject to a general tax regime.

Mining taxes

(a) Bonuses

Bonus is a one-time payment for the subsoil use right for prospecting, exploration and development of mineral deposits. The tax base for the calculation of the bonus is the amount of geological reserves and expected resources registered by State cadaster of deposits and occurrences of minerals of the Kyrgyz Republic, size of the license area, and the drilling depth of water wells. The bonus shall be paid within 30 days from the date of licence issuance.

(b) Royalty

Royalty is the recurrent payments for the use of subsoil for development purposes and/or selection (extraction from the subsoil) of groundwater. The royalty tax base is determined by revenue from mineral sales (excluding certain costs and taxes), the volume of subsoil water withdrawn, or the value of pure metals in ores or concentrates — whichever is higher in the case of metal sales. The royalty rate is 5 percent for gold, silver and platinum, as well as metal-containing ores and concentrates of gold, silver and platinum. For metals, metal-containing ores and metal concentrates, except for gold, silver and platinum — 3 percent.

Non-tax payments

Land rent fee

The land plots for mining use are provided only for temporary use. Upon leasing a land plot, a mining company shall pay a land rent fee, which generally amounts to double the land tax. The tax base is the area of the land plot in square meters.

License retention fee

The fee is paid by holders of licenses for prospecting, exploration, or development of mineral deposits (extraction of minerals) in the Kyrgyz Republic, with the taxable object being the licensed use of mineral resources within a designated area. The tax base is the size of the licensed area. When subsoil is used for development purposes, the fee is not charged after reaching the design capacity, provided that 90% of the annual mineral extraction volume set by the licensing agreement is achieved.

Surface water usage fee

Mining companies pay 100 soms or 60 soms per cubic meter for using surface water, depending on whether the water source is above or below 2,700 meters in elevation.

Ecological fees (waste disposal fees)

Mining companies in the Kyrgyz Republic are also mandated to pay ecological fees for environmental pollution and waste disposal. These payments encompass charges for emissions into the atmosphere, discharges into water bodies, and the placement of industrial and hazardous waste. Environmental pollution fees are charged at 3.24 soms per standardized ton for air emissions and for the disposal of waste and mining dumps, and at a higher rate of 10.5 soms per standardized ton for the discharge of pollutants into the environment through wastewater.

Other mandatory payments

Among other mandatory deductions are social security contributions to the Social Fund of the Kyrgyz Republic regulated by the Law "On State Social Security", the Law "On Tariffs of Social Security Contributions for State Social Security", and other acts.

Laws and regulations on social obligations

Social package

According to the Kyrgyz Law, a social package is a voluntary agreement between a subsoil user and a local government body to promote the socio-economic development of a region in which a subsoil use facility of national importance is located, which is prepared on the basis of a program for the socio-economic development of the local community. However, in practice, subsoil users are rather obligated to enter into such agreements, as tender conditions typically include mandatory commitments to a minimum level of investment in the socio-economic development of the local community where the subsoil operations are conducted.

Local infrastructure development obligations

Separate from social package, mining companies also incur payments for the development and maintenance of local infrastructure and the implementation of targeted activities. Payments are calculated at 2 percent of the revenue generated from the sale of minerals or, if the minerals have not been sold, based on their value prior to processing, with the amount excluding indirect taxes such as VAT and sales tax, but including the costs associated with shipping and transportation of the minerals.

Laws and regulations on labour matters

General requirements

The Labor Code of the Kyrgyz Republic No. 24 dated 23 January 2025 (the "**Labor Code**") establishes a standard workweek of 40 hours, with a daily limit of 8 working hours, and requires employers to provide overtime compensation in accordance with the law. Specific provisions also apply to shift-based work, which is common in the mining sector, to ensure compliance with rest periods and occupational safety standards.

Employers must grant employees annual paid leave, sick leave, and other statutory benefits, including extended annual leave for mining workers due to the hazardous nature of their work. In terms of occupational health and safety, mining companies are obligated to conduct regular risk assessments, maintain safe working conditions, and provide employees with appropriate personal protective equipment. They must also ensure that all workers assigned to physically demanding or dangerous tasks undergo mandatory pre-employment and periodic medical examinations to confirm fitness for duty.

Employee financial benefits

(a) Highland work benefits

Mining companies developing mining deposits must consider regional wage coefficients for employees when paying salaries. For the Gold Deposit the coefficient is 1.2.

(b) Temporary disability benefits

On 18 September 2018, the Government of the Kyrgyz Republic adopted Resolution No. 434, approving a new Regulation on the provision of temporary disability benefits, maternity benefits, and funeral allowances. Under the updated rules, individuals working in high-altitude and remote hard-to-reach areas are entitled to receive temporary disability benefits equal to 100% of their average daily earnings for each working day, including all additional payments. Unlike the previous 2011 regulation, which differentiated benefit rates based on work tenure and provided for mandatory medical examination by the Medical-Social Expert Commission (MSEC) for long-term illnesses, the new regulation applies a uniform 100% benefit rate regardless of tenure and omits the requirement for medical examination by MSEC.

Mandatory insurance

Mining companies are required to obtain mandatory employer civil liability insurance to protect employees against occupational injuries, illnesses, or fatalities incurred during the performance of their job duties. The insured amount under the mandatory employer liability insurance agreement is determined by the contract, but it must not be less than the annual wage fund for all employees, categorized by personnel type (production, administrative-management, and support staff).

National and foreign workers ratio

Subsoil users are required to ensure that at least 90 percent of their workforce involved in operations within the territory of the Kyrgyz Republic consists of Kyrgyz citizens.

Other regulations on foreign workers

Foreign nationals working in the Kyrgyz Republic are subject to local labour laws unless otherwise stipulated by national laws or treaties. They have equal rights to employment, provided they meet qualification and documentation requirements. Employers must apply for foreign worker quotas, and most foreign nationals (excluding those from the EAEU countries: Russia, Kazakhstan, Belarus, Armenia) must obtain work permits, issued by the Migration Department under the Ministry of Labour. Work permits are fee-based, and annual quotas are approved by the Cabinet of Ministers, taking into account economic contributions and priority employment rights of Kyrgyz citizens.

Laws and regulations on land provision and use

Land relations in the Kyrgyz Republic are governed by the Land Code, which classifies land into categories such as agricultural, residential, industrial, protected areas, forest, water infrastructure, and reserve land. If a land user intends to use a land plot for purposes beyond those permitted for its current category, the land may be converted to a different category to enable the intended use in accordance with Kyrgyz Law. Land rights may be acquired either through transfer by a current owner/user or by grant from public authorities. Public or municipal land can be obtained via auction, tender, or direct sale under certain conditions (e.g. pre-existing structures or adjacent ownership). Rights are formalized through agreements that must be registered but do not require notarization.

Restrictions on Foreign Ownership of Land Plots

The Kyrgyz Law permits foreign persons/entities to acquire non-residential buildings and structures, but restricts ownership of land and certain types of immovable property. Foreign ownership of agricultural land is banned, while residential land may only be acquired through mortgage enforcement, subject to disposal within two years. Non-residential land (excluding for agricultural or mining use) may be granted for temporary use, typically by government decision. Land in border areas is generally off-limits to foreigners. Foreign-owned immovable property that cannot be legally held must be disposed of within legally defined periods — typically one to three years — or it may be forcibly sold or transferred to state ownership with compensation.

Rights to lands for mining use

The Constitution and the Subsoil Law establish an ownership system according to which the subsoil is the exclusive property of the state and is under its special protection. Subsoil users shall receive the land use rights alongside the licence issuance. The land use rights typically stay effective as long as the licence is in force. Still, the mining companies shall ensure access to land plots to state officials and representatives of the local government.

Transformation of land plots and payment of the compensation amounts

If land plots are classified under a land category that prohibits mining or related activities, they must be formally reclassified into a category that permits subsoil use before any such operations can legally commence. This reclassification process is always accompanied by the payment of compensation for agricultural/forestry losses and lost profits resulting from the change in land use. Depending on the initial category of the land plot, either the Cabinet of Ministers, local government administration or the Mayor's office of the city of republican or regional significance shall reclassify the land plot subject to approval of local self-government.

Laws and regulations on environmental protection and preservation

Kyrgyzstan's environmental protection and natural resource management are governed by a comprehensive legal framework, including key laws such as the Environmental Protection Law, Environmental Review Law, and others addressing waste management, radiation safety, and protected natural areas. Specific regulations set safety standards for air, water, soil, biodiversity, and waste disposal. The country is also engaged in international environmental initiatives, having acceded to 11 conventions and 3 protocols since 2007. The Ministry of Natural Resources, Environment and Technical Supervision is the competent authority overseeing environmental policy and regulation (including regulation of mining activities).

Environmental impact assessment

In Kyrgyzstan, all projects that may impact the environment — whether through construction, reconstruction, or expansion — are subject to mandatory environmental impact assessment (EIA) and environmental review. EIAs must be conducted by the project initiator during the feasibility stage. A positive state environmental review is a prerequisite for project approval and financing. Projects cannot be commissioned without proper pollution control systems in place. Environmental reviews assess compliance with environmental legislation, with the Ministry of Natural Resources, Environment and Technical Supervision serving as the competent authority. The state review period may take up to three months.

Protected natural areas

It is prohibited or limited to conduct works on prospecting, exploration and development of mineral deposits in specially protected natural areas (reserves, natural parks, wildlife sanctuaries, natural monuments, botanical gardens, dendrological and zoological parks, biosphere territories and/or reserves, transboundary specially protected natural territories). There are also restrictions on conducting works in the border areas.

Closure of mines and reclamation of lands

Mining companies are obligated to plan and finance mine closure and land reclamation in accordance with the Subsoil Law. The Law mandates that subsoil users develop and submit a Mine Closure and Reclamation Plan (MCRP) as part of their licensing process.

Subsoil users are obligated to carry out land reclamation to preserve ecological balance, restore and improve soil fertility, and repurpose lands for agricultural, forestry, water management, recreational, environmental, and sanitary uses. In line with the Subsoil Law and the Land Reclamation Regulation, subsoil users must finance reclamation activities through monthly contributions to special reclamation funds held in bank accounts. Since 17 August 2021, all such accounts have been transferred to state-owned banks. The legislation does not specify the conditions for the release of funds from these accounts. Also, despite the legal obligation to carry out reclamation, the Kyrgyz Law lacks enforcement mechanisms to ensure compliance with this requirement.

Dust Prevention

Mining companies are obligated to implement comprehensive dust prevention and control measures as part of their environmental protection duties. These obligations arise under the Law on Environmental Protection and various technical and sanitary regulations. Required measures particularly include regular sprinkling of roads, which lead to greater payments of surface water usage fee upon amendments in October 2021.

Laws and regulations on foreign investment

Regulation of foreign investments

The Kyrgyz Republic regulates investment activities through the Law on Investments. The Kyrgyz Law grants broad rights and guarantees to foreign investors, as described below.

The National Investment Agency under the President, which oversees investment policy, foreign investment mobilization, export promotion, and investor protection, is the key authority in this area and reports directly to the President.

Government Guarantees to Foreign Investors

Under Kyrgyz Law, foreign investors are guaranteed national treatment, equal rights with domestic investors, and protection against unlawful interference, including expropriation (except in cases of public interest with adequate compensation). Investors are entitled to freely repatriate capital and profits, conduct unrestricted monetary transactions, access public information, and invest in any lawful activity, including licensed ones. They may establish legal entities, hire local or foreign staff (subject to restrictions described above), and acquire most property types (excluding land plots).

Intellectual property rights are fully recognized. Additionally, qualifying investors may access a 10-year stabilization regime, choosing the most favorable tax and nontax conditions in case of legislative changes, as regulated by the Kyrgyz Law.

Foreign Currency Exchange Policy and Control

The National Bank of the Kyrgyz Republic oversees monetary policy and foreign exchange regulation, including the import/export and trade of foreign currency and precious metals. The national currency (som) is the sole legal tender for domestic transactions, with foreign currency use restricted to exceptions provided by law.

Foreign exchange operations are generally liberal: residents and non-residents may freely buy, sell, and transfer foreign currency, and import/export it if properly declared. However, residents must register foreign bank accounts and external loans with the National Bank and submit quarterly reports. The Kyrgyz Republic, as an IMF member under Article VIII, maintains open current account transactions, with the National Bank reserving the right to impose controls to protect national economic security.

Settlement of Investment Disputes

Under Kyrgyz Law, investment disputes may be resolved using any mutually agreed procedure. If no agreement is reached, disputes between investors and public authorities should first be addressed through consultations. If unresolved within three months, the dispute defaults to resolution in Kyrgyz courts unless both parties agree in writing to refer it to international arbitration, either through ICSID or an ad hoc tribunal formed under UNCITRAL rules.

LAWS AND REGULATIONS RELATED TO OUR GUYANA OPERATIONS

Laws and Regulations on Mining Activities

Mining in Guyana is provided for under the Mining Act, Cap 65:01 (the "**Mining Act**"), the Mining Regulations thereunder, and enforced by the Guyana Geology and Mines Commission ("**GGMC**". Under the Mining Act the State is the owner of all subsurface mineral rights in Guyana and authorises the GGMC to manage these resources. The GGMC is a semi-autonomous state agency which reports to a board of directors and a Minister of Mines (Minister of Natural Resources and the Environment). Mining in Guyana is administered via the six established mining districts.

Exploration

Individuals or companies interested in mining must first obtain permission from the GGMC in the particular category they wish to mine. The application process to be undertaken is determined by the scale of mining to be undertaken.

The Mining Act identifies large scale prospecting licences, large scale reconnaissance (Geological, Geophysical and other surveys) permission, medium scale prospecting licences, Quarry licence, small scale prospecting claim and river location licences. The applicant for a prospecting licence must demonstrate that they have the adequate financial resources, technical competence and experience, and must also submit an adequate programme of operations. Small and medium-scale mining and prospecting are prohibited in designated buffer zones near rivers, roads, residences, nature parks, and protected areas.

Large scale prospecting licence holders are required to submit annual work plans and budgets for explorations for approval by the GGMC and are required to submit quarterly and annual progress reports as well as audited financial statements. They are also required to lodge a performance bond of 20% of the annual budget and the GGMC monitors the work through site visits and the submitted reports. Large scale prospecting is restricted in certain areas near villages, public works, agricultural land, and areas of lawful fishing or navigation, requiring consent or notification for exceptions.

Small and medium scale licences can only be issued to Guyanese (citizens, partnerships/associations, companies or cooperatives) (§57 of the Mining Act). Large scale licences, Quarry licences and reconnaissance permission can be issued to Guyanese citizens and Guyanese and foreign companies (§17 of the Mining Act).

All of the permits, except the small scale prospecting permit, is tied to and can only be used over a specified area/property. The GGMC requires that all mining activity be preceded by an exploration period, even if it is small scale.

After getting permission from the GGMC, the next step is to prospect, which will lead to further exploration activity, sampling etc.

Types of Mining Permits

If the area shows promise for minerals the licence holder will apply for a claim (in the small scale) or for a mining permit (medium scale) or mining licence (large scale).

(a) Small Scale (Claims Licence)

Once a prospecting permit holder identifies a viable claim or river location, they must apply for a claim or river location licence within sixty (60) days. This licence confers the right to remove minerals within the boundaries set out in the application. A claim or river location licence is valid for one calendar year, commencing on January 1st and expiring on December 31st, and is renewable annually upon application (Mining Act, §63(2)).

A holder of a mining permit is entitled to exclusive possession of the licensed area and may conduct mining operations therein. In the case of gold mining, the permit also authorizes the removal and disposal of gold, subject to compliance with the Gold Board Act (Mining Act, §64(1)).

To activate a claim or river location licence, the holder must: (i) pay the applicable annual rental fee per acre, as prescribed by the Guyana Geology and Mines Commission (GGMC); (ii) submit an Environmental Management Agreement; and (iii) satisfy all prescribed environmental conditions. The licence does not take effect until these obligations are fulfilled and the GGMC has completed on-site verification of the claim. Although mining operations may not lawfully begin until the claim is duly filed and verified, filing an application and notice of location is sufficient to initiate the process. Notably, small-scale operators are not required to prepare Environmental Impact Assessments (EIAs) during the prospecting phase.

(b) Medium Scale (Mining Permit)

Medium-scale operators may apply for a mining permit or special mining permit upon successful completion of prospecting activities. While an Environmental Impact Assessment (EIA) is not required for medium-scale operations, applicants must submit an Environmental Management Agreement addressing fourteen (14) specified areas, including the installation of an approved mercury retort. Additionally, they are required to prepare and submit a mine closure plan and a contingency and emergency response plan to the Guyana Geology and Mines Commission (GGMC).

Once a suitable site is identified, the holder of a medium-scale prospecting permit must apply for a mining permit within sixty (60) days. The permit authorizes mineral extraction within the boundaries defined in the application and remains valid for a term of five (5) years, or for the life of the mine if shorter. Permits may be renewed upon expiration for additional terms not exceeding five years each, so long as mining operations continue (Mining Act, §63(1)).

The holder of a mining permit is granted exclusive rights to enter, mine, and remove minerals from the permitted area. In the case of gold, the operator is also authorized to remove and dispose of gold subject to compliance with the Gold Board Act (Mining Act, §64(1)).

Mining permit holders must also pay an annual rental fee for each acre under licence, with rates prescribed and periodically updated by the GGMC.

(c) Large Scale (Mining Licence)

Where exploration activities indicate the presence of viable mineral deposits, an operator may apply for a large-scale mining licence under §43 of the Mining Act. The application must be supported by:

- a technical and economic feasibility study,
- a mine development plan, and
- an environmental management plan.

An EIA is also required for most large-scale mining operations. This must be reviewed and approved by the Environmental Protection Agency (EPA) of Guyana, and no mining licence can be issued unless the requisite Environmental Permit is first granted by the EPA (see §B(v) below).

A mining licence is typically granted for a term of twenty (20) years, or for the life of the mine, whichever is shorter. The licence may be renewed upon application at the end of its term, subject to the conditions set out in the Mining Act. The licence holder must pay an annual rental fee for each acre covered by the licence, with the rates prescribed and periodically revised by the Guyana Geology and Mines Commission (GGMC). In some cases, a performance bond may also be required as a condition of approval.

The holder of a mining licence is entitled to conduct mining and development operations, and commence production in accordance with an approved programme of operations, subject to the terms of the licence, applicable mineral agreements, and compliance with the Mining Act, Mining Regulations, and any applicable environmental permits (Mining Act, §44(3)(a)).

With respect to renewal, §50(1) of the Mining Act provides that the Commission may, with the Minister’s approval, grant a renewal on such conditions as it deems fit or refuse to renew the licence. However, §50(2) mandates that the Commission must refuse renewal if the licensee is in default, unless there are special circumstances justifying an exception. The duration of any renewal shall not exceed seven (7) years (§50(3)).

While the renewal process is generally discretionary, the parties may agree by contract to create more specific rights or conditions regarding renewal, thereby contracting out of the purely discretionary regime in certain respects.

Change of Control

Pursuant to §18 of the Mining Act, a body corporate that is the holder of a mining licence must not, without the prior written consent of the Minister: (a) register the transfer of any equity shares to a particular person or nominee; or (b) enter into any agreement, arrangement, or understanding (whether or not legally enforceable) with any particular person, where the effect would be to confer control of the body corporate on that person or another. This provision is designed to ensure that the Government maintains oversight over changes in control of licensed mining operations in Guyana.

§18(3) of the Mining Act defines “control” as including any of the following:

- Holding twenty percent (20%) or more of the issued equity shares of the body corporate;

- The power to appoint or prevent the appointment of fifty percent (50%) or more of the directors; or

- The entitlement to exercise, or to control (whether directly or indirectly, including through trusts) the exercise of, not less than forty percent (40%) of the total voting rights attached to the issued equity shares.

The term "holder" of a mining licence is also expressly defined in the Act to mean the person to whom the licence is granted, or in the case of joint grantees, each such person, and includes any person to whom the licence or an interest therein is lawfully transferred. Accordingly, the statutory requirement for ministerial consent applies only to changes involving the registered licence holder. Indirect changes in shareholding or ultimate ownership may fall outside the scope of §18 unless they result in a qualifying change of control of the licence-holding entity itself.

This interpretation is supported by a plain reading of the Act and by judicial and academic authorities that have construed the term "holder" in comparable statutory contexts to mean the formal, registered holder of the relevant interest. For instance, it is well established that beneficial ownership or economic interests do not constitute "holding" in the statutory sense unless accompanied by legal title or registrable interest.

Nevertheless, it is recognised that regulatory authorities may take a cautious or expansive view of significant corporate reorganisations involving the mining sector, particularly where the scale of operations or perceived strategic importance warrants greater scrutiny. To mitigate any risk of regulatory objection or delay, it is prudent practice to notify the relevant authorities of any transaction that may be perceived as effecting a change of control, even if such a transaction does not, in strict legal terms, trigger the thresholds set out under §18(3).

Where ministerial consent is in fact required, the process involves administrative review by the Guyana Geology and Mines Commission (GGMC) and final approval by the Minister, typically requiring Cabinet-level consideration. While no statutory time frame is prescribed, experience suggests that approval may take several weeks or longer depending on the complexity of the transaction and prevailing administrative priorities. However, provided that the licence terms remain unchanged and the operator remains in good standing, approvals are generally not withheld.

Trust and Nominee Structures

As stated above, small and medium-scale mining permits may only be issued to Guyanese citizens/entities pursuant to §57 of the Mining Act. A common practice has developed whereby foreign entities appoint Guyanese nominees to hold legal title, backed by trust/nominee agreements and powers of attorney. See Section B(x)(b) and (c) below.

The Mining Act contains no prohibition against this structure, and courts have upheld this structure.

Water Rights

Water use for mining operations in Guyana is governed by Part VIII of the Mining Regulations, which outlines the rights of claim holders with respect to natural watercourses. §58 provides that where any watercourse passes through or adjacent to a claim, the use of such water is subject to any applicable regulations in force. Every holder of a claim is entitled to the free use of water naturally flowing through or past the claim, provided it has not already been lawfully appropriated. This use must be consistent with what is, in the opinion of the Commissioner or an authorised mines officer (with the Commissioner's approval), necessary for the proper working of the claim.

§60 further provides that a licence is only required where a dam is to be constructed for the purpose of diverting or altering the natural flow of a waterway. Accordingly, no formal licence is required for the general use of naturally flowing water within or adjacent to a claim. However, if the developer intends to construct a dam or otherwise redirect a watercourse, a specific licence must be obtained for that purpose.

Other Applicable Laws

Mining in Guyana is also affected by the Amerindian Act of 2006 and the Environmental Protection Act of 1996. Other relevant legislation include the Geology and Mines Commission Act 1979, the Explosives Act and Regulations and the River Navigation Act and Regulations.

Under the Amerindian Act, any mining on Amerindian titled lands or waterways requires necessary permissions and compliance with applicable laws. It also requires miners to provide the Village Council with requested information, including a written summary of proposed activities, details of involved parties, a non-technical summary, the site and duration of activities, potential impacts on the village, and any other relevant information.

Laws and Regulations on Corporate Matters

The Companies Act 1991 (the Companies Act) governs corporate matters in Guyana, crucial for our Company's operations through its local subsidiaries. This Act outlines requirements for incorporation, governance, disclosure, and reporting, ensuring entities maintain good standing and avoid regulatory issues. It provides legal protections for shareholders and directors, addressing minority oppression.

The Act, modeled on Canada's Business Corporations Act, recognizes only one corporate form, with no differentiation like partnerships or limited liability companies. Companies can be private, public, external, or government-owned, with specific requirements for each, such as public companies needing at least two directors and a corporate secretary. Conversion from private to public status is allowed, subject to procedural requirements.

Local Incorporation

Incorporation in Guyana requires filing several documents, including Articles of Incorporation and director consents, with the Commercial Registry. *There are no restrictions on foreign ownership of shares, and foreign individuals* can serve as directors. The incorporation process is swift, typically taking three (3) working days, and there is no minimum capital requirement beyond GY$1. Companies must maintain a registered office in Guyana and file annual returns and financial statements to remain in good standing. A Certificate of Good Standing confirms compliance with statutory obligations.

Capacity of a Company

Under Guyanese law, a company possesses full legal capacity to act in its own name, akin to a natural person.

The Companies Act outlines that companies have the rights, powers, and privileges of an individual, allowing them to engage in various business activities. These include entering into contracts, issuing shares, appointing agents, and raising capital through borrowing. Directors are empowered to exercise these functions without needing shareholder approval unless restricted by the company's articles or by-laws. This framework provides companies with significant operational flexibility, enabling them to manage their business effectively and make strategic decisions to support growth and development.

The Companies Act also grants directors the authority to manage financial operations, such as borrowing funds, issuing debentures, and creating security interests over company property. These powers can be delegated to officers or other directors, ensuring efficient financial management. Additionally, companies have the capacity to sue and be sued in their corporate name, reinforcing their status as independent legal entities. This legal framework, influenced by Canadian corporate law principles, ensures that companies in Guyana can fully engage in commercial activities, subject to statutory and constitutional limitations, while maintaining the ability to define and enforce internal limits on their powers.

Oppression Remedies

To prevent abuse by controlling interests, the Companies Act provides remedies for oppression and unfair prejudice, allowing complainants to seek court intervention. The court can grant relief, including governance changes or company winding up. These remedies apply to both domestic and external companies. Courts assess reasonable expectations and whether conduct breaches them, using a two-step approach.

Laws and Regulations on Labour and Employment Matters

Employment Contract

Pursuant to the Interpretation Section of the Termination of Employment and Severance Pay Act, Cap 96:01 ("**TESPA**"), an employee is defined to mean a person who offers his service to an employer under a contract of employment or a dependent contractor and includes, where appropriate, a former employee. Once there is an intention to establish an employer/employee relationship, a contract of services will be required; for an independent contractor, it will be a contract for services.

There is no statutory definition of a contract of employment in Guyana, and as such, the relationship between the employer and the employee is based on the English common law principles of contract.

Notably, there is no requirement for a written employment contract. Oral contracts may be binding on the parties. Employment contracts should include (but are not required to include) the duties to be carried out by the employee, the length of the contract, and quantum of remuneration, obligations and benefits to be had (provided there is no statutory restrictions or public policy violation), job title, rate of pay, leave entitlement and allowances (if any), etc., which may be subject to the terms of any collective bargaining agreement.

Additionally, the implied terms of a contract of services may reference the "custom and practice" of the workplace. There are or may be other documents which may affect the contract of services, such as prior written and oral communications, employee handbooks, disciplinary codes, rules and regulations, and notice boards. Where these additional documents have not been incorporated into the contract of services, whether there was an intention for the parties to be bound by them will depend on the parties' intention, which is a question of fact to be determined by the court. A unilateral verbal variation of a written contract of services is likely to be deemed a breach, and therefore, variations should be reduced into writing, and signed by both parties.

Minimum Working Hours/Wages and Overtime

The statutory minimum wage for the private sector is established by the Labour (National Minimum Wage) Order, with a standard work week of 40 hours over five days, typically including a lunch break. Any work beyond this constitutes overtime, which must be compensated at a rate of one and a half times the normal hourly rate, as prescribed by the Factories (Hours and Holidays) Act (the FHH Act) and the Labour (Conditions of Employment of Certain Workers) Act (the LCE Act). Employers must comply with these provisions to avoid penalties, including fines and imprisonment for repeated offences.

Employees are entitled to designated rest periods, including a minimum one-hour interval for meals and additional breaks for overtime work. They must also receive at least one weekday holiday each week and a half-holiday every alternate Sunday.

Employers are required to maintain records of wages and employment details to demonstrate compliance with statutory wage rates. The Wages Councils Act empowers the Minister to establish councils for specific industries to set enforceable minimum wage rates and working conditions. Contracts offering wages below these statutory levels are automatically adjusted to meet legal requirements, with employers facing penalties for non-compliance. In cases of alleged underpayment, the employer must prove adherence to the relevant wage regulation order.

Employee Insurance

Employee insurance is solely governed by the National Insurance and Social Security Act, Cap. 36:01 (the "**NIS Act**"), with contributions made to the National Insurance Scheme ("**NIS**").

The NIS extends social insurance coverage on a compulsory basis to all persons between the ages of sixteen (16) and sixty (60) years who are engaged in insurable employment (§11 of the NIS Act). Coverage is also extended on a voluntary basis to persons who cease such employment before reaching age sixty (60) years, until the attainment thereof (§15 of the NIS Act; the National Insurance and Social Security (Persons Abroad and Voluntary Contributors) Regulations).

Generally, the benefits are stipulated under §19 of the NIS Act as follows: (i) old age benefits, (ii) invalidity benefits, (iii) survivor's benefits, (iv) sickness benefit (further detailed below), (v) maternity benefits (further detailed below), (vi) funeral benefits, (vii) child care benefits, (viii) constant attendance benefits, (ix) injury benefits, (x) disablement benefits, and (xi) death benefits.

§13(1) of the NIS Act stipulates that contributions shall be payable by insured persons and by employers. Therefore, prior to paying wages to the employee, the employer must deduct the NIS contribution and income tax (the latter of which is detailed further below in Section B(iv)) from the wage or salary.

Probationary Periods

Pursuant to the §2 of TESPA, probationary period means the period of three months following the date on which the employment of an employee by an employer commences, or such other period of time following that date as may be agreed upon between employer and an employee.

Notably, §9 of TESPA stipulates that a new employee may be required to serve a probationary period of employment, but the employer or employee may terminate the employment at any time during the probationary period for any reason and without notice.

Termination

Termination of employment in Guyana is governed by TESPA, which prescribes the lawful bases and procedures for ending the employment relationship. Pursuant to §7, employment may be terminated in one of three ways: (i) by mutual agreement of the parties; (ii) on the ground of redundancy, as set out under §12; or (iii) by either party, whether for good or sufficient cause, or by notice served on the other. Where serious misconduct arises, an employer is entitled under §10 to summarily dismiss an employee without notice or payment of severance, redundancy allowance, or terminal benefits. For such dismissal to be valid, the misconduct must be directly related to the employment relationship and must have a detrimental impact on the employer's business.

Further, §11 of TESPA addresses termination for misconduct, breach of contract, or unsatisfactory performance. It provides that an employer may first issue a written warning. If, within six months of such warning, the employee commits the same or a similar offence, the employer may terminate the contract without notice. An employer is, however, deemed to have waived the right to terminate on the basis of misconduct if no action is taken after acquiring knowledge of the misconduct or following the conclusion of any investigation into it. In relation to unsatisfactory performance, termination is only permitted where the employer has given the employee instructions regarding how the duties should be performed, issued a written warning to comply with those instructions, and the employee nevertheless continues to perform unsatisfactorily.

Where employment is terminated by notice under §7(3)(ii) or for redundancy under §12, §15 of TESPA prescribes the applicable minimum notice periods for contracts of unspecified duration, except during any probationary period. Specifically, the employer must provide not less than two weeks' written notice for employees with less than one year of service, and not less than one month's notice for those employed for one year or more. These notice periods do not apply where the employee is summarily dismissed pursuant to §10. Moreover, an employer is prohibited from issuing a notice of termination while the employee is on any period of authorized leave granted under applicable employment law or contract.

Finally, TESPA permits payment in lieu of notice. Under §16, where an employer elects not to provide written notice in accordance with §15(1), they must pay the employee a sum equal to the remuneration and benefits that would have accrued up to the expiry of the applicable notice period.

Disciplinary Action and Severance

Employers in Guyana are entitled to take disciplinary action against employees where it is reasonable to do so, as set out under §18 of TESPA. Disciplinary measures, short of dismissal, must follow a defined order of severity: (a) a written warning; followed, if necessary, by (b) suspension without pay. Importantly, employers are prohibited from imposing fines or other monetary penalties on employees. In assessing the reasonableness of disciplinary action, the employer must consider the nature of the violation, the employee's duties, the extent of any damage caused, and the employee's previous conduct and personal circumstances. Where a disciplinary procedure is outlined in a company handbook or set of rules that has been incorporated into the contract of employment, such procedures must be strictly followed; deviation from them, such as issuing payment in lieu of notice where summary dismissal is not appropriate, may amount to wrongful dismissal and a breach of contract.

Employment is deemed continuous from the first day of work to the date of termination. Periods of sick leave, maternity leave, annual leave, suspension (with or without pay), reinstatement following dismissal, temporary lay-offs not exceeding six weeks, and lawful lockouts or other employment interruptions arising under contract or statute do not break continuity of service. However, while participation in industrial action in accordance with law or a collective agreement does not interrupt employment continuity, the time spent off the job during such action is not counted toward the length of service. Continuity of employment is also preserved where a business is sold, leased, or otherwise transferred, provided the successor employer expressly agrees to retain the employee's service history.

In cases of redundancy, §21 of TESPA mandates severance or redundancy payments for employees who have completed one or more years of continuous employment. The minimum statutory entitlement is as follows: (a) one week's wages for each completed year of service for the first five years (inclusive of the entitlement year); (b) two weeks' wages for each completed year between the sixth and tenth year; and (c) three weeks' wages for each completed year beyond ten years, subject to a maximum of fifty-two weeks' wages. Pursuant to §21(3), the right to severance is independent of any entitlement to payment in lieu of notice under §16. However, §21(4) excludes employees who are lawfully summarily dismissed under §10 or whose termination occurs under §9 or §11 from receiving severance or redundancy pay. Notably, collective bargaining agreements may confer more favourable severance benefits, and such terms are enforceable.

Failure by an employer to pay severance or redundancy allowances when due constitutes a criminal offence. Upon summary conviction, the employer may be liable to fines and imprisonment, and the court may also order the payment of the outstanding sums. Prosecutions under TESPA are typically instituted by the Chief Labour Officer. More broadly, any breach of TESPA's provisions is considered an offence under law.

Safety and Health Rules

Guyana's legal framework imposes comprehensive obligations on employers to ensure occupational safety and health, principally under the Occupational Safety and Health Act, Cap 99:06 ("**OSHA**"), the LCE Act, and the Accidental Deaths and Personal Injuries (Damages) Act, Cap. 99:05 (the "**ADPI Act**"). These statutes collectively require employers to maintain a safe and healthy work environment, with specific duties and restrictions applicable to a wide range of industrial establishments, including offices, factories, shops, logging operations, banks, hotels, and private homes employing domestic workers.

Under OSHA, employers are required to take reasonable care for the safety of workers by ensuring: (i) a safe place of work, (ii) a safe system of work, (iii) adequate and properly guarded equipment, (iv) the engagement of competent staff, and (v) the provision of adequate training and information on workplace hazards. Employers must also report workplace accidents to the Ministry of Labour. §58(1) of OSHA expressly prohibits retaliation, including dismissal, suspension, or intimidation against employees who report unsafe conditions or act in compliance with the act.

Where twenty or more persons are employed, §23 of OSHA requires the establishment of a joint workplace safety and health committee. The committee must comprise at least four members, or at least six where the workforce exceeds fifty. The names and locations of committee members must be clearly posted in a conspicuous area accessible to workers. The committee's functions include hazard identification, workplace inspection, and promoting compliance with occupational safety requirements. These provisions are reinforced by §11 of the LCE Act, which mandates that employers provide and maintain accessible first-aid supplies as specified in the Second Schedule therein.

The ADPI Act further reinforces employer liability in the context of workplace safety. It governs civil liability in cases of personal injury or death arising out of employment, and §8 of the ADPI Act prohibits any contractual term or disclaimer that attempts to exclude or limit an employer's liability for such incidents. This ensures that injured employees or the families of deceased workers retain full recourse to damages in the event of a breach of the employer's statutory or common law duties. In addition, Part V of OSHA and the employer-specific obligations therein (such as the requirement to provide trained personnel, adequate equipment, and a safe system of work) are directly relevant to the assessment of such liability.

Unionization and Collective Labour Agreements

The right of employees to form or join trade unions and engage in collective bargaining is constitutionally protected in Guyana. Article 147(1) of the Constitution of Guyana, Cap. 1:01 (the "**Constitution**") guarantees every person the freedom of assembly and association, including the right to form or belong to trade unions or other associations for the protection of their interests. Article 147(3) of the Constitution further affirms that neither an employer nor a trade union shall be deprived of the right to enter into collective agreements.

Recognition of a trade union for collective bargaining purposes is governed by the Trade Union Recognition Act, Cap. 98:07 ("**TURA**"). Under §18 of TURA, a union seeking recognition as the majority union for a defined bargaining unit must apply to the Trade Union Recognition and Certification Board. The application must be served on the employer. Upon being granted a certificate of recognition under §23(1) of TURA, the union must be recognized by the employer for the purpose of negotiating terms and conditions of employment. An employer who refuses to recognize a duly certified union commits an offence and is liable, on summary conviction, to a fine and further daily penalties for the duration of the non-compliance.

While Article 147(2) of the Constitution also protects the freedom to strike, employees who engage in industrial action (such as walkouts, sick-outs, picketing, or sit-ins) may nonetheless be in breach of their employment contracts and subject to legal action. However, TESPA specifically addresses the effect of industrial action on employment continuity. Under §4(4) of TESPA, any period of lawful industrial action does not break the continuity of employment, although such time will not be counted in calculating the length of continuous service. This distinction is relevant to entitlements tied to length of service, such as redundancy and severance pay.

Collective agreements themselves are regulated by the Labour Act. Pursuant to §28A(4) of the Labour Act, a copy of every collective agreement must be submitted to the Chief Labour Officer within three months of its execution, although non-submission does not affect the agreement's validity or enforceability. §28A(6) of the Labour Act provides that a collective agreement to which a trade union is a party is legally binding and enforceable. §28B(1) of the Labour Act defines a collective agreement as any agreement or arrangement, regardless of form, between an employer (or employers' organisation) and one or more organisations of employees that prescribes terms and conditions of employment or addresses procedural matters such as grievance handling, dismissal procedures, disciplinary procedures, negotiating rights, or union facilities.

In practice, the terms of any collective agreement will be determined through negotiation between the employer and the recognized union, and such agreements may address a wide range of employment matters, including dispute resolution mechanisms and employee representation rights.

Retirement Funds

There is no statutory or mandatory framework governing retirement funds, with the only old age benefits covered by the NIS as mentioned earlier. It is up to the discretion of private employers to establish retirement funds for employees, although there are no tax-free accounts available for this purpose. Employers are free to establish a local pension plan, which must be registered pursuant to §101(1) of the Insurance Act Cap. 91:02, or foreign pension plans, which do not require local registration.

As a general rule, pensions, gratuities in lieu of pensions and annuities are deductible, pursuant to §14(z) of the Income Tax Act Cap 81.01 (the "**ITA**"), there being no distinction between local and foreign pension plans.

In relation to retroactive payments, §2 of the Income Tax (Prescribed Deduction) Order. [O. 2/1948 48/1968 86/1970] states that a lump sum payment by a company of a pension plan for past employer services will not be charged as a single expense within one fiscal year.

After one-tenth of the lump sum payment is deducted each year, the remainder would be represented on the financial statements of our Company as a tax credit, which would consequently increase the reflection of non-taxable assets on the company tax return, which will be effected in the next fiscal year. This presumes the continuation of business over a term of ten (10) years.

Vacation and Holiday Pay

§3 of the Leave with Pay Act, Cap. 99:02 ("**LWPA**") entitles all employees to paid leave as follows; at least one day of paid leave for each completed month of employment; for half-day workers, each half day counts as a full day in calculating leave; and for daily or hourly workers, one day of paid leave is earned for every 20 days or 160 hours worked.

Under §4(1) of the LWPA, an employer is obliged to mandate an employee to take leave with pay for periods shorter than six consecutive days, excluding Sundays and Public Holidays from the computation.

According to §4(2) of the LWPA, the employer is obligated to provide leave with pay to the worker, to be taken within three months or any other agreed-upon period after the right to such leave accrues. §4(3) of the LWPA further stipulates that the employer has the authority to determine the commencement date of the leave, considering any specific requests made by the worker.

Regarding remuneration for leave with pay, as per §5(1) of the LWPA, the employer is required to compensate the worker with their current daily wage for each day of the leave period. Note that upon termination of employment, §6 of the LWPA mandates the employer to pay the worker, in lieu of any accrued but unused leave with pay, a sum equal to the wages which would have been paid for a like period of leave with pay if taken at that date.

Note that separately, under §5 of the Public Holidays Act (Cap. 19:07) except for obligations under the Bills of Exchange Act, payments or actions related to negotiable instruments are deferred to the next business day if they fall on a public holiday.

Illness Pay

Sick leave is not mandated by the laws of Guyana. Note that the public service follows a customary practice stipulating the requirement of a medical certificate after three (3) days, with an annual quota of twenty-eight (28) days (see §§H42 and H45 of the Public Service Rules 2004). However, this practice is neither applicable to nor binding on private companies.

In any event, the employee is entitled to a daily rate of sickness benefit, as outlined in §§20–23 of the NIS Act, paid by the NIS. The employee qualifies for sickness benefit from NIS on the 4th day of incapacity, as the initial 3 days of sickness are unpaid. In calculating sickness benefit, payment is made for each day, excluding Sundays or holidays, within a period of 26 weeks of continuous incapacity for work. Notably, any two periods of incapacity for work occurring within 8 weeks of each other are considered as one continuous period, starting from the first day of the initial incapacity. Additionally, insured employees over the age of 60 are ineligible for sickness benefit.

The NIS Memorandum on Benefits Payable (2017) outlines the criteria for sickness benefit eligibility, specifying that it is payable to an insured person temporarily unable to work, not due to an employment injury. To qualify, the insured person must: a) have been engaged in insurable employment immediately prior to the onset of incapacity; b) have made at least fifty (50) Contributions since joining the insurance scheme; and c) have been employed and made Contributions for at least eight (8) Contribution Weeks within the thirteen (13) weeks preceding the week in which the incapacity started. The claim for sickness benefit must be accompanied by a medical certificate or any other evidence as determined by the NIS.

Payroll Taxes and/or Unique Country-Specific Taxes

In addition to NIS deductions as outlined in above, income tax is imposed on a person's chargeable income derived from within or outside Guyana, whether or not it is received in Guyana. §5 of the ITA provides that income tax is payable on income from: (a) any trade, business, profession, or vocation, regardless of duration; and (b) any office or employment, including termination payments, housing or living allowances (net of any rent or contributions), and other non-cash employment benefits, except medical, dental, or travel allowances.

Resident individuals (i.e. present in Guyana for at least 183 days in the calendar year) will be entitled to a personal allowance of 1/3 of their income (per annum), whichever is greater. Effective January 1, 2025, pursuant to §36 and §36A of the ITA, personal income tax is levied at a rate of twenty-five percent (25%) per annum on chargeable income up to G$3,120,000. Chargeable income exceeding G $3,120,000 per annum is subject to a higher rate of thirty-five percent (35%).

Tax is payable on the following categories of income: (i) business income, (ii) Employment income, (iii) certain classes of dividends, interest or discounts, (iv) charges for annuities other than an annuity paid out of a superannuation fund and (v) property income.

Tax returns are to be completed annually and submitted to the Guyana Revenue Authority not later than April 30 following the year of income. The tax year in Guyana is the calendar year.

Non-Discrimination Rules

Guyana's legal framework prohibits discrimination in employment and ensures equality of treatment in the workplace. The Prevention of Discrimination Act, Cap. 98:08 (the "**Discrimination Act**"), applies to both the public and private sectors, including employers, employees, employment agencies, vocational training bodies, qualifying bodies, professional and trade organisations, and professional partnerships. The

Discrimination Act seeks to eliminate discrimination in employment, recruitment, training, and membership in professional bodies, and to promote equal remuneration for men and women performing work of equal value.

Under the Discrimination Act, it is unlawful for an employer to discriminate, whether directly or indirectly, intentionally or unintentionally, against a person on the basis of race, sex, religion, colour, ethnic origin, indigenous population, national extraction, social origin, economic status, political opinion, disability, family responsibilities, pregnancy, marital status, or age (except in relation to retirement or legal restrictions on minor employment). Discriminatory conduct is prohibited throughout all stages of employment, including job advertisements, selection procedures, offers of employment, and the creation or abolition of job roles.

Once employed, workers are further protected against discrimination in terms of employment conditions, occupational safety and health, access to training, promotion, or advancement, provision of facilities or benefits, and in relation to dismissal, retrenchment, or any other disadvantage imposed in the workplace. However, the Discrimination Act recognises exceptions where a "genuine occupational qualification" justifies the requirement for a specific characteristic. Such exceptions include jobs requiring a particular religious affiliation, the preservation of decency or privacy (e.g. same-sex caregivers), residential requirements in sex-segregated accommodations, roles suited to married couples, positions within specialised institutions such as prisons or hospitals, or instances where the nature of the service (e.g. personal health or education) is best provided by a person of a particular sex. In the case of disability, an employer may justify non-employment if the essential duties of the job cannot reasonably be performed due to the disability and it would be unduly burdensome to provide the necessary accommodations.

Enforcement of the Discrimination Act may be initiated by the Chief Labour Officer (or a delegated officer) based on a victim's complaint. In addition, victims of discrimination may pursue private criminal proceedings.

The Equal Rights Act, Cap 38:01 (the "**ERA**") complements these protections with specific prohibitions against sex-based discrimination. §2(4) of the ERA provides that no person shall be deemed ineligible for, or discriminated against in, any employment, appointment, or promotion solely on the ground of sex. §2(6) of the ERA deems it discriminatory where men are given preference or more favourable opportunities than women in recruitment, terms of employment, access to advancement or training, or any employment-related benefits or services. Notably, §2(7) of the ERA clarifies that employers may still implement special labour and health protections for women, including maternity-related provisions, paid leave, and support for mothers and children.

Part V of the Persons With Disabilities Act, Cap. 36:05 specifically addresses employment as it relates to preventing workplace discrimination. This act ensures that individuals with disabilities have equal employment opportunities, as mandated by §9 thereof, and requires employers to avoid discriminatory practices in hiring and workplace policies. Additionally, §13 obligates the employer to maintain accurate records related to the employment of persons with disabilities.

Note that the Employment Of Young Persons And Children Act, Cap.99:01 prohibits the employment of children (defined under §2 as individuals under 15 years of age).

Immigration

Any employer intending to hire Expatriates must obtain a work permit for that individual's employment in Guyana. The application is supported by corporate documents of the employer company, including the employer's certificate of incorporation or business registration, NIS and GRA compliance certificates, TIN certificate, and the employer's national identification.

To enter Guyana for employment, the Expatriates must either (i) obtain an Employment Visa on arrival or (ii) secure a Landing Permit in advance, depending on their nationality. Both are processed by the Department of Citizenship, Ministry of the Presidency.

Upon arrival in Guyana with a valid employment visa or landing permit, the applicant will receive an entry stamp authorizing stay for the purpose of employment for an initial discretionary period not exceeding three (3) months, pursuant to §12(1)(a) and §12(1A)(d) of the Immigration Act, Cap. 14:02 (the "Immigration Act"). This period must be extended by way of an Extension of Stay/Work Permit application, which may be granted for up to a maximum of three (3) years under §12(3).

Holders of multiple-entry employment visas or landing permits are permitted to enter and leave Guyana freely for a period of up to three (3) years, or until the visa expires.

Special provisions apply to nationals of CARICOM Member States. Guyana is a member of the Caribbean Community (CARICOM), and under the CARICOM Single Market and Economy (CSME) regime, nationals holding a CSME Skilled National Certificate (together with their spouses) are exempt from obtaining work permits for employment in Guyana. The application for the CSME Certificate must be submitted online.

Although the entry process is generally the same regardless of nationality, the Ministry of Foreign Affairs provides a list of 75 countries whose nationals are exempt from obtaining a visa to enter Guyana, including certain CARICOM and Commonwealth nations.

Failure to leave Guyana upon the expiration of the authorized stay renders the person a "prohibited immigrant" under §13 of the Immigration Act. Pursuant to §15, a prohibited immigrant is not permitted to enter or remain in Guyana, and §26 empowers an immigration officer to remove such individuals from the country.

Laws and Regulations on Environmental Protection

Guyana's environmental legal framework is principally governed by the Environmental Protection Act, Cap. 20:05 (the "**EPA Act**"), which imposes statutory obligations on all entities undertaking activities that may significantly impact the environment.

Under §13 of the EPA Act, environmental permits are issued subject to specific conditions. These include the use of best available technology to minimise adverse effects, adherence to prescribed environmental standards, and the obligation to restore the environment upon project completion. Non-compliance with the terms of a permit may result in suspension or revocation, and may expose the operator to civil or criminal penalties.

Pollution control is addressed under §19 of the Act, which prohibits the discharge or release of any contaminant into the environment unless all reasonable and practicable measures are taken to prevent or minimise harm. Where such release occurs, the permit holder must immediately notify the EPA and take remedial action, including neutralising contaminants, cleaning affected areas, and compensating affected third parties where necessary.

Further, §21 and §22 require specific process licences or discharge permits for facilities that release pollutants into the environment. These licences are subject to ongoing monitoring, and the EPA is empowered to conduct inspections to ensure compliance. Operators must also maintain adequate records of emissions and disposal practices and submit these to the EPA upon request.

§31 of the EPA Act provides for financial assurances as a condition of permitting. The EPA may require an operator to furnish performance bonds or other financial security to ensure funds are available to remediate any environmental harm caused. This is particularly relevant to high-risk activities, including those involving hazardous substances, marine discharge, or sensitive ecosystems.

Environmental Impact Assessments (EIA)

Environmental Impact Assessments ("EIA"s) are a central feature of Guyana's environmental regulatory framework, particularly in the context of projects involving natural resource extraction. These assessments serve to evaluate and mitigate potentially significant environmental impacts prior to project approval.

Pursuant to §11(1) of the Environmental Protection Act, any project that is likely to have a significant effect on the environment or is listed in the Fourth Schedule of the Act must be the subject of an application for an environmental permit. The application must include a summary containing: (i) the site, design, and size of the project; (ii) its possible environmental effects; (iii) the project's duration; and (iv) a non-technical description. Upon receipt, the EPA must consider whether the issuance of a permit is appropriate under §13.

In cases where the potential for environmental impact is not clear to the developer, §11(2) obliges the developer to submit a project summary to the EPA, which must then assess whether an EIA is required. If the EPA determines that a significant impact may result, it must publish a reasoned decision in at least one daily newspaper stating that an EIA is required, in accordance with §11(2)(b).

Where an EIA is required, the developer must conduct a comprehensive study identifying and evaluating the direct and indirect effects of the project on the environment. The EPA's decision to approve or reject the project must consider: (a) submissions made by the public; (b) recommendations of the Environmental Assessment Board; and (c) the contents of the EIA and related environmental impact statement (§12(1)). The EPA is then required to publish its final decision and the reasons underpinning it (§12(2)).

Conversely, where the EPA determines that the project will not significantly affect the environment, it must publish its decision and the rationale for exempting the project from the EIA process under §11(2)(b). This determination is subject to appeal by any affected person to the Environmental Assessment Board under §11(3)(a), which may confirm or reverse the EPA's decision.

Where the potential impact remains uncertain even to the EPA, the Act mandates that an EIA be required to properly determine the environmental risks. In such cases, the EPA proceeds as outlined above, including the requirement for public disclosure and consultation, as well as formal assessment by the Environmental Assessment Board.

Accordingly, any developer undertaking resource-based or large-scale industrial projects in Guyana must anticipate the possibility of undergoing the EIA process, with compliance obligations extending from the application stage through post-project rehabilitation. The EPA retains broad discretion and enforcement authority, and all permit conditions are legally binding and enforceable under the Environmental Protection Act.

Laws and Regulations on Foreign Investment and Currency

Foreign investment, currency regulation, and foreign exchange control in Guyana are governed by a combination of statutes that directly affect the ability of companies to repatriate profits, engage in cross-border transactions, and employ foreign personnel. These laws are of particular relevance to our Company's operations in Guyana, given its status as an international mining group with foreign ownership and financial flows. The framework governs the movement of capital, access to foreign currency, and protection of investment interests. At present, there are no proposed or anticipated changes to this framework that would have a material impact on our Company's business.

Pursuant to §22(1) of the Bank of Guyana Act, Cap. 85:02 (the "**BOG Act**"), all monetary obligations within Guyana must be expressed, recorded, and settled in Guyana dollars, unless the Bank of Guyana grants specific approval to the contrary in consultation with the Minister of Finance. Such approval is obtained by submitting a formal request to the Governor of the Central Bank. The Act also grants the Bank of Guyana statutory authority over currency stability and exchange rate management (§23), as well as oversight of foreign exchange and international transactions (§30). These provisions enable the Bank to align foreign exchange policy with international obligations and to ensure orderly financial conduct across borders (§31).

The Foreign Exchange (Miscellaneous Provisions) Act, Cap. 86:01 regulates the use, transfer, and declaration of foreign currency in Guyana. Under §3, only licensed authorized dealers may engage in transactions involving foreign currency or gold. Any person or entity not so licensed requires permission from the Minister to engage in lending or borrowing in foreign currency. §6 imposes reporting requirements on the physical cross-border movement of currency. Individuals are required to declare sums exceeding US$10,000 (or its equivalent in another currency) to the Commissioner of Customs, using a prescribed form under the Second Schedule. Failure to declare, or making a false declaration, may result in forfeiture of the undeclared sum and criminal penalties, including fines and imprisonment. Violations of §§3 or 4 are subject to enforcement under §5, and breaches may also trigger proceedings under the Customs Act.

The Investment Act, Cap. 73:03 sets out the primary legislative framework for the facilitation and protection of both domestic and foreign investment in Guyana. Under §4, foreign investors are guaranteed treatment no less favourable than that accorded to domestic investors. §5 permits investment across all lawful economic sectors, including natural resource extraction. §§17–18 ensure that investors may import and export products and repatriate profits freely, subject only to satisfaction of tax obligations. §24 affirms the right of investors to transfer funds abroad, including dividends, loan repayments, and capital returns.

§§19–21 provide for the employment of foreign personnel, allowing companies to recruit foreign skilled workers subject to compliance with immigration laws. Work and stay permits for such personnel are facilitated under these provisions. §29 imposes obligations on investors to comply with environmental, health, and safety laws, while §30 mandates that imported goods and equipment conform to national standards. §39 formally establishes the Guyana Office for Investment as the agency responsible for investor facilitation, including the provision of guidance and processing of investment incentives.

Laws and Regulations on Taxation

(a) Corporation Tax — General Imposition: Imposed under the provisions of the Income Tax Act, Cap. 81:01, which charges tax on income accruing in or derived from Guyana or elsewhere. Residents are taxed on worldwide income and non-residents are taxed on Guyana-source income. The rates are determined by reading the relevant sections of the Income Tax Act together. Generally, these rates can range from approximately 25% to 45%, depending on the type of company.

(b) Minimum Corporate Tax (MCT): Charged at 2% of turnover for commercial companies (excluding insurance companies and exempt entities). May be recoverable in future years.

(c) Withholding Tax (WHT): Imposed under §10B of the Corporate Tax Act on specified payments to non-resident companies, at the rate of 10%.

(d) Capital Gains Tax: Imposed at a rate of 20% on net chargeable gains from the disposal of capital assets.

(e) Loss Relief: Ordinary losses carried forward indefinitely, offsetting same-source profits; capital losses carried forward up to 24 years.

(f) Foreign Tax Credit: Relief of 50% for British Commonwealth countries and 25% for others.

(g) Value-Added Tax (VAT): Imposed at 14% on taxable supplies and imports under §9(1) of the VAT Act, Cap. 81:05.

(h) Property Tax: Annual wealth tax imposed under the Property Tax Act, Cap. 81:21, charged at ¾% on net property exceeding G$60 million.

(i) Customs Duty: Imposed under §7 of the Customs Act. Duties are set by resolution of the National Assembly. For specific rates, refer to Item 8703.2, First Schedule, Part I of the Customs (Amendment of Schedules) Act 2019.

(j) Excise Tax: imposed on importation, manufacture, or removal of taxable goods under §3 of the Excise Tax Act, Cap. 82:03.

(k) Capital Duty and Company Registration Fees: Fees vary based on filing type and capital structure, as outlined in the Companies Act and associated fee schedules.

(l) Stamp Duty: Imposed on various instruments under the Stamp Duties (Management) Act, Cap. 80:04, with some exemptions.

(m) Environmental Tax: G$10 per non-returnable unit (metal, plastic, or glass) of alcoholic or non-alcoholic beverage, whether manufactured locally or imported (§7A of the Customs Act).

(n) Transfer Pricing: The Commissioner-General is empowered to assess related-party transactions to ensure they reflect arm's length pricing.

(o) Tax Year and Filing: charged on Calendar year basis, with corporate tax returns due by April 30, and quarterly installments required.

(p) Penalties for Non-Compliance: Include a 10% penalty for late payment, 2% monthly interest, and G$50,000 for late returns.

(q) Audits and Rulings: Random audits within 1–3 years by the Guyana Revenue Authority, with binding tax rulings available.

Tax Concessions

Below are a few of the available exemptions or concessions specific to taxation in Guyana:

- Exemption from income tax under §13(b) of the Income Tax Act for the income of any person exempt from corporation tax under §7 of the Corporation Tax Act.
- Exemption from income tax under §13(y) of the Income Tax Act for emoluments payable under any incentive scheme approved by the Minister.
- Exemption from corporation tax under §7(a) of the Corporation Tax Act for distributions received by a company from a resident company.
- Exemption from corporation tax under §7(b) of the Corporation Tax Act for the profits of an investment company.
- Corporation tax holiday under §2(1)(b) of the Income Tax (In Aid of Industry) Act for income from new economic activity that creates new employment in designated fields, including petroleum exploration, infrastructural development (e.g., renewable energy), or other fields specified by Ministerial Order.
- Extended corporation tax holiday under §2(1A) of the Income Tax (In Aid of Industry) Act for up to 10 years (or longer for renewable energy projects under §2(1)(b)(x)).
- Exemption from withholding tax under §39(12) of the Income Tax Act where a person is exempt from corporation tax under §7 of the Corporation Tax Act.
- Exemption from property tax under §6(x) of the Property Tax Act for property employed in a business during a tax holiday period granted under §2 of the Income Tax (In Aid of Industry) Act.
- Zero-rating of VAT under §17(1) of the VAT Act and Schedule I, paragraph 2(aa), for the first import of certain capital equipment, provided specified conditions are met.
- Zero-rating of VAT under §17(1) of the VAT Act and Schedule I, paragraph 2A(ll), for the supply of certain vehicles for use in the mining industry, subject to the satisfaction of the Commissioner-General.

- Exemption from customs duty under Item 11 of the First Schedule, Part III B(1) of the Customs Schedule for machinery, equipment, motor vehicles, tools, spares, and supplies imported pursuant to an agreement with the Government or published guidelines/regulations.

- Temporary exemption from excise tax under §8 of the Excise Tax Act for goods imported for temporary use, provided they are exported within three months (or an extended period) and subject to a refundable deposit or security.

None of the outlined concessions have a published application form but are based on individual negotiations with the Revenue Authority and the Government of Guyana.

Laws and Regulations on Land and Property

The primary statutes now governing immovable property in Guyana include the Civil Law Act, Cap. 6:01 (the "**Civil Law Act**") the Land Registry Act, Cap. 5:02 (the "**Land Registry Act**"), and the Deeds Registry Act, Cap. 5:01 (the "**Deeds Registry Act**").

Ownership of Property

In Guyana, immovable property may be held under one of two systems: Transport under the Deeds Registry Act, and Certificate of Title under the Land Registry Act. Both forms confer full and absolute ownership, subject to limited statutory exceptions.

Under the Deeds Registry Act, a properly executed transport conveys absolute title to the transferee, subject to statutory claims, registered encumbrances, and fraud. Similarly, under the Land Registry Act, registered land titles are absolute and indefeasible, subject to exceptions like fraud and boundary misdescription.

Nature of Mining Permits

Mining permits in Guyana are recognised as a form of property interest once issued and registered in accordance with the Mining Act. They confer enforceable proprietary rights, allowing holders to enter and extract minerals. The legal character of such permits has been affirmed by the High Court of Guyana, granting holders a legal interest in land.

Trusts in Property

Trusts are recognised under Guyanese law by virtue of §10 of the Civil Law Act, Cap. 6:01, which incorporates the UK Trustee Act, 1893. Express trusts in both movable and immovable property are generally enforceable. However, equitable interests in immovable property are not recognized, leaving the enforceability of resulting or constructive trusts unsettled. This is significant in the mining sector, where trust arrangements are used to allow Guyanese nationals to hold mining permits on behalf of foreign entities.

Leases

Leases in Guyana are governed by English common law principles pursuant to the Civil Law Act. A valid lease requires a fixed term, rent, and exclusive possession. Leases over three years must be executed by deed, while shorter leases require written agreements. Long leases (over 21 years) must comply with the Deeds Registry Act for enforceability against third parties.

Licences

A licence grants a personal privilege to use land without conferring legal or equitable interests. It is revocable unless supported by consideration and intended to be irrevocable for a fixed duration. Courts may enforce a contractual licence according to its terms, preventing premature revocation.

State Land Grants, Leases and Licences

State lands in Guyana are governed primarily by the State Lands Act Cap 62:01 and the regulations made thereunder. The President is empowered to make absolute or provisional grants or leases of State land and to authorise the issuance of licences for specific purposes, such as agriculture, forestry, or quarrying. These delegated powers extend to the Commissioner of Lands and Surveys, the Conservator of Forests, and the Commissioner of Geological Surveys and Mines. However, all rights to extract minerals from State lands must be granted under the Mining Act. Grants and licences are conditional, subject to revocation for non-compliance, and require land surveys before issuance. The President retains significant powers, including the ability to resume land for public purposes with compensation.

Other Compliance Obligations

The Anti-Money Laundering and Countering the Financing of Terrorism Act (the "**AML/CFT Act**") is essential for our Company and our affiliates, particularly in regulated financial or commercial activities.

The Act creates the Financial Intelligence Unit (FIU) and tasked it with analyzing and disseminating information on suspicious transactions, supporting cross-border investigations.

Reporting entities, which include financial institutions and other designated businesses, are required to implement internal compliance programs, including due diligence, record-keeping, and suspicious activity reporting, under oversight by a designated compliance officer.

Recent amendments have strengthened Guyana's compliance with international AML/CFT standards, obligations, requiring enhanced due diligence and verification of beneficial ownership for corporate clients. The National Coordination Committee (NCC) ensures consistent enforcement across agencies. Reporting entities must implement enhanced due diligence and screen transactions to prevent dealings with designated entities.

The FIU is also empowered to impose asset freezing measures pursuant to UN resolutions, allowing for the immediate immobilisation of property associated with designated entities or individuals.

LAWS AND REGULATIONS RELATED TO OUR SURINAME OPERATIONS

Mining Legislation

The Decree E-58 of May 8, 1986 (the "**Mining Decree**") sets out the legal framework for the exploration and exploitation of minerals in Suriname. The Mining Decree provides the Republic of Suriname with the ability to coordinate mining development and implement mining policy in a manner that is consistent with national economic policy. The Mining Decree governs, among other things:

- the granting, registration and termination of mining rights;
- the integration of mining activities into national development, through training opportunities, employment and preference for national goods and services;
- the protection of people and the environment; and
- the fiscal facilities to promote mining.

All minerals within the territory of Suriname are owned by the Republic of Suriname. A person is not permitted to carry out mining activities in Suriname unless authorization has been granted under the Mining Decree. Mining rights under the Mining Decree confer on the holder thereof the right to carry out mining operations and are divided into five types:

(a) the right of reconnaissance;

(b) the right to exploration;

(c) the right of exploitation;

(d) the right to small mining; and

(e) the right to exploit building materials.

Rosebel Gold Mines N.V. ("**RGM**") holds certain rights of exploration and rights of exploitation in Suriname. The nature of such rights under the Mining Decree is discussed below.

Rights of Exploration

Pursuant to Article 28 of the Mining Decree, a right of exploration confers on the holder thereof the exclusive right to explore an area for minerals. A holder of a right of exploration is further entitled to:

- enter the exploration area to conduct exploration activities, being all activities to determine as accurately as possible the nature, quantity, mode of occurrence and economic value of the mineral deposit, as well as all other activities to determine the economical and technical feasibility of its exploitation;
- drill holes for sample collection, make excavations and carry out subsurface work which in his judgment is necessary;
- erect camps and temporary buildings necessary for his personnel and equipment;
- build necessary infrastructure;
- use geological samples collected in the exploration area for tests and analysis; and
- transport samples abroad after obtaining permission from the minister responsible for mining affairs (the "**Minister**").

As such, under applicable law, the holder of a right of exploration legally enjoys land use rights with respect to the exploration area, including the right to build necessary buildings and infrastructure.

The Mining Decree imposes obligations on holders of rights of exploration. Pursuant to Article 29, the holder of a right of exploration is required to:

- begin exploration activities within three months after being granted the right of exploration and continue such activities without interruption (except that interruptions of less than four months are permitted);
- carry out exploration work in accordance with an agreed upon work program;
- submit each year a detailed work program for the following year;
- notify the Minister of any mineral deposit discovery within 30 days of discovery;
- satisfy the minimum spending amounts set out in the order granting the right of exploration;
- keep accurate and complete records of activity and geological results and conduct quarterly and annual reports on progress and results; and

- pay all required duties.

In addition, Article 63 of the Mining Decree provides that the holder of a right of exploration shall pay to the Republic of Suriname at the beginning of each one-year period an amount equal to 50 cents multiplied by the number of hectares to which the right of exploration relates.

Rights of exploration are granted for an initial period of no greater than three years. This initial period may be extended up to two times for a period of two years each if, during the initial period, the holder of the exploration right (i) has carried out its activities in accordance with the agreed program to the satisfaction of the Minister, (ii) has spent the minimum commitment amount for the initial period and (iii) commits to a new minimum commitment amount for the extension period. Thus, rights of exploration may be held for a maximum total of seven years (an initial term of three years, a first extension of two years and a second extension of two years). Pursuant to the Mining Decree, after the initial three year period, the surface to which the right of exploration relates is reduced by 25%. A further 25% surface area reduction is applicable upon each subsequent extension of the right of exploration and, at the end of the seventh year, the right of exploration is relinquished.

Rights of Exploitation

A right of exploitation confers on the holder thereof the exclusive right to extract the minerals to which such right relates at the exploitation area to which such right relates. A holder of a right of exploitation is further entitled to, among other things:

- beneficiate, process, transport and market the minerals to which the right relates in accordance with conditions agreed upon at the timing of the granting of the right;

- erect all works and buildings in or on the exploitation area to mine and process the minerals; and

- to continue reconnaissance and exploration activities on the exploitation area.

- Pursuant to Article 35 of the Mining Decree, the holder of a right of exploitation is required to, among other things:

- commence exploitation activities in a timely manner and continue such activities without interruption, unless such interruption is approved by the Minister;

- maintain accurate and complete records of technical and financial data;

- submit quarterly and annual reports to the Minister; and

- pay such fees and charges as are required by the Mining Decree.

Rights of exploitation are granted for a period of no greater than 25 years, subject to the right of the holder thereof to apply for an extension. Any application for extension must be submitted no later than two years prior to the expiration of the initial term. The area subject to a right of exploitation may not exceed 10,000 hectares. Further, pursuant to Article 32 of the Mining Decree, the Republic of Suriname has a right of option to participate in any exploitation, provided that such option is exercised by the Republic of Suriname within two months of the application for the right of exploitation being submitted.

Mineral Agreement

The relationship between RGM and the Republic of Suriname is governed by the mineral agreement dated April 7, 1994, as amended by an amending and supplemental agreement dated March 13, 2002 and a second amendment and supplemental agreement dated June 6, 2013 (the "**Second Amendment**" and, collectively, the "**Mineral Agreement**"). The Mineral Agreement has been approved by the Suriname National Assembly — the legislative authority of Suriname — and therefore has the force of law.

The Mineral Agreement outlines various business conditions and arrangements with respect to the operations of RGM, including an entitlement of the Republic of Suriname to a 5% carried participation interest in the share capital of RGM. The Mineral Agreement overrides statutory law where deviations are expressly provided for therein and includes the following key terms:

- a stable tax regime, including fixed royalties, income tax, and withholding tax rates;
- obligations to employ and train local personnel;
- provisions dealing with changes in control or share transfers;
- contractual environmental obligations, including with respect to environmental impact assessments and mine closure plans; and
- exemptions from general currency controls.

The Second Amendment of the Mineral Agreement contains the terms and conditions for the establishment of an unincorporated Joint Venture ("**UJV**") through which the Republic of Suriname indirectly holds a 30% participating interest and RGM holds a 70% participating interest in the assets of the UJV, which comprise: (i) mineral rights, licences and other assets in the area surrounding Gross Rosebel; and (ii) certain rights to gold production from the Gross Rosebel exploitation concession in the event that the Republic of Suriname participates in a significant capacity expansion at Gross Rosebel.

Tax Legislation

Corporate Income Tax

Pursuant to tax legislation in Suriname, corporate income tax is levied on entities established in Suriname. Such corporate income tax is levied on the aggregate amount of net income earned from all sources during the entity's accounting period. The annual taxable net income earned by resident entities is subject to the headline corporate income tax rate in Suriname of 36%. The Mineral Agreement provides for an income tax rate being the lesser of the statutory rate in effect (currently 36%) and 45%.

Value Added Tax (VAT) Act

The Value Added Tax Act, which entered into force on January 1, 2023, replaced the former Turnover Tax (Omzetbelasting, OB). This legislation governs the imposition of a general consumption tax on the supply of goods and services within Suriname. The introduction of VAT aims to establish a modern and transparent tax system aligned with international standards, increase government revenue in a sustainable manner and reduce tax avoidance and promote fair competition among businesses.

VAT is levied on (i) the supply of goods and services by entrepreneurs within Suriname and (ii) on the importation of goods into Suriname. The Act applies to: (i) entrepreneurs engaged in economic activities, including production, trade, and services; (ii) both natural persons and legal entities; (iii) certain professional groups are exempt, such as medical practitioners and educational institutions. The VAT Act provides for multiple rates: a standard rate of 10%, applicable to most supplies of goods and services; a reduced rate of 0% or 5% for essential goods and services (e.g., medicines and staple foods); exemptions apply to specific sectors, including financial services, healthcare, and education.

Entrepreneurs are entitled to deduct input VAT paid on purchases and expenses, provided these relate to taxable transactions. This mechanism ensures that VAT is ultimately levied only on the value added.

The Mineral Agreement provides that the implementation of tax changes shall not impact the tax liability of RGM and, as the VAT Act was implemented after the Mineral Agreement was concluded, RGM is exempt from such tax.

Dividend Withhold Tax

Under the Suriname Dividend Withholding Tax Ordinance, a 25% withholding tax is ordinarily imposed on dividend payments by resident companies. However, the Mineral Agreement contains a broad tax exemption with respect to, among other things, the distribution of dividends to shareholders and the repatriation of dividend payments by non-Suriname shareholders.

Environmental Protection Legislation

Pursuant to the Mining Decree, holders of mining rights are generally obligated to take measures for the protection of ecological systems and, upon the termination of mining rights, to take all necessary steps in the interest of public safety, conservation of the sedimentary deposits, making the terrain concerned usable again, and protection of the environment. Until 2020, there was no specific framework law mandating environmental management in Suriname.

The Mineral Agreement required that a Feasibility Study and Environmental and Socio-economic Impact Assessment be submitted to the Republic of Suriname, which was completed in 1997. After further exploration, a final Feasibility Study and ESIA was completed and submitted to the Ministry of Natural Resources in August 2002. RGM received a right of exploitation with respect to the Gross Rosebel concession from the Republic of Suriname after the approval of the final Feasibility Study and the accompanying EIA in December 2002.

The *Environmental Framework Act* S.B. 2020 no. 97 came into effect on May 15, 2020 and sets the perimeters and scope of environmental management in Suriname. The *Environmental Framework Act* forms the legislative basis for the establishment of the National Environment Authority (Nationale Milieu Autoriteit, NMA), which is responsible for coordinating environmental policies, conducting environmental impact assessments, and ensuring compliance with environmental regulations.

Labour and Employment Legislation

Labour Act

The *Labour Act* is the main framework legislation governing employment relationships in Suriname. The maximum working hours for employees is generally 8.5 hours per day or 48 hours per week, provided that the Minister of Labour may grant exemptions for specific industries to have extended working hours. On August 5, 2010, RGM obtained approval from the Minister of Labour for (i) extended working hours of 12 hours per day and (ii) working rotations of 14 consecutive working days followed by 7 days of rest. Pursuant to the *Labour Act*, workers are entitled to a 30 minute break after 5 hours of work. Overtime is permitted under conditions and must be compensated at a minimum of 150% of normal wages, increasing to 200% on rest days. Night work is only permitted in designated sectors or with permission.

Dismissal Protection Act

The *Dismissal Protection Act* regulates termination of employment in Suriname. An employer must obtain prior approval from the Director of Labour for unilateral dismissal unless the termination is by mutual consent or due to urgent cause. Urgent dismissals for serious misconduct may be carried out without such approval provided notice is given to the Labour Inspectorate. The Labor Inspectorate may object to the dismissal. The

Dismissal Protection Act does not provide for statutory severance obligations but compensation may be awarded by the courts depending on the circumstances of the dismissal.

Minimum Wage Act

The Minimum Wage Act sets the legal minimum hourly wage in Suriname. The minimum hourly wage is subject to annual review and adjustment by the Suriname government.

General Pension Act

The *General Pension Act*, adopted in 2014, introduced a mandatory basic pension scheme — the Algemeen Pensioenfonds ("**APF**") — for all employees in the private and semi-public sectors in Suriname, aiming to provide supplementary income in old age alongside the state pension. The *General Pension Act* applies to all employees in the private sector and semi-public entities between the ages of 18 and 60 who are not already covered by a qualifying pension scheme. Employers are legally obligated to register their employees with APF and deduct and transfer pension contributions. Penalties may apply for non-compliance or late payments.

Contributions are shared between employer and employee, whereby the employee contributes a fixed percentage of their gross wage and the employer contributes a higher percentage. The contribution rates are determined by law and can be adjusted by decree. Upon reaching the pensionable age (currently 60), employees receive a monthly pension based on their contributions and accrued entitlements. Pension rights are personal and portable — employees retain their entitlements even if they change jobs. Early or deferred retirement may be possible under certain conditions.

The *General Pension Act* does not replace existing pension schemes, such as those under collective labour agreements or company pension plans. However, employers with an existing pension plan may apply for exemption if the scheme provides equal or better benefits than the *General Pension Act*.

The APF operates under public law and is supervised by the Ministry of Finance and Planning and the Central Bank of Suriname. Annual reporting and independent audits are required to ensure transparency and accountability.

National Basic Health Insurance Act

The *National Basic Health Insurance Act* aims to provide all residents of Suriname with access to essential medical care in an affordable and equitable manner through a legally mandated basic health insurance system. The law came into effect on October 9, 2014. Employers are obligated to insure their employees, and the government provides coverage for non-earning and vulnerable groups such as children, the elderly, and the socially disadvantaged.

Vacation Law

The *Holiday Act* guarantees paid annual leave to employees. Employees are entitled to at least 12 working days of vacation per year after one full year of service, and to receive vacation pay generally calculated at 1.25 times the normal wage.

Sickness and Maternity Leave

Sickness and maternity leave are largely covered in the *Labour Act* and under collective labour agreements. For sickness leave, employees must notify the employer and may be entitled to continued wage payment, usually for up to 6 weeks, following which sickness benefits may be payable under the *Social Insurance Act*. Employees are entitled to 12 weeks of maternity leave, typically 4 to 6 weeks before the expected due date and 6 to 8 weeks after. Maternity pay is provided through social insurance.

Collective Labour Agreements

The *Collective Labour Agreement Act* governs collective labour agreements in Suriname. Collective labour agreements are binding agreements between employers and unions that may offer more favourable terms than the minimum provided by law.

Occupational Health and Safety

The primary goal of the *Safety Act* is to ensure safe and healthy working conditions through preventive measures, inspections and enforcement, and education and awareness. It serves as a general legal framework for occupational health and safety in Suriname, aimed at preventing workplace accidents, occupational diseases and other risks. The general *Safety Act* is supplemented by specific regulations for various sectors, including mining and energy.

Employers are legally obligated to: (i) provide a safe workplace that does not endanger the life or health of employees; (ii) supply appropriate protective equipment (e.g. helmets, gloves, hearing protection); (iii) ensure proper ventilation, lighting, and workplace layout; (iv) regularly maintain and secure machines and installations; and (v) offer training and instruction on safe working practices.

Employees are required to: (i) follow safety instructions and internal regulations; (ii) properly use protective gear; and (iii) avoid actions that may create danger to themselves or others.

The Labour Inspectorate, under the Ministry of Labour, is tasked with monitoring compliance with the *Safety Act*. Inspectors may enter workplaces unannounced and issue warnings or fines. In cases of serious or repeated violations, authorities may suspend operations. Violations may result in criminal penalties, such as fines or imprisonment (e.g. in cases of gross negligence). In the event of a workplace accident, the employer may also face civil liability for damages.

Additional provisions on health and safety are also found in the *Labour Act 2017*, which confirms the employer's duty of care regarding safe working environments.

Foreign Currency Control

Under currency exchange legislation in Suriname, large currency transactions between residents and non-residents are generally subject to the approval of the Foreign Exchange Commission. However, exceptions to currency control restrictions have been agreed upon in the Mineral Agreement, including that: (i) RGM is entitled to export and sell from Suriname any minerals produced from Gross Rosebel without restriction (subject to inspection by customs personnel) and to maintain all sales proceeds in bank accounts outside Suriname; (ii) RGM is permitted to hold and operate foreign currency bank accounts; and (iii) RGM may remit all capital invested and profits earned in Suriname to persons outside of Suriname without restriction.

LAWS AND REGULATIONS RELATED TO OUR GHANA OPERATIONS

Mining Legislation

Ownership of Minerals

Pursuant to Article 256 of the 1992 constitution of Ghana, all minerals in their natural state in or upon any land or water are, the property of the Republic of Ghana and vested in the President on behalf of and in trust for the people of Ghana. In that regard, pursuant to section 5(4) of the Minerals and Mining Act, 2006 (Act 703) ("**Mining Act**") and Article 268(1) of the 1992 Constitution of Ghana, any transaction which involves the granting of rights (extensions) for the exploitation of minerals, including a mining lease, requires Parliamentary ratification to be valid.

Under section 7 of the Mining Act, the Minister responsible for Minerals and Mining (the "**Minister**") has the right of pre-emption to all minerals obtained in Ghana and products derived from the refining or treatment of these minerals. The Gold Board Act, 2025 (Act 1140) also grants the Gold Board the authority to buy a portion or all of the gold produced by large scale mining companies in line with the provisions of the Mining Act.

Types of Mineral Rights

A reconnaissance licence, prospecting licence or a mining lease are the three main categories of mineral rights which may be granted under Ghanaian law. A reconnaissance licence grants the holder the right to search for specified minerals using non-intrusive methods such as geological surveys, but does not permit drilling or excavation unless expressly allowed. It is valid for up to twelve (12) months and may be extended for additional twelve (12) month periods if deemed to be in the public interest.

A prospecting licence allows the holder to explore for specified minerals for up to three (3) years over an area not exceeding seven hundred and fifty (750) contiguous blocks. If a holder of a reconnaissance licence applies for a prospecting licence over the same area and mineral, and has complied with the relevant legal obligations, the Minister is required to grant the prospecting licence within 60 days, subject to other legal requirements. The licence grants exclusive rights to prospect within the specified area. The prospecting licence may be renewed for additional terms of up to three (3) years.

A mining lease permits the holder to extract minerals and may be issued for a maximum period of thirty (30) years over an area of 1 to 300 contiguous blocks. The leaseholder may apply for an extension of the lease for a further period of up to thirty (30) years, at least three months prior to the expiry of the initial term, or within such other period as may be agreed with the Minister. A mining lease is subject to ratification by Parliament.

The Minister, on the Minerals Commission's recommendation, may suspend or cancel a mineral right if the holder fails to make required payments, becomes insolvent, provides false information, or becomes ineligible under the Mining Act. A mining lease may also be suspended or cancelled if the holder fails to carry out significant operations for over two years without good cause**.**

Development Agreement and Stability Agreement

The Minister, with advice from the Minerals Commission and subject to parliamentary ratification, may enter into a development agreement with the holder of a mining lease where the proposed investment will exceed five hundred million United States Dollars (US$500,000,000). A development agreement typically covers operational, environmental, dispute resolution and possibly stability terms.

Additionally, the Minister may enter into a stability agreement, also subject to parliamentary ratification, with the holder of the mining lease, to ensure that the holder of the mining lease will not, for a period not exceeding fifteen (15) years from the date of the agreement, be adversely affected by fiscal or regulatory changes, including taxes, duties, royalties and laws relating to exchange control, transfer of capital and dividend remittance.

Free-Carried Interest and Special Share

Pursuant to section 43 of the Mining Act, 2006 (Act 703) where a mineral right is for mining or exploitation, the Ghanaian government is entitled to acquire a ten percent (10%) free-carried interest in the company without any financial contribution to the company or its mining operations.

This is typically exercised through equity ownership or, as seen in the Revised Investment Agreement with Newmont Golden Ridge (now Zijin Golden Ridge) ("**RIA**"), by receiving 1/9th of declared dividends.

Additionally, pursuant to section 60 of the Mining Act, the Minister may require a mining company to issue a special share to the government at no cost. This share grants limited rights such as attendance at meetings and but does not carry voting rights, dividends, or liquidation rights, and may be redeemed by the government at nominal or no cost.

Dealing with Mineral Rights

In Ghana, mineral rights are transferable subject to the prior written approval from the Minister in accordance with section 14 of the Mining Act. Additionally, under Section 52 of the Mining Act, a person may become a controller of a mining company only after notifying the Minister and either receiving a no objection in writing within two months or the period elapsing without being served with an objection from the Minister.

Operating Permits

Under Regulation 6(1) and 8(1) of Minerals And Mining (Health, Safety And Technical Regulations, 2012) (L.I. 2182), holders of reconnaissance or prospecting licences must obtain an exploration operating permit, and holders of mining leases must obtain a mining operating permit from the Inspectorate Division of the Minerals Commission before commencing operations. These permits are valid for one calendar year and must be renewed annually.

Export Licences

Sections 6 and 104 of the Mining Act provides that the Minister, in consultation with the Minerals Commission, may in writing, licence persons the Minister considers fit, to sell and export or otherwise deal in the specified types and forms of minerals and under terms and conditions specified in the licence.

Other Approvals and Permits

A mining lease holder must submit and obtain approval for a Mining Operating Plan and an Emergency Response Plan from the Minerals Commission's Inspectorate Division under the Minerals and Mining (Health, Safety and Technical Regulations, 2012 L.I. 2182).

A permit from the Water Resources Commission is also required to use divert, dam, store, abstract or use water resources (as defined in the act) or construct or maintain any works for the use of water resources.

Under Minerals and Mining (Mineral Operations — Tracking of Earth Moving and Mining Equipment) Regulations 2020 (L.I. 2404), mineral right holders; mine support service providers; dealers in earth moving and mining equipment; and any other person who intends to use earth moving and mining equipment in mineral operations is required to obtain a permit from the Minerals Commission.

Other required permits include permits to purchase, use and store explosives.

Annual Mineral Rights Fees

Section 24 of the Mining Act requires holders of mineral rights to pay an annual mineral right fee to the Minerals Commission, calculated per cadastral unit. The fee varies by the type and duration of the mineral right: for a Prospecting Licence, it ranges from thirty-two United States Dollars (USD32) to seventy United States Dollars (USD70) over a nine (9) year period, while for a Mining Lease, it is one thousand United States Dollars (USD1,000) for the first two (2) years and one thousand five hundred United States Dollars (USD1,500) from Year three (3) to Year thirty (30) years.

Annual Ground Rent

Section 23 of the Mining Act requires holders of mineral rights to pay annual ground rent. The rent is payable to the landowner or their successors and assigns; however, in the case of stool lands, it must be paid directly to the Office of the Administrator of Stool Lands. The annual ground rent is charged per cadastral unit.

Compensation and Resettlement

Section 74 of the Minerals and Mining Act provides that the owner or lawful occupier of any land subject to a mineral right is entitled to and may claim from the holder of the mineral right compensation for the disturbance of the rights of the owner or occupier. The amount of compensation payable is to be determined by agreement between the parties; however, if the parties are unable to reach an agreement as to the amount of compensation, the matter shall be referred by either party to the Minister who, in consultation with the Government agency responsible for land valuation shall, determine the compensation payable by the holder of the mineral right. The compensation to which an owner or lawful occupier may be entitled, may include compensation for deprivation of the use or in particular, use of the natural surface of the land or part of the land, loss of or damage to immovable properties, in the case of land under cultivation, loss of earnings or sustenance suffered by the owner or lawful occupier, having regard to the nature of their interest in the land, and loss of expected income depending on the nature of the crops on the land and their life expectancy.

Local Content Requirements

Under the Minerals and Mining (Local Content and Local Participation) Regulations, 2020 (L.I. 2431), holders of mineral rights are required to procure goods and services with Ghanaian content to the maximum extent possible. They must also submit a procurement plan to the Minerals Commission for approval, covering an initial five-year period and updated every five years thereafter.

Holders of mineral rights are also required to procure locally, the items that are specified on the procurement list by the Minerals Commission which is reviewed annually.

A mining lease holder must also submit a recruitment and training programme for Ghanaians to the Minerals Commission for approval. This programme should detail efforts to replace expatriates with Ghanaians over time and specify the proportion of expatriate senior staff allowed: not more than 10% in the first three years, 5% after the third year, and a gradual reduction after the sixth year toward full Ghanaian participation.

Regulation 13 of L.I 2431 also provides that the Minister, based on recommendations from the Minerals Commission and in consultation with the Securities and Exchange Commission, will set capital expenditure thresholds for listing on the Ghana Stock Exchange. If a mineral rights holder's planned capital expenditure exceeds this threshold, they must list at least 20% of their equity on the Ghana Stock Exchange within five years of starting mining operations. The thresholds are yet to be set.

Environmental Protection Legislation

Environmental Requirements

Mining companies are required under Ghana's environmental laws to obtain environmental permit(s) prior to undertaking mining operations. An environmental permit is valid for eighteen (18) months, effective from the date of the issue of the permit.

Where an undertaking in respect of which a preliminary environmental report or an environmental impact statement is approved and the company commences activities after obtaining an environmental permit, it is required to obtain within twenty-four (24) months of the date of the commencement of operations, an environmental certificate from the EPA.

The Environmental Assessment Regulations, 1999 (L.I. 1652) requires that an environmental management plan in respect of an undertaking's operations is submitted within eighteen (18) months of commencement of operations and thereafter every three (3) years. If the environmental management plan satisfies the requirements of the EPA, the environmental certificate may be renewed for another three (3) years. Furthermore, a company granted an environmental permit under these Regulations must submit an annual environmental report after twelve (12) months from the date of commencement of operation and every twelve (12) months thereafter to the EPA.

Reclamation Bond

An undertaking involved in mining operations is required to include reclamation plans with its environmental impact statement and to provide security for any default on reclamation or rehabilitation of disturbed land. Regulation 23 of the L.I 1652 provides that those undertakings for which a reclamation plan is required, including mining, shall be required to post a reclamation bond based on the approved work plan.

The terms of such security are agreed upon between the EPA and the undertaking under the terms of a reclamation security agreement. The reclamation security usually takes the form of cash deposit and a bank guarantee.

Forest Entry Permit

Under section 18 of the Mining Act, before undertaking an activity or operation under a mineral right, an applicant is required to obtain the necessary approvals and permits from the Forestry Commission. Any mining activity that affects a forest reserve must be supported by a forest entry permit granted by the Forestry Commission.

Foreign Investment and Currency Legislation

Regulations relating to Foreign Investment

The Ghana Investment Promotion Centre (GIPC) Act, 2013 (Act 865), provides that companies with foreign shareholding are required to register with the GIPC and satisfy the minimum capital requirement stipulated under the GIPC Act before commencing operations in Ghana.

Companies that are jointly owned by Ghanaians and foreign persons are required to have a minimum foreign capital contribution of two hundred thousand United States Dollars (USD200,000.00) or five hundred thousand United States Dollars (USD500,000.00) for wholly foreign owned companies. The foreign capital contribution is for the operations of the company and is payable in cash or goods.

Registration with the GIPC provides certain investment guarantees and incentives under the GIPC Act, such as approved immigration quota to employ foreign nationals, free transferability of foreign currency through an authorized dealer bank for payment of dividends to foreign shareholders, foreign debt servicing and remittance of net proceeds from the sale of the registered enterprise.

Regulations relating to Foreign Currency

Section 15(1) of the Foreign Exchange Act, 2006 (Act 723) (the "**FEA**"), also provides that each payment in foreign currency to or from Ghana between a resident and a non-resident or between non-residents, shall be made through a bank. A holder of a mining lease is guaranteed the free transfer of convertible currency either through the Bank of Ghana or, if classified as a net foreign exchange earner, through a designated foreign exchange account.

Under section 30 of the Mining Act, a holder of a mining lease who earns foreign exchange from mining operations may be allowed by the Bank of Ghana to retain part of the earnings in a designated account for the purchase of spare parts and other necessary inputs.

The RIA permits our Company to obtain and hold funds in the currency that it chooses save that it is required to return to Ghana a minimum of thirty (30%) of its gross proceeds from the sale of gold.

Tax Legislation

Royalties

The Mining Act provides that the holder of a mining lease shall in respect of minerals obtained from its mining operations, pay royalty to the Republic at the rate and in the manner that may be prescribed.

Under the RIA, during the Stability Period, the royalties payable on total mineral sales revenue is based on the gold price: 3.6% if below one thousand three hundred United States Dollars (USD1,300) per ounce, 4.1% for prices between one thousand three hundred United States Dollars (USD1,300) and one thousand four hundred and forty-nine United States Dollars and ninety-nine Cents (USD1,449.99) per ounce, 4.6% between one hundred thousand four hundred and fifty United States Dollars (USD1,450) and two thousand two hundred and ninety-nine United States Dollars and ninety-nine Cents (US$2,299.99) per ounce, and 5.6% if the price of gold is two thousand three hundred United States Dollars (US$2,300) per ounce or above.

Additionally, as stated in the Environmental Guidelines for Mining in Production Forest Reserves (May 2001), mining companies operating within forest reserves are subject to an additional 0.6% royalty payment and this is also captured in the Revised Investment Agreement.

Import duties and excise taxes

The Mining Act currently permits exemption from payment of customs import duties and excise taxes on mining equipment, plant and machinery which are imported for use exclusively for mining operations. The list of exempted items is contained in the Official Mining List which is settled between the Government agencies (Ghana Revenue Authority, Minerals Commission) on the one hand and the Ghana Chamber of Mines, representing the Mining Companies.

The RIA also provides that our Company will be exempt from the payment of taxes and duties on plant, machinery, equipment, parts, fuels and petroleum products, supplies and accessories which are imported necessarily, specifically and exclusively for operations.

Income Tax

Under section 1 of the Income Tax Act, 2015 (Act 896) (as amended), income tax is payable each year by any person with chargeable income or who receives a final withholding payment during the year. While the standard corporate tax rate for mining companies is currently 35%, the Revised Investment Agreement entered into by our Company provides for a reduced corporate tax rate of 32.5%.

Growth and Sustainability Levy

The Growth and Sustainability Levy Act, 2023 (Act 1095) was recently amended by the Growth and Sustainability Levy (Amendment) Act, 2025 (Act 1131). The amendment provides that mining companies are to pay three percent (3%) of their gross production as tax to the Government.

We note that this may not be applicable to our Company currently, since under the RIA, our Company enjoys stability from new taxes during the Stability Period (as defined therein).

LAWS AND REGULATIONS RELATED TO OUR TAJIKISTAN OPERATIONS

Laws and Regulations on Mining Activities

Regulation in the Mining Sector

The Law of the Republic of Tajikistan "On Subsoil" establishes the legal framework for the exploration, protection, and use of subsoil resources, and regulates relations in this sphere.

State Ownership: Subsoil resources, including deposits of precious metals, are exclusively state property. Private ownership of subsoil is prohibited. All rights to use these resources are granted only on the basis of licenses and permits.

Regulation of Placer Mineral Extraction (including Precious Metals): According to **Article 16**, the extraction of placer minerals, including precious metals, is permitted only under licenses issued to individual entrepreneurs and legal entities. Artisanal and free gold panning methods are also allowed, but strictly with official authorization. Unauthorized extraction is prohibited and punishable by law.

Environmental and Technical Requirements: The law mandates compliance with subsoil and environmental protection standards (Articles 23, 24, and 42), and requires a state expert evaluation of reserves before mining can begin (Article 30). Excessive loss, pollution, or unjustified exploitation of deposits is prohibited.

Regulation through Licensing

The Law of the Republic of Tajikistan "On the Permitting System" (as amended on December 27, 2023, No. 2015 and June 20, 2024, No. 2056, adopted on June 22, 2023, No. 1968) establishes the legal and organizational framework for the permitting system in Tajikistan. It regulates the procedures for issuing, reissuing, suspending, and revoking licenses and other permits for activities considered high-risk — including subsoil use, geological exploration, and the employment of foreign labor.

In Tajikistan, the following types of activities related to subsoil use are subject to mandatory licensing, alongside other high-risk sectors:

- Extraction of mineral resources, including precious metals and hydrocarbons;
- Geological exploration, including prospecting, exploration, and evaluation of deposits;
- Exploration and extraction of underground water.

Licenses are issued by the Government of the Republic of Tajikistan or other authorized permitting bodies. The process requires submission of an application, registration, payment of a fee, and compliance with qualification requirements and licensing conditions.

The term of validity of a subsoil use license is determined by the Government.

Information is recorded in the Unified State Register of Licenses.

Engagement of Foreign Labor: to engage foreign specialists in the context of subsoil use, a separate permit is required, including authorization for employment activities.

The procedure is carried out through the permitting authorities and migration control bodies, and involves obtaining a visa, signing an employment contract, and securing insurance.

Violation of the established procedure for employing foreign labor is subject to liability.

Consequences of Non-Compliance with Licensing Requirements: If violations are identified — such as failure to meet licensing conditions, submission of false information, or non-payment of fees — the license may be:

- Suspended for up to 3 months to allow for the correction of violations;
- Revoked by a decision of the court or the permitting authority;

In exceptional cases — such as threats to the environment, human life, or safety — a license may be immediately suspended.

Carrying out activities without a license or permit is considered illegal, and responsible individuals are subject to liability in accordance with the legislation of the Republic of Tajikistan. Losses caused by the unjustified revocation of a license are subject to compensation by the permitting authorities, based on a court decision.

The Law on the Permitting System establishes a strict but transparent regulatory framework for subsoil use and geological exploration, including the involvement of foreign specialists.

Failure to comply with the law may lead to the suspension or revocation of licenses, prohibition of activities, and the imposition of legal liability.

Land Rights

The Land Code of the Republic of Tajikistan, adopted on December 13, 1996 (as amended on June 22, 2023), regulates relations concerning the ownership, use, and protection of land, as well as its designated use.

Land in Tajikistan is the exclusive property of the state and cannot be privately owned.

However, the right to use land may be granted on various grounds, including lease, perpetual, fixed-term, and inheritable lifelong use.

Land allocated for subsoil development (including mineral extraction) is classified as industrial land and may be provided to legal entities and individuals based on licenses and in accordance with the requirements of the legislation:

- Establishes that allocating land for construction on areas containing mineral deposits is only allowed with the approval of mining oversight authorities.
- Provides that land may be withdrawn if mineral deposits are discovered, with mandatory compensation to the land user.
- All losses incurred by land users and costs for land restoration must be reimbursed by the parties in whose interest the land is being used.

Geological Exploration and Temporary Use

- Land may be temporarily allocatee for geological, prospecting, geodetic, and other surveying activities without withdrawal of the land from the current user.
- Compensation for damages and mandatory restoration of the land's original condition are required upon completion of such works.

Liability and Oversight

- State authorities have the right to suspend mineral extraction activities in case of violations and land legislation.
- All projects affecting land are subject to official approval and may be appealed.

The Land Code of Tajikistan establishes strict state control over land use in the field of mineral extraction. To obtain a land plot for extraction, approval from the mining oversight authority, a valid license, and compliance with designated land use and environmental standards are required. Violations may lead to the revocation of the land plot, and any damage caused must be compensated.

Laws and Regulations on Environmental Protection and Ecology

The Law of the Republic of Tajikistan "On Environmental Protection" (as amended as of November 13, 2024) establishes the legal foundations of state policy in the field of environmental protection, sustainable use of natural resources, and ecological safety.

Mineral extraction activities are directly regulated by this law, as they:

- Has a direct impact on components of the natural environment — including land, subsoil, water, air, flora, and fauna;
- Requires a mandatory Environmental Impact Assessment (EIA) and a positive conclusion from the State Environmental Review (Articles 35–36);
- Must comply with limits on emissions, discharges, waste disposal, and natural resource use set by the authorized body (Articles 19–20);
- May be suspended or terminated in case of violations of environmental requirements (Articles 39, 44);
- Is subject to environmental control and monitoring (Articles 9,26).

In addition, natural resource users are required to:

- Ensure environmental safety;
- Restore disturbed natural resources;
- Pay for the use of subsoil and for negative environmental impacts;
- Compensate for any damage caused.

The law establishes a strict regulatory framework under which mineral extraction activities are only permitted if environmental protection requirements are met. These include licensing, impact assessment, environmental review, compliance with standards, monitoring, and mandatory compensation for environmental damage.

The Law of the Republic of Tajikistan "On Environmental Monitoring" (as amended on November 13, 2024, No. 2097) regulates the organizational, legal, and technical aspects of the environmental monitoring system in Tajikistan. Its purpose is to ensure timely detection, assessment, and forecasting of environmental impacts, including those from anthropogenic sources (i.e., human economic activities such as mineral extraction).

Focus on the mineral extraction sector:

- Natural resource users, including subsoil users, are required to carry out local environmental monitoring of impact sources (Article 12), i.e., to monitor emissions, pollution, and impacts on air, water, soil, subsoil, and living organisms.

- Such enterprises must:

  - Organize environmental monitoring activities;

  - Maintain the necessary technical and material infrastructure for monitoring;

  - Use approved measurements methods;

  - Appoint responsible personnel for monitoring and reporting;

  - Submit environmental data to state authorities.

- Environmental monitoring is mandatory during the development and implementation of natural resource use projects and is included as part of the State Environmental Review (Article 18). This is particularly important when launching or expanding mineral extraction operations. Failure to fulfill monitoring obligations may result in legal liability.

- Monitoring data are taken into account when making decisions on construction permits, including in the mining sector, as well as in urban planning, public health assessments, and sustainable development initiatives (Article 8).

The law plays a key role in controlling environmental risks associated with resource extraction and ensures both state and public oversight of the environmental impact of mining operations.

The Law of the Republic of Tajikistan "On Environmental Expertise" (as amended on November 13, 2024, No. 2101) regulates the procedure and principles for conducting environmental reviews to assess the potential impact of proposed activities on the environment. Its primary goal is to prevent environmental, social, and economic consequences resulting from economic and other forms of activity.

- Mineral extraction is classified as a type of planned economic activity subject to mandatory Environmental Impact Assessment (EIA) and subsequent State Environmental Expertise.

- Such activities are considered potentially hazardous to the environment and are subject to the presumption of environmental risk, meaning they require a thorough preliminary assessment before project approval.

- Project documentation related to geological exploration, construction, and operation of extraction facilities must undergo environmental review to verify compliance with environmental standards, permissible pollution levels, and the inclusion of environmental protection measures.

- Without a positive conclusion from the environmental expertise, project financing or implementation is prohibited, including for resource development projects.

- If negative impacts or non-compliance with standards are identified, the project must be revised and resubmitted for review.

- The law also requires the consideration of public opinion, including holding public consultations and allowing for public environmental expertise initiated by citizens.

Thus, for companies engaged in subsoil use in Tajikistan, environmental expertise is a mandatory and legally significant procedure. Failure to comply may result in a ban on project implementation and the imposition of legal liability.

Laws and Regulations on Industrial Safety

The Law of the Republic of Tajikistan "On Industrial Safety of Hazardous Production Facilities" (as amended as of 2020) regulates the legal and organizational framework for ensuring industrial safety at hazardous production facilities (HPFs).

This law is a key regulatory act for enterprises operating in the mining sector, especially those that use hazardous reagents such as cyanides, acids, or operate with waste dumps and tailings storage facilities. Its purpose is to prevent accidents, minimize their consequences, and protect human life and health, the environment, and property.

- Mining and mineral processing enterprises are classified as hazardous production facilities, especially those operating underground or involving hydraulic structures.

- The law also applies to facilities where toxic or highly toxic substances are used or generated, as well as substances harmful to the environment, such as those involved in ore processing.

- Tailings storage facilities fall under the scope of the law as part of such facilities, recognized as potentially hazardous structures.

- Such facilities are required to

    - Develop and industrial safety declaration;

    - Conduct safety assessments and expert reviews;

- o Ensure continuous industrial safety monitoring and control;
- o Maintain emergency response units and ensure readiness to eliminate the consequences of accidents.

All such facilities are subject to mandatory registration in the State Register of Hazardous Production Facilities (HPFs). Violations of the law's requirements may lead to administrative or criminal liability.

Laws and Regulations on Taxation

Activities related to the extraction of mineral resources, including non-ferrous and precious metals, in the Republic of Tajikistan are regulated by both the general provisions of the Tax Code (as amended on April 15, 2025) and by special tax regimes applicable to subsoil users. The overall tax burden for these activities includes several components:

- Corporate Income Tax
- Royalties for the extraction of mineral resources
- Commercial Discovery Bonus
- Export Rent (applicable when raw materials are exported abroad)
- Value-Added Tax (VAT)
- Social Tax
- Property Tax

Tax Base: The tax base for corporate income tax is defined as the difference between the taxpayer's total income and documented expenses incurred in the course of operations. Income and expenses must be recorded in accordance with the provisions of the Tax Code. Losses from previous years may be carried forward and deducted in accordance with applicable legislation.

Tax Rates: Tax rates are set in Article 183 of the Tax Code and vary by type of activity. Generally, these rates can range from approximately 13% to 20% for different sectors, including manufacturing, credit institutions, mobile network operators, and extraction and processing of natural resources. Specifically, companies engaged in the extraction of non-ferrous and precious metals are subject to an 18% tax rate.

Investment Deductions: Under Article 201 of the Tax Code, taxpayers are entitled to investment deductions for certain expenditures. These deductions can range from about 5% to 10% of the value of investments in new technological equipment, modernization of production facilities, and technological upgrades. These are applied in the tax period when the assets are operational.

Royalties for Mineral Extraction

Tax Base: For precious metals, the tax base is the volume of extracted ore, recalculated into pure metal content (in grams or ounces).

For non-ferrous metals, the base is the volume of extraction, valued at the average market price during the reporting period on international exchanges (e.g., LME).

If no sale occurs, the production cost plus a 20% markup is applied.

Royalties are targeted payments for the use of subsoil resources and are calculated based on the volume of extraction for each resource type.

Royalty Rates: Royalty rates vary depending on the type of resource extracted, typically ranging from 6% to 10%. This range varies based on the types of materials, such as non-ferrous and rare metals, precious metals like gold, silver, and platinum, precious stones, and placer mineral resources.

Commercial Discovery Bonus

Tax Base: The bonus is calculated based on economically viable mineral reserves, as confirmed under the terms of the license and/or investment agreement.

It is a one-time payment due upon obtaining a mining license, provided the identified reserves are recognized as economically viable. The amount and payment procedure for the bonus are specified in the license terms and/or investment agreement.

Export Rent

Tax Base: The contract value of exported products, but not less than the average market price on international exchanges (e.g., LME, LBMA, etc.).

Mining companies are required to pay export rent on extracted mineral resources at rates of 2% starting in 2023, 4% — from 2025, and 6% — from 2027.

Withholding Taxes

Tax Base: The gross amount of income paid to a non-resident, without any deductions or expense offsets. The entire amount of accrued income, whether in cash or non-cash form, is subject to tax.

According to Articles 237–239 of the Tax Code, Withholding tax rates for various types of income generally range from 3% to 20%. This includes dividends, interest, royalties, insurance income, income from international transportation and telecommunications, and other income of non-residents, as well as salaries for both residents and non-residents.

The above rates apply if the income is paid to a non-resident who does not have a permanent establishment in Tajikistan. The responsibility for withholding and remitting the tax to the budget lies with the tax agent.

Value-Added Tax (VAT)

Tax Base: The taxable base includes the value of goods (works, services) sold and the value of goods imported into Tajikistan that are subject to VAT upon import.

According to Article 251 of the Tax Code of the Republic of Tajikistan, the sale of non-ferrous and precious metals within Tajikistan is exempt from VAT. However, imported raw materials and equipment, as well as purchases from domestic VAT-paying suppliers, are subject to VAT at a rate of 14%.

VAT paid on purchases is not deductible for the portion related to VAT-exempt operations. Therefore, despite the exemption on sales, VAT remains a significant tax burden for purchases and imports.

Social Tax

Tax Base: The tax base includes the total accrued income of employees, including wages, bonuses, allowances, compensations, and other payments, whether under employment contracts or civil law agreements.

Social tax must be paid on all employee-related payments with a 20% contribution paid by the employer on the wage fund and a 2% deduction withheld from the employee's salary. The taxable base covers basic salary, bonuses, allowances, compensation payments, and payments under both labor and civil contracts.

These rates apply uniformly to all employers, including subsoil users. Payments to foreign employees officially employed in Tajikistan are also subject to social tax.

Other Accounting and Reporting Aspects

- Companies must maintain separate accounting for each type of mineral resource;
- Separate tax returns must be filed for each tax obligation;
- Royalties and export rent must be paid regardless of profitability;
- In export operations, companies are required to disclose pricing methodologies and confirm arm's-length conditions.

LAWS AND REGULATIONS RELATED TO OUR AUSTRALIA OPERATIONS

Laws and Regulations on Mining Activities

Mining Activities in Western Australia

The *Mining Act 1978* (WA) (the **Mining Act**) is the principal legislation governing the exploration and development of mineral resources in Western Australia. It sets out the framework for the granting of mining tenements, environmental obligations (in conjunction with the environmental laws discussed below), and operational compliance for mining activities across the State. Under the Mining Act, there are various licences and leases that may be issued which authorise and govern participation in regulated mining activities. The key features of the different types of licences and leases which may be granted under the Mining Act are discussed below.

Prospecting Licence

The holder of a Prospecting Licence is permitted (amongst other things), subject to conditions and endorsements attaching to the tenement, to excavate, extract, or remove up to 500 tonnes of earth, soil, rock, stone, fluid, or mineral-bearing substances during the term of the licence, unless a greater amount is approved by the Minister. The holder of a Prospecting Licence has a priority entitlement to apply for a Mining Lease or General Purpose Lease over the same land.

A Prospecting Licence remains in force for a period of 4 years and may be extended for one further period of 4 years before expiry. An application for extension must be lodged during the final year of the term of the licence, on or prior to the expiry date. The application for an extension of term must be supported by information to support the ground claimed in respect of the extension request, a summary of work carried out under the licence, and a details programme of work the holder proposes to carry out under the licence if the extension were granted. The licence continues in force until the extension application is determined.

Prospecting Licences are subject to conditions which include minimum expenditure conditions, conditions relating to the payment of prescribed rent, and conditions relating to the prevention or reduction of injury to land and requisite approvals.

Exploration Licence

An Exploration Licence grants the holder the right to explore for specified minerals within the licensed area. The holder of an Exploration Licence may, subject to conditions and endorsements attaching to the tenement, excavate, extract, or remove up to 1,000 tonnes of earth, soil, rock, stone, fluid, or mineral-bearing substances during the term of the licence, unless a greater amount is approved by the Minister. The holder of an Exploration Licence has the right to apply for one or more Mining Leases over any part of the land covered by the Exploration Licence.

An Exploration Licence granted after 10 February 2006 are granted for one initial period of 5 years and may be extended for one further period of 5 years, followed by further periods of 2 years. An application for extension of term of an Exploration Licence must be lodged during the final year of the term of the licence, on or prior to the expiry date. The application for an extension of term must be supported by information to support the ground claimed in respect of the extension request, a summary of work carried out under the licence, and a details programme of work the holder proposes to carry out under the licence if the extension were granted.

Exploration Licences are subject to conditions which include minimum expenditure conditions, conditions relating to the payment of prescribed rent, requisite approvals, conditions relating to the prevention or reduction of injury to land, conditions relating to reserved land, conditions relating to consultation with an underlying Pastoral Lease holder, and the compulsory partial surrender of certain areas subject to Exploration Licences (relevantly, if applied for or granted after 10 February 2006 the holder must relinquish an area which constitutes not less than 40% of the area of the Exploration Licence at the end of 5 years).

Mining Lease

A Mining Lease authorises the holder to mine for, and dispose of, any minerals from the land to which the Mining Lease applies. The Mining Lease grants the holder exclusive rights to use, occupy, and enjoy the land for mining purposes, and the holder owns all minerals lawfully extracted from the Mining Lease area.

A Mining Lease is granted for an initial term of 21 years. The holder of a Mining Lease is entitled to a renewal, as of right, in respect of the first renewal or if section 111A(1)(d) applies. A Mining Lease may be renewed for further successive terms up to 21 years at the discretion of the Minister. An application for the renewal of a Mining Lease must be lodged during the final year of the term of the lease, on or prior to the expiry date.

Mining Leases are subject to conditions which include, minimum expenditure conditions, conditions relating to prescribed rent and royalties, survey requirements, purposes for which the land may be used, conditions relating to the prevention or reduction of injury to land, conditions relating to reserved land including the provision and acceptance of a mining proposal and mine closure plan, and reporting of results.

Miscellaneous Licence

A Miscellaneous Licence may be granted for a range of purposes directly connected to mining operations, such as the construction of roads, pipelines, or water extraction infrastructure. If another mining tenement is granted in respect of land that is subject to a miscellaneous licence the other mining tenement and the miscellaneous licence apply concurrently with respect to that land.

A Miscellaneous Licence is granted for an initial term of 21 years and may be renewed for further periods of 21 years. An application for the renewal of a Miscellaneous Licence must be lodged during the final year of the term of the lease, on or prior to the expiry date.

Miscellaneous Licences are subject to the same conditions as Prospecting Licences relating to the prevention or reduction of injury to land, compliance with the approved purpose for the tenement, and further terms and conditions as may be prescribed.

General Purpose Lease

A General Purpose Lease entitles the holder to exclusive occupation of the land for one or more specified purposes directly connected with mining operations. These purposes may include the erection and operation of machinery, the treatment or deposition of minerals or tailings, and other activities necessary to support mining operations, as outlined in the lease.

A General Purpose Lease is granted for an initial term of 21 years and may be renewed for successive 21 year terms.

General Purpose Leases are subject to conditions which include requisite approvals for ground disturbing work, mining proposal and mine closure plan requirements, survey requirements, and conditions relating to the prevention or reduction of injury to land.

Retention Licence

The holder of a Prospecting Licence or Exploration Licence granted, or applied for before 10 February 2006, and the holder of a Mining Lease (whenever granted or applied for) may apply for a Retention Licence.

A Retention Licence authorises the holder to enter the subject land for further exploration for minerals, and to carry on such operations and carry out such works necessary for that purpose including digging pits, trenches and holes, excavating, extracting and removing earth, soil, rock, stone, fluid or mineral bearing substances not exceeding 1,000 tonnes and to take and divert water. The holder of a Retention Licence has priority entitlement to apply for a Mining or General Purpose Lease over the same land.

The holder of a Prospecting Licence or Exploration Licence granted or applied for after 10 February 2006 can no longer apply for a retention licence but may apply for "retention status". The "retention status" provisions are similar to the current retention licence provisions but a separate title will not be required. The Minister may approve retention status in respect of parts of the licence if a mineral resource is identified but it is impractical to mine because the resource is not economic at the time but may become so in the future, or the resource is required to sustain an existing or proposed mining operation, or there are existing political, environmental or other difficulties in obtaining requisite approvals. Once retention status has been granted, the holder of a Prospecting Licence or Exploration Licence is not required to comply with the prescribed expenditure conditions.

A Retention Licence remains in force for 5 years. The Minister may, on receipt of an application made within the prescribed time and in the prescribed manner, renew or further renew a Retention Licence for a period not exceeding 5 years.

Royalties

Royalties payable to the State of Western Australia are prescribed under the Mining Act and the *Mining Regulations 1981* (WA). In relation to gold, the applicable royalty rate is 2.5% of the royalty value of the gold metal produced. However, no royalty is payable in respect of the first 2,500 ounces of gold metal produced during a financial year from gold bearing material produced or obtained from the same gold royalty project.

Land Access

Under the Mining Act, the grant of a mining tenement does not automatically provide access to areas of private land or pastoral lease land that are within 30 metres of the natural surface and located within a specified distance of certain infrastructure or improvements (such as residences, buildings, or water sources), unless consent is obtained from the landowner and/or occupier.

While a tenement may still be granted without this consent, access to the restricted surface area will be limited to below a depth of 30 metres, and this restriction will be noted on the tenement register.

Consent is typically formalised through an access agreement, which may include terms for compensation to the landowner or occupier. Compensation generally covers losses such as surface disturbance, damage to improvements, or loss of earnings resulting from the tenement holder's activities.

Environmental Protections

Mining operations in Australia are subject to stringent environmental protection laws. These laws are primarily enforced at State and Territory levels, with only limited Federal legislation and regulatory involvement.

Federal environment protection laws

The *Environmental Protection and Biodiversity Conservation Act 1999* (Cth) **(EPBC Act)** is the key piece of environmental protection legislation at the Federal level.

Amongst others, the objects of the EPBC Act are to provide for the protection of the environment, especially those aspects of the environment that are matters of national environmental significance, including (but not limited to) national heritage places, world heritage properties, wetlands of international importance, listed threatened species and ecological communities, migratory species, Commonwealth marine areas and nuclear actions (such as uranium mining).

The Commonwealth Department of the Environment and Energy **(DoEE)** is the key Federal department supervising environment protection in Australia under the EPBC Act. The DoEE also designs and implements Australian Government policy and programs to protect and conserve the environment, water and heritage.

WA-based environment protection laws and approvals

The Mining Act and *Environmental Protection Act 1986* (WA) (the **EPA Act**) are the principal pieces of legislation which regulate the environmental impacts of mining in Western Australia.

Under the Mining Act, proponents of large scale mining operations must secure a mining lease before starting commercial production in Western Australia. All mining lease applications must include a mining proposal and a mine closure plan. The mining proposal's main goal is to allow regulators to evaluate the environmental impact of the project. The mine closure plan outlines the steps that will be taken to ensure that the mine can be closed, decommissioned and rehabilitated to fulfil the legal requirements for rehabilitation and closure. With effect from August 2025, mining proposals and mine closure plans will be merged into a single document to be known as a 'Mining Development and Closure Proposal'. However, mine closure planning will continue to be required throughout the life of a mining project.

Where a mining proposal has potential to impact on the environment, it will be referred to the WA Environmental Protection Authority **(WA EPA)** and the Minister to decide whether formal environmental assessment is required under Part IV of the EPA Act. A large scale mining operation usually initiates an assessment pathway known as 'Public Environmental Review'. This review is triggered when the proposal is of Statewide significance, requires substantial assessment to determine environmental impacts, involves numerous significant and complex environmental issues, or when the level of public interest warrants a public review.

The Commonwealth government has worked to minimise duplication between Commonwealth and State environmental impact assessment processes. Bilateral agreements have been established between the Commonwealth and each State and Territory government to create a unified assessment process for projects involving controlled actions. These agreements recognise the environmental assessment methods used by State or Territory governments but still mandate that assessment reports be submitted to the Commonwealth Minister for final approval.

In Western Australia, taking groundwater requires a licence under the *Rights in Water and Irrigation Act 1914* (WA), administered by the Department of Water and Environmental Regulation. The application process involves several stages, including pre-application consultation, assessment of environmental impacts and ongoing compliance with the conditions imposed on the licence.

Environmental licences and permits are subject to periodic renewal and review. Regulators may impose additional conditions or operational requirements over time to ensure continued environmental protection.

Personal Liability for Environmental Offences

Environment protection laws at both the State and Federal levels establish a range of environmental offences. These typically include a general duty to avoid causing environmental harm, along with specific offences related to various forms of pollution.

In Western Australia, legislation has been introduced that can hold directors and individuals involved in the management of a corporation personally liable for environmental offences committed by their company. Whether a regulator decides to prosecute a director or manager generally depends on the degree of control or influence they exercised over the conduct in question.

There are also statutory defences available to individuals facing personal liability, particularly where they can demonstrate that they took all reasonable steps to prevent the offence. This approach aligns with broader national principles aimed at ensuring personal criminal liability is only imposed where justified by public interest.

Liability for rehabilitation and financial assurance

In Western Australia, mine owners and operators are legally required to undertake rehabilitation activities both progressively during operations and at the end of the mine's life. These obligations are typically imposed through conditions attached to planning and environmental approvals, as well as under the terms of the relevant mining tenement.

To ensure that rehabilitation can be carried out even if a company defaults, the Western Australian State Government requires financial security. Regulators have the authority to determine the amount of this security and to enforce its provision.

Under the Mining Act and the *Mining Rehabilitation Fund Act 2012* (WA), all tenement holders must contribute annually to the Mining Rehabilitation Fund (**MRF**). The MRF is a pooled fund managed by the Department of Energy, Mines, Industry Regulation and Safety (**DEMIRS)**, designed to cover the cost of rehabilitation in cases where operators fail to meet their obligations.

Laws Protecting Indigenous Australians

Federal and State legislation in Australia, particularly in Western Australia, plays a significant role in protecting the culture and heritage of Indigenous Australians, impacting mining projects. The *Native Title Act 1993* (Cth) (**NTA**) recognizes native title as a distinct form of land ownership, acknowledging Indigenous Australians' rights to their traditional lands, and provides for the determination of the nature and extent of native title rights and interests of the native title holders, the extinguishment of native title by particular acts, the validation of certain historical acts which would otherwise be invalid because of their effect on native title and compensation for extinguishment or impairment of native title rights and interests.

Native title cannot be sold or transferred like freehold land and can only be surrendered to the Crown. The NTA requires compliance with specific procedures, such as the 'right to negotiate,' for the valid grant of mining tenements affecting native title. This involves negotiations between the State Government, tenement applicants, and registered native title claimants. As an alternative to the 'right to negotiate' process, Indigenous Land Use Agreements (**ILUA**s) can be negotiated with the relevant native title claimants detailing compensation, access rights and land management terms.

In addition to native title, cultural rights are protected under the *Aboriginal Heritage Act 1972* (WA) in Western Australia. This act requires mining tenement holders to consult with Aboriginal communities and ensure that their activities do not harm Aboriginal cultural heritage sites. Compliance with these acts is mandatory, with breaches potentially leading to legal offences and often constituting a breach of tenement conditions. Tenement holders are encouraged to assess their activities against duty of care guidelines to mitigate risks of non-compliance.

Labour Laws

Federal labour laws

The following Federal industrial relations laws and regulations are applicable to our Group's operation in Australia:

- *Fair Work Act 2009* (Cth) (the **FWA**); and
- *Fair Work Regulations 2009* (Cth).

Broadly speaking, the FWA is a key piece of legislation in Australia that regulates private sector employment and workplace relations, establishing, among other things, the rights and responsibilities for employees and employers.

The FWA establishes the foundational framework for Australia's national workplace relations system. It sets out minimum employment terms and conditions through the 'National Employment Standards', provides statutory protections for job security and employee rights, provides for minimum rates of pay and entitlements, governs collective bargaining and the role and conduct of trade unions and other registered organisations (together with the *Fair Work (Registered Organisations) Act 2009* (Cth)). Additionally, it outlines the powers and functions of the Fair Work Commission, the independent national workplace relations tribunal, and addresses a broad range of employment-related matters including dispute resolution, unfair dismissal, and general protections.

The FWA generally applies to "national system employees" and "national system employers" as defined in sections 13 and 14 of the FWA, respectively. The Fair Work Ombudsman is the federal workplace relations regulator that has broad powers to enforce provisions of the FWA. As such, strict compliance with the FWA by all national system employers is paramount.

In addition, the following Federal superannuation laws are applicable to our Group's operation in Australia:

- *Superannuation Guarantee (administration) Act 1992* (Cth); and
- *Superannuation Guarantee Charge Act 1992* (Cth).

Western Australia

(a) Work health and safety legislation

The following work health and safety laws and regulations are applicable to our Group's operations in Western Australia:

- *Work Health and Safety Act 2020* (WA) (the **WHS Act)**; and
- *Work Health and Safety (Mines) Regulations 2022* (WA) (the **WHS Mines Regulations**).

The recent introduction of the WHS Act, replacing the now repealed *Occupational Safety and Health Act 1984* (WA), and the supporting WHS Mining Regulations, seek to protect the health and safety of workers and other persons by eliminating and minimising risks arising from work or workplaces. The WHS Act also aims to ensure fair and effective mechanisms for representation, consultation, and cooperation between employers and workers to address and resolve health and safety matters in the workplace.

The WHS Act has replaced the work health and safety elements previously set out in the MSI Act. However, levies to cover the cost of regulating health and safety continue to be collected and used for these purposes under the MSI Act and supporting regulations.

(b) Worker's Compensation

The following workers' compensation laws and regulations are applicable to our Group's operations in Western Australia:

- *Worker's Compensation and Injury Management Act 2023* (WA) (the **Compensation and Injury Act**); and
- *Worker's Compensation and Injury Management Regulations 2024* (WA) (the **Compensation and Injury Regulations**)

The Compensation and Injury Act, together with the supporting Compensation and Injury Regulations, implements a scheme for compensating employees who suffer injuries because of their employment.

Regulations on Foreign Investment in Australia

Australia's foreign investment regime is primarily governed by the Foreign Acquisitions and Takeovers Act 1975 (Cth) **(FATA)**, the Foreign Acquisitions and Takeovers Fees Imposition Act 2015 (Cth), and the Foreign Acquisitions and Takeovers Regulation 2015 (**FATR**). Together, these laws empower the Australian Treasurer, advised by the Foreign Investment Review Board (**FIRB)**, to review foreign investment proposals that meet certain thresholds and to block or impose conditions on proposals that are considered contrary to the national interest (these proposals are called 'significant actions').

Some significant actions must be notified to the FIRB before they are taken (these are called 'notifiable actions'). Where a foreign person (as defined in the FATA) **(Foreign Person)** is required to notify FIRB of a proposed notifiable action (which is also a significant action), the foreign person must not take the action until the Treasurer has issued a no objection notification — failure to do so is an offence under the law. The process of notifying a transaction and obtaining a statement of no objection in relation to it is known as obtaining 'FIRB approval'.

If a significant action does not have to be notified, the foreign person can elect to do so. Obtaining a statement of no objection removes the Treasurer's power to prevent the significant action except in very limited circumstances.

Whether an investment is a significant action (including a notifiable action) requiring FIRB approval depends on the background of the investor (particularly whether the investor is a "foreign government investor" (as defined in the FATR) **(Foreign Government Investor)**), the type and value of the asset(s) to be acquired, and the sector in which the investment is to be made.

Investment restrictions on our Group under the FATA

Due to the identity of our major shareholders, each of the entities in the Group are currently classified as both a Foreign Person and a Foreign Government Investor. This classification will remain unchanged post-[REDACTED] on the Hong Kong Stock Exchange, provided that Minxi Xinghang State-owned Assets Investment Company Limited (itself a Foreign Government Investor) retains a shareholding of at least 20% in Zijin Mining Group and Zijin Mining Group retains a shareholding of at least 20% in our Company. This is regardless of the proportion of shares allocated to other Foreign Persons or Foreign Government Investors.

As a result of this status, certain future investments by the Group in Australia may be subject to review and require prior approval from the Treasurer. Further, Norton Gold Fields and its subsidiaries will be required to apply for and obtain FIRB approval for a range of operational matters that occur in the ordinary course of the business of the Australia Norton Gold Mine. These include the grant of new exploration or mining tenements (whether through application for grant, applications for amendments, conversion, substitution or otherwise), grants of extensions and renewals of previously granted exploration or mining tenements, and entry into or the grant of leases and licences over Australian land which they have a right to occupy for a term that is reasonably likely to exceed 5 years.

Such FIRB approval may be granted, denied, or granted subject to conditions that the relevant applicant would be required to comply with. If the necessary approval is not obtained for a particular investment, the relevant applicant will be unable to proceed with that investment or be granted the applicable mining tenement or other interest in Australian land.

Investment restrictions on investors under the FATA

The requirement for FIRB approval when a Foreign Person seeks to acquire an interest in the Company is assessed on a case-by-case basis. It is the investor's responsibility to determine whether FIRB approval is needed before acquiring Shares under this Document. Investors must also ensure compliance with FATA, including securing any necessary governmental or regulatory consents, and fulfilling all other applicable approval, registration, and procedural requirements.

A Foreign Person must obtain FIRB approval from the Treasurer to acquire Shares under this Document if they are a Foreign Government Investor from the PRC. This requirement arises due to the application of association rules under the FATA and the current level of ownership in the Company by Foreign Government Investors from the PRC. As a result, any acquisition of Shares by such investors requires prior approval from the Treasurer.

Similarly, a Foreign Government Investor from a country other than the PRC must also obtain FIRB approval if they intend to acquire 10% or more of the Shares through this Document. These transactions are classified as both 'significant actions' and 'notifiable actions' under the FATA, meaning that failure to notify the Treasurer constitutes a legal offence.

This summary does not cover all scenarios in which FIRB approval may be required for acquiring Shares under this Document. Prospective investors are strongly encouraged to seek independent legal advice before proceeding with any acquisition.

If FIRB approval is required but not obtained, the Treasurer has the authority to take enforcement actions. These may include ordering the disposal of the acquired Shares, restricting the exercise of rights attached to those Shares, or prohibiting or delaying any payments related to them.

In order to facilitate the participation by certain Foreign Government Investors from the PRC in acquiring Shares pursuant to this Document, our Company intends to make an application for FIRB approval on their behalf. This application is intended to cover Foreign Government Investors from the PRC who have been advised of that by our Company and who have also provided a written consent to our Company to have the application for FIRB approval made on their behalf. Any allocation of Shares under this Document to the Foreign Government Investors from the PRC referred to above will be conditional upon receipt of FIRB approval.

1. FURTHER INFORMATION ABOUT OUR GROUP

(a) Incorporation of Our Company

We were incorporated in Hong Kong under the Companies Ordinance as a private company limited by shares on October 22, 2007 under the name of Jinfeng (HK) International Mining Company Limited (金峰(香港)國際礦業有限公司). Our registered office is at Room 7508, Level 75, International Commerce Centre, 1 Austin Road West, Kowloon, Hong Kong.

The name of our Company was changed to Zijin Gold International Company Limited (紫金黃金國際有限公司) on March 19, 2025.

As we were incorporated in Hong Kong, our corporate structure and operations are subject to the Companies Ordinance, the Companies (Winding Up and Miscellaneous Provisions) Ordinance and the Articles of Association. A summary of certain provisions of our Articles of Association is set out in Appendix IV to this Document.

(b) Changes in the Share Capital of Our Company

As at the date of incorporation of our Company, our Company had an initial registered share capital of HK$1 divided into one Share, which was allotted and issued as fully paid to Zijin Northwest. On January 25, 2013, our Company allotted 545,999,999 Shares to Zijin Northwest at HK$1 per Share, and our share capital increased by HK$545,999,999. On March 14, 2025, our Company further allotted 1,171,000,000 Shares to Gold Mountains (H.K.) at approximately HK$6.660974 per Share, and our share capital increased from HK$546,000,000 to HK$1,717,000,000. On May 6, 2025, our Company further allotted 558,000,000 Shares to Gold Mountains (H.K.) at approximately HK$28.516129 per Share, and our share capital increased from HK$1,717,000,000 to HK$24,258,000,000.

Immediately following the completion of [REDACTED] but without taking into account any Shares which may be issued upon the exercise of the [REDACTED], [REDACTED] will be issued as fully paid or credited as fully paid.

Save as disclosed above and as mentioned in "— 1. Further Information about our Group — (c) Written Resolutions of our Shareholders passed on [•]" below, there has been no alteration in the share capital of our Company since its incorporation.

(c) Written Resolutions of our Shareholders passed on [•]

Pursuant to the written resolutions of our Shareholders passed on [•], among other things:

(i) the Articles of Association were approved and adopted in substitution for and to the exclusion of the existing articles of association of our Company, conditional upon [REDACTED] and with effect from the [REDACTED];

(ii) conditional upon the conditions of the [REDACTED] (as set out in "Structure of the [REDACTED] — Conditions of the [REDACTED]" in this Document) being fulfilled (or, if applicable, waived):

(A) the [REDACTED], the [REDACTED] and the [REDACTED] were approved and the Directors were authorized to approve the allotment and issue of the [REDACTED] and any new Shares which are required to be issued if the [REDACTED] is exercised and to negotiate and agree the [REDACTED];

(B) a general unconditional mandate was granted to our Directors to allot, issue and deal with any Shares or securities convertible into Shares and to make or grant share sale plans, offers, agreements or options which would or might require Shares to be allotted, issued or dealt with, provided that the aggregate number of Shares so allotted, issued or dealt with or agreed to be allotted, issued or dealt with by our Directors, otherwise than by way of rights issue or pursuant to the exercise of any options which may be granted under any share option scheme or by virtue of scrip dividend schemes or similar arrangements in accordance with our Articles of Association, shall not exceed the sum of:

(1) [20]% of the aggregate number of Shares in issue immediately following the completion of the [REDACTED] on the [REDACTED] (excluding any Shares which may be issued pursuant to the exercise of the [REDACTED]); and

(2) the aggregate number of Shares repurchased under the authority referred to in sub-paragraph (D) below; and

(C) a general unconditional mandate was granted to our Directors to exercise all the powers of our Company to repurchase on the Stock Exchange, or on any other stock exchange on which our securities may be listed and which is recognized by the SFC and the Stock Exchange, such number of Shares that will represent up to 10% of the total number of Shares in issue immediately following completion of the [REDACTED] (excluding any Shares which may be issued pursuant to the exercise of the [REDACTED]).

Each of the general mandates referred to in paragraphs (B) and (C) above will remain in effect until the earliest of:

(A) the conclusion of our next annual general meeting unless, by ordinary resolution passed at that meeting, the authority is renewed, either unconditionally or subject to condition;

(B) the expiration of the period within which our next annual general meeting is required to be held under any applicable laws of Hong Kong and the Articles of Association; or

(C) the time when such mandate is revoked or varied by an ordinary resolution of our Shareholders in a general meeting.

(d) Group Reorganization

The companies comprising our Group underwent the Reorganization in preparation for the [REDACTED]. Please refer to "History, Reorganization and Corporate Structure — Reorganization" in this Document for further details.

(e) Changes in the Share Capital of Our Major Subsidiaries

Our major subsidiaries are referred to in the Accountants' Report set out in Appendix I to this Document.

Our Company [has been] granted a waiver from strict compliance with the requirements of paragraph 26 of part A of appendix I to the Listing Rules in respect of disclosing the particulars of any alterations in the capital of any member of our Group within two years immediately proceeding the issue of this Document. For details, see "Waivers — Waiver in relation to the disclosure requirements with respect to changes in share capital".

No alteration in the share or registered capital of each of our Company's major subsidiaries took place within the two years immediately preceding the date of this Document. Our major subsidiaries which are primarily responsible for the track record results of our Group include the following:

(1) CGI

(2) Continental Gold Colombia Branch

(3) Rosebel GM

(4) AGM Inc.

(5) Altynken LLC

(6) Zarafshon JV

(7) Norton Gold Fields

(f) Repurchase by our Company of our own securities

This paragraph includes information required by the Stock Exchange to be included in this Document concerning the repurchase by our Company of our own securities.

(i) Provisions of the Listing Rules

The Listing Rules permit companies with a primary listing on the Stock Exchange to repurchase their securities on the Stock Exchange subject to certain restrictions, the most important of which are summarized below:

(A) Shareholders' approval

All proposed repurchases of securities by a company with its primary listing on the Stock Exchange, whether directly or indirectly, must be approved in advance by an ordinary resolution of shareholders, either by way of general mandate or by specific approval of a specific transaction.

Pursuant to the written resolutions of our sole Shareholder passed on [•], our Directors were granted a general unconditional mandate (the "Repurchase Mandate") to repurchase Shares as described above in the paragraphs headed "— 1. Further Information about our Group — (c) Written Resolutions of our Shareholders passed on [•]" in this Appendix.

(B) Source of funds

Repurchases of shares must only be funded out of funds legally permitted to be utilized in this connection in accordance with the Articles, the Listing Rules and the applicable laws of Hong Kong. A company may not repurchase its own securities on the Stock Exchange for a consideration other than cash or for settlement otherwise than in accordance with the trading rules of the Stock Exchange from time to time.

(C) Trading restrictions

The total number of shares which a listed company is authorized to repurchase on the Stock Exchange is such number of shares which represents up to a maximum of 10% of the number of issued shares as at the date of the resolution approving the repurchase. A company may not issue or announce an issue of shares for a period of 30 days immediately following a repurchase (other than an issue of securities pursuant to an exercise of warrants, share options or similar instruments requiring the company to issue securities which were outstanding prior to such repurchase) without the prior approval of the Stock Exchange.

In addition, a listed company is prohibited from repurchasing its shares on the Stock Exchange if the purchase price is higher by 5% or more than the average closing market price for the five preceding trading days on which its shares were traded on the Stock Exchange.

The Listing Rules also prohibit a listed company from repurchasing its shares on the Stock Exchange if the repurchase would result in the number of listed securities which are in the hands of the public falling below the relevant prescribed minimum percentage as required by the Stock Exchange.

A listed company is required to procure that the broker appointed by it to effect a repurchase of shares disclose to the Stock Exchange such information with respect to the repurchase made on behalf of the listed company as the Stock Exchange may require.

(D) Shares to be purchased

The Listing Rules provide that the shares which are proposed to be purchased by a company must be fully paid up.

(E) Status of repurchased securities

The listing of all repurchased shares (whether on the Stock Exchange or otherwise) is automatically cancelled and the relevant documents of title for those shares must be cancelled and destroyed as soon as reasonably practicable.

(F) Suspension of repurchases

A listed company may not make any repurchase of shares on the Stock Exchange at any time after inside information has come to its knowledge until the information is made publicly available. In particular, during the period of one month immediately preceding the earlier of (a) the date of the board meeting (as such date is first notified to the Stock Exchange in accordance with the Listing Rules) for the approval of a listed company's results for any year, half-year, quarterly or any other interim period (whether or not required under the Listing Rules) and (b) the deadline for a listed company to announce its results for any year or half-year under the Listing Rules, or quarterly or any other interim period (whether or not required under the Listing Rules) and ending on the date of the results announcement, the listed company may not repurchase its securities on the Stock Exchange other than in exceptional circumstances. In addition, the Stock Exchange reserves the right to prohibit repurchases of shares on the Stock Exchange if a company has breached the Listing Rules.

(G) Reporting requirements

Repurchases of shares on the Stock Exchange or otherwise must be reported to the Stock Exchange not later than 30 minutes before the earlier of the commencement of the morning trading session or any pre-opening session (Hong Kong time) on the following Business Day. In addition, the company's annual report is required to disclose details regarding repurchases of shares made during the year, including the monthly breakdown of the number of shares repurchased, purchase price per share or the highest and lowest price paid for all such repurchases, where relevant, and the aggregate price paid for such purchases. The directors' report shall contain reference to the purchases made during the year and the reasons for making such purchases.

(H) Core connected persons

A listed company is prohibited from knowingly repurchasing shares on the Stock Exchange from a core connected person, and a core connected person is prohibited from knowingly selling his shares to the company.

(ii) Exercise of the Repurchase Mandate

Exercise in full of the Repurchase Mandate, on the basis of [REDACTED] Shares in issue immediately following the completion of the [REDACTED] (assuming the [REDACTED] is not exercised), could accordingly result in up to [REDACTED] Shares being repurchased by us during the period in which the Repurchase Mandate remains in force.

(iii) General information relevant to the Repurchase Mandate

(A) Our Directors believe that it is in the best interests of us and our Shareholders for our Directors to have a general authority from the Shareholders to enable our Company to repurchase Shares in the market. Repurchases of shares will only be made when our Directors believe that such repurchases will benefit us and our Shareholders. Such repurchases may, depending on market conditions and funding arrangements at the time, lead to an enhancement of our net asset value per Share and/or our earnings per Share.

(B) There might be a material adverse impact on our working capital or gearing position (as compared with the position disclosed in our most recent published audited accounts) in the event that the Repurchase Mandate is exercised in full. However, our Directors do not propose to exercise the Repurchase Mandate to such extent as would, in the circumstances, have a material adverse effect on our working capital requirements or the gearing levels, which in the opinion of our Directors are from time to time appropriate for us.

(C) None of our Directors or, to the best of their knowledge having made all reasonable enquiries, any of their respective close associates has any present intention to sell any Shares to us or our subsidiaries if the Repurchase Mandate is exercised.

(D) Our Directors have undertaken to the Stock Exchange that, so far as the same may be applicable, they will exercise the Repurchase Mandate only in accordance with the Listing Rules and the applicable laws of Hong Kong.

(E) If as a result of a repurchase of Shares, a Shareholder's proportionate interest in the voting rights of our Company increases, such increase will be treated as an acquisition for the purposes of the Takeovers Code. Accordingly, a Shareholder (or a group of Shareholders acting in concert, as defined in the Takeovers Code) could obtain or consolidate control of our Company and become obliged to make a mandatory offer in accordance with Rule 26 of the Takeovers Code. Save as aforesaid, our Directors are not aware of any consequences that would arise under the Takeovers Code as a result of any repurchases pursuant to the Repurchase Mandate.

(F) No core connected person of our Company has notified us that he has a present intention to sell Shares to us, or has undertaken not to do so, if the Repurchase Mandate is exercised.

2. FURTHER INFORMATION ABOUT OUR BUSINESS

(a) Summary of Material Contracts

The following contracts (not being contracts entered into in the ordinary course of business) were entered into by our Company or its subsidiaries within the two years preceding the date of this Document and are or may be material:

(i) the share purchase agreement dated May 9, 2025 entered into between our Company and Gold Mountains (H.K.) International Mining Company Limited, pursuant to which Gold Mountains (H.K.) International Mining Company Limited agreed to transfer 100% of its equity interest in Silver Source to our Company;

(ii) the share purchase agreement dated April 29, 2025 entered into between our Company and Jinyu (H.K.) International Mining Company Limited, pursuant to which Jinyu (H.K.) International Mining Company Limited agreed to transfer 50% of its equity interest in Porgera Jersey to our Company;

(iii) the share purchase agreement dated April 29, 2025 entered into between our Company and Gold Mountains (H.K.) International Mining Company Limited, pursuant to which Gold Mountains (H.K.) International Mining Company Limited agreed to transfer 100% of its equity interest in Superb Pacific to our Company;

(iv) the share purchase agreement dated April 29, 2025 entered into between our Company and Gold Mountains (H.K.) International Mining Company Limited, pursuant to which Gold Mountains (H.K.) International Mining Company Limited agreed to transfer 100% of its equity interest in Guyana Goldfields to our Company;

(v) the share purchase agreement dated May 15, 2025 entered into between our Company and Jinyu (H.K.) International Mining Company Limited, pursuant to which Jinyu (H.K.) International Mining Company Limited agreed to transfer 100% of its equity interest in Norton Gold Fields to our Company;

(vi) the entrusted operations agreement dated June 24, 2025 entered into between our Company and Continental Gold Limited Sucursal Colombia, pursuant to which our Company is entrusted with the exclusive management and operation of the Colombia Buriticá Gold Mine during the term of the agreement;

(vii) the return swap agreement dated June 24, 2025 entered into between our Company and Gold Mountains (H.K.) International Mining Company Limited, pursuant to which our Company will be entitled to the amount received by Gold Mountains (H.K.) International Mining Company Limited from Zijin (America) Gold Mining Company Limited, in return for an upfront consideration of US$880 million;

(viii) the Deed of Non-competition; and

[REDACTED]

(b) Intellectual Property Rights of the Group

(i) Domain Names

As of the Latest Practicable Date, we have registered the following domain names which we consider to be or may be material to our business:

Domain Name	Registered Owner	Date of Registration	Expiry Date
Zijingoldintl.com . .	Our Company	June 13, 2025	June 13, 2026

Save as aforesaid, as of the Latest Practicable Date, there were no other intellectual property rights, which are or may be material in relation to our Group's business.

3. FURTHER INFORMATION ABOUT OUR DIRECTORS AND SUBSTANTIAL SHAREHOLDERS

(a) Disclosure of Interests

(i) Interests and short positions of our Directors and the chief executives of our Company in the share capital of our Company or our associated corporations following completion of the [REDACTED].

Immediately following completion of the [REDACTED] and assuming the [REDACTED] is not exercised, the interests and short positions of each of our Directors and chief executives of our Company in the shares, underlying shares and debentures of our Company or any of our associated corporations (within the meaning of Part XV of the SFO), which, once the Shares are listed on the Stock Exchange, will have to be notified to our Company and the Stock Exchange pursuant to Divisions 7 and 8 of Part XV of the SFO (including interests and short positions which he/she is taken or deemed to have under such provisions of the SFO), or will be required pursuant to Section 352 of the SFO, to be entered in the register referred to therein, or will be required to be notified to our Company and the Stock Exchange pursuant to the Model Code for Securities Transactions by Directors of Listed Issuers contained in the Listing Rules, will be as follows:

Interests in our associated corporations

Name of Director/ chief executive of our Company	Name of associated corporation	Capacity/ Nature of Interest	Number of shares held in the associated corporation	Approximate % shareholding interest in the associated corporation
林泓富 (Lin Hongfu) . .	Zijin Mining	Beneficial ownership	4,908,938[1] (Long position)	0.0065%
王春 (Wang Chun) . . .	Zijin Mining	Beneficial ownership	502,000 (Long position)	0.0019%
簡錫明 (Jian Ximing) .	Zijin Mining	Beneficial ownership	270,000 (Long position)	0.0010%

Note:

1. This includes 3,180,000 A shares covered by share options granted pursuant to the share option schemes of Zijin Mining.

Save as disclosed above in this section, none of our Directors or chief executives of our Company has any interest or short position in the shares, underlying shares or debentures of our Company or any of its associated corporation (within the meaning of the SFO) which will have to be notified to our Company and the Stock Exchange pursuant to Divisions 7 and 8 of

Part XV of the SFO or which will be required, pursuant to section 352 of the SFO, to be entered in the register referred to therein, or which will be required to be notified to our Company and the Stock Exchange pursuant to the Model Code for Securities Transactions by Directors of Listed Issuers once the Shares are listed.

(ii) Save as disclosed in "Substantial Shareholders" in this Document, our Directors are not aware of any person who will, immediately following completion of the [REDACTED], have interests or short positions in our Shares or underlying Shares which would be required to be disclosed to us and the Hong Kong Stock Exchange under the provisions of Divisions 2 and 3 of Part XV of the SFO, or who is, directly or indirectly, interested in 10% or more of the issued voting shares of our Company.

(iii) Save as disclosed in "History, Reorganization and Corporate Structure" in this Document, so far as our Directors are aware, immediately following the completion of the [REDACTED], no persons will, directly or indirectly, be interested in 10% or more of the issued voting shares of any member of our Group (other than our Company).

(b) Directors' Letters of Appointment

Each of our Directors has entered into a letter of appointment with our Company on [•]. The term of appointment shall be for an initial period of three years from the [REDACTED] for each of the independent non-executive Directors and three years from the respective dates of appointment for each of the other Directors.

Pursuant to the terms of the letter of appointment entered into between each Director (on the one part) and our Company (on the other part), (i) the annual director's fees payable by our Company to each of the independent non-executive Directors are HK$300,000, and (ii) no director's fees are payable to the other Directors. The Directors' fees will be payable from the [REDACTED], and are subject to increase or reduction as shall be determined or approved by the Board and/or the Shareholders. Each of the Directors is entitled to reimbursement from our Company for all necessary and reasonable out-of-pocket expenses properly incurred in connection with the performance and discharge of his/her duties under his/her letter of appointment.

(c) Directors' remuneration

For the year ended December 31, 2024, the aggregate amount of the remuneration paid and benefits in kind granted to the Directors by our Group was approximately US$263,370.

Under the arrangements currently in place, the estimated aggregate amount that our Directors will be entitled to receive in the form of remuneration and benefits in kind from any member of our Group for the year ending December 31, 2025 is approximately US$1.8 million (excluding any discretionary bonuses payable to our Directors).

(d) Disclaimers

Save as disclosed in this Document:

(i) none of the Directors nor any of the persons listed in "— 4. Other Information — (e) Qualification and Consent of Experts" below is interested, directly or indirectly, in the promotion of, or in any assets which have been, within the two years immediately preceding the issue of this Document, acquired or disposed of by or leased to, any member of the Group, or are proposed to be acquired or disposed of by or leased to any member of the Group;

(ii) none of the Directors is materially interested in any contract or arrangement subsisting at the date of this Document which is significant in relation to the business of the Group;

(iii) none of our Directors has or is proposed to have a service contract with any member of our Group other than contracts expiring or determinable by the employer within one year without the payment of compensation (other than statutory compensation);

(iv) none of our Directors are interested in any business apart from the Group's business which competes or is likely to compete, directly or indirectly, with the business of the Group; and

(v) so far as is known to our Directors, none of our Directors, their respective close associates, or Shareholders (which to the knowledge of our Directors are interested in more than 5% of the issued share capital of our Company), has any interest in our Company's five largest customers and five largest suppliers.

4. OTHER INFORMATION

(a) Estate Duty

Our Directors have been advised that no material liability for estate duty under the laws of Hong Kong is likely to fall upon any member of our Group.

(b) Litigation

As of the Latest Practicable Date, no member of the Group was engaged in any litigation, arbitration or claim of material importance, and no litigation, arbitration or claim of material importance was known to the Directors to be pending or threatened by or against the Group, that would have a material adverse effect on its business, finance condition or results of operations.

(c) Joint Sponsors

The Joint Sponsors have made an application on our behalf to the Stock Exchange for the [REDACTED] of, and permission to [REDACTED], the Shares in issue and the Shares [REDACTED] as mentioned in this Document (including the additional Shares which may be [REDACTED] pursuant to the exercise of the [REDACTED]). All necessary arrangements have been made to enable such Shares to be admitted into CCASS for clearing and settlement.

CITIC Securities Company Limited ("**CITIC Securities**"), the parent company of CITIC Securities (Hong Kong) Limited ("**CITIC Hong Kong**", one of the Joint Sponsors), acted as the independent financial adviser to Zijin Mining in connection with the [REDACTED] and the [REDACTED].

Notwithstanding the above, considering that (i) the work of independent financial adviser is a restricted one purely to satisfy the regulatory requirements imposed by the CSRC, and the role of independent financial adviser of CITIC Securities is not in conflict with CITIC Hong Kong's role as an independent sponsor for the [REDACTED] (such work is also in line with that undertaken by other financial advisers in similar [REDACTED] cases); and (ii) there is no fee payable to CITIC Securities for its role of independent financial adviser, such relationship between CITIC Securities and Zijin Mining would not be reasonably considered to affect CITIC Hong Kong's independence as sponsor to the Company in performing its duties, and should not reasonably give rise to a perception that CITIC Hong Kong's independence would be so affected under Rule 3A.07(9) of the Listing Rules, and there are no other circumstances affecting CITIC Hong Kong's independence under Rule 3A.07 of the Listing Rules.

Each of the Joint Sponsors satisfies the independence criteria applicable to sponsors set out in Rule 3A.07 of the Listing Rules.

The Joint Sponsors will receive an aggregate of US$800,000 for acting as the sponsors for the [REDACTED].

(d) No Material Adverse Change

Our Directors confirm that there has been no material adverse change in the financial or trading position or prospects of the Group since December 31, 2024 (being the date to which the latest audited combined financial statements of the Group were prepared).

(e) Qualification and Consent of Experts

The following are the qualifications of the experts who have given opinions or advice which are contained in this Document:

Name	Qualification
Morgan Stanley Asia Limited	Licensed to conduct Type 1 (dealing in securities), Type 4 (advising on securities), Type 5 (advising on futures contracts), Type 6 (advising on corporate finance) and Type 9 (asset management) of regulated activities under the SFO
CITIC Securities (Hong Kong) Limited	Licensed to conduct Type 1 (dealing in securities), Type 4 (advising on securities), Type 5 (advising on futures contracts) and Type 6 (advising on corporate finance) of regulated activities under the SFO
Ernst & Young	Certified public accountants and registered public interest entity auditor
Frost & Sullivan Limited	Independent industry consultant
SRK Consulting China Ltd.	Competent person
JLD & MB Legal Consultancy	Legal adviser as to Ghana law
Lloreda Camacho & Co.	Legal adviser as to Colombia law
DeHeng Law Offices (Hong Kong) LLP	Legal adviser as to Hong Kong law

Each of the experts named above has given and has not withdrawn its written consent to the issue of this Document with the inclusion of copies of its report and/or letter and/or summary of opinions (as the case may be) and references to its name included herein in the form and context in which it respectively appears.

As of the Latest Practicable Date, none of the experts named above has any shareholding interest in our Company or any of our subsidiaries or the right (whether legally enforceable or not) to subscribe for or to nominate persons to subscribe for securities in our Company or any of our subsidiaries.

(f) Promoter

Our Company has no promoter for the purpose of the Listing Rules. Within the two years immediately preceding the date of this Document, no cash, securities or other benefit has been paid, allotted or given nor are any proposed to be paid, allotted or given to any promoters in connection with the [REDACTED] and the related transactions described in this Document.

(g) Taxation of holders of Shares

The sale, purchase and transfer of Shares registered with our Hong Kong branch register of members will be subject to Hong Kong stamp duty. The current rate charged on each of the purchaser and seller is 0.1% of the consideration of or, if higher, of the fair value of the Shares being sold or transferred. Profits from dealings in the Shares arising in or derived from Hong Kong may also be subject to Hong Kong profits tax. The Revenue (Abolition of Estate Duty) Ordinance 2005 came into effect on February 11, 2006 in Hong Kong. No Hong Kong estate duty is payable and no estate duty clearance papers are needed for a grant of representation in respect of holders of Shares whose death occurs on or after February 11, 2006.

Intending holders of the Shares are recommended to consult their professional advisors if they are in any doubt as to the taxation implications of subscribing for, purchasing, holding or disposing of or dealing in the Shares. It is emphasized that none of our Company, our Directors or parties involved in the [REDACTED] accepts responsibility for any tax effect on, or liabilities of, holders of Shares resulting from their subscription for, purchase, holding or disposal of or dealing in Shares or exercise of any rights attaching to them.

(h) Preliminary Expenses

We have not incurred any material preliminary expenses.

(i) Binding Effect

This Document shall have the effect, if an application is made in pursuance of this Document, of rendering all persons concerned bound by all of the provisions (other than the penal provisions) of Sections 44A and 44B of the Companies (Winding Up and Miscellaneous Provisions) Ordinance insofar as applicable.

(j) Bilingual Document

The English language and Chinese language versions of this Document are being published separately, in reliance upon the exemption provided by section 4 of the Companies (Exemption of Companies and Prospectuses from Compliance with Provisions) Notice (Chapter 32L of the Laws of Hong Kong). In case of any discrepancies between the English language version and Chinese language version of this Document, the English language version shall prevail.

(k) Miscellaneous

(i) Save as disclosed in this Document, within the two years immediately preceding the date of this Document:

(A) neither we nor any of our subsidiaries has issued or agreed to issue any share or loan capital fully or partly paid up either for cash or for a consideration other than cash;

(B) no commission, discounts, brokerages or other special terms have been granted in connection with the issue or sale of any shares or loan capital of any member of the Group, and no Directors, promoters or experts named in the part headed "— 4. Other Information — (e) Qualification and Consent of Experts" received any such payment or benefit;

(C) no commission has been paid or payable (except commission to [REDACTED]) to any persons for subscribing, agreeing to subscribe, procuring subscription or agreeing to procure subscription of any shares or debentures of our Company.

(ii) Our Directors confirm that, save as disclosed in this Document:

(A) no founder, management or deferred shares of our Company or any of our subsidiaries have been issued or agreed to be issued;

(B) there has not been any interruption in the business of our Group which may have or have had a material adverse effect on the financial position of our Group in the 12 months immediately preceding the date of this Document;

(C) there are no bank overdrafts or other similar indebtedness by our Company or any member of our Group;

(D) there are no hire purchase commitments, guarantees or other material contingent liabilities of our Company or any member of our Group;

(E) no share or loan capital of our Company or any of our subsidiaries is under option or is agreed conditionally or unconditionally to be put under option;

(F) there is no arrangement under which future dividends are waived or agreed to be waived; and

(G) our Group has no outstanding convertible debt securities or debentures.

(iii) There are no other stock exchange on which any part of the equity or debt securities of our Company is listed or dealt in or on which [REDACTED] or permission to deal is being or is proposed to be sought.

(iv) Our register of members will be maintained by our [REDACTED]. Unless the Directors otherwise agree, all transfers and other documents of title of Shares must be lodged for registration with and registered by our [REDACTED]. All necessary arrangements have been made enabling our Shares to be admitted into CCASS for clearing and settlement.

The documents attached to the copy of this Document and delivered to the Registrar of Companies in Hong Kong for registration were, among other documents:
