ZIJIN GOLD INTERNATIONAL COMPANY LIMITED
紫金黃金國際有限公司

(the "**Company**")

(a company incorporated in Hong Kong with limited liability)

WARNING

The publication of this Application Proof is required by The Stock Exchange of Hong Kong Limited (the "**Stock Exchange**")/the Securities and Futures Commission (the "**Commission**") solely for the purpose of providing information to the public in Hong Kong.

This Application Proof is in draft form. The information contained in it is incomplete and is subject to change which can be material. By viewing this document, you acknowledge, accept and agree with the Company, its sponsors, overall coordinators, advisers or members of the underwriting syndicate that:

(a) this document is only for the purpose of providing information about the Company to the public in Hong Kong and not for any other purposes. No investment decision should be based on the information contained in this document;

(b) the publication of this document or supplemental, revised or replacement pages on the Stock Exchange's website does not give rise to any obligation of the Company, its sponsors, overall coordinators, advisers or members of the underwriting syndicate to proceed with an offering in Hong Kong or any other jurisdiction. There is no assurance that the Company will proceed with the offering;

(c) the contents of this document or supplemental, revised or replacement pages may or may not be replicated in full or in part in the actual final listing document;

(d) this document is not the final listing document and may be updated or revised by the Company from time to time in accordance with the Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited;

(e) this document does not constitute a prospectus, offering circular, notice, circular, brochure or advertisement offering to sell any securities to the public in any jurisdiction, nor is it an invitation to the public to make offers to subscribe for or purchase any securities, nor is it calculated to invite offers by the public to subscribe for or purchase any securities;

(f) this document must not be regarded as an inducement to subscribe for or purchase any securities, and no such inducement is intended;

(g) neither the Company nor any of its affiliates, advisers or underwriters is offering, or is soliciting offers to buy, any securities in any jurisdiction through the publication of this document;

(h) no application for the securities mentioned in this document should be made by any person nor would such application be accepted;

(i) the Company has not and will not register the securities referred to in this document under the United States Securities Act of 1933, as amended, or any state securities laws of the United States;

(j) as there may be legal restrictions on the distribution of this document or dissemination of any information contained in this document, you agree to inform yourself about and observe any such restrictions applicable to you; and

(k) the application to which this document relates has not been approved for listing and the Stock Exchange and the Commission may accept, return or reject the application for the subject public offering and/or listing.

No offer or invitation will be made to the public in Hong Kong until after a prospectus of the Company has been registered with the Registrar of Companies in Hong Kong in accordance with the Companies (Winding Up and Miscellaneous Provisions) Ordinance (Chapter 32 of the Laws of Hong Kong). If an offer or an invitation is made to the public in Hong Kong in due course, prospective investors are reminded to make their investment decisions solely based on the Company's prospectus registered with the Registrar of Companies in Hong Kong, copies of which will be distributed to the public during the offer period.

THIS DOCUMENT IS IN DRAFT FORM, INCOMPLETE AND SUBJECT TO CHANGE AND THAT THE INFORMATION MUST BE READ IN CONJUNCTION WITH THE SECTION HEADED "WARNING" ON THE COVER OF THIS DOCUMENT.

SUMMARY

This summary aims to give you an overview of the information contained in this Document. As this is a summary, it does not contain all the information that may be important to you and is qualified in its entirety by, and should be read in conjunction with, the full text of this Document. You should read the entire document before you decide to [REDACTED] in the [REDACTED]. There are risks associated with any [REDACTED]. Some of the particular risks in [REDACTED] in the [REDACTED] are set out in "Risk Factors" in this Document. You should read that section carefully before you decide to invest in the [REDACTED]. Various expressions used in this section are defined in the sections headed "Definitions" and "Glossary of Technical Terms" in this Document.

OVERVIEW

Who We Are

We are a global leading gold mining company formed by combining all of the gold mines of Zijin Mining located outside of China. Leveraging Zijin Mining's competitive advantage in the management of exploration, development and operation of low-grade and refractory resources, we have emerged as a global leading and market-oriented gold mining company principally engaged in exploration, mining, processing, smelting, refining and sale of gold. We integrate high-quality gold mine resources through global mergers and acquisitions, and by leveraging our industry-leading and in-house geological exploration, research and development (**R&D**), engineering, construction, and mine operation capabilities, along with advanced international Environmental, Social, and Governance ("**ESG**") systems. This enables us to achieve continuous reserve expansion, production growth and efficient operations.

As of the Latest Practicable Date, we held interests in eight gold mines located in gold-rich regions across Central Asia, South America, Oceania and Africa, namely the Tajikistan Jilau/Taror Gold Mines, Kyrgyzstan Taldybulak Levoberezhny Gold Mine, Australia Norton Gold Mine, Guyana Aurora Gold Mine, Colombia Buritica Gold Mine (through Colombia Entrustment Arrangement), Suriname Rosebel Gold Mine, Ghana Akyem Gold Mine and PNG Porgera Gold Mine. Among these gold mines, we control and operate seven gold mines and hold a minority interest in the PNG Porgera Gold Mine. By tailoring our operation models to the unique characteristics of each mine, we produce gold in the forms of gold concentrates, gold doré and gold ingots from our mines. Through continuous resource development and operational efficiency improvement, we have successfully established a leading position in the global gold mining industry and achieved proven track record of robust growth, as illustrated in the chart below:

1.5 Million Ounces (46.7 Tonnes)
Gold Production in 2024(1)

No. 9 Globally(2)
Gold Reserves of 27.5 Million Ounces (856.0 Tonnes) as of December 31, 2024(1)

No. 1 Globally(3)
By 2022-2024 CAGR of Gold Production of 21.4%(4)

14+ Million Ounces (450+ Tonnes)
Reserve Expansion post Acquisitions(5)
Weighted Avg. CAGR of 20%+

61.9%
2022-2024 CAGR of Net Profit Attributable to Owners of the Parent

21.4%
2024 Return on Equity (ROE)(6)

Notes:

1) Calculated based on 100% of the equity interest for each mine held by the Company as of the Latest Practicable Date, except for PNG Porgera Gold Mine, which is presented based on 24.5% of the equity interest held by the Company
2) According to Frost & Sullivan, global ranking based on the gold reserves as of December 31, 2024, calculated based on 100% equity interest of each mine controlled by the Company as of the Latest Practicable Date
3) According to Frost & Sullivan, ranking among the top 15 global gold producers by gold production in 2024
4) Calculated based on 100% of the equity interest for each mine held by the Company in the given years
5) Represented the accumulative gold reserve expansion in the mines the Company operated from the completion of the acquisitions to December 31, 2024
6) Calculated using profit for the year of 2024 divided by total equity as of December 31, 2024, multiplied by 100%

We are one of the fastest-growing companies in the global gold mining industry. Starting from the acquisition of the Tajikistan Jilau/Taror Gold Mines in 2007, we have expanded our business through global acquisitions, operational enhancement and production expansion of several large gold mines. According to Frost & Sullivan, our gold Reserves and gold production volume ranked ninth and eleventh globally, respectively, as of December 31, 2024 and in 2024. From 2022 to 2024, the CAGR of our gold production reached 21.4%, and the CAGR of net profit attributable to owners of the parent was 61.9%.

We are a leading mining company in terms of growth, operational efficiency and profitability in the global gold mining industry. Due to our relatively short history compared to other top global gold mining companies, most of the mines we acquired were underperforming at the time of acquisition with poor operational management or resource endowments not fully identified. Through technological innovations, production expansion, and enhanced operational efficiency, each of the Australia Norton Gold Mine, the Guyana Aurora Gold Mine, and the Suriname Rosebel Gold Mine turned profitable within one year after our acquisitions in 2012, 2020, and 2023, respectively. We maintained high capital return in 2024, with ROE of 21.4%. In 2024, our all-in sustaining cost (AISC) was US$1,458 per ounce, ranking sixth lowest among the top fifteen gold mining companies globally, according to Frost & Sullivan. During the Track Record Period, among the six mines we operated, the mining cost per tonne of ore mined was US$38.6, US$31.0 and US$33.3 in 2022, 2023 and 2024, respectively, while the processing cost per tonne of ore milled was US$20.6, US$17.8 and US$19.3, respectively, of the same periods.

The following map illustrates the geographic coverage and locations of the eight gold mines:

Our Controlling Shareholder

Our controlling shareholder, Zijin Mining, is a global leading mining company primarily focused on mineral exploration and development. Zijin Mining operates over 30 large mining projects across 17 countries worldwide as of December 31, 2024, covering metals including gold, copper, lithium, and zinc, among others. Zijin Mining ranks among the top five mining companies globally in terms of resources and reserves, production, revenue, profit, total asset and market capitalization. Zijin Mining is distinguished by its robust research and development team, which excels in technologies that facilitate the full process of the value chain. Zijin Mining has extensive experience in the exploration, construction and operation of large-scale metal mines, complemented by professional and efficient resource acquisition and in-house exploration expertise. Zijin Mining maintains a competitive advantage through its cost-efficient operations and upholds high standards in ESG practices and sustainable development capabilities.

Our Market Opportunities

Gold, recognized as a strategic resource due to its combination of monetary, commodity and financial attributes, has increasingly taken on the role of a safe haven asset in recent years and experienced substantial shifts in its pricing dynamics, largely due to heightened geopolitical uncertainties and more frequent monetary easing cycles globally. Due to these factors, gold has become an increasingly important asset allocation for global central banks and investors. Emerging countries worldwide have been consistently purchasing gold in recent years. Despite this trend, according to Frost & Sullivan, the proportion of gold held by central banks constitutes only 8.9% of asset reserves in emerging countries (non-OECD countries), which is significantly lower than the average of 25.2% in developed countries (OECD member countries) as of December 31, 2024. This disparity highlights significant potential for increasing strategic reserves of gold among emerging countries. Furthermore, by incorporating gold into their asset portfolios, financial institutions can enhance their risk-return profile, which further increases investor interest in gold allocation. Driven by these factors, gold has officially surpassed the Euros to become the second-largest reserve asset for global central banks, accounting for 20% of global official reserves as of December 31, 2024, surpassing the Euro's 16% for the first time, and second only to the US dollar's 46%.

According to Frost & Sullivan, in recent years, due to decreasing global gold mine exploration budgets, discovering high-quality gold mines has become increasingly difficult, resulting in a noticeable decline in the pace and scale of newly discovered large gold mines worldwide. The annual average gold price rose by approximately 35% from 2020 to 2024, according to London Bullion Market Association (LBMA) Gold Price. In the future, gold prices are anticipated to gain further long-term support as the grade of gold mines continues to decline and extraction costs continue to increase. As global gold prices continue to increase and demand for gold continues to grow, the gold mining industry will enjoy favorable development prospects and be able to realize its investment potential.

Our Global Acquisitions

We have extensive experience in global mergers and acquisitions, demonstrating a strong track record in acquiring global resources. Over nearly two decades of development, we have acquired high-potential mine assets across various regions, including South America, Oceania, Central Asia and Africa through various acquisition transactions.

We actively pursue acquisitions of high-potential gold mines and under-valued low-grade and refractory gold mines. Our comprehensive experience in complex cross-border acquisitions, combined with our operational and technical expertise in the gold mining industry, enable us to accurately identify and acquire potential high-value assets globally and to conduct in-house geological exploration and development in a cost-effective way proactively leveraging our strong in-house capabilities following the acquisitions.

We are adept at identifying and seizing low-cost acquisition opportunities. From 2019 to 2024, the average acquisition cost of the mines we acquired was approximately US$61.3 per ounce in terms of gold resources, while the average acquisition cost in the industry during the same period was approximately US$92.9 per ounce, according to Frost & Sullivan, which was 52% higher than ours.

Our Mine Development and Operation Capabilities

We possess advanced technology, advanced project operation and management systems, and optimized supply chain, which form the core of our mine development and operation capabilities. We focus on cost control and efficiency enhancement by combining the procurement of large-scale, intelligent equipment globally with localized employment and production materials to effectively reduce supply chain costs. We employ the Five-Stage-Integrated Life-of-Mine Project Management Procedure, which holistically considers and manages the five key processes — exploration, mining, processing, smelting, and environmental protection, based on the flow of ores. By doing so, we effectively reduce construction and production costs, maximizing economic and social benefits for the projects.

We have global leading cost management capability, with several of our mines turning profitable shortly after our acquisitions. During the Track Record Period, our operating cost growth rate was below the average level of global gold mining companies. The Suriname Rosebel Gold Mine, the Tajikistan Jilau/Taror Gold Mines, the Australia Norton Gold Mine and the Guyana Aurora Gold Mine were all loss-making before our acquisitions and became profitable within one to two years after our acquisitions.

ESG

Our ESG practice is integral in upholding our core value of empowering green production operations through technological innovation to create sustainable value for shareholders and society. We place significant emphasis on ESG by prioritizing mine safety and green mining initiative, fully integrating into local communities, adhering to the principle of "sharing project development benefits with local stakeholders" to drive the economic development for communities and complying with international standards such as United Nations Sustainable Development Goals, etc.

Our Financial Performance

During the Track Record Period, our revenue was US$1,818.0 million, US$2,262.4 million and US$2,989.9 million, respectively, with a CAGR of 28.2%. Our profit attributable to owners of the parent was US$183.7 million, US$230.4 million and US$481.4 million, respectively, with a CAGR of 61.9%.

COMPETITIVE STRENGTHS

We believe that the following key strengths provide us with a competitive advantage and position us well to pursue current and future growth opportunities.

- Global leading gold mining company with high growth and highly certain prospects for reserve and production expansion.
- Excellent track record of continuous expansion through acquisitions, with proven capabilities in target identification, transaction execution and resource integration to achieve value enhancement.
- Leading capabilities of in-house geological exploration, and cost-effective expansion and construction contribute to the sustainable organic growth.
- Realizing cost efficiency and value enhancement through our proprietary and advanced technologies, industry-leading expertise in low-grade and refractory ore utilization and strong mine operational capabilities.
- Commitment to responsible mining practices, achieving green and sustainable development through high ESG standards.
- Visionary management team with extensive expertise and global insights, and the "Perseverance, Entrepreneurship and Innovation" spirit of Zijin Mining.

See "Business — Competitive Strengths" for further details.

GROWTH STRATEGIES

Our goal is to become a world-class, green, high-tech, top-tier gold mining company. We plan to implement the following business strategies to achieve our goal:

- Achieving continuous growth in gold resources and reserves through in-house geological exploration and acquisitions, implementing a resource-first strategy.
- Enhancing production capacity and mineral resource recovery through technological upgrades and operational improvements.
- Continuously advancing technological innovation.
- Unwavering commitment to high-standard ESG practices.

See "Business — Growth Strategies" for further details.

The following table sets out a summary of the details of our major operating mining assets as of the Latest Practicable Date:

Mineralized Zone/Block	Highlights
Jilau/Taror Gold Mines in Tajikistan ("**Tajikistan Jilau/Taror Gold Mines**") .	• Acquired in 2007 • Tajikistan's largest gold producer and largest gold mine in terms of gold Resources • Open-pit mining • LOM: Until 2037 • Resumed production and achieved profitability through technological upgrades after acquisition within two years • As of December 31, 2024, total Mineral Resources amounted to 71.1 Mt, with average Au grade of 1.3 g/t, and Au metal Mineral Resources of 3,040 koz (94.5 tonnes) • In 2024, 174 koz (5.4 tonnes) of gold was produced. • Our equity interest in the mine: 70%
Taldybulak Levoberezhny Gold Mine in Kyrgyzstan ("**Kyrgyzstan Taldybulak Levoberezhny Gold Mine**")	• Acquired in 2011 • Kyrgyzstan's third-largest gold mine in terms of gold Resources • Underground mining • LOM: Until 2033 • As of December 31, 2024, total Mineral Resources amounted to 14.4 Mt, with average Au grade of 3.7 g/t, and Au metal Mineral Resources of 1,700 koz (52.9 tonnes) • In 2024, 120 koz (3.7 tonnes) of gold was produced • Our equity interest in the mine: 60%
Norton Gold Mine in Australia ("**Australia Norton Gold Mine**").	• Acquired approximately 89% during 2012, and further increased its interest to 100% in 2015 • One of Australia's largest gold producers and the only large heap leach project with an annual processing capacity exceeding 5 million tonnes • Open-pit mining and underground mining • LOM: Until 2037 • As of December 31, 2024, total Mineral Resources amounted to 311.5 Mt, with average Au grade of 0.9 g/t, and Au metal Mineral Resources of 9,245 koz (287.6 tonnes) • In 2024, 266 koz (8.3 tonnes) of gold was produced • Our equity interest in the mine: 100%

Mineralized Zone/Block	Highlights
Aurora Gold Mine in Guyana ("**Guyana Aurora Gold Mine**")	• Acquired in 2020 • The only large-scale gold mine project in Guyana with production volume of over 100 koz in 2024 • Open-pit mining and underground mining • LOM: Until 2037 • Originally a loss-making enterprise with suspended operations; resumed production and became profitable rapidly after acquisition • As of December 31, 2024, total Mineral Resources amounted to 79.2 Mt, with average Au grade of 2.4 g/t, and Au metal Mineral Resources of 6,052 koz (188.4 tonnes) • In 2024, 130 koz (4.1 tonnes) of gold was produced • Our equity interest in the mine: 100%
Buriticá Gold Mine in Colombia ("**Colombia Buriticá Gold Mine**")	• Acquired in 2020 • One of Colombia's largest producing gold mines, a globally ultra-high-grade large gold mine, and Colombia's first large modern underground mine • Underground mining • LOM: Until 2039 • Recognized by the Colombian government as a "National Strategic Interest Project" • As of December 31, 2024, total Mineral Resources amounted to 50.4 Mt, with average Au grade of 7.2 g/t, and Au metal Mineral Resources of 11,700 koz (364.9 tonnes) • In 2024, 322 koz (10.0 tonnes) of gold was produced • Our economic interest in the mine: 68.8%
Rosebel Gold Mine in Suriname ("**Suriname Rosebel Gold Mine**")	• Acquired in 2023 • A world-class gold mine and one of South America's largest producing open-pit gold mines • Open-pit mining • LOM: Until 2042 • Originally a loss-making project; turned profitable in the year of the acquisition • As of December 31, 2024, total Mineral Resources amounted to 457.1 Mt, with average Au grade of 0.8 g/t, and Au metal Mineral Resources of 12,036 koz (374.3 tonnes) • In 2024, 240 koz (7.5 tonnes) of gold was produced • Our equity interest in the mine: 95.0%

Mineralized Zone/Block	Highlights
Akyem Gold Mine in Ghana ("**Ghana Akyem Gold Mine**")	• Acquired in 2025 • One of Ghana's largest gold mines • Open-pit mining and underground mining • LOM: Until 2038 • As of December 31, 2024, total Mineral Resources amounted to 162.7 Mt, with average Au grade of 1.8 g/t, and Au metal Mineral Resources of 9,539 koz (296.7 tonnes) • In 2024, 203 koz (6.3 tonnes) of gold was produced • Our equity interest in the mine: 100%
Porgera Gold Mine in Papua New Guinea ("**PNG Porgera Gold Mine**")	• Acquired 47.5% interest in 2015; currently indirectly holding 24.5% interest • Papua New Guinea's second-largest gold mine • Open-pit mining and underground mining • As of December 31, 2024, total Mineral Resources attributable to us on equity basis amounted to 51.5 Mt, with average Au grade of 2.7 g/t, and Au metal Mineral Resources of 4,414 koz (137.3 tonnes) • In 2024, the gold production volume attributable to us on equity basis was 46 koz (1.4 tonnes) • Our equity interest in the mine: 24.5%

Our Mineral Resources and Ore Reserves

Mineral Resources

As of December 31, 2024, the total Mineral Resources for our mines, including Ghana Akyem Gold Mine we acquired in 2025 and our minority interests in PNG Porgera Gold Mine, are estimated to be about 1,197.7 Mt, with an average Au grade of 1.5 g/t and Au metal Mineral Resources of 57,737 koz (1,796.5 tonnes).

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)]	Au Grade[(1)]	Au Metal Contained[(1)]

Notes:

(1) Figures and economic interests are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. Except for PNG Porgera Gold Mine, the Mineral Resources Information of which is calculated based on 24.5% of the equity interest held by the Company, the Mineral Resources information is calculated based on 100% of the equity interest for each asset held by the Company.

(2) The information is presented based on the 24.5% equity interest we held as of December 31, 2024. A separate Competent Person's Report for the PNG Porgera Gold Mine is not included in this document, as we only hold a minority interest in such asset while Barrick Mining is the operator and our Directors are of the view that given such background of ownership and operatorship, it is reasonable to cite Resources & Reserves information from public filings of Barrick Mining and SRK has conducted independent review and verified such information.

(3) The "Total consolidated" information is calculated based on 100% of the equity interest for each asset held by the Company, except for PNG Porgera Gold Mine, which is presented based on 24.5% of the equity interest held by the Company.

(4) The "Total attributable" information is calculated based on the percentage of the equity interest for each asset held by the Company.

Ore Reserves

As of December 31, 2024, the total Proved and Probable Ore Reserves for our mines including Ghana Akyem Gold Mine we acquired in 2025 and our minority interests in PNG Porgera Mine were estimated to be about 608.6 Mt, with total Proved and Probable Au grade Ore Reserves of 1.4 g/t. Our total Proved and Probable Ore Reserves contained 27,534 koz (856.0 tonnes) of Au contained metal.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves (including gold Resource information) as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)]	Au Grade[(1)]	Au Metal Contained[(1)]

Notes:

(1) Figures and economic interests are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. Except for PNG Porgera Gold Mine, which is calculated based on 24.5% of the equity interest held by the Company, the Ore Reserves information is calculated based on 100% of the equity interest for each asset held by the Company.

(2) The information is presented based on the 24.5% equity interest we held as of December 31, 2024. A separate Competent Person's Report for the PNG Porgera Gold Mine is not included in this document, as we only hold a minority interest in such asset while Barrick Mining is the operator and our Directors are of the view that given such background of ownership and operatorship, it is reasonable to cite Resources & Reserves information from public filings of Barrick Mining and SRK has conducted independent review and verified such information.

(3) The "Total consolidated" information is calculated based on 100% of the equity interest for each asset held by the Company, except for PNG Porgera Gold Mine, which is presented based on 24.5% of the equity interest held by the Company.

(4) The "Total attributable" information is calculated based on the percentage of the equity interest for each asset held by the Company.

Our Gold Production Volume

The following table sets forth our ore processed volume and mine production volume in relation to our gold mining businesses for the periods indicated:

	Year Ended December 31,								
	2022			2023			2024		
	Ore Processed[(1)]	Gold Production[(1)]		Ore Processed[(1)]	Gold Production[(1)]		Ore Processed[(1)]	Gold Production[(1)]

Subtotal attributable[(3)]	**11,289**	**658**	**20.5**	**22,253**	**943**	**29.3**	**25,411**	**1,039**	**32.3**
Non-consolidated mines									
Ghana Akyem Gold Mine[(4)]	8,195	413	12.8	7,646	290	9.0	8,287	203	6.3
PNG Porgera Gold Mine[(5)]	—	—	—	—	—	—	882	46	1.4
Total[(6)]	**21,856**	**1,262**	**39.3**	**32,834**	**1,441**	**44.8**	**37,690**	**1,501**	**46.7**

Notes:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them, and figures of tonnes/koz may not be an arithmetic conversion based on the rounding figures as shown in the table.

(2) The "Subtotal consolidated" information is calculated based on 100% of equity interest for each asset held by the Company.

(3) The "Subtotal attributable" information is calculated based on the percentage of equity interest for each asset held by the Company.

(4) The acquisition of the Ghana Akyem Gold Mine was completed in April 2025.

(5) PNG Porgera Gold Mine's operations were suspended in April 2020 due to the expiration of mining lease, and it resumed mining in January 2024. Figures shown in the table for the PNG Porgera Gold Mine is calculated based on 24.5% of the equity interest held by the Company.

(6) The "Total" information is calculated by adding the "Subtotal consolidated" information and the information of Ghana Akyem Gold Mine (assuming its production volume during the Track Record Period before acquisition can be consolidated) and PNG Porgera Gold Mine (based on 24.5% of the equity interest held by the Company).

Planned Production Schedule

As set forth in the Competent Person's Report, the following chart sets forth the planning production schedule for the operations of each of the mines up to 2030. For the full production schedule over the life of mine, see "Business" for further details.

Type	Unit	LOM Total	2025	2026	2027	2028	2029	2030
Tajikistan Jilau/Taror Gold Mines								
Gold Produced	koz	1,882	173	198	245	212	249	161
Kyrgyzstan Taldybulak Levoberezhny Gold Mine								
Gold Produced	koz	787	107	97	91	86	90	95
Australian Norton Gold Mine								
Gold Produced	koz	2,587	185	263	226	215	173	185
Guyana Aurora Gold Mine								
Gold Produced	koz	2,161	143	152	187	189	128	205
Colombia Buriticá Gold Mine								
Gold Produced	koz	4,471	308	286	290	302	327	282
Suriname Rosebel Gold Mine								
Gold Produced	koz	5,056	304	325	291	291	290	263
Ghana Akyem Gold Mine								
Gold Produced	koz	5,956	113	249	299	385	415	491

Licenses and Permits

During the Track Record Period and as of the Latest Practicable Date, we have obtained the requisite licenses, permits and certificates required by the relevant laws and regulations for our current operations in all material aspects, other than the mining and exploration permits and/or licenses being renewed. For more details, please see the respective list of licenses and permits in tabular form set out in the description of the production business of each of our mines in "Business".

Our Gold Operating Costs

For the year ended December 31, 2024, our gold AISC was US$1,458 per ounce. According to Frost & Sullivan, our AISC was ranked sixth lowest among the top fifteen gold mining companies globally by gold production in 2024.

Set forth below is our gold AISC for the periods indicated as stated in the Competent Person's Report:

	Year Ended December 31,		
	2022	2023	2024
	US$/oz (approximately)		
Tajikistan Jilau/Taror Gold Mines	759	1,475	1,581
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	1,007	1,119	1,318
Australia Norton Gold Mine	1,604	2,112	2,047
Guyana Aurora Gold Mine	1,764	1,712	1,572
Colombia Buriticá Gold Mine	856	962	802
Suriname Rosebel Gold Mine	—	1,463	1,547
Our Group	**1,046**	**1,449**	**1,458**

Our Revenue, Sales Volume and Average Selling Price

We generate substantially all of our revenue from the sales of gold. Our other revenue mainly includes the sales of other non-ferrous metals such as silver and copper, as well as rental income from rentals of machinery equipment. Our revenue amounted to US$1,818.0 million, US$2,262.4 million and US$2,989.9 million in 2022, 2023 and 2024, respectively.

The table below sets forth our revenue of each mine and percentage of our total revenue for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Tajikistan Jilau/Taror Gold Mines	691,122	38.0	440,604	19.5	515,849	17.3
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	223,933	12.3	258,015	11.4	286,161	9.6
Australia Norton Gold Mine	303,798	16.7	373,044	16.5	562,882	18.8
Guyana Aurora Gold Mine	160,107	8.9	190,145	8.4	318,125	10.6
Colombia Buriticá Gold Mine	439,021	24.1	531,735	23.5	729,517	24.4
Suriname Rosebel Gold Mine	—	—	468,822	20.7	577,401	19.3
Total	1,817,981	100.0	2,262,365	100.0	2,989,935	100.0

Our revenue from gold sales was US$1,724.2 million, US$2,167.2 million and US$2,812.0 million in 2022, 2023 and 2024, respectively, accounting for 94.8%, 95.8% and 94.0%, respectively, of our total revenue.

The following table sets forth our disaggregated revenue information and percentage of our total revenue for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Gold	1,724,229	94.8	2,167,179	95.8	2,811,980	94.0
Others	93,752	5.2	95,186	4.2	177,955	6.0
Total	1,817,981	100.0	2,262,365	100.0	2,989,935	100.0

The following table sets forth the key statistics of our gold sales for the periods indicated:

	Year ended December 31,		
	2022	2023	2024
Revenue from gold sales (US$ in millions)	1,724.2	2,167.2	2,812.0
Sales volume (koz)	1,020	1,163	1,229
Sales volume (t)	31.7	36.2	38.2
Average selling price (US$/oz)(1)	1,690	1,863	2,288
Market price of gold (US$/oz)(2)	1,801	1,942	2,386
Cash operating cost (US$ in millions). . . .	1,315.9	1,442.1	1,697.9

Note:

(1) Calculated as revenue from gold sales divided by sales volume.

(2) The average gold price in the global market for the periods indicated, according to London Bullion Market Association (LBMA) Gold Price.

Our average selling prices of gold, calculated as our revenue from gold sales divided by sales volume, were generally in line with the gold prices in the global market because most of our gold were sold to the end customers including international gold refineries, precious metal traders or financial institutions, at prices which were referenced to the spot prices. Our average selling prices were generally slightly lower than the gold market prices in 2022, 2023 and 2024.

The following table sets forth our sales volume and average selling price for each mine for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	Sales volume	Average selling price(1)	Sales volume	Average selling price(1)	Sales volume	Average selling price(1)
	(koz)	(US$/oz)	(koz)	(US$/oz)	(koz)	(US$/oz)
Tajikistan Jilau/Taror Gold Mines(2)	387	1,602	213	1,815	171	2,469
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	123	1,758	131	1,910	119	2,347
Australia Norton Gold Mine	177	1,718	212	1,762	265	2,120
Guyana Aurora Gold Mine	89	1,797	97	1,944	131	2,407
Colombia Buriticá Gold Mine	244	1,731	269	1,854	300	2,191
Suriname Rosebel Gold Mine	—	—	241	1,948	243	2,380
Total	**1,020**	**1,690**	**1,163**	**1,863**	**1,229**	**2,288**

Note:

(1) Calculated as revenue from gold sales divided by sales volume on an actual basis.

(2) In 2022, the average selling price of gold at the Tajikistan Jilau/Taror Gold Mines was relatively low, primarily because sales composed of gold concentrate, selling price of which had a higher discount.

OUR CUSTOMERS, SUPPLIERS AND CONTRACTORS

Our Customers

During the Track Record Period, our primary products were gold, and other Mineral Resources products. Our products are mainly sold to market customers including financial institutions directly or through the Zijin Mining Group. Certain subsidiaries of Zijin Mining, acting as traders of various mineral resources, are responsible for, among other things, arranging for the external sale of mineral resources produced by the Group to external refineries, end-customers or traders. By leveraging the centralized and experienced sales capabilities of these subsidiaries of Zijin Mining, the sales coordination within the Group has been enhanced, thereby optimizing operational efficiencies and economies of scale, and securing favorable commercial terms. Therefore, during the Track Record Period, Zijin Mining Group was our largest customer, and we expect to continue this business relationship with the Zijin Mining Group upon completion of the [REDACTED]. See "Connected Transaction — Zijin Mining Sales Framework Agreement" for further details.

During the Track Record Period, our top five customers in the respective year were Zijin Mining Group, refiners of precious metals and other non-ferrous metals as well as trading companies. For each of the years ended December 31, 2022, 2023 and 2024, revenue contributed by our top five customers amounted to US$1,275.4 million, US$1,769.4 million and US$2,517.0 million, respectively, accounting for 70.2%, 78.2% and 84.2% of our total revenue for the same periods, respectively. Revenue contributed by our largest customer for each of years ended December 31, 2022, 2023 and 2024 amounted to US$597.7 million, US$635.8 million and US$1,272.9 million, respectively, accounting for 32.9%, 28.1% and 42.6% of our total revenue for the same periods, respectively.

Our Suppliers

We procure various materials, such as diesel fuel, processing chemicals, explosives, and related consumables, as well as machinery and equipment for our production operations mainly from (i) Zijin Mining Group, (ii) different local suppliers where we operate and/or (iii) the original equipment manufacturers. We also procure various services, such as security services, transporting services, engineering services and loading and hauling services, from various local suppliers. We usually source qualified suppliers through market research and request of fee quotes. During the Track Record Period, we purchased equipment and raw materials mainly from certain subsidiaries of Zijin Mining, as part of the centralized procurement arrangement implemented by us so that we could procure equipment and raw materials in accordance with the procurement policy of Zijin Mining and enjoy the economies of scale. During the Track Record Period, Zijin Mining Group was our largest supplier, and we expect to continue this business relationship with the Zijin Mining Group upon completion of the [REDACTED]. See "Connected Transaction — Zijin Mining Centralized Procurement Framework Agreement" for further details.

During the Track Record Period, all of our top five suppliers in the respective year were service or commodity providers such as suppliers of electricity, fuel, and transportation. For each year of the Track Record Period, purchases from our top five suppliers amounted to US$348.0 million, US$423.3 million and US$454.3 million, respectively, accounting for 30.7%, 30.4% and 31.2% of our cost of sales for the same periods, respectively. Purchases from our largest supplier for each year of the Track Record Period amounted to US$154.1 million, US$195.6 million and US$175.7 million, respectively, accounting for 13.6%, 14.0% and 12.1% of our cost of sales for the same periods, respectively.

Our Contractors

As of December 31, 2024, we also engaged 46 third party contractors to undertake construction and engineering work, 15 third-party contractors for exploration work and 52 third-party contractors for mining and processing work. From time to time, we may engage other third-party contractors to support our mining activities, such as construction or improvement of tailing dams and roads in mining sites. See "Business — Contractors" for further details.

COMPETITION

According to Frost & Sullivan, the gold mining industry has become increasingly concentrated in recent years. This trend is largely driven by mergers and resource integration among leading gold producers. Major gold mining companies, with their efficient operations, global presence, financial strength, and other competitive advantages, are now at the forefront of the industry. These large gold mining companies have been able to achieve economies of scale through consolidation, which has allowed them to optimize production processes and reduce unit costs. The top 15 global gold producers contributed approximately 30.5% of the global gold production in 2024. Among these leading companies, our gold Reserves and gold production volume ranked ninth and eleventh globally, respectively, in 2024, according to Frost & Sullivan.

Our major competitors are large international companies. We primarily compete based on our ability to obtain gold Reserves and Resources, which is dependent on our financial conditions, technical ability, equipment and machinery and human capital. We also compete with international players in acquiring attractive gold mining properties. The mining industry is a capital-intensive industry that requires significant technical, exploration and management experience. Moreover, mining is subject to extensive regulations and requires a number of licenses and permits to operate. These factors constitute significant barriers to enter the gold mining industry.

See "Industry Overview" for details of the competitive landscape and our market position.

KEY RISK FACTORS

Our business faces risks including those set out in "Risk Factors." As different investors may have different interpretations and criteria when determining the significance of a risk, you should read the section headed "Risk Factors" in its entirety before you decide to participate in our [REDACTED]. Some of the major risks that we face include:

- Volatility in gold price could materially and adversely affect the profitability of our business, financial condition, results of operations and the cash flows.

- We operate in a number of countries and may also face geopolitical and country risks arising from our operations.

- We are subject to risks and uncertainties relating to our historical and future acquisitions and investments and establishing joint ventures, and we may fail to successfully implement our expansion strategies and integrate them with our existing business.

- Our business is subject to a number of operational risks and hazards specific to the mining industry, which may result in increased costs or losses, personal injuries or casualties, damage to reputation, suspension of operations and other penalties.

- We are subject to uncertainty in the results of exploration, and we may not be able to expand or replenish our mineral resources and reserves through further exploration. Failure to discover new reserves, maintain or enhance existing reserves, develop new operations or expand our current operations could adversely affect our business and results of operations.

SUMMARY OF HISTORICAL FINANCIAL INFORMATION

The following is a summary of our historical financial information as of and for the years ended December 31, 2022, 2023 and 2024 extracted from the Accountants' Report set out in Appendix I to this Document. The summary below should be read in conjunction with the combined financial information in Appendix I, including the accompanying notes and the information set forth "Financial Information."

Combined Statements of Profit and Loss and Comprehensive Income

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Revenue	1,817,981	100.0	2,262,365	100.0	2,989,935	100.0
Cost of sales	(1,197,527)	(65.9)	(1,669,689)	(73.8)	(1,855,611)	(62.1)
Gross profit	**620,454**	**34.1**	**592,676**	**26.2**	**1,134,324**	**37.9**
Profit before tax	**427,404**	**23.5**	**414,741**	**18.3**	**936,955**	**31.3**
Profit for the year	**290,316**	**16.0**	**322,161**	**14.2**	**620,555**	**20.8**
Attributable to:						
Owners of the parent	183,680	10.1	230,383	10.2	481,371	16.1
Non-controlling interests	106,636	5.9	91,778	4.1	139,184	4.7
Adjusted EBITDA[(1)]	828,726	45.6	865,805	38.3	1,384,464	46.3

Note:

(1) Adjusted EBITDA, as we present it, represents profit for the year before income tax, finance costs, interest income from bank deposits, depreciation and amortization and equity-settled share award schemes expenses. Adjusted EBITDA is not a standard measure under IFRS Accounting Standards. The use of adjusted EBITDA has limitation as an analytical tool, and you should not consider it in isolation from, or as a substitute for analysis of, our results of operations or financial condition as reported under IFRS Accounting Standards.

We generate substantially all of our revenue from the sales of gold. Our other revenue mainly includes the sales of other non-ferrous metals such as silver and copper, as well as rental income from rentals of machinery equipment. Our revenue amounted to US$1,818.0 million, US$2,262.4 million and US$2,989.9 million in 2022, 2023 and 2024, respectively.

Our cost of sales primarily comprises raw material costs, depreciation and amortization, labor expenses, royalty expenses, labor cost, energy consumption costs and others. Our cost of sales increased during the Track Record Period. For the years ended December 31, 2022, 2023 and 2024, our cost of sales amounted to US$1,197.5 million, US$1,669.7 million and US$1,855.6 million, respectively.

Our profit for the year amounted to US$290.3 million, US$322.2 million and US$620.6 million, in 2022, 2023 and 2024, respectively, primarily due to the increase in revenue in gold sales volume and increase in average selling price.

Summary Combined Statements of Financial Position

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Non-Current Assets	3,455,590	4,090,116	4,201,863
Current Assets	736,533	1,064,775	1,200,874
Current Liabilities	550,398	1,077,906	955,000
Net Current Assets/(Liabilities)	186,135	(13,131)	245,874
Total Assets Less Current Liabilities	3,641,725	4,076,985	4,447,737
Non-Current Liabilities	1,277,646	1,485,655	1,545,646
Net Assets	2,364,079	2,591,330	2,902,091

We recorded net current assets of US$186.1 million as of December 31, 2022 and net current liabilities of US$13.1 million as of December 31, 2023, primarily attributable to an increase in other payables and accruals and an increase in trade payables, partially offset by an increase in prepayments, other receivables and other assets and an increase in cash and cash equivalents.

We recorded net current liabilities of US$13.1 million as of December 31, 2023 and net current assets of US$245.9 million as of December 31, 2024, primarily attributable to a decrease in other payables and accruals, a decrease in trade payables, an increase in cash and cash equivalents, an increase in prepayments, other receivables and other assets and an increase in inventories.

Combined Statements of Cash Flow

The following table sets forth a summary of our cash flows for the periods indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Net cash flows from operating activities	714,749	924,874	876,455
Net cash flows used in investing activities	(453,412)	(720,992)	(399,633)
Net cash flows used in financing activities	(346,560)	(135,633)	(396,959)
Net (decrease)/increase in cash and cash equivalents	(85,223)	68,249	79,863
Cash and cash equivalents at beginning of year	171,228	86,458	154,754
Effect of foreign exchange rate changes, net	453	47	(32)
Cash and cash equivalents at end of year	86,458	154,754	234,585

KEY FINANCIAL RATIOS

	As of and for the year ended December 31,		
	2022	2023	2024
		(US$ in thousands)	
Rates of return			
Return on assets[(1)] (%)	6.9	6.2	11.5
Return on equity[(2)] (%)	12.3	12.4	21.4
Liquidity ratios			
Current ratio[(3)] (times)	1.34	0.99	1.26
Quick ratio[(4)] (times)	0.77	0.62	0.80
Gearing ratio[(5)] (times)	0.29	0.28	0.25
Profit margin			
Gross profit margin[(6)] (%)	34.1	26.2	37.9
Net profit margin[(7)] (%)	16.0	14.2	20.8

Notes:

(1) Return on assets ratio is calculated using the profit for the year divided by total assets at the end of the year, multiplied by 100%.

(2) Return on equity ratio is calculated using the profit for the year divided by total equity at the end of the year, multiplied by 100%.

(3) Current ratio is calculated using total current assets divided by total current liabilities.

(4) Quick ratio is calculated using total current assets less inventories divided by total current liabilities.

(5) Gearing ratio is calculated by dividing total debt (which includes current and non-current portions of convertible debentures, interest-bearing bank and other borrowings, and lease liabilities) by total equity.

(6) Gross profit margin is calculated based on the gross profit for the year divided by the total revenue for the respective year and multiplied by 100%. See the paragraphs headed "Period to period comparison of results of operations" above in this section for more details on our gross profit margins.

(7) Net profit margin is calculated based on the profit for the year divided by the total revenue for the respective year and multiplied by 100%. See the paragraphs headed "Period to period comparison of results of operations" above in this section for more details on our net profit margins.

ACQUISITIONS DURING AND AFTER THE TRACK RECORD PERIOD

During the Track Record Period, Zijin Mining acquired Rosebel GM (which held the Suriname Rosebel Gold Mine) and Newmont Gold Ridge (which held Ghana Akyem Gold Mine). The percentage ratios of each of these acquisitions were under 25% pursuant to Rule 4.05A of the Listing Rules.

On June 29, 2025, we entered into an agreement with Cantech S.à.r.l ("**Cantech**") in relation to the acquisition of all issued share capital in each of RG Gold LLP ("**RGG**") and RG Processing LLP ("**RGP**"), which together held the Raygorodok Gold Mine in Kazakhstan (the "**Kazakhstan Raygorodok Gold Mine**") with a cash consideration of US$1.2 billion, subject to customary adjustments with reference to the financial information of RGG and RGP as of September 30, 2025. We intend to obtain a loan from financial institutions to finance the payment of the consideration.

See "History — Acquisitions during and after the Track Record Period" for further details.

RELATIONSHIP WITH ZIJIN MINING

As at the Latest Practicable Date, Zijin Mining, through its wholly owned subsidiaries, Zijin Northwest and Gold Mountains (H.K.), was indirectly interested in 100% of the issued share capital of our Company. Immediately upon completion of the [REDACTED] and the [REDACTED] (without taking into account any Shares which may be issued pursuant to the exercise of the [REDACTED]), Zijin Mining will control approximately [REDACTED] of the issued share capital of our Company through Zijin Northwest and Gold Mountains (H.K.). Hence, upon [REDACTED], Zijin Mining, Zijin Northwest and Gold Mountains (H.K.) constitute our Controlling Shareholders under the Listing Rules.

Upon completion of the [REDACTED], the businesses of our Group and the Zijin Mining Group will be clearly delineated. Zijin Mining Group principally assumes the roles of owner, investor and/or operator in respect of its business in the exploration and mining of copper, zinc, lithium, and other metal resources, as well as gold mining within the PRC; whereas our Group will exclusively own and operate overseas gold mines.

Save for the Colombia Buriticá Gold Mine, the equity interests of all the overseas gold mines will be transferred to our Group prior to completion of the [REDACTED], and the Zijin Mining Group will not, following completion of the [REDACTED], engage in the exploration and mining of gold outside the PRC.

Please see "Relationship with Controlling Shareholders" for further details.

RECENT DEVELOPMENTS AND NO MATERIAL ADVERSE CHANGE

In April 2025, we completed the acquisition of Ghana Akyem Gold Mine. See "— Acquisitions during and after the Track Record Period."

Since December 31, 2024, the gold spot price has been steadily increasing from US$2,644.6 per ounce on January 2, 2025 to US$3,340.2 per ounce on June 26, 2025, according to London Bullion Market Association (LBMA) Gold Price. Fluctuations in gold prices may affect our results of operations and financial performance in 2025 and going forward.

Our Directors confirm that there has been no material adverse change in our financial, operational or trading positions or prospects since December 31, 2024, being the date of our combined financial statements as set out in Appendix I to this Document, and up to the date of this Document.

THE [REDACTED] AND THE [REDACTED]

Regulatory requirements of the [REDACTED]

Zijin Mining, our Controlling Shareholder, is a company listed in Hong Kong and the PRC. The [REDACTED] of our Company constitutes a [REDACTED] from an A-Share listed company as defined under the Spin-off Rules. The [REDACTED] has been approved by the shareholders of Zijin Mining at an extraordinary general meeting held on June 26, 2025.

In addition, our [REDACTED] will constitute a [REDACTED] from Zijin Mining, our Controlling Shareholder, pursuant to the Listing Rules. The proposal in relation to the [REDACTED] was submitted by Zijin Mining to the Stock Exchange for approval pursuant to Practice Note 15, and the Stock Exchange has confirmed that Zijin Mining may proceed with the [REDACTED]. The [REDACTED], if it proceeds, will not constitute a notifiable transaction for Zijin Mining under the Listing Rules.

Reasons for and benefits of the [REDACTED]

The [REDACTED] will be commercially beneficial to Zijin Mining and the Company, as the [REDACTED] will, among other things, (a) enable the Group to enhance its profiles amongst its customers, suppliers and other business partners, as well as its financial profile; (b) enable Zijin Mining to direct its financial resources to itself, (c) enable Zijin Mining to continue to benefit from any potential upside in our business through consolidation of the Group's financial performance and receipt of dividend income from the Group; and (d) enable investors to better value Zijin Mining with its focus on its retained business. See "History — The [REDACTED] of our Group from Zijin Mining" for further details.

The [REDACTED]

Qualifying Zijin Mining H Shareholders will be entitled to participate in the [REDACTED] on a preferential basis as to allocation only by way of the [REDACTED]. See "History — The [REDACTED] of Our Group from Zijin Mining" and "[REDACTED]" for further details.

[REDACTED]

USE OF [REDACTED]

Assuming that the [REDACTED] is not exercised, after deducting the [REDACTED] and other estimated [REDACTED] [REDACTED] payable by us in connection with the [REDACTED], and assuming an [REDACTED] of HK$[REDACTED] per Share (being the mid-point of the indicative [REDACTED] range of HK$[REDACTED] and HK$[REDACTED]), we estimate that we will receive net [REDACTED] of approximately HK$[REDACTED] million from the [REDACTED].

We intend to use the [REDACTED] from the [REDACTED] for the purposes and in the amounts set forth below, subject to adjustments based on our evolving business needs and changing market conditions:

(i) Approximately [REDACTED]% of the net [REDACTED], or HK$[REDACTED] million, is expected to be used to repay the bridge loan for financing the acquisition of the Kazakhstan Raygorodok Gold Mine.

(ii) Approximately [REDACTED]% of the net [REDACTED], or HK$[REDACTED] million, is expected to be used over the next five years for the upgrade and construction project of existing mines to fully enhance our production capabilities.

(iii) Approximately [REDACTED]% of the net [REDACTED], or HK$[REDACTED] million, is expected to be used over the next five years for the exploration activities to fully realize our growth potential.

(iv) Approximately [REDACTED]% of the net [REDACTED], or HK$[REDACTED] million, is expected to be used for general corporate purposes.

For further information relating to our future plans and use of [REDACTED] from the [REDACTED], see "Future Plans and Use of [REDACTED]" in this document.

[REDACTED]

DIVIDEND POLICY

We do not currently have a dividend policy. We did not declare or pay any dividend during the Track Record Period. We may only pay dividends out of the profits of the Company available for distribution and we may only pay dividends after recovery of accumulated losses. The Company may by ordinary resolution declare dividends but no dividend shall exceed the amount recommended by the Board. The declaration, payment and amount of any future dividends will depend on our earnings and financial condition, operating requirements, capital requirements and any other conditions that our Directors may deem relevant.

Our Board may declare dividends by considering our results of operations, cash flows and financial conditions, operating and capital requirements and other relevant factors. The payment of any dividends will also depend on the availability of dividends, if any, received from the entities, which is the immediate subsidiary of the Company and the holding vehicle of our operating subsidiaries in each region. In addition to capital injection, such entities may also provide our operating subsidiaries with shareholder loans, which will be repaid to those entities.

DEFINITIONS

In this document, unless the context otherwise requires, the following expressions shall have the following meanings.

"AFRC"	Accounting and Financial Reporting Council
"AGM Inc."	AGM Inc., a company incorporated in Guyana with limited liability on November 16, 2011, and an indirect wholly-owned subsidiary of our Company upon completion of the Reorganization
"Altynken LLC"	Altynken Limited Liability Company, a company incorporated in Kyrgyzstan with limited liability on April 5, 2006, and an indirect non-wholly owned subsidiary of our Company upon completion of the Reorganization
"Articles" or "Articles of Association"	the articles of association of our Company conditionally adopted on [•] with effect from the [REDACTED], and as amended from time to time, a summary of which is set out in Appendix IV to this document
"associate(s)"	has the meaning ascribed to it under the Listing Rules
[REDACTED]	[REDACTED]
[REDACTED]	[REDACTED]
"Australia Norton Gold Mine"	Paddington and Binduli operational centres, including eight project areas in Kalgoorlie Region, Western Australia
[REDACTED]	[REDACTED]
"Board" or "Board of Directors"	the board of Directors of our Company
[REDACTED]	[REDACTED]

DEFINITIONS

[REDACTED]	[REDACTED]
[REDACTED]	[REDACTED]
"CAGR"	the compound annual growth rate, annualized average growth rate between given years, assuming growth takes place at an exponentially compounded rate
[REDACTED]	[REDACTED]
[REDACTED]	[REDACTED]
"CGI"	Continental Gold Inc., a company established in Ontario, Canada with limited liability on July 7, 2021. CGI is directly wholly-owned by Zijin America, which in turn is owned as to 68.77% by Gold Mountains (H.K.)
"China" or "PRC"	the People's Republic of China, but for the purpose of this document and for geographical reference only and except where the context requires, references in this document to "China" and the "PRC" do not include Hong Kong, Macau and Taiwan
"close associate(s)"	has the meaning ascribed to it under the Listing Rules
"Colombia Entrustment Arrangement"	has the meaning ascribed to it in "Relationship with Zijin Mining"
"Colombia Buriticá Gold Mine"	Buriticá gold mine project in Colombia
"Companies Ordinance" or "Hong Kong Companies Ordinance"	the Companies Ordinance (Chapter 622 of the Laws of Hong Kong), as amended or supplemented from time to time
"Companies (Winding Up and Miscellaneous Provisions) Ordinance"	the Companies (Winding Up and Miscellaneous Provisions) Ordinance (Chapter 32 of the Laws of Hong Kong), as amended and supplemented from time to time

"Company", "our Company", "we" or "us"	Zijin Gold International Company Limited (紫金黃金國際有限公司) (formerly known as Jinfeng (HK) International Mining Company Limited (金峰(香港)國際礦業有限公司)), a company incorporated in Hong Kong with limited liability on October 22, 2007
"Competent Person" or "SRK"	has the same meaning ascribed to it under Rule 18.01 of the Hong Kong Listing Rules and, in the context of this document, means SRK Consulting (China) Ltd., an independent mining and geological consultant, which is an Independent Third Party
"Competent Person's Reports" or "SRK Reports"	the Competent Person's reports prepared by SRK on the Tajikistan Jilau/Taror Gold Mines, Kyrgyzstan Taldybulak Levoberezhny Gold Mine, Australia Norton Gold Mine, Guyana Aurora Gold Mine, Colombia Buritica Gold Mine, Suriname Rosebel Gold Mine and Ghana Akyem Gold Mine, the effective date of which is May 31, 2025 and details of which are set out in Appendices III to this Document.
"connected person"	has the meaning ascribed to it under the Listing Rules
"connected transaction"	has the meaning ascribed to it under the Listing Rules
"Continental Gold"	Continental Gold Limited, a company registered and redomiciled in Bermuda with limited liability on December 21, 2015. Continental Gold is indirectly wholly-owned by Zijin America, which is in turn owned as to 68.77% by Gold Mountains (H.K.)
"Continental Gold Colombia Branch"	the Colombia branch of Continental Gold, established on July 5, 2007
"Controlling Shareholders"	has the meaning ascribed to it under the Listing Rules and, unless the context otherwise requires, means Zijin Northwest, Gold Mountains (H.K.), and Zijin Mining
"core connected person"	has the meaning ascribed to it under the Listing Rules
"Deed of Non-Competition"	the deed of non-competition to be enforced into by Zijin Mining with and in favor of our Company, before the completion of the proposed [REDACTED] as further described in "Relationship with Zijin Mining — Independence of our Group from our Controlling Shareholders — Deed of Non-Competition"
"Director(s)"	the director(s) of our Company
"EIT Law"	the Enterprise Income Tax Law of the PRC (中華人民共和國企業所得稅法), as amended, supplemented or otherwise modified from time to time

DEFINITIONS

[REDACTED]	[REDACTED]
"Extreme Conditions"	the occurrence of "extreme conditions" as announced by any government authority of Hong Kong due to serious disruption of public transportation services, extensive flooding, major landslides, large-scale power outage or any other adverse conditions caused by a super typhoon
[REDACTED]	[REDACTED]
"Frost & Sullivan"	Frost & Sullivan Limited, our independent industry consultant
"Ghana Akyem Gold Mine"	Akyem gold mine project in Ghana
[REDACTED]	[REDACTED]
"Gold Excellence"	Gold Excellence Holdings Company Limited, a company incorporated in Hong Kong with limited liability on July 5, 2024, and a direct wholly-owned subsidiary of our Company
"Gold Mountains (H.K.)"	Gold Mountains (H.K.) International Mining Company Limited, a company incorporated in Hong Kong with limited liability on November 3, 2004 which holds 76% equity interest in our Company as at the Latest Practicable Date. It is one of our Company's Controlling Shareholders and a direct wholly-owned subsidiary of Zijin Mining

"Gold Source"	Gold Source International Holdings Company Limited, a company incorporated in Hong Kong with limited liability on September 11, 2024, and a direct wholly-owned subsidiary of our Company
"Group", "our Group" or "the Group"	our Company and its subsidiaries or, where the context requires, in respect of the period before our Company became the holding company of its current subsidiaries, the businesses operated by such subsidiaries as if they were subsidiaries of our Company at that time or their predecessors, as the case may be
"Guyana Goldfields"	Guyana Goldfields Inc., a company incorporated in Canada on March 2, 2005, and a direct wholly-owned subsidiary of our Company upon completion of the Reorganization
"Guyana Aurora Gold Mine"	Aurora gold mine project in Guyana
"HK$" or "Hong Kong dollars" or "HK dollars" or "cents"	Hong Kong dollars and cents respectively, the lawful currency of Hong Kong
[REDACTED]	[REDACTED]

"Zijin Mining"	Zijin Mining Group Co., Ltd (紫金礦業集團股份有限公司) (formerly known as 福建紫金礦業股份有限公司), a company incorporated in the PRC on September 6, 2000 with limited liability, the shares of which are listed on the Main Board of the Stock Exchange (stock code: 02899) and the Shanghai Stock Exchange (stock code: 601899). Zijin Mining is one of our Controlling Shareholders
"Zijin Mining A Share(s)"	the Zijin Mining Shares which are listed on Shanghai Stock Exchange
"Zijin Mining Group"	Zijin Mining and its subsidiaries which for the purpose of this Document and unless the context otherwise requires, excludes our Group
"Zijin Mining H Share(s)"	the overseas-listed foreign shares in the share capital of ordinary shares of Zijin Mining which are listed on the Stock Exchange and traded in Hong Kong dollars
"Zijin Mining Share(s)"	the issued share(s) of Zijin Mining
"Zijin Mining A Shareholder(s)"	the holders of Zijin Mining A Share(s)
"Zijin Mining H Shareholder(s)"	the holders of Zijin Mining H Share(s)
"Zijin Northwest"	Zijin Mining Group Northwest Co., Ltd. (紫金礦業集團西北有限公司), a company incorporated in the PRC on August 9, 2004, which holds 24% equity interest in our Company as at the Latest Practicable Date. It is one of our Controlling Shareholders and a wholly-owned subsidiary of Zijin Mining
"%"	percent

The English translation of the PRC entities, enterprises, nationals, facilities, regulations in Chinese or another language included in this Document is for identification purposes only. In the event of any inconsistency, the Chinese names shall prevail.

GLOSSARY OF TECHNICAL TERMS

This glossary contains explanations of certain technical terms used in this Document in connection with our Company and our business. Such terminology and meanings may not correspond to standard industry meanings or usages of those terms.

"Ag"	the chemical symbol of silver
"all-in sustaining cost" or "AISC"	a metric which means operating costs excluding amortisation and depreciation, plus all costs not included therein relating to sustaining current production including sustaining capital expenditure. It generally comprises of cash costs (including by-product credits), sustaining capital, exploration expenses, reclamation cost, inventory movement, royalties, selling expenses and general and administrative expenses
"annual mining capacity"	the quantity of ore that a mining operation can be extracted within a year
"annual processing capacity"	the quantity of ore that a processing plant can handle and process each year
"Au"	the chemical symbol for of gold
"CIC"	carbon-in-column process, a gold extraction process which is a gold-bearing cyanide solution through columns filled with activated carbon, where the gold is adsorbed onto the carbon's surface
"CIL"	carbon-in-leach process, a gold extraction process that combines leaching and adsorption. In CIL, activated carbon is added directly to the leaching tanks, allowing gold to be dissolved from the ore and adsorbed onto the carbon simultaneously
"CIP"	carbon-in-pulp process, a gold extraction process where activated carbon is added to a slurry of ground ore to adsorb dissolved gold from a cyanide solution
"concentrate" or "gold concentrate"	a powdery or wet product containing an upgraded mineral content resulting from initial processing of mined ore to remove some waste materials. A concentrate is an intermediary product, which would still be subject to further processing, such as smelting, to effect recovery of metal

"crusher"	a machine for crushing rocks to smaller grain size
"Cu"	the chemical symbol of copper
"cut-off grade"	the grade threshold above which a mineral material is considered potentially economic and is selectively mined and processed as ore
"deposit"	natural occurrence of a useful mineral, or an ore, sufficient in extent and degree of concentration to invite exploitation
"designed mining capacity"	the mining capacity planned based on the mine's design, equipment, and technical parameters
"dilution"	the reduction of grade for mined ore due to the inclusion of waste material in the mined ore
"doré"	unrefined gold bar produced at the mine site or other gold sources before sending to a refinery where the gold is further refined or processed to meet specific requirements
"drilling"	use of a machine to create holes for exploration or for loading with explosives
"exploration"	activity to prove the location, volume and quality of an orebody
"feed grade"	in respect of mineral processing, with reference to the mass of gold in the total mass of the ore fed into the processing mill, and expressed in g/t Au
"flotation"	a process by which some mineral particles are induced to become attached to bubbles of froth and float, and others to sink, so that the valuable minerals are concentrated and separated from the remaining rock or mineral material
"g"	gram(s)
"g/t"	gram(s) per metric tonne — metal concentration
"gold bullion"	refined gold in the form of bars
"gold production" or "gold production volume"	refers to the total amount of gold extracted and processed from mining operations over a specific period, serving as a key indicator of a mining project's performance

"gold recovery"	the percentage of gold recovered compared to the amount of gold contained in the feed ore in the context of a processing plant, or the percentage of gold produced compared to the amount of gold contained in the feed concentrates in the context of a smelting plant
"grade"	ratio of the content of a useful element or its compounds in an ore, for which the greater the content, the higher the grade. For gold, grade is commonly expressed in grams per tonne of ore (g/t Au)
"HPGR"	high pressure grinding rolls, or a type of industrial equipment used to reduce the size of materials, particularly in mining and cement production. They work by compressing materials between two counter-rotating rolls, creating a high-pressure environment that fractures the material
"Indicated Mineral Resource"	is that part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit. Geological evidence is derived from adequately detailed and reliable exploration, sampling and testing gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes, and is sufficient to assume geological and grade (or quality) continuity between points of observation where data and samples are gathered
"Inferred Mineral Resource"	is that part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
"ingot"	a solid block of metal that has been cast into a specific shape for ease of handling, storage, and further processing
"kg"	kilogram(s), the basic unit of mass in the international system of units

"km"	kilometer(s), a metric unit measure of distance equal to 1,000 meters
"Knelson gravity separation"	a method used to recover valuable minerals, particularly gold, from ore using centrifugal force and fluidization where the denser particles are concentrated by the interplay of centrifugal force, fluidization water, and the shape of the concentrator
"koz"	thousand ounces, a unit of weight
"kt"	thousand metric tonnes, a metric unit of weight, being equivalent to 1.0 million kg
"kWh"	kilowatt hours
"LBMA"	London Bullion Market Association, a wholesale over-the-counter market for the trading of gold and silver, which sets gold prices twice daily at 10:30 am and 3:00 pm London BST with the price set in U.S. dollars
"leach"	dissolve minerals or metals out of ore with chemicals
"LOM" or "Life of Mine"	life of mine. It refers to the shortest timeframe that the Ore Reserves of a mine are estimated to be fully utilized after considering the actual situation of the mine and strategic plan of the mining operation. Should the mine owner decide to reduce the mining and processing volume per annum and/or discover additional Ore Reserves, it would take longer time to utilize the Ore Reserves of the mine and the life of mine would be lengthened
"Measured Mineral Resource"	is that part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit. Geological evidence is derived from detailed and reliable exploration, sampling and testing gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes, and is sufficient to confirm geological and grade (or quality) continuity between points of observation where data and samples are gathered

"mineralization"	area with continuous distribution belts of mineralization, including the occurrence of deposits, mine sites and alteration of waste rock, as exploration indicators and under control of same geology conditions. It is a key zone for estimation and further planning of exploration of minerals
"mined resources and reserves"	resources and reserves that have been extracted
"mining rights"	the rights to mine Mineral Resources and obtain mineral products in areas where mining activities are licensed
"Modifying Factors"	see the definition under the JORC Code as set out in "Summary of the JORC Code"
"Mtpa"	million tonnes per year
"open pit mine"	a deposit that is having mined or extracted using open-pit mining
"open-pit mining"	a surface mining technique that extracts minerals from an open pit in the ground. Open-pit mining is the most common method used throughout the world for mineral mining and does not require extractive methods or tunnels. This surface mining technique is used when mineral or ore deposits are found relatively close to the surface of the earth
"ore"	mineral bearing rock which can be mined and treated profitably under current or immediately foreseeable economic conditions
"orebody"	natural mineral accumulations which can be extracted for use under existing economic conditions and using existing extraction techniques
"ore processing" or "processing"	the process which in general refers to the extraction of usable portions of ores by using physical and chemical methods
"ore processed"	the volume of ore that is processed
"ounce(s)" or "oz"	unit of weight for precious metals, and one troy ounce equals 31.1035 grams
"overburden materials"	consists of non-valuable materials such as soil, rock, and vegetation that must be removed to access the underlying mineral deposit during mining operations

GLOSSARY OF TECHNICAL TERMS

"POX"	a method combined approach that concentrates ore through flotation and then subjects it to pressure oxidation, enhancing the breakdown of sulfide minerals and improving metal recovery
"processing recovery"	percentage of metal produced compared to the amount of metal contained in the feed ore in the context of a processing plant, or the percentage of metal produced compared to the amount of metal contained in the feed concentrates in the context of a smelting plant
"Probable Ore Reserve"	is the economically mineable part of an Indicated Mineral Resource and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve. A Probable Ore Reserve has a lower level of confidence than a Proved Ore Reserve but is sufficiently reliable to demonstrate that, at the time of reporting, extraction could reasonably be justified
"Proved Ore Reserve"	is the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors. A Proved Ore Reserve represents the highest confidence category of Ore Reserve estimate and implies a high degree of confidence in geological and grade continuity, and in the Modifying Factors
"refining"	final stage of the metallurgical process of refining crude metal products to a pure or very pure end-product
"rehabilitation"	in the context of mining, the process of returning the land to another productive use or the restoration of land and environmental values to a mine site after the mining has been completed
"R&D"	research and development
"Reserves" or "Ore Reserves"	portion of the measured and/or indicated resources that can be economically mined, which is an estimate after a pre-feasibility study, feasibility study or equivalent technical and economic evaluation, with possible ore losses and depletion, and the reasonable use of conversion factors fully taken into account to make mining technically feasible and economically viable. This contains both probable and proved reserves

GLOSSARY OF TECHNICAL TERMS

"Resources" or "Mineral Resources"	solid Mineral Resources identified by mineral resource exploration, generally reviewed, and expected to be economically minable, which quantity, grade or quality is estimated with reference to geological information, geological understanding and relevant technical requirements including Inferred Resources, Indicated Resources and Measured Mineral Resources
"ROM"	run-of-mine, of or relating to ore that is in its natural and unprocessed state produced from a mine
"SABC"	semi-autogenous ball mill crusher process, a mineral grinding circuit that combines semi-autogenous and ball milling. Ore is initially fed into a semi-autogenous mill, where it is ground using the ore itself and a small amount of steel balls. The partially ground ore is then transferred to a ball mill for pebble crushing with steel balls
"smelting"	pyro metallurgical process of separating metal by fusion from those impurities with which it is chemically combined or physically mixed
"stockpile"	a temporary storage area where mined ore are accumulated before processing, allowing for operational flexibility and continuous workflow
"stope"	an underground excavation from which ore is being extracted
"stoping"	removal of the ore from an underground mine leaving behind an open space known as a stope
"stripping ratio"	the amount of waste that needs to be removed to extract a certain amount of ore, divided by the amount of ore extracted

GLOSSARY OF TECHNICAL TERMS

"Sublevel open stoping method"	a mining method which ore is recovered in open stopes normally backfilled after being mined. Stopes are often large, particularly in the vertical direction. The ore body is divided into separate stopes. Between stopes, ore sections are set aside for pillars to support the hanging wall. Pillars are normally shaped as vertical beams across the ore body. Horizontal sections of ore, known as crown pillars, are also left to support mine workings above the producing stopes
"tailings"	the waste materials (residue) produced by the processing plant after extraction of valuable minerals
"tailings dam", "tailing storage facility" or "TSF"	a storage facility for tailings
"tonne" or "t"	metric tonne, a metric unit of weight, being equivalent to 1,000 kg
"t/d"	tonne per day
"underground mine"	a mine with openings in the earth accessed via shafts and adits below the land surface to extract minerals
"vein"	sheet-like body of minerals formed by fracture filling or replacement of host rock

SUMMARY OF THE JORC CODE

The Mineral Resources and Ore Reserves statements in this Document have been prepared in accordance with the JORC Code. The JORC Code is an internationally accepted Mineral Resources and Ore Reserves classification system established in Australia, which was first published in February 1989 and last revised in December 2012. The JORC Code is commonly used in competent person's report for reporting resources and reserves for public companies reporting to the Hong Kong Stock Exchange. The JORC Code is used by the Competent Person to report the Mineral Resources and Ore Reserves of our mines in this Document.

The JORC Code defines "Mineral Resource" as a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are subdivided in order of increasing geological confidence into the following categories:

- **Inferred Mineral Resource** — is that part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes;

- **Indicated Mineral Resource** — is that part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit. Geological evidence is derived from adequately detailed and reliable exploration, sampling and testing gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes, and is sufficient to assume geological and grade (or quality) continuity between points of observation where data and samples are gathered; and

- **Measured Mineral Resource** — is that part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit. Geological evidence is derived from detailed and reliable exploration, sampling and testing gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes, and is sufficient to confirm geological and grade (or quality) continuity between points of observation where data and samples are gathered.

SUMMARY OF THE JORC CODE

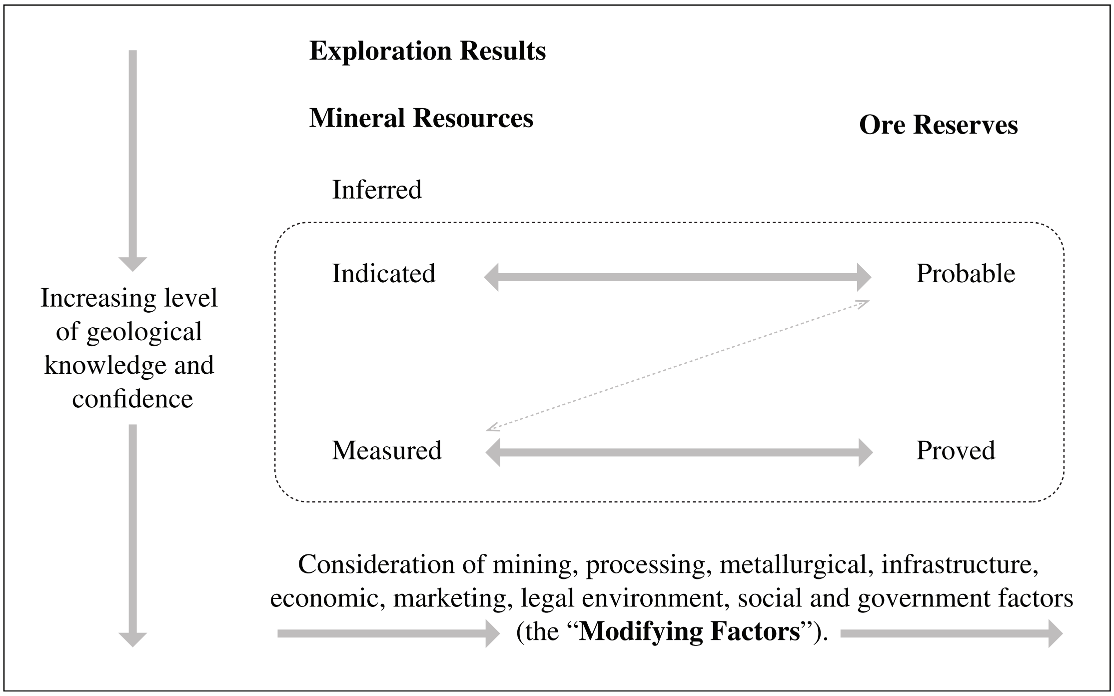
The JORC Code defines "Ore Reserve" as the economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.

Ore Reserves are sub-divided into the following categories:

- **Probable Ore Reserve** — is the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve; and

- **Proved Ore Reserve** — is the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors.

The following diagram summarises the general relationship between Exploration Results, Mineral Resources and Ore Reserves under the JORC Code:



Source: the JORC Code, 2012

SUMMARY OF THE JORC CODE

Ore Reserves are generally quoted as comprising a portion of the total Mineral Resource rather than the Mineral Resources being additional to the Ore Reserves quoted. Under the JORC Code either procedure is acceptable, provided the method adopted is clearly identified. The Competent Person's Reports in this Document report all of the Ore Reserves as part of the Mineral Resources, which are estimated and reported by Competent Person.

FORWARD-LOOKING STATEMENTS

This Document includes forward-looking statements. All statements other than statements of historical facts contained in this Document, including, without limitation, those regarding our future financial position, our strategies, plans, objectives, goals, targets and future developments in the markets where we participate or are seeking to participate, and any statements preceded by, followed by or that include the words "believe," "expect," "estimate," "predict," "aim," "intend," "will," "may," "plan," "consider," "anticipate," "seek," "should," "could," "would," "continue," or similar expressions or the negative thereof, are forward-looking statements. These forward-looking statements involve known and unknown risks, uncertainties and other factors, some of which are beyond our control, which may cause our actual results, performance or achievements, or industry results, to be materially different from any future results, performance or achievements expressed or implied by the forward-looking statements. These forward-looking statements are based on numerous assumptions regarding our present and future business strategies and the environment in which we will operate in the future. Important factors that could cause our actual performance or achievements to differ materially from those in the forward-looking statements include, among other things, the following:

- our ability to successfully implement our business plan and strategies;
- our business strategies, operating plans and objectives;
- the amount and nature of, and potential for, future development of our business;
- our dividend policy;
- our expectations with respect to our ability to acquire and maintain regulatory licenses or permits;
- our financial condition and performance;
- various business opportunities that we may pursue;
- our ability to identify and successfully take advantage of new business development opportunities;
- our ability to identify and integrate suitable acquisition targets;
- our ability to control or reduce costs;
- our ability to identify, measure, monitor and control risks in our business, including our ability to improve our overall risk profile and risk management practice;
- the actions and developments of our suppliers, customers and competitors;

- future developments, trends and conditions in the industry and markets in which we operate;
- general economic, market and business conditions in Hong Kong, the PRC and overseas;
- changes in the regulatory and operating conditions in the industry and markets in which we operate;
- exchange rate fluctuations and restrictions;
- capital market(s) developments; and
- the other risk factors discussed in this Document as well as other factors beyond our control.

Additional factors that could cause actual performance or achievements to differ materially include, but are not limited to, those discussed in "Risk Factors" and elsewhere in this Document. We caution you not to place undue reliance on these forward-looking statements, which reflect our view only as of the date of this Document. You should read this Document in its entirety and with the understanding that the actual future results may be materially different from what we expect. Subject to the requirements of applicable laws, rules and regulations, we undertake no obligation to update or revise any forward-looking statements, whether as a result of new information, future events or otherwise. In light of these risks, uncertainties and assumptions, the forward-looking events discussed in this Document might not occur in the way we expect, or at all. All forward-looking statements contained in this Document are qualified by reference to the cautionary statements set out in this section as well as the risks and uncertainties discussed in "Risk Factors".

RISK FACTORS

Prospective [REDACTED] should carefully read and consider all the information set out in this Document. In particular, you should evaluate the risks and uncertainties described below before making any investment in the [REDACTED]. This includes (without limitation) the fact that we conduct our operations outside of Hong Kong, and the legal and regulatory environment which, in some respects, may differ from that in Hong Kong. Any of the risks and uncertainties listed below could have a material adverse effect on our business, results of operations, financial condition, or on the trading price of the [REDACTED] (causing them to decline significantly) and could cause you to lose all or part of your [REDACTED]. Additional risks and uncertainties not presently known to us or that we currently deem immaterial could also harm our business, results of operations, financial condition, or on the trading price of the Shares. Past performance is no guarantee of future results.

RISKS RELATED TO OUR BUSINESS AND INDUSTRY

Volatility in gold price could materially and adversely affect the profitability of our business, financial condition, results of operations and the cash flows.

Gold is our primary source of revenue. There are many factors influencing the price of gold, including, among others, major central banks' monetary policies, geopolitical conflicts, general global economic conditions, inflationary expectations, fluctuations in the exchange rate of the US dollar, fluctuations in the stock and other financial markets and other political, military, social and economic contingencies. These factors are beyond our control. In particular, the persistent gold-buying behavior of major central banks, especially the substantial purchases by emerging market central banks, has provided strong support for gold prices. Meanwhile, the uncertainty of the global economy, including the anticipated changes in interest rate policies and fiscal dynamics, particularly the uncertainty surrounding the US budget process, has further enhanced the appeal of gold as a safe-haven asset. Between 2010 and 2024, the global annual average gold prices demonstrated an upward trend with fluctuations and reached US$2,386.4 per ounce in 2024, according to London Bullion Market Association (LBMA) Gold Price.

Although the price of gold remained high in 2024 and the first half of 2025, there can be no assurance of the risk of volatility in gold prices in the future. The gold prices in recent years have been gradually increasing and have generally had a positive impact on our financial performance. However, there is no assurance that the prices will remain at such levels and any decrease in the price of gold may materially and adversely affect our business, financial condition and results of operations. Decline in gold prices may also result in greater pressure on our production and operations.

We operate in a number of countries and may also face geopolitical and country risks arising from our operations.

We own or operate gold mines in different regions, namely Colombia, Tajikistan, Australia, Kyrgyzstan, Guyana, Suriname and Ghana, and we hold minority equity interest in a gold mine in Papua New Guinea. Gold mining operations across these diverse geopolitical landscapes expose us to a range of country-specific risks that could materially and adversely affect our business, financial condition and results of operations. These risks include, without limitation, (a) political and social dynamics on the mining sector (including any community opposition), which may often lead to regulatory changes and shifts in government policies balancing different causes and initiatives such as economic and infrastructure development and environmental protection. These dynamics would have an impact on environmental regulations, labor laws and indigenous rights, and would in turn affect compliance costs and our profitability; (b) security concerns in certain regions, which may in turn pose risks to personnel and assets; (c) complex legal and regulatory environment, which may become difficult to navigate due to a lack of transparency; (d) infrastructure limitations, such as inadequate transportation and energy supply, which may in turn hinder operational efficiency and increase costs; (e) civil unrests, which could disrupt mining operations and supply chains; and (f) illegal mining activities and land disputes, which can further pose operational risks to our operations.

Other potential risks that may add to the complexity of operating in these regions include but are not limited to: mining royalty and various tax increases or claims by governmental bodies, expropriation or nationalization, foreign exchange controls, trade disputes, high rates of inflation, extreme fluctuations in currency exchange rates and commodity prices, credit risks, import and export regulations which may impose trade restrictions, cancellation or renegotiation of contracts, environmental and permitting regulations, illegal mining operations by third parties on our properties, labor unrest, surface access issues and change in taxation. We only have political risk insurance coverage against these risks in certain jurisdictions where we operate, and there is no assurance that the coverage of such insurance is sufficient to guard us against the risks exposed to us. See "— We may not be adequately insured against losses and liabilities arising from our operations."

In general, current and future operations may also expose us, and may further expose us, to various risks associated with conducting business in foreign countries and territories, such as, among other risks, (a) an increase in competition from local or international competitors or failure to anticipate changes to the competitive landscape in global markets; (b) material disputes between local government authorities, the employees or contractors and us in connection with the performance of a party's obligation or the scope of a party's responsibilities under relevant agreements; (c) difficulties and costs associated with complying with, and enforcing remedies under, a wide variety of complex domestic and international laws, treaties, regulations, and rules, including but not limited to local environmental and labor laws and regulations; (d) inability to obtain or maintain the requisite licenses, permits, approvals and certificates in foreign jurisdictions; (e) economic sanctions, trade restrictions, trade barriers such as imposition of tariffs, discrimination, protectionism or unfavorable policies against Chinese companies; (f) potential loss of key employees, and difficulties with staffing and managing operations after localization, including with respect to compliance with local labor laws; (g) exposure to litigation or third-party claims outside of the PRC or Hong Kong, including labor disputes; (h) uncertainties in the interpretation and application of tax laws and regulations, more onerous tax obligations and unfavorable tax conditions; (i) potential disputes with, and loss of, international customers or other parties we work with; (j) cultural differences and language barriers; (k) infringement of our intellectual property rights in foreign jurisdictions; and (l) lack of a well-developed legal system in certain foreign jurisdictions in which we conduct our business, which may create difficulties in the enforcement of our legal rights or enforcement conflicts which may cause our non-compliance.

Our inability in determining the potential impact of these risks on our future financial position or results of operations, and any changes, if any, in mining or investment policies or shifts in political attitude in these regions, may affect our exploration, mining, processing and sales activities, which may materially and adversely affect our financial condition, results of operations and prospects.

We are subject to risks and uncertainties relating to our historical and future acquisitions and investments and establishing joint ventures, and we may fail to successfully implement our expansion strategies and integrate them with our existing business.

Our gold assets and investments were acquired historically. We have entered and may from time to time enter into strategic acquisitions and investments with third parties in the mining industry if suitable opportunities arise. We have established joint ventures and may establish more joint ventures with third parties if we believe that the joint venture will complement our expansion strategies.

The success of our existing and future joint ventures depends on a number of factors, including the financial resources of the other shareholders and joint venture partners, their willingness and ability to honor their commitments under the joint venture agreements, the manner in which they exercise control, veto or other governance rights in respect of the joint venture, and the extent to which they cooperate in operational and strategic decisions with respect to the relevant mine. If we become engaged in material disagreements with our joint venture partners, the operational and financial results of the underlying mines may be adversely affected. In addition, we may face difficulties in assimilating or failure to integrate operations, technologies, production procedures and management of employees of these projects.

Any strategic acquisition, investment and joint ventures with third parties could subject us to a number of risks, including risks associated with sharing proprietary information and a reduction or loss of control of operations that are material to the business. We may also make strategic divestitures of our assets or restructure our business operations. We may raise additional financing through the divestiture of our stakes in any business. Moreover, strategic acquisitions, investments and joint ventures may be expensive to implement and subject us to the risk of non-performance by a counterparty, which may in turn lead to monetary losses that may materially and adversely affect our business. If we cannot successfully integrate acquisitions, investments, joint ventures and other partnerships on a timely basis, we may be unable to generate sufficient revenue to offset acquisition costs, may incur costs in excess of what we anticipate, and the expectations of our future results of operations and synergies may not be achieved. In addition, the results of operations may be materially and adversely affected if we are unable to improve the efficiency of our operations.

Acquisitions may also involve substantial risks, including, but not limited to: mineral ore bodies that may not meet expectations; higher costs of integration than we anticipated; unforeseen difficulties in integrating operations, accounting systems and personnel of any acquired companies, realizing anticipated synergies and maximizing the financial and strategic position of the combined enterprise, and maintaining uniform standards, policies and controls; provision and implementation of financial undertakings to local authorities; mandatory requirements of share issuance and dividends distribution to local authorities; uncertainty of timeline as to the update of ownership of mining titles after completion of acquisition; inability to manage the newly acquired entities due to new operating and regulatory requirements; diversion of financial and management resources from existing operations; uncertainty as to whether investment opportunities or initiatives are identified and assessed accurately in terms of the likely benefits, commercial viability and technical feasibility of such initiatives; insufficiency of experience in managing or operating such investments, which may increase the need to recruit additional personnel with suitable experience and/or cause the investments to fail to achieve the intended commercial benefits or the level of economic returns or at all; failure to attract and retain management and key employees; unforeseen difficulties related to entering geographic regions or markets where we do not have prior experience; failure to obtain sufficient equity or debt financing; potential undisclosed liabilities, litigation or other proceedings; the loss of key customers or suppliers; disputes or breaches by our joint venture partners or strategic business partners, or the inability of our joint venture partners or strategic business partners to fulfill contractual obligations due to their businesses or financial condition; uncertainty of financial condition of the joint venture partners; and difficulties in obtaining various governmental approvals.

In particular, the Company completed the acquisition of Ghana Akyem Gold Mine in April 2025. As of the Latest Practicable Date, two mining leases which had been renewed by the Ministry of Lands and Natural Resources of Ghana in January 2025 are in the process of being ratified by the Parliament of Ghana as required by the Ghanaian Constitution. As advised by our Ghana Legal Advisor, it is not uncommon practice for the ratification process of Parliament to take years and for mining companies with ongoing mining operations to continue mining operations based on a renewed mining lease which is pending ratification by Parliament. They are also not aware of any precedent in which a mining company has been subject to regulatory enforcement action solely on the basis of continuing mining operations prior to the ratification of its renewed mining lease. Therefore, the risk of enforcement action against the Company for continuing operations while ratification is pending is generally considered to be low.

However, it remains uncertain when such mining lease will be ratified, or whether it will be ratified at all. See "— We are subject to license period of mining rights and may fail to obtain, retain or renew the government permits, licenses and approvals required for our mining and exploration activities."

Any of the above factors could lead to, among other things, business disruptions, increased costs and losses, which could have a material and adverse effect on our business, financial condition, results of operations and overall growth. In particular, current and future geopolitical tensions globally and political tensions in the jurisdictions we operate could materially and adversely affect our existing business and future strategies. We cannot assure you that we can effectively manage or acquire the projects to expand or sustain our business development. In the event that we are unable to successfully acquire or manage projects, it may materially and adversely affect our business, financial condition and results of operations.

Our business is subject to a number of operational risks and hazards specific to the mining industry, which may result in increased costs or losses, personal injuries or casualties, damage to reputation, suspension of operations and other penalties.

Our operations are subject to a number of operational risks and hazards specific to mining industry, some of which are beyond our control and cannot be completely eliminated through prevention efforts. Mining, processing and exploration activities are typically exposed to elements of significant risks and hazards, including, but not limited to, (i) mining risks; (ii) occupational risks; (iii) legal and regulatory risks; (iv) infrastructure and equipment risks; and (v) environmental, social, health and safety risks.

Mining Risks. Risks and hazards commonly associated with mining operations include: unexpected maintenance or technical problems; interruptions to our mining operations due to hazardous weather conditions and natural disasters, such as floods, including, but not limited to, surface and underground flooding, landslides and earthquakes; electricity or fuel supply interruptions; critical equipment failures in our mining, processing and production operations; the handling and storage of certain dangerous substances and the use of heavy machinery; unusual or unexpected variation in the mine and geological or mining conditions, such as instability of the slopes and subsidence of the working areas; seismic events; exposure to health-related hazards, such as inhalable dust, silicosis and noise; surface or underground fires and explosions, including those caused by flammable gas or in connection with blasting; cave-ins, blockages, wall collapses or gravity induced falls of ground; discharges of gases and toxic substances; releases of radioactivity; electrocution; falling from height; accidents related to the presence of mobile machinery, including underground trains and shaft conveyances; industrial accidents, including, but not limited to, accidents and conditions resulting from drilling, blasting and removing and processing material which would also include, but is not limited to, the inhalation of dust and noise induced hearing loss; human errors and conduct; environmental degradation, including pollution of ground and surface water, air or soil; environmental issues, including production disruption due to weather conditions; and other accidents or conditions resulting from mining activities, such as blasting and the transport, storage and handling of hazardous materials.

Occupational risks. Our operations involve the handling and storage of explosives and other dangerous articles. Although we have set stringent rules in relation to the handling of such dangerous articles, which comply with the relevant laws, regulations and policies in the jurisdictions in which we operate, there is no assurance that accidents will not occur and our operations would not be disrupted or suspended in relation to occupational hazards and production safety. Should we be liable for such accidents, we may be fined and criminal liabilities may be imposed on our employees. In addition, due to the geographic setting and relatively high elevation difference, there is a possibility of localized mud-rock flow which may occur during the rainy season, and a risk of instability of the slopes and subsidence of the working areas. As certain of our mining process requires the use of explosives, any improper storage or use of these materials could result in personal injury or death and other damages.

The above risks and hazards may result in personal injury, damage to, or destruction of, properties or production facilities, environmental damages, business interruptions and damage to our business reputation. Further, dust emission from our production process may adversely affect the health of our on-site employees and in extreme cases, it may cause pneumoconiosis or other occupational diseases.

Legal and regulatory risks. As an integrated gold mining company engaged in mining, processing and exploration, we are subject to extensive laws, rules and regulations imposed by the governments in the respective jurisdictions in which we operate. For more details, see "— We are subject to government regulations on the mining industry."

Infrastructure and equipment risks. Our infrastructure and facilities may contain design defects, and the success of commissioning and trial production may not guarantee smooth formal production in the future. The breakdown or modification of the facilities may delay the production and incur significant costs. In addition, we may experience in the future increased costs of production arising from compliance with production safety laws and regulations. See "— Our operations may face risks in relation to production delays and increased production costs resulting from design defects, production safety and occurrence of accidents."

Environmental, social, health and safety risks. The mining industry is inherently susceptible to work-related injuries and industrial and mining accidents. Such incidents may also result in breaches of the conditions for our mining and exploration licenses or any other approvals, permits or authorizations, which may result in fines and penalties or even potential revocation of such licenses, approvals, permits and authorizations. There can be no assurance that accidents will not occur at our operations in the future despite our efforts to comply with safety protocols and applicable laws and regulations. If we fail to comply with any relevant laws, regulations or policies or if any accident occurs, our reputation, business, financial condition and results of operations may be adversely affected, and we may be subject to penalties, civil liabilities, and/or criminal liabilities. Moreover, our operations may be affected by accidents of third parties. In addition to adversely affecting our business and results of operations, safety accidents in the region may also adversely affect our reputation.

Finally, our operations are subject to health and safety and production safety legislation which imposes duties and obligations on the employer to ensure, amongst other things, a working environment which is healthy and safe, as far as is reasonably practicable. In terms of the health and safety legislation, an employer may be subject to significant penalties and/or administrative fines for non-compliance. Depending on the particular circumstances, litigation (criminal and/or civil) may be instituted against the employer in respect of an accident, dangerous occurrence or health threatening occurrence which has resulted in the death of an employee (or contractor staff). In terms of production safety laws or regulations, in case of failure to comply with these regulations, we would be required to suspend our operations, rectify the non-compliance within a limited period and/or pay fines. Failure to rectify any problem could lead to suspension of our operations and fines as well. In addition, accidents may arise due to various reasons, such as the mishandling of dangerous articles in our operations. Any changes to the health and safety laws which increase the burden of compliance on the employer and impose higher penalties for non-compliance may result in further significant costs for us.

We are subject to uncertainty in the results of exploration, and we may not be able to expand or replenish our mineral resources and reserves through further exploration. Failure to discover new reserves, maintain or enhance existing reserves, develop new operations or expand our current operations could adversely affect our business and results of operations.

Resources and reserves are non-renewable, and the exploration of new and potential resources is crucial to a mining enterprise. Exploration of mineral resources bears uncertainties, and therefore substantial expenses may be incurred from initial drilling to production. The success of any mining exploration program depends on various factors including, among other things, (i) whether ore bodies can be located; (ii) whether the location of ore bodies are economically viable to mine; (iii) whether appropriate metallurgical processes can be developed and appropriate mining and processing facilities can be economically constructed; and (iv) whether necessary governmental permits, licenses and consents can be obtained.

In order to maintain gold and other non-ferrous metal production beyond the life of the current proved and probable reserves, we must identify further reserves capable of economical exploitation. However, due to the unpredictable and speculative nature of our industry, there is also no assurance that any exploration can lead to the discovery of economically feasible reserves. If we fail to replenish our mineral resource levels in existing or new mining areas, we may not be able to maintain the current production levels after the remaining usable life of the existing mining areas lapses. As we primarily engage in the exploration, mining, processing, refining and sales of gold globally, our sustainable development relies on our ability to expand upstream resources by acquiring exploration and mining rights worldwide and our ability to replenish resources and reserves with quality ores. Further, other mining enterprises may compete with us in terms of acquiring mining resources. Such competition may make it more difficult for us to acquire new resources. There is no assurance that we will be able to continue acquiring mining resources in the future.

To access additional reserves in explored areas, we will need to successfully complete development projects, including extending existing mines and developing new mines. We typically conduct feasibility studies to determine whether to undertake significant construction projects. Actual results may differ significantly from those anticipated by our feasibility studies. In addition, there are a number of uncertainties inherent in the development and construction of any new mine or an extension to an existing mine, including: (i) the availability and timing of necessary governmental approvals; (ii) the timing and cost necessary to construct mining and processing facilities, and the availability and cost of smelting and refining arrangements; (iii) the availability and cost of labor, utilities, auxiliary materials and other supplies and the accessibility of transportation and other infrastructure; and (iv) the availability of funds to finance construction and production activities.

Furthermore, the future mining and development in the areas currently covered by exploration licenses is subject to further government approvals. There can be no assurance that our future plan to expand our mineral resources and reserves will succeed. Such plans may be delayed or adversely affected by various factors, including, but not limited to, failure to obtain relevant regulatory approvals, failure to secure sufficient financing to fund our expansion and production, the occurrence of geotechnical difficulties, constraints on managerial, operational, technical and/or other resources, and the incurrence of higher-than-expected operational costs.

In addition, to the extent we participate in the development or operation of a project through a joint venture or any other multi-party commercial structure, there could be technical, legal or other disagreements, or divergent interests or goals among the parties, which could jeopardize the success of the project. In addition, if a viable deposit is discovered, it could take us several years and a large amount of capital expenditure from the initial phases of exploration to production commencement, during which time the presumed market price of gold may change, and the capital cost and economic feasibility of such deposit may change. There is also no assurance that we will have, or be able to raise, the required funds to engage in these activities or to meet our obligations with respect to any exploration properties in which we have or may acquire an interest. Furthermore, there can be no assurance that reported resources will be converted into reserves, and actual results upon production may materially differ from those anticipated at the time of discovery. In the event we fail to replace our depleted resources and reserves, to expand our resources or reserves base or our future expansion plans are delayed or fail to deliver the expected economic benefits, our business, financial condition, results of operations and future growth may be materially and adversely affected.

Illegal mining, gold theft and robbery may occur on some of our properties. These activities are difficult to control and can disrupt our business and expose us to liability.

Illegal mining activities, theft and robbery of gold bearing materials and production inputs are common in the industry and may occur on our properties. Illegal mining is mining activity that is carried out without land rights, mining license, exploration or transportation permit, or any document that can legitimate the ongoing operations. It is generally associated with a number of negative impacts, including poor working practices, corruption, child labor and human trafficking. Effective local government administration is often lacking in the locations where illegal miners operate because of rapid population growth and the lack of functioning structures which can create a complex and unstable social environment. Activities of the illegal miners may cause pollution or other damage to our properties, including, for example, underground fires, or personal injury or death, for which we may potentially be held liable. Illegal miners are often assisted by a syndicate of employees of legal mining operations. Consequently, in the event that our employees are found to be assisting illegal miners, we will be required to dismiss all implicated employees and this may result in labor unrest. Illegal mining activities could also result in depletion of mineral deposits, potentially making the future mining of such deposits uneconomical. The presence of illegal miners could lead to project delays and disputes regarding the development or operation of commercial gold deposits.

There are illegal mining activities in and around our Colombia Buriticá Gold Mine. In our view, the Colombian government has failed to provide our Colombia Buriticá Gold Mine with full protection and security and fair and equitable treatment in accordance with its obligations under the Canada-Colombia Free Trade Agreement. Any theft or robbery of gold may reduce the amount of gold that we are able to recover from our operations. Rising gold prices may increase the likelihood of such thefts or robbery occurring. There can be no assurance that our security measures will effectively prevent illegal activities — which may be committed by third parties, employees or former employees — from happening in the future, or, in such case, that our insurance will be adequate to recover part or all of our loss (if any). Illegal mining, gold theft and robbery could result in the loss of reserves, mine stoppages, and have a material and adverse effect on our business, results of operations and financial position.

We are subject to license period of mining rights and may fail to obtain, retain or renew the government permits, licenses and approvals required for our mining and exploration activities.

Our right to exploit mineral deposits is governed by the laws and regulations of the jurisdictions in which our mining properties are located. In the countries in which we operate, the formulation or implementation of governmental policies and the exercise of legislative discretion by governmental authorities on certain issues may be unpredictable. This may include changes in laws relating to mineral rights and ownership of mining assets and the right to prospect and mine, and, in extreme cases, nationalization, expropriation, nullification or orders to dispose of existing rights, concessions, licenses, permits, agreements and/or contracts. In addition, in relation to mining operations in the regions where we operate, we may be required to obtain or renew mining rights for conducting mining activities in a specific mining area and other necessary regulatory approvals during the relevant license period. Our ability to carry out our business operations is subject to our ability to obtain and retain necessary approvals, licenses and permits from relevant governmental authorities and to renew them when they expire.

We generally cannot exploit the entire mineral resources of any of our mines during the initial license period. We apply to the appropriate authorities for a renewal when such licenses or permits are about to expire. For example, we have applied to renew one of our mining leases of the Australia Norton Gold Mine which will expire in October 2025. As such, we have already started the process of seeking the necessary regulatory approvals for this renewal. As of the Latest Practicable Date, we are in ongoing discussion with certain Australian authorities to seek to complete the renewal process prior to the relevant expiry date. If we we fail to renew our mining rights upon expiry or we cannot effectively utilize the resources within the license period specified in the relevant mining rights, our business, financial condition and results of operations may be adversely affected.

Even if we meet the substantive and procedural conditions and legal requirements stipulated in the relevant laws and regulations, we may not be able to obtain or renew such approvals, licenses or permits; comply with all conditions requested or imposed by governmental authorities to maintain those permits from time to time; or obtain, retain or renew other approvals, licenses and permits necessary for our business operations in the future, either in respect of our existing mines or at any mines we may operate in the future. In addition, when we obtain or renew such approvals, licenses or permits, despite meeting all substantive and procedural conditions and legal requirements, the review process may be prolonged or delayed. In addition, the granting of such approvals, licenses or permits may also be subject to ratifications or approvals by governmental authorities, political bodies or local parliaments or legislative institutions, the process of which may also be prolonged and delayed.

As of the Latest Practicable Date, certain applications filed by us in relation to expired licenses remained pending. We have obtained legal advice that such licenses or leases yet to be renewed will continue to be in force pending the renewal decision, or that the risk of us not being able to continue our ongoing mining operations under the existing lease or license until the new lease or license is ratified or granted by the applicable governmental authority and/or parliamentary body is low. Nonetheless, it remains uncertain as to whether such licenses or leases would be renewed in time or at all (and if renewed, whether such renewals may be subject to onerous conditions), which might have a material adverse effect on our operations or result in the loss of the relevant tenure.

In some of the countries in which we operate, in addition to the applicable licenses or leases being renewed, there are other necessary regulatory approvals which must be obtained, for instance, under foreign investment laws, to permit us to continue to hold these licenses or leases and conduct our ongoing operations. To the extent that any such regulatory approvals are outstanding, it remains uncertain as to whether they will be obtained in time or at all (and if obtained, whether such approvals may be subject to onerous conditions), which might have a material adverse effect on our operations or result in the loss of the relevant tenure.

There can be no assurance that we will at all times maintain or act in compliance with our existing permits by the relevant governmental authorities. In addition, we may require new permits, licenses and/or approvals from time to time. Changes in local laws, regulations and policies, including those with respect to environmental protection and mining and exploration activities, are outside of our control may affect our ability to obtain timely renewals for such permits, licenses and/or approvals, and during such time we may be compelled by law or regulators to cease mining and exploration activities in accordance with the relevant laws and regulations. Any failure to obtain, retain or renew, or any delay in obtaining or renewing, such approvals, licenses or permits could subject us to a variety of administrative penalties or other government actions and adversely impact our business, financial condition and results of operations.

Our reserve estimates and gold production estimates are based on a number of assumptions, which, if changed, may require us to lower our estimates. We may not be able to achieve our production estimates.

Our Mineral Resources and Ore Reserves estimates are based on a number of assumptions. Neither Mineral Resource estimates, nor Ore Reserve estimates, are precise calculations. Ore Reserve estimates are based on available assumptions and considerations on extraction of Measured and Indicated Mineral Resources; and the Mineral Resources estimates are dependent on the interpretation of limited information on the location, shape and continuity of the occurrence and on the available sampling results. The accuracy of the estimates depends on the quantity and quality of available data, the assumptions made, and the judgments used in engineering and geological interpretation, which in each case may prove to be unreliable.

The Ore Reserves estimates contained in this Document represent the tonnage and grade of gold and other Mineral Resources that we believe can be economically mined and processed and are estimated based on a number of economic and technical assumptions, including, among other things, currency exchange rates, dilutions, metallurgical and mining recovery assumptions, many of which are beyond our control. Ore Reserves estimation is a time-related behavior and activity, and the Ore Reserves presented in this Document has reflected the considerations and assumptions made being valid on the date of the Competent Person's Report. There is no assurance that our estimates will prove accurate or that the Ore Reserves can be mined or processed profitably. For details, see "Appendix III — Competent Person's Reports."

In addition, compared to Measured or Indicated Mineral Resources, Inferred Mineral Resources have a greater amount of uncertainty as to their existence and as to whether they can be mined economically as such Mineral Resources are inferred from geological evidence and assumed but not verified. We cannot assure you that all or part of the Inferred Mineral Resources will ever be upgraded to a higher category. No Inferred Mineral Resources have been included in LOM plan presented in this Document.

The inclusion of Mineral Resources estimates should not be regarded as a representation that all these amounts can be economically mined or processed, and nothing contained in this Document should be interpreted as assurances of the economic viability of the mines that we hold mining licenses or exploration permits to or the profitability of our future operations. A reduction of our Mineral Resources or Reserves, including due to any of the above could have a material adverse effect on our business, financial condition and results of operations.

In addition, our ability to achieve the estimated gold production volume is subject to a variety of risks and uncertainties that could materially affect our operations. These include, but are not limited to, operational challenges such as equipment failures, labor disputes and adverse weather conditions, as well as risks and hazards of the types discussed elsewhere in this Document, which may disrupt our mining activities. Additionally, geological uncertainties, including unexpected variations in ore grade and mineral reserves, could lead to discrepancies between projected and actual production levels. Compliance with environmental regulations and obtaining necessary permits may also impact our production capabilities, as delays or changes in regulatory requirements could hinder our operations. Furthermore, fluctuations in gold prices and demand may necessitate adjustments to our production plans, potentially resulting in lower output than anticipated. Supply chain disruptions, technical and engineering risks, and financial constraints are additional factors that could adversely affect our ability to meet production targets. As a result, there can be no assurance that we will achieve our estimated gold production volume, which could have a material adverse effect on our future cash flow, business, financial condition and results of operations.

Our operations may face risks in relation to production delays and increased production costs resulting from design defects, production safety and occurrence of accidents.

Our infrastructure and facilities may contain design defects which may not guarantee the success of commissioning and trial production for smooth operation in the future. By the same token, our operations may be faced by ageing infrastructure, unplanned breakdowns and stoppages that may result in production delays, increased costs and industrial accents. Once shafts reach the end of their planned lifespan and begin operating under extended LOM conditions, additional maintenance, condition monitoring and care is required. Although we have comprehensive strategies in place to address these issues, incidents resulting in production delays, increased costs or industrial accidents may occur. Such incidents may have a material adverse effect on our business, financial condition and results of operations.

Similarly, the breakdown of facilities or machinery (and the downtime required to fix or modify such facilities or machinery) may delay the production and incur significant costs. We and our third-party contractors may encounter accidents, technical difficulties, mechanical failure or breakdown in mining, processing and exploration activities, as well as possible flooding, mudslides, instability of the slopes, and subsidence of the working areas and the like due to severe weather conditions and natural disasters.

In addition, as we increasingly conduct mining at greater depths, we may face higher operational risks associated with deep underground mining, including, but not limited to, increased stress on our mining structures, increased temperatures and ventilation difficulties, higher risk of rock bursts and seismic activities that may affect the operation and safety of our mines. Deeper mining will require us to enhance our mining infrastructure, methods and techniques, and devote more manpower and utilities to our mining activities, which will increase our costs. For example, from time to time our mines may be adversely affected by severe weather conditions as the climate, terrain and vegetation may be conducive to naturally occurring fires.

Furthermore, our operations rely on the existence and maintenance of appropriate and adequate infrastructure, including, but not limited to, the continuous and stable supply of power, at our mining concessions and surrounding areas. As a result, our operations may be adversely affected where such infrastructure ceases to exist or fails to be properly maintained by the local authorities and/or third parties. This may be beyond our control, and such risks cannot be completely eliminated through prevention efforts.

Our employees and our contractors may encounter accidents, technical difficulties, mechanical failure or breakdown during the mining and production processes, as well as manmade and natural disasters beyond our control. There can be no assurance that accidents will not occur in the future. The occurrence of accidents may disrupt or suspend our operations, increase production costs, result in liability to us and harm our reputation. Such incidents may also result in breaches of the conditions for our mining licenses or any other approvals, licenses or authorizations, which may result in fines and penalties or even possible revocation of such permits, approvals, licenses and authorizations.

We cannot assure you that safety accidents will not occur at our gold mines in the future. See "— Our business is subject to a number of operational risks and hazards specific to the mining industry, which may result in increased costs or losses, personal injuries or casualties, damage to reputation, suspension of operations and other penalties" for further details.

The failure of tailings storage facilities could adversely impact our business, reputation and results of operations.

Mining companies face inherent risks in their operation of tailings storage facilities. Tailings storage facilities are structures designed and managed to contain fine mining waste, known as "tailings." Tailings are a by-product of mining, consisting of the processed rock or soil left over from separating the commodities of value from the rock or soil within which they occur. However, the use of tailings storage facilities expose us to certain risks that could be detrimental to operations, the environment, and/or public health and safety that may arise from some present process or future event. Tailings storage facilities designed as upstream raised facilities may present greater risk, particularly where the facility is located in a high seasonal rainfall area or an area of high seismic activity. When tailings storage facilities fail, the consequences can be catastrophic for communities, local economies and the surrounding environment. The occurrence of dam failures and environmental leakage incidents at one of our tailings storage facilities could also lead to the loss of human life and/or extensive property and permanent environmental damage, leading to the need for a large expenditure on contingencies and on recovering the regions and people affected, and the payment of penalties, fines or other monetary damages.

Tailings facilities are in a near-constant state of change, from initial construction, during operations and until closure. This presents a significant challenge in reviewing and assessing their safety, requiring a multi-faceted program with multiple levels of safety assessment in order to be effective. We maintain measures to manage our dams' safety, including adoption of new safety measures and undertaking routine reviews by independent international consulting companies. While we have tailings facilities in place in each of the gold mines we own or operate, there can be no assurance of the effectiveness of our designs or the construction quality of the tailings storage facilities, or that any monitoring throughout the operations of the tailings storage facilities will identify any safety concerns. Nor can there be any assurance that any of the measures that have been put in place to safeguard our tailings storage facilities will prevent the failure of one or more of them, or that such potential failure will be detected in advance. We also cannot assure you that our operating partners maintain similar safety precautions or monitoring systems on their tailings storage facilities.

The failure of a dam at a tailings storage facility could lead to multiple legal proceedings and investigations, which could include class action lawsuits, criminal proceedings and public civil actions (against us, any of our subsidiaries and/or individuals) for significant amounts of damages.

As a result of any dam failures, additional environmental, health and safety laws and regulations may be forthcoming globally, including in the regions where we operate, which may ban or curtail any storage of wet tailings or the construction or use of upstream tailings storage facilities. In addition, changes in industry standards, laws and regulations may impose more stringent conditions in connection with the licensing process of projects and operations and increased criminal and civil liability for companies, officers and contractors. For example, on August 5, 2020, the International Council on Mining and Metals, the United Nations Environment Programme (UNEP) and the Principles for Responsible Investment (PRI) established an international tailings standard, the Global Industry Standard on Tailing Management (GISTM).

The occurrence of any of the above mentioned such risks could have a material and adverse effect on our business, financial condition and results of operations.

Our operations are exposed to risks relating to environmental protection and rehabilitation.

Operations of gold mines are subject to environmental risks and hazards. We are subject to environmental laws and regulations, such as the treatment and discharge of hazardous wastes and materials. These laws and regulations set a series of standards for waste substances that may be discharged into the environment, and impose fees for the discharge of such waste substances. We are required to conduct our mining operations in a manner that minimizes the impact on the environment.

Environmental hazards may occur in connection with our operations as a result of human negligence, force majeure or otherwise. As advised by local legal counsel in the regions we operate, we did not have any material incidents of non-compliance with the environmental laws and regulations at our mines that resulted in material penalties during the Track Record Period. We cannot assure you that our operations will not have environmental risks or hazards in the future. The occurrence of any environmental hazards may delay production, increase production costs, cause personal injuries or property damage, result in liability to us and damage our reputation. Such incidents may also result in breaches of the conditions for our mining and exploration licenses or other approvals, licenses or authorizations, which may result in fines or penalties, impact the renewal of our existing permits, approvals, licenses and authorizations, or even lead to possible revocation of such permits, approvals, licenses and authorizations.

We may experience increased production costs arising from compliance with environmental laws and regulations. Moreover, there is a heightened awareness of environmental protection. As a result, it is possible that more stringent environmental laws and regulations may be implemented in the future, or the existing environmental laws and regulations may be more strictly enforced. We may not always be able to comply with future laws and regulations in relation to environmental protection and rehabilitation economically, or at all. Should we fail to comply with any such laws and regulations, we may be subject to penalties and liabilities under the relevant local laws and regulations, including but not limited to warnings, fines, suspension of production and closure of the facility that fails to comply with the relevant environmental standards.

Maintaining and increasing compliance with ESG standards and implementing initiatives to sustain our care for local communities and building our reputation could increase our operational costs.

Mining is essentially geotechnical engineering. Mining development can be highly synergistic with environmental protection and ecological development. Facing new challenges such as global sustainable development and climate change, we adhere to international standards and have adopted international standards, such as GRI, SASB and TCFD, to guide the development of our ESG system, deeply integrates ESG concepts into the entire corporate development process. We enhance the foundation for green and sustainable development, established ecological restoration and environmental protection plans which are highly adaptable to our projects, and strive to promote the implementation of effective measures for "carbon neutrality and carbon reduction" to help achieve global green sustainable development and "net zero" targets. Maintaining and increasing compliance with ESG standards and building our reputation could increase our operational costs.

In addition, the continued success of our existing operations and future projects are in part dependent upon broad support of and a healthy relationship with the local communities in which our operations are located, in addition to conducting operations in a manner that is not detrimental to the environment. While formal permission to operate is ultimately controlled by host governments, many mining activities require social permission from host communities and influential shareholders to carry out operations effectively, sustainably and profitably.

The consequences of negative community reaction could therefore give rise to material reputational damage which can pose obstacles to our ability to develop our projects and maintain our operations, and have a material adverse impact on the cost, profitability, ability to finance or even the viability of an operation. If our operations are delayed or shut down as a result of political and community instability, our earnings may be constrained and the long-term value of our business could be adversely impacted. Even in cases where no action adverse to us is actually taken, the uncertainty associated with such political or community instability could adversely impact the perceived value of our assets and mining investments and, consequently, have a material adverse effect on our financial condition. In order to maintain our social license to operate, we may need to design or redesign parts of our affected mining operations to minimize their impact on the relevant communities and the environment, either by changing mining plans to avoid such impact, by modifying operations, by changing planned capital expenditures, or by relocating the affected people to an agreed location, thereby increasing our operating costs.

Also, action is increasingly taken by members of the general financial and investment communities, such as asset managers, sovereign wealth funds, public pension funds, universities and other groups, to promote improvements in ESG performance by mining companies, which may impact our ability to raise funds if we are perceived to have ESG deficiencies. Voluntary compliance with gold mining industry standards and reporting against multiple sustainability and ESG indices could result in significant costs. Stringent standards relating to responsible gold, including but not limited to the World Gold Council Conflict-Free Gold Standard and the World Gold Council Responsible Gold Mining Principles, have been introduced. Additionally, the increasing demand for disclosure on performance with regard to ESG and the plethora of disclosure formats and indices being demanded may result in significant costs to ensure and demonstrate compliance (particularly where standards change rapidly or duplication in reporting is required).

The cost of measures and other issues relating to the sustainable development of mining operations has placed significant demands on our resources and could increase capital and operating costs and have a material and adverse impact on our reputation, business, financial condition and results of operations.

Our business and operations may be adversely affected by union activities, as well as new and existing labor laws. Work stoppage, labor shortage and other labor related matters may have an adverse effect on our businesses.

Our business depends on good relations with our employees. We support trade unions in negotiating and signing the employee wage collective agreements with us to protect the lawful rights and interests of our employees. Among other things, Continental Gold passed an union agreement through collective negotiation, which balanced our sustainable development with the steady improvement of employee benefits.

Because our employees are highly unionized, trade unions hence have a significant impact on the general labor relations environment. Trade unions advocate for improved conditions of employment and change to labor regulations, and to promote various political and social goals by using their collective power and ability to withhold labor. Therefore, union involvement in wage negotiations and collective bargaining increases the risk of strike action and rising labor expenses. Wage negotiations in other industries and other mining sectors may influence the stance unions take toward the industry in which we operate. Our employees might exercise their right to strike within the ambit of the legislations and relevant local laws and regulations, which could have a material and adverse effect on both our business and reputation, and disruptions in the operation of our mines. During the Track Record Period and up to the Latest Practicable Date, we have not experienced any significant labor disputes within our Group or labor disputes on the operation of our Group, nor have we experienced any difficulty in recruiting and retaining the experienced employees.

Although we believe our labor relations with our employees and contractors are good, there can be no assurance that a work slowdown, a work stoppage or strike will not occur at any of our facilities or development projects or exploration prospects. Work slowdowns, stoppages, disputes with employee unions or other labor-related developments or disputes could result in a decrease in our production levels and adverse publicity, which could have a material adverse effect on our business, results of operations and financial condition.

Failure to settle issues successfully with local communities may materially and adversely affect our business.

In our international operations, interactions with different cultures are inevitable. We approach local communities with an attitude of equality and inclusiveness, especially when we come to the traditional culture of indigenous groups. However, our production and operational activities may create conflicts with local communities, including disputes relating to land use rights and settlement relocation, as our business activities are often located at or near existing towns and villages, natural water courses and other infrastructure of the local community. These issues may result in community protests, road blockades and third-party claims. There is no assurance that we, our affiliates or our business partners can successfully manage community relationships or settle local community issues. Opposition from the local community, political or environmental groups as well as regulatory authorities with respect to development or construction of mining projects or mineral refineries could increase our development costs and cause delays, interruptions or even cancelations to our development plans and harm our reputation. Failure to successfully settle the local community issues may have a material and adverse effect upon our business, prospects, financial condition and results of operations.

We are subject to costs and risks related to mine closures.

Our existing mining operations have a limited life. Eventual closure of our operations will entail costs and risks regarding on-going monitoring, rehabilitation and compliance with environmental standards, which may exceed the provisions we have made. We have rehabilitation obligations in respect of areas we have cleared for mining and production purposes. We are required to rehabilitate and re-vegetate mined land. The key costs and risks for mine closures are: (i) long-term management of permanent engineered structures (such as tailings dams) and acid drainage; (ii) achievement of environmental remediation, rehabilitation and closure standards (including the assessment, funding and implementation of post-closure polluted and extraneous water pumping treatment); (iii) orderly retrenchment of employees and third-party contractors; and (iv) relinquishment of the sites with associated permanent structures and community development infrastructure and programs to new owners. The successful completion of these tasks is dependent on our ability to successfully implement the closure plan agreed with the relevant government authorities, community and employees. The consequences of a difficult closure range from increased closure costs and handover delays to on-going monitoring and environmental rehabilitation costs and damages to our reputation, as well as giving rise to potential liabilities, if the desired outcomes cannot be achieved, if the relevant mines fail to meet the relevant closure standard or if a post-closure accident or environmental incident occurs. In the event of a difficult closure, our business, financial condition and results of operations could be materially and adversely affected.

In an effort to address mine closure and other geological environment issues, a mining company is required to accrue rehabilitation funds subject to the applicable laws and regulations in certain jurisdictions. For example, as part of the transition of ownership of Ghana Akyem Gold Mine, we have been actively working with the local authorities and financial institutions in relation to the posting of reclamation bond based on an approved work plan for reclamation as required under the Environmental Assessment Regulations of Ghana. As of the Latest Practicable Date, we completed the cash payment obligation on our part in relation to such statutory obligation, and are working with the local authorities to resolve the provision of financial guarantee to be provided by local financial institutions. In the event of a default in accruing required rehabilitation funds in the future, we could be subject to a variety of penalties and other administrative actions, resulting in our inability to proceed with certain administrative procedures relating to mining permits (including annual inspection, renewal, alteration and mortgage registration), suspension of mining permits or ceasing of operations which may materially and adversely affect our business, financial condition and results of operation.

We face intense industry competition.

We compete with a number of large gold mining companies. For further details of our competitors, see "Industry Overview — Competitive Landscape of the Gold Mining Industry" and "Business — Competition." Our competitors may have certain advantages over us, including, for example, diversified sources of fundings, better financial performance, greater technical and Mineral Resources, greater economies of scale, broader name recognition and more established relationships in certain markets. As a result, these competitors may be able to devote more resources to the discovery of new Mineral Resources and reserves and acquire new Mineral Resources or other gold mining companies. Competition could also have an adverse impact on the demand for, and pricing of, our gold products, which in turn affects our business growth and financial condition. There can be no assurance that we will be able to continue to compete effectively or maintain or improve our market position. If we fail to compete effectively, it will have a material adverse effect on our businesses, results of operations and financial condition.

We also face intense competition for the acquisition of attractive gold mining assets. Industry competition may lessen our opportunities to acquire new Mineral Resources or other gold mining companies and, ultimately, may have a material adverse impact on our business, financial condition, results of operations and growth prospects.

We may not be able to maintain the provision of adequate and uninterrupted supplies of electricity, water, materials and equipment at commercially acceptable prices, or at all.

Electricity and water are the main utilities used in our operations. Our mining and ore processing processes require adequate and stable supply of electricity. Our electricity supplies are mainly from the local electricity companies. In addition, our water supply are mainly from surface water, pit water or underground wells near the mine areas. In some countries and regions, a permit is required for water use. The local laws and regulations may also require the installation of calibrated water meters and payment of resource fees. If we fail to meet these requirements, water supply may be suspended and our production will be inevitably disrupted.

Major raw materials and consumables used in our production include pipes, rubber pipe fittings, crusher and ball mill accessories. During the Track Record Period, all of our top five suppliers in the respective year were service or commodity providers such as suppliers of raw materials, mining development contractors, fuel suppliers. During the Track Record Period, we did not experience any material interruptions in our operations due to power shortages or outages. However, we cannot assure you that we would not be subject to any power outages in the future. If we are to be subject to power outages or there is prolonged power shortage in the future or there are any possible changes in the power consumption policies adopted by the governments in the regions where our mines are located, our production will be inevitably disrupted. Our business, financial conditions and results of operations will therefore be adversely and materially affected.

We procure various materials, such as diesel fuel, processing chemicals, and related consumables, as well as machinery and equipment for our production operations from (i) different local suppliers where we operate and/or (ii) the original equipment manufacturers. We also procure various services, such as security services, transporting services, engineering services and loading and hauling services, from various local suppliers. We usually source qualified suppliers through bidding invitations. We require candidates to provide the relevant licenses and permits for reference. We may undertake further due diligence, such as background checks and risk assessments, as and when necessary. The selected suppliers are put on our approved supplier list, which is reviewed and updated on a periodical basis. To secure competitive prices, we may enter into long-term agreements with certain suppliers for the provision of materials and/or service from time to time. There can be no assurance that supplies of electricity, water or raw materials will not be interrupted or that their prices will not increase in the future. In the event that our existing suppliers cease to supply us with electricity, water or raw materials at commercially acceptable prices or at all, our operations will be interrupted, and our financial condition and results of operations will be materially and adversely affected.

We rely on third-party contractors to conduct certain portion of our business.

During the Track Record Period, we outsourced a portion of our exploration, mining and processing activities to contractors in the regions where our mining properties are located. As of December 31, 2024, we engaged 46 third party contractors to undertake construction and engineering work, 15 third-party contractors for exploration work and 52 third-party contractors for mining and processing work. For more details, see "Business — Contractors." As a result, our operations have been affected by the performance of these contractors. Our operations at sites utilizing contractors or contract mining are subject to a number of risks, some that are outside of our control, including, but not limited to, contract risk, execution risk, dispute and litigation risk, regulatory risk and labor risk, which could result in additional costs and liabilities.

Although we monitor the works of these contractors to ensure that they carry out the work on time, on budget and in accordance with our mine plannings and specification, we may not be able to control the quality, safety and environmental standards of the works conducted by contractors to the same extent as the works conducted by our own employees. There can be no assurance that the contractors are in full compliance with all relevant laws and regulations, which may subject them to suspension of relevant licenses, approvals, permits and/or authorizations that would adversely and materially impact our operations. Should this happen, we may not be able to engage replacement contractors on similar terms, or at all, in a timely manner. We may become engaged in disputes with our contractors, which could lead to additional expenses, business interruptions, distractions and potential loss of production time and additional costs, any of which could materially and adversely affect our business, financial condition and results of operations. In addition, we may be legally obligated, as an owner of the exploration permit or mining license, to ensure operational safety. In the event of any safety-related accident involving a contractor, we may be held directly liable or liable for compensation to the extent of our faults regardless of any contractual provisions to the contrary. Any failure by contractors to meet any of our quality, safety and environmental standards may result in liabilities to us and could also affect our compliance with government rules and regulations relating to exploration, mining and workers' safety.

The occurrence of one or more of these risks could have a material and adverse effect on our business, financial condition and results of operations.

We may not be able to detect and prevent fraud or other misconduct committed by our employees, representatives, agents, customers, external contractors or other third parties.

We may be exposed to fraud or other misconduct committed by our employees, representatives, agents, customers, or other third parties that could subject us to litigation, financial losses and sanctions imposed by governmental authorities, which may affect our reputation. While our internal control procedures are designed to monitor our operations and ensure overall compliance, such procedures may not be able to identify all incidents of non-compliance or suspicious transactions in a timely manner, or at all.

Furthermore, it is not always possible to detect and prevent fraud and other misconduct. The precautions we take to prevent and detect such activities may not be effective. If such fraud or other misconduct does occur, it may cause negative publicity and could adversely affect our business, financial condition and results of operations. As of the Latest Practicable Date, we are not aware of any ongoing enquiries or investigations by any relevant regulators, agencies or authorities in relation to fraud or other misconduct allegations against us. Any adverse media coverage against us may have a material adverse effect on our reputation, thereby affecting our business, financial condition and results of operations.

We have a high concentration of customers and the loss of one or more of these customers could adversely affect our business, financial condition, and results of operations.

Due to the nature of our business and industry norm, we have a limited customer base and face high concentration of a small number of customers for a significant portion of revenues. In 2022, 2023 and 2024, revenue contributed by our top five customers amounted to US$1,275.4 million, US$1,769.4 million and US$2,517.0 million, respectively, accounting for 70.2%, 78.2% and 84.2% of our total revenue for the same periods, respectively. In 2022, 2023 and 2024, revenue contributed by our largest customer amounted to US$597.7 million, US$635.8 million and US$1,272.9 million, respectively, accounting for 32.9%, 28.1% and 42.6% of our total revenue for the same periods, respectively. During the Track Record Period, our largest customer is Zijin Mining Group, mainly because we have been selling mining products to our customers through certain subsidiaries of the Zijin Mining Group. These subsidiaries, acting as traders of various mineral resources, are responsible for, among other things, arranging for the external sale of mineral resources produced by the Zijin Mining Group to external refineries, end-customers or traders. For more details, see "Connected Transactions — Sale Arrangement with Zijin Mining". Although there are readily available customer and a diversified customer portfolio to mitigate potential customer attrition, we cannot assure you that our business will be unaffected by changes in our customer composition. Shifts in our customer base may significantly impact our revenue and profitability, particularly in the event of a reduction or termination of business with key customers.

Our internal control and risk management systems may not fully protect us against various risks inherent in our business.

We have established internal control and risk management systems to manage our risk exposures, primarily our operational risk, legal risk and liquidity risk. For further details, see "Business — Risk Management and Internal Control Measures." In addition, as part of the [REDACTED], we have implemented internal control measures to ensure independence between our Group and the Zijin Mining Group. For details, see "Relationship with Zijin Mining". However, we may not be successful in implementing our internal control and risk management systems. While we seek to continue to enhance such systems from time to time, we cannot assure you that our internal control and risk management systems are adequate or effective notwithstanding our efforts, or material deficiencies in our internal control system will not be discovered in the future. Any failure to address any potential risks and internal control deficiencies could materially and adversely affect our business, financial condition and results of operations. Since our internal control and risk management systems depend on their implementation by our employees, we cannot assure you that all of our employees will adhere to such policies and procedures, and the implementation of such policies and procedures may involve human errors or mistakes. Moreover, our growth and expansion may affect our ability to implement stringent internal control and risk management policies and procedures as our business evolves. Our efforts to maintain our internal controls have required, and in the future may require, increased costs and significant management time and commitment. If we fail to maintain effective internal controls in the future, or timely adopt, implement and modify, as applicable, our internal control and risk management policies and procedures, our business, financial condition, results of operations and reputation, as well as the accuracy of our financial reports, could be materially and adversely affected.

We may not be adequately insured against losses and liabilities arising from our operations.

We carry insurance covering risks in relation to safety production obligations. We also carry insurance for loss of and damages to our various machinery, equipment and inventories. We also maintain additional accident insurance for our employees engaged in mining activities. In line with industry practice, we generally do not carry any business interruptions or litigation insurance. We engage professional third-party logistics service providers for the cross-border transporting of our products to customers and transporting of certain materials we procured from suppliers. Generally, such logistics service providers are responsible for maintaining insurance associated with transportation. We consider our insurance coverage to be adequate for the needs of our business operations and in line with the industry norm and the relevant laws and regulations in different jurisdictions we operate.

However, due to the nature of our business, our employees may handle explosive materials. We may experience accidents in the course of our operations which may cause significant property damage, personal injuries or other liabilities. There may also be significant uninsured damages to our properties, inventories or other assets or liabilities claims against us. Losses and liabilities incurred or payments that we may be required to make, if not adequately insured against, could materially and adversely affect our business, financial condition and results of operations or otherwise materially disrupt our operations.

The failure to maintain or protect intellectual property rights used by us and our trade secrets could have an adverse effect on our business, financial condition and results of operations.

During the Track Record Period, we did not possess intellectual property rights which are material to our business operations, and used the intellectual property rights of the Zijin Mining Group. To compete in these markets, companies rely or may rely on a combination of trade secret protection, nondisclosure and licensing agreements, patents and trademarks to establish and protect proprietary intellectual property rights. Intellectual property rights used by us may be challenged or infringed upon by third parties or we may be unable to maintain, renew or enter into new license agreements with owners of intellectual property on reasonable terms. In addition, intellectual property used by us may be subject to infringement or other unauthorized use. Unauthorized use of intellectual property rights by us or the Zijin Mining Group's inability to preserve existing intellectual property rights could adversely impact our competitive position and results of operations.

Proprietary trade secrets and unpatented know-how are also very important to our business. We rely on trade secrets to protect certain aspects of our technology. Although we have actively taken measures to protect trade secrets, we cannot assure you that such measures will be effective and suffice to prevent any infringement. Our employees, consultants, contractors, outside scientific collaborators and other advisors may unintentionally or willfully disclose our confidential information to competitors, and confidentiality agreements may not provide an adequate remedy in the event of unauthorized disclosure of confidential or proprietary information. Enforcing a claim that a third party illegally obtained and is using our trade secrets is expensive and time-consuming, and the outcome is unpredictable. Moreover, our competitors may independently develop equivalent knowledge, methods and know-how. Failure to obtain or maintain trade secret protection could adversely affect our competitive business position.

We may not be able to retain or secure key senior management members or key qualified personnel for our operations.

Our sustainable success depends heavily on our current senior management team. We depend on the continued service of our executive officers and other skilled managerial and technical personnel. Competition for qualified personnel in the industries in which we operate is intense. Our businesses and financial condition may suffer if we lose the services of a number of key personnel and are not able to recruit quality replacements. Furthermore, as our businesses continue to grow, we will need to improve our managerial, technical and operational knowledge and allocation of resources, to implement an effective management system and strengthen management control across our businesses. In order to fund our on-going operations and future growth, we will need to have sufficient internal sources of liquidity or access to additional financing from external sources. Further, we will be required to manage relationships with a greater number of customers, suppliers, contractors, service providers, lenders and other third parties. We may develop or invest in new businesses ancillary to or related to our existing businesses and such diversification may place significant demands on our management and resources as we may not have the experience or expertise necessary for the successful development of such new businesses. In particular, qualified personnel may be scarce in certain regions where our mines are located. If we fail to attract qualified personnel or retain appropriate management and technically skilled personnel, or if there are not sufficient succession plans in place, our businesses and financial condition may be materially and adversely affected.

Any negative publicity regarding our Directors, employees or products and us, regardless of its nature or veracity, could adversely affect our business.

Our brand and our image are sensitive to the public's perception of us, which includes not only the quality of our products, but also our corporate management and culture. We cannot assure that no one will, intentionally or incidentally, disseminate information about us, including the quality of our products, our internal management matters and negative information for management, that may result in negative perception of us by the public. Although we will promptly take clarification or rectification measures if we face negative publicity, we cannot assure you that such measures will always be effective. In addition, as a listed company, we and member of our management or employees are under the supervision of securities regulatory bodies and subject to certain regulatory inquiries and penalties. Any negative publicity about our Directors, employees, spokespersons or products and us, regardless of nature or veracity, could lead to potential loss of customers or investors' confidence or difficulty in retaining or recruiting talents that are essential to our business operations. As a result, our business, financial condition, results of operations, reputation and prospects may be materially and adversely affected.

We face certain risks and uncertainties beyond our control from man-made and natural disasters, diseases or public health emergencies that may adversely impact our business and operations.

Our business operations are subject to certain risks and uncertainties, some of which are beyond our control. These risks and uncertainties mainly include: major catastrophic events and natural disasters, including earthquakes, fires, floods, landslides, drought, snowstorms, sandstorm, drought, mudslides and other hazardous weather conditions which may cause the instability of slopes and subsidence of working areas in our mines, power, water or fuel shortages, critical equipment failures, malfunction and breakdown of information management systems, unexpected maintenance or technical problems, or are susceptible to potential wars or terrorist attacks; geological or mining conditions such as instability of the slopes and subsidence of the working areas; unexpected or periodic interruptions due to inclement or hazardous weather conditions; disruptions or shortages of water, power or fuel supply; industrial or manmade accidents occurring in connection with our mining or ore processing operations; and critical equipment failures, malfunction and breakdowns of information management systems, unexpected maintenance or technical problems; acts of war; terrorism; and threats from epidemics. Serious natural disasters may result in loss of lives, injury, destruction of assets. Epidemics threaten human lives and may materially and adversely affect their livelihood as well as their living and consumption patterns. Natural disasters, acts of war, terrorism or other factors beyond our control may adversely affect the economy, infrastructure and livelihood of the people in the regions where we conduct our business. Any of these risks and uncertainties could materially and adversely affect our business, financial condition and results of operations.

We rely on information technology and communications systems, the failure of which may significantly and adversely impact our operations and business.

We rely on our information technology and communications systems to support our business operations. Our information technology and communications systems could be exposed to, among other things, damage or interruption from telecommunications failure, unauthorized entry, malicious computer code and other sorts of breach in cybersecurity, fire, natural disaster, power loss, industrial action and human error. While we have offsite backup systems in place, the occurrence of any of the above may also disrupt our information technology and communications systems and may lead to important data (including geophysical and geological data) being irretrievably lost or damaged. Such damage or interruption may adversely affect our business, results of operations and financial position.

FINANCIAL CONDITIONS

We incur amortization expenses related to our mining rights. The carrying value of our mining and exploration rights may incur impairments due to material decreases in the amount of our Reserves, which may adversely affect our results of operations.

As of December 31, 2022, 2023 and 2024, we had intangible assets of US$1,527.8 million, US$1,530.9 million and US$1,439.5 million, respectively, mainly representing the net carrying amount of our exploration and mining rights. Mining rights are stated at cost less accumulated amortization and any impairment losses. Mining rights cover the costs of getting mining licenses and exploration rights. They also include expenses for exploration and evaluation assets when a property is ready for commercial production, as well as the costs of acquiring interests in the reserves of existing mining sites. The mining rights are amortized in accordance with the production plans of the entities concerned and the proven and probable mineral reserves of the mines using the units-of-production method. Mining rights are written off to profit or loss if the mining property is abandoned.

Proved mineral reserves are estimated based on professional knowledge, experience and industry practice. Generally, the mineral reserve volume estimated based on probing and estimation may not be very accurate. The estimation is updated in accordance with new technologies and new information. Any changes in estimation will have impacts on the amounts of mining assets' depreciation and mining rights' amortization using the units-of-production method, on the stripping ratio which was used in the capitalization of stripping costs, and on each of the transaction prices of the metal streaming arrangement. Any material decrease in the amount of our Mineral Reserves for our mine or changes to our production plans may result in impairment of the carrying value of our mining rights and related assets or results in a recognition of impairment losses related to our intangible assets, which may have a material adverse effect on our business, financial condition and results of operations.

Our businesses and operations require significant capital resources on an ongoing basis. If we do not obtain additional financing, our business may be at risk, or execution of our development plan may be delayed.

The exploration, mining and production of gold requires substantial capital investments. Our capital expenditure primarily includes (i) purchase of items of property, plant and equipment; and (ii) purchase of intangible assets. Total cash outflow of purchase of property, plant and equipment and intangible assets amounted to US$518.4 million, US$436.9 million and US$487.0 million in 2022, 2023 and 2024, respectively. We funded the capital expenditures mainly with our operating cashflows and the interest-bearing bank and other borrowings. Our capital expenditures in recent years and in the future are expected to remain at a high level, which may impact our financing arrangements in the future.

Our principal source of liquidity has been, and is expected to continue to be, cash generated from operating activities together with available credit facilities and bank borrowings. Our liquidity requirements primarily relate to funding our working capital requirements and our capital expenditures. To fund our ongoing operations, existing and future capital expenditure requirements, investment plans and other financing requirements, we may, in the future, need access to additional financing from external sources in addition to internal sources of liquidity. Obtaining additional funding will be subject to various factors, including general market conditions, investor acceptance of our business plans, lenders' perception of our creditworthiness, the global and local economies, regulations that affect the availability and costs of financing, and ongoing results from our construction and commissioning efforts. Any disruptions, uncertainty or volatility in the capital and credit market resulting from any global financial crisis may also limit our ability to obtain financing to meet our funding requirements. These financings could require contractual or other restrictions on our operations or on alternatives that may be available to us. If we raise additional funds by issuing debt securities, these debt securities could impose significant restrictions on our operations. Any such required financing may not be available in amount or on terms acceptable to us, and the failure to procure such required financing could have a material and adverse effect on our development plan and continuous growth.

We may also not be able to obtain financing on favorable terms, or at all, to fund our on-going operations, existing and future capital expenditure requirements, acquisitions and investment plans and other funding requirements. Our ability to raise additional funds could be materially affected by the fluctuations in the capital market. If we are unable to raise adequate funds, we may be required to delay some of our development projects or expansion plans, or commercialization of our Mineral Resources, therefore affecting our profitability in the short and long term.

We have an increased level of indebtedness and may incur additional indebtedness in the future. Any restrictive covenants imposed on us by our financing agreements could materially and adversely affect our business, financial condition and results of operations.

We have financed a portion of our capital requirements through bank and other borrowings and expect to continue to do so in the foreseeable future. The increased level of indebtedness could adversely affect our operations, including, but not limited to, reducing our cash flow available for working capital, capital expenditures and other general corporate purposes as a result of our debt servicing obligations, limiting our flexibility in planning for or reacting to the changes in our businesses and the industry; and limiting our ability to obtain additional financing and potentially increasing our financing costs. Our ability to meet our payment and other obligations under our outstanding debt depends on our ability to generate cash flows in the future or to obtain external financing. There is no assurance that our business will generate sufficient cash flows from operations to satisfy our obligations under our outstanding debt and to fund other liquidity needs. If we are not able to generate sufficient cash flows to meet such obligations, we may need to refinance or restructure our debt, reduce or delay capital investments, or seek additional equity or debt financing. Our ability to obtain future external financing involves a number of uncertainties including our future operational results, financial condition, cash flow, general economic conditions, interest rates, credit availability from banks and other creditors, and the liquidity of capital markets in the jurisdictions in which we operate. There can be no assurance that additional external financing, either on a short-term or on a long-term basis, will be made available or, if available, that such financing will be obtained on terms favorable to us. If we fail to obtain adequate funds to serve our debt obligations and to satisfy our operations or development plans, our business, financial condition and results of operations could be materially and adversely affected.

Furthermore, our bank loan agreements may include various conditions and covenants that require us to obtain the lending bank's prior consent for certain transactions. We may be required to comply with similar restrictive covenants or other terms under any new loan and other financing arrangements in the future. In addition, we are required to comply with various financial covenants, and new financial covenants may be imposed under any new loan and other financing arrangements. If market conditions deteriorate, or if our operating results were to be depressed, we may need to request amendments or waivers to the covenants and restrictions under our debt agreements. There can be no assurance that we will be able to obtain such relief should it be needed. A breach of any of these covenants or restrictions could result in a default that would permit our lenders to declare all amounts outstanding thereunder to be due and payable, together with accrued and unpaid interest, trigger cross-default provisions under other debt agreements and, as applicable, cause the termination of commitments of relevant lenders to make further extensions of credit under our financing agreements or credit facilities. If we were unable to repay our indebtedness to our lenders in such an event, the lenders could, among other things, proceed against collateral, which could include substantially all of our assets. Our future ability to comply with financial covenants and other conditions, to make scheduled payments of principal and interest, or to refinance existing borrowings depends on our business performance, which is subject to economic, financial, competitive and other factors, including, but not limited to, the other risks described in this Document. Any failure to comply with the covenants of our financing agreements or to obtain financing for our business could have a material and adverse effect on our business, financial condition, results of operations and prospects. Any failure to make required debt payments could, among other things, adversely affect our ability to conduct operations or raise capital, which could have a material adverse effect on our business, financial condition and results of operations.

We are subject to risks relating to inventory, including the risk of obsolescence and impairment, as well as the transport and storage of inventory.

Having an appropriate level of raw materials inventory is pivotal in minimizing the effect of the volatility of raw materials prices and minimizing the risk of obsolescence of our inventory. Any sudden decrease in the market demand and the corresponding unanticipated drop in the sales and the prices of the relevant goods or any failure of us in successfully maintaining the flexibility in our raw materials and spare parts supply arrangements could cause our inventory to accumulate or depreciate in value, which may adversely affect our businesses, financial condition and results of operations. While our work-in-progress and finished goods are not exposed to the risk of obsolescence since they do not deteriorate easily, we review our inventory from time to time and make provisions for write-down of inventories when it deems necessary. Assumptions regarding gold price and recovery rate will have impact on the assessment of the value of our inventories.

Furthermore, our transportation subcontractors are responsible for (i) delivery of the gold concentrate to their smelters; and (ii) transporting gold bullion to the local gold exchanges. Our gold concentrate is valuable item, and we are subject to risk of delay, damage or loss of such items, which may occur for reasons beyond our control, including labor disputes or strikes, acts of war or terrorism and natural disasters. While we seek to ensure the safety of our deliveries through engaging security personnel to guard our shipments, we cannot assure you that there will not be any safety accidents or loss of such deliveries. Moreover, we have less control over these subcontractors. Any delay, damage or loss of our work-in-progress and products during the transportation process may have a material and adverse effect on our business, financial condition and results of operations.

We are subject to risks relating to raw materials, energy consumption and increasing labor expenses.

Raw material costs, energy consumption costs and labor costs are important components of our operating costs. We regularly monitor the fluctuation in the market price of raw materials and energy and assesses its impact on our operations. If there is a shortage of raw materials or energy for any reason or the cost of raw materials and energy increases significantly, our production costs are likely to increase and our profit margin may decrease. In addition, labor costs in the regions where we operate may rise substantially as a result of the enactment of new labor laws and social development. Worldwide inflation may also increase our costs of labor. Rising labor costs may increase our operating costs and therefore materially and adversely affect our business, financial condition and results of operations. For more details, see "— Our business and operations may be adversely affected by union activities, as well as new and existing labor laws. Work stoppage, labor shortage and other labor related matters may have an adverse effect on our businesses." and "— We may not be able to maintain the provision of adequate and uninterrupted supplies of electricity, water, materials and equipment at commercially acceptable prices, or at all."

There can be no assurance that the use of hedging instruments will always benefit us.

From time to time, we enter into hedging activities to mitigate the impact of commodity market price fluctuations on our products and raw materials, and to guard against interest rate and exchange rate risks. During the Track Record Period, to hedge against gold price fluctuations for a portion of its anticipated gold sales, Norton Gold entered into master gold forward contracts with financial institutions and agreed to deliver a specified amount of gold products at a predetermined price on a set future date. These contracts have expired. However, gold price has been fluctuating in the global market, and we will continue to assess whether to enter into further hedging activities.

There can be no assurance that the use of hedging instruments will always benefit us. Gold hedging instruments may prevent us from realizing the full benefit of potential subsequent increases in the gold price, which would affect our results of operation. In addition, our business, financial condition and results of operations could be materially and adversely affected if for any reason our gold production is unexpectedly interrupted and, as a result, we are unable to produce sufficient gold to cover any hedging instruments that we have acquired. The counterparty to any hedging transaction could also default on its obligations. Without hedging transactions, we may not be able to lock in our selling price when the gold price decreases, which may reduce the revenue that we may receive.

We are exposed to credit risk in relation to defaults from customers or counterparties.

We trade only with third parties who we believe to be reputable. It is our policy that all customers who wish to trade on credit terms are subject to credit verification procedures. In addition, trade receivable balances are monitored on an ongoing basis to ensure that our exposure to bad debts is not significant. As such, we do not obtain collateral in our ordinary course of dealings. However, there can be no assurance that all of our counterparties are creditworthy and reputable and will not default on us in the future, despite our efforts to conduct credit assessments on them. Credit risk is managed centrally based on customers or counterparties, geographic regions and industries. As of December 31, 2022, 2023 and 2024, we had a specific concentration of credit risk. Approximately 25.9%, 63.2%, and 67.3% of our trade receivables were from the largest customers in terms of trade receivable balances, and approximately 87.8%, 97.3% and 96.7% of our trade receivables were from the top five customers in terms of trade receivable balances during the same periods. The balance of our trade receivables did not hold any collateral or other credit enhancements.

The credit risk associated with our certain financial assets and contract assets, such as commercial acceptance bills receivable, trade receivables, other receivables and certain derivative instruments, arises from default of the counterparties, with a maximum exposure equal to the carrying amounts of these instruments. Our maximum exposure to credit risk at each end of the reporting period is the total amount charged to the customers less the amount of the impairment provision. We are also exposed to credit risk through the granting of financial guarantees. Since we trade only with recognized and creditworthy third parties, there is no requirement for collateral, nor do we hold any collateral or other credit enhancements over our trade receivable balances. Failure of our counterparties to fulfil their obligations to us under our contracts may materially adversely affect our financial condition and results of operations.

Rising inflation may increase our operational costs and materially adversely affect our business, financial conditions, results of operations and prospects.

Our business has been, and may continue to be, directly affected by volatile commodity costs and other inflationary pressures. Inflation can lead to increased costs across various aspects of our mining operations, including labor, energy, equipment and raw materials, which are critical components of our mining operations and are essential for maintaining efficient and profitable operations.

In general, inflationary pressures can exacerbate existing economic challenges, leading to higher operational costs and reduced profitability. The cost of labor and energy, as well as imported goods and services, may rise, impacting our ability to maintain competitive production costs. Additionally, inflation can lead to (a) increased interest rates, affecting our financing costs and capital expenditure plans; (b) increased compliance costs and wage pressures, due to stringent labor laws, (c) higher costs for equipment and materials, impacting our capital expenditure and operational budgets, (d) currency fluctuations, affecting the value of our revenues and financial stability. There can be no assurance that we can successfully monitor inflation and implement cost-control measures against inflation, or that any such strategies will be fully effective, and unforeseen inflationary events could adversely affect our operations.

Geopolitical risks and conflicts around the world could further disrupt supply chains and create additional inflationary pressures. Specifically, the Russia-Ukraine conflict in 2022 has led to sanctions, travel bans, and asset or financial freezes being levied by the United States, European Union and other countries against Russian entities and individuals, with additional sanctions being proposed. These sanctions and other measures have had a significant impact on commodity prices, including increased oil, gas, ammonia nitrate, copper, steel and gold prices. The oil price is a driver of a number of our input costs, including fuel and transport costs, while gas prices have an impact on power costs, and other commodity prices drive direct mining and processing costs. These inflationary pressures could also cause interest rates and the cost of borrowing to increase and could have a material adverse effect on global financial markets and economic conditions. The extent and duration of the war, sanctions and resulting market disruptions are impossible to predict. Any inflationary impacts or disruptions caused by the war or resulting sanctions may have a material adverse effect on our business, financial condition and results of operations, and may magnify the impact of other risks described in this Document.

We may face risks from changes in tax policies, adjustments in resource tax rates and potential changes in corporate income tax and value-added tax exemptions could impact our profitability.

Gold mining operators may encounter significant risks stemming from changes in tax policies, adjustments in resource tax rates, as well as potential modifications to corporate income tax and value-added tax exemptions, could adversely affect our profitability. These changes may lead to increased operational costs and reduced margins, impacting our financial performance and strategic planning. As tax policies are subject to governmental review and alteration, we must remain vigilant and adaptable to ensure compliance and mitigate potential financial repercussions. It is crucial for us to continuously monitor legislative developments and engage with policymakers to advocate for favorable tax conditions that support sustainable mining operations.

We are subject to regulatory risks with respect to our tax compliance.

In the ordinary course of business we may be subject to inquiries, reviews, claims, assessments or other regulatory actions conducted by relevant tax or revenue authorities in the jurisdictions in which we operate. We may be subject to additional tax or duty liabilities, or increased statutory royalties in relation to our mining and mineral production operations, as a result of any unfavorable decisions made by such relevant tax or revenue authorities, which may materially and adversely affect our business, financial position and results of operations. Such regulatory actions may also divert our management's attention and other resources, especially if they are not resolved in a timely manner. For example, we carried out certain intra-group transactions during the Track

Record Period, and our profit allocation and income tax positions in connection with such transactions are subject to the interpretations by relevant tax authorities of applicable tax law as well as applicable rules and regulations in relevant jurisdictions. There is no assurance that the respective tax authorities would not challenge the appropriateness of our historical intra-group transactions or that the relevant regulations or standards governing such arrangements will not be subject to future changes. If a competent tax authority later determines that the transfer prices and the transaction terms that we have adopted as well as our historical income tax provisions and accruals are not appropriate, such authority may require the relevant subsidiaries to re-assess the transfer prices and re-allocate the income or adjust the taxable income. If we are considered not to be in compliance with the applicable intra-group transactions rules and regulations, the relevant tax authority may also have the power to order us to pay all outstanding tax and statutory interest and/or fines. This may materially adversely affect our financial condition and results of operations.

LEGAL

There is an ongoing international arbitration with the Colombian government. We are also subject to risks relating to litigation and regulatory proceedings in jurisdictions where we operate.

Our Columbia Buriticá Gold Mine is located in Buriticá, Colombia, and is a globally recognized large-scale gold mine with exceptionally high grades. There are illegal mining activities in and around the Colombia Buriticá Gold Mine. In our view, the Colombian government has failed to provide our Colombia Buriticá Gold Mine with full protection and security and fair and equitable treatment in accordance with its obligations under the Canada-Colombia Free Trade Agreement. In light of the foregoing, Continental Gold Inc. has filed an arbitration request with the International Centre for Settlement of Investment Disputes (ICSID) of the World Bank against the Republic of Colombia, asserting Continental Gold Inc.'s rights and interests and seeking compensation for the damages caused by the Colombian government's actions. As of the Latest Practicable Date, the international arbitration procedure was still in progress. We cannot predict the outcome of the international arbitration. Preparing for this international arbitration or any related matters has caused us to incur costs, and we expect these costs to continue until the international arbitration concludes.

From time to time, the mining operators may be involved in litigation, arbitration, or disputes with the Colombian government. We may also be subject to inquiries, investigations and proceedings by regulatory and other governmental agencies in the ordinary course of our business in Colombia or other jurisdictions where we operate.

As of the Latest Practicable Date, we were not involved in any litigations and legal proceedings that may materially affect our business and results of operations. Although we take an active approach in defending claims and investigations, such investigations and litigations may have or will cause serious damage to our reputation, which in turn may affect our business, results of operations and financial condition. There is no assurance that we could successfully defend such claims and investigations, and there is no assurance that such incidents will not occur in the future. Such legal challenges can arise from disagreements over mining rights, environmental regulations, or tax obligations, and may lead to cancelation of the exploration and mining rights, abandonment of existing mining concession contracts and pending proposals for new mining concession contracts, and a ban from doing business with the relevant government for a period of time. In addition, prolonged legal proceedings may divert resources and attention from the core business activities. The uncertainty associated with these disputes can impact investor confidence and market perception, potentially affecting the share prices and the access to the capital market for financing. Even if we are successful in defending ourselves against these actions, the costs of defense may be significant. In market downturns, the number of legal claims and the amount of damages sought in litigation and regulatory proceedings may increase. In addition, unfavorable outcomes could result in substantial financial liabilities, including fines, penalties, or the revocation of mining licenses, which would severely disrupt operations and future growth prospects.

Meanwhile, adverse publicity about concerns relating to our brand, whether or not legitimate, may decrease customers' confidence in us and result in losses which we may not be able to recover. Actions brought against us or any of our subsidiaries may result in settlements, injunctions, fines, penalties, stock delisting or other results adverse to us that could harm our reputation. A significant judgement or regulatory action against us or any of our subsidiaries, or a disruption in our business arising from adverse adjudications in proceedings against our directors, officers or employees would have a material adverse effect on our liquidity, business, financial condition, results of operations and prospects.

We may face risks associated with the Colombia Entrustment Arrangement.

We operate the Columbia Buriticá Mine through the Colombia Entrustment Arrangement, pursuant to the Entrusted Operations Agreement and the Return Swap Agreement. Zijin Mining has also undertaken to the Company that, (a) at the appropriate time when conditions for a transfer are considered favourable (i.e. when the international arbitration with the Colombian government is resolved), Zijin Mining will transfer its interests in Zijin America to the Company. In addition, as a result of the Colombia Entrustment Arrangement, the Return Swap Agreement, and the undertaking of Zijin Mining Group, from an accounting perspective, the Company would consolidate the assets, liabilities and operation results of Zijin America (which includes Continental Gold Inc. and the Colombia Buriticá Gold Mine) into the consolidated financial information of the Group. See "Relationship with Zijin Mining — Colombia Entrustment Arrangement" for the detail of the Colombia Entrustment Arrangement and unwinding mechanism of such arrangement. There is no assurance on the timing of Zijin Mining's transfer of its interests in Zijin America to us and we cannot assure you that the transfer remains commerically favorable to us.

As advised by our legal advisor as to the Colombia law, (a) the entry into of the Entrusted Operations Agreement and/or the Return Swap Agreement would not require any notification, filings, authorizations or approvals from the Colombian governmental or regulatory authorities in Colombia, and would not affect the mining rights held by the Colombia Buritica Gold Mine for its operations, provided that the ownership of the related assets of the Colombia Buriticá Gold Mine will not be transferred, and (b) the Entrusted Operations Agreement and the Return Swap Agreement, as a whole, are not in contravention to any legal and regulatory restrictions under Colombian laws and regulations, if the Colombian government deems. Nonetheless, there are substantial uncertainties regarding the interpretation and application of current and future Colombian laws, regulations and rules.

In addition, Colombia's political and economic environment can influence the stability and enforcement of the Colombia Entrustment Arrangement. Political changes, economic instability, or shifts in government policy could impact our ability to maintain favorable terms or continue operations under the Colombia Entrustment Arrangement.

We actively manage our relationship with Colombian authorities and shareholders to ensure compliance with, and maintain the integrity of, the Colombia Entrustment Arrangement. However, there can be no assurance that unforeseen changes or challenges will not arise, potentially affecting our business operations and financial results.

We are subject to government regulations on the mining industry.

Our mining production is subject to extensive laws, rules and regulations imposed by the governments in the respective jurisdictions in which we operate, including those relating to exploration, development, production, taxation, labor standards, vocational health and safety, waste treatment, environmental monitoring, protection and control, operation management and other issues.

For example, these governments continue to strengthen the enforcement of safety regulations in relation to the mining industry. There can be no assurance that more stringent laws and regulations regarding production safety will not be implemented or that existing laws and regulations will not be more stringently enforced. We may not be able to comply with all existing or future laws and regulations in relation to production safety economically, or at all. Should we fail to comply with any production safety laws or regulations, we may be required to suspend our operations, rectify the production safety problems within a limited period and pay fines, or otherwise subject to the revocation or cancellation of the permits, licenses and approvals required for our mining and exploration activities. Any changes to these policies and regulations may increase our operating costs and may adversely affect our business, financial condition and results of operations.

We are subject to regulatory or legislative impositions of various costs, and any legislative changes may have an adverse effect on our business, operations and profits.

In recent years, governments (local and national), communities, non-governmental organizations and trade unions in several jurisdictions, have sought and, in some cases, have implemented greater costs on the mining industry, including, for example, the imposition of additional taxes and royalties, and relevant policies. For more details of the taxes and royalties that we are subject to, see "Regulations." The policies adopted may impose additional restrictions, obligations, operational costs, taxes or royalty payments on gold mining companies, including us, any of which could have a material adverse effect on our business, financial condition and results of operations.

We are subject to anti-corruption, anti-bribery, anti-money laundering, financial, export control regulations and similar laws and regulations. Any non-compliance with such laws can subject us to administrative, civil and criminal fines and penalties, collateral consequences, remedial measures and legal expenses, all of which could adversely affect our business, results of operations, financial condition and reputation.

We are subject to anti-corruption, anti-bribery, anti-money laundering, financial, export control regulations and similar laws and regulations in various jurisdictions in which we conduct activities, including the U.S. Foreign Corrupt Practices Act, or FCPA, the U.K. Bribery Act 2010, and other anti-corruption laws and regulations. If we fail to comply with anti-corruption, anti-bribery, anti-money laundering, financial and export control regulations and similar laws and regulations, we could be subject to whistleblower complaints, adverse media coverage, investigations, and severe administrative, civil and criminal sanctions, collateral consequences, remedial measures and legal expenses, all of which could materially and adversely affect our business, results of operations, financial condition and reputation. Any violation or even an alleged or suspected violation could harm our reputation and cause our suppliers, customers, financial institutions or other counterparties to refuse to do business with us, which may adversely affect our business, our results of operations, or the trading price of our Shares.

Our businesses are susceptible to downturns in the general economy and industries in which we operate or which we serve.

Our business is susceptible to economic and market conditions in the general economy and industries in which we operate or which we serve. A reduction in demand or supply could materially and adversely affect our business, financial condition and results of operations. Demand for our gold mining resources depends on the general economy, level of activity and growth in the industries which we serve. Development of the relevant industries is subject to various factors, including but not limited to market fluctuations of the prices of commodities, macroeconomic policies, general political or economic conditions, technological development, government investment plans, fluctuations in global production capacity and consumer spending, many of which are beyond our control. Unfavorable global financial or economic conditions could materially and adversely affect our sales volume. Since 2025, the U.S. government has announced certain tariffs and relevant new policies affecting various countries or regions as well as industries, thereby creating uncertainties to the economic development of various countries and global trade. Intensified geopolitical tension has brought uncertainties to the global economy as well as significant volatilities in the global financial market. Uncertainties about future economic conditions make it challenging for us to forecast our results of operations, make business decisions and identify risks that may affect our business, which may in turn materially and adversely affect our business, financial condition and results of operations. Any severe or prolonged slowdown in the global economy may materially and adversely affect the market conditions in the jurisdictions in which we operate, which may in turn materially and adversely affect our business, financial condition and results of operations.

RISKS RELATED TO DOING BUSINESS IN JURISDICTIONS IN WHICH WE OPERATE

Economic, political or social instability and security risks as well as shifts in political and social attitudes affecting the regions where we operate may have a material adverse effect on our operations and profits.

Operating in regions characterized by economic, political or social instability presents a significant risk for gold mining operators, including us, potentially impacting both operational continuity and profitability. Economic fluctuations can lead to volatile commodity prices, affecting revenue streams and financial planning. Political instability, including changes in government, regulatory frameworks or mining policies, can introduce uncertainty and disrupt operations, potentially leading to increased compliance costs or restrictions on mining activities. Social instability, including civil unrest, physical violence, contested election, military coups or shifts in public sentiment towards mining activities, can further exacerbate these challenges, potentially resulting in operational delays or increased security risks. An increase in the frequency, severity or geographic reach of violent crimes, political turmoil and similar events could also have a material adverse effect on investment and confidence in, and the performance of the economy of those countries in which we operate or may operate. Additionally, shifts in political and social attitudes may lead to heightened scrutiny and demands for more stringent environmental and social governance practices, necessitating additional investments and adjustments to operational strategies. These factors collectively pose a threat to the stability and predictability of operations, potentially leading to reduced profitability and challenges in maintaining investor confidence. See also "We operate in a number of countries and may also face geopolitical and country risks arising from our overseas operations."

The current tensions in international trade and rising global and cross-regional political tensions.

Our operations may be adversely affected by the regional and global economic markets. Rising political tensions could reduce levels of trades, investments, technological exchanges and other economic activities. Such tensions, and any escalation thereof, may have a negative impact on the general, economic, political and social conditions in the regions where we operate. In case of a tightening of credit in financial markets globally, this could also impact the markets in which we operate and our ability to arrange for financing for our capital requirements. In addition, any adverse impact on our customers or business partners arising from such tensions, sanctions or other events beyond their control may disrupt our business relationships with them. Any difficulties we face in accessing financing on acceptable terms and conditions could have a material adverse effect on our business, financial condition, results of operations and prospects. Additionally, Russian actions with respect to Ukraine have resulted in certain sanctions and export controls being imposed by the United States, the European Union, the United Kingdom and other jurisdictions. Sanctions laws and regulations are constantly evolving, and new persons and entities are regularly added to the lists of sanctioned persons. We cannot assure you that (i) our business operations will not be impacted by sanctions or export controls, and (ii) areas and regions in which we operate will not become a sanctioned area in the future. The conflict between Russia and Ukraine and the recent tension in the Middle East, including related economic sanctions, could lead to disruption, instability and volatility in global markets and industries that could adversely impact our business. We cannot predict the impact of the Russia-Ukraine conflict and the recent tension in the Middle East, and any heightened military conflict or geopolitical instability that may follow. Any such disruptions or resulting sanctions may adversely affect our business.

There may be changes from time to time with respect to the legal systems of the jurisdictions in which we have operations, and any failure to comply with laws and regulations could adversely affect us.

The legal systems of the jurisdiction in which we have operations vary significantly from jurisdiction to jurisdiction. Some jurisdictions have a civil law system based on written statutes and others are based on common law. Unlike the common law system, prior court decisions under the civil law system may be cited for reference but are not legally binding on other courts. Some of the markets in which we operate have not developed a fully integrated legal system. Laws and regulations that are recently enacted may not sufficiently cover all aspects of economic activities in such markets. In particular, the interpretation and enforcement of these laws and regulations are subject to changes and evolving, and the application of some of these laws and regulations to our businesses is not settled. Since local administrative and court authorities have discretion in interpreting and implementing statutory provisions and contractual terms, the outcome of administrative and court proceedings and the level of legal protection we have in many of the localities in which we operate are unpredictable. Local courts may have discretion to reject enforcement of foreign awards or arbitration awards. These uncertainties may affect our judgment on the relevance of legal requirements and our ability to enforce our contractual rights or claims. In addition, the regulatory changes may be exploited through unmerited or frivolous legal actions, claims concerning the conduct of third parties, or threats in attempt to extract payments or benefits from us. Furthermore, many of the legal systems in our markets are based in part on government policies and internal rules, some of which are not published on a timely basis, or at all, and may have retroactive effect. There are other circumstances where key regulatory definitions are unclear, imprecise or missing, or where interpretations that are adopted by regulators are inconsistent with interpretations adopted by a court in analogous cases. As a result, we may not be aware of our violation of certain policies and rules until some time after the violation. In addition, any administrative and court proceedings in our markets may be protracted, resulting in substantial costs and diversion of resources and management attention. It is possible that a number of laws and regulations may be adopted or construed to apply to us in our geographic markets and elsewhere that could affect our industries. Scrutiny and regulation of the industries in which we operate may further increase, and we may be required to devote additional legal and other resources to addressing this regulation. Changes in current laws or regulations or the imposition of new laws and regulations regarding our industries in our geographic markets may slow the growth of our industries and adversely affect our financial condition and results of operations.

Laws and regulations in the countries where we have operations may affect our pursuit of growth strategies in part through acquisitions.

The legal and regulatory environments in the countries in which we operate can significantly impact our ability to pursue growth strategies, particularly those involving acquisitions. Each jurisdiction has its own set of laws and regulations governing mergers and acquisitions, including antitrust laws, foreign investment restrictions, and industry-specific regulations, which can introduce complexities and uncertainties into the acquisition process. Compliance with these regulations may require extensive due diligence, legal consultations, and potentially lengthy approval processes, which can delay or even derail planned acquisitions. In addition, changes in these laws or their interpretation by regulatory authorities can further complicate acquisition strategies, potentially leading to increased costs or necessitating strategic pivots. These factors can affect our ability to seamlessly integrate acquired entities, realize anticipated synergies, and achieve growth objectives. If we fail to fully comply with the requirements of the regulations and other relevant rules and any required approval processes in the regions where we operate in a timely manner, it may delay the process or affect our ability to complete such transactions, which could affect our ability to expand our business or maintain our market share.

It may be difficult for the Hong Kong regulators to obtain information or call for regulatory assistance in the jurisdictions in which we operate where circumstances necessitate in the course of overseeing us as a listed company by the regulations in Hong Kong.

We will be regulated by the SFO and other applicable laws and regulations in Hong Kong upon the [REDACTED]. Our Directors and we will be required to provide the SFC with all information relating to our business that is necessary for its investigation of our affairs as may be required under Hong Kong laws or regulations. Among the countries where we generated revenue during the Track Record Period, Tajikistan, Kyrgyzstan, Guyana and Suriname are Non-IOSCO MMOU Countries and have not signed any regulatory cooperation agreement or memorandum of understanding with the SFC or the Stock Exchange, it may be difficult for the Hong Kong regulators to obtain information or call for regulatory assistance in these countries where circumstances necessitate in the course of overseeing us as a listed company by the regulations in Hong Kong. Although we continue to grow our operations in our core markets and expand our presence into further global jurisdictions, we will continuously monitor our local business operations, and business expansion rate in the markets where we have operations, on an ongoing basis. Our management will also report periodic information of the revenue generated by our operating entities to our Board. We will take necessary steps with respect to access to the books and records of our operating entities and fully cooperate with regulatory requests in order to facilitate the Hong Kong Stock Exchange and the SFC's access to information of these operating entities based abroad.

You may experience difficulties in effecting service of legal process, enforcing Shareholders' rights and foreign judgments or bringing actions against our management named in this document based on foreign laws.

We are a company incorporated under the laws of Hong Kong. The rights of the Shareholders and the fiduciary duties of our Directors under the Hong Kong laws may differ in some respects from what they would be under statutes or judicial precedents of other jurisdictions where investors may be located.

Substantially all of our assets are located outside of Hong Kong and the PRC, some of our Directors and executive officers reside within the PRC and some of the assets of those persons are located within the PRC. It may be difficult, complicated and time-consuming for investors to effect service of process upon those persons inside the PRC or to enforce against us or them in the PRC any judgments obtained from non-PRC courts. A judgment of a court of another jurisdiction may only be reciprocally recognized or enforced if the jurisdiction has a treaty with the PRC or if the judgment complies with the principle of reciprocity and do not violate the basic principles of the PRC laws, national sovereignty, security, social interests and public interests, subject to the satisfaction of other requirements. On January 25, 2024, the Supreme People's Court issued the Arrangement on Mutual Recognition and Enforcement of Judgments in Civil and Commercial Matters by Courts of the Mainland and of the Hong Kong Special Administrative Region (關於內地與香港特別行政區法院相互認可和執行民商事案件判決的安排) (the "**Arrangement**"), which was implemented on January 29, 2024. Under the Arrangement, any relevant party may apply to the relevant PRC court or Hong Kong court for recognition and enforcement of a final court judgment in civil and commercial cases subject to the conditions set forth in the Arrangement. Although the Arrangement has come into effect, uncertainties remain as to the outcome and effectiveness of any action brought under the Arrangement. The recognition and enforcement of foreign judgments are provided for under the PRC Civil Procedures Law. Courts in China may recognize and enforce foreign judgments in accordance with the requirements of the PRC Civil Procedures Law on basis of either on (i) the treaties between China and the country where the judgment is made or (ii) on principles of reciprocity between jurisdictions. In addition, according to the PRC Civil Procedures Law, the courts in China will not enforce a foreign judgment against us or our Directors and officers if they decide that the judgment violates the basic principles of PRC law or national sovereignty, security or public interest. As a result, in case of violation of the above principles, there is no assurance that a judgment rendered by a court outside the PRC would be recognized and enforced in a court in mainland China.

We may rely to a significant extent on dividends and other distributions on equity paid by our principal operating subsidiaries to fund cash and financing requirements. Any limitation on the ability of our operating subsidiaries to make payments to us could have a material adverse effect on our ability to conduct our business.

We are a holding company and rely on dividends and other distributions on equity paid by our principal operating entities for our cash and financing requirements, including the funds necessary to pay dividends and other cash distributions to our Shareholders, fund inter-company loans, service any debt we may incur and pay our expenses. When our principal operating entities incur additional debt, the instruments governing the debt may restrict their ability to pay dividends or make other distributions or remittances to us. Furthermore, the laws, rules and regulations applicable to our principal operating subsidiaries and certain other subsidiaries permit payments of dividends only out of their retained earnings, if any, determined in accordance with applicable accounting standards and regulations. The distribution of dividends to us from the subsidiaries in the other geographic markets in which we operate is subject to restrictions imposed by the applicable laws and regulations in these markets. Any limitation on the ability of our subsidiaries to make payments to us could have a material and adverse effect on our ability to conduct our business.

Governmental control of currency conversion may limit our ability to utilize our revenues effectively and affect the value of your investment.

We expect to receive a portion of any future revenues we earn in local currencies. Under our current corporate structure, our Hong Kong holding company may rely on dividend payments from our subsidiaries incorporated in other countries to fund any cash and financing requirements we may have. The distribution of dividends to us from the subsidiaries in these markets as well as other markets in which we operate may be subject to restrictions imposed by the applicable laws and regulations in these markets. See "— We may rely to a significant extent on dividends and other distributions on equity paid by our principal operating subsidiaries to fund cash and financing requirements. Any limitation on the ability of our operating subsidiaries to make payments to us could have a material adverse effect on our ability to conduct our business." The local government may exercise discretion in accordance with applicable laws and regulations and restrict access in the future to foreign currencies and/or US dollars. Our failure to obtain sufficient foreign currencies or US dollars to satisfy our demands may have a material adverse impact on our ability to fund our operations in other jurisdictions and our ability to pay dividends in foreign currencies to our Shareholders.

RISKS RELATING TO THE [REDACTED] AND THE [REDACTED]

If the [REDACTED] of our Shares is higher than our consolidated net tangible book value per Share, purchasers of our Shares in the [REDACTED] may experience immediate dilution upon such purchases, and may experience further dilution if we issue additional Shares in the future.

The [REDACTED] of our Shares is expected to be higher than the net tangible assets per Share immediately prior to the [REDACTED]. Therefore, purchasers of our Shares in the [REDACTED] will experience an immediate dilution in net tangible asset value per Share. In addition, in order to expand our business, we may consider offering and issuing additional securities in the future. Purchasers of our Shares may experience dilution in the net tangible asset value per Share of their [REDACTED] in Shares if we issue additional securities in the future at a price which is lower than the net tangible asset value per Share prior to the issuance of such additional securities.

In addition, there is no assurance that the Controlling Shareholders will not dispose of their Shares following the expiration of their respective lock-up periods after the [REDACTED]. We cannot predict the effect, if any, of any future sales of the Shares by any of our Controlling Shareholders, or that the availability of the Shares offered by any of the Controlling Shareholders for purchase may have on the market price of the Shares. Sales of a substantial number of Shares by any of our Controlling Shareholders or the market perception that such sales may occur could materially and adversely affect the prevailing market price of the Shares.

There is no prior public market for our Shares and an active trading market for our Shares may not develop.

Prior to the [REDACTED], there was no public market for our Shares. An active public market may not develop or be sustained after the [REDACTED]. The initial [REDACTED] range for our Shares was the result of, and the [REDACTED] will be the result of, negotiations among us and the [REDACTED] on behalf of the [REDACTED] and may not be indicative of prices that will prevail in the trading market after the [REDACTED]. We have applied for the [REDACTED] of, and permission to deal in, our Shares on the Stock Exchange. However, even if approved, being [REDACTED] on the Stock Exchange does not guarantee that an active trading market for our Shares will develop or be sustained. If an active market for our Shares does not develop after the [REDACTED], the market price and liquidity of our Shares may be adversely affected. As a result, you may not be able to resell your Shares at prices equal to or greater than the price paid for the Shares in the [REDACTED].

The liquidity and market price of our Shares may be volatile, which may result in substantial losses for investors purchasing our Shares pursuant to the [REDACTED].

The price and trading volume of our Shares may be volatile as a result of the following factors, as well as others, which are discussed in this "Risk Factors" section or elsewhere in this Document, some of which are beyond our control:

- actual or anticipated fluctuations in our results of operations (including variations arising from foreign exchange rate fluctuations);
- news regarding loss of key personnel by us or recruitment of key personnel by our competitors;
- announcements of competitive developments, acquisitions or strategic alliances in our industry;
- changes in earnings estimates or recommendations by financial analysts;
- potential litigation or regulatory investigations;
- changes in general economic conditions or other developments affecting us or our industry;
- price movements on international stock markets, the operating and stock price performance of other companies, other industries and other events or factors beyond our control; and
- release of any lock-up or other transfer restrictions on the outstanding Shares or sales or perceived sales of additional Shares by our Company or other Shareholders.

In addition, the securities markets have from time to time experienced significant price and volume fluctuations that are not related or disproportionate to the operating performance of particular companies. This may include a general global economic downturn, substantial volatility in equity securities markets, and volatility and tightening of liquidity in credit markets. While it is difficult to predict how long these conditions will last, they could continue to present risks for an extended period of time. If we experience such fluctuations, results of operations and financial position could be materially and adversely affected. Moreover, market fluctuations may also materially and adversely affect the market price of our Shares.

The market price of our Shares when trading begins could be lower than the [REDACTED] as a result of, among other things, adverse market conditions or other adverse developments that could occur between the time of sale and the time trading begins.

The [REDACTED] will be determined on the [REDACTED]. However, the [REDACTED] will not commence trading on the Stock Exchange until they are delivered, which is expected to be on the second business day after the [REDACTED]. As a result, investors may not be able to sell or otherwise deal in the [REDACTED] during that period. Accordingly, holders of the [REDACTED] are subject to the risk that the price of the [REDACTED] when trading begins could be lower than the [REDACTED] as a result of adverse market conditions or other adverse developments that may occur between the time of sale and the time trading begins.

Future or perceived sales of substantial amounts of our Shares could affect their market price.

The market price of our Shares could decline as a result of future sales of substantial amounts of our Shares or other related securities, the issuance of new shares or other securities, or the perception that such sales may occur. Our ability to raise future capital at favorable times and prices may also be materially and adversely affected. Our Shares held by the relevant Controlling Shareholders are currently subject to certain lock-up undertakings. For more details, see "[REDACTED]" However, there is no assurance that following the expiration of the lock-up periods, these Shareholders will not dispose of any Shares. We cannot predict the effect of any future sales of the Shares by any of our Shareholders on the market price of our Shares.

Our Controlling Shareholders have substantial control over our Company and their interests may not be aligned with the interests of the other Shareholders.

Prior to and immediately following the completion of the [REDACTED], our Controlling Shareholders will remain having substantial control over their interests in the issued share capital of our Company. Subject to, among others, the Articles of Association and the Listing Rules, the Controlling Shareholders by virtue of their controlling beneficial ownership of the share capital of the Company, will be able to exercise significant control and exert significant influence over our business or otherwise on matters of significance to us and other Shareholders by voting at the general meeting of the Shareholders and at Board meetings. The interests of the Controlling Shareholders may differ from the interests of other Shareholders and the Shareholders are free to exercise their votes according to their interests. Our Controlling Shareholder may cause us to undertake certain corporate transactions or not enter into certain corporate transactions, which may not be in the best interests of our other Shareholders. We cannot assure you that our Controlling Shareholder will vote on Shareholders' resolutions in a way that will benefit all of our Shareholders. To the extent that the interests of the Controlling Shareholders conflict with the interests of other Shareholders, the interests of other Shareholders can be disadvantaged and harmed.

In addition, there is no assurance that the Controlling Shareholders will not dispose of their Shares following the expiration of their respective lock-up periods after the [REDACTED]. We cannot predict the effect, if any, of any future sales of the Shares by any of our Controlling Shareholders, or that the availability of the Shares offered by any of the Controlling Shareholders for purchase may have on the market price of the Shares. Sales of a substantial number of Shares by any of our Controlling Shareholders or the market perception that such sales may occur could materially and adversely affect the prevailing market price of the Shares.

We have significant discretion as to how to use the net [REDACTED] of the [REDACTED], and you may not necessarily agree on how we use them.

Our management may use the net [REDACTED] from the [REDACTED] in ways that you may not agree with or that do not yield a favorable return to our Shareholders. By investing in our Shares, you are entrusting your funds to our management, upon whose judgment you must depend, for the specific uses we will make of the net [REDACTED] from the [REDACTED]. For more information, see "Future Plans and Use of [REDACTED]."

Our dividend policy is subject to the discretion of our Directors and we may not declare dividends on our Shares in the future.

We do not currently have a dividend policy. We did not declare or pay any dividend during the Track Record Period. We may only pay dividends out of the profits of the Company available for distribution, and we may only pay dividends after recovery of accumulated losses. The amount of dividends actually distributed to our Shareholders will depend upon our earnings and financial position, operating requirements, capital requirements and any other conditions that our Directors may deem relevant and will be subject to the approval of our Shareholders. There is no assurance that dividends of any amount will be declared or distributed in any year in the future. For further details, see "Financial Information — Dividends."

Certain facts, forecast and other statistics in this document obtained from publicly available sources have not been independently verified and may not be reliable.

Certain facts, forecasts and other statistics in this Document are derived from various government, official sources and public information. However, our Directors cannot guarantee the reliability of such source materials. We believe that the sources of the said information are appropriate sources for such information and have taken reasonable care in extracting and presenting such information. We have no reason to believe that such information is false or misleading or that any fact has been omitted that would render such information false or misleading. Nevertheless, information from government and official sources has not been independently verified by us, the Joint Sponsors, the [REDACTED] or any of their respective affiliates or advisers and, therefore, we make no representation as to the accuracy of such facts and statistics. Further, we cannot assure our investors that they are stated or compiled on the same basis or with the same degree of accuracy as similar statistics presented elsewhere. In all cases, our investors should consider carefully how much weight or importance should be attached to or placed on such facts or statistics.

If securities or industry analysts do not publish research reports about our business, or if they adversely change their recommendations regarding our Shares, the market price and trading volume of our Shares may decline.

The trading market for the [REDACTED] will depend in part on the research and reports that securities or industry analysts publish about us or our business. If research analysts do not establish and maintain adequate research coverage or if one or more of the analysts who covers us downgrades the [REDACTED] or publishes inaccurate or unfavorable research about our business, the market price for the [REDACTED] would likely decline. If one or more of these analysts cease coverage of our Company or fail to publish reports on us regularly, we could lose visibility in the financial markets, which, in turn, could cause the market price or trading volume for the [REDACTED] to decline.

You should read the entire document carefully and should not rely on any information contained in press articles or other media relating to us, the [REDACTED] or the [REDACTED].

We strongly caution you not to rely on any information contained in press articles or other media regarding us and the [REDACTED]. Prior to the publication of this Document, there has been press and media coverage regarding us, our business, our industry and the [REDACTED]. Such press and media coverage may include references to certain information that does not appear in this Document, including certain operating and financial information and projections, valuations and other information. None of us or any other person involved in the [REDACTED] has authorized the disclosure of any such information in the press or media and none of us accepts any responsibility for any such press or media coverage or the accuracy or completeness of any such information or publication. Our Company, the Joint Sponsors, the [REDACTED], any of our and their respective directors, supervisors, officers, representatives, employees, advisors or any other persons or parties involved in the [REDACTED] make no representation as to the appropriateness, accuracy, completeness or reliability of any such information or publication. To the extent that any such information is inconsistent or conflicts with the information contained in this document, our Company, the Joint Sponsors, the [REDACTED], any of our and their respective directors, supervisors, officers, representatives, employees, advisors or any other persons or parties involved in the [REDACTED] disclaim responsibility for it, and you should not rely on such information.

Forward-looking statements contained in this Document are subject to risks and uncertainties.

This document contains certain statements and information that are forward-looking and uses forward-looking terminology such as "believe," "expect," "estimate," "predict," "aim," "intend," "will," "may," "plan," "consider," "anticipate," "seek," "should," "could," "would," "continue," and other similar expressions. You are cautioned that reliance on any forward-looking statement involves risks and uncertainties and that any or all of those assumptions could prove to be inaccurate and as a result, the forward-looking statements based on those assumptions could also be incorrect. INFORMATION ABOUT THIS DOCUMENT AND THE [REDACTED]

[REDACTED]

INFORMATION ABOUT THIS DOCUMENT AND THE [REDACTED]

[REDACTED]

In preparation for the [REDACTED], our Company has applied for the following waivers from strict compliance with the relevant provisions of the Listing Rules:

WAIVER IN RELATION TO CONNECTED TRANSACTIONS

Our Group has entered into, and expects to continue after the [REDACTED], certain transactions which will constitute partially-exempt or non-exempt continuing connected transactions under the Listing Rules upon the [REDACTED]. Our Company has applied to the Stock Exchange for, and the Stock Exchange [has granted] us, certain waivers from strict compliance with Chapter 14A of the Listing Rules in respect of the continuing connected transactions as disclosed in "Connected Transactions". For further details, see "Connected Transactions".

WAIVER IN RELATION TO MANAGEMENT PRESENCE

Rule 8.12 of the Listing Rules requires our Company to have a sufficient management presence in Hong Kong. This normally means that at least two of our Company's executive Directors must be ordinarily resident in Hong Kong. Since our Company's core business operations are based, managed and conducted outside of Hong Kong, our Company does not have, and for the foreseeable future will not have, sufficient management presence in Hong Kong for the purpose of satisfying the requirements of the Listing Rules.

Accordingly, we have applied to the Stock Exchange for, and the Stock Exchange has granted us, a waiver from strict compliance with Rule 8.12 of the Listing Rules on the condition that the following arrangements be made for maintaining regular communication with the Stock Exchange:

(a) our Company has appointed Mr. Yiu Kai ("**Mr. Yiu**"), an executive Director of our Company, and Mr. Ho Kin Wai ("**Mr. Ho**"), a joint company secretary of our Company, as our Company's authorized representatives for the purpose of Rule 3.05 of the Listing Rules to serve as our Company's principal channel of communication with the Stock Exchange. Mr. Yiu and Mr. Ho ordinarily reside in Hong Kong. Each of our authorized representatives will be available to meet with the Stock Exchange to discuss any matters in relation to our Company within a reasonable period of time and will be readily contactable by phone and email to deal with enquiries from the Stock Exchange. As and when the Stock Exchange wishes to contact the Directors on any matter, each of our Company's authorized representatives will have the means to contact all of the Directors promptly at all times. Our Company will promptly inform the Stock Exchange of any change in our authorized representatives;

(b) our Company has provided our Company's authorized representatives with our Directors' respective office phone numbers, mobile phone numbers, fax numbers and e-mail addresses to the extent possible; and our Directors will provide our Company's authorized representatives with the phone numbers of their places of accommodation if they expect to travel or otherwise be out of office. Therefore, our Company's authorized representatives would have the means for contacting all Directors promptly at all times as and when the Stock Exchange wishes to contact our Directors on any matters;

(c) our Company has provided the Stock Exchange with the contact details of our Directors (including their respective office phone numbers, mobile phone numbers, fax numbers and e-mail addresses, to the extent possible) to facilitate the communication with the Stock Exchange. Furthermore, each Director who does not ordinarily reside in Hong Kong has confirmed that he possesses or is able to apply for valid travel documents to visit Hong Kong and is able to meet with the Stock Exchange within a reasonable period after requested by the Stock Exchange;

(d) in accordance with Rule 3A.19 of the Listing Rules, our Company has appointed Somerley Capital Limited as our Company's compliance advisor, to act as an additional channel of communication with the Stock Exchange at least for the period commencing on the [REDACTED] and ending on the date on which our Company complies with Rule 13.46 of the Listing Rules in respect of the financial results for the first full financial year commencing immediately after the [REDACTED]. Our Company's compliance advisor will be available to respond to any inquiries from the Stock Exchange concerning our Company and will act as the principal channel of communication with the Stock Exchange when the Authorized Representatives are not available. In addition, our Company's compliance advisor will also advise on the on-going compliance requirements and other issues arising under the Listing Rules after the [REDACTED]; and

(e) our Company will retain a Hong Kong legal advisor to advise our Company on on-going compliance requirements and other issues arising under the Listing Rules and other applicable laws and regulations in Hong Kong (as amended and supplemented from time to time) after the [REDACTED].

WAIVER IN RELATION TO THE DISCLOSURE REQUIREMENTS WITH RESPECT TO CHANGES IN SHARE CAPITAL

We have applied for, and the Stock Exchange [has granted], a waiver from strict compliance with the requirements of paragraph 26 of Part A of Appendix 1 to the Listing Rules in respect of disclosing the particulars of any alterations in the capital of any member of the Group within two years immediately preceding the issue of this Document.

We have identified seven entities that we consider are the major subsidiaries primarily responsible for the track record results of our Group (the "**Selected Entities**", and each a "**Selected Entity**"). Our Group has approximately 38 subsidiaries in total, across 13 different jurisdictions upon the completion of our Reorganization. It would be unduly burdensome for our Company to disclose this information, which would not be material or meaningful to investors. By way of illustration, prior to the Reorganization, for the years ended December 31, 2022, 2023 and 2024, (i) the aggregate revenue of the Selected Entities represented 100%, 100% and 100% of our Group's total revenue, respectively, and (ii) the aggregate total assets of the Selected Entities represented 96%, 99% and 95% of our Group's total assets, respectively. Accordingly the remaining subsidiaries in our Group are insignificant to the overall results of our Group and none of which contributes to more than 5% our Group's total assets for each period of our Track Record Period. Similarly, subsequent to our Reorganization, we expect the remaining subsidiaries to continue to be insignificant to the overall results of our Group.

Particulars of the changes in the share capital of our Company and the Selected Entities have been disclosed in "Statutory and General Information — 1. Further Information about our Group — (b) Changes in the Share Capital of our Company" and "Statutory and General Information — 1. Further Information about our Group — (e) Changes in the Share Capital of Our Major Subsidiaries" in Appendix VI to this Document.

WAIVER IN RELATION TO JOINT COMPANY SECRETARIES

Pursuant to Rules 3.28 and 8.17 of the Listing Rules, the company secretary must be an individual who, by virtue of his/her academic or professional qualifications or relevant experience, is, in the opinion of the Stock Exchange, capable of discharging the functions of the company secretary. The Stock Exchange considers the following academic or professional qualifications to be acceptable:

(a) a member of The Hong Kong Chartered Governance Institute;

(b) a solicitor or barrister (as defined in the Legal Practitioners Ordinance); and

(c) a certified public accountant (as defined in the Professional Accountants Ordinance).

Pursuant to Note 2 to Rule 3.28 of the Listing Rules, in assessing "relevant experience", the Stock Exchange will consider the individual's:

(a) length of employment with the issuer and other issuers and the roles he/she played;

(b) familiarity with the Listing Rules and other relevant law and regulations including the Securities and Futures Ordinance, the Companies Ordinance, the Companies (Winding Up and Miscellaneous Provisions) Ordinance and the Takeovers Code;

(c) relevant training taken and/or to be taken in addition to the minimum requirement of taking not less than 15 hours of relevant professional training in each financial year under Rule 3.29 of the Listing Rules; and

(d) professional qualifications in other jurisdiction.

Pursuant to paragraph 13 of Chapter 3.10 of the Listing Guide, the Stock Exchange will consider a waiver application by an issuer in relation to Rules 3.28 and 8.17 of the Listing Rules based on the specific facts and circumstances. Factors that will be considered by the Stock Exchange include:

(a) whether the issuer has principal business activities primarily outside Hong Kong;

(b) whether the issuer was able to demonstrate the need to appoint a person who does not have the Acceptable Qualification (as defined under paragraph 11 of Chapter 3.10 of the Listing Guide) nor Relevant Experience (as defined under paragraph 11 of Chapter 3.10 of the Listing Guide) as a company secretary; and

(c) why the directors consider the individual to be suitable to act as the issuer's company secretary.

Further, pursuant to paragraph 13 of Chapter 3.10 of the Listing Guide, such waiver, if granted, will be for a fixed period of time (the "**Waiver Period**") and on the following conditions:

(a) the proposed company secretary must be assisted by a person who possesses the qualifications or experience as required under Rule 3.28 of the Listing Rules and is appointed as a joint company secretary throughout the Waiver Period; and

(b) the waiver will be revoked if there are material breaches of the Listing Rules by the issuer.

Our Company considers that while it is important for the company secretary to be familiar with the relevant securities regulation in Hong Kong, he/she also needs to have experience relevant to our Company's operations, nexus to the Board and close working relationship with the management of our Company in order to perform the function of a company secretary and to take the necessary actions in the most effective and efficient manner. At the same time, given we will continue to be a subsidiary of Zijin Mining, it is also for the benefit of our Company to appoint a person who is familiar with the compliance obligations of Zijin Mining and with the appropriate qualification as company secretary.

We have appointed Ms. Huang Xiaohong ("**Ms. Huang**") and Mr. Ho as our joint company secretaries. Ms. Huang is our vice president. Since Ms. Huang does not possess a qualification stipulated in Rule 3.28 of the Listing Rules, she is not able to solely fulfill the requirements as a company secretary of a listed issuer stipulated under Rules 3.28 and 8.17 of the Listing Rules. In order to provide support to Ms. Huang, we have appointed Mr. Ho, a fellow member of the Hong Kong Institute of Certified Public Accountants, a member of the Hong Kong Chartered Governance Institute and the Chartered Governance Institute, and holder of the qualification of Chartered Secretary, Chartered Governance Professional and Certified Public Accountant of Hong Kong, who meets the requirements under Rules 3.28 and 8.17 of the Listing Rules, as a joint company secretary to provide assistance to Ms. Huang, for a three-year period from the [REDACTED] so as to enable her to acquire the relevant experience (as required under Rule 3.28(2) of the Listing Rules) to duly discharge her duties. Mr. Ho is also a joint company secretary of Zijin Mining.

Accordingly, we have applied to the Stock Exchange for, and the Stock Exchange [has granted], a waiver from strict compliance with the requirements under Rules 3.28 and 8.17 of the Listing Rules in relation to the appointment of Ms. Huang as our joint company secretary. Pursuant to the Chapter 3.10 of the Listing Guide, such waiver has been granted on the conditions that:

(a) Mr. Ho is appointed as a joint company secretary to assist Ms. Huang in discharging her functions as a company secretary and in gaining the relevant experience under Rule 3.28 of the Listing Rules;

(b) our Company will further ensure that Ms. Huang has access to the relevant training and support to enable her to familiarize herself with the Listing Rules and the duties required of a company secretary of an issuer listed on the Stock Exchange. Our Hong Kong legal advisors have provided training to Ms. Huang on the principal requirements of the Listing Rules and the Hong Kong laws and regulations applicable to our Company after the [REDACTED]. In addition, Ms. Huang will endeavor to familiarize herself with the Listing Rules, including any updates to it, during the three-year period from the [REDACTED];

(c) Ms. Huang has confirmed that she will attend no less than 15 hours of training courses on the Listing Rules, corporate governance, information disclosure, investor relations as well as the functions and duties of a company secretary of a Hong Kong listed issuer during each financial year as required under Rule 3.29 of the Listing Rules;

(d) before the expiry of Ms. Huang's initial term of appointment as the company secretary of our Company, our Company will evaluate her experience in order to determine if she has acquired the qualifications required under Rule 3.28 of the Listing Rules; and

(e) this waiver will be revoked immediately if and when Mr. Ho ceases to provide such assistance during the three-year period, and we undertake to re-apply to the Stock Exchange for a waiver in the event that Mr. Ho ceases to meet the requirements under Rule 3.28 of the Listing Rules or otherwise ceases to serve as a joint company secretary of our Company. In addition, this waiver is subject to revocation in the event of any material breaches of the Listing Rules by our Company.

Prior to the end of the three-year period, we will demonstrate and seek the confirmation from the Stock Exchange that Ms. Huang, having had the benefit of Mr. Ho during the three years, has attained the relevant experience and is capable of discharging the functions of our company secretary.

See "Directors and Senior Management" in this Document for further information regarding the qualifications of Ms. Huang and Mr. Ho.

The information and statistics set out in this section and other sections of this Document were extracted from the Frost & Sullivan Report prepared by Frost & Sullivan, which was commissioned by us, and from various official government publications and other publicly available publications. We engaged Frost & Sullivan to prepare the Frost & Sullivan Report, an independent industry report, in connection with the [REDACTED]. The information from official government sources has not been independently verified by us, the Joint Sponsors, [REDACTED], or any other parties involved in the [REDACTED], or any of our or their respective directors, officers, or representatives, and no representation is given as to its accuracy.

SOURCE AND RELIABILITY OF INFORMATION

We have commissioned Frost & Sullivan, an Independent Third Party, to conduct a study of Global gold and gold mining industry. We agreed to pay Frost & Sullivan a fee of US$58,750 for the preparation of Frost & Sullivan Report, and our directors consider that such fee reflects market rates and are of the view that the payment of the fee does not affect the fairness of conclusions drawn in Frost & Sullivan Report. Founded in 1961, Frost & Sullivan has over 45 global offices with more than 3,000 industry consultants, market research analysts, technology analysts and economists.

RESEARCH METHODOLOGY

During the preparation of the Frost & Sullivan Report, Frost & Sullivan conducted primary research that involved discussing the status of the industry with industry participants and industry experts, as well as secondary research that involved reviewing company reports, independent research reports and Frost & Sullivan's own database. Our Directors have confirmed that there has been no adverse change in the market situation since the date of Frost & Sullivan Report which may qualify, contradict, or have impact on the information of this section.

BASIS AND ASSUMPTION

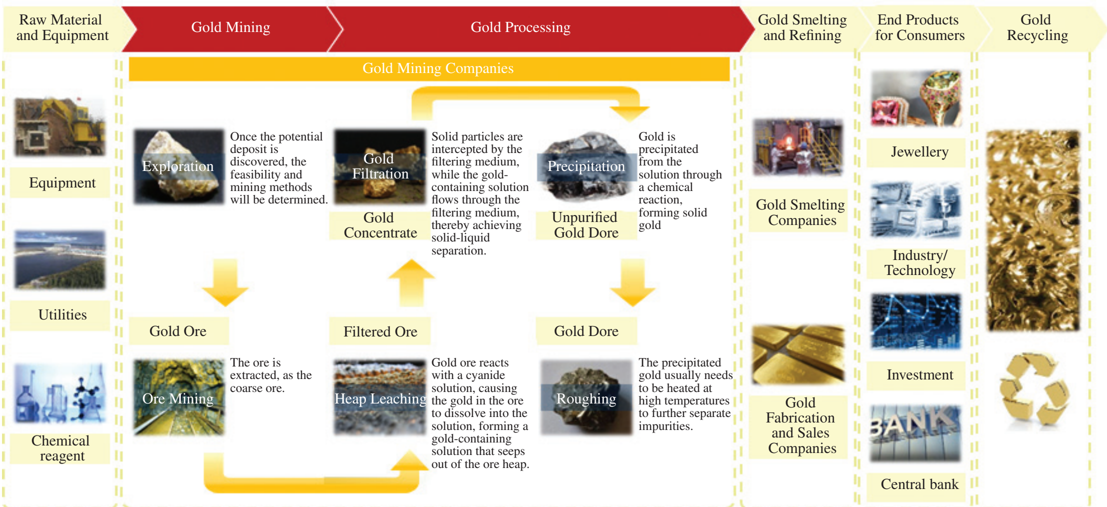
Frost & Sullivan Report was compiled based on the following assumptions: (i) government policies on gold and gold mining industries globally and in the major countries discussed will remain consistent during the forecast period; (ii) the global gold and gold mining industries will be driven by the factors which are stated in Frost & Sullivan Report.

OVERVIEW OF THE GOLD MINING INDUSTRY

Introduction of Gold

Gold is a precious metal used for coinage, jewellery, and high-tech manufacturing. Gold products include gold concentrate, doré, ingot, bullion, coins, and derivatives. The upstream of gold mining industry includes raw material and equipment supply. The midstream includes processes of gold mining, gold processing, gold smelting and refining. Downstream includes gold products for different uses such as jewellery, industry/technology, investment and central bank reserve, as well as gold recycling. Global gold supply mainly comes from gold mine and recycled gold, with gold mine being the most important source of gold supply. Gold mining refers to the process of extracting ore from the earth's crust. Modern gold mining usually takes place in areas where significant concentration of gold-bearing ores exists.

Value Chain of Global Gold Mining Industry



Source: Frost & Sullivan

Global Gold Demand

Global demand for gold is generally divided into the following categories: (i) jewellery, (ii) investment (including gold ingots, bars, coins and exchange traded funds ("**ETF**"), (iii) central bank reserves, and (iv) technological or industrial use. Historically, gold was mainly consumed for jewellery fabrication, gold ingots, bars and coins for value preservation purposes and central bank reserves. Nowadays, besides abovementioned uses, gold is also increasingly used for technology and industry purposes such as high-end and precise manufacturing, as well as dentistry. Moreover, gold is also frequently traded in financial market as gold-linked ETF products develop. Central banks are putting emphasize on having gold reserves for hedging financial risks.

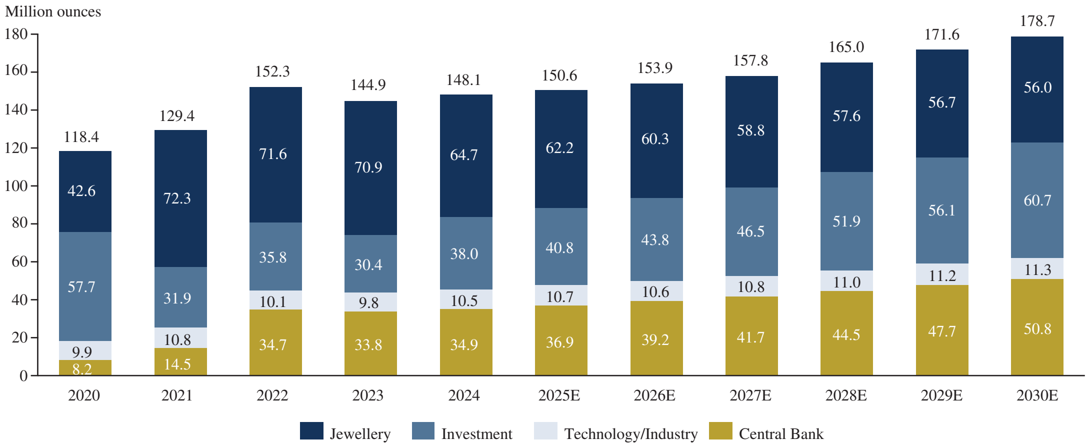
Global gold demand increased at a CAGR of 5.8% from 2020 to 2024, reaching 148.1 million ounces (4,606.1 tonnes) in 2024. Compared to 2023, global gold demand rose in 2024, mainly due to higher gold reserve demand from central banks and increased investment demand fuelled by the need for risk diversification.

Investments include purchase of gold ingots, bars and coins as well as ETF. In 2021, investments in gold decreased by more than 40% compared with the 2020 level. This was mainly caused by a decrease in gold investments through ETFs. In 2022, investments in gold increased, especially for investments in gold ingots, coins and bars, which was largely due to geopolitical concerns and hedging against inflation. In 2023, investments in gold decreased by 15% compared with the 2022 level. This was mainly caused by the rising gold price. In 2024, global investments in gold demonstrated an increasing trend, with total global gold investment increasing to 38.0 million ounces (1,181.7 tonnes).

From 2024 to 2030, global gold demand is expected to grow steadily at a CAGR of 3.2% mainly due to (i) increase in gold demand by central banks for value preservation and risk diversification, in the context of current geopolitical uncertainties; and (ii) increase in gold demand for investment.

Gold Demand (by end use), Global, 2020–2030E

	Jewellery	Investment	Technology/ Industry	Central Bank	Total
CAGR 20–24	11.0%	-9.9%	1.4%	43.7%	5.8%
CAGR 24–30E	-2.4%	8.1%	1.2%	6.4%	3.2%

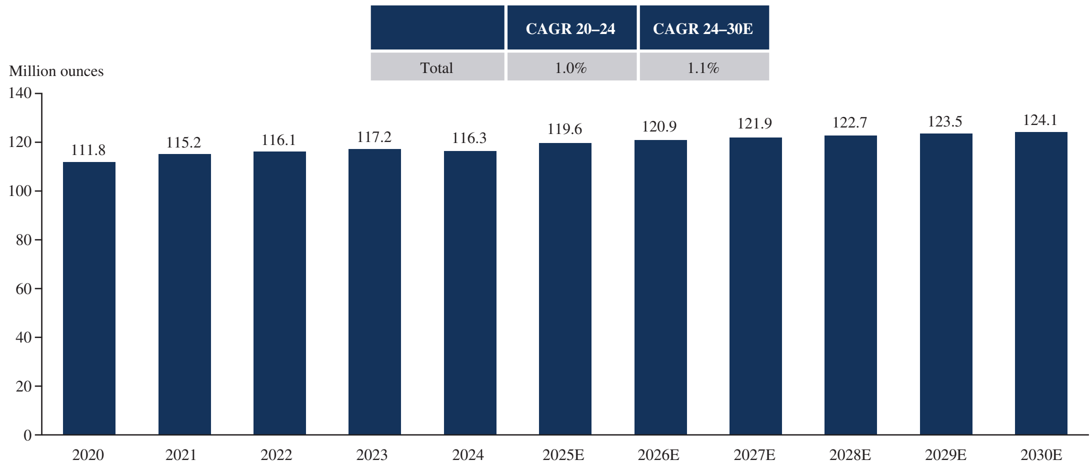


Source: World Gold Council, Frost & Sullivan

Global Gold Mine Production

From 2020 to 2024, global gold mine production experienced a period of moderate growth and slight fluctuations. The global gold mine production increased from 111.8 million ounces (3,475.9 tonnes) to 116.3 million ounces (3,618.4 tonnes), with a modest CAGR of 1.0% during the period. During the forecast period, the global gold mine production is expected to experience continued growth over the next few years. This trend is primarily driven by the increasing importance of gold's safe-haven attributes in the face of geopolitical conflicts and economic uncertainties, which has led to a significant rise in investment demand and drove the increase in gold mine production. Additionally, potential advancements in mining technologies and improvements in operational efficiencies are also expected to contribute to the increase in gold mine production. From 2024 to 2030, the forecasted gold mine production is projected to follow an upward trajectory, increasing from 116.3 million ounces (3,618.4 tonnes) to 124.1 million ounces (3,860.8 tonnes), with a CAGR of 1.1% during the period.

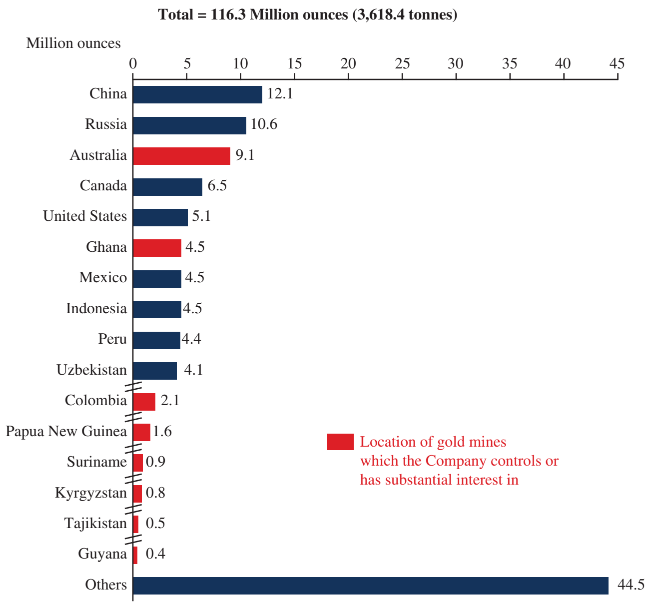
Gold Mine Production, Global, 2020–2030E



Source: World Gold Council, Frost & Sullivan

In 2024, the top ten gold-producing countries accounted for 65.5 million ounces (2,038.2 tonnes) of gold mine production, representing 56.3% of the world's total gold mine output.

Gold Mine Production (by countries), Global, 2024

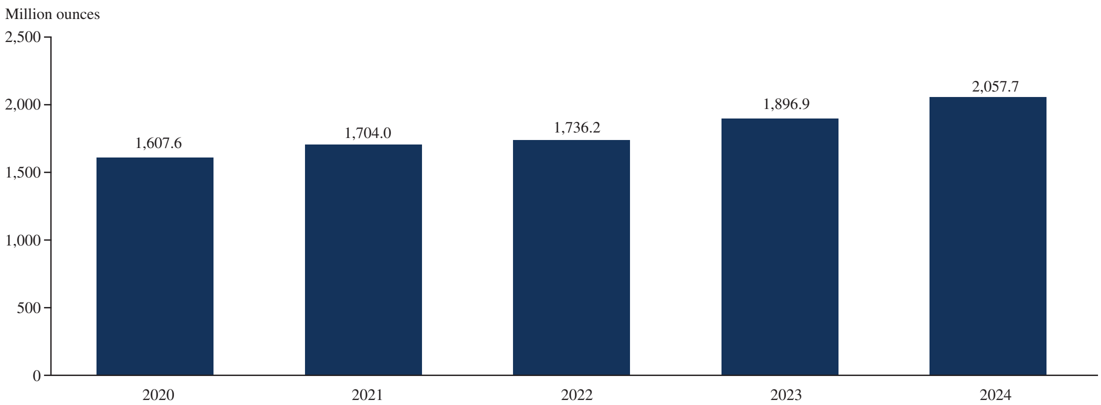


Source: World Gold Council, Frost & Sullivan
Note: Countries after Uzbekistan are not in ranked order.

Global Gold Reserves

From 2020 to 2024, the global gold reserves have shown a continuous upward trend. This trend is driven by several key factors. Technological advancements in exploration have increased the efficiency and accuracy of resource detection, leading to the discovery of more potential reserves. Governments' supportive policies have also encouraged enterprises to invest more in exploration and development. In addition, with the recovery and growth of the global economy, the demand for various resources has also been steadily increasing, prompting industries to boost their investment in resource development. From 2020 to 2024, the global gold reserves grew from 1,607.6 million ounces (50,000.0 tonnes) to 2,057.7 million ounces (64,000.0 tonnes).

Gold Reserves, Global, 2020–2024



Source: The U.S. Geological Survey, Frost & Sullivan

Note: Gold reserves refer to part of the reserve base that could be economically extracted or produced at the time of determination and include only recoverable materials.

In 2024, the top ten countries in terms of gold reserves held a total of 1,556.1 million ounces (48,400.0 tonnes) of gold, accounting for 75.6% of the world's total gold reserves.

Gold Reserves by Countries, Global, 2024

Note: Countries after Uzbekistan are not in ranked order.

Global All-in Sustaining Cost

AISC is an important indicator for measuring the cost of gold production. Gold producers usually adopt various measures such as refined management and production process optimization to achieve a large-scale, intensive, and mechanized production model, in order to control and reduce AISC, thereby improving the company's production efficiency and profitability, and increasing gold production. From Q1 2022 to Q4 2024, the global average AISC increased moderately, rising from US$1,229.9 per ounce to US$1,450.2 per ounce. When the gap between the gold price and AISC widens, gold producers tend to increase production to maximize profits.

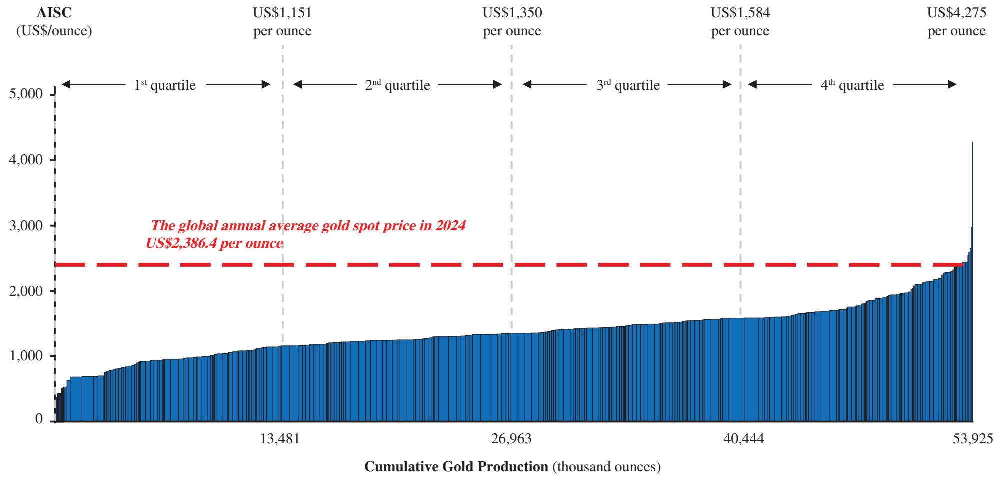
8	Company B	1,484.0
9	Company A	1,516.0
10	Company F	1,611.0
11	Company H	1,629.0
12	Company J	1,686.0
13	Company I	1,961.8
14	Company N	2,126.0
15	Company K	N/A*

Source: Annual Report, Frost & Sullivan
Note: Company K has not disclosed AISC during 2024.

Global Cost Curve

The gold cost curve illustrates the distribution of gold mine production across various cost levels as a proportion of total global output. In 2024, the annual average gold spot price remained above the AISC for the majority of gold mines. This indicates that the gold mining industry has been broadly profitable, with most companies able to generate earnings at prevailing price levels. Such favorable market conditions not only strengthen the financial stability and investment appeal of gold mining companies, but also incentivize increased capital expenditure in production and exploration. As a result, the industry's overall supply capacity is expected to improve.

Cost Curve, Global, 2024



Source: Frost & Sullivan

Global Gold Price

The persistent gold-buying behavior of global central banks, especially the substantial purchases by emerging market central banks, has provided strong support for gold prices. Meanwhile, the uncertainty of the global economy, including the anticipated changes in interest rate policies and fiscal dynamics, particularly the uncertainty surrounding the US budget process, has further enhanced the appeal of gold as a safe-haven asset. Between 2010 and 2024, global annual average gold prices demonstrated an upward trend with fluctuations and reached US$2,386.4 per ounce in 2024, according to London Bullion Market Association (LBMA) Gold Price. In the context of de-dollarization, emerging market central banks may further increase their gold reserves, driving the annual average gold price to continue rising during the forecast period and reach US$3,387.7 per ounce by 2026, according to London Bullion Market Association (LBMA) Gold Price.

Price Analysis of Raw Materials

Diesel, as a crucial raw material for gold mining, is primarily utilized in the operation of heavy machinery and transportation vehicles within mining sites. The global diesel price has experienced significant fluctuations over the past few years. It increased from US$0.8 per liter in 2020 to US$1.3 per liter in 2022, and then slightly decreased to US$1.2 per liter in 2024.

Market Drivers of Global Gold Mining Industry

- ***Global Demand Resurgence.*** The worldwide demand for gold is experiencing a notable upsurge, driven by multiple factors. From 2024 to 2030, global gold demand is expected to grow steadily at a CAGR of 3.2% mainly due to (i) increase in gold demand by central banks for value preservation and risk diversification, in the context of current geopolitical uncertainties; and (ii) increase in gold demand for investment globally. As a traditional store of value, gold's appeal is intensifying amid economic uncertainties. Inflationary pressures and fluctuating currency values are prompting investors to seek the stability that gold offers. This trend aligns perfectly with the strategic focus of leading gold producers on expanding their global asset base. Companies with robust resource and reserves and production capabilities are well-positioned to meet the rising market demand, leveraging their extensive experience in gold mining and exploration to ensure a steady supply.

- ***Technological Advancements in Mining.*** Advancements in mining technology are revolutionizing the gold mining industry. Innovative techniques and equipment are enhancing extraction efficiencies, reducing costs, and making previously uneconomical deposits viable. Leading companies in the sector have been at the forefront of adopting and developing cutting-edge technologies. The commitment to technological innovation not only boosts operational efficiency but also strengthens their competitive edge in the global market. By integrating advanced technologies into their mining processes, these companies are able to optimize resource utilization and production, ensuring sustainable growth in the evolving gold mining industry landscape.

Development Trend of Global Gold Mining Industry

- ***Digital Transformation in Gold Mining.*** The gold mining industry is on the cusp of a digital revolution. Companies are increasingly integrating advanced technologies such as artificial intelligence, machine learning, and automation into their operations. These digital tools enhance efficiency, reduce operational risks, and improve decision-making processes. By leveraging data analytics and predictive modelling, gold producers can optimize mining and processing activities, leading to higher productivity and cost savings. This digital transformation is set to reshape the industry, making it more resilient and responsive to market changes.

- ***ESG Focus and Sustainable Practices.*** Environmental, social, and governance (ESG) factors are increasingly influencing the gold mining industry. Consumers and investors are demanding higher ESG standards, driving companies to adopt sustainable practices. Leading gold producers have proactively embraced ESG principles, implementing responsible mining practices across their operations. The dedication to environmental protection, community engagement, and ethical business conduct enhances their reputation and market appeal. By adhering to high ESG standards, these companies not only meet the expectations of stakeholders but also contribute to the long-term sustainability of the gold mining industry.

- ***Exploration and New Discoveries***. The search for new gold deposits is a crucial trend in the industry. With existing mines facing depletion challenges, companies are investing heavily in exploration technologies and geological research. Advanced geophysical and geochemical techniques, along with satellite imagery and data analytics, are helping to identify potential new gold deposits in remote and previously unexplored areas. This focus on exploration is essential to ensure a steady supply of gold for the future.

- ***Rising Industry Concentration***. As market competition intensifies and resources become more concentrated, leading mining companies are leveraging their strengths in technology, funding, management, and resource acquisition to continuously expand their market share and gradually take a dominant position in the industry. Meanwhile, some less competitive companies are facing operational pressures, with some even choosing to exit the market. These changes in the industry landscape not only enhance the market influence of leading companies but also make the allocation of resources in the entire gold mining industry more concentrated and efficient, driving the industry's development towards greater scale and intensive operation.

Key Success Factors of Global Gold Mining Industry

- ***Operational Efficiency and Cost Management.*** Operational efficiency and cost control are critical to the long-term success of gold mining companies. Maintaining competitive AISC through optimized production processes, effective resource utilization, and technology adoption enhances profitability and resilience across commodity cycles. Efficient operations also support regulatory compliance, sustainability goals, and capital reinvestment for growth.

- ***Advanced Gold Exploration Technologies.*** In the competitive landscape of the gold mining industry, companies with superior gold exploration technologies will gain a significant edge in the future. As existing mines face depletion, the continuous and stable supply of gold increasingly relies on the discovery of new deposits. Advanced exploration technologies can more efficiently identify potential gold deposits, reduce exploration costs, and increase success rates, enabling gold mining companies to meet environmental regulatory challenges and ensuring the sustainability of exploration activities, thereby positioning them competitive in the market.

- ***Strategic Mergers and Acquisitions.*** Mergers and acquisitions (M&A) play a vital role in the growth and success of gold mining companies. A disciplined approach to acquisitions, focusing on high-quality assets in stable jurisdictions, has led to substantial reserve growth and stock price appreciation for some firms. Strategic M&A activities allow companies to expand their resource base, gain access to new markets, and achieve economies of scale, which are essential for long-term success.

- ***ESG Performance.*** ESG factors have become increasingly important in the gold mining industry. Companies with strong ESG performance are more likely to secure financing, maintain social licenses, and attract investors. For instance, 78% of institutional investors now mandate ESG pre-screening for mining investments, emphasizing the need for companies to invest in sustainable practices such as carbon reduction and water management. Adhering to high ESG standards not only mitigates risks but also enhances a company's reputation and long-term viability.

- ***Market Adaptability and Risk Management.*** The ability to adapt to changing market conditions and manage risks effectively is essential for gold mining companies. Fluctuations in gold prices, influenced by supply and demand dynamics, macroeconomic trends, and investor sentiment, present both challenges and opportunities. Companies must employ strategic planning and risk management strategies to navigate price volatility and ensure sustained profitability. Additionally, proactive risk management can safeguard assets and ensure stability in uncertain environments.

COMPETITIVE LANDSCAPE OF THE GOLD MINING INDUSTRY

The gold mining industry has become increasingly concentrated in recent years. This trend is largely driven by mergers and resource integration among leading gold producers. Major gold mining companies, with their efficient operations, global presence, financial strength, and other competitive advantages, are now at the forefront of the industry. These large gold mining companies have been able to achieve economies of scale through consolidation, which has allowed them to optimize production processes and reduce unit costs.

Simultaneously, regulatory controls, particularly those related to safety and environmental protection, have been further intensified. Gold production companies that are less competitive, with aging facilities and insufficient resources, have been compelled to either shut down or undergo substantial transformations. Moreover, the total production cost of gold mining has escalated. This is due to a combination of factors, including the decline in ore grade, the increased mining of refractory resources, and the heightened investment in safety and environmental protection. As a result, smaller gold mining companies have gradually been exiting the market.

Ranking of Global Gold Mining Industry

The top 15 global gold producers contributed approximately 30.5% of the global gold mine production in 2024. Among these leading companies, the Group ranked eleventh globally in 2024, with total gold production of 1.5 million ounces (45.3 tonnes) from its seven mines. Also, among these producers, the Group ranked first in production growth with a CAGR of 21.4% from 2022 to 2024.

Ranking of Gold Producers (by gold mine production), Global, 2024

Rank	Company	Gold Mine Production	Market Share	Production CAGR 2022–2024
		(Million oz)	(%)	(%)
1	Company A	6.5	5.6%	4.8%
2	Company B	3.9	3.4%	–2.8%
3	Company C	3.5	3.0%	5.4%
4	Company D	3.1	2.7%	4.7%
5	Company E	3.0	2.6%	8.7%
6	Company F	2.7	2.3%	–1.5%
7	Company G	2.2	1.9%	5.3%
8	Company H	2.1	1.8%	–7.1%
9	Company I	1.6	1.4%	2.4%
10	Company J	1.6	1.3%	2.5%
11	**The Group**	**1.5**	**1.2%**	**21.4%**
12	Company K	1.2	1.1%	9.3%
13	Company L	1.1	0.9%	–2.5%
14	Company M	0.8	0.7%	–11.5%
15	Company N	0.7	0.6%	6.5%
	Others	80.9	69.5%	—
	Total	**116.3**	**100%**	**—**

Note: The production of the PNG Porgera Gold Mine is not included in the calculation of the Group's production in the ranking. Zijin Mining is not included in the ranking. The production of Company K's listed subsidiary is excluded from the calculation of Company K's production in the ranking.

Company A was established in 1921 and is listed on the New York Stock Exchange.

Company B was established in 1983 and is listed on the New York Stock Exchange and Toronto Stock Exchange.

Company C was established in 1957and is listed on the New York Stock Exchange and Toronto Stock Exchange.

Company D was established in 1958 and is not publicly listed.

Company E was established in 2006 and is listed on London Stock Exchange and Moscow Exchange.

Company F was established in 2004 and is listed on Johannesburg Stock Exchange, New York Stock Exchange and Australian Securities Exchange.

Company G was established in 1993 and is listed on Toronto Stock Exchange and New York Stock Exchange.

Company H was established in 1998 and is listed on Johannesburg Stock Exchange, New York Stock Exchange and Toronto Stock Exchange.

Company I was established in 2003 and is listed on Australian Securities Exchange.

Company J was established in 1950 and is listed on Johannesburg Stock Exchange.

Company K was established in 2000 and is listed on Shanghai Stock Exchange and Hong Kong Stock Exchange.

Company L was established in 2017 and is listed on London Stock Exchange and Toronto Stock Exchange.

Company M was established in 2007 and is listed on Toronto Stock Exchange and New York Stock Exchange.

Company N was established in 2013 and is listed on Johannesburg Stock Exchange and New York Stock Exchange.

As of December 31, 2024, the Group ranked ninth globally with 26.1 million ounces (809.9 tonnes) of gold reserves.

Ranking of Gold Producers (by reserves), Global, 2024

Rank	Company	Reserves (Million oz)
1	Company A	134.1
2	Company E	116.7
3	Company B	89.0
4	Company C	54.3
5	Company D	51.0
6	Company H	44.3
7	Company F	31.2
8	Company J	28.5
9	**The Group**	**26.1**
10	Company G	21.9
11	Company I	20.9
12	Company L	18.4
13	Company K	18.2
14	Company M	8.8
15	Company N	7.2

Note: Reserves include proven and probable gold reserves. The reserves of the PNG Porgera Gold Mine is not included in the calculation of the Group's reserves in the ranking.

Entry Barriers of Global Gold Mining Industry

- ***Policy Barrier.*** Policy barriers present significant challenges for new entrants in the global gold mining industry. Governments in key gold-producing countries impose strict regulatory frameworks, including complex permitting processes, environmental compliance requirements, and land-use restrictions, which can delay projects for years. Many jurisdictions also enforce resource nationalism, such as higher royalties, export restrictions, or mandatory local ownership, reducing profitability for foreign investors. Additionally, political instability in some gold-rich regions creates uncertainty over contract enforcement and property rights, deterring long-term investment. These policy hurdles favor established mining firms with the expertise and financial resources to navigate regulatory landscapes, while raising the risk and cost for newcomers, further consolidating industry dominance among a few major players.

- ***Resource Barrier.*** The global gold mining industry faces significant resource barriers to entry, primarily due to the limited availability of high-quality gold deposits and the high capital intensity required for exploration and development. First, economically viable gold reserves are geographically concentrated in a few regions (e.g., China, Russia, Australia, and Africa), and most easily accessible deposits have already been exploited, forcing new entrants to explore in remote or politically unstable areas. Second, the industry requires massive upfront investments in exploration, mine development, and infrastructure with long payback periods, deterring smaller players. Additionally, declining ore grades and stricter environmental regulations further increase operational costs, making it difficult for newcomers to compete with established miners who benefit from economies of scale, existing reserves, and advanced extraction technologies.

- ***Capital Barrier***. Capital barriers pose a formidable challenge for new entrants in the global gold mining industry. Developing a gold mine requires enormous upfront investments, often exceeding billions of dollars, to cover exploration, feasibility studies, infrastructure, and production setup — with no guaranteed returns. The industry's long payback periods (often 10+ years) and exposure to volatile gold prices further deter risk-averse investors. Established players benefit from economies of scale, existing cash flows, and access to cheaper financing, while newcomers face high borrowing costs or equity dilution to secure funding. Additionally, stringent environmental and ESG (Environmental, Social, and Governance) standards now demand even greater capital for sustainable operations, widening the gap between incumbents and potential competitors. These financial hurdles reinforce the dominance of well-capitalized majors and limit market entry for smaller firms.

- ***Technology Barrier***. Technology barriers significantly restrict new entrants in the global gold mining industry. Modern gold extraction and processing rely on advanced technologies, such as automated drilling, sensor-based ore sorting, and bioleaching, which require specialized expertise and high R&D investments. Established firms leverage proprietary technologies and decades of operational data to optimize recovery rates and reduce costs, while newcomers face steep learning curves and inefficiencies. Additionally, deeper and lower-grade deposits demand cutting-edge exploration tech and sustainable solutions, raising entry costs further. Without access to these innovations, smaller players struggle to compete, reinforcing the dominance of tech-equipped industry leaders.

HISTORY AND DEVELOPMENT

Overview

Zijin Mining was established in 2000 and principally engaged in the exploration, mining, processing, smelting, refining and sale of gold and other mineral resources in the PRC. Throughout the years, Zijin Mining has expanded its mining operations to various overseas jurisdictions.

Over the past 20 years, Zijin Mining (together with its subsidiaries) had made considerable progress in expanding its overseas gold mining assets, through acquiring the Tajikistan Jilau/Taror Gold Mines in 2007, the Kyrgyzstan Taldybulak Levoberezhny Gold Mine in 2011, the Australia Norton Gold Mine from 2012 to 2015, the Colombia Buriticá Gold Mine and Guyana Aurora Gold Mine in 2020, the Suriname Rosebel Gold Mine in 2023 and the Ghana Akyem Gold Mine in 2025. In addition, Zijin Mining also had held interest in the PNG Porgera Gold Mine since 2015.

To facilitate the [REDACTED] and the [REDACTED], Zijin Mining has undergone corporate reorganization to consolidate all its overseas gold mine assets under our Company, positioning us as a significant player in the global gold mining industry. Save for the Colombia Buriticá Gold Mine which we operate via the Colombia Entrustment Arrangement, the equity interests of all the overseas gold mines will be transferred to our Company prior to the completion of the [REDACTED], and Zijin Mining will not, following completion of the [REDACTED], engage in the exploration and mining of gold outside the PRC. For further details, please refer to "— Our Company, our Shareholding and the Reorganization — Reorganization" below and "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement".

Key business development milestones

The following is a summary of the key milestones and achievements in the business development of our Group:

Year	Event
2007	Acquisition of the Tajikistan Jilau/Taror Gold Mines.
2011	Acquisition of the Kyrgyzstan Taldybulak Levoberezhny Gold Mine.
2012 to 2015 . .	Acquisition of the Australia Norton Gold Mine.
2015	Investment in the PNG Porgera Gold Mine.
2020	Acquisition of the Colombia Buriticá Gold Mine and Guyana Aurora Gold Mine.
2023	Acquisition of the Suriname Rosebel Gold Mine.

Year	Event
2025	Acquisition of the Ghana Akyem Gold Mine.
	Completion of the Reorganization.
	Proposed acquisition of the Kazakhstan Raygorodok Gold Mine.

OUR COMPANY, OUR SHAREHOLDING CHANGES AND THE REORGANIZATION

Incorporation of our Company and initial shareholding changes

On October 22, 2007, our Company was incorporated in Hong Kong under the Companies Ordinance as a company with limited liability and a wholly-owned subsidiary of Zijin Northwest. As of the date of incorporation, one fully-paid Share was issued to Zijin Northwest at HK$1.

On January 25, 2013, our Company allotted 545,999,999 Shares to Zijin Northwest at HK$1 per Share.

The Reorganization

In preparation for the [REDACTED], the following steps were implemented to establish our Group:

1. Subscription of Shares in our Company

On March 14, 2025, our Company further allotted 1,171,000,000 Shares to Gold Mountains (H.K.) at approximately HK$6.7 per Share. On May 6, 2025, our Company further allotted 558,000,000 Shares to Gold Mountains (H.K.) at approximately HK$28.5 per Share.

Immediately after such share allotments, our Company was held as to 24% and 76% by Zijin Northwest and Gold Mountains (H.K.) respectively.

2. Acquisition of Porgera Jersey

On April 29, 2025, our Company entered into a share purchase agreement with Jinyu (H.K.), pursuant to which our Company agreed to acquire 50% of the equity interest in Porgera Jersey from Jinyu (H.K.), at a consideration of US$60,000,000, subject to post-completion adjustment with reference to the net asset value of Porgera Jersey on June 30, 2025, i.e., the completion date of such transaction.

Upon completion of the share purchase on June 24, 2025, Porgera Jersey became a joint venture between our Company and Barrick Mining Corporation, an Independent Third Party.

Porgera Jersey is a non-controlling shareholder of New Porgera, a company which holds the mining license of the PNG Gold Mine.

3. *Acquisition of Superb Pacific*

On April 29, 2025, our Company entered into a share purchase agreement with Gold Mountains (H.K.), pursuant to which our Company agreed to acquire 100% of the equity interest in Superb Pacific from Gold Mountains (H.K.), at a base consideration of US$170,000,000, subject to post-completion adjustment with reference to the net asset value of Superb Pacific on June 30, 2025, i.e., the completion date of such transaction.

Upon completion of the share purchase on June 30, 2025, Superb Pacific became a wholly-owned subsidiary of our Company.

Superb Pacific is the investment holding company of Altynken LLC, which manages the Kyrgyzstan Taldybulak Levoberezhny Gold Mine and holds the mining license.

4. *Acquisition of Guyana Goldfields*

On April 29, 2025, our Company entered into a share purchase agreement with Gold Mountains (H.K.), pursuant to which our Company agreed to acquire 100% of the equity interest in Guyana Goldfields from Gold Mountains (H.K.), at a consideration of US$440,000,000, subject to post-completion adjustment with reference to the net asset value of Guyana Goldfields on June 30, 2025, i.e., the completion date of such transaction.

Upon completion of the share purchase on June 30, 2025, Guyana Goldfields became a wholly-owned subsidiary of our Company.

Guyana Goldfields is the investment holding company of AGM Inc., which manages the Guyana Aurora Gold Mine and holds the mining license.

5. *Acquisition of Silver Source*

On May 9, 2025, our Company entered into a share purchase agreement with Gold Mountains (H.K.), pursuant to which our Company agreed to acquire 100% of the equity interest in Silver Source from Gold Mountains (H.K.), at a consideration of US$320,000,000, subject to post-completion adjustment with reference to the net asset value of Silver Source on June 30, 2025, i.e., the completion date of such transaction.

Upon completion of the share purchase on June 30, 2025, Silver Source became a wholly-owned subsidiary of our Company.

Silver Source is the investment holding company of Rosebel GM, which manages the operations of the Suriname Rosebel Gold Mine and holds the mining license.

6. Acquisition of Norton Gold Fields

On May 15, 2025, our Group entered into a share purchase agreement with Jinyu (H.K.), pursuant to which our Group agreed to acquire 100% of the equity interest in Norton Gold Fields from Jinyu (H.K.), at a consideration of US$260,000,000, subject to post-completion adjustment with reference to the net asset value of Norton Gold Fields on June 30, 2025, i.e., the completion date of such transaction.

Upon completion of the share purchase on June 30, 2025, Norton Gold Fields became an indirect wholly-owned subsidiary of our Company.

Norton Gold Fields, together with its wholly-owned subsidiaries, own and operate the Australia Norton Gold Mine. The material mining licenses comprising the Australia Norton Gold Mine are held by Norton Gold Fields and its wholly-owned subsidiaries.

7. Colombia Entrustment Arrangement

We entered into the Colombia Entrustment Arrrangement to allow our Company and our shareholders to enjoy the economic benefit of Zijin America, the intermediate holding company of the Colombia Buriticá Gold Mine, and maintain clear delineation between our Group and Zijin Mining Group. Please see "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement."

Completion of the Reorganization

Upon completion of the Reorganization and immediately before the [REDACTED], our Company was held as to 24% and 76% by Zijin Northwest and Gold Mountains (H.K.) respectively, each in turn being wholly-owned by Zijin Mining. The necessary regulatory approvals in relation to the implementation of Reorganization [have been] obtained.

Our Subsidiaries and Joint Venture

We carry out our business through various principal subsidiaries and a joint venture, as well as two entities that are combined to our financial information through Colombia Entrustment Arrangement, the details of which are set out as follows:

No.	Name	Place and date of establishment	Issued share capital	Shareholding	Principal business activities
1.	Altynken LLC	April 2006, Kyrgyzstan	KGS$10,000	60% by Superb Pacific[(1)]	Operating the daily business of the Kyrgyzstan Taldybulak Levoberezhny Gold Mine
2.	AGM Inc.	November 2011, Guyana	US$63,000,500	100% by Guyana Goldfields	Operating the daily business of the Guyana Aurora Gold Mine

No.	Name	Place and date of establishment	Issued share capital	Shareholding	Principal business activities
3.	Rosebel GM	May 2002, Suriname	US$8,000,000	95% by Silver Source(2)	Operating the daily business of the Suriname Rosebel Gold Mine
4.	Zarafshon JV.	December 2008, Tajikistan	TJS$73,474,747	70% by our Company(3)	Operating the daily business of the Tajikistan Jilau/Taror Gold Mines
5.	Norton Gold Fields .	December 2004, Australia	AUD186,845,000	100% indirectly by our Company	Operating the daily business of the Australia Norton Gold Mine
6.	Continental Gold Colombia Branch *(a branch company of Continental Gold)*	July 2007, Colombia	COP11,238,405,220	100% by CGI(4)	Operating the daily business of the Colombia Buriticá Gold Mine(5)
7.	CGI.	July 7, 2021, Ontario, Canada	100 Shares	100% by Zijin America(5)	Holding company of Continental Gold and trading of gold
8.	Zijin Golden Ridge . .	October 1997, Ghana	GHS$455,709,071.4	100% by Gold Source	Operating the daily business of the Ghana Akyem Gold Mine
9.	Porgera Jersey (*joint venture*)	September 2021, Jersey	US$18,600,002	50% by our Company	A non-controlling shareholder of New Porgera(6), a company which holds the mining license of the PNG Porgera Gold Mine

Notes:

1. Altynken LLC is directly held as to 60% by Superb Pacific and 40% by Kyrgyzaltyn Open Joint Stock Company, an Independent Third Party (save for being a connected person of our Company at subsidiary level due to its shareholding in Altynken LLC).
2. Rosebel GM is directly held as to 95% class A shares by Silver Source and 5% class A shares by the government of Suriname, an Independent Third Party. Silver Source holds 100% of the class B Shares of Rosebel GM.
3. Zarafshon JV is directly held as to 70% by our Company and 30% by the government of the Republic of Tajikistan, an Independent Third Party (save for being a connected person of our Company at subsidiary level due to its shareholding in Zarafshon JV).
4. Continental Gold Colombia Branch is a branch company of Continental Gold. Continental Gold is wholly-owned by CGI.
5. Pursuant to the Colombia Entrustment Arrangement, the assets, liabilities and operation results of Zijin America, the intermediate holding company of the Colombia Buriticá Gold Mine will be consolidated to the financial results of our Company. For further details, please refer to "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement" in this Document.
6. New Porgera is held as to 49% by Porgera Jersey and the remaining 51% by (i) Kumul Minerals (Porgera) Limited as to 36%; (ii) MRDC Porgera (Escrow) Limited as to 10%; and (iii) Mineral Resources Enga Limited as to 5%, all of which are Independent Third Parties. Porgera Jersey is owned as to 50% by our Company and 50% by Barrick Mining Corporation, an Independent Third Party. As the Reorganization of New Porgera is not completed by end of December 31, 2024, the financial contribution by New Porgera is not reflected in the financial information of the Group for the three years ended December 31, 2024. New Porgera is not considered as our subsidiary upon completion of Reorganization and completion of the [REDACTED].

ACQUISITIONS DURING AND AFTER THE TRACK RECORD PERIOD

Acquisition of the Suriname Rosebel Gold Mine

On October 18, 2022, Zijin Mining and Silver Source entered into a share purchase agreement with IAMGOLD Corporation ("**IAG**"), a New York Stock Exchange and Toronto Stock Exchange listed company (the "**Rosebel SPA**"). Pursuant to the Rosebel SPA, Silver Source acquired 95% of the outstanding class A Shares and 100% of the outstanding class B Shares of Rosebel GM held by IAG for a consideration of US$371 million (the "**Rosebel Acquisition**"). The purchase price of the Rosebel Acquisition was determined based on due diligence of Rosebel GM and on normal commercial terms. Rosebel GM is a Suriname company and is mainly engaged in the exploration, mining, processing and sales of gold and other minerals. It holds 100% ownership interest in the Suriname Rosebel Gold Mine. Following the completion of the Rosebel Acquisition, Rosebel GM became a non-wholly owned subsidiary by Silver Source.

Acquisition of the Ghana Akyem Gold Mine

On October 9, 2024, Zijin Mining and Gold Source entered into a share purchase agreement (the "**Akyem SPA**") with Newmont Corporation ("**Newmont**") and Newmont Golden Ridge Ltd (a wholly-owned subsidiary of Newmont, "**Newmont Golden Ridge**"). Pursuant to the Akyem SPA, Gold Source acquired 100% of the equity interest in Newmont Golden Ridge for a consideration of US$1 billion (the "**Akyem Acquisition**"). The purchase price of the Akyem Acquisition was determined based on due diligence of Newmont Golden Ridge and on normal commercial terms. Newmont Golden Ridge is a company registered in Ghana and owns 100% of the Ghana Akyem Gold Mine, which is located in one of the world's major gold metallogenic belts. The Akyem Acquisition was completed on April 16, 2025. Following the completion of the Akyem Acquisition, Newmont Golden Ridge became a wholly-owned subsidiary of Gold Source and was subsequently renamed as Zijin Golden Ridge. For the years ended December 31, 2022, 2023 and 2024, the financial results of Zijin Golden Ridge would not form part of our financial results.

Each of the Rosebel Acquisition and Akyem Acquisition did not constitute a major transaction pursuant to Note 1 to Rule 4.05A of the Listing Rules.

Acquisition of the Kazakhstan Raygorodok Gold Mine

Background

On June 29, 2025, our Group entered into an agreement with Cantech S.à.r.l ("**Cantech**") (the "**Kazakhstan SPA**") in relation to the acquisition of all issued share capital in each of RG Gold LLP ("**RGG**") and RG Processing LLP ("**RGP**", together RGG, the "**Target Companies**"), which together held the Raygorodok Gold Mine in Kazakhstan (the "**Kazakhstan Raygorodok Gold Mine**") for a cash consideration of

US$1.2 billion, subject to customary adjustments with reference to the financial information of the Target Companies as of September 30, 2025 (the "**Kazakhstan Acquisition**").

Cantech is an investment holding company, which is owned as to 65% by V Group International S.A (under management of Verny Capital, one of the largest equity investment companies in Kazakhstan, acting as an investment advisor to V Group International S.A.) and as to 35% by RCF VII-RG Gold S.a.r.l, which is affiliated with Resource Capital Funds, a U.S. private equity firm focused on mining and resource investments. Each of Cantech, V Group International S.A., and RCF VII-RG Gold S.a.r.l, is and their respective ultimate beneficial owners is an Independent Third Party.

Each of RGG and RGP was incorporated in Kazakhstan. The mining asset and mining rights of the Kazakhstan Raygorodok Gold Mine were held by RGG, and the processing plant asset of the Kazakhstan Raygorodok Gold Mine was held by RGP. According to the audited financial information of the RGG and RGP provided by the Target Companies, the revenue, profit before tax and net profit for each of RGG and RGP for the years ended December 31, 2023 and December 31, 2024 are as follows:

	For the financial year ended December 31,	
	2023	2024
	(US$ million)	(US$ million)
RGG		
Revenue	367	473
Profit before tax	127	213
Net profit	101	172
RGP		
Revenue	121	153
Profit before tax	29	31
Net profit	29	31

According to the audited financial information of RGG and RGP provided by the Target Companies, as of December 31, 2024, the total assets of RGG and RGP amounted to US$293 million and US$310 million, respectively; total liabilities of RGG and RGP amounted to US$88 million and US$221 million, respectively; and net assets of RGG and RGP amounted to US$205 million and US$89 respectively.

The above financial information of RGG and RGP was provided and prepared by the Target Companies in accordance with IFRS. Given each of RGG and RGP is owned by the Seller, we have presented the financial information of RGG and RGP as separate standalone entities and not on a consolidated basis.

Information about the Target Companies and the Kazakhstan Raygorodok Gold Mine

The Kazakhstan Raygorodok Gold Mine is located in the Burabay region of Akmola Province in northern Kazakhstan. The core mining right of the Kazakhstan Raygorodok Gold Mine is a subsoil use contract which is valid until December 31, 2040. The Kazakhstan Raygorodok Gold Mine also holds six exploration rights, two geological study permits, and one subsoil space use permit.

The Kazakhstan Raygorodok Gold Mine consists of 2 open pits (South and North Raygorodok). According to the technical information provided by the Seller and the Target Companies in October 2024, the Resource and Reserve estimates as of December 31, 2023 were as follows:

- **Mineral Resources (with a cut-off gold price of US$2000/ounce):** Total mineral resources amounted to 241 million tons, with an average Au grade of 1.01 g/t, totaling 242.1 tons of gold metal.

- **Ore Reserves (with a cut-off gold price of US$1750/ounce):** Ore Reserves amounts to 94.9 million tonnes, with an average gold grade of 1.06 g/t, totaling 100.6 tons of gold metal.

The Kazakhstan Raygorodok Gold Mine is an active open-pit mine in production. It comprises two open pits (North and South Raygorodok) located 2 kilometers apart. The production and operation of both open-pits are stable, with a detailed mine plan. The types of ores in the open-pit mines include oxide ore, mixed ore and primary ore.

In 2016, the heap leach plant of the Kazakhstan Raygorodok Gold Mine completed construction and commenced operation, which was mainly used to treat oxide ore. In 2022, a new carbon-in-pulp (CIP) cyanidation plant was constructed and commissioned. In 2024, the Kazakhstan Raygorodok Gold Mine achieved processing capacity of 5.76 million tonnes of ore per year, with a gold recovery of around 88%. From 2022 to 2024, the project produced 2.0 tonnes, 5.9 tonnes and 6.0 tonnes of gold dore, respectively.

According to the information provided by Cantech, the Kazakhstan Raygorodok Gold Mine has a Life of Mine of 16 years (from 2025 to 2040), with an average annual gold production of 5.5 tonnes. Based on the preliminary research of our technical team, if proper optimization and technical renovation investments are put in place, the mining and processing capacity may be upgraded to 10 million tonnes per annum. We also believe that the production volume and economic efficacy of the Kazakhstan Raygorodok Gold Mine may be further improved through optimisation of open-pit mining, modification of processing technologies and procedures and other improvement measures.

The above technical and operational information in this section in relation to Kazakhstan Raygorodok Gold Mine, including, among other things, its Resources and Reserves, production, processing and recovery, was provided by Cantech, the Target Companies or their third party advisers to our Company in connection with the Kazakhstan Acquisition (as appropriate).

Terms of the Kazakhstan SPA

The principal terms of the Kazakhstan SPA are set out as follows:

Date	June 29, 2025
Purchaser.	Jinha (Singapore) Mining Pte. Ltd., a wholly owned subsidiary of our Company, which will set up a wholly-owned subsidiary in Astana International Financial Centre in Kazakhstan as the equity interest transferee of the interests in the Target Companies
Seller.	Cantech S.à.r.l
Target	Entire issued share capital in each of RGG and RGP
Consideration	US$1.2 billion (on a "cash-free and debt-free" basis), to be further adjusted by Cantech and our Group based on the amount of cash, working capital, interest-bearing debts and other related items in the financial statements as at September 30, 2025, wherein the interest-bearing debts will continue to be borne by the Target Companies. If the Kazakhstan Acquisition is completed after September 30, 2025, the operating income of the Target Companies after September 30, 2025 shall belong to our Group. The Consideration was determined by the Cantech and our Group after arm's length negotiation with reference to the mineral resources and ore reserves, production, processing and recovery, expansion and optimization prospects, as well as the financial information of the Target Companies.
Conditions precedent . . .	The conditions precedent to the completion of the Kazakhstan Acquisition include: a) the Purchaser having received the written consent for economic concentration from the Agency for Protection and Development of Competition of the Republic of Kazakhstan for the acquisition of the Target Companies; b) the Purchaser having received the written consent of the relevant competent authority stating that it consents to the transaction contemplated under the Kazakhstan SPA; and

c) the Purchaser having received the regulatory outbound investment approvals, filings or registration required to be obtained from or completed with the applicable PRC authorities.

Other terms . . . . The Kazakhstan SPA also includes representations, warranties, covenants of both the Purchaser and the Seller to the Kazakhstan Acquisition, termination rights and other provisions customary for a transaction of this nature including with respect to transition services, tax matters, indemnification and dispute resolution.

Reasons for and Benefits of the Kazakhstan Acquisition

The Kazakhstan Raygorodok Gold Mine hosts relatively significant resource. It is a large-scale, active open pit mine, with a long mine life, and well-established infrastructure. The processing technologies of the project are mature, with relatively low all-in sustaining costs, contributing to strong financial performance. We see further opportunities in improving its operational efficiency and production levels. The Kazakhstan Acquisition is expected to have positive contribution to our Group's output and profits following the completion of the Kazakhstan Acquisition.

The Kazakhstan Acquisition aligns with our strategic direction to increase acquisitions of significant resources and projects. The Kazakhstan Raygorodok Gold Mine can generate favourable synergies with our Tajikistan Jilau/Taror Gold Mine and the Kyrgyzstan Taldybulak Levoberezhny Gold Mine. This can further deepen our engagement in the resource-rich Central Asia region in the future, and optimise our global resources allocation.

The Kazakhstan Acquisition is expected to enhance our asset scale, profitability, and global industry position. This is in line with our growth strategy. We expect the Kazakhstan Acquisition will further enrich our gold resource, increase our gold production, and accelerate the achievement our production growth.

Our Directors are of the view that the terms of the Kazakhstan Acquisition are fair and reasonable and in the interests of our Shareholders as a whole. We intend to obtain a loan to finance the payment of the consideration payable under the Kazakhstan SPA.

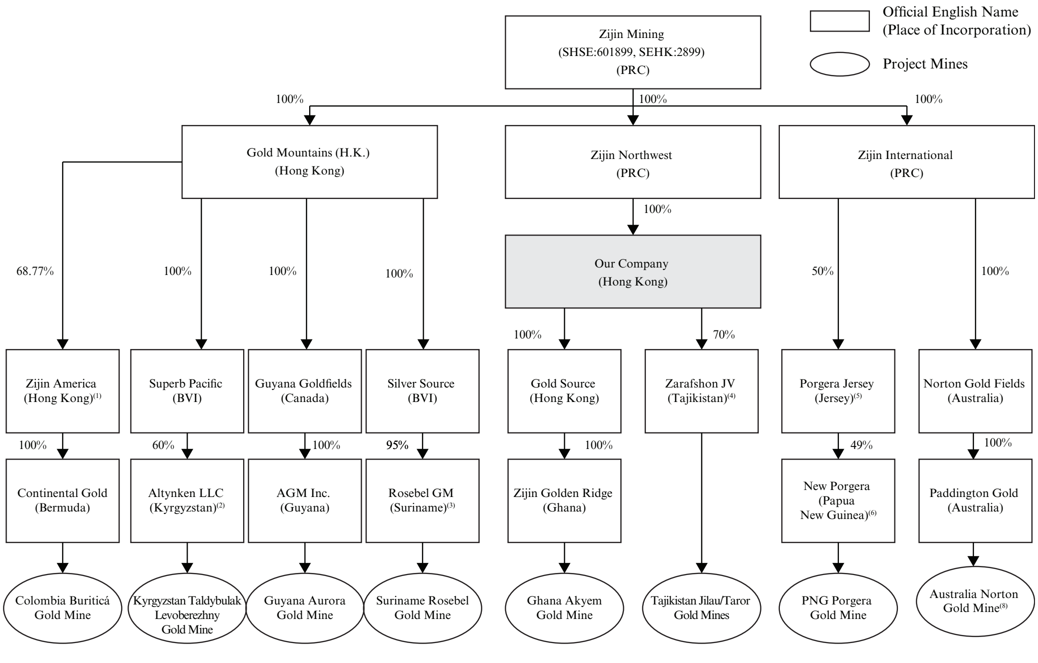
CORPORATE STRUCTURE OF OUR GROUP BEFORE THE REORGANIZATION

The following diagram sets out the corporate and shareholding structure of our Group immediately before the Reorganization:

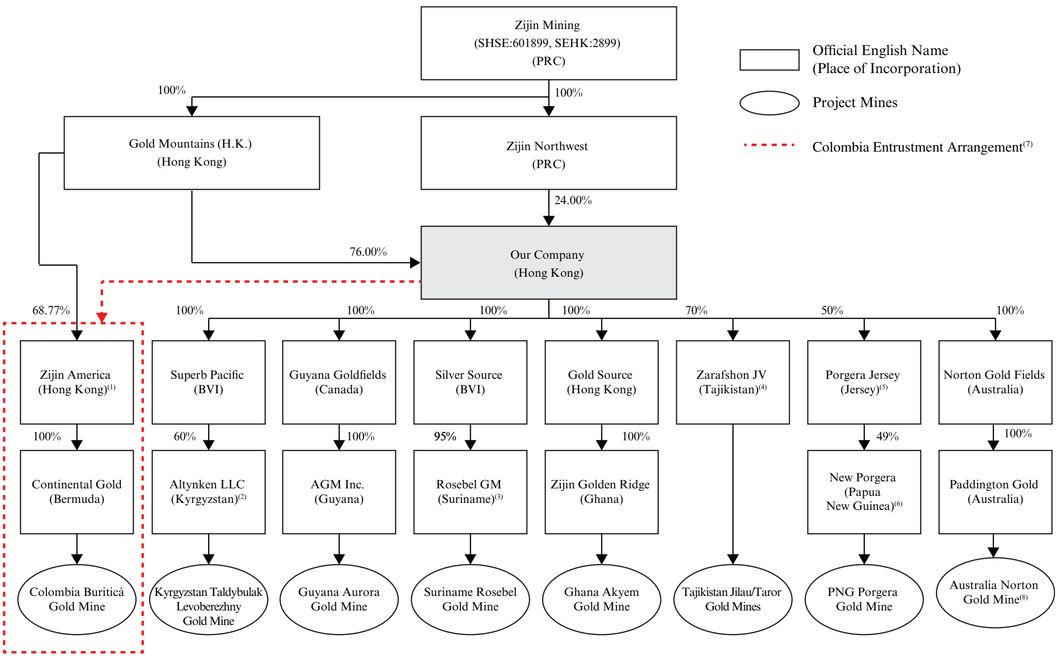


Notes:

1. Zijin America is directly held as to 68.77% by Gold Mountains (H.K.) and by (i) CLAI Gilding (BVI) Investment Limited as to 22.74%; (ii) ZLCFL-Cayman International Investment Cooperation Limited as to 7.26%; and (iii) Longyan Xinjing Investment Partnership (Limited Partnership) as to 1.23%, all of which are Independent Third Parties (save for CLAI Gilding (BVI) Investment Limited being a connected person of our Company at subsidiary level due to its shareholding in Zijin America).
2. Altynken LLC is directly held as to 60% by Superb Pacific and 40% by Kyrgyzaltyn JSC, an Independent Third Party (save for being a connected person of our Company at subsidiary level due to its shareholding in Altynken LLC).
3. Rosebel GM is directly held as to 95% class A shares by Silver Source and 5% class A shares by the government of Suriname, an Independent Third Party. Silver Source holds 100% of class B shares of Rosebel GM.
4. Zarafshon JV is directly held as to 70% by our Company and 30% by the government of the Republic of Tajikistan, an Independent Third Party (save for being a connected person of our Company at subsidiary level due to its shareholding in Zarafshon JV).
5. Porgera Jersey is a joint venture directly held as to 50% by our Company and 50% by Barrick Mining Corporation, an Independent Third Party.
6. New Porgera is directly held as to 49% by Porgera Jersey and the remaining 51% by (i) Kumul Minerals (Porgera) Limited as to 36%; (ii) MRDC Porgera (Escrow) Limited as to 10%; and (iii) Mineral Resources Enga Limited as to 5%, all of which are Independent Third Parties. Porgera Jersey is owned as to 50% by our Company and 50% by Barrick Mining Corporation, an Independent Third Party. As the Reorganization of New Porgera is not completed by end of December 31, 2024, the financial contribution by New Porgera is not reflected in the financial information of the Group for the three years ended December 31, 2024. New Porgera is not considered as our subsidiary upon completion of Reorganization and completion of the [REDACTED].
7. Pursuant to the Colombia Entrustment Arrangement, the assets, liabilities and operation results of the Colombia Buriticá Gold Mine will be consolidated to the financial results of our Company. For further details, please refer to "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement".
8. The mining assets and mining titles of the Australia Norton Gold Mine are primarily held by Norton Gold Fields and Paddington Gold.

SIMPLIFIED CORPORATE STRUCTURE OF OUR GROUP AFTER THE REORGANIZATION

The following diagram sets out the simplified corporate and shareholding structure of our Group immediately after completion of the Reorganization but before completion of the [REDACTED]:



Notes:

1. Zijin America is directly held as to 68.77% by Gold Mountains (H.K.) and by (i) CLAI Gilding (BVI) Investment Limited as to 22.74%; (ii) ZLCFL-Cayman International Investment Cooperation Limited as to 7.26%; and (iii) Longyan Xinjing Investment Partnership (Limited Partnership) as to 1.23%, all of which are Independent Third Parties (save for CLAI Gilding (BVI) Investment Limited being a connected persons of our Company at subsidiary level due to its shareholding in Zijin America).
2. Altynken LLC is directly held as to 60% by Superb Pacific and 40% by Kyrgyzaltyn JSC, an Independent Third Party (save for being a connected person of our Company at subsidiary level due to its shareholding in Altynken LLC).
3. Rosebel GM is directly held as to 95% class A shares by Silver Source and 5% class A shares by the government of Suriname, an Independent Third Party. Silver Source holds 100% of class B shares of Rosebel GM.
4. Zarafshon JV is directly held as to 70% by our Company and 30% by the government of the Republic of Tajikistan, an Independent Third Party (save for being a connected person of our Company at subsidiary level due to its shareholding in Zarafshon JV).
5. Porgera Jersey is a joint venture directly held as to 50% by our Company and 50% by Barrick Mining Corporation, an Independent Third Party.
6. New Porgera is directly held as to 49% by Porgera Jersey and the remaining 51% by (i) Kumul Minerals (Porgera) Limited as to 36%; (ii) MRDC Porgera (Escrow) Limited as to 10%; and (iii) Mineral Resources Enga Limited as to 5%, all of which are Independent Third Parties. Porgera Jersey is owned as to 50% by our Company and 50% by Barrick Mining Corporation, an Independent Third Party. As the Reorganization of New Porgera is not completed by end of December 31, 2024, the financial contribution by New Porgera is not reflected in the financial information of the Group for the three years ended December 31, 2024. New Porgera is not considered as our subsidiary upon completion of Reorganization and completion of the [REDACTED].
7. Pursuant to the Colombia Entrustment Arrangement, the assets, liabilities and operation results of Zijin America, the intermediate holding company of the Colombia Buriticá Gold Mine will be consolidated to the financial results of our Company. For further details, please refer to "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement".
8. The mining assets and mining titles of the Australia Norton Gold Mine are primarily held by Norton Gold Fields and Paddington Gold.

THE [REDACTED] OF OUR GROUP FROM ZIJIN MINING

PRC Regulatory Requirement On The [REDACTED]

Zijin Mining, one of our Controlling Shareholders, is a company listed in the Stock Exchange and the Shanghai Stock Exchange. The [REDACTED] of our Company constitutes a [REDACTED] from an A-Share listed company as defined under the Spin-off Rules. The [REDACTED] has been approved by the shareholders of Zijin Mining at an extraordinary general meeting held on June 26, 2025. Zijin Mining filed the relevant announcements related to the [REDACTED] with the Shanghai Stock Exchange on May 1, 2025, May 27, 2025, June 25, 2025 and June 27, 2025.

Hong Kong Regulatory Requirement On The [REDACTED]

Our [REDACTED] will constitute a [REDACTED] from Zijin Mining, one of our Controlling Shareholders. The proposal in relation to the [REDACTED] was submitted by Zijin Mining to the Stock Exchange for approval pursuant to Practice Note 15 of the Listing Rules ("**Practice Note 15**"), and the Stock Exchange has confirmed that Zijin Mining may proceed with the [REDACTED]. The board of directors of Zijin Mining believes that the [REDACTED] is beneficial to both Zijin Mining and our Company for the following reasons, among others:

(a) The [REDACTED] would enable investors to better value Zijin Mining with its focus on its retained business. The timing of the [REDACTED] and [REDACTED] coincides with the upward cycle of gold prices, which is beneficial for promoting the revaluation of Zijin Mining's gold assets. We will remain a subsidiary of Zijin Mining, with its financial results consolidated into Zijin Mining's consolidated financial statements upon [REDACTED]. The [REDACTED] and [REDACTED] are expected to significantly enhance Zijin Mining's overall value, shareholder value, and the levels of market value management and asset securitization;

(b) As the Group will be responsible for its own financing requirements, Zijin Mining will not need to consider the funding demands of the Group upon the completion of the [REDACTED] and the [REDACTED] and can therefore direct its financial resources to itself;

(c) As we are expected to remain as a subsidiary of Zijin Mining upon completion of the [REDACTED] and the [REDACTED], Zijin Mining will continue to benefit from any potential upside in our business through consolidation of the Group's financial performance and receipt of dividend income from the Group;

(d) The [REDACTED] will allow for the value of the Group to be reflected on its own merits and increase its operational and financial transparency through which investors would be able to appraise and assess the performance and potential of the Group separately and distinctly from those of Zijin Mining.

(e) The business of the Group has grown to a size sufficient to command a separate [REDACTED] status and the value of the Group is expected to be enhanced through the [REDACTED] given that:

(i) a [REDACTED] on the Stock Exchange will enhance our profile amongst its customers, suppliers and other business partners, as well as its ability to recruit talent;

(ii) a [REDACTED] on the Stock Exchange will provide clarity of the financial profile of our Group, thereby enabling us to directly and independently access both equity and debt capital markets and obtain better credit ratings in the future, should the need arise; and

(iii) our independent [REDACTED] will lead to a more direct alignment of our management's responsibilities and accountability with our operating and financial performance. This is expected to result in enhanced management focus, which should in turn lead to improved decision-making processes, faster response time to market changes and increased operational efficiency. The management of our Company will be under heightened scrutiny from the investor community and it will be possible to measure their performance against the stock market performance of us relative to publicly traded industry peers. It will also be possible to link management incentives to such performance, thereby increasing management motivation and commitment.

The [REDACTED], if it proceeds, will not constitute a notifiable transaction for Zijin Mining under the Listing Rules.

Practice Note 15 requires Zijin Mining to have due regard to the interests of their respective existing shareholders by providing them with an [REDACTED], either by way of a [REDACTED] or by way of a [REDACTED] in the [REDACTED] of our Company (the "**[REDACTED]**").

Pursuant to the applicable laws and regulations in the PRC, due to the restrictions on profit distribution in the PRC Company Law and its articles of association, Zijin Mining will not be able to, by way of [REDACTED], [REDACTED] the Shares to its shareholders in order to fulfil the [REDACTED]. Further, fulfilling the [REDACTED] by way of [REDACTED]. An extraordinary general meeting of all shareholders of Zijin Mining and class shareholders' meetings of each of the A Share shareholders and H Share shareholders of Zijin Mining was held on June 26, 2025 pursuant to Zijin Mining's articles of association to approve the [REDACTED]. As a result, Zijin Mining will provide the [REDACTED] to the [REDACTED] by way of the [REDACTED].

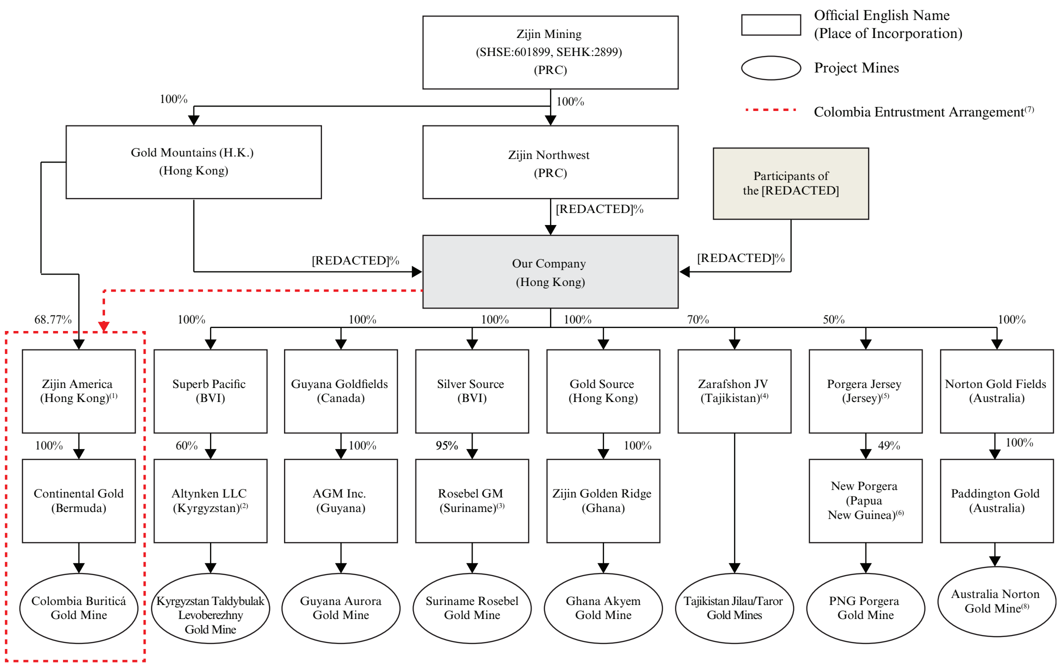
In respect of the [REDACTED], pursuant to Article 23 of the Implementation Rules for Registration, Depository and Clearing Services under the Mainland-Hong Kong Stock Markets Connect Program (《內地與香港股票市場交易互聯互通機制登記、存管、結算業務實施細則》), China Securities Depository and Clearing Co., Ltd. does not provide services relating to the subscription of newly issued shares. Accordingly, [REDACTED] cannot exercise the [REDACTED] through the Shanghai-Hong Kong Stock Connect or Shenzhen-Hong Kong Stock Connect upon our [REDACTED]. See "Structure of the [REDACTED]" for further details of the [REDACTED].

APPLICATION FOR [REDACTED] ON THE STOCK EXCHANGE

Our Company has made an application to the Stock Exchange for the [REDACTED] of, and permission to [REDACTED], our Shares. No part of the share or loan of our Company is listed or dealt in on any other stock exchange. At present, our Company is not seeking or proposing to seek such listing of, or permission to deal in, the share or loan of our Company on any other stock exchange.

SIMPLIFIED CORPORATE STRUCTURE OF OUR GROUP IMMEDIATELY AFTER THE [REDACTED]

The following diagram illustrates the simplified corporate and shareholding structure of our Group immediately following completion of the [REDACTED] (assuming the [REDACTED] is not exercised):



Notes:

1. Zijin America is directly held as to 68.77% by Gold Mountains (H.K.) and by (i) CLAI Gilding (BVI) Investment Limited as to 22.74%; (ii) ZLCFL-Cayman International Investment Cooperation Limited as to 7.26%; and (iii) Longyan Xinjing Investment Partnership (Limited Partnership) as to 1.23%, all of which are Independent Third Parties (save for CLAI Gilding (BVI) Investment Limited being a connected persons of our Company at subsidiary level due to its shareholding in Zijin America).
2. Altynken LLC is directly held as to 60% by Superb Pacific and 40% by Kyrgyzaltyn JSC, an Independent Third Party (save for being a connected person of our Company at subsidiary level due to its shareholding in Altynken LLC).
3. Rosebel GM is directly held as to 95% of class A shares by Silver Source and 5% of class A shares by the government of Suriname, an Independent Third Party. Silver Source holds 100% of class B shares of Rosebel GM.
4. Zarafshon JV is directly held as to 70% by our Company and 30% by the government of the Republic of Tajikistan, an Independent Third Party (save for being a connected person of our Company at subsidiary level due to its shareholding in Zarafshon JV).
5. Porgera Jersey is a joint venture directly held as to 50% by our Company and 50% by Barrick Mining Corporation, an Independent Third Party.
6. New Porgera is directly held as to 49% by Porgera Jersey and the remaining 51% by (i) Kumul Minerals (Porgera) Limited as to 36%; (ii) MRDC Porgera (Escrow) Limited as to 10%; and (iii) Mineral Resources Enga Limited as to 5%, all of which are Independent Third Parties. As the Reorganization of New Porgera is not completed by end of December 31, 2024, the financial contribution by New Porgera is not reflected in the financial information of the Group for the three years ended December 31, 2024. New Porgera is not considered as our subsidiary upon completion of Reorganization and completion of the [REDACTED].
7. Pursuant to the Colombia Entrustment Arrangement, the assets, liabilities and operation results of Zijin America, the intermediate holding company of the Colombia Buriticá Gold Mine will be consolidated to the financial results of our Company. For further details, please refer to "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement".
8. The mining assets and mining titles of the Australia Norton Gold Mine are primarily held by Norton Gold Fields and Paddington Gold

OVERVIEW

Who We Are

We are a global leading gold mining company formed by combining all of the gold mines of Zijin Mining located outside of China. Leveraging Zijin Mining's competitive advantage in the management of exploration, development and operation of low-grade and refractory resources, we have emerged as a global leading and market-oriented gold mining company principally engaged in exploration, mining, processing, smelting, refining and sale of gold. We integrate high-potential gold mine resources through global mergers and acquisitions, and by leverageing our industry-leading and in-house geological exploration, R&D, engineering, construction, and mine operation capabilities, along with advanced international Environmental, Social, and Governance ("**ESG**") systems. This enables us to achieve continuous reserve expansion, production growth and efficient operations.

As of the Latest Practicable Date, we held interests in eight gold mines located in gold-rich regions across South America, Oceania, Central Asia and Africa. By tailoring our operation models to the unique characteristics of each mine, we produce gold in the forms of gold concentrates, gold doré and gold ingots from our mines. Through continuous gold resource acquisition, development and operational efficiency improvement, we have successfully established a leading position in the global gold mining industry and achieved proven track record of robust growth, as illustrated in the chart below:

1.5 Million Ounces (46.7 Tonnes)
Gold Production in 2024(1)

No. 9 Globally(2)
Gold Reserves of 27.5 Million Ounces (856.0 Tonnes) as of December 31, 2024(1)

No. 1 Globally(3)
By 2022-2024 CAGR of Gold Production of 21.4%(4)

14+ Million Ounces (450+ Tonnes)
Reserve Expansion post Acquisitions(5)
Weighted Avg. CAGR of 20%+

61.9%
2022-2024 CAGR of Net Profit Attributable to Owners of the Parent

21.4%
2024 Return on Equity (ROE)(6)

Notes:

1) Calculated based on 100% of the equity interest for each mine held by the Company as of the Latest Practicable Date, except for PNG Porgera Gold Mine, which is presented based on 24.5% of the equity interest held by the Company
2) According to Frost & Sullivan, global ranking based on the gold reserves as of December 31, 2024, calculated based on 100% equity interest of each mine controlled by the Company as of the Latest Practicable Date
3) According to Frost & Sullivan, ranking among the top 15 global gold producers by gold production in 2024
4) Calculated based on 100% of the equity interest for each mine held by the Company in the given years
5) Represented the accumulative gold reserve expansion in the mines the Company operated from the completion of the acquisitions to December 31, 2024
6) Calculated using profit for the year of 2024 divided by total equity as of December 31, 2024, multiplied by 100%

We are one of the fastest-growing mining companies in the global gold mining industry. Starting from the acquisition of the Tajikistan Jilau/Taror Gold Mines in 2007, we have expanded our business through global acquisitions, operational enhancement and production expansion of several large gold mines. According to Frost & Sullivan, our gold Reserves and gold production volume ranked ninth and eleventh globally, respectively, as of December 31, 2024 and in 2024. From 2022 to 2024, the CAGR of our gold production reached 21.4%, and the CAGR of net profit attributable to owners of the parent was 61.9%.

We are a leading mining company in terms of growth, operational efficiency and profitability in the global gold mining industry. Due to our relatively short history compared to other top global gold mining companies, most of the mines we acquired were underperforming at the time of acquisition with poor operational management or resource endowments not fully identified. Through technological innovations, production expansion, and enhanced efficiency management, each of the Australia Norton Gold Mine, the Guyana Aurora Gold Mine, and the Suriname Rosebel Gold Mine turned profitable within one year after our acquisitions in 2012, 2020, and 2023, respectively. In 2024, our AISC was US$1,458 per ounce, ranking sixth lowest among the top fifteen gold mining companies globally, according to Frost & Sullivan. We maintained high capital return in 2024, with ROE of 21.4%. During the Track Record Period, among the six mines we operated, the mining cost per tonne of ore mined was US$38.6, US$31.0 and US$33.3 in 2022, 2023 and 2024, respectively, while the processing cost per tonne of ore milled was US$20.6, US$17.8 and US$19.3, respectively, of the same periods.

The following map illustrates the geographic coverage and locations of the eight gold mines:

Our Controlling Shareholder

Our controlling shareholder, Zijin Mining, is a global leading mining company primarily focused on mineral exploration and development. Zijin Mining has over 30 large mining projects across 17 countries worldwide as of December 31, 2024, covering metals including gold, copper, lithium, and zinc, among others. Zijin Mining ranks among the top five mining companies globally in terms of resources and reserves, production, revenue, profit, total asset and market capitalization. Zijin Mining is distinguished by its robust research and development team, which excels in technologies that facilitate the full process of the value chain. Zijin Mining has extensive experience in the exploration, construction and operation of large-scale metal mines, complemented by professional and efficient resource acquisition and in-house exploration expertise. Zijin Mining maintains a competitive advantage through its cost-efficient operations and upholds high standards in ESG practices and sustainable development capabilities.

Mr. Chen Jinghe, the founder and chairman of Zijin Mining, is highly esteemed in the global mining industry. Under his leadership, the team has developed the Five-Stage-Integrated Life-of-Mine Project Management Procedure that integrates and manages the process of exploration, mining, processing, smelting and environmental protection, aimed at maximizing economic and social benefits of our mine assets.

We inherit and are shaped by the extensive industry expertise accumulated over 30 years by Zijin Mining. Our aim is to empower green production operations and create sustainable value for shareholders and the society, enabling us to maintain low cost and high efficiency while expanding our operational scale. While we operate independently, Zijin Mining will continue to provide comprehensive and robust support in areas such as technology, talent, and operational know-how.

Our Market Opportunities

Gold, recognized as a strategic resource due to its combination of monetary, commodity and financial attributes, has increasingly taken on the role of a safe haven asset in recent years and experienced substantial shifts in its pricing dynamics, largely due to heightened geopolitical uncertainties and more frequent monetary easing cycles globally. Due to these factors, gold has become an increasingly important asset allocation for global central banks and investors. Emerging countries worldwide have been consistently purchasing gold in recent years. Despite this trend, according to Frost & Sullivan, the proportion of gold held by central banks constitutes only 8.9% of asset reserves in emerging countries (non-OECD countries), which is significantly lower than the average of 25.2% in developed countries (OECD member countries) as of December 31, 2024. This disparity highlights significant potential for increasing strategic reserves of gold among emerging countries. Furthermore, by incorporating gold into their asset portfolios, financial institutions can enhance their risk-return profile, which further increases investor interest in gold allocation. Driven by these factors, gold has officially surpassed the Euros to become the second-largest reserve asset for global central banks, accounting for 20% of global official reserves as of December 31, 2024, surpassing the Euro's 16% for the first time, and second only to the US dollar's 46%.

According to Frost & Sullivan, in recent years, due to decreasing global gold mine exploration budgets, the proportion of investment in gold exploration within the global metals exploration budget decreased from approximately 65% in the 1990s to 44% in 2024. Additionally, discovering high-quality gold mines has become increasingly difficult, resulting in a noticeable decline in the pace and scale of newly discovered large gold mines worldwide. The annual average gold price rose by approximately 35% from 2020 to 2024, according to London Bullion Market Association (LBMA) Gold Price. In the future, gold prices are anticipated to gain further long-term support as the grade of gold mines continues to decline and extraction costs continue to increase. As global gold prices continue to increase and demand for gold continues to grow, the gold mining industry will enjoy favorable development prospects and be able to realize its investment potential.

Our Global Acquisitions

We have extensive experience in global mergers and acquisitions, demonstrating a strong track record in acquiring global resources. Over nearly two decades of development, we have acquired high-potential mine assets across various regions, including South America, Oceania, Central Asia and Africa through various acquisition transactions.

We actively pursue acquisitions of high-potential gold mines and under-valued low-grade and refractory gold mines. Our comprehensive experience in complex cross-border acquisitions, combined with our operational and technical expertise in the gold mining industry, enable us to accurately identify and acquire potential high-value assets globally and to conduct in-house geological exploration and development in a cost-effective way, proactively leveraging our strong in-house capabilities following the acquisitions. For example, we have achieved a total reserve expansion of over 14 million ounces in the six mines we operated during the period from completion of the mine acquisitions to December 31, 2024, representing a weighted average CAGR of over 20% of reserve expansion. Our acquisition experience, as well as construction and operation management capabilities, allow us to expand our resource and production volumes steadily in the evolving gold mining industry.

We are adept at identifying and seizing low-cost acquisition opportunities. From 2019 to 2024, the average acquisition cost of the mines we acquired was approximately US$61.3 per ounce in terms of gold resources, while the average acquisition cost in the industry during the same period was approximately US$92.9 per ounce, according to Frost & Sullivan, which was 52% higher than ours.

Our Mine Development and Operation Capabilities

We possess advanced technology, advanced project operation and management systems, and optimized supply chain, which form the core of our mine development and operation capabilities. We focus on cost control and efficiency enhancement by combining the procurement of large-scale, intelligent equipment globally with localized employment and production materials to effectively reduce supply chain costs. We employ the Five-Stage-Integrated Life-of-Mine Project Management Procedure, which holistically considers and manages the five key processes — exploration, mining, processing, smelting, and environmental protection, based on the flow of ores. By doing so, we effectively reduce construction and production costs, maximizing economic and social benefits for the projects.

We have global leading cost management capability, with several of our mines turning profitable shortly after our acquisitions. During the Track Record Period, among the six mines we operated, the mining cost per tonne of ore mined was US$38.6, US$31.0 and US$33.3 in 2022, 2023 and 2024, respectively, while the processing cost per tonne of ore milled was US$20.6, US$17.8 and US$19.3, respectively, of the same periods. During the Track Record Period, our operating cost growth rate was below the average level of global gold mining companies. The Suriname Rosebel Gold Mine, the Tajikistan Jilau/Taror Gold Mines, the Australia Norton Gold Mine and the Guyana Aurora Gold Mine were all loss-making before our acquisitions and became profitable within one to two years after our acquisitions.

We have global leading technological capabilities for development and effective utilization of low-grade and refractory gold resources. Our Controlling Shareholder, Zijin Mining, owns the only State Key Laboratory for Comprehensive Recovery of Low-grade and Refractory Gold Resources in China's gold mining industry. Through technological innovations, Zijin Mining has achieved a series of breakthroughs in the efficient development of low-grade and refractory gold ores. Taror Gold Mine contain copper, silver, arsenic, carbon, and sulfur, with fine gold particle size and significant differences in the characteristics of different ore types. We developed the POX technology for arsenic and carbon-bearing gold concentrates and copper concentrates to deal with the challenges of processing refractory gold ores. From July 2023 to December 2024, the gold recovery increased from 79% to 81%, generating an additional profit of approximately US$110 million. This demonstrates that we have a successful model for the management of refractory polymetallic gold deposits globally.

ESG

Our ESG practice is integral in upholding our core value of empowering green production operations through technological innovation to create sustainable value for shareholders and society. We place significant emphasis on ESG by prioritizing mine safety and green mining initiative, fully integrating into local communities, adhering to the principle of "sharing project development benefits with local stakeholders" to drive the economic development for communities and complying with international standards such as ISO 14001 and United Nations Sustainable Development Goals, etc.

We are committed to carrying out business activities that positively benefit the local community. We adhere to the strategy of promoting local employment, with an average local employee ratio of approximately 95.5% (excluding the PNG Porgera Gold Mine) as of December 31, 2024. Our workforce is composed of individuals from 38 countries, and during the Track Record Period, we implemented over 140 public welfare projects.

We have consistently adopted high safety standards, risk control and preventive measures, and we continuously update and improve our internal control measures to enhance production safety in our operations. As a result, we did not have any material safety incidents involving our workforce during the Track Record Period.

Our Financial Performance

During the Track Record Period, our total revenue was US$1,818.0 million, US$2,262.4 million and US$2,989.9 million, respectively, with a CAGR of 28.2%. Our net profit attributable to owners of the parent was US$183.7 million, US$230.4 million and US$481.4 million, respectively, with a CAGR of 61.9%.

COMPETITIVE STRENGTHS

We are a global leading gold mining company with high growth and highly certain prospects for reserve and production expansion.

We are a global leading gold mining company. As of the Latest Practicable Date, we held interests in eight gold mines in gold-rich areas across South America, Oceania, Central Asia and Africa. As of December 31, 2024 and in 2024, our gold Reserves and gold production volume ranked ninth and eleventh globally, respectively, according to Frost & Sullivan.

We have maintained high growth through our continuous acquisitions, in-house geological exploration, technological renovation and capacity expansion. From 2022 to 2024, our gold production achieved a CAGR of 21.4%, placing us first among the top fifteen gold mining companies globally, according to Frost & Sullivan.

Our gold mines offer clear and highly certain prospects for reserve expansion and production growth. For example, the Colombia Buriticá Gold Mine is a world-class, ultra-high-grade large gold mine, with resource and reserve grade as high as 7.2 g/t and 6.9 g/t, respectively, as of December 31, 2024. The main ore body of the mine remains open at depth and along the edges, with favorable geological conditions for mineralization. The Suriname Rosebel Gold Mine also shows promising prospects at depth and the periphery under exploration. We also see great potentials in our recently acquired Ghana Akyem Gold Mine. Through further underground mine construction and technological renovation in processing, we expect to increase the mine's capacity from the current approximately 190 koz (6 tonnes) per year to over 600 koz (19 tonnes) per year at its peak.

We possess excellent track record of continuous expansion through acquisitions, with proven capabilities in target identification, transaction execution and resource integration to achieve value enhancement.

We have established our gold asset portfolio purely through acquisitions over the past nearly two decades, having accumulated extensive experience and established a highly mature and replicable model for expansion. We have utilized a variety of transaction models, including asset acquisition, public market transaction through tender offer and scheme of arrangement, and joint venture establishment with other leading gold mining companies. By skillfully utilizing these models, we maintain flexibility in the competitive dynamics of the acquisition opportunities and significantly enhance the execution efficiency of these transactions.

We are able to accurately identify acquisition opportunities with significant value upsides. From 2019 to 2024, the average acquisition cost of the mines we acquired was approximately US$61.3 per ounce in terms of gold resources, while the average acquisition cost in the industry during the same period was approximately US$92.9 per ounce, according to Frost & Sullivan, which was 52% higher than ours.

After the acquisitions, we utilized our strong technical expertise, engineering and construction and project management capabilities to address various challenges and rapidly enhance the economic value of the mines. We have achieved a highly successful track record, which was primarily attributed to: (1) our full-fledged capabilities in geological exploration, mine development, construction project development management and operation; (2) upgrades and improvements of the mining, processing flows and technologies; (3) optimization of the supply chains to achieve cost optimization; (4) our unique Five-Stage-Integrated Life-of-Mine Project Management Procedure, which integrates and manages the processes of exploration, mining, processing, smelting and environmental protection, aiming to maximize social and economic benefits; and (5) economies of scale achieved through capacity and production expansion.

Our value-enhancement practices have been consistently proven effective over time:

- In August 2020, when we completed the acquisition of the Guyana Aurora Gold Mine, it was in a state of shutdown due to technical issues in underground mining and financial constraints. Within three months post-acquisition, we achieved full resumption of operations. In November 2021, we initiated the underground mine construction, aiming to develop the mine into Guyana's first modern underground mine with a designed mining capacity of 6,000 tonnes of ores per day. We rapidly turned the mine from loss-making to profitable after the acquisition, and anticipate to fully recover our acquisition and construction investments with the accumulative net cash flow post-acquisition in 2026.

- The Suriname Rosebel Gold Mine faced significant challenges prior to our acquisition, including severe lack of stripping in open pits, low production efficiency and high costs, which resulted in underutilized capacity and sustained losses. In February 2023, we completed the acquisition and promptly initiated the technological renovation for mining and processing facilities and capacity expansion. We optimized the stripping plan and blasting parameters, enhanced maintenance of the mining equipment, and applied our expertise in large-scale low-grade ore development and utilization, a specialty of our Controlling Shareholder Zijin Mining. We increased the average gold recovery from 89% for the two years prior to the acquisition to 96% in 2023 and 94% in 2024. We successfully turned the mine profitable in 2023, the same year of our acquisition, and anticipate to fully recover our acquisition and construction investments with the accumulative net cash flow post-acquisition in 2025.

- In March 2020, we completed the acquisition of the Colombia Buriticá Gold Mine. Despite the challenges during the pandemic lockdown, we swiftly resumed construction and established mining and processing capacity of 3,000 tonnes of ores per day by October 2020. In 2020, we achieved gold production of 70.7 koz (2.2 tonnes). In December 2020, we initiated the construction and technological renovation of the processing plant of 4,000 tonnes of ores per day, completed the construction within 12 months by December 2021 and commenced the operations in March 2022. We comprehensively utilize the technologies of gravity separation, flotation, carbon leaching and zinc powder replacement and achieved effective recovery of gold, silver, and copper.

Our leading capabilities of in-house geological exploration, and cost-effective expansion and construction contribute to the sustainable organic growth.

Our Controlling Shareholder, Zijin Mining, has significantly weighed on resource and reserve expansion through in-house geological exploration. As of December 31, 2024, the accumulative copper and gold resources incremented through in-house geological exploration by Zijin Mining accounted for 47% and 50% of the total resources, respectively. We have fully inherited Zijin Mining's advantages in this area and significantly expanded the reserves in our mines after the acquisitions. We have achieved a total reserve expansion of over 14 million ounces in the six mines we operated during the period from completion of the mine acquisitions to December 31, 2024, representing a weighted average CAGR of over 20% of reserve expansion.

We primarily employ an "acquisition — exploration — reserve expansion" model to achieve sustainable growth. Leveraging our expertise in geological structures and mineralization patterns, and the extensive experience accumulated through long-term exploration practices, we are able to quickly identify areas with promising reserve expansion prospects. We have developed a well-rounded exploration model that comprises three-dimensional geological survey, efficient geophysical detection, precise geochemical exploration, three-dimensional comprehensive location prediction and verification through drilling. We also utilize the advanced geological exploration technology and self-developed equipment from our Controlling Shareholder, Zijin Mining, such as Sinian 3D Induced Polarization System, Fluxgate UAV Aeromagnetic and Three-component Borehole Magnetic Survey. By integrating these cutting-edge technologies and equipment, we have achieved significant reserve expansion at a low cost. From 2019 to 2024, the average exploration cost at the six mines that we operated during the period was as low as US$12.2 per ounce in terms of gold resources, which was significantly below the industry average of US$31.5 per ounce during the same period, according to Frost & Sullivan.

We have achieved superior execution efficiency and cost effectiveness along the mine development and capacity expansion. Our Controlling Shareholder, Zijin Mining, is one of the few mining companies with full-fledged capabilities covering the entire chain of research and development, engineering, construction and operation. It has developed more than 15 large-scale mining projects over the past decade and accumulated extensive experience. Drawing on Zijin Mining's expertise, our skilled teams in various functions work together effectively, utilizing global resources to advance the project development and construction in an expedited manner. For example, we completed the construction and commenced the operation of the Binduli Project at the Australia Norton Gold Mine within 16 months, despite various restrictions and challenges during the pandemic. Among the capacity expansion and technological renovation projects we had completed by December 31, 2024, the weighted average capital expenditure intensity was approximately US$1,825 per ounce in terms of gold production capacity, significantly lower than the industry average of US$3,500 to US$4,000 per ounce, according to Frost & Sullivan.

We realize cost efficiency and value enhancement through our proprietary and advanced technologies, industry-leading expertise in low-grade and refractory ore utilization and strong mine operational capabilities

We are empowered by our proprietary and advanced mining, processing and metallurgy technologies and exceptional operational capabilities. Although the mineral endowment varies in our mines, we have effectively achieved value enhancement through continuous research and development, technological renovation and operational optimization.

Our Controlling Shareholder, Zijin Mining, is known for expertise in handling low-grade and refractory ores and possesses the industry's only State Key Laboratory for Comprehensive Recovery of Low-grade and Refractory Gold Resources in China. The first gold mine of Zijin Mining, Zijinshan Gold and Cooper Mine, was initially regarded as low-grade and small-scale, but was developed into one of the largest gold mines in China through Zijin Mining's continuous technical innovation and breakthroughs, systematic management initiatives and operational optimization. We have inherited the expertise from Zijin Mining and have been extensively utilizing proprietary technologies such as hot-pressure pre-oxidation and bioleaching, to effectively develop low-grade and refractory ores, which have significantly increased the economic value of our mines, and in turn further enhanced the technical and operational capabilities of our team. We deploy technologies that adapt to the specific conditions and characteristics of each mine, through which we have achieved numerous accomplishments in production efficiency enhancement and cost reduction:

- *Australia Norton Gold Mine*: For the Paddington Mill in our Australia Norton Gold Mine, we use a series of processes including crushing, grinding, flotation, and CIL/CIP to process different types of ore during the free-milling and refractory process, and extract fine material from the heap leach plant. This process achieves high recovery and stable performance. The Binduli North Heap Leach Plant combines crushing, HPGR grinding, screening, heap leaching, and CIC adsorption, and works smoothly with high-salinity water.

- *Tajikistan Jilau/Taror Gold Mines:* Tajikistan Jilau/Taror Gold Mines feature a pressure oxidation project for arsenic- and carbon-bearing gold (copper) concentrates. To address challenges such as the coexistence of oxidized and sulfide ores at the Taror Gold Mine and the Jilau Gold Mine, we developed a comprehensive utilization technology for low-grade and refractory ores, combining flotation, pressure oxidation, CIL, and heap leaching. This enabled the efficient extraction and utilization of complex, low-grade ores and gold concentrates, effectively recovering multiple metal components and producing qualified gold ingots, silver ingots, and cathode copper.

- *Suriname Rosebel Gold Mine:* To tackle the challenges of low ore grade, carbon, and arsenic content, and refractory nature at the Suriname Rosebel Gold Mine, we developed an integrated recovery technology. This included optimizing the crushing and grinding system to increase the annual processing capacity of the plant to approximately 10 million tonnes. We conducted in-depth research on the refractory ores and implemented innovative optimizations of the gravity separation and CIL/CIC processes. As a result, we increased the average gold recovery of Suriname Rosebel Gold Mine from 89% for the two years prior to the acquisition to 96% in 2023 and 94% in 2024.

We carry out dedicated management and results-oriented operations in our mines throughout the mine life. We look into the detailed aspects of operations and utilize targeted measures that precisely cater to the specific conditions of each mine and therefore realize superior outcome. For example, to reduce the cost of procurement of certain equipment and raw materials for the Guyana Aurora Gold Mine and the Suriname Rosebel Gold Mine, we have globally extended our source of procurement, which significantly reduced the costs and led to optimization in our supply chain management. We are advancing the trial use of autonomous mining truck at the Australia Norton Gold Mine to optimize the utilization of labor force. During the Track Record Period, among the six mines we operated, the mining cost per tonne of ore mined was US$38.6, US$31.0 and US$33.3 in 2022, 2023 and 2024, respectively, while the processing cost per tonne of ore milled was US$20.6, US$17.8 and US$19.3, respectively, of the same periods, that demonstrated the unit economics enhancement as our production and operation constantly scaled up.

We are committed to responsible mining practices, achieving green and sustainable development through high ESG standards.

We are committed to the "Zijin Model" for a responsible ESG framework and sustainable development. Our Controlling Shareholder, Zijin Mining, is a member of the World Gold Council ("**WGC**") and among the first gold mining companies in China to pledge adherence to the World Gold Council's Responsible Gold Mining Principles ("**RGMPs**"). Zijin Mining consistently maintains high ESG standards and has achieved significant results, such as an ESG rating of 89 in 2024 that ranked top five among the 525 global metals companies, by London Stock Exchange Group ("**LSEG**"). Upon [REDACTED], we will be committed to Zijin Mining's best ESG practices, adhering to the RGMPs and other international ESG standards, to promote green and sustainable development.

Under Zijin Mining's ESG framework, our ESG practices have been widely recognized in the regions where we operate, demonstrated by the awards we received for various aspects across multiple regions. For example, during the Track Record Period, Continental Gold received "the 2024 Sustainable Development Certification", Zeravshan received the "Outstanding Contribution to Environmental Protection Award", among others.

We follow comprehensive and multi-tiered international ESG standards, such as ISO 14001 and others. We focus on risk-oriented environmental management, continuously assessing environmental risks and aiming to minimize ecological impact while maximizing operational efficiency. We have adopted "green exploration" as one of our drilling quality acceptance criteria and promoted remote sensing technologies and geophysical exploration methods. We integrated the "Dual-Carbon" commitment into our core agenda of future development and are dedicated to clean energy solutions. The Tajikistan Jilau/Taror Gold Mines, the Colombia Buriticá Gold Mine, and the Suriname Rosebel Gold Mine had achieved 100% utilization of clean energy in purchased electricity as of December 31, 2024. The Guyana Aurora Gold Mine completed two phases of photovoltaic projects with a total capacity of 18MW in 2024, and the Suriname Rosebel Gold Mine's 25MW photovoltaic project is under construction. We advance green mining and prioritize ecological restoration across our global operations. While it is the industry normal practice to conduct reclamation only after the mine operations end, we carry out continuous reclamation concurrently with our development and mining activities. Furthermore, we have built wastewater monitoring systems in our mines to monitor the downstream water quality, while most of our mines have substantially achieved wastewater recycling and zero discharge. During the Track Record Period, we invested in dedicated environmental funds. Through innovative and responsible environmental protection practices, we are dedicated to long-term ecological balance and sustainable development.

We place significant importance to corporate social value, continuously enhancing investment in community development, employee growth and occupational health. We actively promote economic development in the regions where we operate and share benefits with the local communities. For example, our "Sowing the Future" agricultural development program in Colombia has been ongoing for five years. We actively promote the development of the Rosebel Community Fund in Suriname and provided financial support in the areas of education, health, sports, and socio-economic development in 2024. We value employee development and well-being, adopting localized and diverse talent development approaches. We also prioritize occupational safety in our operation. During the Track Record Period, our lost-time injury frequency rate was as low as 0.21 per million work hours. We have completed the certifications for the ISO 45001 Occupational Health and Safety Management System certification for all the mines we operated.

Our development is led by our visionary management team with extensive expertise and global insights, and the "Perseverance, Entrepreneurship and Innovation" spirit of Zijin Mining.

We are led by an elite management team with extensive experience in the mining industry and capital markets, with expertise across gold mining technology, acquisition and multinational operation as well as ESG. Our senior management team has rich experience in the gold mining industry and global mining practices.

Our Chairman, Mr. Lin Hongfu, is a leader with a strong background in both technology and management, possessing nearly three decades of experience in the mining industry and extensive management practice. Since joining Zijin Mining in 1997, Mr. Lin has progressed through a complete career path from technician to production manager, senior executive, and Director. He has held positions including Director of the Zijin Mining Group Gold Smelting Co., Ltd., General Manager of Bayannur Zijin Nonferrous Metals Co., Ltd., Mine Manager of the Zijinshan Gold and Copper Mine, etc., and has served as Vice President of Zijin Mining since 2006. Through the extensive experience, Mr. Lin has developed a deep understanding of mining technology and business practices through the entire value chain and overall management of mining enterprises. He has organized or led the construction and operational management of numerous large-scale mining projects. As a Director, Executive Vice President, and Chairman of the Overseas Business Management Committee of Zijin Mining, Mr. Lin is well positioned to integrate resources and provide us with technical and business support.

Our CEO and Executive Director, Dr. Guo Xian Jian, has over forty years of experience in research and development, engineering operation and management in the mining industry. He has held senior management positions at research institutions and mining companies such as Beijing General Research Institute for Nonferrous Metals, Noranda Inc. and Hatch Ltd. During his career, Dr. Guo has led numerous research and engineering projects, including several large-scale projects with investments exceeding billion dollars. Dr. Guo served as the Chief Engineer of Zijin Mining from 2017 to 2019 and has been a senior advisor in engineering and technology since 2019, leading multiple key R&D projects and achieving significant results. Dr. Guo has been deeply involved in and led the development and acquisition of several of our projects, including the commissioning and renovation of the Colombia Buriticá Gold Mine, the resumption of operations at the Guyana Aurora Gold Mine, the handover of the Suriname Rosebel Gold Mine, the pressure pre-oxidation project at the Tajikistan Jilau/Taror Gold Mines and low-grade heap leaching project of the Binduli Project at the Australia Norton Gold Mine.

Led by our senior management team, we will consistently enhance our technical and operational capabilities. We embrace and advance the "Perseverance, Entrepreneurship, Innovation" spirit of Zijin Mining, remaining steadfast in overcoming challenges. We actively pursue operational and technical breakthroughs. Our senior management team continues to guide us toward achieving ambitious goals and sustainable growth.

GROWTH STRATEGIES

Our goal is to become a top-tier world-class, green, and high-tech gold mining company. We plan to implement the following business strategies to achieve our goal.

Achieving continuous growth in gold resources and reserves through in-house geological exploration efforts and acquisitions, implementing a resource-first strategy.

Mineral resources are the foundation for a mining company's survival and development. We will conduct further geological exploration on our existing mines and their surrounding areas to increase gold resources and reserves. Additionally, we will reassess existing mine resources based on gold prices, re-evaluate technical improvement and development plans, fully utilize low-grade resources, extend the Life of Mine and increase the value of our mines. We will also increase our efforts in acquiring gold mines to expand Mineral Resources and Ore Reserves, which is crucial to our production growth.

We are focusing on exploring areas in our existing mines with significant potential, particularly the Colombia Buriticá Gold Mine, the Suriname Rosebel Gold Mine and the Ghana Akyem Gold Mine:

- *Colombia Buriticá Gold Mine*: The Colombia Buriticá Gold Mine is located in Middle Cauca Copper-Gold Belt of the Northern Andes in South America, surrounded by numerous contemporaneous porphyry and hydrothermal copper-gold deposits, such as Titribi, Marmato, and La Cosola. The existing deposits at Buriticá, along with greenfield projects, have significant exploration potential. Areas around Colombia Buriticá Gold Mine, such as Greater Buriticá and Berlin, have revealed numerous gold-copper mineralization clues, with some verification completed. The Veta Sur vein extends to the southwest, and the "BMZ" type high-grade mineralization exposed at depths of 850m-450m remains open, indicating substantial potential for large-scale mineral deposits below 400m. Future comprehensive studies on mineralization patterns are expected to achieve significant exploration and reserves expansion goals.

- *Suriname Rosebel Gold Mine*: Located in the Guiana Shield of South America, the Suriname Rosebel Gold Mine is part of a world-renowned orogenic gold deposit cluster, with mineralization conditions similar to the West African Leo Shield. The existing Rosebel and Saramacca mines have significant potential for reserves expansion at depth and along the edges. We possess mining and exploration rights spanning a vast area across the two mines, with only a small fraction having reached brownfield exploration stages. Target areas within the Rosebel mining rights, such as Mamacreek and Blauwe Tent, have shown promising geophysical and geochemical anomalies. We are planning to integrate exploration resources and increase investment to achieve breakthroughs in reserves expansion in the deep and peripheral greenfield areas of existing mines.

- *Ghana Akyem Gold Mine*: The Akyem Gold Mine is located in the northeastern part of the renowned Ashanti Gold Belt within the orogenic gold deposit cluster of West Africa's "Gold Coast." The identified resources are primarily concentrated within the Ghana Akyem Gold Mine, with the majority of existing drilling controls distributed along the main pit and its deeper extensions. Sparse drilling results indicate that the Akyem mineralization zone continues to extend northeast and southwest along the strike beyond the main pit, with an additional strike length of about 2,200 meters at depth that has not yet been systematically drill-tested. Over the next three years, we plan to conduct systematic infill and supplementary exploration along the northeastern and southwestern extensions of the Akyem main mineralized zone.

Acquiring gold mines is crucial for further sustained growth in gold resources and reserves and production. We will prioritize regions in South America, Africa and Central Asia, focusing on areas near our existing gold mines to achieve management synergies. We give priority to target assets that are in or near production stage. We will draw on the extensive experience of our senior management team and Zijin Mining in global resource acquisitions, and we can effectively identify and secure acquisition opportunities with significant potential to expand our resources and enhance the operational efficiency of acquired mines. When evaluating potential acquisition targets, we will consider various factors such as the asset quality, community, the development stage of the asset as well as the potential for us to add value. We will fully leverage the advantages and strategies of our Controlling Shareholder's acquisition approach, carefully balancing the benefits and risks of acquisitions. We will strive to assess whether the acquired assets have value-added potential and whether our technological and management innovations can create new value from the acquisition. We have entered into an agreement in relation to the acquisition of the Kazakhstan Raygorodok Gold Mine. The Kazakhstan Raygorodok Gold Mine hosts relatively significant resource. It is a large-scale, active open pit mine, with a long mine life, and well-established infrastructure. The processing technologies of the project are mature, with relatively low all-in sustaining costs, contributing to strong financial performance. We see further opportunities in improving its operational efficiency and production levels. This acquisition is expected to have positive contribution to our output and profits.

Enhancing production capacity and mineral resource recovery through technological upgrades and operational improvements

Global mining companies are currently facing challenges such as rising operational costs, shortage of high-potential resources, and increasing expenses related to resource acquisition. Amidst such challenges, we recognize that improving operational efficiency, reducing the cost of acquiring high-potential resources, lowering the capital expenditure intensity per unit of production capacity, and enhancing profitability and ROE are crucial for our sustainable growth. Our in-house full-process technological capabilities and engineering expertise will enable us to enhance our construction and operational efficiencies and allow us to continuously improve our competitiveness.

We also plan to undertake a series of construction and expansion projects within our current mining sites to enhance production capacity and resource conversion. Our expansion plans include the following:

- *Tajikistan Jilau/Taror Gold Mines*: We will continue to develop comprehensive utilization technologies for low-grade and refractory ores, addressing challenges such as the coexistence of Taror oxide and sulfide ores at Jilau. We aim to continuously optimize our processing flow to achieve efficient extraction and to maximise utilization of complex ores and gold concentrates, further reducing costs and enhancing efficiency.

- *Australia Norton Gold Mine*: We are transitioning to in-house mining operations and optimizing global procurement to cut costs. Key projects are being fast-tracked, including Phase II of the Binduli North Heap Leach Plant, which will use fine screening for HPGR products to better sort and process ores of different grades. We are also upgrading processing plant to handle refractory ores at Paddington Mill and applying ore-sorting technology to enhance pre-concentration efficiency and utilize waste rock. New underground mine development is in progress. Once operational, these projects will raise our annual processing capacity from 9 to 11 million tonnes of ores and gold output will increase accordingly, enhancing our profitability, competitiveness, and contribution to the local economy and communities.

- *Guyana Aurora Gold Mine*: We plan to gradually commission the Phase I underground mining project by 2025 and fully realize the commissioning and reaching design capacity of the 3.3 million tonnes per year processing plant upgrade project. We prioritize technological renovation, planning to utilize industry-leading processing technologies (such as Knelson gravity separation, tailings cyanide washing, and leaching tank processes) to achieve early recovery, improve gold leaching rates, and reduce sodium cyanide consumption, gradually achieving cost reduction and efficiency enhancement.

- *Colombia Buriticá Gold Mine*: We are actively engaged in exploration and reserve expansion efforts, focusing on the characteristics of narrow veins/reefs by promoting the miniaturization of mining equipment and implementing underground sorting measures to reduce ore loss and dilution rates and improve ore grade. Additionally, we plan to continuously optimize materials and energy consumption, as well as improve processing flow, and fully recover non-ferrous metals such as gold, silver, and copper for efficient resource utilization. We anticipate increasing daily ore mining and processing capacity from 4,000 tonnes to 5,000 tonnes and boosting annual mining capacity by 320,000 of ores to achieve an annual mining and processing target of 1.65 million tonnes of ores, thereby significantly enhancing the mine's production capacity.

- *Suriname Rosebel Gold Mine*: We are committed to developing the Suriname Rosebel Gold Mine into one of the main gold-producing mines in South America. To address challenges such as the low gold grade of RGM ore and the carbon and arsenic content in Saramacca, we have developed large-scale utilization technology for low-grade ores, achieving an annual processing capacity of 10 million of ores with a uni-serial semi-autogenous mill and the overall gold recovery reaching 94% in 2024. Building on the current processing plant's annual processing capacity of 10 million tonnes of ores, we are exploring the feasibility of increasing such capacity to 11–13 million tonnes, thereby enhancing the mine's production capacity.

- *Ghana Akyem Gold Mine*: After completing the acquisition, our next step is to re-evaluate the open-pit mineable resources and reserves based on new cut-off grades, expand the open-pit boundaries, and comprehensively increase the open-pit mine life and resource utilization rate. Additionally, we plan to enhance the processing plant's technological renovation to increase the annual processing capacity from 7.6 million tonnes to 12.0 million tonnes of ores, significantly boosting gold production.

Continuously advancing technological innovation

Our technological expertise is a cornerstone of our competitive advantage, reinforced by over 30 years of technological innovation and accumulation of project experience from Zijin Mining. Our extensive expertise and experience span across geological exploration, mining, gold extraction and the comprehensive recovery and utilization of low-grade and refractory resources. Such expertise and experience enable us to establish a competitive edge in cost control and develop industry-leading solutions in green, low-carbon, efficient, and sustainable resource development. We will focus on addressing key industry challenges, such as:

- For low-grade gold ore, especially below 0.3 g/t, we plan to enhance extraction efficiency and promote profitable industrial production;

- For refractory ores with high arsenic and refractory gold ores with carbon, we plan to research on environmental protection technologies during cyanide slag recovery, gold concentrate pre-oxidation extraction, and bio-oxidation of gold concentrates;

- Modification of existing processes, systematic analysis of existing production processes to optimize the rationality of the process.

We plan to continue investing in technological innovation in order to lead the industry in creating intelligent and sustainable mining and green development solutions. We will focus on addressing key industry challenges, such as extracting more value from ores and advancing digitalization of mining operations and green mining. We are actively promoting the integration of digital information systems in our mine operations, accelerating the mechanization, automation, intelligence and AI application enhancements of our mines to reduce costs and improve production efficiency and safety. We are engaging in the digital and intelligent transformation of the mines.

Unwavering commitment to high-standard ESG practices

We are committed to maintaining high ESG standards consistent with Zijin Mining adhering to international standards and best practices, and ensuring that ESG principles are fully integrated into the operations of our mines across various regions. We recognize the significance of responsible and sustainable development in driving our growth. Our sustainable development strategy will focus on the following:

- We are committed to improving our environmental practices by installing clean energy facilities such as solar, wind and hydropower at our mining and refining sites. We aim to enhance our ecological and environmental protection capabilities by focusing on projects like mine closures and tailings storage facilities. These efforts are intended to reduce our environmental impact and promote a sustainable future.

- We are committed to maintaining a strong focus on communities, actively building positive relationships with the communities in which we operate while promoting our sustainable development goals. Additionally, during the Track Record Period, the Colombia Buriticá Gold Mine successfully finalized its first collective agreement, which balances sustainable development and employee welfare, establishing a new standard for overseas project governance. We plan to continue investing in community projects and increase the local employee ratio. We believe that fostering strong community relationships not only supports our long-term growth but also positively contributes to regional harmony and stability.

- We will continue to build a corporate governance system that aligns our operational management with international standards, tailored to the specific conditions of each mine. This system will create a practical governance structure, management processes, and internal control mechanisms based on the operational characteristics, scale, and environmental conditions of different mines. We are focusing on improving internal management and operational efficiency while adhering to international best practices and enhancing the Company's governance quality.

BUSINESS MODEL

We are one of the leading gold mining companies in the world, engaged in the exploration, mining, processing, smelting, refining and sale of gold. We held interests in eight gold mines located in gold-rich regions across South America, Oceania, Central Asia and Africa, namely the Tajikistan Jilau/Taror Gold Mines, Kyrgyzstan Taldybulak Levoberezhny Gold Mine, Australia Norton Gold Mine, Guyana Aurora Gold Mine, Colombia Buriticá Gold Mine (through Colombia Entrustment Arrangement), Suriname Rosebel Gold Mine, Ghana Akyem Gold Mine and PNG Porgera Gold Mine. Among these gold mines, we control and operate seven gold mines and hold a minority interest in the PNG Porgera Gold Mine. Leveraging the different production models of each mine, we produce gold concentrates, gold dore and gold ingots, which are then sold to downstream refineries, precious metal traders or financial institutions.

Gold concentrates

Gold dore

Gold ingots

Our gold production experienced rapid growth during the Track Record Period, with total gold production volume of approximately 1,262 koz (39.3 tonnes), 1,441 koz (44.8 tonnes) and 1,501 koz (46.7 tonnes) for the years ended December 31, 2022, 2023 and 2024, respectively[1].

Note:

(1) The total gold production volume includes gold production volume of Ghana Akyem Gold Mine assuming its production volume during the Track Record Period before the acquisition can be consolidated, and attributable gold production volume of PNG Porgera Gold Mine based on 24.5% of the equity interest held by the Company.

The following table sets out a summary of the details of our major operating mining assets as of the Latest Practicable Date:

Mineralized Zone/Block	Highlights
Jilau/Taror Gold Mines in Tajikistan ("**Tajikistan Jilau/Taror Gold Mines**") .	• Acquired in 2007 • Tajikistan's largest gold producer and largest gold mine in terms of gold Resources • Open-pit mining • LOM: Until 2037 • Resumed production and achieved profitability through technological upgrades after acquisition within two years • As of December 31, 2024, total Mineral Resources amounted to 71.1 Mt, with average Au grade of 1.3 g/t, and Au metal Mineral Resources of 3,040 koz (94.5 tonnes) • In 2024, 174 koz (5.4 tonnes) of gold was produced. • Our equity interest in the mine: 70%
Taldybulak Levoberezhny Gold Mine in Kyrgyzstan ("**Kyrgyzstan Taldybulak Levoberezhny Gold Mine**")	• Acquired in 2011 • Kyrgyzstan's third-largest gold mine in terms of gold Resources • Underground mining • LOM: Until 2033 • As of December 31, 2024, total Mineral Resources amounted to 14.4 Mt, with average Au grade of 3.7 g/t, and Au metal Mineral Resources of 1,700 koz (52.9 tonnes) • In 2024, 120 koz (3.7 tonnes) of gold was produced • Our equity interest in the mine: 60%

Mineralized Zone/Block	Highlights
Norton Gold Mine in Australia ("**Australia Norton Gold Mine**")	• Acquired approximately 89% during 2012, and further increased its interest to 100% in 2015 • One of Australia's largest gold producers and the only large heap leach project with an annual processing capacity exceeding 5 million tonnes • Open-pit mining and underground mining • LOM: Until 2037 • As of December 31, 2024, total Mineral Resources amounted to 311.5 Mt, with average Au grade of 0.9 g/t, and Au metal Mineral Resources of 9,245 koz (287.6 tonnes) • In 2024, 266 koz (8.3 tonnes) of gold was produced • Our equity interest in the mine: 100%
Aurora Gold Mine in Guyana ("**Guyana Aurora Gold Mine**")	• Acquired in 2020 • The only large-scale gold mine project in Guyana with production volume of over 100 koz in 2024 • Open-pit mining and underground mining • LOM: Until 2037 • Originally a loss-making enterprise with suspended operations; resumed production and became profitable rapidly after acquisition • As of December 31, 2024, total Mineral Resources amounted to 79.2 Mt, with average Au grade of 2.4 g/t, and Au metal Mineral Resources of 6,052 koz (188.4 tonnes) • In 2024, 130 koz (4.1 tonnes) of gold was produced • Our equity interest in the mine: 100%

Mineralized Zone/Block	Highlights
Buriticá Gold Mine in Colombia ("**Colombia Buriticá Gold Mine**")	• Acquired in 2020 • One of Colombia's largest producing gold mines, a globally ultra-high-grade large gold mine, and Colombia's first large modern underground mine • Underground mining • LOM: Until 2039 • Recognized by the Colombian government as a "National Strategic Interest Project" • As of December 31, 2024, total Mineral Resources amounted to 50.4 Mt, with average Au grade of 7.2 g/t, and Au metal Mineral Resources of 11,700 koz (364.9 tonnes) • In 2024, 322 koz (10.0 tonnes) of gold was produced • Our economic interest in the mine: 68.8%
Rosebel Gold Mine in Suriname ("**Suriname Rosebel Gold Mine**")	• Acquired in 2023 • A world-class gold mine and one of South America's largest producing open-pit gold mines • Open-pit mining • LOM: Until 2042 • Originally a loss-making project; turned profitable in the year of the acquisition • As of December 31, 2024, total Mineral Resources amounted to 457.1 Mt, with average Au grade of 0.8 g/t, and Au metal Mineral Resources of 12,036 koz (374.3 tonnes) • In 2024, 240 koz (7.5 tonnes) of gold was produced • Our equity interest in Rosebel GM: 95.0%

Mineralized Zone/Block	Highlights
Akyem Gold Mine in Ghana ("**Ghana Akyem Gold Mine**")	• Acquired in 2025 • One of Ghana's largest gold mines • Open-pit mining and underground mining • LOM: Until 2038 • As of December 31, 2024, total Mineral Resources amounted to approximately 162.7 Mt, with average Au grade of 1.8 g/t, and Au metal Mineral Resources of 9,539 koz (296.7 tonnes) • In 2024, 203 koz (6.3 tonnes) of gold was produced • Our equity interest in the mine: 100%
Porgera Gold Mine in Papua New Guinea ("**PNG Porgera Gold Mine**")	• Acquired 47.5% interest in 2015; currently indirectly holding 24.5% equity interest • Papua New Guinea's second-largest gold mine • Open-pit mining and underground mining • As of December 31, 2024, total Mineral Resources attributable to us on equity basis amounted to approximately 51.5 Mt, with average Au grade of 2.7 g/t, and Au metal Mineral Resources of 4,414 koz (137.3 tonnes) • In 2024, the gold production volume attributable to us on equity basis was 46 koz (1.4 tonnes) • Our equity interest in the mine: 24.5%

Mineral Resources and Ore Reserves

Independent Report

We engaged SRK Consulting (China) Ltd. ("**SRK**"), an Independent Third Party and an international consulting company that offers advice and solutions to resource industries for mining projects, to prepare the Competent Person's Report as set out in Appendix III to this Document, which is an independent assessment and evaluation of our Mineral Resources and Ore Reserves as of December 31, 2024.

The information set forth below relating to our Mineral Resources and Ore Reserves constitutes forward looking information, which is subject to certain risks and uncertainties. Please refer to "Risk Factors" and "Forward-Looking Statements" for details.

According to SRK, there was no material change in the Competent Person's Report, or our Mineral Resources and Ore Reserves estimate, since May 31, 2025, being the effective date of the Competent Person's Report, and up to the date of this Document.

Our Mineral Resources and Ore Reserves

Mineral Resources

As of December 31, 2024, the total Mineral Resources for our mines, including Ghana Akyem Gold Mine we acquired in 2025 and our minority interests in PNG Porgera Gold Mine, were estimated to be about 1,197.7 Mt, with an average Au grade of 1.5 g/t and Au metal Mineral Resources of 57,737 koz (1,796.5 tonnes).

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources (including gold Resource information) as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[1]	Au Grade[1]	Au Metal Contained[1]	
		(Mt)	(g/t)	(koz)	(t)
Tajikistan Jilau/Taror Gold Mines.	Measured	48.5	1.2	1,924	59.9

Notes:

(1) Figures and economic interest are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. Except for PNG Porgera Gold Mine, the Mineral Resources Information of which is calculated based on 24.5% of the equity interest held by the Company, the Mineral Resources information is calculated based on 100% of the equity interest for each asset held by the Company.

(2) The information is presented based on the 24.5% equity interest we held as of December 31, 2024. A separate Competent Person's Report for the PNG Porgera Gold Mine is not included in this document, as we only hold a minority interest in such asset while Barrick Mining is the operator and our Directors are of the view that given such background of ownership and operatorship, it is reasonable to cite Resources and Reserves information from public filings of Barrick Mining and SRK has conducted independent review and verified such information.

(3) The "Total consolidated" information is calculated based on 100% of the equity interest for each asset held by the Company, except for PNG Porgera Gold Mine, which is presented based on 24.5% of the equity interest held by the Company.

(4) The "Total attributable" information is calculated based on the percentage of the equity interest for each asset held by the Company.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our non-gold Resources as of December 31, 2024:

Mineralized Zone/Block	Category	Ag Grade(1) (g/t)	Ag Metal Contained(1) (t)	Cu Grade(1) (%)	Cu Metal Contained(1) (t)
Tajikistan Jilau/Taror Gold Mines . .	Measured	13.1	138.8	0.60	63,769
	Indicated	12.0	89.6	0.49	36,810

	Inferred	20.6	432.2	—	—
	Total	**22.7**	**1,143.9**	**—**	**—**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them.

Ore Reserves

As of December 31, 2024, the total Proved and Probable Ore Reserves for our mines including Ghana Akyem Gold Mine we acquired in 2025 and the minority interests in PNG Porgera Gold Mine, were estimated to be about 608.6 Mt, with total Proved and Probable Au grade Ore Reserves of 1.4 g/t, and our total Ore Reserves contained 27,534 koz (856.0 tonnes) of Au metal.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves (including gold Reserve information) as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[1] (Mt)	Au Grade[1] (g/t)	Au Metal Contained[1] (koz)	(t)

Non-consolidated mines									
Ghana Akyem Gold Mine(4)	8,195	413	12.8	7,646	290	9.0	8,287	203	6.3
PNG Porgera Gold Mine(5)	—	—	—	—	—	—	882	46	1.4
Total(6)	**21,856**	**1,262**	**39.3**	**32,834**	**1,441**	**44.8**	**37,690**	**1,501**	**46.7**

Notes:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them, and figures of tonnes/koz may not be an arithmetic conversion based on the rounding figures as shown in the table.

(2) The "Subtotal consolidated" information is calculated based on 100% of equity interest for each asset held by the Company.

(3) The "Subtotal attributable" information is calculated based on the percentage of equity interest for each asset held by the Company.

(4) The acquisition of the Ghana Akyem Gold Mine was completed in April 2025.

(5) PNG Porgera Gold Mine's operations were suspended in April 2020 due to the expiration of mining lease, and it resumed mining in January 2024. Figures shown in the table for the PNG Porgera Gold Mine is calculated based on 24.5% of the equity interest held by the Company.

(6) The "Total" information is calculated by adding the "Subtotal consolidated" information and the information of Ghana Akyem Gold Mine (assuming its production volume during the Track Record Period before acquisition can be consolidated) and PNG Porgera Gold Mine (based on 24.5% of the equity interest held by the Company).

Our Gold Operating Costs

For the year ended December 31, 2024, our gold AISC was US$1,458 per ounce. According to Frost & Sullivan, our AISC was ranked sixth lowest among the top fifteen gold mining companies globally by gold production in 2024.

Set forth below is our gold AISC for the periods indicated as stated in the Competent Person's Report:

	Year Ended December 31,		
	2022	2023	2024
		(US$/oz)	
Tajikistan Jilau/Taror Gold Mines	759	1,475	1,581
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	1,007	1,119	1,318
Australia Norton Gold Mine	1,604	2,112	2,047
Guyana Aurora Gold Mine	1,764	1,712	1,572
Colombia Buriticá Gold Mine	856	962	802
Suriname Rosebel Gold Mine	—	1,463	1,547
Our Group	**1,046**	**1,449**	**1,458**

Our Revenue Breakdown

During the Track Record Period, we generated revenue from six different gold mines we operate. The Ghana Akyem Gold Mine and the PNG Porgera Gold Mine are not consolidated to our combined financial statements during the Track Record Period.

The following table sets forth a breakdown of our revenue by origin of our products for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Tajikistan Jilau/ Taror Gold Mines	691,122	38.0	440,604	19.5	515,849	17.3
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	223,933	12.3	258,015	11.4	286,161	9.6
Australia Norton Gold Mine	303,798	16.7	373,044	16.5	562,882	18.8
Guyana Aurora Gold Mine	160,107	8.9	190,145	8.4	318,125	10.6
Colombia Buriticá Gold Mine	439,021	24.1	531,735	23.5	729,517	24.4
Suriname Rosebel Gold Mine	—	—	468,822	20.7	577,401	19.3
Total	**1,817,981**	**100.0**	**2,262,365**	**100.0**	**2,989,935**	**100.0**

During the Track Record Period, we generated our revenue primarily from gold sales and others (including copper and silver sales and rental income from rentals of machinery equipment). The following table sets forth the breakdown of our revenue by business segment for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Gold	1,724,229	94.8	2,167,179	95.8	2,811,980	94.0
Others	93,752	5.2	95,186	4.2	177,955	6.0
Total	**1,817,981**	**100.0**	**2,262,365**	**100.0**	**2,989,935**	**100.0**

OUR GOLD PRODUCTION BUSINESS OF TAJIKISTAN JILAU/TAROR GOLD MINES

Overview

The Tajikistan Jilau/Taror Gold Mines include Jilau and Taror Gold Mines, which are located at Sughd Province, Tajikistan. We hold the Tajikistan Jilau/Taror Gold Mines through Joint Venture Zeravshan Limited Liability Company ("**Zeravshan**"), in which we hold 70% of the equity interest. The mines feature porphyry-skarn types. The extraction and processing methods employed at the mine include open mining and flotation. POX process are utilized in the Tajikistan Jilau/Taror Gold Mines to process refractory gold mines containing arsenic and copper.

Operation Performance

In 2022, 2023 and 2024, our gold production business in the Tajikistan Jilau/Taror Gold Mines processed 5,167 kt, 5,555 kt and 5,971 kt of ores, and produced 203 koz (6.3 tonnes), 202 koz (6.3 tonnes) and 174 koz (5.4 tonnes) of gold, respectively.

The gold production volume of the Tajikistan Jilau/Taror Gold Mines slightly decreased from 203 koz (6.3 tonnes) in 2022 to 202 koz (6.3 tonnes) in 2023. The gold production volume decreased to 174 koz (5.4 tonnes) in 2024, primarily due to the decrease in milling grade in 2024.

In 2022, 2023 and 2024, the gold recovery of the Tajikistan Jilau/Taror Gold Mines was approximately 89.7%, 87.9% and 75.3%, respectively. The decrease in recovery in 2024 is mainly due to the reduction of the milling grade.

Development and Expansion

We will continue to develop comprehensive utilization technologies for low-grade refractory ores, addressing challenges such as the coexistence of Taror oxide and sulfide ores at Jilau. We aim to continuously optimize metallurgical technology indicators to achieve efficient extraction and utilization of complex ores and gold concentrates, fully reducing costs and enhancing efficiency.

Mineral Resources and Ore Reserves

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources in Tajikistan Jilau/Taror Gold Mines as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)]	Au Grade[(1)]	Au Metal Contained[(1)]	
		(Mt)	(g/t)	(koz)	(t)
Tajikistan Jilau/Taror Gold Mines.	Measured	48.5	1.2	1,924	59.9
	Indicated	14.5	1.7	801	24.9
	Inferred	8.1	1.2	314	9.8
Equity interest: 70%	**Total**	**71.1**	**1.3**	**3,039**	**94.5**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves in the Tajikistan Jilau/Taror Gold Mines as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)]	Au Grade[(1)]	Au Metal Contained[(1)]	
		(Mt)	(g/t)	(koz)	(t)
Tajikistan Jilau/Taror Gold Mines.	Proved	43.4	1.2	1,701	52.9
	Probable	13.9	1.7	772	24.0
Equity interest: 70%	**Total**	**57.3**	**1.3**	**2,473**	**76.9**

Note:

Note:

(1) Numbers have been subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them.

Mining Licenses and Exploration Permits

As of the Latest Practicable Date, we held four valid material gold mining licenses in relation to Tajikistan Jilau/Taror Gold Mines, details of which are set out below:

Type	Serial Number	Geographical Area (ha)	Effective Period	Status
Jilav Mining License . . .	0000117	N/A	November 29, 2023 to November 29, 2028	Valid
Taror Mining License . . .	0000118	N/A	November 29, 2023 to November 29, 2028	Valid
Hirshonai Shimoli Mining License . . .	0000105	N/A	October 31, 2022 to October 31, 2027	Valid
Olimpi Mining License . . .	0000104	N/A	October 31, 2022 to October 31, 2027	Valid

We aim to renew the above mining licenses before their respective expiry dates.

Historical Milestone and Planned Production Schedule

Historical Milestone

The following timeline illustrates key historical milestones in the development of the Tajikistan Jilau/Taror Gold Mines:

Year	Milestone
2007	• Completed the acquisition

Planned Production Schedule

As set forth in the Competent Person's Report, the following chart sets forth the planned production schedule for the operations at the Tajikistan Jilau/Taror Gold Mines for the periods indicated over the Life of Mine:

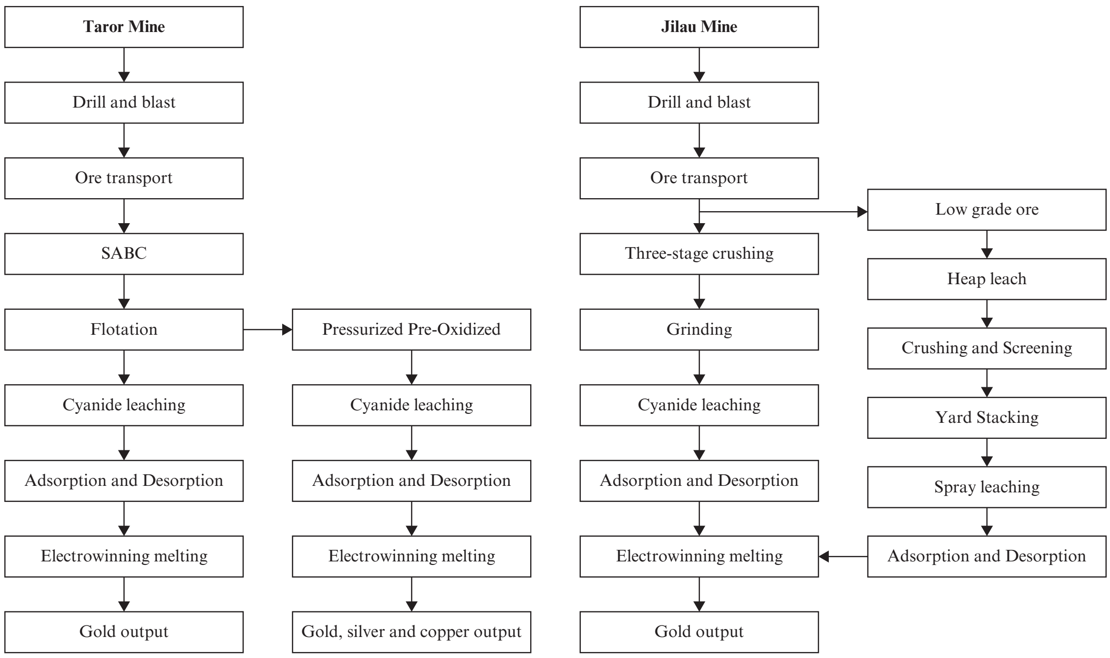
Type	Unit	LOM	2025	2026	2027	2028	2029	2030
Gold Produced	koz	1,882	173	198	245	212	249	161

Type	Unit	2031	2032	2033	2034	2035	2036	2037
Gold Produced	koz	147	112	102	85	83	98	17

Operating Process of Gold Production Business in Tajikistan

(a) Overview

The main mining process of Jilau Mine and Taror Mine are open-pit mining and flotation. The following diagram sets forth the general workflow of the production process:



(b) Mining

The Jilau Mine and Taror Mine utilize open-pit mining methods. The production process typically begins with drilling with down-the-hole drill rigs, followed by medium-to-deep hole blasting. After blasting, ore and rock are differentiated through geological secondary ore delineation. Ore is then loaded by hydraulic excavators and transported by dump trucks. Subsequently, the ore will be processed at the processing plant, while waste rock will be in accordance with environmental regulations.

(c) Processing

- In Jilau Mine, low grade ore are heap leached to gold cyanide complex. High grade ore are processed to gold-loaded carbon through crushing and grinding, as well as the CIL process. The gold-loaded carbon is transported to gold refineries to produce gold ingots.

- In Taror Mine, after the ore is crushed and grounded, it is processed in a full sulfur flotation process. The flotation concentrate is then transported to smelting plant for POX process and recovered in a CIL process, resulting in gold cyanide complex. The flotation tailings also undergo a CIL process to produce gold cyanide complex. Those gold cyanide complex are then transported to gold refineries to produce gold ingots.

Exploration Activities in Tajikistan Jilau/Taror Gold Mines

Since our acquisition in 2007, Zeravshan has consistently advanced production exploration and deep peripheral mineral prospecting. Looking ahead, the focus will be on two key areas:

- Exploration of the Southern Jilau Ore body: Over the next five years, the plan is to conduct 13,000 meters of drilling, with an expected addition of 10 tonnes of gold Resources.

- Expansion of the deep peripheral areas of the Taror Mine: Over the next five years, the plan is to conduct 23,000 meters of drilling, with an expected addition of 10 tonnes of gold Resources.

Copper and Silver Production Business in Tajikistan Jilau/Taror Gold Mines

Copper is a by product of our gold production in the Tajikistan Jilau/Taror Gold Mines. Considering this, we constructed and commenced operations at a copper smelting plant in July 2023. The first batch of cathode copper was produced in September 2023, with recognized revenue starting in 2024. Currently, the copper smelting plant has a daily processing capacity of 500 tonnes of concentrate. It was the first enterprise who has the capacity to produce high-purity copper in Tajikistan. In 2024, the production and sales volume of cathode copper were 5,300 tonnes.

The Tajikistan Jilau/Taror Gold Mines also produce and engage in the sale of silver ingots. In 2024, the production volume of silver ingots amounted to 21.6 tonnes.

OUR GOLD PRODUCTION BUSINESS OF KYRGYZSTAN TALDYBULAK LEVOBEREZHNY GOLD MINE

Overview

The Kyrgyzstan Taldybulak Levoberezhny Gold Mine is the third-largest gold mine in Kyrgyzstan. It is located in the Northern Tianshan Mountain gold-copper mineralization zone, known as the Golden Belt of Central Asia. The project is an integrated mining complex that includes mining, processing, smelting and sales, with a processing capacity of 2,800 tonnes per day. We hold the Kyrgyzstan Taldybulak Levoberezhny Gold Mine through Altynken Limited Liability Company ("**Altynken Limited**"), in which we hold 60% of the equity interest. The Kyrgyzstan Taldybulak Levoberezhny Gold Mine features magmatic-hydrothermal Cu-Au deposit. The extraction and processing methods employed at the mine include underground mining and flotation.

Operation Performance

In 2022, 2023 and 2024, our gold production business in the Kyrgyzstan Taldybulak Levoberezhny Gold Mine processed 1,014 kt, 1,060 kt and 990 kt of ore, and produced 131 koz (4.1 tonnes), 129 koz (4.0 tonnes) and 120 koz (3.7 tonnes) of gold, respectively.

The gold production volume of the Kyrgyzstan Taldybulak Levoberezhny Gold Mine slightly decreased from 131 koz (4.1 tonnes) in 2022 to 129 koz (4.0 tonnes) in 2023. The gold production volume of the Kyrgyzstan Taldybulak Levoberezhny Gold Mine decreased from 129 koz (4.0 tonnes) in 2023 to 120 koz (3.7 tonnes) in 2024, primarily due to the decreased ore processing arising from safety project construction.

In 2022, 2023 and 2024, the gold recovery of the Kyrgyzstan Taldybulak Levoberezhny Gold Mine was approximately 89.5%, 90.4% and 90.4%, respectively.

We aim to make continuous efforts to maintain the average gold processing recovery of the Kyrgyzstan Taldybulak Levoberezhny Gold Mine.

In accordance with the latest local tax regulations dated January 18, 2022 in the Kyrgyz Republic, the corporate income tax rate for enterprises engaged in gold dore and gold ingots is 0%.

Development and Expansion

As of the Latest Practicable Date, the Kyrgyzstan Taldybulak Levoberezhny Gold Mine did not have any concrete plan for expansion.

Mineral Resources and Ore Reserves

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources in the Kyrgyzstan Taldybulak Levoberezhny Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage(1)	Au Grade(1)	Au Metal Contained(1)	
		(Mt)	(g/t)	(koz)	(t)
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	Measured	2.1	4.0	270	8.4
	Indicated	9.2	3.7	1,100	34.0
	Inferred	3.1	4.8	340	10.5
Equity interest: 60%	**Total**	**14.4**	**3.7**	**1,700**	**52.9**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves in the Kyrgyzstan Taldybulak Levoberezhny Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage(1)	Au Grade(1)	Au Metal Contained(1)	
		(Mt)	(g/t)	(koz)	(t)
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	Proved	1.3	4.0	170	5.2
	Probable	6.3	3.6	740	23.0
Equity interest: 60%	**Total**	**7.6**	**3.7**	**910**	**28.0**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

Mining Licenses and Exploration Permits

As of the Latest Practicable Date, we held one valid material mining license in relation to Kyrgyzstan Taldybulak Levoberezhny Gold Mine, details of which are set out below:

Type	Serial Number	Geographical Area (ha)	Effective Period	Status
Mining License . . .	471AE	98.0	April 7, 2006 to January 5, 2026	Valid

We aim to renew the above mining license before its expiry date.

Historical Milestones and Planned Production Schedule

Historical Milestones

The following timeline illustrates key historical milestones in the development of the Kyrgyzstan Taldybulak Levoberezhny Gold Mine:

Year	Milestone
2011	• Acquired 60% of the equity interest of Altynken Limited
2013	• Commenced construction of Kyrgyzstan Taldybulak Levoberezhny Gold Mine
2015	• Commenced trial operation of Kyrgyzstan Taldybulak Levoberezhny Gold Mine
2022	• Ore mined capacity increased to 1 million tonne per year

Planned Production Schedule

As set forth in the Competent Person's Report, the following chart sets forth the planned production schedule for the operations at the Kyrgyzstan Taldybulak Levoberezhny Gold Mine for the periods indicated over the Life of Mine:

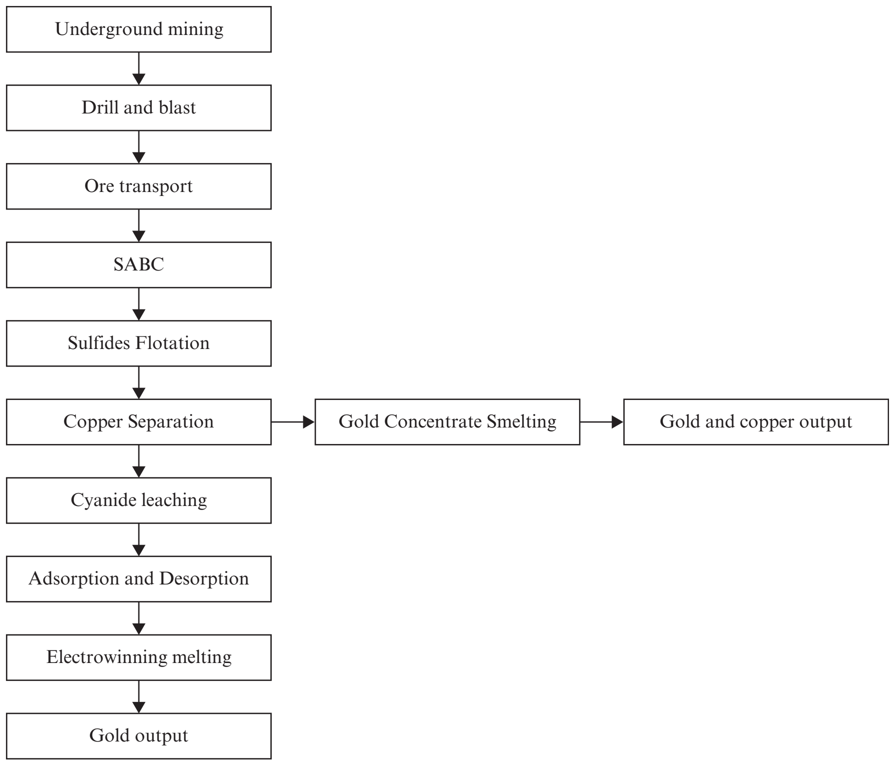
Type	Unit	LOM	2025	2026	2027	2028
Gold produced	koz	787	107	97	91	86

Type	Unit	2029	2030	2031	2032	2033
Gold produced	koz	90	95	97	77	48

Operating Process of Gold Production Business in Kyrgyzstan

(a) Overview

The extraction and processing methods employed at the mine include underground mining and flotation. The following diagram sets forth the general workflow of the production process:



(b) Mining

The mining process of the Kyrgyzstan Taldybulak Levoberezhny Gold Mine is mainly upward drift horizontal slicing fill mining method, using a combination of main declines, flat tunnels, chutes, and vertical shaft lifting for truck transportation.

(c) Processing

- *Mineral Processing*. The gold mineral processing consists of multiple stages, starting with crushing the raw materials, followed by grinding to achieve the desired fineness. This is succeeded by mixed flotation and regrinding processes to further refine the material. Subsequently, copper sulfide-pyrite separation is conducted to extract valuable minerals, and the process concludes with the cyanide leaching of the sulphide concentrate to recover gold.

- *Smelting*. In the smelting phase, the procedure begins with the desorption electrowinning of gold-loaded carbon, which is essential for extracting gold. This step is followed by the removal of impurities to ensure the purity of the metal. The refined product is then subjected to further refining processes, culminating in the smelting of the material into alloyed gold, which enhances its properties for various applications.

Exploration Activities in Kyrgyzstan Taldybulak Levoberezhny Gold Mine

Altynken Limited has significantly increased its exploration investment in recent years. Through detailed exploration activities, including diamond drilling and comprehensive analysis, Altynken Limited has delineated several key target zones, verified through engineering efforts, resulting in the addition of new gold Resources. Concurrently, systematic research around the mine has further identified the extended strike of the ore body, enhancing the classification of resource categories.

Looking ahead, Altynken Limited plans to intensify its exploration efforts. Firstly, from 2026 to 2027, we intend to invest in deep and peripheral exploration within the core area of Taldybulak Levoberezhny, with the expectation of increasing gold Resources by more than 10 tonnes. Secondly, over the next two to three years, Altynken Limited will prioritize preliminary geological research and exploration in three potential target areas, aiming to add new high-potential resources to support sustainable development.

OUR GOLD PRODUCTION BUSINESS OF AUSTRALIA NORTON GOLD MINE

Overview

We operate our Australia Norton Gold Mine through our wholly-owned subsidiary, Norton Gold Fields Pty Ltd ("**Norton Gold**"), which is one of Australia's largest domestic gold producers. Norton Gold has a mining and processing complex in Western Australia's Kalgoorlie gold region, including tenement packages of more than 870 km surrounding the 4.0 Mtpa Paddington Mill (the "**Paddington Mill**") and the 5.0 Mtpa Binduli North Heap Leach Project (the "**Binduli Project**"). The mines of Australia Norton Gold Mine feature greenstone shear zone type. The extraction and processing methods employed at the mine include open-pit mining, underground mining, CIL/CIP, and heap leaching.

Operation Performance

In 2022, 2023 and 2024, our gold production business in the Australia Norton Gold Mine processed 3,658 kt, 6,642 kt and 8,065 kt of ore, and produced 177 koz (5.5 tonnes), 216 koz (6.7 tonnes) and 266 koz (8.3 tonnes) of gold, respectively.

The gold production volume of the Australia Norton Gold Mine increased from 177 koz (5.5 tonnes) to 216 koz (6.7 tonnes) in 2023. This was primarily due to the commencement of commercial production at the Binduli Project in April 2023, which has continued to ramp up since then. The gold production volume of the Australia Norton Gold Mine increased from 216 koz (6.7 tonnes) to 266 koz (8.3 tonnes) in 2024, primarily driven by the increased processing capacity at the Binduli Project.

In 2022, 2023 and 2024, the gold recovery of the Australia Norton Gold Mine was approximately 85.8%, 85.8% and 86.8%, respectively. We have made constant efforts to improve the average gold recovery of the Australia Norton Gold Mine. In addition to on-site process optimization to improve gold recovery, the Paddington Mill is investing in pipeline infrastructure to improve quality of water source and reduce the impact of water quality fluctuations on gold recovery. The Binduli Project is improving its gold recovery by reducing particle size of leaching ore, improving water quality, and implementing a fines removal project.

Development and Expansion

Our current efforts are strategically centered on enhancing processing capacity and gold output, with a focus on driving system-wide synergies across our two operational hubs. To this end, we are transitioning to owner-operated mining and strengthening global procurement to reduce costs and improve efficiency. Aligned with this core objective, several key development projects are being fast-tracked. For example, Phase II of the Binduli North Heap Leach Plant will utilize fine aperture tension screens to process HPGR products more efficiently, enabling improved grade-based ore separation and enhanced heap leach performance. At the same time, we are upgrading refractory ore processing capabilities at the Paddington Mill and introducing ore-sorting technology to boost pre-concentration and recover value from waste rock. In parallel, a new phase of underground mine development is underway. These initiatives are not stand-alone — they are designed to work in coordination, improving feed grade, optimizing plant flexibility, and maximizing the return on our combined infrastructure. Once fully operational, these projects will increase annual processing capacity from 9 million tonnes to 12 million tonnes with production volume to be increased, significantly enhancing profitability, competitiveness, and our contribution to the regional economy and local communities.

Norton Gold holds extensive tenement resources located within a world-class gold mineralisation belt, offering significant geological exploration potential. The abundant resource base provides a solid foundation for sustainable growth and demonstrates strong long-term development prospects.

Mineral Resources and Ore Reserves

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources in the Australia Norton Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)] (Mt)	Au Grade[(1)] (g/t)	Au Metal Contained[(1)] (koz)	(t)
Australia Norton Gold Mine	Measured	17.5	1.2	690	21.5
	Indicated	193.7	0.8	5,222	162.4
	Inferred	100.3	1.0	3,333	103.7
Equity interest: 100%	**Total**	**311.5**	**0.9**	**9,245**	**287.6**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves in the Australia Norton Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)] (Mt)	Au Grade[(1)] (g/t)	Au Metal Contained[(1)] (koz)	(t)
Australia Norton Gold Mine	Proved	4.9	1.2	186	5.8
	Probable	115.6	0.8	2,883	89.7
Equity interest: 100%	**Total**	**120.4**	**0.8**	**3,070**	**95.5**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

Mining Leases

As of the Latest Practicable Date, we held 33 valid material mining leases in relation to Australia Norton Gold Mine, details of which is set out below:

Type	Tenement Number	Lease Area (ha)	Current Term	Status
Mining Lease . . .	M24/20	533.85	October 20, 1983 to October 19, 2025	Live
Mining Lease . . .	M24/181	41.41	December 29, 1987 to December 28, 2029	Live
Mining Lease . . .	M24/180	45.76	December 29, 1987 to December 28, 2029	Live
Mining Lease . . .	M24/234	370.55	June 13, 1988 to June 12, 2030	Live
Mining Lease . . .	M24/302	985.90	December 8, 1989 to December 7, 2031	Live
Mining Lease . . .	M24/82	82.74	February 12 to 1986 to February 11, 2028	Live
Mining Lease . . .	M24/266	122.75	September 29, 1988 to September 28, 2030	Live
Mining Lease . . .	M16/45	614.85	November 3, 1987 to November 2, 2029	Live
Mining Lease . . .	M24/170	819.75	November 3, 1987 to November 2, 2029	Live
Mining Lease . . .	M24/616	984.10	February 19, 1998 to February 18, 2040	Live
Mining Lease . . .	M24/564	541.60	November 4, 1997 to November 3, 2039	Live
Mining Lease . . .	M26/474	893.55	November 4, 1997 to November 3, 2039	Live
Mining Lease . . .	M26/243	228.80	June 12, 1990 to June 11, 2032	Live
Mining Lease . . .	M26/447	876.40	January 25, 1995 to January 24, 2037	Live
Mining Lease . . .	M26/446	510.35	November 30, 1994 to November 29, 2036	Live
Mining Lease . . .	M26/387	111.20	December 11, 1992 to December 10, 2034	Live
Mining Lease . . .	M26/430	130.55	October 25, 1993 to October 24, 2035	Live
Mining Lease . . .	M26/420	121.20	September 17, 1993 to September 16, 2035	Live
Mining Lease . . .	M26/445	207.20	January 20, 1995 to January 19, 2037	Live

Type	Tenement Number	Lease Area (ha)	Current Term	Status
Mining Lease . . .	M26/468	881.60	November 4, 1997 to November 3, 2039	Live
Mining Lease . . .	M24/944	280.65	June 11, 2015 to June 10, 2036	Live
Mining Lease . . .	M16/44	593.35	November 3, 1987 to November 2, 2029	Live
Mining Lease . . .	M16/106	542.20	February 15, 1989 to February 14, 2031	Live
Mining Lease . . .	M16/58	292.65	March 9, 1988 to March 8, 2030	Live
Mining Lease . . .	M24/166	433.30	February 9, 1988 to February 8, 2030	Live
Mining Lease . . .	M24/304	694.65	March 28, 1990 to March 27, 2032	Live
Mining Lease . . .	M24/155	375.05	August 6, 1987 to August 5, 2029	Live
Mining Lease . . .	M24/79	9.60	January 28, 1987 to January 27, 2029	Live
Mining Lease . . .	M24/29	845.15	January 4, 1984 to January 3, 2026	Live
Mining Lease . . .	M27/185	824.75	January 18, 1995 to January 17, 2037	Live
Mining Lease . . .	M27/437	747.41	December 6, 2012 to December 5, 2033	Live
Mining Lease . . .	M24/862	113.10	September 3, 2007 to September 2, 2028	Live
Mining Lease . . .	M24/187	221.70	January 19, 1988 to January 18, 2030	Live

We aim to make the necessary applications for renewal of the above mining leases before their respective expiry dates. Mining lease M24/20 has a current expiry date in October 2025. As such, we have already started the process of seeking the necessary regulatory approvals for this renewal. As of the Latest Practicable Date, we are in ongoing discussion with certain Australian authorities to seek to complete the renewal process prior to the relevant expiry date.

Historical Milestones and Planned Production Schedule

Historical Milestones

The following timeline illustrates key historical milestones in the development of the Australia Norton Gold Mine:

Year	Milestone
2007	• Norton Gold acquired Paddington Mill
2012	• Completed the acquisition of Australia Norton Gold Mine
2020	• Commenced low-grade refractory ore and the construction of north heap leach of Binduli Project
2022	• Completed the construction of north heap leach of Binduli Project
2024	• North heap leach of Binduli Project achieved its designed mining capacity

Planned Production Schedule

As set forth in the Competent Person's Report, the following chart sets forth the planned production schedule for the operations at the Australia Norton Gold Mine for the periods indicated over the Life of Mine:

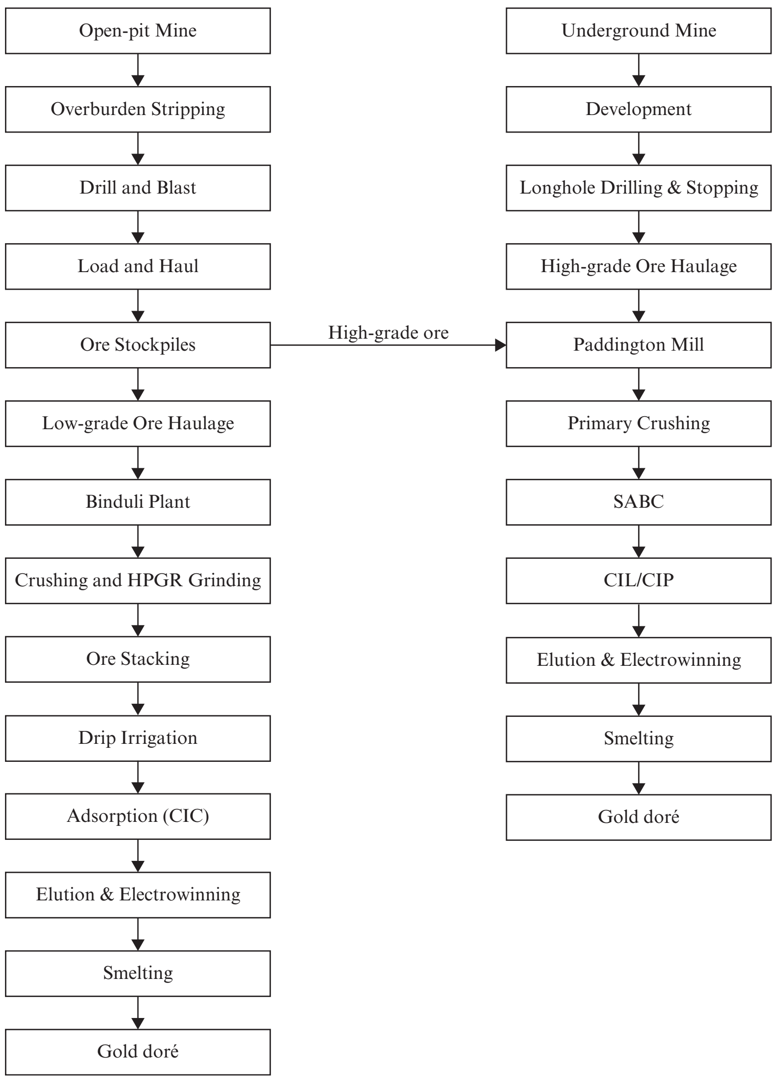
Type	Unit	LOM	2025	2026	2027	2028	2029	2030
Gold Produced	koz	2,587	185	263	226	215	173	185

Type	Unit	2031	2032	2033	2034	2035	2036	2037	2038
Gold Produced	koz	207	229	263	235	215	96	72	24

Operating Process of Gold Production Business in Australia

(a) Overview

The extraction and processing methods employed at the mine include open mining, underground mining, CIL/CIP process, and heap leaching and flotation depending on the depth and grade of the ore body. The following diagram sets forth the general workflow of the production process:



(b) Mining

The open-pit operation adopts conventional bench mining techniques commonly used in Australia. The process begins with the removal of overburden and waste rock to expose the ore body, followed by drilling and blasting to fragment the rock. Grade control drilling is conducted at close spacing ahead of mining to accurately define ore boundaries and minimise dilution. Based on the grade control model, material is classified as either ore or waste. Ore is loaded by hydraulic excavators or wheel loaders into haul trucks and transported to designated ore stockpiles. Waste rock is hauled to waste rock dumps (WRDs).

Underground mining operations utilize decline access and sublevel open stoping methods. A spiral decline is developed from surface to access the ore zones, with lateral development drives established to expose ore blocks — supported by detailed grade control sampling and geological mapping. Ore is extracted using long-hole stoping techniques. Once blasted, ore is collected by LHD (Load-Haul-Dump) units and transferred to underground haul trucks for transport to surface via the decline. Waste rock generated from development headings is similarly hauled to surface and either stored in approved waste facilities or used for underground backfilling where appropriate. Backfilling is also applied in mined-out stopes to maintain ground stability and support the sequencing of adjacent stopes, using either Cemented Rock Fill (CRF) or paste fill, depending on the mine design.

(c) Processing

Paddington Mill

Paddington Mill primarily treats high-grade ore sourced from both open-pit deposits and underground operations. After primary crushing by a gyratory crusher, (ROM) ore is fed into a SABC circuit, Gravity recovery is conducted using Nelson concentrators installed on the hydrocyclone underflow, targeting coarse gold particles. The recovered gravity concentrate is intensively leached in an Acacia Reactor to maximise gold recovery.

The hydrocyclone overflow is thickened and then subjected to cyanide leaching through a CIL/CIP process, during which activated carbon adsorbs the dissolved gold from solution. Gold is subsequently recovered via elution, electrowinning, and smelting to produce doré bars. These bars are transported to the Perth Mint for final refining into bullion before being sold to the market.

Binduli Project

The Binduli North Heap Leach Plant is purpose-built for the large-scale processing of low-grade gold ore. The ore undergoes two-stage crushing, followed by HPGR grinding. It is then conveyed via long-distance conveyors, grasshoppers, and a stacker to form engineered heap leach pads.

The stacked ore is irrigated with a leaching solution through a drip system, allowing gold to dissolve into the pregnant leach solution (PLS), which is collected and pumped to a carbon-in-column (CIC) adsorption circuit. Gold in the PLS is adsorbed onto activated carbon and subsequently recovered through elution, electrowinning, and smelting to produce doré gold. The doré is then transported to the Perth Mint for final refining and sale.

Exploration Activities in Australia Norton Gold Mine

Norton Gold is committed to a balanced exploration strategy focused on expanding its resource base, extending mine life, and improving operational margins through targeted exploration activities. The primary goal is to sustain production at the Paddington Mill and Binduli Project while diversifying the company's mineral resource base. This includes resource and reserve growth at existing operations and brownfield exploration across high-potential tenements. Norton has achieved significant increases in Mineral Resources and Ore Reserves through its dedicated resource and reserve growth programs. These results support the company's strategic objective of increasing annual production to over 260 koz (approximately 8 tonnes), compared to historical levels of approximately 160 koz (approximately 4.5 tonnes). A key focus is on brownfield exploration in and around existing mines to extend their operational life. Priority targets include Tuart, Bullant, Enterprise, Federal, Binduli South, and Racetrack, where recent exploration has delivered encouraging results. A resource definition drilling program is currently underway to advance this opportunity. Additionally, refractory projects such as Racetrack are being studied for future development.

OUR GOLD PRODUCTION BUSINESS OF GUYANA AURORA GOLD MINE

Overview

The Guyana Aurora Gold Mine is the only large operational gold mining project in Guyana with production volume of over 100 koz in 2024. It is located at Cuyuni-Mazaruni District, Guyana. We hold the Guyana Aurora Gold Mine through our indirectly wholly-owned subsidiary, AGM Inc. ("**AGM**"). The Guyana Aurora Gold Mine is greenstone-hosted gold deposit or orogenic gold deposit. The extraction and processing methods employed at the mine include open-pit mining, underground mining and gravity separation, leaching and carbon adsorption and elution and refining.

Operation Performance

In 2022, 2023 and 2024, our gold production business in the Guyana Aurora Gold Mine processed 2,489 kt, 2,660 kt and 2,712 kt of ore, and produced 91 koz (2.8 tonnes), 95 koz (3.0 tonnes) and 130 koz (4.1 tonnes) of gold, respectively.

The gold production volume of the Guyana Aurora Gold Mine increased from 91 koz (2.8 tonnes) in 2022 to 95 koz (3.0 tonnes) in 2023, and further increased to 130 koz (4.1 tonnes) in 2024, primarily due to the operation of additional ball grinding machine we purchased in March 2023, which increased our daily processing capacity from 7.5 kt to 8.0 kt.

In 2022, 2023 and 2024, the gold recovery of the Guyana Aurora Gold Mine was approximately 91.1%, 90.5% and 92.9%, respectively. The general high recovery are mainly attributed to the commissioning of the upgraded ball mill machine we utilized, which optimized the grinding fineness.

We have made constant efforts to improve the average gold processing recovery of the Guyana Aurora Gold Mine. In February 2025, the new ball mill machine was put into operation, further optimizing the grinding fineness. Additionally, three newly constructed leaching tanks were commissioned in June 2025, increasing the leaching efficiency. Looking ahead, we expect that the gold processing recovery will increase further in 2025.

Development and Expansion

We plan to gradually commission the Phase I underground mining project by 2025 and fully realize the commissioning and production of the 3.3 million/year processing plant upgrade project. We prioritize technological upgrades, planning to utilize industry-leading process technologies (such as Knelson gravity separation, tailings cyanide washing, and leaching tank processes) to achieve early recovery, improve gold leaching rates, and reduce sodium cyanide consumption, gradually achieving cost reduction and efficiency enhancement.

Mineral Resources and Ore Reserves

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources in the Guyana Aurora Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage(1)	Au Grade(1)	Au Metal Contained(1)	
		(Mt)	(g/t)	(koz)	(t)
Guyana Aurora Gold Mine	Measured	2.1	2.8	189	5.9
	Indicated	40.3	2.7	3,428	106.7
	Inferred	36.8	2.1	2,435	75.8
Equity interest: 100%	**Total**	**79.2**	**2.4**	**6,052**	**188.4**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves in the Guyana Aurora Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage(1)	Au Grade(1)	Au Metal Contained(1)	
		(Mt)	(g/t)	(koz)	(t)
Guyana Aurora Gold Mine	Proved	2.2	2.5	175	5.5
	Probable	31.9	2.1	2,188	68.1
Equity interest: 100%	**Total**	**34.0**	**2.2**	**2,364**	**73.5**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

Mining Licenses and Exploration Permits

As of the Latest Practicable Date, we held one valid material mining licenses and three exploration permits in relation to Guyana Aurora Gold Mine, details of which are set out below:

Type	Serial Number	Geographical Area (km^2)	Effective Period	Status
Mining License.	ML/G1	58.028	November 18, 2011 to November 18, 2031	Valid

We aim to renew the above mining license before its expiry date.

Historical Milestones and Planned Production Schedule

Historical Milestones

The following timeline illustrates key historical and planned milestones in the development of the Guyana Aurora Gold Mine:

Year	Milestone
2020	• Completed acquisition • Resumed operations within 90 days following the completion of the acquisition
2021	• Resumed and commenced underground mining
2023	• The external audits for ISO 14001 and ISO 45001 environmental and occupational health and safety management systems were successfully completed
2023	• In March, the secondary mill at the Guyana Aurora Gold Mine processing plant was successfully commissioned with feed

Planned Production Schedule

As set forth in the Competent Person's Report, the following chart sets forth the planned production schedule for the operations at the Guyana Aurora Gold Mine for the periods indicated over the Life of Mine:

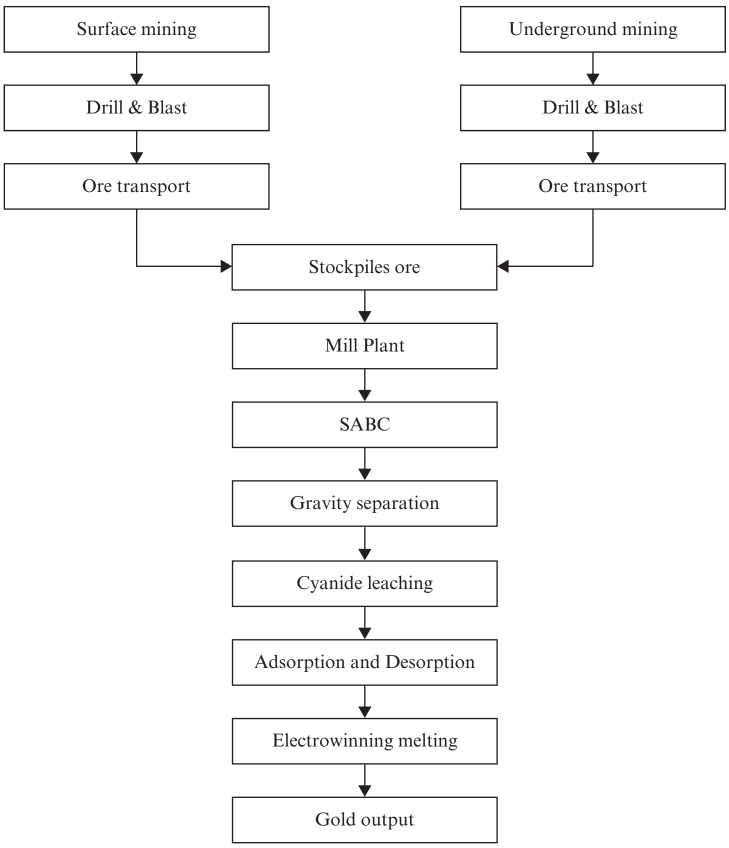
Type	Unit	LOM	2025	2026	2027	2028	2029	2030
Gold Produced	koz	2,161	143	152	187	189	128	205

Type	Unit	2031	2032	2033	2034	2035	2036	2037
Gold Produced	koz	173	160	199	178	182	170	96

Operating Process of Gold Production Business in Guyana

(a) Overview

The extraction and processing methods employed at the mine include open-pit mining, underground mining and gravity separation, leaching and carbon adsorption, acid wash and elution, refining. The following diagram sets forth the general workflow of the production process:



(b) Mining

The open-pit mining process includes down-the-hole drilling, medium and deep hole bench blasting, excavator loading, wide-body mining truck transportation, and dozer and front loader waste disposal process.

The first phase of underground mining development construction, including the main and auxiliary shaft construction, the development and mining of satellite ore bodies, as well as the construction of return air shafts. The mining methods used are the sublevel open stoping method and the large-diameter long hole open stoping with delayed backfill method.

(c) Processing

The mineral processing technology consists of the following procedures: crushing, semi-autogenous grinding with ball milling, cyclone classification, gravity separation, cyanide leaching, carbon adsorption, carbon desorption and regeneration, gold refining, cyanide removal, and tailings disposal. The ore is primarily supplied by the open-pit mining plant, with a small amount provided by the underground mining plant.

Exploration Activities in Guyana Aurora Gold Mine

In recent years, the geological exploration efforts at the Guyana Aurora Gold Mine have primarily focused on expanding the resource and reserves for underground mining and identifying successor resources for open-pit mining. This has involved supplementary exploration of the main production ore body, and screening and verifying peripheral target areas to extend the operational life of open-pit mining. Through surface drilling and combined exploration, the company has enhanced control over the strike and tendency of the ore body, thereby expanding its size. Additionally, based on metallogenic studies, the company has verified parallel ore body groups, adding new resources. By integrating geological, physical, and chemical exploration data, including geomagnetic and airborne magnetic surveys, the company has defined multiple mineral prospects and target areas through trenching and drilling validation.

Over the next three years, AGM plans to deepen exploration of the main ore body's deep side to expand known ore reserves. Efforts will also focus on exploring blank areas around the main ore body and evaluating greenfield target areas to accelerate the transformation of outcrop mining and replacement resources. The planned exploration activities include drilling, trenching, and sample analysis, with a budget allocated to support these initiatives. We anticipate adding new gold Resources and identifying several key exploration targets.

OUR GOLD PRODUCTION BUSINESS OF COLOMBIA BURITICÁ GOLD MINE

Overview

The Colombia Buriticá Gold Mine is located in Buriticá, Colombia. The Colombia Buriticá Gold Mine is a globally recognized large-scale gold mine with exceptionally high grades. It is Colombia's first large-scale underground mine and has been recognized by the Colombian government as a "Project of National Strategic Interest". We hold a 68.8% of the economic interest in this project through the Colombia Entrustment Agreement, which is currently in production and undergoing expansion. The mine features epithermal deposit types. The extraction and processing methods employed at the mine include underground mining, gravity separation, flotation, and cyanide leaching.

We own the Colombia Buriticá Gold Mine through the Colombia Entrustment Arrangement. The assets, liabilities and operation results of the Colombia Buriticá Gold Mine will be consolidated to the financial results of our Company. For further details, please refer to the section headed "Relationship with Zijin Mining — Colombia Entrustment Arrangement" in this document.

Operation Performance

In 2022, 2023 and 2024, our gold production business in Colombia Buriticá Gold Mine processed 1,332 kt, 1,454 kt and 1,461 kt of ore, and produced 248 koz (7.7 tonnes), 268 koz (8.3 tonnes) and 322 koz (10.0 tonnes) of gold, respectively.

The gold production volume of the Colombia Buriticá Gold Mine increased from 248 koz (7.7 tonnes) in 2022 to 268 koz (8.3 tonnes) in 2023. This was primarily due to the technical upgrade we completed in late 2021. The gold production volume of the Colombia Buriticá Gold Mine increased from 268 koz (8.3 tonnes) in 2023 to 322 koz (10.0 tonnes) in 2024, primarily due to the increased milling grade in 2024.

In 2022, 2023 and 2024, the gold recovery of the Colombia Buriticá Gold Mine was approximately 88.4%, 90.6% and 91.9%, respectively. Following the transformation of flotation technology and the optimization of the process flow, the recovery of sulfide-encapsulated gold has progressively improved, leading to a gradual increase in the overall recovery.

In 2025, Continental Gold Colombia Branch was involved in a tax dispute with the Colombian tax authorities in relation to the tax levied to one of the then sellers of CGI arising from its disposal to Zijin Mining in 2020. The tax dispute is currently being addressed, and discussions are ongoing with various parties involved. Pursuant to the Return Swap Agreement, we expect such tax dispute to have no material adverse impact over our operations and financial performance.

We have made constant efforts to improve the average gold processing recovery of the Colombia Buriticá Gold Mine. Looking ahead, we expect that the gold processing recovery will increase further by increasing the yield of gold concentrates.

Development and Expansion

We are actively engaged in exploration and reserve expansion/growth efforts, focusing on the characteristics of narrow veins/reefs by promoting the miniaturization of mining equipment and implementing underground sorting measures to reduce ore loss and dilution rates and improve ore grade. Additionally, we plan to continuously optimize material and energy consumption, enhance processing indicators and fully recover non-ferrous metals such as gold, silver, and copper for efficient resource utilization. We anticipate increasing daily ore production from 4,000 tonnes to 5,000 tonnes and boosting annual mining capacity by 320,000 tonnes to achieve an annual production target of 1.65 million tonnes, thereby significantly enhancing the mine's production capacity and market competitiveness.

Mineral Resources and Ore Reserves

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources in the Colombia Buriticá Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)]	Au Grade[(1)]	Au Metal Contained[(1)]	
		(Mt)	(g/t)	(koz)	(t)
Colombia Buriticá Gold Mine	Measured	10.1	7.7	2,500	78.2
	Indicated	19.2	7.1	4,400	136.9
Economic interest:	Inferred	21.0	7.1	4,800	149.8
68.8%	**Total**	**50.4**	**7.2**	**11,700**	**364.9**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves in Colombia as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)]	Au Grade[(1)]	Au Metal Contained[(1)]	
		(Mt)	(g/t)	(koz)	(t)
Colombia Buriticá Gold Mine	Proved	7.0	7.6	1,740	53.5
	Probable	15.5	6.5	3,240	101.0
Economic interest: 68.8%	**Total**	**22.5**	**6.9**	**4,980**	**154.5**

Note:

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of non-gold Resources in the Colombia Buriticá Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Ag Grade	Ag Metal Contained
		(g/t)	(t)
Colombia Buriticá Gold Mine	Measured	23.4	236.8
	Indicated	24.7	474.9
	Inferred	20.6	432.2
	Total	**22.7**	**1,143.9**

Note:

(1) Numbers have been subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of non-gold Reserves in the Colombia Buriticá Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Ag Grade (g/t)	Ag Metal Contained (kg)
Colombia Buriticá Gold Mine	Proved	21.1	148.0
	Probable	19.8	307.0
	Total	**20.2**	**455.0**

Note:

1. Numbers have been subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them.

Mining Concession Agreements

As of the Latest Practicable Date, Continental Gold held one valid material mining concession agreement in relation to the Colombia Buriticá Gold Mine, details of which are set out below:

Type	Serial Number	Geographical Area (ha)	Effective Period	Status
Mining concession agreement .	P7495011	1,894.8412	March 20, 2013 to March 20, 2043	Valid

We aim to renew the above mining license before its expiry date.

Historical Milestones and Planned Production Schedule

Historical Milestones

The following timeline illustrates key historical milestones in the development of the Colombia Buriticá Gold Mine:

Year	Milestone
2020	• Completed the acquisition and commenced commercial operation
2021	• Completed 4 kt per day technical upgrade project in processing plant
2024	• Higabra's second level tunnel has achieved full line penetration, which improved the underground ventilation system of the mine

Planned Production Schedule

As set forth in the Competent Person's Report, the following chart sets forth the planned production schedule for the operations at the Colombia Buriticá Gold Mine for the periods indicated over the Life of Mine:

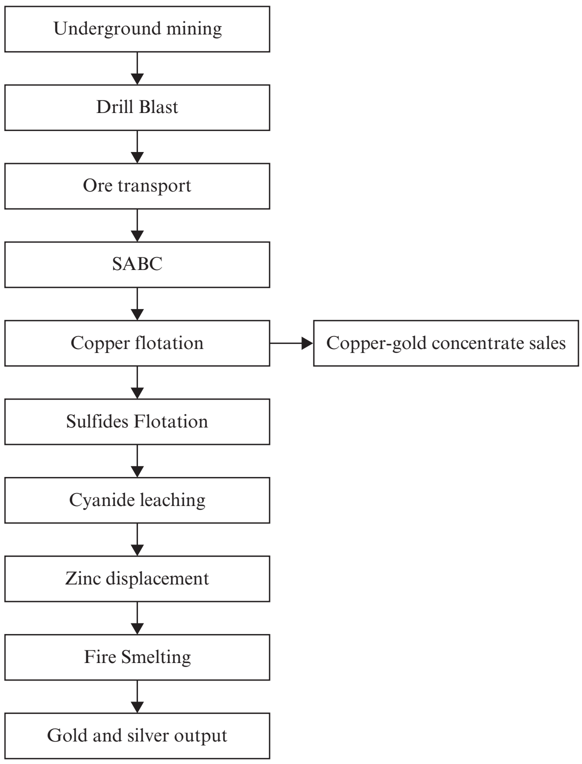
Type	Unit	LOM	2025	2026	2027	2028	2029	2030	2031
Gold Produced . . .	koz	4,471	308	286	290	302	327	282	351

Type	Unit	2032	2033	2034	2035	2036	2037	2038	2039
Gold Produced . . .	koz	386	367	355	332	256	247	219	163

Operating Process of Gold Production Business in Colombia

(a) Overview

Continental Gold operates a comprehensive production process from resource exploration to product sales. The geological exploration department is tasked with drilling and exploring resources within the mining rights area, and it shares the resource model with the mining department. The mining department validates the resource model through infill drilling, develops a grade control model, and uses this model to design and plan mining production. The following diagram sets forth the general workflow of the production process:



(b) Mining

The underground mine employs the long-hole stoping method, with access to the ore body provided by two declines and a tunnel. The mining process follows a sequence of rock drilling, blasting, loading, transportation, and backfilling. Blasted ore is loaded by Load-Haul-Dump (**LHD**) vehicles into dump trucks, which transport it to the surface stockpile via the declines. Front-End Loaders (**FELs)** then transfer the ore to the crusher at the processing plant.

(c) Processing

The processing circuit involves several stages, including pre-selection tailings disposal, grinding, semi-autogenous grinding in an open circuit, re-election, priority copper and gold selection, whole sulphide flotation, sulphide concentrate thickening, leaching, counter-current washing, zinc powder replacement, heavy sand and gold mud smelting, and tailings dehydration. This process produces refined copper-gold concentrate and high-quality gold ingots, which are subsequently sold. The crushing and grinding stages utilize a SABC circuit, with a gravity separation system integrated into the grinding circuit to recover liberated gold grains. The grinding products undergo a preferential flotation process to recover copper and other sulfide minerals, resulting in copper-gold concentrate, sulphide concentrate, and flotation tailings. The copper-gold concentrate is sold directly. Flotation tailings are filtered, with a portion of the filter cake used for underground filling and the remainder stored in the Tailings Storage Facility (**TSF**). The sulphide concentrate undergoes cyanidation followed by the Merrill-Crowe zinc precipitation process to extract gold and silver.

Exploration Activities in Colombia Buriticá Gold Mine

In 2024, the deep exploration program at the Colombia Buriticá Gold Mine has led to significant increases in Mineral Resources. Notably, drilling activities have intercepted substantial high-grade gold ore bodies, with promising results indicating the extension of the Veta Sur vein to the southwest. Additionally, high-grade mineralization at depths between 850m and 450m elevation remains open, suggesting considerable potential for discovering large-scale high-grade gold or porphyry copper ore bodies below 400m elevation.

The Colombia Buriticá Gold Mine is strategically situated within the North Andean Middle Cauca copper-gold mineralization belt in South America, an area known for its numerous porphyry and hydrothermal copper-gold deposits, such as Titribi, Marmato, and La Cosola. Continental Gold has identified deposits with significant exploration potential in both deep margins and greenfield projects. In the neighboring areas of Buriticá and Berlin, numerous gold and copper ore indicators have been discovered and partially verified. For these prospecting rights areas, we anticipates achieving substantial exploration and Mineral Resources increases by enhancing the comprehensive study of mineralization patterns in the future.

OUR GOLD PRODUCTION BUSINESS OF SURINAME ROSEBEL GOLD MINE

Overview

The Suriname Rosebel Gold Mine is one of the largest in-production open-pit gold mines in South America. It is located at Brokopondo and Sipaliwini Districts in northern Suriname. We hold the Suriname Rosebel Gold Mine through our indirect subsidiary, Rosebel GM. The Suriname Rosebel Gold Mine features greenstone-hosted gold deposit type. The extraction and processing methods employed at the mine include open-pit mining and cyanidation process. The main orebody of the Suriname Rosebel Gold Mine remains open at depth and along the strike, indicating significant potential for further resource expansion. The Suriname Rosebel Gold Mine includes Rosebel ore and Saramacca ore, two mining areas in Rosebel and Saramacca which Rosebel GM holds 100% and 70% equity interests, respectively.

We acquired Rosebel GM in 2023.

Operation Performance

In 2023 (after acquisition in February) and 2024, Suriname Rosebel Gold Mine processed 7,817 kt and 9,321 kt of ore, and produced 241 koz (7.5 tonnes) and 240 koz (7.5 tonnes) of gold, respectively. Since our acquisition, the gold production volume of the Suriname Rosebel Gold Mine remained relatively stable.

In 2022, 2023 and 2024, the gold recovery of the Suriname Rosebel Gold Mine was approximately 93.7%, 96.6% and 94.5%, respectively. The slight decrease in the gold recovery in 2024 was due to the processing challenges related to the refractory ores in Saramacca.

We have made constant efforts to improve the average gold processing recovery of the Suriname Rosebel Gold Mine through targeted technical upgrades to crushing and grinding circuits, coupled with extensive metallurgical test work on refractory ores. Looking ahead, the deployment of advanced mineral processing technologies, specifically tailored to treat refractory Saramacca ores, is expected to drive steady recovery improvements. These innovations aim to mitigate ore variability and optimize extraction efficiency, ensuring sustained progress in gold recovery performance.

Development and Expansion

We are committed to developing the Suriname Rosebel Gold Mine into one of the main gold-producing mines in South America. To address challenges such as the low gold grade of Rosebel ore and the carbon and arsenic content in Saramacca ore, we have developed large-scale utilization technology for low-grade ores, achieving an annual processing capacity of 10 million tonnes with a single-series semi-autogenous mill. The overall gold recovery reached 94% in 2024. Building on the current processing plant's annual capacity of 10 million tonnes, we are exploring the feasibility of increasing capacity to 11–13 million tonnes.

Mineral Resources and Ore Reserves

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources in Suriname Rosebel Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage(1)	Au Grade(1)	Au Metal Contained(1)	
		(Mt)	(g/t)	(koz)	(t)
Suriname Rosebel Gold Mine	Measured	270.5	0.8	7,187	223.5
	Indicated	156.6	0.8	4,072	126.7
	Inferred	29.9	0.8	777	24.2
Equity interest: 95%	**Total**	**457.1**	**0.8**	**12,036**	**374.3**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves in Suriname Rosebel Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage(1)	Au Grade(1)	Au Metal Contained(1)

	Probable	41.6	0.8	1,040	32.3
Equity interest: 95%	**Total**	**221.6**	**0.8**	**5,583**	**173.6**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

Mining Licenses and Exploration Permits

As of the Latest Practicable Date, Rosebel GM held two valid exploitation concessions and nine valid exploration concessions in relation to Suriname Rosebel Gold Mine, details of which are set out below:

Type	Serial Number	Geographical Area (ha)	Effective Period	Status
Exploitation Concession	GMD 468/20	17,000	December 16, 2002 to December 16, 2027	Valid
Exploitation Concession	GMD 301/19	4,975	May 2, 2019 to May 2, 2044	Valid
Exploitation Concession	GMD 536/24	466	February 3, 2025 to February 3, 2030	Pending final registration
Exploration Concession	GMD 467/24	7,769	November 18, 2024 to November 18, 2026	Valid
Exploration Concession	GMD 470/24	5,075	November 18, 2024 to November 18, 2026	Valid
Exploration Concession	GMD 472/24	112.1	February 3, 2025 to February 3, 2027	Valid
Exploration Concession	GMD 469/24	2,188	February 3, 2025 to February 3, 2027	Valid
Exploration Concession	GMD 471/24	1,459	February 3, 2025 to February 3, 2027	Valid
Exploration Concession	GMD 473/24	36.75	February 3, 2025 to February 3, 2027	Valid
Exploration Concession	GMD 468/24	3,425	18 November 2024 to 18 November 2026	Valid
Exploration Concession	GMD 537/24	7,095	8 April 2025 to 8 April 2027	Valid
Exploration Concession	GMD 421/24	2,540	15 May 2024 to 15 May 2026	Valid

We aim to renew the above concessions before their respective expiry dates to the extent permitted by applicable laws. However, exploration rights in Suriname may be extended up to a maximum of two times for a period of two years each. Several of Rosebel GM's exploration rights (particularly, GMD 470/24, GMD 469/24, GMD 471/24, GMD 468/24, GMD 467/24, GMD 473/24, GMD 472/24 and GMD 421/24) have already been extended twice and therefore cannot be extended further under applicable laws.

Historical Milestones and Planned Production Schedule

Historical Milestones

The following timeline illustrates key historical and planned milestones in the development of the Suriname Rosebel Gold Mine:

Year	Milestone
2004	• Commenced commercial production;
2008	• Recorded mine throughput and gold production
2016	• RGM signs agreement to acquire a 70% interest in the Saramacca property
2020	• Commenced commercial production in Saramacca
2023	• Completed the acquisition of Rosebel GM

Planned Production Schedule

As set forth in the Competent Person's Report, the following chart sets forth the planned production schedule for the operations at the Suriname Rosebel Gold Mine for the periods indicated over the Life of Mine:

Type	Unit	LOM	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036

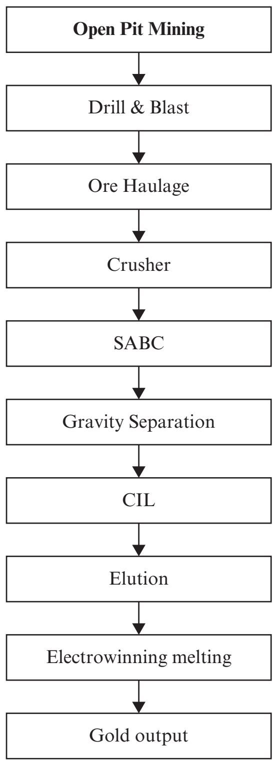
Operating Process of Gold Production Business in Suriname

(a) Overview

The Suriname Rosebel Gold Mine utilizes a combination of open-pit mining, gravity separation, and CIL for gold extraction and processing. The primary orebody exhibits geological continuity, remaining open at depth and along strike, which underscores substantial potential for future resource expansion through targeted exploration. The following diagram sets forth the general workflow of the production process:



(b) Mining

The Suriname Rosebel Gold Mine uses a traditional truck-and-shovel method for open-pit mining, which involves a sequence of drilling, blasting, loading, and hauling to effectively manage ore and waste rock. During blast hole drilling, geological sampling is conducted to analyze gold content, allowing for precise control over the ore grade and planning for resource allocation and cut-off points. Excavation strategies are guided by rock classifications: soft rock is excavated directly, while transition and hard rock require controlled blasting to break them down efficiently. After blasting, material that meets the gold grade criteria is either processed immediately or stored for future use, while waste rock that doesn't contain valuable gold is moved to specially designed storage areas that comply with environmental and safety standards. This organized approach improves operational efficiency by focusing on processing high-grade ore, reducing costs associated with low-grade material, and supporting long-term sustainability and productivity goals through flexible planning and strict environmental management.

(c) Processing

The gold extraction process at Suriname Rosebel Gold Plant follows an integrated flowsheet combining crushing, grinding, gravity separating, cyanide leaching and metallurgical recovering. Ore enters the circuit through haul trucks feeding a primary gyratory crusher, with subsequent ball mill via vibrating grizzly and cone crushers. Crushed material undergoes controlled blending through dual apron feeders before advancing to comminution.

The grinding circuit combines a semi-autogenous (SAG) mill operating in open configuration with three ball mills in closed-circuit cyclone loops. Screen oversize from the SAG mill undergoes cone crushing prior to recirculation. Cyclone underflow splits into two steps: 20% feeds the gravity separation circuit for gold recovery, while the majority progresses to classification.

Cyclone overflow enters into a high-rate thickener, which feeds two parallel processing lines, each containing leach tanks and CIL vessels. Depleted CIL tailings transfer to the TSF, while process water recirculates via a dedicated reclaim system.

A carbon-in-column (CIC) auxiliary circuit scavenges residual gold from solution prior to TSF discharge.

Gold recovery occurs through electrowinning cells. The resulting sludge combines with gravity concentrate for drying and flux addition before induction furnace smelting produces gold doré.

Exploration Activities in Suriname Rosebel Gold Mine

Rosebel GM places strong emphasis on exploration, consistently investing in annual drilling campaigns to expand its mineral resource base and extend the LOM. All current mining activities continue to use open-pit methods. Notably, the mineralization in existing pits remains open along strike and at depth. Historically, drilling has been concentrated within the top 300 meters, leaving substantial upside potential for deeper exploration and resource expansion.

Rosebel GM has conducted the following resource expansion projects over past two years:

- Infill Drilling: Enhances resource confidence within operational pits through high-density sampling, optimizing orebody modeling and mine planning.

- Near-Pit Exploration: Targets lateral extensions of known orebodies, enabling phased push-back designs to access additional mineralization adjacent to current mining areas.

- Deep Drilling Programs: Focus on select pits to evaluate underground mining potential, assessing depth continuity of high-grade zones for future underground development.

In parallel with these drilling programs, the Rosebel Gold Mine actively pursues regional expansion opportunities, targeting new concessions to diversify its resource base and scale operations. This strategic focus on securing additional mineral rights and developing untapped reserves aims to substantially extend the LOM.

OUR GOLD PRODUCTION BUSINESS OF GHANA AKYEM GOLD MINE

Overview

The Ghana Akyem Gold Mine is one of the largest in-production open-pit gold mines in Ghana. It is located at Eastern Region, Ghana. We hold the Ghana Akyem Gold Mine through our indirectly wholly-owned subsidiary, Zijin Golden Ridge Limited ("**Golden Ridge**"). The Ghana Akyem Gold Mine features orogenic gold mine type. The extraction and processing methods employed at the mine include open-pit mining, underground mining and CIL process.

We completed the acquisition of Ghana Akyem Gold Mine in April 2025.

In 2022, 2023 and 2024, the gold production volume of the Ghana Akyem Gold Mine amounted to 413.0 koz (12.8 tonnes), 290.0 koz (9.0 tonnes) and 203.0 koz (6.3 tonnes) respectively. In 2022, 2023 and 2024, the gold recovery of the Ghana Akyme Gold Mine was approximately 89.5%, 89.5% and 89.0%, respectively. We expect the production volume will increase after the acquisition as we implement management and technical renovation plans.

Development and Expansion

After completing the acquisition, we plan to apply economic geology theories to re-evaluate the open-pit mineable resource and reserves based on new cut-off grades, expand the open-pit boundaries, and comprehensively increase the open-pit service life and resource utilization rate. Additionally, we plan to enhance the processing plant's technological renovation to increase the annual processing capacity from 7.6 million tonnes to 12.0 million tonnes, significantly boosting gold production and extending the Life of Mine.

Mineral Resources and Ore Reserves

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Mineral Resources in Ghana Akyem Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage(1)	Au Grade(1)	Au Metal Contained(1)	
		(Mt)	(g/t)	(koz)	(t)
Ghana Akyem Gold Mine	Measured	119.5	1.7	6,350	197.5
	Indicated	32.0	2.3	2,411	75.0
	Inferred	11.2	2.2	778	24.2
Equity interest: 100%	**Total**	**162.7**	**1.8**	**9,539**	**296.7**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

The following table, which is based on the Competent Person's Report in accordance with the JORC Code, sets forth the information of our Ore Reserves in Ghana Akyem Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage(1)	Au Grade(1)	Au Metal Contained(1)	
		(Mt)	(g/t)	(koz)	(t)
Ghana Akyem Gold Mine	Proved	108.0	1.5	5,065	157.5
	Probable	26.0	2.0	1,609	50.0
Equity interest: 100%	**Total**	**133.0**	**1.6**	**6,674**	**207.6**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 100% of equity interest for each asset held by the Company.

Mining Leases and Prospecting Licenses

As of the Latest Practicable Date, Golden Ridge held two material mining leases and four prospecting licenses in relation to the Ghana Akyem Gold Mine, details of which are set out as follows:

Type	Serial Number	Geographical Area (ha)	Effective Period	Status
Mining Lease (Akyem West)	ML.5/199	16.59	January 19, 2025 to January 18, 2030	Valid, subject to parliamentary ratification
Mining Lease (Akyem East)	PL.5/126	47.67	January 19, 2025 to January 18, 2037	Valid, subject to parliamentary ratification
Prospecting License (Abirem)	PL.5/160	31.5	June 7, 2024 to June 6, 2027	Valid
Prospecting License (Abodom)	PL.5/135	9.87	September 3, 2024 to September 2, 2027	Valid
Prospecting License (Kenbert)	PL.5/3VOL.2	14.7	September 3, 2024 to September 2, 2027	Valid
Prospecting License (Maman River)	PL.5/134	23.52	June 7, 2024 to June 6, 2027	Valid

As of the Latest Practicable Date, two mining leases which had been renewed by the Ministry of Lands and Natural Resources in January 2025 have not yet been ratified by the Parliament of Ghana as required by the Ghanaian Constitution. As advised by our Ghana Legal Advisor, it is not uncommon practice for mining companies with ongoing mining operations to continue mining operations based on a renewed mining lease which is pending ratification by Parliament. They are also not aware of any precedent in which a mining company has been subject to regulatory enforcement action solely on the basis of continuing mining operations prior to the ratification of its renewed mining lease. Therefore, the risk of enforcement action against the Company for continuing operations while ratification is pending is generally considered to be low given that the ratification process is not with our control. However, it remains uncertain when such mining leases will be ratified, or whether they will be ratified at all. See "Risk Factors — We are subject to risks and uncertainties relating to our historical and future acquisitions and investments and establishing joint ventures, and we may fail to successfully implement our expansion strategies and integrate them with our existing business." and "Risk Factors — We are subject to license period of mining rights and may fail to obtain, retain or renew the government permits, licenses and approvals required for our mining and exploration activities."

Historical Milestones and Planned Production Schedule

Historical Milestones

The following timeline illustrates key historical milestones in the development of the Ghana Akyem Gold Mine:

Year	Milestone
2025	We completed the acquisition of Ghana Akyem Gold Mine.

Planned Production Schedule

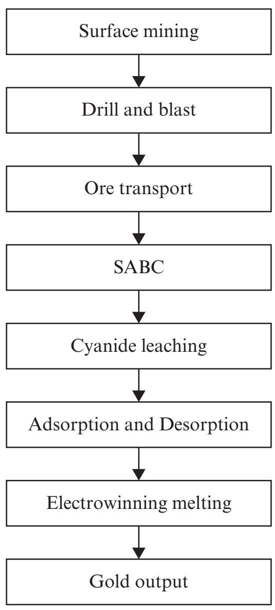
As set forth in the Competent Person's Report, the following chart sets forth the planned production schedule for the operations at the Ghana Akyem Gold Mine for the periods indicated over the Life of Mine:

Type	Unit	LOM	2025	2026	2027	2028	2029	2030	2031
Gold Produced . . .	koz	5,956	113	249	299	385	415	491	608

Type	Unit	2032	2033	2034	2035	2036	2037	2038
Gold Produced	koz	568	474	519	529	527	577	202

Operating Process of Gold Production Business in Ghana

We apply extraction and processing methods including open-pit mining, underground mining and CIL process. The following diagram sets forth the general workflow of the production process we plan to conduct in Ghana Akyem Gold Mine:



Exploration Activities in Ghana Akyem Gold Mine

The identified resources are primarily concentrated within the east side of Akyem, with existing drilling controls focused along the main pit and its deeper extensions. Preliminary drilling results suggest that the Akyem mineralization zone extends northeast and southwest beyond the main pit, with additional strike length at depth that remains largely unexplored.

Aligned with Golden Ridge's strategic plan, systematic infill and supplementary exploration will be conducted over the next three years along the northeastern and southwestern extensions of the Akyem main mineralized zone. This program includes diamond drilling and is supported by a significant investment. Upon completion, the exploration is expected to enhance gold resources. Concurrently, preliminary prospecting in peripheral license areas aims to identify additional exploitable resource bases.

OUR GOLD PRODUCTION BUSINESS OF PNG PORGERA GOLD MINE

Overview

Our PNG Porgera Gold Mine refers to our investment in Porgera Gold Mine, which is located at Enga Province, Papua New Guinea. We indirectly hold 24.5% equity interest in PNG Porgera Gold Mine through New Porgera. The PNG Porgera Gold Mine features epithermal vein-type gold deposit. The extraction and processing methods employed at the mine include open-pit mining and underground mining.

The PNG Porgera Gold Mine suspended production in April 2020 due to the refusal to extend the previous Special Mining Lease. After successful renegotiation and renewal of the Special Mining Lease, it resumed mining in January 2024 and resumed production in February 2024. Barrick (PD) Australia Limited, a wholly-owned subsidiary of Barrick Mining Corporation, is currently operating the PNG Porgera Gold Mine.

The gold production volume attributable to us on equity basis of the PNG Porgera Gold Mine amounted to 46 koz (1.4 tonnes) in 2024.

The planned production schedule for the operations at the PNG Porgera Gold Mine in 2025 is 376 koz (11.7 tonnes) of gold, of which 92 koz (2.9 tonnes) will be attributable to us on equity interest basis.

A separate CPR for the PNG Porgera Gold Mine is not included in this Document considering we only hold a minority interest in the asset and we are not the operator of the mine.

Mineral Resources and Ore Reserves

The following table sets forth the information of our Mineral Resources in PNG Porgera Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)]	Au Grade[(1)]	Au Metal Contained[(1)]	
		(Mt)	(g/t)	(koz)	(t)
PNG Porgera Gold Mine	Measured	0.7	6.9	163	5.0
	Indicated	31.9	2.9	2,929	91.1
	Inferred	18.9	2.2	1,323	41.1
Equity interest: 24.5%	**Total**	**51.5**	**2.7**	**4,414**	**137.3**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 24.5% of equity interest held by the Company.

The following sets forth the information of our gold Reserves in PNG Porgera Gold Mine as of December 31, 2024:

Mineralized Zone/Block	Category	Tonnage[(1)]	Au Grade[(1)]	Au Metal Contained[(1)]	
		(Mt)	(g/t)	(koz)	(t)
PNG Porgera Gold Mine	Proved	0.8	5.8	151	4.7
	Probable	10.4	4.0	1,330	41.4
Equity interest: 24.5%	**Total**	**11.2**	**4.1**	**1,481**	**46.1**

Note:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them. The information is calculated based on 24.5% of equity interest for each asset held by the Company.

SALES AND CUSTOMERS

Overview

During the Track Record Period, our primary products were gold. We also sold other mineral products such as silver and copper. Details of our sale of products of different mines as of the Latest Practicable Date are set out as below:

Business	Main Products
Tajikistan Jilau/Taror Gold Mines	Gold ingots and gold concentrates
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	Gold ingots
Australia Norton Gold Mine	Gold doré
Guyana Aurora Gold Mine	Gold doré
Colombia Buriticá Gold Mine	Gold doré and gold concentrates
Suriname Rosebel Gold Mine	Gold doré
Ghana Akyem Gold Mine .	Gold doré

Our average selling price of gold mining business is determined based on the gold metal contained in the gold products despite the variant grades of the products. For details of the average selling price, please refer to "Financial Information — Sales volume and Average Selling Price".

Sale arrangements

The following table sets forth our sale arrangements during the Track Record Period and as of the Latest Practicable Date:

Business	Sales arrangements
Tajikistan Jilau/Taror Gold Mines	Gold ingots are sold to Tajikistan National Bank. By-products including silver ingots and copper are sold to third party customers through Zijin Mining Group. See "Connected Transaction — Zijin Mining Sales Framework Agreement".
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	Gold concentrates and gold doré are generally processed to gold ingots by third party processor and then sold to market customers including the National Bank of Kyrgyzstan, which also has the right of first refusal of our gold ingots. See "Connected Transaction — Altynken Sales Agreement".
Australia Norton Gold Mine	Gold doré are sold to third party refineries in Australia.
Guyana Aurora Gold Mine	Gold doré are sold to third party customers through the Zijin Mining Group. See "Connected Transaction — Zijin Mining Sales Framework Agreement".
Colombia Buriticá Gold Mine	Gold concentrates and gold doré are sold to third party customers through the Zijin Mining Group. See "Connected Transaction — Zijin Mining Sales Framework Agreement".
Suriname Rosebel Gold Mine	Gold doré are sold to sold to external customers through the Zijin Mining Group. See "Connected Transaction — Zijin Mining Sales Framework Agreement".
Ghana Akyem Gold Mine .	Gold doré are sold to third party refineries.

Sale of mining products to Zijin Mining Group

During the Track Record Period, in the usual and ordinary course of business, we had sold mining products (including gold and other by-products (such as copper)) to Zijin Mining Group. Zijin Mining Group, acting as traders of various mineral resources, was responsible for, among other things, arranging for the sale of mineral resources produced by us to third party refineries, end-customers or traders. By leveraging the centralized and experienced sales capabilities of Zijin Mining Group, the sales coordination within the Group has been enhanced, thereby optimizing operational efficiencies and economies of scale, and securing favorable commercial terms. Therefore, during the Track Record Period, Zijin Mining Group was our largest customer, and we expect to continue this business relationship with the Zijin Mining Group upon completion of the [REDACTED].

The prices charged by the Group to Zijin Mining Group were determined on arm's length basis, with reference to (i) the prevailing market price of the mineral resources in international market such as London Bullion Market Association, Shanghai Huatong Silver Exchange and Shanghai Future Exchange; and (ii) trading margins on the price based on arm's length discussion with reference to similar arrangements in the open market.

We can also decide whether to use the centralized sales under Zijin Mining Group considering the costs and the benefits when deciding future sales arrangements. As such, some of the gold mines owned by us would engage in direct sales and has sold its mining products to other independent traders during the Track Record Period, and some would engage Zijin Mining Group as direct customers (as part of the intra-group arrangements of Zijin Mining Group as a whole). According to Frost & Sullivan, it is the industry norm to sell mineral products to global traders, who then resell the products to end users. Our Directors are of the view that the centralized sales function of Zijin Mining Group has been enabling economies of scale in terms of prices we obtained from customers as well as business partners (for modifying the gold products to commodity-level gold), and has been a mutually beneficial arrangements for both Zijin Mining Group and us. According to Frost & Sullivan, similar centralised sales arrangements are in place for other major mining companies.

See "Connected Transaction — Zijin Mining Group Sales Framework Agreement" for further details.

Customers

During the Track Record Period, the brand and quality of our products were widely recognized by the market. In addition, we have established stable relationships with precious metals refiners and trading companies. In line with industry practice, we generally do not engage in marketing activities. This is mainly due to the scarcity of gold Resources and strong demand for gold. We mainly identify and procure customers by inviting bids from potential customers. We believe our customers typically would not directly export our products to other countries, as the majority of our customers are metal refineries, which would process our products in order to produce gold, silver or copper products for higher purity.

During the Track Record Period, our top five customers in the respective year were Zijin Mining Group, refiners of precious metals and other non-gold metals as well as trading companies. For each of the years ended December 31, 2022, 2023 and 2024, revenue contributed by our top five customers amounted to US$1,275.4 million, US$1,769.4 million and US$2,517.0 million, respectively, accounting for 70.2%, 78.2% and 84.2% of our total revenue for the same periods, respectively. Revenue contributed by our largest customer for each of years ended December 31, 2022, 2023 and 2024 amounted to US$597.7 million, US$635.8 million and US$1,272.9 million, respectively, accounting for 32.9%, 28.1% and 42.6% of our total revenue for the same periods, respectively. The following tables set out details of our five largest customers in each year of the Track Record Period:

Rank	Customer	Type of Products Sold	Nature of Business	Credit terms	Settlement Method	Revenue	% of Total Revenue
						(US$ in thousands)	
For the year ended December 31, 2024							
1. . .	Zijin Mining Group	Gold, Copper, Silver	Production of mineral or smelting products of gold, copper, lead, zinc, and other metals	30 days	Wire transfers	1,272,921	42.6%
2. . .	Customer A	Gold	Financial institution	30 days	Wire transfers	410,453	13.7%
3. . .	Customer B	Gold	Refining and Gold Trading	3 days	Wire transfers	317,557	10.6%
4. . .	Kyrgyzaltyn JSC	Gold	Mining, processing, refining, and sales of gold	30 days	Wire transfers	279,815	9.4%
5. . .	Customer C	Gold	Gold smelting	10 days	Wire transfers	236,240	7.9%
					Sub-total	**2,516,986**	**84.2%**
For the year ended December 31, 2023							
1. . .	Zijin Mining Group	Gold, Copper, Silver	Production of mineral or smelting products of gold, copper, lead, zinc, and other metals	30 days	Wire transfers	635,784	28.1%
2. . .	Customer C	Gold	Gold smelting	10 days	Wire transfers	457,674	20.2%
3. . .	Customer A	Gold	Financial institution	30 days	Wire transfers	263,029	11.6%
4. . .	Kyrgyzaltyn JSC	Gold	Mining, processing, refining, and sales of gold	30 days	Wire transfers	250,933	11.1%
5. . .	Customer D	Gold	Refining and Gold Trading	5 days	Wire transfers	162,014	7.2%
					Sub-total	**1,769,434**	**78.2%**
For the year ended December 31, 2022							
1. . .	Zijin Mining Group	Gold, Copper, Silver	Production of mineral or smelting products of gold, copper, lead, zinc, and other metals	30 days	Wire transfers	597,705	32.9%
2. . .	Kyrgyzaltyn JSC	Gold	Mining, processing, refining, and sales of gold	30 days	Wire transfers	212,432	11.7%
3. . .	Customer E	Gold	Smelting	30 days	Wire transfers	160,112	8.8%
4. . .	Customer F	Copper	Wholesale and retail trade of various commodities	30 days	Wire transfers	158,665	8.7%
5. . .	Customer A	Gold	Financial institution	30 days	Wire transfers	146,517	8.1%
					Sub-total	**1,275,431**	**70.2%**

To the best of our knowledge, during the Track Record Period and up to the Latest Practicable Date, except for Zijin Mining Group and Kyrgyzaltyn JSC, all of our major customers were Independent Third Parties. As of the Latest Practicable Date, except for Zijin Mining Group and Kyrgyzaltyn JSC, none of our Directors, their associates or any of our shareholders (who or which to the knowledge of the Directors owned more than 5% of our issued share capital) had any interest in any of our five largest customers in each year of the Track record Period.

PROCUREMENT AND SUPPLIERS

Our Operations

We procure various materials, such as diesel fuel, processing chemicals, and related consumables, as well as machinery and equipment for our production operations mainly from (i) Zijin Mining Group, (ii) different local suppliers where we operate and/or (iii) the original equipment manufacturers. We also procure various services, such as security services, transporting services, engineering services and loading and hauling services, from various local suppliers. Except for Zijin Mining Group, we usually source qualified suppliers through market research and request of fee quotes. We require candidates to provide the relevant licenses and permits for reference. We may undertake further due diligence, such as background checks and risk assessments, as and when necessary. The selected suppliers are put on our approved supplier list, which is reviewed and updated on a periodical basis.

During the Track Record Period, we had purchased equipment and raw materials from certain subsidiaries of Zijin Mining, as part of the centralized procurement arrangement implemented by us so that we could procure equipment and raw materials in accordance with the procurement policy of Zijin Mining and enjoy the economies of scale (the "**Centralized Procurement Arrangement**"). The relevant equipment and raw materials include, among other things, mainly spare parts (i.e. pipes, rubber pipe fittings) and consumables (i.e. crusher and ball mill accessories). While we are at our liberty and are able to obtain alternative source of procurement of such equipment and raw materials of similar pricing and quality at comparable terms in the market, the Centralized Procurement Arrangement has enabled us to procure equipment and raw materials for its business operations together with the other business units of Zijin Mining Group such that the bargaining power vis-à-vis third parties are enhanced, thereby ensuring competitive pricing and stable supply. In general, Zijin Mining Group charges the costs of the relevant items as required by us, and a fixed percentage of the costs of such items as service fees to cover its overheads and human resources. Therefore, during the Track Record Period, Zijin Mining Group was our largest supplier, and we expect to continue this business relationship with the Zijin Mining Group upon completion of the [REDACTED].

See "Connected Transaction — Zijin Mining Group Centralized Procurement Framework Agreement" for further details.

Suppliers

To secure competitive prices, we may enter into long-term agreements with certain suppliers for the provision of materials and/or service from time to time. Our suppliers generally transport the purchased materials or supplies to our facilities.

During the Track Record Period, all of our top five suppliers in the respective year were service or commodity providers such as suppliers of electricity, fuel, and transportation. For each year of the Track Record Period, purchases from our top five suppliers amounted to US$348.0 million, US$423.3 million and US$454.3 million, respectively, accounting for 30.7%, 30.4% and 31.2% of our purchases for the same periods, respectively. Purchases from our largest supplier for each year of the Track Record Period amounted to US$154.1 million, US$195.6 million and US$175.7 million, respectively, accounting for 13.6%, 14.0% and 12.1% of our purchases for the same periods, respectively. The following table sets forth our top five suppliers for each year during the Track Record Period:

Rank	Supplier	Type of products/ services provided	Nature of Business	Credit terms	Settlement Method	Purchase amount	% of our total purchases
						(US$ in thousands)	
For the year ended December 31, 2024							
1. . .	Zijin Mining Group	Engineering and technical services, equipment and raw materials, etc	Production of mineral or smelting products of gold, copper, lead, zinc, and other metals	30 days	Wire transfers	175,733	12.1%
2. . .	Supplier A	Mining outsourcing	Mining service contractor	14 days	Wire transfers	103,243	7.1%
3. . .	Supplier B	Underground mining development contracting	A specialist underground mining contractor	30 days	Wire transfers	78,787	5.4%
4. . .	Supplier C	Diesel oil	Oil-bearing material management and sales	30 days	Wire transfers	54,382	3.7%
5. . .	Supplier D	Diesel oil	Lubricant	30 days	Wire transfers	42,135	2.9%
					Sub-total	**454,280**	**31.2%**
For the year ended December 31, 2023							
1. . .	Zijin Mining Group	Engineering and technical services, equipment and raw materials, etc	Production of mineral or smelting products of gold, copper, lead, zinc, and other metals	30 days	Wire transfers	195,580	14.0%
2. . .	Supplier A	Mining outsourcing	Mining service contractor	14 days	Wire transfers	64,162	4.6%
3. . .	Supplier B	Underground mining development contracting	A specialist underground mining contractor	30 days	Wire transfers	62,743	4.5%
4. . .	Supplier C	Diesel oil	Oil-bearing material management and sales	30 days	Wire transfers	53,991	3.9%
5. . .	Supplier D	Diesel oil	Lubricant	30 days	Wire transfers	46,797	3.4%
					Sub-total	**423,273**	**30.4%**

Rank	Supplier	Type of products/ services provided	Nature of Business	Credit terms	Settlement Method	Purchase amount	% of our total cost of sales
						(US$ in thousands)	
For the year ended December 31, 2022							
1. . .	Zijin Mining Group	Engineering and technical services, equipment and raw materials, etc	Production of mineral or smelting products of gold, copper, lead, zinc, and other metals	30 days	Wire transfers	154,089	13.6%
2. . .	Supplier B	Underground mining development contracting	A specialist underground mining contractor	30 days	Wire transfers	67,748	6.0%
3. . .	Supplier A	Mining outsourcing	Mining service contractor	14 days	Wire transfers	46,518	4.1%
4. . .	Supplier D	Diesel oil	Lubricant	30 days	Wire transfers	41,492	3.7%
5. . .	Supplier E	Engineering construction and project management	Contracting group providing services	30 days	Wire transfers	38,180	3.4%
					Sub-total	**348,027**	**30.7%**

During the Track Record Period and as of the Latest Practicable Date, we did not experience any material impact to our operation or financial condition due to any significant fluctuation in prices set by our suppliers or any material breach of contract on the part of our suppliers.

During the Track Record Period and as of the Latest Practicable Date, except for the Zijin Mining Group, none of our Directors, their associates or any of our shareholders (who or which to the knowledge of the Directors owned more than 5% of our issued share capital) had any interest in any of our five largest suppliers except for Zijin Mining Group, in each year of the Track Record Period and the top five suppliers are all independent third parties.

During the Track Record, Zijin Mining Group was our largest customer and supplier. In practice, distinctive subsidiaries of the Zijin Mining Group (in their capacity as distinctive business units) acted as the centralized sales and procurement entities for the entire Zijin Mining Group (as a whole and including our Group), and therefore, the Zijin Mining Group was accounted for both our Group's customers and suppliers for such reasons. Please refer to "Relationship with Zijin Mining" and "Connected Transaction — Non-exempt Continuing Connected Transactions" for further details.

CONTRACTORS

In line with industry practice, from time to time, we may engage contractors to support our mining activities, such as construction or improvement of our mining activities. During the Track Record Period and up to the Latest Practicable Date, we did not have any material disputes with our contractors that would have material adverse impact on our operation. The table below sets forth the breakdown of the category, number and fees incurred during the Track Record Period:

	As of or for the year ended December 31,					
	2022		2023		2024	
	Number of contractor	Fee incurred	Number of contractor	Fee incurred	Number of contractor	Fee incurred
		(US$ in thousands)		(US$ in thousands)		(US$ in thousands)
Construction and Engineering	41	150,702	43	99,548	46	114,988
Exploration	14	25,891	15	26,899	15	26,572
Mining and Processing	40	193,267	52	274,499	52	330,941
Total	**95**	**369,860**	**110**	**400,946**	**113**	**472,501**

Due to the intensive competition in the relevant contracting service market, we do not believe that it would be difficult for us to find alternative contractors to provide similar services on terms comparable to those with our existing contractors. For relevant risks, see "Risk Factors — Risks Relating to Our Business and Industry — We rely on third-party contractors to conduct certain portion of our business."

To the best of our knowledge, during the Track Record Period and up to the Latest Practicable Date, except for Zijin Mining Group, our contractors were independent third parties. As of the Latest Practicable Date, none of our Directors, their associates or any of our shareholders (who or which to the knowledge of the Directors owned more than 5% of our issued share capital) had any interest in any of our contractors except for Zijin Mining Group.

We typically select contractors through bidding invitations. Before engaging a contractor, we will assess their qualification, competence and experience. In particular, we require candidates to provide copies of their qualifications, licenses, certificates and permits for review and verification. We then form an evaluation committee and supervision committee and follow the prescribed selection procedure to shortlist candidates for business negotiations, after which we will make the final decision.

We require our contractors to comply with all applicable laws and regulations in respect of safety and environmental protection. We also require our contractors to abide by our safety management system and our internal control requirements. The relevant departments in our Company undertake regular check of our contractors to confirm that they are operating in accordance with the technical specifications of our project and industry standards. In the event we discover significant non-compliance or other issues in the implementation of our project, we are entitled to suspend such contractor's work and require them to take correctional actions. In addition, we require our contractors to purchase insurance for their employees and properties.

GOLD FORWARD CONTRACTS AND STREAMING

Gold Forward Contracts

As part of Norton Gold's risk management strategy, during the Track Record Period, Norton Gold engages in gold forward contracts to hedge against gold price fluctuations for a portion of its anticipated gold sales. Norton Gold entered into master gold forward contracts with financial institutions in Australia and agreed to deliver a specified amount of gold products at a predetermined price on a set future date. These gold forward contracts do not qualify as financial instruments for accounting purposes, as they fall under the normal purchase/sale exemption due to the physical delivery of gold upon contract fulfilment. All related transactions are executed in strict compliance with Norton Gold's internal policies relating to derivative instrument trading and other risk management policies. Those gold forward contracts expired on December 31, 2024, and Norton Gold has not entered into any gold forward contracts as of the Latest Practicable Date.

Metal Streaming

On June 25, 2019, Continental Gold entered into a metals streaming agreement with Triple Flag Precious Metals Corp. and obtained a prepayment of US$100,000,000 from Triple Flag. Continental Gold shall satisfy its delivery obligations with 2.1% of the future gold production of the Colombia Buriticá Gold Mine (the "**Gold Delivery Obligation**") and silver production equals to 1.84 times of the Gold Delivery Obligation (the "**Silver Delivery Obligation**"). For each ounce of products delivered under the agreement, Triple Flag would pay 10% and 5%, respectively, of the gold and silver market prices prevailing at the time of delivery. Besides, the agreement also stipulates that Continental Gold may choose to repurchase the Gold Delivery Obligation in advance before December 31, 2021, and the consideration would be US$80,000,000 less 90% of the value of the gold delivered. Continental Gold redeemed the Gold Delivery Obligation in advance in 2020 and began to fulfil the Silver Delivery Obligation. For the year ended 2022, 2023 and 2024, revenue generated from Silver Delivery Obligation was US$5.9 million, US$8.6 million and US$10.5 million, respectively.

UTILITIES

Electricity

Our Operations in Tajikistan Jilau/Taror Gold Mines

The Tajikistan Jilau/Taror Gold Mines primarily obtain electricity through two 110KV high-voltage lines from the substation in Pangjakent City. The pricing for electricity is standardized by the government of Tajikistan. During the Track Record Period and up to the Latest Practicable Date, we did not experience any significant interruptions in our operations due to power shortages or outages.

Our Operations in Kyrgyzstan Taldybulak Levoberezhny Gold Mine

The Kyrgyzstan Taldybulak Levoberezhny Gold Mine's electricity supply is provided by the Kyrgyz National Grid Company, with the specific entry point at the Beslovka substation in the Kemin District of Chuy Region. Electricity is transmitted via a 110KV overhead line to our Zim 110 substation. The electricity pricing is set by the Kyrgyz government at a statutory rate. During the Track Record Period and up to the Latest Practicable Date, we did not experience any significant interruptions in our operations due to power shortages or outages.

Our Operations in Australia Norton Gold Mine

The Paddington Mill is supplied with electricity from the grid, while the Binduli processing plant uses a combination of diesel and solar power. Electricity costs vary by location, with specific rates charged applied to each location. During the Track Record Period and up to the Latest Practicable Date, we did not experience any significant interruptions in our operations due to power shortages or outages.

Our Operations in Guyana Aurora Gold Mine

The Guyana Aurora Gold Mine's current electricity supply consists of approximately 80% diesel-generated power, with pricing based on diesel procurement costs, and approximately 20% solar power. The solar power pricing is variable and settled according to the terms of an investment power supply service agreement with Zijin Longking Clean Energy (Georgetown) Co., Ltd., linked to the monthly average diesel price. During the Track Record Period and up to the Latest Practicable Date, we did not experience any significant interruptions in our operations due to power shortages or outages.

Our Operations in Colombia Buriticá Gold Mine

The Colombia Buriticá Gold Mine's electricity supply primarily comes from Empresas Públicas de Medellín ("**EPM**"), a state-owned utility company in Colombia and the main energy provider in the Antioquia region. The electricity pricing is determined within the framework set by the Colombian Energy and Gas Regulatory Commission and through medium- to long-term power purchase agreements with EPM. Specific price fluctuations are influenced by the national electricity auction mechanism, local grid stability, and price indices. During the Track Record Period and up to the Latest Practicable Date, we did not experience any significant interruptions in our operations due to power shortages or outages.

Our Operations in Suriname Rosebel Gold Mine

We primarily obtain electricity through a water plant near the Rosebel mind area. We also has a 5MW photovoltaic power generation equipment. The Saramacca mining area uses diesel power generation. Two power purchase arrangements ("**PPAs**") with the Suriname Electricity Company (EBS), totaling 32 MW. PPAs involve pricing based on variable and fixed monthly costs, with ongoing discussions for new terms since December

2022. During the Track Record Period and up to the Latest Practicable Date, we did not experience any significant interruptions in our operations due to power shortages or outages.

Our Operations in Ghana Akyem Gold Mine

The Ghana Akyem Gold Mine's electricity supply is primarily provided by the Volta River Authority, managed by the government of Ghana. The substation and transmission lines were funded by us, but their operation and maintenance are conducted by the government. During the Track Record Period and up to the Latest Practicable Date, we did not experience any significant interruptions in our operations due to power shortages or outages.

Water

Our Operations in Tajikistan Jilau/Taror Gold Mines

The Tajikistan Jilau/Taror Gold Mines sources water from wells drilled by Zeravshan, while production water is drawn from channels managed by the Pengjikent Water Authority, with water pricing standardized by the Tajikistan government. During the Track Record Period and up to the Latest Practicable Date, there were no significant interruptions in operations due to water supply issues.

Our Operations in Kyrgyzstan Taldybulak Levoberezhny Gold Mine

The Kyrgyzstan Taldybulak Levoberezhny Gold Mine's produces water primarily from the Taldybulak surface water. While Kyrgyz law does not require a permit for surface water use, it mandates the installation of calibrated water meters and the payment of surface water resource fees. In compliance, we have installed calibrated water meters at the water source intake and at the entry points of each water unit, with monthly water usage recorded and fees calculated accordingly. During the Track Record Period and up to the Latest Practicable Date, there were no significant interruptions in operations due to water supply issues.

Our Operations in Australia Norton Gold Mine

The Australia Norton Gold Mine sources its water from various old open pits in the tenement, which is the mixture of underground inflow water and surface rainfall rundown water. During the Track Record Period and up to the Latest Practicable Date, there were no significant interruptions in operations due to water supply issues.

Our Operations in Guyana Aurora Gold Mine

The Guyana Aurora Gold Mine sources its production water from an on-site collection pond, while domestic water is drawn from underground wells. During the Track Record Period and up to the Latest Practicable Date, there were no significant interruptions in operations due to water supply issues.

Our Operations in Colombia Buriticá Gold Mine

The Colombia Buriticá Gold Mine site uses pit water for production, which is treated on-site to meet industrial and environmental standards. As pit water is generated through mining activities, there is no cost for water acquisition. Water pricing is determined by internal cost accounting and budget control, unaffected by third-party utility pricing mechanisms. During the Track Record Period and up to the Latest Practicable Date, there were no significant interruptions in operations due to water supply issues.

Our Operations in Suriname Rosebel Gold Mine

The Suriname Rosebel Gold Mine primarily uses recycled water from TSFs for its processing plant, which handles approximately 10 million tonnes of ore annually. Drinking water is sourced from shallow wells, treated, and supplied to the camp and plant. During the Track Record Period and up to the Latest Practicable Date, there were no significant interruptions in operations due to water supply issues.

Our Operations in Ghana Akyem Gold Mine

The Ghana Akyem Gold Mine sources its water from self-extracted underground water and pit water, which incurs no usage fees or resource taxes. The primary cost associated with water usage is electricity. During the Track Record Period and up to the Latest Practicable Date, there were no significant interruptions in operations due to water supply issues.

LOGISTICS

During the Track Record Period, Zijin Mining Group were primary responsible for the logistics of the products and services we procured under the Centralized Procurement Arrangement. We also engage professional third-party logistics service providers for the cross-border transporting of our products to customers by air and/or land transport and, to a lesser extent, transporting of certain materials we procured from suppliers. Generally, such logistics service providers are responsible for maintaining insurance associated with the transportation and bear the relevant risks. During the Track Record Period and up to the Latest Practicable Date, we did not experience any material shortage of transportation capacity.

INVENTORY

Our inventories mainly include raw materials, work-in-progress, turnover materials and inventory consumables. Our inventory personnel are generally responsible for implementation of our inventory policies. Our inventory personnel are separated into: (i) a warehousing team, which is responsible for physical management, such as receiving, storing and issuing supplies; and (ii) an inventory team, which is responsible for managing our inventory system and data, such as the actual levels for individual items. Our inventory levels are managed pursuant to our consumption record and lead time for supplies. All inventory information is recorded in our inventory system and categorized for ease of data analysis. We set the minimum and maximum inventory levels in our inventory system, which assists us arrange timely procurement. We undertake inventory review routinely and periodically. We generally increase our inventory of raw materials prior to certain predicable events, such as monsoon seasons.

For details of relevant risks, see "Risk Factors — We are subject to risks relating to inventory, including the risk of obsolescence and impairment, as well as the transport and storage of inventory."

QUALITY CONTROL

Quality control is crucial to our operations. We have a dedicated product quality department, a measurement team and a sampling team to ensure quality control. We have also established a stringent quality control system to ensure the quality of our products throughout our different production stages. If a quality issue is raised by a customer, we will undertake comprehensive investigations and consult with the relevant customers, and, to the extent needed, may submit any dispute to qualified third-party organization for arbitration. During the Track Record Period, we did not receive any material complaints due to quality issues of our products.

With respect to mining and processing, we have implemented a comprehensive quality control system to monitor the quality at each key stage of our mining and processing procedures. We have established specific guidelines for procedures to manage the quality of the ores mined. Ores mined from our mines are sample-tested at our laboratories on a regular basis to monitor the grade of the ore.

We provide quality and technical specifications to our suppliers and generally require suppliers to provide warranties for the supplies they provide. We inspect shipments of raw materials before accepting delivery. We require our third-party contractors to meet our qualification requirements and conduct their operations in accordance with our internal standards, industry standards and relevant laws and regulations. We regularly inspect the work of our suppliers, and we conduct full quality inspections upon project completion.

COMPETITION

According to Frost & Sullivan, the gold mining industry has become increasingly concentrated in recent years. This trend is largely driven by mergers and resource integration among leading gold producers. Major gold mining companies, with their efficient operations, global presence, financial strength, and other competitive advantages, are now at the forefront of the industry. These large gold mining companies have been able to achieve economies of scale through consolidation, which has allowed them to optimize production processes and reduce unit costs. The top 15 global gold producers contributed approximately 30.5% of the global gold production in 2024. Among these leading companies, our gold Reserves and gold production volume ranked ninth and eleventh globally, respectively, as of December 31, 2024 and in 2024, according to Frost & Sullivan.

Our major competitors are large international companies. We primarily compete based on our ability to obtain gold Reserves and Resources, which is dependent on our financial conditions, technical ability, equipment and machinery and human capital. We also compete with international players in acquiring attractive gold mining properties. The mining industry is a capital-intensive industry that requires significant technical, exploration and management experience. Moreover, mining is subject to extensive regulations and requires a number of licenses and permits to operate. These factors constitute significant barriers to enter the gold mining industry.

For further details of the competition landscape and our market position, see "Industry Overview."

OUR OPERATIONS IN NON-IOSCO COUNTRIES

Among the countries where we generated revenue during the Track Record Period, Tajikistan, Kyrgyzstan, Guyana and Suriname are Non-IOSCO MMOU Countries and have not signed any regulatory cooperation agreement or memorandum of understanding with the SFC or the Stock Exchange. This may present certain difficulties for the Hong Kong regulators to seek regulatory assistance and information from the statutory securities regulators in such Non-IOSCO MMOU Countries in a readily available manner.

Our business in the Non-IOSCO MMOU Countries, on an aggregate basis, is significant to our operations. In 2022, 2023 and 2024, our revenue generated from customers located in the Non-IOSCO MMOU Countries in aggregate contributed to approximately 59.2%, 60.0% and 56.8% of our total revenue, respectively. As of December 31, 2024, we have substantially mining assets in Non-IOSCO MMOU Countries.

Other than the Non-IOSCO MMOU Countries as set out above, all the countries where we generated revenue or had operations during the Track Record Period are IOSCO MMOU Countries.

While we continue to expand globally and enhance our market positions in various countries, we expect the contribution of our business in Non-IOSCO MMOU Countries to remain significant in the near future. We will continue to monitor the significance of our business in the Non-IOSCO MMOU Countries and consider appropriate measures to ensure that access to the books and records of our operating entities are available to the Hong Kong regulators.

Based on the foregoing, we believe we are and will be in compliance with Rule 8.02A of the Listing Rules.

INTELLECTUAL PROPERTY

We conduct our business under the trade names of "Zijin Gold International".

During the Track Record Period, we did not possess intellectual property rights which are material to our business operations.

During the Track Record Period and up to the Latest Practicable Date, we were not involved in any material dispute or litigation relating to infringement of trademarks and patents nor, to the best of our knowledge, did we infringe any trademarks and patents belonging to other parties.

EMPLOYEES

We believe that our employees are critical to our success. Our human resources department is responsible for recruiting, managing and training our employees. As of December 31, 2024, we had 8,025 full-time employees in total.

The following table sets forth the number of our employees by function and by region as of the dates indicated:

	As of December 31,		
Function	**2022**	**2023**	**2024**
Production	4,480	5,569	5,771
Sales	18	20	18
Technology	563	697	628
Finance	77	97	99
Administration	926	1,455	1,509
Total[1]	**6,064**	**7,838**	**8,025**

Notes:

1. The numbers shown above do not include Ghana Akyem Gold Mine and PNG Porgera Gold Mine.

We have maintained a good relationship and expect to maintain an amicable relationship in the future with our employees. During the Track Record Period and up to the Latest Practicable Date, there were no material strikes which had an adverse impact on our operation and no material disputes between our Group and our employees.

We have established comprehensive human resources systems to manage recruitment, employee development, salary and compensation, among other things. We design our remuneration packages by reference to the local mining industry benchmark and are competitive compared with our competitors. We also make contributions to mandatory insurance for our employees as required by the relevant laws and regulations of jurisdictions where we operate, respectively, and provides employee benefits such as commercial insurance.

ENVIRONMENTAL, SOCIAL AND GOVERNANCE

We are committed to establishing the "Zijin Model" for sustainable development and building a responsible ESG framework. Zijin Mining consistently maintains high ESG standards and has achieved significant results, such as an LSEG ESG rating of 89 in 2024, ranking among the top five of 525 global metals and mining companies assessed by LSEG. Under Zijin Mining's ESG framework, our ESG practices have been widely recognized in the regions where we operate during the Track Record Period. Our commitment to environmental, social and governance matters is a key factor ensuring our long-term sustainable development and continued business success. Accordingly, we place great importance on implementing the environmental, social and governance policies at the highest level of our Company.

Under Zijin Mining's ESG framework, the ESG practices have been widely recognized in the regions where we operated during the Track Record Period. For example, Continental Gold received the Promoting the Establishment of the "Global Zero Harm Vision" Excellence in Safety Culture Award and the "2024 Sustainable Development Certification" from the Environmental Management Bureau of Antioquia. Zeravshan received the "Outstanding Contribution to Environmental Protection Award" from the Environmental Protection Department of Sughd Province. Altynken LLC received the "Labor Protection and Occupational Health Award" and AGM Inc. received the "Annual Carbon Footprint Reduction Award", among others. Upon our [REDACTED], we will continue to adopt Zijin Mining's best practices and adhere to international ESG standards to promote green and sustainable development.

International industry standards and best international practices have been applied in our mines. For instance, Zijin Mining is a member of the World Gold Council and among the first gold mining companies in China to pledge adherence to the RGMPs. We have aligned our policies with industry standards to ensure that gold is responsibly produced under strict ESG governance. We prioritize human rights for our employees and communities, avoid involvement in conflicts, and conduct rigorous risk assessments through our supply chain. We continuously evaluate and improve our ESG performance and enforce systems to ensure legal and sustainable mining practices.

Furthermore, we have also been in compliance with International Organization for Standardization (ISO) 14001 and Global Reporting Initiative (GRI) standards. We have established the institutional standards and management practices by adhering to relevant guidelines, local regulations, and site-specific laws at each mine. This alignment with higher standards helps mitigate the risks of tailings dam failures and environmental leakage incidents.

In addition, we have established a sound ESG-governance structure under which the Board formulates our overall ESG strategies and goals. The ESG Department leads our ESG management efforts, focusing on developing systems, tracking industry trends, coordinating resources, and compiling annual reports. It ensures effective communication with Board and reports progress to the Board. Functional and business support departments manage specific ESG issues, set performance targets, and assist in report compilation. Business supervisory departments oversee ESG management in business segments, promote system transformation, and support report compilation and stakeholder communication.

We set up metrics and targets to assess and manage ESG related risks. For instance, we consistently monitor on two key indicators that have substantial impacts: carbon emissions and tailings management.

We may not be able to fully comply with these international industry standards at all times, which may impact our business, reputation, our results of operations and our ability to raise funds or obtain financing if we are perceived to have deficiencies in our ESG practice. For details, see "Risk Factors — The failure of a tailings storage facility could adversely impact our business, reputation and results of operations" and "Risk Factors — Maintaining and increasing compliance of industry standards and keeping sufficient ESG disclosure to maintain our reputation and care for local communities could increase our operation costs".

We aim to continuously enhance our systematic environmental management system, optimize water resources, energy, and logistics management strategies, judiciously use natural resources, practice the principles of a circular economy, strictly control tailings, waste, wastewater, and pollutant management, and minimize the negative impact on the natural environment. Simultaneously, we actively address climate change, consider potential climate risks and opportunities impacts, continuously increase the proportion of renewable energy use through self-built photovoltaics and participation in green energy trading, as well as contribute to reduction of carbon emission.

We always prioritize the construction of green mines, actively seek a balance between mining development and ecological protection and strive to adhere to the development concept of "Mutual Prosperity and Development" with the community. We emphasize corporate social value, continuously enhancing investment in community development, employee growth, and occupational health. We actively promote economic development in the countries and regions in which our projects are located and share the benefits of corporate development with local communities.

We prohibit all forms of corruption and bribery and require our employees to comply with the anti-bribery laws and regulations applicable in the countries where they work and the countries where they conduct business. We have established a set of policies and regulations, including the Reporting Management Rules and Internal Supervision Rules, demonstrating our zero-tolerance and stringent investigation stance towards bribery and corruption. We hold anti-corruption training for our Board, senior management and employees on a regular basis. In 2024, we held a total of 70 anti-corruption training sessions.

Environmental Protection

We are fully committed to environmental protection and to adhering to the highest standards for sustainable development. Our business operations are subject to various legal requirements in relation to environmental protection, such as air pollution, wastewater discharge, solid waste disposal and noise control, under the relevant local laws and regulations. For more details, see "Regulations."

We use green exploration technologies, incorporating "green exploration" as one of the drilling quality acceptance criteria, and fully utilize remote sensing technologies (including drones, satellite imagery) and geophysical methods to reduce damage to surface vegetation and ecosystems. During the Track Record Period, we invested in dedicated environmental funds. We are committed to deploying clean energy solutions, actively promoting clean energy to replace traditional fuels, with the Tajikistan Jilau/Taror Gold Mines, the Colombia Buriticá Gold Mine, and the Suriname Rosebel Gold Mine achieving 100% clean energy utilization in purchased electricity. We are advancing photovoltaic power generation projects, with the Guyana Aurora Gold Mine completing the first phase of a 3MW and the second phase of a 15MW photovoltaic project in 2024, and the Suriname Rosebel Gold Mine continuing the construction of a 25MW photovoltaic project.

We are committed to promoting green mining in our global operations, placing a high emphasis on ecological restoration during the mine development process. During both the construction and production phases, we promptly carry out ecological restoration in stabilized areas, creating favorable conditions for a healthy ecological environment at the mines. This approach surpasses the international norm of conducting "reclamation" only after mining operations have concluded. We focus on controlling mine wastewater discharge, with most of our gold mines achieving near-complete wastewater recycling and zero discharge. Additionally, we have invested in building online monitoring systems downstream of the mines, which automatically monitor the water quality of downstream water bodies 1–2 times daily, ensuring that mine development does not impact downstream areas.

Our Environmental Protection Policy

In order to systematically address the various environmental protection matters arising from our operations, we have formulated environmental protection policies and measures, which set out the detailed procedures for undertaking various environmental protection work.

Our environmental protection policies and measures generally cover the major aspects of our operations, such as:

- **Hazardous materials**. We reinforce the groundwork at our industrial sites and store raw materials in our facilities in a way which prevents leakage of hazardous materials into the soil. Hazardous waste is segregated into specific color-coded waste receptacles. Generally, explosives packaging and cyanide packaging are removed for disposal by the qualified suppliers.

- **Prevention of air pollution**. In relation to processing plants, dust suppression sprays are utilized and dry dust collection systems have been installed on ore crushing circuits/conveyor belt transfer points. In relation to underground mining, we install major ventilation systems (including ventilation exhausts) and use water for dust suppression.

- **Wastewater treatment**. We have constructed water recycling systems to ensure that wastewater will be recycled for use as far as practicable. For wastewater which will be released to the external environment, we ensure that the wastewater must go through sediment retention systems before being discharged. We carry out relevant treatment at tailings dams to prevent groundwater pollution. We also maintain a comprehensive database of processed water data.

- **Solid waste**. Scrap steel and other clean underground wastes are collected for beneficial re-use where appropriate. Lead batteries are recycled by accredited vendors. We also employ a waste compactor to reduce landfill volumes and associated emissions. In addition, we divert wooden materials, plastics, and other recyclables away from landfill for recycling by approved vendors, thereby reducing landfill volumes and associated emissions.

- **Noise control**. We take various measures to reduce the noise generated in our operations, such as selecting low-noise equipment and machinery, installing silencers, and adsorption materials, as well as noise isolation and elimination equipment.

- **Tailing Storage**. Extensive monitoring systems are included in the design of tailings dams as early warning mechanisms. These systems also enable ongoing assessment of the stability and integrity of the structures. Inspections are conducted as per international standards. In addition, independent auditors conduct regular third-party audits.

- **Biodiversity**. Flora and fauna assessments and updates are undertaken to ensure appropriate planning and impact management. In the context of agreed post-mining land use, sequential re-vegetation is conducted for the establishment of self- sustaining ecosystems. We transplant various exotic and indigenous species to enhance biodiversity. There is also waste receptacle management to reduce risk of vermin infestation.

We have been tracking Scope 1 and Scope 2 greenhouse gas emissions, waste discharge, water reuse rate and use of resources during the Track Record Period. The following tables illustrate the Scope 1 and Scope 2 greenhouse gas emissions, generation of hazardous solid waste, water reuse rate and use of resources during the Track Record Period:

- Greenhouse Gas Emission

	Year ended December 31,		
	2022	2023	2024
Scope 1 Greenhouse Gas Emissions (tonne)	194,493.1	456,889.5	433,329.4
Scope 2 Greenhouse Gas Emissions (tonne)	251,226.4	106,940.0	102,293.1
Total	**445,719.4**	**563,829.5**	**535,622.5**

- Waste Discharge

	Year ended December 31,		
	2022	2023	2024
Hazardous Waste (kt)	140.4	5.9	6.6
Non-hazardous Waste (Mt)	82.8	162.1	156.5

- Water

	Year ended December 31,		
	2022	2023	2024
Water Reuse Rate (%)	94.9	95.1	88.8
Waste Water (kt)	22,800.6	18,166.7	7,881.5

- Use of Resources

	Year ended December 31,		
	2022	2023	2024
Electricity Consumption (kWh)	506,711,079	775,338,326	842,191,555
Water Consumption (t)	208,326,972	294,394,769	136,122,924

In addition, due to the rapid advancement of environmental protection laws, regulations and industry standards, we closely monitor the latest developments in regulations and standards and regularly update our environmental protection policies and measures with the aim to ensure and uphold the highest possible standards.

Corporate Social Responsibility

We place great emphasis on fulfilling our corporate social responsibilities and are committed to ensuring that the communities and regions in which we operate can genuinely benefit from our development. We actively explore solutions that can bring a positive impact to the local community. We take practical actions in promoting employment, rural revitalization, improving people's livelihoods, public welfare education and other area.

We emphasize corporate social value, continuously enhancing investment in community development, employee growth, and occupational health. We actively promote economic development in the countries and regions in which our projects are located and share the benefits of corporate development with local communities. During the Track Record Period, we invested in community development in the regions where we control mines. For example, our "Sowing the Future" agricultural development program in Colombia has been ongoing for five years, supporting farmers in developing specialized agriculture, participating in or implementing agricultural and livestock entrepreneurship projects and productive projects, directly benefiting community families and indirectly benefiting people. We actively promote the development of the Rosebel Community Fund in Suriname, focusing on community development, educational assistance, and the promotion of business and employment. In 2024, we provided financial support in the areas of education, health, sports, and socio-economic development. We value employee development and well-being, adopting localized and diverse talent development approaches.

Occupational health and safety

We adopt high safety standards, continuously update and enhance our internal control measures to enhance production safety in our operations. Our production management systems and technologies enable us to achieve automation, digitization, and intelligence control in the gold production process.

We have implemented safety guidelines on employees' proper use and maintenance of the equipment. Our employees are required to wear protective gear, such as safety helmets, work clothes, gloves, waterproof boots, dust masks and self-rescue devices, to ensure their safety at work, taking into account the level of risk of the particular task or production site. We conduct inspections on the condition of our employees' protective gear before they enter production sites. We offer regular training on health, safety and accident prevention to our employees from time to time.

In addition, we have established and implemented comprehensive safety protocols and periodically evaluate their sufficiency. Regular evaluations are conducted to identify and address potential health and safety risks in alignment with our internal work safety policies, ensuring that all production activities are carried out in a safe manner. For safety facilities within our mines, we conduct regular checks and maintenance to ensure they provide reliable protection for work safety. A dedicated safety responsibility team is in place to regularly inspect the implementation of work safety measures, identify potential issues, and address them promptly.

Our Occupational Health and Safety (OHS) management system strictly follows ISO 45001 standards and fully integrates local legal and regulatory requirements and industry best practices. During the Track Record Period, our lost-time injury frequency rate was as low as 0.21 per million work hours. As of December 31, 2024, the ISO 45001 Occupational Health and Safety Management System certification coverage rate for all operational sites where we have held control for over three years reached 100%. Continental Gold in Colombia received the Global "Zero Harm Vision" Award for promoting an excellent safety culture. Tajikistan Jilau/Taror Gold Mines received the Annual Outstanding Safety Production and Environmental Protection Award.

Potential ESG-Related Risks and Our Strategies

Our mining activities and production processes pose potential ESG-related risks such as gas emission, wastewater, noise, solid waste, tailings management, and land remediation and biodiversity risks. To mitigate the adverse impact of these risks, we have taken the following measures:

- **Greenhouse Gas emission** — strengthen the supervision of greenhouse gas emissions at all stages of production and take various measures on-site to reduce emissions, such as adoption of clean energy, energy-saving and emission-reducing technologies;

- **Wastewater** — enhance wastewater management measures. Wastewater discharge will only be allowed if it meets the environmental protection standards. Moreover, we improve the wastewater utilization system to achieve internal water resource recycling within the mine;

- **Noise** — purchase and use equipment and noise reduction technologies that could reduce the overall noise levels, equip relevant technical personnel with necessary noise reduction gear and conduct regular inspections on noise emissions;

- **Solid waste** — implement waste sorting management, requiring all departments and individuals to discard or store different types of solid waste at designated locations. At the same time, to reduce the pollution and hazardous of solid waste, we strive to recycle treated waste again in the production process;

- **Tailing management** — strictly adhere to international standards for tailings management and take various measures to properly handle tailings residues, such as striving for dry tailings disposal, using impermeable membranes, and improving ore dressing reagents, to avoid potential hazards to the surrounding ecological environment and communities. We also regularly conduct strict inspections and supervision of the safety, environmental protection, and anti-seepage aspects of tailings dams to ensure that tailings do not collapse, leak liquids, or cause other major incidents. At the same time, we have established strict disposal processes and measures for closed tailings, and carried out greening and restoration work on closed tailings to ensure that the restored tailings do not pose any harm or negative impact on the environment and surrounding communities;

- **Land remediation and biodiversity** — rely on the existing site conditions to plan land use reasonably, striving to preserve the original appearance of the surrounding mountains during the process of mineral resource extraction. In the construction of open-pit mines, we will try to avoid soil erosion caused by the construction process and minimize land occupation. We will strictly design the construction machinery, operation modes, and construction seasons to reduce soil erosion caused by construction from entering water bodies. In addition, we strictly require our employees to prohibit hunting and capturing birds and other wild animals; and

- **Local community's concerns** — engage in regular communication with local residents in an open and honest manner, listening to the real needs of community members, and allocate resources to address actual issues. We also focus on the goals of community co-construction and sustainable development, such as supporting community projects, and improving road and water and electricity facilities, to provide a safe and convenient living environment for community residents.

At the same time, we commit to supporting education, healthcare, and poverty reduction projects, as well as public welfare and charitable causes, striving to create positive social impacts and cultural benefits. It is our policy to follow local legal regulations and industry standards in carrying out community work. Our goal is to create long-term benefits for the communities where we operate by improving infrastructure, promoting education and employment, and creating decent jobs. These efforts aim to stimulate local economic development and enhance the well-being of both society and the surrounding communities.

SEASONALITY

Our Directors considered that, and as confirmed by Frost & Sullivan, our gold mining and ore processing business is generally not subject to any seasonal fluctuations.

INSURANCE

We carry insurance covering risks in relation to safety production obligations. We also carry insurance for loss of and damages to our various machinery, equipment and inventories. We also maintain additional accident insurance for our employees engaged in mining activities. In line with industry practice, we generally do not carry any business interruptions or litigation insurance. We consider our insurance coverage to be adequate for the needs of our business operations and in line with the industry norm and the relevant laws and regulations in different jurisdictions we operate. If any significant uninsured damages to any of our properties, inventories or other assets or liabilities claims against us occur, our business, financial condition and results of operations may be adversely affected. For details, see "Risk Factors — We may not be adequately insured against losses and liabilities arising from our operations."

PROPERTIES

Our headquarters is located at Unit 7508, Level 75, International Commerce Centre, 1 Austin Road West, Kowloon, Hong Kong. As of the Latest Practicable Date, our various businesses were located in Colombia, Tajikistan, Australia, Kyrgyzstan, Guyana, Suriname and Ghana. As of the Latest Practicable Date, we occupied or managed properties in various locations, for daily business operations, production and dormitories. These properties are used for non-property activities as defined under Rule 5.01(2) of the Listing Rules.

As of December 31, 2024, none of the properties held or leased by us had a carrying amount of 15% or more of our combined total assets. Therefore, according to Chapter 5 of the Listing Rules and section 6(2) of the Companies (Exemption of Companies and Prospectuses from Compliance with Provisions) Notice (Cap. 32L of the Laws of Hong Kong), this document is exempted from compliance with the requirements of section 342(1)(b) of the Companies (Winding Up and Miscellaneous Provisions) Ordinance in relation to paragraph 34(2) of the Third Schedule to the Companies (Winding Up and Miscellaneous Provisions) Ordinance which requires a valuation report with respect to all our interests in land or buildings.

LICENSES AND PERMITS

In addition to mining and exploration permits, we are required to obtain various licenses, permits and certifications for our operations.

During the Track Record Period and as of the Latest Practicable Date, we have obtained the requisite licenses, permits and certificates required by the relevant laws and regulations for our current operations in all material aspects, other than the mining and exploration permits and/or licenses being renewed.

For more details, please see "— Our Gold Production Business of Tajikistan Jilau/Taror Gold Mines — Mining Licenses and Exploration Permits", "— Our Gold Production Business of Kyrgyzstan Taldybulak Levoberezhny Gold Mine — Mining Licenses and Exploration Permits", "— Our Gold Production Business of Australia Norton Gold Mine — Mining Leases", "— Our Gold Production Business of Guyana Aurora Gold Mine — Mining Licenses and Exploration Permits", "— Our Gold Production Business of Colombia Buriticá Gold Mine — Mining Concession Agreements", "— Our Gold Production Business of Suriname Rosebel Gold Mine —

Mining Leases, Exploration Licenses and Prospecting Licenses" and "— Our Gold Production Business of Ghana Akyem Gold Mine — Mining Leases, Exploration Licenses and Prospecting Licenses".

LEGAL PROCEEDINGS AND NON-COMPLIANCES

Legal Proceedings

During the Track Record Period and up to the Latest Practicable Date, we had not been a party to, and were not aware of any threat of, any material legal, arbitral or administrative proceeding which, in our opinion, would likely have a material and adverse effect on our business, financial condition or results of operations. We may from time to time become a party to various legal, arbitral or administrative proceedings arising in the ordinary course of our business.

Legal Compliance

We primarily operate in eight jurisdictions and our business is regulated and supervised under different regulatory environments. We are subject to various regulatory requirements and guidelines issued by the regulatory authorities in the jurisdictions in which we operate. We aim to monitor regulatory environments and adopt adequate internal procedures and guidelines to manage our operations in order to avoid potential non-compliance or misconduct.

During the Track Record Period and up to the Latest Practicable Date, we had not been and were not involved in any material non-compliance incidents that have led to fines, enforcement actions or other penalties that could, individually or in the aggregate, have a material adverse effect on our business, financial condition and results of operations.

RISK MANAGEMENT AND INTERNAL CONTROL MEASURES

We are subject to various risks relating to our operations, please see "Risk Factors — Risks Relating to Our Business and Industry — Our internal control and risk management systems may not fully protect us against various risks inherent in our business" for details. We have established internal control and risk management systems consisting of the relevant organizational framework policies, risk management policies and risk control procedures to manage our risk exposures, primarily our operational risk, legal risk and liquidity risk

Our management has designed and implemented risk management policies to address various potential risks we have identified in relation to our operations, including financial risks and corporate governance risks. Our risk management policy sets forth procedures to identify, analyze, mitigate and monitor the relevant risks. We are dedicated to establishing a comprehensive risk management system which operates effectively and is suitable for our long-term business development.

In addition, we have adopted internal control policies and procedures and we plan to continuously monitor and improve our management procedures to ensure the effective operation of those internal controls are in line with the growth of our business and good corporate governance practice.

Our Directors are of the view that we have taken all reasonable steps to establish a proper internal control system. As such, our Directors are of the view, that our internal control measures are adequate and effective.

OVERVIEW

As at the Latest Practicable Date, Zijin Mining, through its wholly owned subsidiaries, Zijin Northwest and Gold Mountains (H.K.), was indirectly interested in 100% of the issued share capital of our Company.

Immediately upon completion of the [REDACTED] (without taking into account any Shares which may be issued pursuant to the exercise of the [REDACTED]), Zijin Mining will control approximately [REDACTED] of the issued share capital of our Company through Zijin Northwest and Gold Mountains (H.K.). Hence, upon [REDACTED], Zijin Mining, Zijin Northwest and Gold Mountains (H.K.) constitute our Controlling Shareholders under the Listing Rules. Please refer to "History, Reorganization and Corporate Structure" for the simplified corporate structure of the Group.

BACKGROUND OF ZIJIN MINING

Zijin Mining is a multinational mining group dedicated to the exploration and development of copper, gold, zinc, lithium, silver, molybdenum and other metallic mineral resources globally, supplemented by refining, processing and sales of related products. The exploration and development of copper, gold and zinc mineral resources is the core component of Zijin Mining's business. Zijin Mining also covers refining and processing businesses, as well as other mining-related businesses such as research, design and application of mining engineering, etc. As at the end of 2024, Zijin Mining has more than 30 large and ultra-large mineral resource development bases in 16 overseas countries and 17 provinces (autonomous regions) in China. Zijin Mining's production volume of mine-produced copper, gold, zinc and silver in 2024 reached approximately 1.07 million tonnes, 73 tonnes, 450 thousand tonnes, and 436 tonnes, respectively. For the year ended December 31, 2024, Zijin Mining realised operating income of RMB303.6 billion and profits before tax of RMB48.1 billion. As at December 31, 2024, Zijin Group's total assets amounted to RMB396.6 billion. Zijin Mining was listed on the Stock Exchange in December 2003 (stock code: 2899) and was subsequently listed on the Shanghai Stock Exchange in April 2008 (stock code: 601899).

INDEPENDENCE OF OUR GROUP FROM OUR CONTROLLING SHAREHOLDERS

Our Directors are of the view that our Group is able to carry on its business independently from our Controlling Shareholders (including their close associates) following the completion of the [REDACTED] for the following reasons.

Clear Delineation of Business

Overview

Zijin Mining Group is primarily engaged in exploration, development, refining, and processing of copper, gold, zinc, and other metallic mineral resources globally, with significant operations in China.

Upon completion of the [REDACTED], the businesses of our Group and Zijin Mining Group will be clearly delineated. Zijin Mining Group principally assumes the roles of owner, investor and/or operator in respect of its business in the exploration and mining of copper, zinc, lithium, and other metal resources, as well as gold mining within the PRC; whereas our Group will exclusively own and operate overseas gold mines. In addition to the clear geographical delineation and difference in mining assets, the major customers and operation model of gold mine assets of our Group and Zijin Mining Group are also substantially different.

Save for the Colombia Buriticá Gold Mine, the equity interests of all the overseas gold mines will be transferred to our Group prior to the completion of the [REDACTED], and Zijin Mining Group will not, following completion of the [REDACTED], engage in the exploration and mining of gold outside the PRC. Please see "— Colombia Entrustment Arrangement" below for further details in relation to the Colombia Buriticá Gold Mine.

Colombia Entrustment Arrangement

Structure of Zijin America and the Colombia Buriticá Gold Mine

Colombia Buriticá Gold Mine is a gold mine located in Colombia, wholly owned by Continental Gold Colombia Branch, a branch of Continental Gold, which is in turn owned by CGI, which is in turned wholly-owned by Zijin America. Zijin America is directly held as to 68.77% by Gold Mountains (H.K.) and by (i) CLAI Gilding (BVI) Investment Limited as to 22.74%; (ii) ZLCFL-Cayman International Investment Cooperation Limited as to 7.26%; and (iii) Longyan Xinjing Investment Partnership (Limited Partnership) as to 1.23%, all of which are Independent Third Parties (save for CLAI Gilding (BVI) Investment Limited being a connected persons of our Company at subsidiary level due to its shareholding in Zijin America).

International arbitration

In light of the international arbitration between CGI and the Colombian government, any interactions with the Colombian Government, including in the context of any regulatory approvals or tax rulings that may be required under Colombian law in connection with a change in ownership structure of the Colombia Buriticá Gold Mine, may potentially create additional risks. See also "Risk Factors — There is an ongoing international arbitration with the Colombian government. We are also subject to risks relating to litigation and regulatory proceedings in jurisdictions where we operate."

Terms of the Colombia Entrustment Arrangement

Against this backdrop, in order to allow our Company and our shareholders to enjoy the economic benefit of the Colombia Buriticá Gold Mine from the completion of the Proposed [REDACTED] and to avoid any direct or indirect competition between the Group and

Zijin Mining Group in any material respect and maintain clear business delineation between our Group and Zijin Mining Group, our Group and Zijin Mining proposed to enter into the following arrangements (the "**Colombia Entrustment Arrangement**") before the completion of the [REDACTED], the material terms of which are summarized below:

(a) ***Entrusted Operations Agreement:*** in consideration for an annual management fee, the Group will be entrusted with the exclusive management and operation of the Colombia Buriticá Gold Mine during the term of the Entrusted Operations Agreement, including without limitation, the exploration, development, extraction, processing, sales, transportation, and environmental restoration of the Colombia Buriticá Gold Mine. Our Group will be authorised to make business decisions and manage operations, except for certain matters that require review by Continental Gold Colombia Branch as required by applicable laws and its articles of association. The Entrusted Operations Agreement is entered into by our wholly-owned subsidiary and Continental Gold Colombia Branch, and will be governed by the laws of Colombia. In addition, neither Zijin Mining Group nor the Group has the right to unilaterally terminate the Entrusted Operations Agreement.

(b) ***Return Swap Agreement:*** in return for an upfront consideration as agreed based on a negotiated amount with reference to the fair value of such estimated total economic performance of Zijin America (with reference to the mine life of the Colombia Buriticá Gold Mine), our Group will be entitled to the amounts received by Gold Mountains (H.K.), the direct shareholder of Zijin America, including without limitation, any dividend, capital arising from capital reduction, and cash return (if any) received by Gold Mountains (H.K.) from Zijin America (collectively, the "**Colombia Economic Benefits**"), during the term of the Return Swap Agreement. The Return Swap Agreement is entered into by Gold Excellence and Gold Mountains (H.K.), and will be governed by the laws of Hong Kong.

(c) ***Undertaking by Zijin Mining:*** in connection with the [REDACTED], Zijin Mining will undertake to our Company that, at the appropriate time when conditions for a transfer are considered favorable, (i) Zijin Mining and our Group will enter into a transaction to enable our Group to acquire Zijin Mining's interests in Zijin America or the related assets of the Colombia Buriticá Gold Mine it holds to our Company at a fair and reasonable price at the time of the transaction, subject to arm's length negotiation and compliance with the shareholders' agreement of Zijin America, provided that such transaction shall comply with all applicable rules and regulations which Zijin Mining and our Company are subject to, (ii) Zijin Mining undertakes not to sell Zijin Mining's interests in Zijin America or the related assets of the Colombia Buriticá Gold Mine it holds to any other third parties, and (iii) if the Zijin Mining Group intends to transfer, pledge, or impose any other rights restrictions on all or part of the assets of the entrusted operations business of the Colombia Buriticá Gold Mine, our Group's prior written consent is required.

The Colombia Entrustment Arrangement has been effective since June 2025, and will last until the expiry of the mine life of the Colombia Buriticá Gold Mine, or until the Zijin Mining Group's interests in Zijin America are transferred to the Group, whichever is earlier.

The Colombia Entrustment Arrangement is designed to be a temporary arrangement to (i) deal with the uncertainties arising out of the international arbitration without delaying the [REDACTED], (ii) ensure clear delineation of businesses and maximize shareholders' value in connection with the [REDACTED] by allowing the Company to manage the Colombia Buriticá Gold Mine and obtain the economic benefits derived from Zijin America pursuant to the Colombia Entrustment Arrangement, and (iii) offer sufficient protection to the Company over its future acquisition of Zijin America through equity transfer at an appropriate time.

In addition to the above key documentation for the Colombia Entrustment Arrangement, given that Zijin America also indirectly holds a number of potential projects in Colombia which CGI has been conducting preliminary exploration work, the holding company of each relevant exploration project (which would be a subsidiary of Zijin America) would also enter into an agreement with a wholly-owned subsidiary of the Company, pursuant to which, the management and decision making of the exploration work and relevant operation activity in the lifetime of these projects which would significant impact the returns of these potential projects would be determined by the Group. It is currently expected that, once these exploration work has been completed and when the relevant mine can be classified as gold mine asset or non-gold mine asset based on the economic value of the resources inside the mine:

- "gold mine assets" will be retained under Zijin America through CGI, and a separate entrusted operations agreement (the terms of which are expected to be substantially similar to that for the Colombia Mine) would be entered into between the holding company of the relevant mine and a subsidiary of the Company prior to commencement of production of such relevant mine. Upon transfer of the Zijin Mining Group's interests in Zijin America by GMHK to the Group, these "gold mine assets" will be also be transferred to the Group in one go; and

- "non-gold mine assets" will no longer be held under Zijin America nor consolidated under the Company. It will be transferred to other members of the Zijin Mining Group (excluding Zijin America and its subsidiaries) with reference to its fair value at the time prior to their respective commencement of operations. As such, overseas operation of "non-gold mine assets" would be kept at the Zijin Mining Group.

The unwinding of the Colombia Entrustment Arrangement

Pursuant to the undertaking from Zijin Mining to our Company, at the appropriate time when conditions for a transfer are considered favourable, the Zijin Mining Group and the Group will enter into a transaction to enable the Group to acquire Zijin Mining Group's interests in Zijin America at a fair and reasonable price (on a net-off basis) at the time of the transaction (which will be determined with the value derived from the Entrusted Operations Agreement and the fair value of the Return Swap Agreement to be unwound at the time of transaction (on one hand), and to be partially off-set by the fair value of Zijin Mining Group's interests in Zijin America based on arm's length negotiation (on the other hand)).

Given the Company's status as the exclusive operator, the relevant consideration is anticipated to be immaterial in light of the fact that the fair value of the Return Swap Agreement to be terminated upon transaction execution approximates the arm's length fair value of the Zijin Mining Group's interests in Zijin America.

Legal and accounting implications

The Colombia Entrustment Arrangement is designed to be a temporary arrangement to (i) deal with the uncertainties arising out of the international arbitration without delaying the [REDACTED], (ii) ensure clear delineation of businesses and maximize shareholders' value in connection with the [REDACTED] by allowing the Company to manage the Colombia Buriticá Gold Mine and obtain the Colombia Economic Benefits pursuant to the Colombia Entrustment Arrangement, and (iii) offer sufficient protection to the Company over its future acquisition of Zijin America through equity transfer at an appropriate time.

Despite that Zijin Mining has legal ownership over Zijin America, pursuant to the Colombia Entrustment Arrangement (including the Entrusted Operations Agreement, Return Swap Agreement and the undertaking of Zijin Mining Group), from an accounting perspective, we would consolidate the assets, liabilities and operation results of Zijin America (which includes CGI and Continental Gold, subsidiaries of Zijin America, and the Colombia Buriticá Gold Mine (controlled by Continental Gold)) into the consolidated financial information of the Group.

As advised by the Company's legal advisor as to the Colombia law, the entry into the Entrusted Operations Agreement and/or the Return Swap Agreement would not require any notification, filings, authorizations or approvals from the Colombian governmental or regulatory authorities in Colombia, and would not affect the mining rights held by the Colombia Buriticá Gold Mine for its operations, provided that the legal ownership of the related assets of the Colombia Buriticá Gold Mine will not be transferred. In addition, the Entrusted Operations Agreement and the Return Swap Agreement, as a whole, is not in contravention of any legal and regulatory restrictions under Colombian laws and regulations.

We have been further advised by our Special Hong Kong legal advisor, that the obligations of the parties under the Return Swap Agreement, upon due authorization, execution and delivery by the parties thereto, constitute legally valid, binding and enforceable obligations under Hong Kong law, subject to general principles of law and equity, and any applicable bankruptcy, insolvency, similar laws or other customary limitations, and there are no registrations, filings, or similar formalities imposed by any regulatory authority or government agency in Hong Kong upon the parties in relation to the execution and delivery of the Return Swap Agreement or the performance by such entities of their respective obligations thereunder under the laws of Hong Kong.

The Colombia Entrustment Arrangement will, upon completion of the [REDACTED] and the [REDACTED], constitute continuing connected transactions between the Company and the Zijin Mining Group, and will be subject to the reporting, annual review, announcement and independent shareholders' approval requirements under Chapter 14A of the Listing Rules. See "Connected Transactions — Colombia Entrustment Arrangement" for further details.

Based on the foregoing, we believe that (i) there is clear delineation between our business and the business of Zijin Mining Group; (ii) there will be no direct or material competition between our Group and Zijin Mining Group upon completion of the [REDACTED]; and (iii) sufficient arrangements are or will be in place to ensure the clear delineation and minimal competition between Zijin Mining Group and our Group.

Deed of Non-Competition

Notwithstanding there is a clear delineation between the businesses of Zijin Mining Group and our Group as detailed above, Zijin Mining Group has irrevocably and unconditionally provided the Deed of Non-Competition to our Company in connection with the [REDACTED] to ensure there remains a clear delineation of our respective businesses in the future. Pursuant to the Deed of Non-Competition:

(i) After the completion of the [REDACTED], provided that Zijin Mining Group is our indirect Controlling Shareholder, Zijin Mining Group guarantees not to use its position as an indirect Controlling Shareholder to adversely impact our interests and the interests of our other shareholders. Zijin Mining will continue to maintain our independence in terms of personnel, assets, business, finance, and institutions, and ensure that our Company has the required business system and the ability to operate independently;

(ii) Zijin Mining undertakes to strictly comply with the information disclosure requirements for related parties and connected persons of listed companies and to disclose the relevant information about Zijin Mining and all directly or indirectly controlled enterprises in a truthful, accurate and complete manner;

(iii) After the completion of the [REDACTED], during the period when Zijin Mining Group is our indirect Controlling Shareholder, Zijin Mining will not directly or indirectly engage in the business of our Group ("**[REDACTED] Business**") (save for its interests via our Company) or any business activities which competes with the [REDACTED] Business or otherwise may have a significant adverse impact to the [REDACTED] Business, except for the Colombia Entrustment Arrangement, including: (1) directly or indirectly engaging in the [REDACTED] Business; (2) investing in, acquiring, or merging with companies or economic organizations whose principal business is engaged in the Spin-off Business; (3) operating companies or economic organizations whose principal business is engaged in the [REDACTED] Business through contracted operations, leasing operations, etc.; (4) providing funding, business, and technical support or assistance to companies or economic organisations whose principal business is in completion with us in any manner;

(iv) Zijin Mining will take legal and effective measures to ensure that existing or future subsidiaries and other enterprises or entities controlled by it do not engage in the [REDACTED] Business;

(v) If there is a significant adverse competitive relationship between any business opportunities obtained by Zijin Mining and the business operated by us, including without limitation, the [REDACTED] Business, we have the right to, either through priority acquisition or entrusted operation, require Zijin Mining to consolidate the competing business into our Group; and

(vi) If Zijin Mining obtains any business opportunities that compete or may compete with the [REDACTED] Business (i.e., overseas exploration and mining of gold, supplemented by refining, processing and sales of related products outside the PRC), Zijin Mining will immediately notify us and give priority to us in participating in such business opportunities.

Administrative independence

All of the essential administrative functions of our Group will be handled by our own team independently of Zijin Mining and without support from Zijin Mining upon completion of the [REDACTED] and the [REDACTED].

Our Group and Zijin Mining have been sharing certain financial, procurement, warehousing, contract management and engineering management systems and software on a clear cost allocation basis based on the number of personnel engaged for certain gold mine assets. Upon completion of the [REDACTED], our Group and Zijin Mining will continue to share non-essential administrative costs related to the operations of departments such as IT and marketing and logistics with a clear cost allocation basis with reference to the number of personnel in accordance with the exemption available under chapter 14A of the Listing Rules. Our Group established independent finance, internal audit and legal departments, and does not rely on the services provided by the existing departments of Zijin Mining.

Notwithstanding any sharing of resources to optimize the administration costs structure of our Group, all essential functions involving any management decision or discretion will be retained and performed by our Group independently of Zijin Mining. Given the immateriality of the relevant transaction amounts for the sharing of non-essential administrative functions between our Group and Zijin Mining, our administrative independence would not be affected.

Management independence

Our Board comprises three executive Directors, three non-executive Directors and three independent non-executive Directors. For further details of our Directors, please refer to "Directors and Senior Management". Among the nine Directors, only three non-executive Directors currently are expected to hold positions in Zijin Mining upon [REDACTED], details of which are set out below:

Name of Director	Position(s) in our Company upon [REDACTED]	Position(s) in Zijin Mining upon [REDACTED]
Mr. Lin Hongfu	Non-executive Director and chairman of the Board	Executive Director and standing vice president
Mr. Wang Chun	Non-executive Director	Vice president
Mr. Jian Ximing	Non-executive Director	Chief executive officer at the overseas operations department

Our Group does not rely on Zijin Mining Group in terms of directorship and management, and that the day-to-day operations and management functions of our Group, upon [REDACTED], can be managed independently of Zijin Mining Group, given that:

(i) as at the Latest Practicable Date, other than Mr. Lin Hongfu, Mr. Wang Chun and Mr. Jian Ximing, there is no other overlapping management upon [REDACTED];

(ii) none of the executive Directors and core management team of our Group with executive functions will hold any position in Zijin Mining upon [REDACTED];

(iii) our Group has and will have a sufficient level of independence of directorship and management and a team of full-time senior management and employees focused exclusively on its businesses;

(iv) our Company will have a sufficient number of independent non-executive directors which meets the requirements of the Listing Rules to protect the interests of our Company and the Shareholders as a whole; and

(v) each of the Directors is aware of his/her fiduciary duties as a Director, which require, among other things, that he/she acts for the benefit and in the best interests of our Company and does not allow any conflict between his/her duties as a Director and his/her personal interests. In the event of any actual or potential conflict of interest between our Group and Zijin Mining, the conflicted directors will be required to abstain from voting on the relevant board resolution and the other directors will vote and decide on the matter.

Nevertheless, to address potential conflict of interests that may arise in the future, our Company has adopted certain corporate governance measures. Please refer to "— Corporate Governance" in this section for details.

Based on the reasons above, our Directors are of the view that our Group is capable of managing our business independently from Zijin Mining and its close associates following the completion of the [REDACTED].

Financial independence

As at May 31, 2025, our Group had certain amounts due to Zijin Mining and its subsidiaries in the amount of US$867.6 million. Given Zijin Mining has US$38 million due to us as of the same date, the net amount due to Zijin Mining is US$829.6 million (the "**Net Amount Due**"). In addition, as of May 31, 2025, our Group has recorded right-of-use assets amounting to US$37.9 million in relation to certain financial lease arrangements between our Group and Zijin Mining. Save as disclosed above, (i) there is no outstanding loan facility or other form of credit granted by our Group to Zijin Mining, or vice versa; (ii) none of the loans of our Group was guaranteed, secured or indemnified by Zijin Mining; and (iii) our Group has not provided any guarantee, security or indemnification in respect of any loans of Zijin Mining.

Our Company expects to be able to repay a portion of the Net Amount Due upon [REDACTED] such that the remaining portion of the Net Amount Due will be within the range of approximately US$400 to US$500 million at the time of [REDACTED]. On June 26, 2025, a letter of intent was obtained independently of Zijin Mining from a reputable bank in relation to the provision of credit facilities of up to a maximum of US$1 billion, and expect to obtain credit facilities of the same amount before [REDACTED].

We expect to repay the remainder of the Net Amount Due by 2028, either by refinancing with financial institutions or by cash payment.

Our Directors are of the view that our Company is financially independent from Zijin Mining, and the Net Amount Due to Zijin Mining will not affect our financial independence based on the following reasons:

Our ability to secure financing independently

Our Group is able to finance our operations through our internally generated working capital and through borrowings, loans and credit facilities from independent third parties without guarantees or other security provided by Zijin Mining.

In addition, as at the Latest Practicable Date, we have obtained a letter of intent from a reputable bank in relation to the provision of credit facilities of up to a maximum of US$1 billion, and expect to obtain credit facilities of the same amount before [REDACTED], the terms of which are expected to be afforded to us on similar terms as other facilities previously provided by the relevant banks to the Zijin Mining Group.

Strong financial position

Our profit attributable to equity holders of our Group amounted to US$481.4 million as of December 31, 2024, and combined total assets and net assets amounted to US$5,402.7 and US$2,902.1 million, respectively. We did not incur any bank loans and bank borrowings for the year ended December 31, 2024. During the Track Record Period, our Group had generated over US$2.5 billion of net operating cash flow in aggregate. During the Track Record Period, our Group had generated US$714.7 million, US$924.9 million and US$876.5 million of net operating cash flow in each of the three years ended December 31, 2024. As of May 31, 2025, we also have financial resources (including cash and cash equivalents) of not less than US$650 million.

Further, it is expected that the [REDACTED] will enhance our profile in Hong Kong, the PRC and internationally, facilitate investment by Hong Kong and other international investors, enable us to gain access to Hong Kong's capital markets and benefit us by exposing it to a wide range of private and institutional investors, thereby further enhancing the financial position of our Group.

Independent financial operation

Our Group has established our own finance department with a team of financial staff, who are responsible for financial control, accounting, reporting, group credit and the internal control function of the our Group, independent from Zijin Mining. Our Group is also able to make financial decisions independently and Zijin Mining does not intervene with our use of funds. Our Group has also established an independent audit system, a standardized financial and accounting system and a complete financial management system.

Operational independence

Our Directors believe that we can continue operating independently from Zijin Mining Group after the [REDACTED] for the following reasons:

(i) we have the necessary qualifications for carrying out our business;

(ii) we have independent production capabilities, and do not rely on the production capacities of Zijin Mining Group;

(iii) we have independent channels to contact customers and suppliers, and have our own management team to carry out business; and

(iv) we have independent sales and supplies channels.

During the Track Record Period, we conducted certain transactions with Zijin Mining and its close associates, and such transactions are expected to continue upon the [REDACTED] and will constitute connected transactions of our Company. These connected transactions have been and will continue to be conducted on arm's length and on normal commercial terms in the ordinary and usual course of business of our Group, and the pricing policy of our Group and our connected persons and not be prejudicial to the interests of any of the parties. See "Connected Transactions" for further details.

Based on the above, our Directors are satisfied that we have been operating independently from Zijin Mining Group and their respective close associates will continue to be able to operate independently.

CORPORATE GOVERNANCE

Zijin Mining has confirmed that it fully comprehends its obligations to act in our Shareholders' best interests as a whole. Our Directors believe that there are adequate corporate governance measures in place to manage existing and potential conflicts of interest. In order to further avoid potential conflicts of interest, we have implemented the following measures:

(a) as part of our preparation for the [REDACTED], we will adopt, upon [REDACTED], our Articles of Association to comply with the Listing Rules. In particular, our Articles of Association provided that, unless otherwise provided, a Director shall not vote on any resolution approving any contract or arrangement or any other proposal in which such Director or any of his/her associates have a material interest, and if he/she shall do so his/her vote shall not be counted (nor shall such Director be counted in the quorum for the resolution);

(b) a Director with material interests shall make full disclosure in respect of matters that may have actual or potential conflict with any of our interest and abstain from the board meetings on matters in which such Director or his/her associates have a material interest, unless the attendance or participation of such Director at such meeting of the Board is specifically requested by a majority of the independent non-executive Directors;

(c) we are committed that our Board should include a balanced composition of executive Directors, non-executive Directors and independent non-executive Directors. We have appointed three independent non-executive Directors and we believe our independent non-executive Directors possess sufficient experience and they are free of any business or other relationship which could interfere in any material manner with the exercise of their independent judgment and will be able to provide an impartial, external opinion to protect the interests of our public Shareholders. For details of our independent non-executive Directors, please refer to "Directors and Senior Management";

(d) we have appointed Somerley Capital Limited as our compliance advisor, which will provide advice and guidance to us in respect of compliance with the applicable laws and the Listing Rules including various requirements relating to Directors' duties and corporate governance;

(e) we have adopted the internal control and corporate governance measures to ensure that the terms of our continuing connected transactions are fair and reasonable and not prejudicial to the interests of our Company and the minority Shareholders, as further described in "Connected Transactions — Internal Control Measures".

(f) as required by the Listing Rules, our independent non-executive Directors shall review any continuing connected transaction annually and confirm in our annual report that such transactions have been entered into in our ordinary and usual course of business, are either on normal commercial terms or on terms no less favorable to us than those available to or from Independent Third Parties and on terms that are fair and reasonable and in the interests of our Shareholders as a whole;

(g) Zijin Mining has undertaken to us in the Deed of Non-Competition that it will not, and will procure its close associates not to, engage in any [REDACTED] Business, save for the exceptions as disclosed under the paragraphs headed "Deed of Non-Competition" above, which will protect our Group from potential competition from the Zijin Mining Group in respect of the operation of overseas gold mine assets;

(h) on an annual basis, our independent non-executive Directors will review the non-compete undertakings provided by Zijin Mining and its compliance with such undertakings; and

(i) our Company will disclose in its annual report each year the compliance status of the Deed of Non-Competition.

Rule 8.10 of the Listing Rules

Save as disclosed above, as at the Latest Practicable Date, none of Zijin Mining and our Directors had any interest in any other business which competes or is likely to compete, either directly or indirectly with our business which would require disclosure under Rule 8.10 of the Listing Rules.

OUR CONNECTED PERSONS

Upon the [REDACTED] and [REDACTED], the following connected persons of our Company will conduct non-exempted or partially exempted transactions with our Group:

Name	Information of our Connected Persons and Relationship with our Group
Zijin Mining Group	As at the Latest Practicable Date, Zijin Mining is our Controlling Shareholder. Therefore, the Zijin Mining Group will become a connected person of our Company upon [REDACTED] for the purpose of the Listing Rules.
Kyrgyzaltyn JSC.	As at the Latest Practicable Date, Kyrgyzaltyn JSC is a substantial shareholder of Altynken LLC, an indirect non-wholly owned subsidiary of our Company. Therefore, Kyrgyzaltyn JSC will become a connected person of our Company at the subsidiary level upon [REDACTED] for the purpose of the Listing Rules.

SUMMARY OF OUR CONTINUING CONNECTED TRANSACTIONS

The following table sets forth a summary of our non-exempt or partially-exempt continuing connected upon [REDACTED]:

No.	Transaction	Applicable Listing Rules	Waiver sought	Annual caps for the year ending December 31,		
				2025	2026	2027
				(unless otherwise specified: US$ in million)		
A.	**Partially Exempt Continuing Connected Transactions**					
1)	Altynken Sales Agreement	14A.35, 14A.53, 14A.101 and 14A.105	Announcement and the annual cap requirements under Chapter 14A of the Listing Rules	4 tonnes of gold	N/A	N/A
B.	**Non-exempt Continuing Connected Transactions**					
2)	Zijin Mining Technical Service Framework Agreement	14A.35, 14A.36, 14A.46 and 14A.105	Announcement and independent Shareholders' approval requirements under Chapter 14A of the Listing Rules	110	150	270
3)	Zijin Mining Centralized Procurement Framework Agreement	14A.35, 14A.36, 14A.46 and 14A.105	Announcement and independent Shareholders' approval requirements under Chapter 14A of the Listing Rules	210	420	370
4)	Colombia Entrustment Arrangement and Transactions with Zijin America. . .	14A.35, 14A.36, 14A.46, 14A.52, 14A.53 and 14A.105	Announcement and independent Shareholders' approval, contractual term and annual cap requirements under Chapter 14A of the Listing Rules	N/A	N/A	N/A

No.	Transaction	Applicable Listing Rules	Waiver sought	Annual caps for the year ending December 31,		
				2025	2026	2027
				(unless otherwise specified: US$ in million)		
5)	Zijin Mining Sales Framework Agreement	14A.35, 14A.36, 14A.46, 14A.53 and 14A.105	Announcement and independent Shareholders' approval, and the annual cap requirements under Chapter 14A of the Listing Rules	28 tonnes of gold, 31.0 tonnes of silver and 4,800 tonnes of copper	29 tonnes of gold, 31.0 tonnes of silver and 5,200 tonnes of copper	30 tonnes of gold, 32.0 tonnes of silver and 5,900 tonnes of copper
6)	Zijin Mining Financial Services Framework Agreement	14A.35, 14A.36, 14A.46 and 14A.105	Announcement and independent Shareholders' approval under Chapter 14A of the Listing Rules	See "— Zijin Mining Financial Services Framework Agreement" below		

PARTIALLY EXEMPT CONTINUING CONNECTED TRANSACTIONS

Altynken Sales Agreement

Principal Terms

On March 20, 2025, Altynken LLC, an indirect non-wholly owned subsidiary of our Company, entered into a sales agreement (the "**2025 Altynken Sales Agreement**") with Kyrgyzaltyn JSC, pursuant to which Altynken LLC will sell gold doré to Kyrgyzaltyn JSC for further processing, consistent with the Altynken Sale Arrangement (as defined below) during the Track Record Period. The term of the 2025 Altynken Sales Agreement is valid for a term of one year.

Subject to compliance with the Listing Rules and applicable laws and regulations, the parties expect to enter into a new sales agreement on similar terms upon the expiry of the 2025 Altynken Sales Agreement.

Reasons for the transaction

During the Track Record Period, Altynken LLC has entered into sales contracts with Kyrgyzaltyn Open Joint Stock Company annually (the "**Altynken Sale Arrangement**"). Pursuant to the joint venture agreement between our Group and Kyrgyzaltyn Open Joint Stock Company in relation to Altynken LLC, Kyrgyzaltyn JSC has the right to purchase all or part of the gold produced from the Kyrgyzstan Taldybulak Levoberezhny Gold Mine in the event that the Kyrgyzstan National Bank or any other entities authorized by the Kyrgyzstan government did not exercise their right of first refusal.

Kyrgyzaltyn JSC is the only gold processor in Kyrgyzstan that has the technology and qualifications required to process gold doré into gold ingots. Since banks only accept gold ingots, Altynken LLC has been selling gold doré to Kyrgyzaltyn JSC for processing prior to its onward-selling to banks. The Altynken Sale Arrangement has enabled Altynken LLC to leverage the expertise of Kyrgyzaltyn JSC to refine and process the unprocessed gold doré.

Pricing policies

The price payable of the gold doré under the Altynken Sales Agreement will be determined with reference to the (i) prevailing market price of the gold in the London Bullion Market Association and (ii) to be partially net off by the refinery and processing fee that would be charged by Kyrgyzaltyn JSC.

Historical transaction amounts and historical transaction volume

The total transaction amount received by Altynken LLC from Kyrgyzaltyn JSC under the Altynken Sale Arrangement for the years ended December 31, 2022, 2023 and 2024 are set forth below:

	Year ended December 31,		
	2022	2023	2024
	(US$ in thousands)	(US$ in thousands)	(US$ in thousands)
Transaction amount received under the Altynken Sale Arrangement	212,432 (representing 3.75 tonnes of gold)	250,933 (representing 4.08 tonnes of gold)	279,815 (representing 3.7 tonnes of gold)

Proposed cap

The proposed cap for the transactions contemplated under the 2025 Altynken Sales Agreement is 4 tonnes of gold. Since all of the gold doré produced from the Kyrgyzstan Taldybulak Levoberezhny Gold Mine will be sold to Kyrgyzaltyn JSC, our Company has taken into account the historical transaction amount and the expected gold doré production for the term of the 2025 Altynken Sales Agreement when arriving at the annual cap.

Waiver from strict compliance with annual cap requirements

Under Rule 14A.53(1) of the Listing Rules, an annual cap expressed in monetary terms must be set for continuing connected transactions. We have applied to the Stock Exchange for, and the Stock Exchange [has granted], a waiver to us from strict compliance with Rule 14A.53(1) in respect of the annual cap of the transactions under 2025 Altynken Sales Agreement to be expressed as the transaction volume of gold ores to be sold under the 2025 Altynken Sales Agreement.

Our Directors are of the view that an annual cap with a fixed monetary amount for the transactions under the Altynken Sales Agreement would impose an arbitrary ceiling as all the gold ores extracted from the Kyrgyzstan Taldybulak Levoberezhny Gold Mine will be sold to Kyrgyzaltyn JSC, and it would not be possible to provide any meaningful estimates given the fluctuations in the global market price for mining resources, which influence the sales price of gold ore. Such a cap would neither accurately reflect the actual transaction amount nor provide meaningful information to investors of our Group.

Our Directors consider an alternative non-monetary cap based on the transaction volume to be appropriate in the circumstances because it will be difficult for our Company to reasonably estimate the monetary annual cap for the transactions under the 2025 Altynken Sales Agreement. Our Directors are, therefore, of the view that that it is not in the interest of our Company and our Shareholders to impose an annual cap in monetary terms for the 2025 Altynken Sales Agreement as prescribed by Rule 14A.53(1) of the Listing Rules.

Listing Rules implications

Since the 2025 Altynken Sales Agreement has been entered into with connected person at the subsidiary level during the ordinary course of our business and on normal commercial terms where our Directors have approved the transactions and our independent non-executive Directors have confirmed that the terms of the transactions are fair and reasonable, the transaction is on normal commercial terms and in the interests of our Company and our Shareholders as a whole, pursuant to Rule 14A.101 of the Listing Rules, the transaction will be subject to the reporting, annual review and announcement requirements but exempt from the independent shareholders' approval requirement.

NON-EXEMPT CONTINUING CONNECTED TRANSACTIONS

Zijin Mining Technical Services and Support Framework Agreement

Principal Terms

On [•], we entered into a technical services and support framework agreement (the "**Zijin Mining Technical Services and Support Framework Agreement**") with Zijin Mining Group, pursuant to which Zijin Mining Group will provide technical services and support to us, including construction, installation and engineering service, and we shall pay fees for the service rendered in return, consistent with the Zijin Mining Technical Service Arrangement (as defined below) during the Track Record Period.

The initial term of the Zijin Mining Technical Services and Support Framework Agreement will commence on the [REDACTED] and end on December 31, 2027. Subject to compliance with the Listing Rules and the applicable laws and regulations, the Zijin Mining Technical Services and Support Framework Agreement may be renewed upon mutual consent by the parties.

Reasons for the transaction

During the Track Record Period, in the usual and ordinary course of business, Zijin Mining Group has provided technical services and support to our Group, including construction, installation and engineering service (the "**Zijin Mining Technical Service Arrangement**"). The relevant technical services provided include, among other things, provision of underground mining services, factory design and construction, building of geological models, issue reserve reports, assay services etc. The Technical Service Arrangement has enabled our Group to leverage the technical expertise accumulated by Zijin Mining Group throughout its operating history, particularly in the construction and installation of necessary facilities within the mine assets, which in turn enabled the gold mine assets within our Group to adhere to the operating standard of Zijin Mining Group as one of the largest mining group in the PRC. While technical services such as construction and installation services can be easily sourced at comparable terms in the market, the rich experience by the Zijin Mining Group would enable smooth cooperation and quick implementation time.

Pricing policies

The fees payable to Zijin Mining Group by our Group under the Zijin Mining Technical Service Arrangement will be determined on arm's length basis with reference to the relevant labor costs, time needed, and expertise required, and with reference to third-party quotations for similar services. The terms offered to us by Zijin Mining Group shall not be less favorable to our Group than the terms offered to us by our independent suppliers for the same or similar type and scope of technical services.

Historical transaction amounts

The total transaction amount paid by our Group to Zijin Mining Group under the Zijin Mining Technical Service Arrangement for the years ended December 31, 2022, 2023 and 2024 are set forth below:

	Year ended December 31,		
	2022	2023	2024
	(US$ in thousands)	(US$ in thousands)	(US$ in thousands)
Transaction amount paid under the Zijin Mining Technical Service Arrangement	38,059	78,174	74,096

Annual caps

The following table sets forth the proposed annual caps for the maximum annual amounts of fees payable by our Group to Zijin Mining Group pursuant to the Zijin Mining Technical Service and Support Framework Agreement:

	Year ending December 31,		
	2025	2026	2027
	(US$ in thousands)	(US$ in thousands)	(US$ in thousands)
Maximum aggregate annual amount of fees payable by our Group for the Zijin Mining Technical Service and Support Framework Agreement	110,000	150,000	270,000

The annual caps are calculated based on the expected business growth of our Group after the completion of the Akyem Acquisition and the Kazahkstan Acquisition, our historical demand for such services and the current asset portfolio of our Group.

Listing Rules implications

As the highest applicable percentage ratio of the Technical Service and Support Framework Agreement calculated for the purposes of chapter 14A of the Listing Rules is expected to exceed 5%, the Zijin Mining Technical Service and Support Framework Agreement will, upon [REDACTED], constitute continuing connected transactions under the Listing Rules subject to reporting, annual review, announcement and independent shareholders' approval requirements.

Zijin Mining Centralized Procurement Framework Agreement

Principal Terms

On [•], we entered into a centralized procurement framework agreement (the "**Zijin Mining Centralized Procurement Framework Agreement**") with Zijin Mining Group, pursuant to which we will procure equipment and raw materials from Zijin Mining Group, and we shall pay fees for the equipment and materials procured, consistent with the Zijin Mining Centralized Procurement Arrangement (as defined below) during the Track Record Period.

The initial term of the Centralized Procurement Framework Agreement will commence on the [REDACTED] and end on December 31, 2027. Subject to compliance with the Listing Rules and applicable laws and regulations, the Zijin Mining Centralized Procurement Framework Agreement may be renewed upon mutual consent by the parties.

Reasons for the transaction

During the Track Record Period, in the usual and ordinary course of business, our Group had purchased equipment and raw materials under an arrangement (the "**Zijin Mining Centralized Procurement Arrangement**") from Zijin Mining Group, as part of the centralized procurement arrangement implemented by Zijin Mining Group so that members of the Zijin Mining Group could procure equipment and raw materials to enjoy the benefits of economies of scale.

The relevant equipment and raw materials include mainly spare parts (i.e. pipes, rubber pipe fittings) and consumables (i.e. crusher and ball mill accessories). The Zijin Mining Centralised Procurement Arrangement has enabled our Group to procure equipment and raw materials for its business operations together with the other business units of Zijin Mining Group such that the bargaining power vis-à-vis third parties are enhanced, thereby enhancing ensuring competitive pricing and stable supply.

Pricing policies

The fees payable to Zijin Mining Group by our Group under the Zijin Mining Centralized Procurement Arrangement will be determined on arm's length basis with reference to the costs of the relevant items as required by our Group with a fixed percentage of costs of such items as service fees to cover overhead and human resources cost. The terms offered to us shall not be less favorable to our Group than the terms offered to us by our independent suppliers for the same or similar type and scope of procurement services.

Historical transaction amounts

The total transaction amount paid by our Group to Zijin Mining Group under the Zijin Mining Centralized Procurement Arrangement for the years ended December 31, 2022, 2023 and 2024 are set forth below:

	Year ended December 31,		
	2022	2023	2024
	(US$ in thousands)	(US$ in thousands)	(US$ in thousands)
Transaction amount paid under the Zijin Mining Centralized Procurement Arrangement	110,941	111,095	80,254

Annual caps

The following table sets forth the proposed annual caps for the maximum annual amounts of fees payable by our Group to Zijin Mining Group pursuant to the Zijin Mining Centralized Procurement Framework Agreement:

	Year ending December 31,		
	2025	2026	2027
	(US$ in thousands)	(US$ in thousands)	(US$ in thousands)
Maximum aggregate annual amount of fees payable by our Group pursuant to the Zijin Mining Centralized Procurement Framework Agreement	210,000	420,000	370,000

The following factors were considered in arriving at the above annual caps: (i) the total consumption value (annual material purchase amount) expected by each mine of our Group; (ii) the estimated future demand considering business growth; (iii) the Akyem Acquisition and the Kazahkstan Acquisition; and (iv) the current asset portfolio of our Group.

Listing Rules implications

As the highest applicable percentage ratio for the Zijin Mining Centralized Procurement Framework Agreement calculated for the purposes of chapter 14A of the Listing Rules is expected to exceed 5%, the Zijin Mining Centralized Procurement Framework Agreement will, upon [REDACTED], constitute continuing connected transactions under the Listing Rules subject to reporting, annual review, announcement and independent shareholders' approval requirements.

Colombia Entrustment Arrangement and Transactions with Zijin America

Principal Terms

We have entered into the Colombia Entrustment Arrangement, which includes (i) an Entrusted Operations Agreement between our Group and Continental Gold (a non-wholly owned subsidiary of Zijin Mining); and (ii) a Return Swap Agreement between our Group and Gold Mountains (H.K.) before [REDACTED], pursuant to which we and our prospective Shareholders upon [REDACTED] are entitled to enjoy the economic benefit of the Colombia Buriticá Gold Mine despite not having any legal ownership in it. For the detailed terms of the Colombia Entrustment Arrangement, please refer to "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement".

In addition, from time to time, given that the financial results of Zijin America is consolidated to our Group pursuant to the Colombia Entrustment Arrangement, there will be transactions between the Group and Zijin America (and its subsidiaries) arising from the implementation of the Colombia Entrustment Arrangement, including financing transactions, sales transactions and procurement transactions, as we manage the Colombia Buriticá Gold Mine pursuant to the Colombia Entrustment Arrangement (collectively, the "**Transactions with Zijin America**").

The Colombia Entrustment Arrangement will last until the expiry of the mine life of the Colombia Buriticá Gold Mine, or until the Colombia Buriticá Gold Mine is no longer held by Zijin Mining Group, whichever is earlier.

Reasons for the transaction

Please refer to "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement" for details and reasons for such transaction.

Listing Rules Implications

As the highest applicable percentage ratio for the transactions arising from the Colombia Entrustment Arrangement and the Transactions with Zijin America calculated for the purposes of Chapter 14A of the Listing Rules is expected to exceed 5%, the Colombia Entrustment Arrangement and Transactions with Zijin America will, upon [REDACTED], constitute continuing connected transactions under the Listing Rules subject to reporting, annual review, announcement and independent shareholders' approval requirements.

Waiver from strict compliance with contractual term requirements

Under Rule 14A.52 of the Listing Rules, a listed issuer is required to set a contractual term not exceeding three years. It is impracticable for us to set a contractual term not exceeding three years in respect of the Colombia Entrustment Arrangement. Our Directors are of the view that, in order for the Colombia Entrustment Arrangement to be fully effective, and to enable our Group and our investors to enjoy the economic benefits of the Colombia Buriticá Gold Mine, the nature of the Colombia Entrustment Arrangement would require the Entrusted Operation Agreement and the Return Swap Agreement to be of a duration longer than three years, which promotes stability and continuity in operations and assignment of economic benefits, and is beneficial to us and our shareholders as a whole. Please refer to "Relationship with Zijin Mining — Clear Delineation of Business — Colombia Entrustment Arrangement" for further details in relation to the Entrusted Operation Agreement and the Return Swap Agreement. Therefore, we have applied to the Stock Exchange for, and the Stock Exchange [has granted], a waiver under Rule 14A.52 of the Listing Rules from strict compliance with the contractual term requirements

Waiver from strict compliance with annual cap requirements

Under Rule 14A.53(1) of the Listing Rules, an annual cap expressed in monetary terms must be set for continuing connected transactions. We have applied to the Stock Exchange for, and the Stock Exchange [has granted], a waiver to us from strict compliance with Rule 14A.53(1) in respect of the annual caps of the transactions under the Colombia Entrustment Arrangement.

Our Directors are of the view that it is impractical for Zijin Mining Group and us to accurately estimate the economic benefits to be received each year, as well as the transaction amounts between Zijin America and us as we manage the Colombia Buriticá Gold Mine, and it would also not be in our interest and the interest of our shareholders to adopt fixed monetary caps for such transactions as such caps will impose an arbitrary ceiling on the dividend that we could receive from Colombia Buriticá Gold Mine, in contrary to the purpose of adopting the Colombia Entrustment Arrangement. Our Directors are, therefore, of the view that it is not in the interest of our Company and our Shareholders to impose an annual cap in monetary terms for the Colombia Entrustment Arrangement as prescribed by Rule 14A.53(1) of the Listing Rules.

Zijin Mining Sales Framework Agreement

Principal Terms

On [•], we entered into a sales framework agreement (the "**Zijin Mining Sales Framework Agreement**") with Zijin Mining Group, pursuant to which we will sell gold and other by-products (such as copper and silver) to Zijin Mining Group, and Zijin Mining Group shall pay the purchase price for the products sold in return, consistent with the Sale Arrangement (as defined below) during the Track Record Period.

The initial term of the Zijin Mining Sales Framework Agreement will commence on the [REDACTED] and end on December 31, 2027. Subject to compliance with the Listing Rules and applicable laws and regulations, the Zijin Mining Sales Framework Agreement may be renewed upon mutual consent by the parties.

Reasons for the transaction

During the Track Record Period, in the usual and ordinary course of business, our Group had sold mining products to Zijin Mining Group under an arrangement (the "**Zijin Mining Sale Arrangement**"), which involved the sale of gold and other by-products (such as copper and silver) from our Group to the Zijin Mining Group. Certain subsidiaries within the Zijin Mining Group, acting as traders of various mineral resources, are responsible for, among other things, arranging for the external sale of mineral resources produced by our Group to external refineries, end-customers or traders. By leveraging the centralized and experienced sales capabilities of Zijin Mining Group, the Zijin Mining Sale Arrangement has enhanced sales coordination within the Zijin Mining Group, thereby optimizing operational efficiencies and economies of scale, and securing mutually favorable commercial terms.

Pricing policies

The prices payable by Zijin Mining Group to our Group under the Zijin Mining Sales Framework Agreement will be determined on arm's length basis with reference to (i) the prevailing market price of the mineral resources in international market such as the London Bullion Market Association, the Shanghai Huatong Silver Exchange and the Shanghai Future Exchange; and (ii) trading margins on the price of gold doré, gold ingot and gold concentrate based on arm's length discussion with reference to similar arrangements in the open market.

Historical transaction amounts and historical transaction volume

The total transaction received by our Group from Zijin Mining Group for the Sale Arrangement for the years ended December 31, 2022, 2023 and 2024 are set forth below:

	Year ended December 31,		
	2022	2023	2024
	(US$ in thousands)	(US$ in thousands)	(US$ in thousands)
Transaction amount received for the Zijin Mining Sale Arrangement	597,704 (related to 10.3 tonnes of gold; 20.3 tonnes of silver; 1,588.4 tonnes of copper)	635,785 (related to 10.3 tonnes of gold; 29.7 tonnes of silver; 2,304.4 tonnes of copper)	1,272,927 (related to 15.6 tonnes of gold; 30.2 tonnes of silver; 6,795.9 tonnes of copper)

Annual caps

The following table sets forth the proposed annual caps for the volume (tonnage) of mining products sold by our Group to the Zijin Mining Group pursuant to the Sale Framework Agreement:

	Year ending December 31,		
	2025	2026	2027
	(tonnes)	(tonnes)	(tonnes)
Maximum annual transaction volume (tonnage) sold by our Group under the Sale Framework Agreement			
Gold	28.0	29.0	30.0
Silver.	31.0	31.0	32.0
Copper	4,800	5,200	5,900

The annual cap of sales volume of mining products sold by our Group is based on the expected output for each mine, the expected business growth of our Group and the current asset portfolio of our Group.

Waiver from strict compliance with annual cap requirements

Under Rule 14A.53(1) of the Listing Rules, an annual cap expressed in monetary terms must be set for continuing connected transactions. We have applied to the Stock Exchange for, and the Stock Exchange [has granted], a waiver to us from strict compliance with Rule 14A.53(1) in respect of the annual caps of the transactions under the Sales Framework Agreement to be expressed as the transaction volume of gold, silver and copper respectively to be sold under the Sales Framework Agreement.

Our Directors are of the view that an annual cap with a fixed monetary amount for the transactions under each of the Sales Framework Agreement would impose an arbitrary ceiling on the sales of mining products to the Sales Entities and impact the amount of products that could be sold. It would not be possible to provide any meaningful estimates given the unpredictable fluctuations in the global market price for mining resources, which influence the sales price of mining resources under the Sales Framework Agreement, setting a fixed monetary cap for the next three years is impractical. Such a cap would neither accurately reflect actual transaction amounts nor provide meaningful information to investors of our Group.

Moreover, it could also restrict the business operations, reduce flexibility, and weaken competitiveness of our Group. Unless unrealistically large amounts are set as the annual caps, a fixed monetary annual cap would unnecessarily restrain our Group from smoothly conducting or expanding our businesses in the ordinary course and as part of our normal businesses, weaken the flexibility of future development and adjustments, and lessen the competitive edge of businesses operated by our Group. The annual caps will also be easily exceeded as a result of increasing mining product prices and fluctuating foreign exchange rates. Such volatile movement in the price of mining products is not within the control of, or predictable by, our Company. Any increased mining products market price may result in increased monetary transaction amount, which in turn could lead to the annual cap being exceeded, thus setting such an annual cap in monetary terms would be inappropriate as it would not be within our Group's control as to whether the annual cap is exceeded.

Our Directors are also of the view that setting an annual cap with a fixed monetary amount would cause unnecessary disruption to our Group's operations, and would not be in the best interest of our Group and would not be commercially practicable if we are required to seek our Board's approval regularly to increase the monetary annual cap to align the cap with fluctuations in the mining resources market price, considering that the convening of Board meetings and Shareholders' meetings shall require compliance with, among others, our internal corporate governance policy, our Articles of Association and the compliance requirements arising from our status as a listed company on the Stock Exchange. Our Directors consider an alternative non-monetary cap based on the transaction volume to be appropriate in the circumstances because it will be difficult for our Company to reasonably estimate the monetary annual cap for the transactions under the Sales Framework Agreement. Our Directors are, therefore, of the view that it is not in the interest of our Company and our Shareholders to impose an annual cap in monetary terms for the Sales Framework Agreement as prescribed by Rule 14A.53(1) of the Listing Rules.

Zijin Mining Financial Services Framework Agreement

Principal Terms

On [•], we entered into a financial services framework agreement (the "**Zijin Mining Financial Services Framework Agreement**") with the Zijin Mining Group, pursuant to which, the Zijin Mining Group will provide our Group with financial services, among others (i) deposits and related services (the "**Deposit Services**"), (ii) financial lease services (the "**Financial Lease Services**"), (iii) insurance underwriting services (the "**Insurance Underwriting Services**"), and (iv) other financial services, similar to the Financial Services Arrangement (as defined below) during the Track Record Period.

The initial term of the Zijin Mining Financial Services Framework Agreement will commence on the [REDACTED] and end on December 31, 2027. Subject to compliance with the Listing Rules and the applicable laws and regulations, the Zijin Mining Financial Services Framework Agreement may be renewed upon mutual consent by the parties.

Reasons for the transaction

During the Track Record Period, in the usual and ordinary course of business, certain subsidiaries of the Zijin Mining Group ("**Relevant Entities**") provided to our Group the Deposit Services, Financial Lease Services and Insurance Underwriting Services (the "**Zijin Mining Financial Services Arrangement**"), as the Relevant Entities have been acting as the asset management hubs of the Zijin Mining's operations and financial management, in order to the satisfy capital needs of various subsidiaries of Zijin Mining in different jurisdictions more effectively and efficiently.

The Zijin Mining Financial Services Arrangement has enabled our Group to enjoy the Deposit Services, Financial Lease Services and Insurance Underwriting Services at a lower rate than otherwise available to us from third party financial institutions, as the rates on deposits offered by the Relevant Entities to our Group will be equal to or more favorable than those offered by other commercial banks in jurisdictions where we operate. As such, the financial services provided by the Zijin Mining Group can effectively reduce our finance costs.

Our Group is also expected to benefit from the Zijin Mining Group's better understanding of operations of our Group which should allow expedient and efficient service provision. In addition, the customers of the Zijin Mining Group in respect of the financial services are limited to entities within the Zijin Mining Group (including our Group), thereby reducing the credit and operational risks that Zijin Mining Group may otherwise be exposed to if its customers included other entities unrelated to the Zijin Mining Group.

Pricing policies

Deposit Services. The interest rates applicable to the Deposit Services provided by the Zijin Mining Group to us shall be (i) on normal commercial terms; (ii) no less than benchmark interest rates for comparable deposit for the same period provided by other major commercial banks in Hong Kong or in the PRC; and (iii) no less than interest rates for comparable deposit for the same period applicable to other members of the Zijin Mining Group provided by the Relevant Entities.

Financial Leases. We enter into financial leases with the Zijin Mining Group (as lessor), whereby Zijin Mining Group normally purchases the leased asset from the supplier in accordance with the instructions and selection by our Group (as lessee) and will then lease the leased asset to the our Group for an agreed period and receive rentals regularly.

The consideration for the lease consists of the purchase price of the leased equipment, interests on the lease as agreed between the parties and handling fees (if any).

- The principal amount of the Financial Lease Services shall be the price at which the leased asset is purchased from the supplier and shall be arrived at after negotiation between our Group and the supplier on normal commercial terms with reference to the market price of such leased asset.

- The lease interests of the Financial Lease Services shall be determined with reference to, among others, (i) market conditions and the benchmark interest rate for term loans from third party financial lease providers from time to time; (ii) terms and conditions which are no less favorable to our Group than those offered by lessors of similar qualifications; and (iii) the credit assessment of lessor, the term of finance lease agreement, principal amount, regulatory policy orientation, industry development strategy and the business model and credit enhancement measures of the lessor.

- The handling fees of the Financial Lease Services shall be determined with reference to, among others, (i) the official rates or standards published by monetary authorities (if applicable), (ii) no higher than handling fees for similar financial services provided by other commercial banks to members of our Group, if there are no official rates or standards applicable.

Insurance Underwriting Services and Other Financial Services. The insurance premiums and/or handling fees provided by the Zijin Mining Group shall be (i) determined with the official rates or standards published by monetary authorities (if applicable), and (ii) no higher than handling fees for similar financial services provided by other commercial banks to members of our Group, if there are no official rates or standards applicable.

Taking into account the no less favorable interest rates and other commercial benefits to our Group, we consider that the preservation of such financial arrangement with the Zijin Mining Group is beneficial to our Shareholders as a whole. In addition, our Company has the right to choose the financial services provided by independent third parties to us, and we are not under any obligation to use financial services provided by Zijin Mining Group.

Historical transaction amounts

The relevant historical amount of the relevant financial services under the Zijin Mining Financial Services Arrangement for the years ended December 31, 2022, 2023 and 2024 are set forth below:

	Year ended December 31,		
	2022	2023	2024
		(US$ in thousands)	
Transaction Amount in relation to Zijin Mining Financial Services Arrangement			
Maximum daily balance of Deposit Services	140,048	242,413	372,061
Total transaction amount of the Financial Lease Services	N/A	2,292	48,867
Insurance premiums	N/A	N/A	4,897
Handling fee for Other Financial Services .	N/A	N/A	N/A

Annual caps

The following table sets forth the proposed annual caps for the maximum annual amounts of fees payable by our Group to Zijin Mining Group pursuant to the Zijin Mining Financial Services Framework Agreement:

	Year ended December 31,		
	2025	2026	2027
		(US$ in thousands)	
Maximum transaction amount under Zijin Mining Financial Services Framework Agreement			
Maximum daily balance of Deposit Services	600,000	800,000	1,000,000
Total transaction amount of the Financial Lease Services	73,000	68,000	36,000
Insurance premiums	6,000	7,000	8,000
Handling fee for Other Financial Services .	5,000	5,000	5,000

The following factors were considered in arriving at the above annual caps:

- **Deposit Services:** the annual caps were determined with reference to the maximum daily balance of deposits under the Deposit Services during the Track Record Period. In light of our Group's overall development plan, mine merger and acquisition plan and steady year-by-year expansion of development scale, the scale of our Group's funds is expected to show an increasing trend and the caps for deposits for the relevant period are determined on a year-by-year increase correspondingly.

- **Financial Lease Services:**

  o The International Financial Reporting Standards 16 (Leases) are applicable to the Financial Lease Services. Pursuant to International Financial Reporting Standards 16 (Leases), we recognize right-of-use assets at the commencement date of the lease (i.e. the date on which the underlying asset is available for use). Right-of-use assets are measured at cost, less any accumulated depreciation and impairment losses, and adjusted for any remeasurement of lease liabilities. At the commencement date of a lease, our Company recognizes lease liabilities measured at the present value of lease payments to be made over the lease term. Accordingly, under International Financial Reporting Standards 16 (Leases), we will recognize the target assets of the relevant financial leases, which represent our right to use the assets for which our Company (subject to the specific lease terms and conditions set out in each lease agreement) is reasonably certain to obtain ownership of the leased assets at the expiry of the lease term, which are included in right-of-use assets and lease liabilities on initial recognition.

  o The annual caps are determined with reference to the expected financial leases to be renewed and entered into based on the development plan of our Group. We expect this to increase in light of our Group's overall development plan, mine merger and acquisition plan and steady year-by-year expansion of development scale.

- **Insurance premiums:** the annual caps are based on the expected insurance services to be provided by the Zijin Mining Group. We expect this to increase in light of our overall development plan, mine merger and acquisition plan and steady year-by-year expansion of development scale.

Pursuant to the Zijin Mining Financial Services Framework Agreement, the Zijin Mining Group may provide other financial services to our Group, including financial services that were not yet carried out during the Track Record Period, such as overdraft or settlement services, the fees of which will be determined with reference to handling fee charged by third party commercial banks. Taking into account efficiency of service provision from the Zijin Mining Group, it will be more favorable to our Company to procure such financial services from the Zijin Mining Group to meet our business needs in future. The proposed caps of other financial services for the relevant period are determined, with reference to the cash flow expected to be generated from other financial services which may be carried out in the relevant period.

Listing Rules implications

As the highest applicable percentage ratio for the transactions arising from the Zijin Mining Financial Services Framework Agreement calculated for the purposes of Chapter 14A of the Listing Rules is expected to exceed 5%, the Zijin Mining Financial Services Framework Agreement will, upon [REDACTED], constitute continuing connected transactions under the Listing Rules subject to reporting, annual review, announcement and independent shareholders' approval requirements.

INTERNAL CONTROL MEASURES

We have adopted the following internal control and corporate governance measures to ensure that the terms of our transactions with the connected persons are fair and reasonable and not prejudicial to the interests of our Company and the minority Shareholders:

- our Board (including our independent non-executive Directors) will be responsible for reviewing and evaluating the terms of the framework agreements for the continuing connected transactions (including any renewal thereof), in particular the pricing principles and annual caps, to ensure that such terms are fair and reasonable to our Group and compliant with relevant laws and regulations, our Group's internal policies and the Listing Rules;

- various internal departments of our Company (including but not limited to our finance department and legal department) will regularly monitor the implementation of the continuing connected transactions and keep track of the aggregate transaction amounts under the relevant framework agreements to ensure that the pricing principles and annual caps contained therein are complied with;

- when determining the fees payable by the connected persons to our Group (and vice versa) under the framework agreements, our Group will regularly research into prevailing market conditions and practices and make reference to the pricing and terms offered by our Group to Independent Third Parties for similar transactions, to ensure that the terms and conditions offered to/by the connected persons are fair and reasonable and are no less favorable to our Group than those offered to other comparable Independent Third Parties; and

- our independent non-executive Directors and auditors will conduct annual review of the continuing connected transactions under the framework agreements and provide annual confirmations in accordance with Rules 14A.55 and 14A.56 of the Listing Rules.

APPLICATION FOR WAIVERS

Our Directors (including our independent non-executive Directors) consider that disclosure of all the partially-exempt and non-exempt continuing connected transactions in full compliance with the Listing Rules would be impracticable and would add unnecessary administrative costs to our Group. In addition, our Directors (including the independent non-executive Directors) believe that it is in our Group's interests to continue these continuing connected transactions after the [REDACTED].

Pursuant to Rule 14A.105 of the Listing Rules, we have applied for, and the Stock Exchange [has granted], a waiver from strict compliance with the requirements under Chapter 14A of the Listing Rules in respect of the partially-exempt and non-exempt continuing connected transactions. In addition, we confirm that we will comply with the Listing Rules in relation to the partially-exempt and non-exempt continuing connected transactions.

In addition, we have applied for, and the Stock Exchange [has granted], a waiver from strict compliance with monetary annual caps under Rule 14A.53(1) of the Listing Rules in relation to the 2025 Altynken Sale Agreement, the Colombia Entrustment Arrangement and Transactions with Zijin America and the Zijin Mining Sale Framework Agreement. We have also applied for, and the Stock Exchange [has granted], a waiver from strict compliance with the requirements to set contractual term not exceeding three years under Rule 14A.52 of the Listing Rules in relation to the Colombia Entrustment Arrangement and the Transactions with Zijin America.

As required by the Listing Rules, our independent non-executive Directors shall review the continuing connected transactions annually and confirm in the annual report and accounts of our Company that such transactions have been entered into in our Company's ordinary and usual course of business, are either on normal commercial terms or on terms no less favorable to our Group than those available to, or from, independent third parties, and on terms that are fair and reasonable and in the interests of the Shareholders as a whole.

In the event of any future amendments to the Listing Rules imposing more stringent requirements than those applicable as of the Latest Practicable Date on the continuing connected transactions referred to in this Document, our Company will take immediate steps to ensure compliance with such new requirements within a reasonable time.

Apart from the requirements for three-year contractual term, setting annual cap, announcement, and independent Shareholders' approval (where applicable), of which waivers are sought above, we will comply at all times with the other applicable provisions under Chapter 14A of the Listing Rules in respect of the non-exempt continuing connected transactions.

DIRECTORS' VIEW

Our Directors (including the independent non-executive Directors) are of the view that (i) the continuing connected transactions as set out above have been and will be entered into in the ordinary and usual course of business of our Company and on normal commercial terms, and are fair and reasonable and in the interest of our Company and our Shareholders as a whole; (ii) the longer term of the Colombia Entrustment Arrangement promotes stability and continuity in operations and assignment of economic benefits, and is beneficial to us and our shareholders as a whole; (iii) the proposed monetary caps or alternative caps (where applicable) for the 2025 Altynken Sale Agreement, the Zijin Mining Sales Framework Agreement, the Zijin Mining Centralized Procurement Agreement, the Zijin Mining Technical Service and Support Framework Agreement and the Zijin Mining Financial Services Framework Agreement as described above are fair and reasonable and in the interests of our Shareholders as a whole; and (iv) the absence of cap for the Colombia Entrustment Arrangement and Transactions with Zijin America is fair and reasonable and in the interests of our Shareholders as a whole.

JOINT SPONSORS' CONFIRMATION

Based on the documentation provided by the Company, the Joint Sponsors' due diligence and discussions with the Company, the Joint Sponsors are of the view that (i) the continuing connected transactions as set out above have been and will be entered into in the ordinary and usual course of business of the Company and on normal commercial terms, and are fair and reasonable and in the interest of the Company and the Shareholders as a whole; (ii) the longer term of the Colombia Entrustment Arrangement promotes stability and continuity in operations and assignment of economic benefits, and is beneficial to the Company and the shareholders as a whole; (iii) the proposed monetary caps or alternative caps (where applicable) for the 2025 Altynken Sales Agreement, the

Zijin America Sales Framework Agreement, the Zijin America Centralized Procurement Agreement, the Zijin America Technical Service and Support Framework Agreement and the Zijin Mining Financial Services Framework Agreement as described above are fair and reasonable and in the interests of the Shareholders as a whole; and (iv) the absence of cap for the Colombia Entrustment Arrangement and Transactions with Zijin America is fair and reasonable and in the interests of the Shareholders as a whole.

BOARD OF DIRECTORS

Our Board currently consists of 9 Directors, including 3 executive Directors, 3 non-executive Directors and 3 independent non-executive Directors.

The table below sets our information in respect of our Directors.

Name	Age	Date of joining our Group *(Note)*	Date of appointment as Director	Position(s) for the current tenure in our Company	Roles and responsibilities

Note: Denotes the time from which the relevant Director joined Zijin Group (for the purpose of this note, the term Zijin Group here includes our Group).

DIRECTORS

Our Board currently consists of 9 Directors, comprising 3 executive Directors, 3 non-executive Directors and 3 independent non-executive Directors. The powers and duties of our Board include convening general meetings and reporting our Board's work at our Shareholders' meetings, determining our business and investment plans, preparing our annual financial budgets and final reports, formulating proposals for profit distributions and exercising other powers, functions and duties as conferred by the Articles of Association.

Executive Directors

Guo Xian Jian (郭先健)

Dr. Guo Xian Jian, aged 66, is an executive Director and the chief executive officer of our Group.

Dr. Guo joined Zijin Mining as chief engineer in August 2017, and has been the senior advisor of Zijin Mining since December 2019, guiding the company's engineering and technology, as well as the development and operation of overseas projects. Upon completion of the [REDACTED], Dr. Guo will focus on his roles and responsibilities as the chief executive officer of our Group and will no longer have any roles and responsibilities in the Zijin Mining Group. During his tenure with Zijin Mining, he was deeply involved in several key projects comprising our Group, including the commissioning and technical renovation of the Colombia Buritica Gold Mine the operation resumption and technical renovation of the Guyana Aurora Gold Mine, the implementation of the pressure pre-oxidation project for the Tajikistan Jilau/Taror Gold Mines, the commissioning and ram-up of the heap leaching project at Australia Norton Gold Mine, the transfer and production upgrade of the Suriname Rosebel Gold Mine.

Dr. Guo has been engaged in research and development, engineering, project management, and plant operation optimization in the metal and mining field for over forty years. He began his career in July 1982 and has held several prominent positions in research institutions and metal and mining enterprises, including the deputy director of the Metallurgical Institute at Beijing General Research Institute of Nonferrous Metals from April 1989 to February 1995, senior researcher at the Technology Center of Noranda Inc. from January 1997 to December 2001, and as the director (China region) and technical director (non-ferrous metals) at Hatch Ltd respectively from January 2002 to December 2005, and August 2011 to July 2017. He also served as the vice president at Ramu NiCo Management (MCC) Limited from January 2006 to July 2011 and technical advisor (project owner representative) for the CGN Mining Company Ltd Husab Uranium Project in Namibia from September 2013 to November 2016. Dr. Guo had his residency in Beijing Technology University as visiting professor during January 2017 to December 2019. In his career, he led the completion of dozens of research and engineering and metallurgical projects, including several large-scale mining and mineral processing (metallurgy) projects with investments exceeding billion dollars.

Dr. Guo is a registered engineer in Canada and possesses great industry knowledge and expertise in Non-ferrous Metal industry. He graduated with a bachelor's degree in Non-ferrous Metallurgy from Jiangxi University of Science and Technology, the PRC, in July 1982, followed by a master's degree in Non-ferrous Metallurgy from Kunming University of Science and Technology, the PRC, in June 1986, and a doctorate degree in same field in March 1989. Subsequent to his academic studies, he furthered his academic pursuits with research collaboration with the Mackay School of Earth Sciences and Engineering (formerly Mackay School of Mines), University of Nevada, USA and McGill University, Canada. Dr. Guo has published over 40 papers in renowned domestic and international journals and international academic conferences and is the writer of the books "Chemistry and Application of Copper Pyro-metallurgical Slag" published in 2023 and "Theory and Practice of Comprehensive Utilization of Low-grade Gold Resources" to be published.

Yiu Kai (饒佳)

Mr. Yiu Kai, aged 43, is an executive Director and chief financial officer of our Group. Mr. Yiu joined Zijin Mining in February 2011 and from September 2022 to June 2025, he has been serving as the general manager of the planning and finance department of Zijin Mining. Upon completion of the [REDACTED], Mr. Yiu will focus on his roles and responsibilities as the chief financial officer of our Group and will no longer have any roles and responsibilities in the Zijin Mining Group. During his tenure in Zijin Mining, he was involved in the financial management of Norton Gold Fields and New Porgera, and has been managing the financial function of the Group as the general manager of the planning and finance department of Zijin Mining.

Mr. Yiu has previously held positions as an accountant at HLM CPA Limited from December 2003 to February 2005, a senior accountant at Ernst & Young from February 2005 to May 2008, an assistant manager at John Lees & Associates Limited from May 2008 to October 2008 and as a manager at the transaction advisory services department at Ernst & Young Transactions Limited from October 2008 to February 2011.

Mr. Yiu is a certified public accountant in China and Hong Kong, a chartered certified accountant in the United Kingdom, and a certified practising accountant in Australia. He graduated with a bachelor's degree in accounting from the Hong Kong University of Science and Technology, in November 2003 and obtained a master's degree in business administration from the University of Hong Kong in November 2015.

Huang Zhihua (黃志華)

Dr. Huang Zhihua, aged 43, is an executive Director and the chief operating officer of our Group. Dr. Huang joined Zijin Mining in August 2007, and he has been the executive director and general manager of Hunan Zijin Lithium Co., Ltd., a wholly owned subsidiary of Zijin Mining, since 2024. Upon completion of the [REDACTED], Dr. Huang will focus on his roles and responsibilities as the chief operating officer of our Group and will no longer have any roles and responsibilities in the Zijin Mining Group. During his tenure with Zijin Mining, he was involved in several key projects comprising the Group, including the plant manager of Zijinshan Gold-Copper Mine, the concentrator manager at Kamoa Copper S.A., and the executive deputy general manager of Hunan Zijin Lithium Co., Ltd.

Dr. Huang is a senior engineer. He graduated with a bachelor's degree in mineral processing engineering from Central South University in June 2004, followed by a master's degree in May 2007, and a doctorate degree in June 2021 in mineral engineering from Central South University, the PRC.

Non-executive Directors

Lin Hongfu (林泓富)

Mr. Lin Hongfu, aged 51, is a non-executive Director and the chairman of the Board of our Company.

Mr. Lin is a senior engineer. He began his career in August 1997 at Zijin Mining and held the positions of plant manager at Zijin Mining's gold refinary plant, deputy chief of the Zijinshan Gold Mine, general manager and chairman of Bayannur Zijin Non-ferrous Metals Co., Ltd., etc. He served as a vice-president of the Zijin Mining from August 2006 to October 2013. He served as a director of Zijin Mining and vice-president of the Zijin Mining from October 2013 to December 2019. He has been serving as a director and standing vice-president of Zijin Mining since December 2019.

Mr. Lin has also been concurrently serving as the chairman of the board of Fujian Longking Co., Ltd, a company listed on the Shanghai Stock Exchange (stock code: 600388), since June 2022.

He obtained a master's degree in executive business administration from Tsinghua University, the PRC, in January 2011.

Wang Chun (王春)

Mr. Wang Chun, aged 56, is a non-executive Director of our Company.

Mr. Wang is a senior engineer. He previously served as the researcher of the Beijing General Research Institute of Mining and Metallurgy, the technical director of Ramu Nico Management (MCC), vice-president of operations and technology of CMOC Group Limited.

Mr. Wang joined Zijin Mining in February 2013, serving as deputy chief engineer of Zijin Mining and Metallurgy Design Institute. From March 2018 to September 2019, he worked at Beijing Yongbo Resources Investment Holding Co., Ltd. Since February 2013, Mr. Wang has held various roles, including being the deputy chief engineer of the Zijin Mining, general manager of Continental Gold Limited Sucursal Colombia from October

2019 to October 2021 and general manager of Gold Mountains (H.K.) from November 2021 to December 2022. He has been serving as a vice-president of Zijin Mining since December 2022.

He also currently serves as a non-independent director of Ivanhoe Mines Ltd. (listed in Toronto Stock Exchange, stock code: IVN)

He graduated with a bachelor's degree in applied chemistry from Central South University of Technology, the PRC in July 1990 and obtained a doctorate in inorganic chemistry from the Changchun Institute of Applied Chemistry, Chinese Academy of Sciences, the PRC, in April 1996.

Jian Ximing (簡錫明)

Mr. Jian Ximing, aged 48, is a non-executive Director of our Company.

Mr. Jian joined Zijin Mining in October 2000 and has held various positions, including project leader (deputy director) at the Zijinshan Copper-Gold Mine Technical Reform Command, deputy manager, manager, and assistant general manager of the infrastructure department at Bayannur Zijin Nonferrous Metals Co., Ltd., manager of the infrastructure department, assistant general manager, and deputy general manager at Zijin Copper Co., Ltd., general manager of Hunchun Polymetallic Co., Ltd., general manager of Hunchun Zijin Mining Co., Ltd., general manager of the construction department of Zijin Mining, executive deputy general manager of Serbia Zijin Copper Doo Bor, and director and general manager of overseas operations of Zijin Mining. Since August 2023, he has been serving as the chief executive officer of the overseas operations department of Zijin Mining.

He is a senior enginner and was recognized as a senior reserve talent of Zijin Mining in 2021 and 2022. Mr. Jian graduated with a diploma in housing construction engineering from Fujian University of Technology (then Fujian College of Architecture), the PRC, in July 1999 and later obtained a diploma in civil engineering from Southwest University, the PRC, in 2012.

Independent non-executive Directors

Xie Shaobo (謝少波)

Mr. Xie Shaobo, aged 51, is an independent non-executive Director of our Company.

Mr. Xie Shaobo is a seasoned professional with a distinguished career in the banking and finance sector, specializing in metals and mining advisory services across the Asia Pacific region. He is recognized for his strategic leadership and expertise in mergers and acquisitions, capital markets, and financial advisory services.

Since June 2014, Mr. Xie has been serving as the managing director and co-head of metals and mining for Asia Pacific at Standard Chartered Bank. His notable achievements include advising on high-profile transactions such as Zhaojin Gold's acquisition of Tietto, CMOC's divestment of Northparkes copper mine, and IGO's acquisition of a stake in Tianqi Lithium's Australian businesses.

Prior to his current role, Mr. Xie held significant positions at Citi as director and head of China metals and mining from July 2011 to April 2014, where he secured key buy-side mandates and fostering relationships with major Chinese state-owned and private enterprises. His earlier experience includes leadership roles at HSBC Investment Banking from December 2007 to April 2011, where he led a team in the metal and mining resources and energy group, and at Alcoa Asia Pacific from April 2004 tp December 2007, where he managed major acquisition projects and financial analysis for large-scale operations as project director.

Mr. Xie graduated with a bachelor's degree in applied chemistry from East China University of Science and Technology in July 1994.

Hui Lai Kwan (許麗君)

Ms. Hui Lai Kwan, aged 54, is an independent non-executive Director of our Company.

Ms. Hui has extensive experience in accounting, corporate governance, and strategic consulting. Since February 2021, she has been serving as an independent non-executive director at Yuexiu Services Group Limited (stock code: 6626), where she chairs the audit committee and is a member of the environmental, social and governance committee, nomination committee, and remuneration committee. Yuexiu Services Group Limited is a provider of property management services, value-added services, and operational services. It was spun off from Yuexiu Property Company Limited in June 2021.

Ms. Hui has over 25 years of professional experience as a registered accountant, with a strong background in audit, consulting, business transformation, crisis management, financial and IT control and risk management. Her expertise extends to regulatory reporting and compliance, capital markets, mergers and acquisitions, process optimization, internal control and risk assessment, ESG compliance management, corporate governance, and strategic planning. Since 2024, Ms. Hui has been working as a self-employed consultant, providing advisory services to enterprises, startups, and social enterprises.

Previously, Ms. Hui held various senior roles, including corporate governance and strategy director at i-CABLE Network Operations Limited, part of the i-CABLE Communications Limited Group (stock code: 1097) (i-CABLE group), from August 2022 to January 2024. From September 2018 to July 2022, she has acted as the consultant for Golden Advice Enterprises Limited and transformation lead for i-CABLE group from October 2021 to July 2022. She also served as chief financial officer at Asana (Hong Kong) Limited from February to August 2018, as head of finance at Aviva Life Insurance

Company Limited from May 2016 to February 2018 and as director in the regional controllers department at Manulife Financial Asia Limited. From August 1992 to December 2010, she worked in KPMG where she gained experience in audit, tax and advisory services across diverse industries and her past position therein was senior manager of capital markets group and was responsible for provision of technical support services to audit team on listing matters.

Ms. Hui holds a bachelor of social sciences in economics from the University of Hong Kong, a postgraduate diploma in early childhood education, and a kindergarten principal certificate from Hong Kong Baptist University. She is a registered accountant with the Hong Kong Institute of Certified Public Accountants.

Chan Hon (陳漢)

Mr. Chan Hon, aged 65, is an independent non-executive Director of our Company.

Mr. Chan has an extensive career in legal advisory and compliance services, specializing in financial law across various international markets. He is known for his expertise in investment banking securities, asset securitization, structured notes issuance, foreign exchange derivatives, bank lending, and investment funds, as well as his role as an arbitrator for commercial disputes.

Mr. Chan started his legal career with law firms in London and then moved to Hong Kong office before becoming an in-house legal counsel with international banks. His last in-house position was assistant general counsel at Deutsche Bank China from July 2006 to November 2016, where he was also appointed head of compliance for the bank until 2008. He was head of legal and compliance at ING Group in Singapore from September 2004 to June 2006, and senior legal advisor at ING Group in Hong Kong from April 1999 to August 2004. His legal expertise was further developed during his tenure at Credit Suisse in Hong Kong from July 1997 to April 1999, following his departure from Allen & Overy in Hong Kong. Since January 2017, Mr. Chan has been serving as a senior consultant and now as an international arbitrator, primarily in Hong Kong, Singapore and China. Mr. Chan has also been concurrently serving as the independent non-executive Director for Orient Securities Co., Ltd since November 2022.

Mr. Chan obtained a bachelor of laws from the University of Leeds in 1991 and completed the Solicitor Qualifying Examination Course in 1992. He further enhanced his expertise with legal and financial training programmes. He was admitted as a solicitor in England and Wales in 1994 and in Hong Kong in 1996.

SENIOR MANAGEMENT

The following table sets out information regarding the members of senior management of our Company.

Name	Age	Date of joining our Group *(Note)*	Date of appointment as senior management	Position(s) for the current tenure in our Company	Roles and responsibilities
Guo Xian Jian (郭先健)	66	August 18, 2017	December 30, 2019	Chief Executive Officer and executive Director	Responsible for strategic vision, corporate management and business planning

Note: Denotes the time from which the relevant members of senior management first became involved in matters relating to the business of our Group while under the employment of Zijin Mining or our Group (where applicable).

Dr. Guo Xian Jian is our chief executive officer. For details of his biography, see "— Directors — Executive Directors" in this section.

Mr. Yiu Kai is our chief financial officer. For details of his biography, see "— Directors — Executive Directors" in this section.

Dr. Huang Zhihua is our chief operating officer. For details of his biography, see "— Directors — Executive Directors" in this section.

Huang Xiaohong (黃曉虹)

Ms. Huang Xiaohong, aged 41, is a Vice President and a joint company secretary of our Group. She joined Zijin Mining Group Co., Ltd. in November 2015 and has held various management positions, including deputy general manager of the Overseas Operations Department of Zijin Mining, deputy general manager of the Investment Department, and general manager of Gold Mountains (H.K.) International Mining Company. She was appointed executive general manager of the International Business Department of Zijin Mining in August 2024. Upon completion of the [REDACTED], Ms. Huang will focus on her roles and responsibilities as the vice president of our Group and as one of the joint company secretaries of the Company, and will no longer have any roles and responsibilities in the Zijin Mining Group. During her tenure with Zijin Mining, Ms. Huang contributed to the exploration and development of international business opportunities.

Prior to joining Zijin Mining, Ms. Huang accumulated nearly ten years of professional experience in investment management. From January 2006 to August 2008, she served in the investment advisory team at ROI Group in New York. She then joined Waitex International (New York) as Assistant to Chairman and financial associate from 2008 to 2010. From May 2010 to June 2013, she served as Vice President of ICAN Capital in Beijing. From May 2014 to June 2015, she served as Investment General Manager at Qingdao Furi Group.

Ms. Huang obtained a bachelor's of arts degree from Iowa Wesleyan College in the United States in August 2006, a master's degree in Financial Management from Pace University in the United States in May 2009, and a Master of Business Administration from the Massachusetts Institute of Technology in the United States in May 2024.

Huang Yuanguang (黃遠光)

Mr. Huang Yuanguang, aged 44, is the Vice President of our Group. Mr. Huang joined Zijin Mining in June 2016, where he initially served as the human resources director. In February 2023, he transitioned to Norton Gold Fields as its chief executive officer, before returning to Zijin Mining in July 2024 to resume his role as human resources director. He also has been serving the chairman of the board's risk control and supervision committee of Norton Gold Fields ever since. Upon completion of the [REDACTED], Mr. Huang will focus on his roles and responsibilities as the vice president of our Group and will no longer have any roles and responsibilities in the Zijin Mining Group. During his tenure with Zijin Mining, he has been involved in managing the operations of Norton Gold Fields, contributing to its growth and development. He was also a member of the management committee of Zijinshan gold copper mine.

Mr. Huang began his career in July 2002 and has held strategic and senior positions at various organizations prior to joining Zijin Mining, including serving as the Human Resources Director at Nine Dragons Paper Holdings Limited from September 2013 to September 2015.

Mr. Huang graduated with a bachelor's degree in Economics from Guangdong Ocean University in the PRC in June 2002 and obtained a master's degree in Business Administration from Lanzhou University in the PRC in June 2008.

Liao Jiansheng (廖建生)

Mr. Liao Jiansheng, aged 57, is the Vice President of our Group.

Mr. Liao joined Zijin Mining in August 2009 and has since held several key positions, including executive deputy general manager and executive general manager of the Overseas Operations Department of Zijin Mining and head of Representative Office of Zijin Mining in Belgrade. With extensive experience in foreign affairs and international trade, and fluency in both Russian and English, Mr. Liao has played a vital role in strengthening the company's global development and international engagement.

Upon completion of the [REDACTED], Mr. Liao will focus on his roles and responsibilities as the vice president of our Group and will no longer have any roles and responsibilities in the Zijin Mining Group. During his tenure with Zijin Mining, he was deeply involved in key managerial role in the key projects comprising the Group, including his position as the deputy general manager in JV Zeravshan LLC.

Mr. Liao began his career in August 1989 and has held positions in various government institutions and agencies. These include the Ministry of Foreign Affairs, the Fujian Provincial Foreign Economic and Trade Cadres' Training Center, the Fujian Provincial Foreign Economic and Trade Talent Exchange Service Center, and China (Fujian) Foreign Trade Center (Holdings) Limited.

Mr. Liao graduated with a bachelor's degree in Russian from Fujian Normal University in July 1989.

Lin Wei (林煒)

Mr. Lin Wei, aged 43, is the Vice President of the Group. Mr. Lin joined Zijin Mining in January 2008 and was appointed chief executive officer of Norton Gold Fields in July 2024. Following the completion of the [REDACTED], Mr. Lin will focus on his role and responsibilities as Vice President of the Group and will no longer hold any position or perform any duties within Zijin Mining Group. Mr. Lin began his career at the Zijinshan Gold-Copper Mine, where he worked for seven years across various departments including processing, mining, and functional roles, progressing from entry-level positions to department manager. In 2015, he was seconded to Norton Gold Fields in Australia, where he successively served as project manager, and general manager of projects. In March 2024, he was appointed chief operating officer of Norton Gold Fields.

Mr. Lin obtained a Bachelor's degree in Mineral Processing Engineering from China University of Mining and Technology (Beijing) in the PRC in July 2005, and a Master's degree in Non-ferrous Metallurgy from the University of Science and Technology Beijing in the PRC in January 2008. In April 2022, he earned a Master of Philosophy in Mining and Metallurgical Engineering from Curtin University in Australia. In 2024, he was certified as a Quarry Manager and Site Senior Executive by the WorkSafe Commissioner of the Department of Mines, Industry Regulation and Safety (DMIRS), Western Australia.

Wang Qianjie (王乾杰)

Mr. Wang Qianjie, aged 43, is the Vice President of our Group.

Mr. Wang commenced his professional journey in February 2007. His career has spanned various esteemed positions, including roles at Southeast Geological and Mineral Exploration Branch Company, where he advanced from a project manager to deputy general manager, and at Zijin Mining, where he served as director of the international geological exploration division and deputy general manager of the international division. He has also worked at Barrick (Niugini) Limited as a senior geologist.

In July 2024, Mr. Wang assumed his current role at Rosebel GM. His expertise and leadership have been recognized through various accolades, including a Group Second-Class Merit and a Ministerial Science and Technology Award for his contributions to geological exploration and mineral discovery in China's central and eastern regions.

Mr. Wang holds a bachelor's degree in Geochemistry from Peking University in the PRC, obtained in June 2004, and a master's degree in Mineralogy, Petrology, and Ore Deposit Studies from the same institution, completed in January 2007.

Save as disclosed above, each of our Directors and senior management members confirms with respect to himself or herself that (1) he or she had no other relationship with any Director, senior management or substantial Shareholder of our Company as at the Latest Practicable Date; (2) he or she did not hold any other directorships in the three years prior to the Latest Practicable Date in any public companies of which the securities are listed on any stock exchange in Hong Kong and/or overseas; and (3) there are no other matters concerning our Directors' appointment that need to be brought to the attention of our Shareholders and the Stock Exchange or shall be disclosed pursuant to Rule 13.51(2)(h) to (v) of the Listing Rules.

JOINT COMPANY SECRETARIES

Ms. Huang Xiaohong was appointed as a joint company secretary of our Company with effect from June 17, 2025. For details of her biography, please refer to "— Senior Management" in this section.

Mr. Ho Kin Wai was appointed as a joint company secretary of our Company with effect from June 17, 2025.

Mr. Ho obtained a bachelor's degree in business administration from the Hong Kong University of Science and Technology. He is a fellow of the Hong Kong Institute of Certified Public Accountants, a member of the Hong Kong Chartered Governance Institute and the Chartered Governance Institute, and holds the qualifications of Chartered Secretary, Chartered Governance Professional and Certified Public Accountant of Hong Kong. He joined Zijin Mining in July 2013, and served as the assistant company secretarial manager, company secretarial manager and senior company secretarial manager of Gold Mountains (H.K.). Mr. Ho is also a joint company secretary of Zijin Mining.

BOARD COMMITTEES

Our Board has established the Audit Committee, the Remuneration Committee and the Nomination Committee and delegated various responsibilities to these committees, which assist our Board in discharging its duties and overseeing particular aspects of our Group's activities.

Audit Committee

We have established an Audit Committee in compliance with Rule 3.21 of the Listing Rules and the Corporate Governance Code set out in Appendix C1 to the Listing Rules with written terms of reference. The primary duties of the Audit Committee are to (i) review and supervise our financial reporting process and internal control system, risk management and internal audit of our Group; (ii) provide advice and comments to our Board in respect of financial risk, risk management and internal control matters; and (iii) perform other duties and responsibilities as may be assigned by the Board.

The Audit Committee comprises three independent non-executive Directors, namely, Ms. Hui Lai Kwan, Mr. Xie Shaobo and Mr. Chan Hon, Ms. Hui Lai Kwan is the chairperson of the Audit Committee. Ms. Hui holds the appropriate professional qualifications as required under Rules 3.10(2) and 3.21 of the Listing Rules.

Remuneration Committee

We have established a Remuneration Committee in compliance with Rule 3.25 of the Listing Rules and the Corporate Governance Code set out in Appendix C1 to the Listing Rules with written terms of reference. The primary duties of the Remuneration Committee include, but are not limited to, the following: (i) making recommendations to our Board on our policy and structure for all remuneration of Directors and senior management and on the establishment of a formal and transparent procedure for developing policy on such remuneration; and (ii) reviewing and approving matters relating to share schemes of our Company.

The Remuneration Committee comprises one non-executive Director and two independent non-executive Directors, namely, Mr. Xie Shaobo, Mr. Chan Hon and Mr. Lin Hongfu. Mr. Xie Shaobo is the chairperson of the Remuneration Committee.

Nomination Committee

We have established a Nomination Committee in compliance with Rule 3.27A of the Listing Rules and the Corporate Governance Code set out in Appendix C1 to the Listing Rules with written terms of reference. The primary duties of the Nomination Committee include, but are not limited to, (i) reviewing the structure, size and composition of our Board on a regular basis and make recommendations to the Board regarding any proposed changes to the composition of our Board; (ii) identifying, selecting or making recommendations to our Board on the selection of individuals nominated for directorship, and ensuring the diversity of our Board members; (iii) performing review on the contributions made by our Directors (including our independent non-executive Directors) and the sufficiency of time devoted to perform their duties; (iv) assessing the independence of our independent non-executive Directors; and (v) making recommendations to our Board on relevant matters relating to the appointment, re-appointment and removal of our Directors.

The Nomination Committee comprises one non-executive Director and two independent non-executive Directors, namely, Mr. Lin Hongfu, Ms. Hui Lai Kwan and Mr. Xie Shaobo. Mr. Lin Hongfu is the chairperson of the Nomination Committee.

REMUNERATION OF DIRECTORS AND SENIOR MANAGEMENT

Our Directors and members of our senior management receive compensation from our Group in the form of salaries, bonuses and other benefits in kind such as contributions to a retirement benefit scheme.

The aggregate remuneration (including fees, salaries, contributions to a retirement benefit scheme, discretionary bonuses and other allowances and other benefits in kind) paid to our Directors for the years ended December 31, 2022, 2023 and 2024 was US$276,000, US$268,000 and US$263,000, respectively. Save as disclosed in Note 11 to the Accountants' Report in Appendix I to this Document, no other amounts have been paid or are payable by any member of our Group to our Directors during the Track Record Period.

The aggregate amount of wages, salaries and bonuses, pension costs and other allowances and other benefits in kind paid to our five highest paid individuals in respect of each of the three years ended December 31, 2022, 2023 and 2024 was US$2.5 million, US$2.4 million and US$2.6 million, respectively.

No remuneration was paid by us to our Directors or the five highest paid individuals as an inducement to join or upon joining us or as a compensation for loss of office during the Track Record Period. Further, none of our Directors had waived or agreed to waive any remuneration during the Track Record Period.

Under the existing arrangements that are currently in force as of the date of this Document, the aggregate remuneration (including fees, salaries, contributions to pension schemes and other allowances and other benefits in kind but excluding discretionary bonuses) payable to our Directors for the year ending December 31, 2025 is estimated to be around US$1.8 million in aggregate.

Our Board will review and determine the remuneration and compensation packages of our Directors and senior management and will, following the [REDACTED], receive recommendation from the Remuneration Committee which will take into account salaries paid by comparable companies, time commitment and responsibilities of our Directors and performance of our Group.

CORPORATE GOVERNANCE

Our Company recognizes the importance of incorporating elements of good corporate governance in the management structures and internal control procedures of our Group so as to achieve effective accountability.

Our Company has adopted the code provisions stated in the Corporate Governance Code. Our Company is committed to the view that the Board should include a balanced composition of executive Directors, non-executive Directors and independent non-executive Directors so that there is a strong independent element on the Board, which can effectively exercise independent judgment.

BOARD DIVERSITY POLICY

Our Board has adopted a board diversity policy which sets out the approach to achieve diversity on our Board. Our Company recognizes and embraces the benefits of having a diverse Board and sees increasing diversity at the Board level as an essential element in supporting the attainment of our Company's strategic objectives and sustainable development. Our Company seeks to achieve Board diversity through the consideration of a number of factors, including but not limited to talent, skills, gender, age, cultural and educational background, ethnicity, professional experience, independence, knowledge and length of service. We will select potential Board candidates based on merit and their potential contribution to our Board while taking into consideration our own business model and specific needs from time to time. All Board appointments will be based on meritocracy and candidates will be considered against objective criteria, having due regard to the benefits of diversity on our Board.

Our Board has a balanced mix of knowledge, skills and experience. They completed studies in various majors including but without limitation to non-ferrous metallurgy, accounting, mineral processing, steelmaking, applied chemistry and construction engineering. We have three independent non-executive Directors who have different industry backgrounds. Furthermore, our Directors are of a wide range of age, from 43 to 66 years old. Taking into account our business model and specific needs as well as the presence of one female Director out of a total of nine Board members, we consider that the composition of our Board satisfies our board diversity policy.

We will implement policies to ensure gender diversity when recruiting staff to develop a pipeline of female senior management and potential successors to the Board. We will strive to enhance our female representation and achieve appropriate balance of gender diversity with reference to the stakeholders' expectation and international and local recommended best practices. Furthermore, we will implement comprehensive programs aimed at identifying and training our female staff who display leadership and potential, with the goal of promoting them to the senior management or the Board.

Our Nomination Committee is responsible for ensuring the diversity of our Board members. After [REDACTED], our Nomination Committee will review our board diversity policy and its implementation annually to monitor its continued effectiveness and we will disclose the implementation of our board diversity policy, including any measurable objectives set for implementing the board diversity policy and the progress on achieving these objectives, in our corporate governance report on an annual basis.

COMPLIANCE ADVISOR

We have appointed Somerley Capital Limited as our compliance advisor pursuant to Rule 3A.19 of the Listing Rules. Pursuant to Rule 3A.23 of the Listing Rules, our compliance advisor will advise us in the following circumstances:

- before the publication of any regulatory announcement, circular or financial report;
- when a transaction, which might be a notifiable or connected transaction, is contemplated, including share issues and share repurchases;
- where we propose to use the [REDACTED] from the [REDACTED] in a manner different from that detailed in this Document or where our business activities, developments or results deviate from any forecast, estimate, or other information in this Document; and
- where the Stock Exchange makes an inquiry of us regarding unusual movements in the price or trading volume of our Shares.

Pursuant to Rule 3A.24 of the Listing Rules, the Compliance Advisor will, on a timely basis, inform our Company of any amendment or supplement to the Hong Kong Listing Rules that are announced by the Hong Kong Stock Exchange. The Compliance Advisor will also inform our Company of any new or amended law, regulation or code in Hong Kong applicable to us, and advise us on the continuing requirements under the Hong Kong Listing Rules and applicable laws and regulations.

The term of the appointment shall commence on the [REDACTED] and end on the date on which we distribute our annual report in respect of our financial results for the first full financial year commencing after the [REDACTED] and such appointment may be subject to extension by mutual agreement.

CONFIRMATION FROM OUR DIRECTORS

Rule 3.09D of the Listing Rules

Each of our Directors confirms that he or she (1) has obtained the legal advice referred to under Rule 3.09D of the Listing Rules in June 2025; and (2) understands his or her obligations as a director of a listed issuer under the Listing Rules.

Rule 3.13 of the Listing Rules

Each of the independent non-executive Directors confirms (1) his/her independence as regards each of the factors referred to in Rule 3.13(1) to (8) of the Listing Rules; (2) that he/she has no past or present financial or other interest in the business of our Company or our subsidiaries or any connection with any core connected person of our Company under the Listing Rules as of the Latest Practicable Date; and (3) that there are no other factors that may affect his/her independence at the time of his/her appointment.

SUBSTANTIAL SHAREHOLDERS

So far as our Directors are aware, immediately prior to and following the completion of the [REDACTED], the following persons will have an interest or a short position in the Shares or the underlying Shares of our Company which will be required to be disclosed to our Company and the Stock Exchange pursuant to the provisions of Division 2 and 3 of Part XV of the SFO:

Name of Shareholder	Nature of interest	Shares held immediately prior to the completion of the [REDACTED]		Shares held immediately after the [REDACTED] (assuming that the [REDACTED] is not exercised)		Shares held immediately after the [REDACTED] (assuming that the [REDACTED] is exercised in full)	
		Number	*Percentage*	*Number*	*Percentage*	*Number*	*Percentage*
Gold Mountains (H.K.)	Beneficial owner	1,729,000,000	76%	1,729,000,000	[REDACTED]	1,729,000,000	[REDACTED]
Zijin Northwest	Beneficial owner	546,000,000	24%	546,000,000	[REDACTED]	546,000,000	[REDACTED]
Zijin Mining	Interest in controlled corporation[(1)]	2,275,000,000	100%	2,275,000,000	[REDACTED]	2,275,000,000	[REDACTED]

Notes:

(1) Zijin Mining held the entire equity interests in Gold Mountains (H.K.) and Zijin Northwest. For the purpose of the SFO, Zijin Mining is deemed to be interested in the Shares beneficially owned by Gold Mountains (H.K.) and Zijin Northwest.

Save as disclosed above, our Directors are not aware of any person who will, immediately following the completion of the [REDACTED], have an interest or a short position in the Shares or underlying Shares which will be required to be disclosed to our Company and the Stock Exchange under the provisions of Division 2 and 3 of Part XV of the SFO or will be, directly or indirectly, interested in 10% or more of the nominal value of any class of share capital carrying rights to vote in all circumstances at general meetings of our Company or any of our subsidiaries. Our Directors are not aware of any arrangement which may at a subsequent date result in a change of control in our Company.

ISSUED SHARE CAPITAL

The following is a description of the share capital of our Company in issue as of the Latest Practicable Date and to be issued as fully paid or credited as fully paid immediately following the [REDACTED].

Assuming the [REDACTED] is not exercised, our Company's issued share capital immediately after completion of the [REDACTED] will be as follows:

Shares in issue as at the date of this Document	2,275,000,000 Shares
Shares to be issued pursuant to the [REDACTED]. . . .	[REDACTED]
Total issued Shares upon completion of the [REDACTED]	**[REDACTED]**

Assuming the [REDACTED] is exercised in full, our Company's issued share capital immediately after completion of the [REDACTED] will be as follows:

Shares in issue as at the date of this Document	2,275,000,000 Shares
Shares to be issued pursuant to the [REDACTED]. . . .	[REDACTED]
Total issued Shares upon completion of the [REDACTED] and the [REDACTED]	**[REDACTED]**

ASSUMPTIONS

The above table assumes that the [REDACTED] becomes unconditional and is completed in accordance with the relevant terms and conditions and that the Shares are issued pursuant to the [REDACTED]. The above does not take into account any Shares which may be issued or repurchased by our Company pursuant to the general mandates granted to our Directors to issue or repurchase Shares as described below.

RANKING

The [REDACTED] are ordinary shares in the share capital of our Company and will rank equally and carry the same rights in all respects with all Shares currently in issue or to be issued as mentioned in this Document and, in particular, will rank in full for all dividends or other distributions declared, made or paid on the Shares in respect of a record date which falls after the date of this Document.

GENERAL MANDATE TO ISSUE SHARES

Subject to the [REDACTED] becoming unconditional, our Directors have been granted a general mandate to allot, issue and deal with Shares or securities convertible into Shares and to make or grant share sale plans, offers, agreements or options which would or might require the exercise of such powers to allot, issue and deal with the Shares, with an aggregate number of Shares allotted or agreed to be allotted, otherwise than by way of rights issue or pursuant to the exercise of any options which may be granted under any share option scheme or by virtue of scrip dividend schemes or similar arrangements in accordance with our Articles, not more than the sum of:

(i) 20% of the aggregate number of Shares in issue immediately following completion of the [REDACTED] on the [REDACTED] (excluding Shares which may be allotted and issued pursuant to the exercise of the [REDACTED]); and

(ii) the aggregate number of Shares repurchased by our Company (if any) under the general mandate to repurchase Shares granted to our Directors referred to below.

This general mandate will expire at the earliest of:

(i) the conclusion of our Company's next annual general meeting; or

(ii) the expiration of the period within which the next annual general meeting of our Company is required by the Articles or any other applicable laws and regulations of Hong Kong to be held; or

(iii) when varied, revoked or renewed by an ordinary resolution of our Shareholders in a general meeting.

Please refer to "Appendix V — Statutory and General Information — 1. Further Information about our Group — (c) Written Resolutions of our Shareholders passed on [•]" for details of this general mandate.

GENERAL MANDATE TO REPURCHASE SHARES

Subject to the [REDACTED] becoming unconditional, our Directors have been granted a general mandate to exercise all the powers of our Company to repurchase Shares with a total number of Shares of not more than [10]% of the aggregate number of Shares immediately following completion of the [REDACTED] but excluding any Shares which may be issued pursuant to the exercise of the [REDACTED].

This mandate only relates to repurchases made on the Stock Exchange, or any other approved stock exchange(s) on which the Shares are listed (and which is recognized by the SFC and the Stock Exchange for this purpose), and which are made in accordance with all applicable laws and/or requirements of the Listing Rules. A summary of the relevant Listing Rules is set out in "Appendix V — Statutory and General Information — 1. Financial Information about our Group — (f) Repurchase by our Company of our own securities — (i) Provisions of the Listing Rules.".

This mandate will expire at the earliest of:

(i) the conclusion of our Company's next annual general meeting; or

(ii) the expiration of the period within which the next annual general meeting of our Company is required by the Articles or any other applicable laws and regulations of Hong Kong to be held; or

(iii) when varied, revoked or renewed by an ordinary resolution of our Shareholders in a general meeting.

Please refer to "Appendix V — Statutory and General Information — 1. Financial Information about our Group — (f) Repurchase by our Company of our own securities — (iii) General information relevant to the Repurchase Mandate." for details of this repurchase mandate.

CIRCUMSTANCES UNDER WHICH GENERAL MEETING AND CLASS MEETING ARE REQUIRED

Pursuant to the Companies Ordinance and the Articles of Association, our Company may from time to time by ordinary Shareholders' resolution (i) increase its capital; (ii) capitalize its profits; (iii) allot and issue bonus shares; (iv) convert its shares into a larger or smaller number; (v) dividing its shares into several classes; (vi) cancel any shares which have not been taken or that have been forfeited; and (vii) make provisions for the issue and allotment of shares. In addition, our Company may reduce its share capital by Shareholders' special resolution. For details, see "Appendix IV — Summary of Articles of Association — Alteration of Capital".

Further, subject to the provisions of the Companies Ordinance, all or any of the special rights (unless otherwise provided by the terms of issue) attached to any class of shares may be varied or abrogated either with the consent in writing of the holders of not less than 75% of the total voting rights of the holders of the shares of that class, or with the sanction of a special resolution passed at a general meeting of the holders of the shares of that class. For details, see "Appendix IV — Summary of Articles of Association — Variation of Rights".

OVERVIEW

We are a global leading gold mining company formed by integrating all of the gold mines of Zijin Mining located outside of China. Leveraging Zijin Mining's competitive advantage in the management of exploration, development and operation of low-grade and refractory resources, we have emerged as a global leading and market-oriented gold mining company principally engaged in exploration, mining, processing, refining and sale of gold. We integrate high-potential gold mine resources through global mergers and acquisitions, and by leverageing our industry-leading and in-house geological exploration, R&D, engineering, construction, and mine operation capabilities, along with advanced international ESG systems. This enables us to achieve continuous reserve expansion, production growth and efficient operations.

During the Track Record Period, our revenue was US$1,818.0 million, US$2,262.4 million and US$2,989.9 million, respectively, with a CAGR of 28.2%. Our profit attributable to owners of the parent was US$183.7 million, US$230.4 million and US$481.4 million, respectively, with a CAGR of 61.9%.

MAJOR FACTORS AFFECTING OUR RESULTS OF OPERATIONS

We believe that the most significant factors affecting our results of operations include the following key factors:

Gold Prices and Demand in End Markets

During the Track Record Period, we derived a substantial portion of our revenue from the sales of gold. Our revenue derived from the sales of gold was 94.8%, 95.8% and 94.0% in 2022, 2023 and 2024, respectively. Fluctuations in gold price directly affect our results of operations.

The market price of gold is largely subject to market forces, in particular, the supply and demand for gold products. We generally sell gold to the end customers including international gold refineries, precious metal traders or financial institutions, the price of which is referenced to the market prices. The gold price is affected by numerous factors beyond our control, for example, the global economic cycles, fluctuations in the global currency markets, general supply of and demand for gold, gold sales and purchases by central banks, macroeconomic factors such as GDP growth prospects, inflation and interest rates of major economies, geopolitical conflicts, and speculative trading activities.

Historically, the gold price has experienced significant volatility. This is primarily because gold is often seen as a safe-haven asset during times of geopolitical uncertainty. Since November 2022, the gold price has climbed due to market turbulence, rising recession expectations, slower interest rate hike prospects, and more gold purchases from central banks which underpinned the gold demand. The global annual average gold price in the global market increased from US$1,801.3 per ounce in 2022 to US$1,942.1 per ounce in 2023, and further to US$2,386.4 per ounce in 2024, according to London Bullion Market Association (LBMA) Gold Price. Any significant decrease in the gold price may materially and adversely affect our business, financial condition and results of operations.

Production Volume

Our results of operations are dependent on our production volume of gold. The following table sets forth our production volume in relation to our gold mining business for the periods indicated:

	Year Ended December 31,								
	2022			2023			2024		
	Ore Processed(1)	Gold Production(1)		Ore Processed(1)	Gold Production(1)		Ore Processed(1)	Gold Production(1)	
	(kt)	(koz)	(t)	(kt)	(koz)	(t)	(kt)	(koz)	(t)
Tajikistan Jilau/Taror Gold Mines	5,167	203	6.3	5,555	202	6.3	5,971	174	5.4
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	1,014	131	4.1	1,060	129	4.0	990	120	3.7
Australia Norton Gold Mine	3,658	177	5.5	6,642	216	6.7	8,065	266	8.3
Guyana Aurora Gold Mine	2,489	91	2.8	2,660	95	3.0	2,712	130	4.1
Colombia Buriticá Gold Mine	1,332	248	7.7	1,454	268	8.3	1,461	322	10.0
Suriname Rosebel Gold Mine	—	—	—	7,817	241	7.5	9,321	240	7.5
Total consolidated(2)	**13,661**	**849**	**26.4**	**25,188**	**1,151**	**35.8**	**28,521**	**1,252**	**38.9**
Total attributable(3)	**11,289**	**658**	**20.5**	**22,253**	**943**	**29.3**	**25,411**	**1,039**	**32.3**

Notes:

(1) Figures are subject to rounding. Accordingly, figures shown as totals in the table may not be an arithmetic aggregation of the figures preceding them, and figures of tonnes/koz may not be an arithmetic conversion based on the rounding figures as shown in the table.

(2) The "Total consolidated" information is calculated based on 100% of equity interest for each asset held by the Company.

(3) The "Total attributable" information is calculated based on the percentage of equity interest for each asset held by the Company.

Our production volume is influenced by several factors, including the capacity and efficiency of our processing operations. The actual production volume may differ from our production plan, potentially causing our actual results of operations to deviate from our projected outcomes. This variation can be attributed to a range of reasons, such as discrepancies in the grade, tonnage, metallurgical, and other characteristics of the actual gold ores mined compared to estimates. Additionally, decreases in gold price may change the way we operate the mine, leading to lower production volume. Furthermore, natural phenomena, including weather conditions, floods, droughts, and rock falls, many of which are beyond our control, can also impact our production volume. Our sales volume is generally correlated with our production volume during the Track Record Period.

Cost of Sales and Recovery Rate

Our cost of sales primarily comprises raw material costs, depreciation and amortization, labor cost, royalty expenses, energy consumption costs and others. The cost of raw materials primarily consists of costs for grinding materials and other materials used in our operations. Depreciation and amortization costs are associated with the depreciation of fixed assets and the amortization of intangible assets. Labor cost refers to the salaries and benefits paid to personnel involved in our production activities. Certain major components of our operating cash costs, such as mining and processing-related expenses, are directly linked to our mining and sales volume. Consequently, increases in our mining, production and sales volume will lead to higher costs in these areas. Additionally, increased capital expenditures will raise our depreciation and amortization costs, which, in turn, will increase our cost of sales. Raw material costs constitute the largest component of our cost of sales, which represented 36.6%, 42.7% and 39.8% of our total cost of sales for the years ended December 31, 2022, 2023 and 2024, respectively. The increases of raw material costs in 2023 and 2024 were mainly due to the increase in our sales volume.

Our mining efficiency is also measured by the recovery rate, in particular, the gold processing recovery rate in our mines. Our processing recovery rate is affected by both the grade and mineralization characteristic of the ores and the specific processing techniques employed. A lower recovery rate would result in increased cost of sales per unit. For information regarding the recovery rates of our mines, please see the description of each of our mines in "Business." We have made constant efforts to improve the gold processing recovery rate in our mines.

Strategic Acquisitions and Investments

Our overall growth is driven by both organic expansion and strategic acquisitions and investments. We believe that successfully executing acquisition strategies and integrating acquired operations are major drivers of business and operational success. We may also incur costs from acquisitions of gold assets to ensure robust and sustainable growth. During the Track Record Period, we acquired 95% equity of the Suriname Rosebel Gold Mine in February 2023, with a total consideration of US$371.5 million. After the acquisition, during the same year, the Suriname Rosebel Gold Mine contributed US$468.8 million to our revenue and US$93.7 million to our profit. In April 2025, we acquired the Ghana Akyem Gold Mine, which will be included in our consolidated financial statements for the year ending December 31, 2025. Looking ahead, we will continue to explore strategic acquisitions and investments. Our capacity to identify quality acquisition and investment targets, negotiate favorable terms, and effectively integrate and optimize acquired operations will continue to influence our business, financial condition, and operational outcomes.

Furthermore, strategic acquisitions and investments present various risks, such as operational integration challenges, difficulties in assimilating cultures and personnel, diversion of management focus, risks associated with entering new markets, and potential loss of key personnel from acquired businesses. These factors could have a significant adverse impact on our business, financial standing, and operational outcomes.

Expansion and Capital Expenditures

The gold mining industry is capital-intensive, requiring substantial upfront investment in equipment, land, and compliance with stringent safety and environmental regulations. This high barrier to entry means that only entities with significant financial resources can engage in large-scale gold mining operations. To expand production of our mining assets, we continue to invest in construction and processing equipment to renovate and improve our mining facilities. We invest in advanced technology to enhance operational efficiency, safety, and environmental sustainability — for example, addressing the challenges posed by declining gold grades and the necessity to mine at greater depths and utilizing technologies that allow for enhanced monitoring and control to ensure safety and reduction of emission. We believe by focusing on capital expenditures, we can increase our production volume, thereby maximizing the potential of our existing mines while maintaining a commitment to sustainability and efficiency.

During the Track Record Period, our capital expenditure primarily included (i) purchase of items of property, plant and equipment; and (ii) purchase of intangible assets. The total cash outflow of purchase of property, plant and equipment and intangible assets amounted to US$518.4 million, US$436.9 million and US$487.0 million for the years ended December 31, 2022, 2023 and 2024, respectively, representing 28.5%, 19.3% and 16.3% of our revenue, respectively, for the same periods. The costs associated with our capital expenditure plans could significantly impact our financial condition and operational results, especially if we are unable to deliver expansion projects on time and within budget, or fail to generate sufficient gold production and sales to recover our investment or achieve profitability. Therefore, management must consistently evaluate the necessary capital investments to meet our sustainable production objectives and drive revenue growth, when balancing competing cash needs and the impact of increased depreciation expenses on cost of sales.

Government Policies Relating to Gold Mining Industry

Government policies play a significant role in shaping the gold mining industry, and can impact various aspects of mining operations, from exploration and extraction to environmental management and economic contributions. The local, provincial, and central authorities of Tajikistan, Kyrgyzstan, Australia, Guyana, Colombia, Suriname, Ghana and Papua New Guinea each exercise a substantial degree of control over the gold and mining industry within their respective territories. Our operations in these countries are subject to a range of national laws, regulations, policies, standards, and requirements, particularly concerning exploration, mining, production, taxation, labor standards, occupational health and safety, waste treatment, environmental protection, and operational management. In each of these jurisdictions, the respective governments hold full authority to grant, renew, and terminate the permits and licenses for exploration, mining, and production activities. While we anticipate being able to renew our licenses and permits in each of the markets we operate, any inability to do so for any reason could materially and adversely affect our business and results of operations.

SENSITIVITY ANALYSIS

Our results of operations are principally affected by gold price and sales volume. The following table sets out a sensitivity analysis of gold price, reflecting the impact that a hypothetical fluctuation of gold price, with all other variables remain constant, would have on our gross profit and profit for the year. The hypothetical analysis presented below are not necessarily indicative of the results that may be expected for any future period.

	For the year ended December 31, 2022 (US$ in millions, except for percentages)									
Hypothetical fluctuation of gold price	**(30%)**	**(20%)**	**(15%)**	**(10%)**	**(5%)**	**5%**	**10%**	**15%**	**20%**	**30%**
Change in gross profit	(480)	(320)	(240)	(160)	(80)	80	160	240	320	480
Percentage change in gross profit	(78%)	(52%)	(39%)	(26%)	(13%)	13%	26%	39%	52%	78%
Change in profit for the year	(366)	(244)	(183)	(122)	(61)	61	122	183	244	366
Percentage change in profit for the year	(125%)	(83%)	(63%)	(42%)	(21%)	21%	42%	63%	83%	125%

	For the year ended December 31, 2023 (US$ in millions, except for percentages)									
Hypothetical fluctuation of gold price	(30%)	(20%)	(15%)	(10%)	(5%)	5%	10%	15%	20%	30%
Change in gross profit	(600)	(400)	(300)	(200)	(100)	100	200	300	400	600
Percentage change in gross profit	(102%)	(68%)	(51%)	(34%)	(17%)	17%	34%	51%	68%	102%
Change in profit for the year	(438)	(292)	(219)	(146)	(73)	73	146	219	292	438
Percentage change in profit for the year	(139%)	(93%)	(70%)	(46%)	(23%)	23%	46%	70%	93%	139%

	For the year ended December 31, 2024 (US$ in millions, except for percentages)									
Hypothetical fluctuation of gold price	(30%)	(20%)	(15%)	(10%)	(5%)	5%	10%	15%	20%	30%
Change in gross profit	(786)	(524)	(393)	(262)	(131)	131	262	393	524	786
Percentage change in gross profit	(69%)	(46%)	(35%)	(23%)	(12%)	12%	23%	35%	46%	69%
Change in profit for the year	(564)	(376)	(282)	(188)	(94)	94	188	282	376	564
Percentage change in profit for the year	(89%)	(60%)	(45%)	(30%)	(15%)	15%	30%	45%	60%	89%

BASIS OF PREPARATION

The historical financial information has been prepared in accordance with IFRS Accounting Standards (which include all International Financial Reporting Standards), which comprise all standards and interpretations approved by the International Accounting Standards Board (the "**IASB**").

Our Directors believe that we have adequate resources to continue operations and meet our abilities as at when they fall due for the foreseeable future of not less than 12 months from the end of the reporting period, by taking into account: (a) our expected cash inflows from operating activities; and (b) the bank facilities obtained subsequent to the reporting date. Therefore, our Directors are of the opinion that it is appropriate to prepare the historical financial information on a going concern basis.

The historical financial information has been prepared under the historical cost convention except for equity investments designated at fair value through other comprehensive income and certain financial instruments which have been measured at fair value at the end of each of the Track Record Periods.

MATERIAL ACCOUNTING POLICIES, SIGNIFICANT ACCOUNTING JUDGMENTS AND ESTIMATES

Some of our accounting policies require us to apply estimates and assumptions and complex judgments relating to accounting items. The estimates and assumptions we use and the judgments we make in applying our accounting policies have a significant impact on our financial position and operating results. Our management continually evaluates such estimates, assumptions and judgments based on past experience and other factors, including industry practices and expectations of future events that are believed to be reasonable under the circumstances. There has not been any material deviation between our management's estimates or assumptions and actual results, and we have not made any material changes to these estimates or assumptions during the Track Record Period. We do not expect any material changes in these estimates and assumptions in the foreseeable future.

When reviewing our combined financial statements, you should consider, amongst other things: (i) information about our material accounting policy; (ii) the judgments and other uncertainties affecting the application of such policies; and (iii) the sensitivity of reported results to changes in conditions and assumptions. Information about our material accounting policy, estimates and judgments, which are important for an understanding of our financial condition and results of operations, including any changes in accounting policy and disclosures, are set out in detail in notes 4 and 5 to the Accountants' Report in Appendix I to this Document.

Revenue Recognition

Revenue from Contracts with Customers

Revenue from contracts with customers is recognized when control of goods or services is transferred to the customers at an amount that reflects the consideration to which we expect to be entitled in exchange for those goods or services.

When the consideration in a contract includes a variable amount, the amount of consideration is estimated to which we will be entitled in exchange for transferring the goods or services to the customer. The variable consideration is estimated at contract inception and constrained until it is highly probable that a significant revenue reversal in the amount of cumulative revenue recognized will not occur when the associated uncertainty with the variable consideration is subsequently resolved.

When the contract contains a financing component which provides the customer with a significant benefit of financing the transfer of goods or services to the customer for more than one year, revenue is measured at the present value of the amount receivable, discounted using the discount rate that would be reflected in a separate financing transaction between we and the customer at contract inception. When the contract contains a financing component which provides us with a significant financial benefit for more than one year, revenue recognized under the contract includes the interest expense accreted on the contract liability under the effective interest method. For a contract where the period between the payment by the customer and the transfer of the promised goods or services is one year or less, the transaction price is not adjusted for the effects of a significant financing component, using the practical expedient in IFRS 15.

Sale of Mineral Products

Revenue from the sale of products is recognized at the point in time when control of the asset is transferred to the customer, generally on delivery of the products.

Metal Streaming Arrangement

There was a metal streaming arrangement in Continental Gold Inc, a company which was acquired by Zijin Mining in 2020. In that arrangement, Continental Gold received an upfront amount in cash from an investor and in return, the investor received the right to purchase a certain proportion of future gold and silver production for the life of the mine at a price of a certain proportion of the market price at the time of delivery.

This upfront amount is considered to be a partial prepayment for the future delivery of an unknown, but estimable, amount of gold and silver ounces, with each ounce presenting a separate performance obligation. Upon receipt, the upfront amount is recognized as a contract liability. The upfront consideration is considered to represent variable consideration, on the basis that the portion of the upfront amount to be allocated to each future ounce will depend on the number of ounces estimated to remain in the mine. Revenue is recognized at the point in time when control of the goods is transferred. In addition, the transaction price is considered to contain a significant financing component, given the long-term nature of the upfront payment and the period of time between the receipt of the upfront cash, and the satisfaction of the future performance obligations. Given this, when the underlying production profile of the mine changes and the reserves and resources are updated, the variable portion of the transaction price allocated to each ounce will need to be updated in accordance with the requirements in IFRS 15 relating to changes in variable transaction price. The change in transaction price per unit will therefore result in a retrospective adjustment to revenue in the period in which the change occurs, reflecting the updated number of ounces expected to be delivered under the streaming arrangement. There will also be a corresponding adjustment to the interest charge.

Revenue from Other Sources

Rental income is recognized on a time proportion basis over the lease terms. Variable lease payments that do not depend on an index or a rate are recognized as income in the accounting period in which they are incurred.

Property, Plant and Equipment and Depreciation

Property, plant and equipment, other than construction in progress, are stated at cost less accumulated depreciation and any impairment losses. The cost of an item of property, plant and equipment comprises its purchase price and any directly attributable costs of bringing the asset to its working condition and location for its intended use.

Expenditure incurred after items of property, plant and equipment have been put into operation, such as repairs and maintenance, is normally charged to the statement of profit or loss in the period in which it is incurred. In situations where the recognition criteria are satisfied, the expenditure for a major inspection is capitalized in the carrying amount of the asset as a replacement. Where significant parts of property, plant and equipment are required to be replaced at intervals, we recognize such parts as individual assets with specific useful lives and depreciates them accordingly.

Depending on the nature of the item of property, plant and equipment, depreciation is calculated on the straight-line basis to write off the cost of each asset to its residual value over our estimated useful life or it is calculated on the Units of Production ("**UOP**") basis to write off the cost of the asset proportionately to the extraction of the proven and probable mineral reserves. The estimated useful lives and annual depreciation rates for the assets depreciated on the straight-line basis are as follows:

	Estimated useful lives	Annual depreciation rates
Buildings	8 to 20 years	5.00%–12.50%
Plant, machinery and equipment.	5 to 15 years	6.67% to 20.00%
Motor vehicles	4 to 15 years	6.67%–25.00%
Power generation and transmission equipment	8 to 30 years	3.33%–12.50%
Office equipment, electronic equipment and others	3 to 10 years	10.00%–33.33%
Mining properties	5 to 40 years	2.50%–20.00%

Where parts of an item of property, plant and equipment have different useful lives, the cost of that item is allocated on a reasonable basis among the parts and each part is depreciated separately. Residual values, useful lives and the depreciation method are reviewed, and adjusted if appropriate, at least at the end of each of the Track Record Periods.

An item of property, plant and equipment including any significant part initially recognized is derecognized upon disposal or when no future economic benefits are expected from its use or disposal. Any gain or loss on disposal or retirement recognized in the statement of profit or loss in the years the asset is derecognized is the difference between the net sales proceeds and the carrying amount of the relevant asset.

Construction in progress is stated at cost less any impairment losses, and is not depreciated. It is reclassified to the appropriate category of property, plant and equipment when completed and ready for use.

Intangible Assets

Intangible assets acquired separately are measured on initial recognition at cost. The cost of intangible assets acquired in a business combination is the fair value at the date of acquisition. The useful lives of intangible assets are assessed to be either finite or indefinite. Intangible assets with finite lives are subsequently amortized over the useful economic life and assessed for impairment whenever there is an indication that the intangible asset may be impaired. The amortization period and the amortization method for an intangible asset with a finite useful life are reviewed at least at each financial year end.

Exploration and evaluation assets

Exploration and evaluation assets are stated at cost less impairment losses. Exploration and evaluation assets includes costs of geological prospecting for technical consultancy and costs of feasibility study for commercial development which incurred in the surroundings, outer ring and deep areas of the existing or externally acquired mineral properties, and costs of drilling, trench sampling and other associated activities. Such expenditures may be capitalized when the mineral properties are reasonably determined to be commercially available and recognized as mining rights after obtaining mining rights or permits, which will be amortized under the units-of-production method. If any construction was abandoned in the development phase or belongs to the productive exploration, all costs shall be written off and recognized in profit or loss for the current period.

Impairment reviews of exploration and evaluation assets are undertaken if events or changes in circumstances indicate a potential impairment. The carrying value of exploration and evaluation assets is compared to the recoverable amount, which is the higher of value-in-use and the fair value less costs of disposal. For the purposes of assessing impairment, assets are grouped at the lowest levels for which there are separately identifiable cash-generating units. Exploration and evaluation assets that suffered impairment are reviewed for possible reversal of the impairment at each of the Relevant Periods.

Exploration and mining rights

Exploration rights are stated at cost less impairment losses. Exploration rights include the cost of acquiring exploration rights.

Mining rights are stated at cost less accumulated amortization and any impairment losses. Mining rights include the cost of acquiring mining licenses, exploration rights and exploration and evaluation assets upon determination that an exploration property is capable of commercial production, and the cost of acquiring interests in the mining reserves of existing mining properties. The mining rights are amortized in accordance with the production plans of the entities concerned and the proven and probable mineral reserves of the mines using the UOP method. Mining rights are written off to profit or loss if the mining property is abandoned.

Estimation Uncertainty

Exploration Expenditures

After determining the capitalization amount of exploration expenditures, we will regularly evaluate the exploration results. If the reviewed geological exploration report shows that there are no prospecting results or no economically recoverable reserves, or that the economic benefits of mining cannot be achieved and further exploration is unnecessary due to low grade and difficulties in mining and processing, the exploration and development costs previously collected will be expensed and included in the profit and loss for the current period in a lump sum.

Proved Mineral Reserves

Proved mineral reserves are estimated based on professional knowledge, experience and industry practice. Generally, the mineral reserve volume estimated based on probing and estimation may not be very accurate. The estimation is updated in accordance with new technologies and new information. Any changes in estimation will have impacts on the amounts of mining assets' depreciation and mining rights' amortization using the units-of-production method, on the stripping ratio which was used in the capitalization of stripping costs, and on each of the transaction prices of the metal streaming arrangement. This may result in changes of or impacts on our development and operation plan, and hence our operations and operating results.

Inventories

Inventories are stated at the lower of cost and net realizable value. Cost is determined on the weighted average basis and, in the case of work in progress and finished goods, comprises direct materials, direct labor and an appropriate proportion of overheads. Net realizable value is based on estimated selling prices less any estimated costs to be incurred to completion and disposal.

Provisions

A provision is recognized when a present obligation (legal or constructive) has arisen as a result of a past event and it is probable that a future outflow of resources will be required to settle the obligation, provided that a reliable estimate can be made of the amount of the obligation.

When the effect of discounting is material, the amount recognized for a provision is the present value at the end of each of the Track Record Periods of the future expenditures expected to be required to settle the obligation. The increase in the discounted present value amount arising from the passage of time is included in finance costs in the statement of profit or loss.

Provisions for our obligations for environmental rehabilitation and restoration of mines are based on estimates of required expenditure at the mines in accordance with the local rules and regulations where the mines are located. We estimate our liabilities for final reclamation and mine closure based upon detailed calculations of the amount and timing of the future cash expenditure for the required work. Spending estimates are escalated for inflation, then discounted at a discount rate that reflects current market assessments of the time value of money and the risks specific to the liability such that the amount of provision reflects the present value of the expenditures expected to be required to settle the obligation. We record a corresponding asset in the period in which the liability is incurred. The liability is accreted to the projected expenditure date. As changes in estimates occur (such as mine plan revisions, changes in estimated costs, or changes in the timing of the performance of reclamation activities), the revisions to the obligation and the asset are recognized at the appropriate discount rate.

Business Combinations

Business Combinations of Entities under Common Control

Business combinations of entities under common control are accounted for using the pooling of interests method. The results of subsidiaries are combined from the beginning of the Track Record Periods or the date on which a subsidiary first came under the common control of the controlling shareholders, whichever is later, and continue to be combined until the date that the Company's control ceases. The assets and liabilities of the combining entities are reflected at their existing carrying values at the date of combination. No amount is recognized in respect of goodwill or excess of the acquirer's interest in the net fair value of the acquiree's identifiable assets, liabilities and contingent liabilities over cost at the time of common control combination, which, instead, is recorded as part of equity.

Business Combinations (other than Business Combinations of Entities under Common Control) and Goodwill

Business combinations are accounted for using the acquisition method. The consideration transferred is measured at the acquisition date fair value which is the sum of the acquisition date fair values of assets transferred by us, liabilities assumed by us to the former owners of the acquiree and the equity interests issued by us in exchange for control of the acquiree. For each business combination, we elect whether to measure the non-controlling interests in the acquiree at fair value or at the proportionate share of the acquiree's identifiable net assets. All other components of non-controlling interests are measured at fair value. Acquisition-related costs are expensed as incurred.

We determine that we have acquired a business when the acquired set of activities and assets includes an input and a substantive process that together significantly contribute to the ability to create outputs.

When we acquire a business, we assess the financial assets and liabilities assumed for appropriate classification and designation in accordance with the contractual terms, economic circumstances and pertinent conditions as at the acquisition date. This includes the separation of embedded derivatives in host contracts of the acquiree.

Any contingent consideration to be transferred by the acquirer is recognized at fair value at the acquisition date. Contingent consideration classified as an asset or liability is measured at fair value with changes in fair value recognized in profit or loss. Contingent consideration that is classified as equity is not remeasured and subsequent settlement is accounted for within equity.

Goodwill is initially measured at cost, being the excess of the aggregate of the consideration transferred, the amount recognized for non-controlling interests and any fair value of our previously held equity interests in the acquiree over the identifiable assets acquired and liabilities assumed. If the sum of this consideration and other items is lower than the fair value of the net assets acquired, the difference is, after reassessment, recognized in profit or loss as a gain on bargain purchase.

After initial recognition, goodwill is measured at cost less any accumulated impairment losses. Goodwill is tested for impairment annually or more frequently if events or changes in circumstances indicate that the carrying value may be impaired. We perform our annual impairment test of goodwill as of December 31. For the purpose of impairment testing, goodwill acquired in a business combination is, from the acquisition date, allocated to each of our cash-generating units, or groups of cash-generating units, that are expected to benefit from the synergies of the combination, irrespective of whether our other assets or liabilities are assigned to those units or groups of units.

Impairment is determined by assessing the recoverable amount of the cash-generating unit (group of cash-generating units) to which the goodwill relates. Where the recoverable amount of the cash-generating unit (group of cash-generating units) is less than the carrying amount, an impairment loss is recognized. An impairment loss recognized for goodwill is not reversed in a subsequent period.

Where goodwill has been allocated to a cash-generating unit (or group of cash-generating units) and part of the operation within that unit is disposed of, the goodwill associated with the operation disposed of is included in the carrying amount of the operation when determining the gain or loss on the disposal. Goodwill disposed of in these circumstances is measured based on the relative value of the operation disposed of and the portion of the cash-generating unit retained.

Impairment of Non-financial Assets

Where an indication of impairment exists, or when annual impairment testing for an asset is required (other than inventories, deferred tax assets and financial assets), the asset's recoverable amount is estimated. An asset's recoverable amount is the higher of the asset's or cash-generating unit's value in use and its fair value less costs of disposal, and is determined for an individual asset, unless the asset does not generate cash inflows that are largely independent of those from other assets or groups of assets, in which case the recoverable amount is determined for the cash-generating unit to which the asset belongs. In testing a cash-generating unit for impairment, a portion of the carrying amount of a corporate asset (e.g., a headquarters building) is allocated to an individual cash-generating unit if it can be allocated on a reasonable and consistent basis or, otherwise, to the smallest group of cash-generating units.

An impairment loss is recognized only if the carrying amount of an asset exceeds our recoverable amount. In assessing value in use, the estimated future cash flows are discounted to their present value using a pre-tax discount rate that reflects current market assessments of the time value of money and the risks specific to the asset. An impairment loss is charged to the statement of profit or loss in the period in which it arises in those expense categories consistent with the function of the impaired asset.

An assessment is made at the end of each of the Track Record Periods as to whether there is an indication that previously recognized impairment losses may no longer exist or may have decreased. If such an indication exists, the recoverable amount is estimated. A previously recognized impairment loss of an asset other than goodwill is reversed only if there has been a change in the estimates used to determine the recoverable amount of that asset, but not to an amount higher than the carrying amount that would have been determined (net of any depreciation/amortization) had no impairment loss been recognized for the asset in prior years. A reversal of such an impairment loss is credited to the statement of profit or loss in the period in which it arises.

Share-based Payments

The Company's Controlling Shareholder Zijin Mining operates some share award schemes. Our employees (including Directors) receive remuneration in the form of share-based payments, whereby employees render services in exchange for equity instruments ("**equity-settled transactions**"). The cost of equity-settled transactions with employees is measured by reference to the fair value at the date at which they are granted, further details of which are given in note 38 to the Accountants' Report set out in Appendix I to this Document.

The cost of equity-settled transactions is recognized in employee benefit expense, together with a corresponding increase in equity, over the period in which the performance and/or service conditions are fulfilled. The cumulative expense recognized for equity-settled transactions at the end of each reporting period until the vesting date reflects the extent to which the vesting period has expired and our best estimate of the number of equity instruments that will ultimately vest. The charge or credit to the statement of profit or loss for a period represents the movement in the cumulative expense recognized as at the beginning and end of that period.

Service and non-market performance conditions are not taken into account when determining the grant date fair value of awards, but the likelihood of the conditions being met is assessed as part of our best estimate of the number of equity instruments that will ultimately vest. Market performance conditions are reflected within the grant date fair value. Any other conditions attached to an award, but without an associated service requirement, are considered to be non-vesting conditions. Non-vesting conditions are reflected in the fair value of an award and lead to an immediate expensing of an award unless there are also service and/or performance conditions.

For awards that do not ultimately vest because non-market performance and/or service conditions have not been met, no expense is recognized. Where awards include a market or non-vesting condition, the transactions are treated as vesting irrespective of whether the market or non-vesting condition is satisfied, provided that all other performance and/or service conditions are satisfied.

Where the terms of an equity-settled award are modified, as a minimum an expense is recognized as if the terms had not been modified, if the original terms of the award are met. In addition, an expense is recognized for any modification that increases the total fair value of the share-based payments, or is otherwise beneficial to the employee as measured at the date of modification. Where an equity-settled award is cancelled, it is treated as if it had vested on the date of cancellation, and any expense not yet recognized for the award is recognized immediately.

COMBINED STATEMENTS OF PROFIT OR LOSS AND COMPREHENSIVE INCOME

The following table sets forth a summary of our combined statements of profit or loss, in U.S. dollars and percentage of our total revenue, for the periods indicated. This information should be read together with our combined financial statements and related notes included elsewhere in this Document. Our historical results presented below are not necessarily indicative of the results that may be expected for any future period.

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Revenue	1,817,981	100.0	2,262,365	100.0	2,989,935	100.0
Cost of sales	(1,197,527)	(65.9)	(1,669,689)	(73.8)	(1,855,611)	(62.1)
Gross profit	620,454	34.1	592,676	26.2	1,134,324	37.9
Other income and gains	4,900	0.3	13,050	0.6	10,667	0.4
Selling and distribution expenses	(670)	(0.0)	(515)	(0.0)	(262)	(0.0)
Administrative expenses	(121,801)	(6.7)	(121,128)	(5.4)	(141,095)	(4.7)
Impairment losses on financial assets, net	(345)	(0.0)	(138)	(0.0)	(2)	(0.0)
Other expenses	(18,167)	(1.0)	(18,322)	(0.8)	(23,527)	(0.8)
Finance costs	(56,967)	(3.1)	(50,882)	(2.2)	(43,150)	(1.4)
Profit before tax	427,404	23.5	414,741	18.3	936,955	31.3
Income tax expenses	(137,088)	(7.5)	(92,580)	(4.1)	(316,400)	(10.6)
Profit for the year	290,316	16.0	322,161	14.2	620,555	20.8
Attributable to:						
Owners of the parent	183,680	10.1	230,383	10.2	481,371	16.1
Non-controlling interests	106,636	5.9	91,778	4.1	139,184	4.7
Adjusted EBITDA[(1)]	828,726	45.6	865,805	38.3	1,384,464	46.3

Note:

(1) Adjusted EBITDA, as we present it, represents profit for the year before income tax, finance costs, interest income from bank deposits, depreciation and amortization and equity-settled share award schemes expenses. Adjusted EBITDA is not a standard measure under IFRS Accounting Standards. The use of adjusted EBITDA has limitation as an analytical tool, and you should not consider it in isolation from, or as a substitute for analysis of, our results of operations or financial condition as reported under IFRS Accounting Standards.

DESCRIPTION OF KEY STATEMENT OF PROFIT OR LOSS ITEMS

Revenue

We generate substantially all of our revenue from the sales of gold. Our other revenue mainly includes the sales of other non-ferrous metals such as silver and copper, as well as rental income from rentals of machinery equipment. Our revenue amounted to US$1,818.0 million, US$2,262.4 million and US$2,989.9 million in 2022, 2023 and 2024, respectively.

The following table sets forth our disaggregated revenue information and percentage of our total revenue for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Gold	1,724,229	94.8	2,167,179	95.8	2,811,980	94.0
Others	93,752	5.2	95,186	4.2	177,955	6.0
Total	1,817,981	100.0	2,262,365	100.0	2,989,935	100.0

The table below sets forth our revenue of each mine and percentage of our total revenue for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Tajikistan Jilau/ Taror Gold Mines	691,122	38.0	440,604	19.5	515,849	17.3
Kyrgyzstan Taldybulak Levoberezhny Gold Mine	223,933	12.3	258,015	11.4	286,161	9.6
Australia Norton Gold Mine	303,798	16.7	373,044	16.5	562,882	18.8
Guyana Aurora Gold Mine	160,107	8.9	190,145	8.4	318,125	10.6
Colombia Buriticá Gold Mine	439,021	24.1	531,735	23.5	729,517	24.4
Suriname Rosebel Gold Mine	—	—	468,822	20.7	577,401	19.3
Total	1,817,981	100.0	2,262,365	100.0	2,989,935	100.0

Gold Sales

Our revenue is predominantly derived from the sales of gold. Our revenue from gold sales was US$1,724.2 million, US$2,167.2 million and US$2,812.0 million in 2022, 2023 and 2024, respectively, accounting for 94.8%, 95.8% and 94.0%, respectively, of our total revenue.

The following table sets forth the key statistics of our gold sales for the periods indicated:

	Year ended December 31,		
	2022	2023	2024
Revenue from gold sales (US$ in thousands)	1,724,229	2,167,179	2,811,980
Sales volume (koz)	1,020	1,163	1,229
Sales volume (t)	31.7	36.2	38.2
Average selling price (US$/oz)(1)	1,690	1,863	2,288
Market price of gold (US$/oz)(2)	1,801	1,942	2,386

Note:

(1) Calculated as revenue from gold sales divided by sales volume.

(2) The average gold price in the global market for the periods indicated, according to London Bullion Market Association (LBMA) Gold Price.

Our average selling prices of gold, calculated as our revenue from gold sales divided by sales volume, were generally in line with the gold prices in the global market because most of our gold were sold to the end customers including international gold refineries, precious metal traders or financial institutions, at prices which were referenced to the spot prices. Our average selling prices were generally slightly lower than the gold market prices in 2022, 2023 and 2024, primarily because (i) Norton Gold entered into master gold forward contracts with financial institutions in Australia and agreed to deliver a specified amount of gold products at a predetermined price on a set future date, and (ii) we sold different volume of gold at different spot prices while the market price reflects the average of the spot prices over each year. For details of our hedging arrangements, please refer to "Business — Hedging and Streaming". Our sales volume is generally correlated with our production volume during the Track Record Period.

Sales Volume and Average Selling Price

The following table sets forth our sales volume and average selling price for each mine for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	Sales volume	Average selling price[(1)]	Sales volume	Average selling price[(1)]	Sales volume	Average selling price[(1)]
	(koz)	(US$/oz)	(koz)	(US$/oz)	(koz)	(US$/oz)
Tajikistan Jilau/ Taror Gold Mines[(2)]	387	1,602	213	1,815	171	2,469
Kyrgyzstan Taldybulak Levoberezhny Gold Mine . .	123	1,758	131	1,910	119	2,347
Australia Norton Gold Mine	177	1,718	212	1,762	265	2,120
Guyana Aurora Gold Mine . .	89	1,797	97	1,944	131	2,407
Colombia Buriticá Gold Mine	244	1,731	269	1,854	300	2,191
Suriname Rosebel Gold Mine	—	—	241	1,948	243	2,380
Total	**1,020**	**1,690**	**1,163**	**1,863**	**1,229**	**2,288**

Note:

(1) Calculated as revenue from gold sales divided by sales volume on an actual basis.

(2) In 2022, the average selling price of gold at the Tajikistan Jilau/Taror Gold Mines was relatively low, primarily because sales composed of gold concentrate, selling price of which had a higher discount.

Cost of Sales

Our cost of sales primarily comprises raw material costs, depreciation and amortization, labor cost, royalty expenses, energy consumption costs and others. Our cost of sales increased during the Track Record Period, which was generally in line with the increase in our sales volume. For the years ended December 31, 2022, 2023 and 2024, our cost of sales amounted to US$1,197.5 million, US$1,669.7 million and US$1,855.6 million, respectively.

The following table sets forth a breakdown of our cost of sales for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Raw material costs(1)	438,767	36.6	712,427	42.7	737,685	39.8
Depreciation and amortization	287,675	24.0	309,929	18.6	321,197	17.3
Royalty expenses	77,383	6.5	154,394	9.2	223,825	12.1
Labor cost	109,603	9.2	176,832	10.6	204,838	11.0
Energy consumption costs	76,589	6.4	116,993	7.0	121,394	6.5
Others(2)	207,510	17.3	199,114	11.9	246,672	13.3
Total	**1,197,527**	**100.0**	**1,669,689**	**100.0**	**1,855,611**	**100.0**

Notes:

(1) Raw materials included the costs of purchasing raw and auxiliary materials and outsourcing costs.

(2) Others mainly include production related supporting costs, such as security costs, transportation costs and repairment costs, etc.

Our raw material costs increased from US$438.8 million in 2022 to US$712.4 million in 2023, and further increased to US$737.7 million in 2024, primarily due to the increase in our sales volume during the Track Record Period.

Our depreciation and amortization increased from US$287.7 million in 2022 to US$309.9 million in 2023, and remained relatively stable at US$321.2 million in 2024, primarily due to the increased equipment depreciation and amortization after the acquisition of the Suriname Rosebel Gold Mine in 2023.

Our royalty expenses increased from US$77.4 million in 2022 to US$154.4 million in 2023, and further increased to US$223.8 million in 2024, primarily due to the increase in our revenue during the Track Record Period.

Our labor cost increased from US$109.6 million in 2022 to US$176.8 million in 2023, and further increased to US$204.8 million in 2024, primarily due to (i) the additional labor cost of the Suriname Rosebel Gold Mine after the acquisition in 2023 and (ii) increased bonuses to employees due to the increase in our sales volume during the Track Record Period.

The following table sets forth a breakdown of our cost of sales by products for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Gold	1,163,533	97.2	1,630,903	97.7	1,794,783	96.7
Others	33,994	2.8	38,786	2.3	60,828	3.3
Total	**1,197,527**	**100.0**	**1,669,689**	**100.0**	**1,855,611**	**100.0**

Gross Profit and Gross Profit Margin

Our gross profit consists of revenue less cost of sales. Gross profit margin represents gross profit divided by total revenue, expressed as a percentage.

The following table sets forth a breakdown of our gross profit and gross profit margin by products for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Gold	560,696	32.5	536,276	24.7	1,017,197	36.2
Others	59,758	63.7	56,400	59.3	117,127	65.8
Total	**620,454**	**34.1**	**592,676**	**26.2**	**1,134,324**	**37.9**

Our gross profit of gold sales decreased by 4.4% from US$560.7 million in 2022 to US$536.3 million in 2023 and our gross profit margin of gold sales decreased from 32.5% in 2022 to 24.7% in 2023. The decreases were primarily due to (i) the increased unit operating costs attributing to the decreased milled grade at the Colombia Buriticá Gold Mine, the Guyana Aurora Gold Mine and the Australia Norton Gold Mine, (ii) the increased contractor costs for the Australia Norton Gold Mine and the Colombia Buriticá Gold Mine in relation to mining activities, and (iii) the additional costs relating to the newly-launched underground mining at the Guyana Aurora Gold Mine in 2023.

Our gross profit of gold sales increased by 89.7% from US$536.3 million in 2023 to US$1,017.2 million in 2024, and our gross profit margin of gold sales increased from 24.7% in 2023 to 36.2% in 2024. The increases were primarily due to (i) the 22.8% year-on-year increase in our average selling price of gold from US$1,863 per ounce in 2023 to US$2,288 per ounce in 2024 and (ii) decreased unit operating costs attributing to improved milled grade at the Colombia Buriticá Gold Mine and the Guyana Aurora Gold Mine.

Our gross profit of others was US$59.8 million, US$56.4 million and US$117.1 million in 2022, 2023 and 2024, respectively. Our gross profit margin of others was 63.7%, 59.3% and 65.8% in 2022, 2023 and 2024, respectively. Our gross profit margin for others was significantly higher than gold, primarily because sliver and copper were by-products and most of the mining processing costs were allocated to gold production.

Other Income and Gains

Our other income and gains mainly represent fair value gains from interest income generated from fixed deposits and current deposits, fair value gains from derivative instrument transactions such as power purchase agreements, convertible bonds, and foreign exchange forward contracts, exchange gains, and fair value gains from financial assets such as listed equity investments.

The following table sets forth a breakdown of our other income and gains for the periods indicated:

	Year ended December 31,		
	2022	2023	2024
	(US$ in thousands)		
Other income			
Interest income	1,588	2,768	9,104
Others(1)	647	2,903	1,069
Gains			
Foreign exchange gain, net	341	5,452	—
Fair value gains, net:			
Financial assets at fair value through profit or loss	—	—	494
Derivative instruments — transactions not qualifying as hedges	—	1,927	—
Realized gains on settlement, net			
Gains on derecognition of foreign currency forwards	2,324	—	—
Total	**4,900**	**13,050**	**10,667**

Note:

(1) Others mainly include insurance reimbursement fees, fine income, compensation payments, and recovery of written-off funds, etc. In 2023, others amounted to US$2.9 million, an increase of US$2.3 million compared to 2022. This was mainly due to Continental Gold Inc. receiving equipment insurance reimbursement of US$1.6 million.

In 2023, we incurred fair value gains, net from derivative instrument transactions of US$1.9 million from derivative instruments, primarily because of the fair value gains of US$2.7 million arising from the power purchase agreement of the Suriname Rosebel Gold Mine, partially offset by the US$0.8 million fair value loss from exchange. According to the power purchase agreement entered between Rosebel and the Suriname Electricity Company, the electricity price paid by Rosebel is linked to the gold price. We identified it as a derivative financial instrument measured at fair value and with its changes recognized in the current period's profit and loss. Please refer to Appendix II — Note 29 for more details.

Our interest income increased from US$1.6 million in 2022 to US$2.8 million in 2023, and further increased to US$9.1 million in 2024, primarily due to the increase in bank deposits.

Selling and Distribution Expenses

Our selling and distribution expenses primarily consist of labor cost, travel expenses, depreciation and amortization, vehicle expenses, and others. For the years ended December 31, 2022, 2023 and 2024, our selling and distribution expenses amounted to US$0.7 million, US$0.5 million and US$0.3 million, respectively.

Administrative Expenses

Our administrative expenses primarily consist of wages and benefits for administrative staff, depreciation and amortization, exploration expenses, office expenses, consulting service fees, and others.

The following table sets forth a breakdown of our administrative expenses for the periods indicated:

	Year ended December 31,					
	2022		2023		2024	
	US$	%	US$	%	US$	%
	(in thousands, except for percentages)					
Wages and benefits	53,330	43.8	52,997	43.8	64,834	46.0
Depreciation and amortization	7,274	6.0	8,709	7.2	11,531	8.2
Exploration expenses	9,043	7.4	11,656	9.6	9,041	6.4
Office expenses	7,247	5.9	8,234	6.8	7,587	5.4
Consulting service fees	8,028	6.6	4,891	4.0	5,922	4.2
Others[(1)]	36,879	30.3	34,641	28.6	42,180	29.8
Total	**121,801**	**100.0**	**121,128**	**100.0**	**141,095**	**100.0**

Note:

(1) Others mainly include property insurance premium, travel and conference expenses, rental fees and miscellaneous labor cost.

Impairment Losses on Financial Assets, Net

Our impairment losses on financial assets, net, primarily consist of impairment losses on accounts receivable and other receivables. Our impairment losses on financial assets, net amounted to US$0.3 million, US$0.1 million and US$2.0 thousand in 2022, 2023 and 2024, respectively.

Other Expenses

Our other expenses primarily consist of exchange losses, donation expenses, fixed assets loss expenses, losses from changes in fair value, and compensation expenses.

The table below lists the details of other expenses for the periods indicated:

	Year ended December 31,		
	2022	2023	2024
		(US$ in thousands)	
Exchange losses	—	—	12,703
Donation expenses	2,296	4,176	3,572
Fixed assets loss expenses	395	2,622	1,612
Derivative instruments — transactions not qualifying as hedges	8,351	5,624	4,396
Compensation expenses	5,628	24	—
Losses from changes in fair value	78	646	—
Losses on derecognition of foreign currency forwards	—	4,448	—
Others	1,419	782	1,244
Total	**18,167**	**18,322**	**23,527**

Finance Costs

Our finance costs primarily consist of interest on related-party borrowings, interest expense arising from metal streaming arrangement and interest on lease liabilities.

The following table sets forth a breakdown of our finance costs for the periods indicated:

	Year ended December 31,		
	2022	2023	2024
		(US$ in thousands)	
Interest on bank loans	367	775	653
Interest on related-party borrowings	57,018	47,289	44,304
Interest expense arising from metal streaming arrangement	6,603	7,165	9,020
Interest on lease liabilities	761	648	2,411
Less: Interest capitalized	(9,438)	(7,669)	(16,230)
Unwinding of discount on provisions and other long-term liabilities	1,656	2,674	2,992
Total	**56,967**	**50,882**	**43,150**

Income Tax Expenses

For the years ended December 31, 2022, 2023 and 2024, our income tax expenses amounted to US$137.1 million, US$92.6 million and US$316.4 million, respectively. Our income tax expense consists of current income tax and deferred income tax. Current income tax comprises Hong Kong profit tax and tax prevailing in the jurisdictions in which we operate. Our effective income tax rate, calculated as income tax expense divided by profit before taxation, was 32.1%, 22.3% and 33.8% for the years ended December 31, 2022, 2023 and 2024, respectively.

The following table sets forth a breakdown of our income tax expense for the periods indicated:

	Year ended December 31,		
	2022	2023	2024
		(US$ in thousands)	
Current — Hong Kong	10,208	18,372	12,769
Current — Elsewhere	118,679	101,981	189,299
Deferred	8,201	(27,773)	114,332
Total	**137,088**	**92,580**	**316,400**

NON-IFRS FINANCIAL MEASURE

In evaluating our business, we consider and use adjusted EBITDA and adjusted EBITDA margin, which are non-IFRS measures, as supplemental measures to review and assess our operating performance. We believe that these non-IFRS measures facilitate comparison of operating performance from period to period.

We provide a reconciliation of adjusted EBITDA and adjusted EBITDA margin to profit for the year, calculated and presented in accordance with IFRS. Adjusted EBITDA refers to earnings before income tax, finance costs, interest income from bank deposits, depreciation and amortization and equity-settled share award schemes expenses. Adjusted EBITDA margin is calculated based on the Adjusted EBITDA for the year divided by the total revenue for such year and multiplied by 100%. The terms adjusted EBITDA and adjusted EBITDA margin are not defined under IFRS and should not be considered in isolation or construed as alternatives to loss/profit from operations or any other measure of performance or as an indicator of our operating performance or profitability. The use of adjusted EBITDA and adjusted EBITDA margin have limitations as an analytical tool, and you should not consider them in isolation from, or as a substitute for analysis of, our results of operations or financial condition as reported under IFRS Accounting Standards.

The following table presents a reconciliation of adjusted EBITDA and adjusted EBITDA margin to loss/profit for each of the years/periods indicated:

	For the year ended December 31,		
	2022	2023	2024
		(US$ in millions)	
Profit for the year	290.3	322.2	620.6
Adjustments for:			
Income tax	137.1	92.6	316.4
Finance costs	57.0	50.9	43.2
Interest income from bank deposits	(1.6)	(2.8)	(9.1)
Depreciation and amortization	344.8	402.2	412.2
Equity-settled share award schemes expenses	1.1	0.7	1.3
Adjusted EBITDA[(1)]	**828.7**	**865.8**	**1,384.5**
Adjusted EBITDA margin[(2)] (%)	45.6%	38.3%	46.3%

Notes:

(1) Adjusted EBITDA, as we present it, represents profit for the year or period before income tax, finance costs, interest income from bank deposits, depreciation and amortization and equity-settled share award schemes expenses. Adjusted EBITDA is not a standard measure under IFRS Accounting Standards. The use of adjusted EBITDA has limitation as an analytical tool, and you should not consider it in isolation from, or as a substitute for analysis of, our results of operations or financial condition as reported under IFRS Accounting Standards.

(2) Adjusted EBITDA margin is calculated based on the Adjusted EBITDA for the year divided by the total revenue for such year and multiplied by 100%. Adjusted EBITDA margin is not a standard measure under IFRS Accounting Standards. The use of adjusted EBITDA margin has limitation as an analytical tool, and you should not consider it in isolation from, or as a substitute for analysis of, our results of operations or financial condition as reported under IFRS Accounting Standards.

PERIOD-TO-PERIOD COMPARISON OF RESULTS OF OPERATIONS

Year Ended December 31, 2024 Compared with Year Ended December 31, 2023

Revenue

Our revenue increased by 32.2% from US$2,262.4 million in 2023 to US$2,989.9 million in 2024, primarily attributable to (i) the 22.8% year-on-year increase in our average selling price of gold from US$1,863 per ounce in 2023 to US$2,288 per ounce in 2024, and (ii) increase in sales volume from 1,163 koz (36.2 tonnes) in 2023 to 1,229 koz (38.2 tonnes) in 2024, mainly due to the significant increase in gold sales at the Australia Norton Gold Mine, the Colombia Buriticá Gold Mine and the Guyana Aurora Gold Mine.

Cost of Sales

Our cost of sales increased by 11.1% from US$1,669.7 million in 2023 to US$1,855.6 million in 2024, primarily due to our increase in sales volume of gold. In particular, our royalty expenses increased from US$154.4 million in 2023 to US$224.2 million in 2024, which was in line with the increase in our revenue.

Gross Profit and Gross Profit Margin

Our gross profit increased by 91.4% from US$592.7 million in 2023 to US$1,134.3 million in 2024. Our gross profit margin increased from 26.2% in 2023 to 37.9% in 2024, primarily due to the 22.8% year-on-year increase in our average selling price of gold from US$1,863 per ounce in 2023 to US$2,288 per ounce in 2024.

Other Income and Gains

Our other income and gains decreased by 18.3% from US$13.1 million in 2023 to US$10.7 million in 2024, primarily due to the decrease in derivative instruments — transactions not qualifying as hedges from US$1.9 million in 2023 to nil in 2024 and exchange gain from US$5.5 million in 2023 to nil in 2024. These decreases were offset by an increase in our interest income from US$2.8 million in 2023 to US$9.1 million in 2024, primarily due to the increase in bank deposits.

Selling and Distribution Expenses

Our selling and distribution expenses decreased by 49.1% from US$515 thousand in 2023 to US$262 thousand in 2024, primarily attributable to a reduction in sales staff in the Tajikistan Jilau/Taror Gold Mines due to changes in sales products. Our selling and distribution expenses accounted for less than 0.1% of our total revenue in both of 2023 and 2024.

Administrative Expenses

Our administrative expenses increased by 16.5% from US$121.1 million in 2023 to US$141.1 million in 2024, primarily attributable to the company's performance improved, leading to an increase in employee salaries and bonuses. Our administrative expenses accounted for 5.4% and 4.7% of our total revenue in 2023 and 2024, respectively.

Impairment Losses on Financial Assets, Net

We recorded impairment losses on financial assets, net of US$0.1 million in 2023 and US$2.0 thousand in 2024, respectively, primarily attributable to changes in impairment losses on accounts receivable and other receivables.

Other Expenses

Our other expenses increased from US$18.3 million in 2023 to US$23.5 million in 2024, primarily attributable to (i) exchange losses arising from the settlement with certain clients in RMB and the depreciation of RMB against US dollars in 2024; and (ii) exchange loss experienced by the Colombia Buriticá Gold Mine due to the depreciation of the Colombian peso against US dollar, devaluing its local peso-denominated monetary assets in 2024.

Finance Costs

Our finance costs decreased from US$50.9 million in 2023 to US$43.2 million in 2024, primarily attributable to the increase in capitalized interest and the decrease in interest on related-party borrowings.

Income Tax Expenses

Our income tax expenses increased from US$92.6 million in 2023 to US$316.4 million in 2024, primarily because of (i) the increased profit before tax in 2024 and (ii) the low income tax expenses in 2023 due to the impact of deferred tax caused by exchange rate changes of the Colombia Buriticá Gold Mine.

Profit for the Year

As a result of the foregoing, our profit for the year increased significantly by 92.6% from US$322.2 million in 2023 to US$620.6 million in 2024.

Profit for the Year Attributable to Owners of the Parent

As a result of the foregoing, profit for the year attributable to owners of the parent increased significantly by 108.9% from US$230.4 million in 2023 to US$481.4 million in 2024.

Year Ended December 31, 2023 Compared with Year Ended December 31, 2022

Revenue

Our revenue increased by 24.4% from US$1,818.0 million in 2022 to US$2,262.4 million in 2023, primarily attributable to (i) the 10.2% year-on-year increase in our average selling price of gold from US$1,690 per ounce in 2022 to US$1,863 per ounce in 2023, and (ii) increase in sales volume from 1,020 koz (31.7 tonnes) in 2022 to 1,163 koz (36.2 tonnes) in 2023, partially due to additional sales volume from the Suriname Rosebel Gold Mine acquired in 2023.

Cost of Sales

Our cost of sales increased by 39.4% from US$1,197.5 million in 2022 to US$1,669.7 million in 2023, primarily due to a higher sales volume of gold, largely resulting from the acquisition of the Suriname Rosebel Gold Mine. In particular, our royalty expenses increased from US$77.4 million in 2023 to US$154.4 million in 2024, mainly due to increased revenue.

Gross Profit and Gross Profit Margin

Our gross profit decreased by 4.5% from US$620.5 million in 2022 to US$592.7 million in 2023. Our gross profit margin decreased from 34.1% in 2022 to 26.2% in 2023.

Our gross profit of gold sales decreased by 4.4% from US$560.7 million in 2022 to US$536.3 million in 2023. Our gross profit margin of gold sales decreased from 32.5% in 2022 to 24.7% in 2023, primarily due to (i) newly-launched heap leach project in the Australia Norton Gold Mine which was ramping up in 2023, (ii) the increased unit operating costs attributing to the decreased milled grade at the Colombia Buriticá Gold Mine, the Guyana Aurora Gold Mine and the Australia Norton Gold Mine, and (iii) the increased contractor costs for the Colombia Buriticá Gold Mine in relation to the increase in mining activities and higher outsourcing unit prices.

Other Income and Gains

Our other income and gains increased by 167.3% from US$4.9 million in 2022 to US$13.1 million in 2023, primarily attributable to the foreign exchange gain arising from repaying the principal and interest of the interest-bearing borrowings due from Zijin Mining in 2023 in RMB and the depreciation of RMB against US dollars in 2023.

Selling and Distribution Expenses

Our selling and distribution expenses were US$670 thousand in 2022 and US$515 thousand in 2023. Our selling and distribution expenses accounted for less than 0.1% of our total revenue in both 2022 and 2023.

Administrative Expenses

Our administrative expenses remained relatively stable at US$121.8 million in 2022 and US$121.1 million in 2023. Administrative expenses accounted for 6.7% of our total revenue in 2022 and 5.4% of our total revenue in 2023.

Impairment Losses on Financial Assets, Net

We recorded impairment losses on financial assets, net, of US$0.3 million in 2022 and US$0.1 million in 2023, respectively.

Other Expenses

Our other expenses remained stable at US$18.2 million in 2022 and US$18.3 million in 2023.

Finance Costs

Our finance costs decreased from US$57.0 million in 2022 to US$50.9 million in 2023, primarily due to the decrease of interest on related-party borrowings, which was because we repaid certain loans from related party at the beginning of 2023.

Income Tax Expenses

Our income tax expenses decreased from US$137.1 million in 2022 to US$92.6 million in 2023, primarily attributable to the impact of (i) the US27.8 million deferred tax incurred in 2023, mainly caused by exchange rate changes and (ii) deferred income tax liability of the Colombia Buriticá Gold Mine in 2023.

Profit for the Year

As a result of the foregoing, our profit for the year increased by 11.0% from US$290.3 million in 2022 to US$322.2 million in 2023.

Profit for the Year Attributable to Owners of the Parent

As a result of the foregoing, profit for the year attributable to owners of the parent increased by 25.4% from US$183.7 million in 2022 to US$230.4 million in 2023.

DISCUSSION ON KEY ITEMS OF COMBINED STATEMENTS OF FINANCIAL POSITION

The following table sets out selected information from our summary combined balance sheet as of the dates indicated, which has been extracted from our audited combined financial statements included in Appendix I to this Document.

	As of December 31,		
	2022	2023	2024
	(US$ in thousands)		
Non-Current Assets			
Property, plant and equipment	1,753,479	2,360,312	2,533,639
Right-of-use assets	22,942	15,998	55,393
Intangible assets	1,527,789	1,530,875	1,439,478
Investments in associates	13,536	13,690	12,540
Equity investments designated at fair value through other comprehensive income	137	137	137
Deferred tax assets	16,545	21,754	10,138
Other non-current assets	121,162	147,350	150,538
Total Non-Current Assets	**3,455,590**	**4,090,116**	**4,201,863**
Current Assets			
Inventories	313,795	400,272	437,362
Trade receivables	117,802	142,279	118,224
Prepayments, other receivables and other assets	206,662	360,314	402,539
Derivative financial assets	5,269	—	—
Financial assets at fair value through profit or loss	1,666	1,020	1,514
Restricted cash	4,881	6,136	6,650
Cash and cash equivalents	86,458	154,754	234,585
Total Current Assets	**736,533**	**1,064,775**	**1,200,874**
Current Liabilities			
Trade payables	155,370	306,667	244,768
Convertible debentures	62,042	67,666	70,859
Derivative financial liabilities	—	4,959	5,484
Other payables and accruals	279,548	652,825	499,587
Income tax payables	29,561	24,057	73,665
Interest-bearing bank and other borrowings	13,536	13,690	41,650
Lease liabilities	10,341	8,042	18,987
Total Current Liabilities	**550,398**	**1,077,906**	**955,000**
Net Current Assets/(Liabilities)	**186,135**	**(13,131)**	**245,874**
Total Assets Less Current Liabilities	**3,641,725**	**4,076,985**	**4,447,737**

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Non-Current Liabilities			
Interest-bearing bank and other borrowings	594,359	641,527	569,147
Lease liabilities	9,995	4,124	32,270
Derivative financial liabilities	—	25,842	26,520
Deferred tax liabilities	455,040	467,228	569,944
Provisions	93,519	228,609	233,106
Other non-current liabilities	124,733	118,325	114,659
Total Non-Current Liabilities	**1,277,646**	**1,485,655**	**1,545,646**
Net Assets	**2,364,079**	**2,591,330**	**2,902,091**
Equity			
Equity attributable to owners of the parent			
Share capital	69,706	69,706	69,706
Reserves	1,735,980	1,943,093	2,255,670
Non-controlling interests	558,393	578,531	576,715
Total Equity	**2,364,079**	**2,591,330**	**2,902,091**

Property, Plant and Equipment

The following table sets forth the net carrying amounts of our property, plant and equipment as of the dates indicated.

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Mining properties	614,809	1,033,071	1,018,785
Plant, machinery and equipment	458,488	631,026	635,179
Buildings	121,902	190,759	190,751
Power generation and transmission equipment	42,670	77,156	72,879
Office equipment, electronic equipment and others	9,169	9,145	10,038
Motor vehicles	67,095	180,758	224,361
Construction in progress	439,346	238,397	381,646
Total	**1,753,479**	**2,360,312**	**2,533,639**

The net carrying amounts of our mining properties increased from US$614.8 million as of December 31, 2022 to US$1,033.1 million as of December 31, 2023, primarily due to (i) the acquisition of the Suriname Rosebel Gold Mine in 2023, (ii) continued infrastructure stripping for new open-pit mines, which increased capitalized stripping costs in 2023, and (iii) the additional fixed assets due to the completion of new construction projects in the Australia Norton Gold Mine. The net carrying amounts of our mining properties remained relatively stable at US$1,018.8 million as of December 31, 2024.

The net carrying amounts of our plant, machinery and equipment increased from US$458.5 million as of December 31, 2022 to US$631.0 million as of December 31, 2023, primarily due to (i) the acquisition of the Suriname Rosebel Gold Mine in 2023, which led to an increase in machinery and equipment, and (ii) additional machinery and equipment we purchased in 2023. The net carrying amounts of plant, machinery and equipment further increased to US$635.2 million as of December 31, 2024.

The net carrying amounts of our construction in progress decreased from US$439.3 million as of December 31, 2022 to US$238.4 million as of December 31, 2023, primarily because we completed several construction projects in 2023 such as the construction projects in the Australia Norton Gold Mine and the Colombia Buriticá Gold Mine. The net carrying amounts of our construction in progress then increased to US$381.6 million as of December 31, 2024, primarily because we had new construction projects in the Australia Norton Gold Mine.

Right-of-use Assets

Our right-of-use assets represented our leasehold land, buildings, machinery and equipment and motor vehicles. The following table sets forth a breakdown of right-of-use assets as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Leasehold land	3,072	2,539	2,006
Buildings	837	1,748	1,903
Machinery and equipment	19,033	10,352	10,019
Motor vehicles	—	1,359	41,465
Total	**22,942**	**15,998**	**55,393**

Our right-of-use assets decreased from US$22.9 million as of December 31, 2022 to US$16.0 million as of December 31, 2023, primarily due to the normal depreciation and amortization of right-of-use assets.

Our right-of-use assets increased from US$16.0 million as of December 31, 2023 to US$55.4 million as of December 31, 2024, primarily due to the increase of motor vehicles at the Suriname Rosebel Gold Mine.

Intangible Assets

The following table sets forth the net carrying amounts of our intangible assets as of the dates indicated.

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Exploration and mining rights	1,394,547	1,383,254	1,286,773
Exploration and evaluation assets	131,762	145,980	150,261
Software	1,480	1,641	2,444
Total	**1,527,789**	**1,530,875**	**1,439,478**

The net carrying amounts of our exploration and mining rights decreased from US$1,394.5 million as of December 31, 2022 to US$1,383.3 million as of December 31, 2023, and further decreased to US$1,286.8 million, primarily due to the normal amortization during the Track Record Period.

Investments in Associates

We recorded investments in associates of US$13.5 million, US$13.7 million and US$12.5 million as of December 31, 2022, 2023 and 2024, respectively. The slight decrease in 2024 was primarily attributable to foreign currency translation differences.

Equity Investments Designated at Fair Value through Other Comprehensive Income

Our equity investments designated at fair value through other comprehensive income represented investment in equity of non-listed companies. We recorded equity investments designated at fair value through other comprehensive income of US$137 thousand as of each of December 31, 2022, 2023 and 2024.

Deferred Tax Assets

Our deferred tax assets represented recognized deferred assets due to tax-accounting differences. The following table sets forth a breakdown of our deferred tax assets as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Tax losses	45,848	98,206	25,700
Unrealized profit	11,105	10,701	10,138
Accruals and other provisions	3,742	2,076	4,028
Rehabilitation provision	23,349	27,580	24,980
Others	5,581	7,079	19,747
Total	**89,625**	**145,642**	**84,593**

Our deferred tax assets increased from US$89.6 million as of December 31, 2022 to US$145.6 million as of December 31, 2023, primarily attributable to an increase in tax losses arising from the acquisition of Suriname Rosebel Gold Mine and an increase in tax losses of the Australia Norton Gold Mine.

Our deferred tax assets decreased from US$145.6 million as of December 31, 2023 to US$84.6 million as of December 31, 2024, primarily due to the utilized tax losses from previous year of Australia Norton Gold Mine, Suriname Rosebel Gold Mine and Guyana Aurora Gold Mine.

Other Non-current Assets

Our other non-current assets primarily consisted of stockpiled ore, value-added tax refundable, advance payment for equipment, underground development costs and others. The following table sets out a breakdown of our inventories as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Stockpiled ore[1]	37,587	89,127	108,272
Value-added tax refundable	22,340	31,807	19,184
Advance payment for equipment	50,148	8,773	5,252
Underground development costs	2,692	4,462	5,942
Others	8,395	13,181	11,888
Total	**121,162**	**147,350**	**150,538**

Note:

(1) If the ore stockpile is not expected to be processed in 12 months after the reporting date, it is included in non-current assets.

Our other non-current assets increased from US$121.2 million as of December 31, 2022 to US$147.4 million as of December 31, 2023, primarily due to the acquisition of Suriname Rosebel Gold Mine in 2023, which led to an increase in stockpiled ores. This was partially offset by a decrease in advance payment for equipment, primarily because we prepaid the construction related fees of Zarafshon JV and AGM Mine in 2022 while the construction was completed in 2023.

Our other non-current assets increased from US$147.4 million as of December 31, 2023 to US$150.5 million as of December 31, 2024, primarily due to an increase in stockpiled ores from Suriname Rosebel Gold Mine, partially offset by a decrease in Continental Gold Colombia Branch's value added tax refundable.

Inventories

Our inventories primarily consisted of raw materials, work in process and finished goods. The following table sets out a breakdown of our inventories as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Raw materials	180,746	261,319	273,598
Work in process	100,648	123,375	138,339
Finished goods	32,401	15,578	25,425
Total	313,795	400,272	437,362

Our inventories increased from US$313.8 million as of December 31, 2022 to US$400.3 million as of December 31, 2023, primarily due to the acquisition of Suriname Rosebel Gold Mine in 2023, which led to an increase in the balance of raw materials.

Our inventories increased from US$400.3 million as of December 31, 2023 to US$437.4 million as of December 31, 2024, primarily due to (i) an increase in raw materials, largely because of the Guyana Aurora Gold Mine's procurement of essential materials as basic inventory to mitigate stockout risks; and (ii) an increase in work-in-process balance primarily from the Suriname Rosebel Gold Mine, due to the increase production volume; and partially offset by an increase in impairment provision.

The table below sets forth an aging analysis for our inventories, net of loss allowances as of the dates indicated.

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Within 1 year	217,422	268,828	283,064
1–2 years	58,710	48,631	65,895
2–3 years	20,082	50,460	36,811
over 3 years	17,581	32,353	51,592
Total	**313,795**	**400,272**	**437,362**

The following table sets forth our inventory turnover days for the periods indicated:

	Year ended December 31,		
	2022	2023	2024
Inventory turnover days(1)	103	78	82

Note:

(1) Inventory turnover days are calculated using the average of opening balance and closing balance of inventories for a year divided by cost of sales for the relevant year and multiplied by 365 days.

Our inventory turnover days decreased from 103 days in 2022 to 78 days in 2023 primarily because of the sales of the gold concentrate we produced and stored in previous years. The inventory turnover days remained stable at 82 days in 2024.

As of May 31, 2025, US$115.3 million, or 26% of our inventories as of December 31, 2024, had been consumed.

Trade Receivables

Our trade receivables primarily referred to trade receivables from trading companies, less impairment. The following table sets forth a breakdown of our trade receivables as of the dates indicated:

	As of December 31,		
	2022	**2023**	**2024**
	(US$ in thousands, except turnover days)		
Trade receivables (subject to provisional pricing) — fair value	2,199	10,848	6,756
Trade receivables (not subject to provisional pricing) — amortize cost	115,965	131,864	111,833
Impairment	(362)	(433)	(365)
Total	**117,802**	**142,279**	**118,224**
Average trade receivable turnover days[(1)]	15	21	16

Note:

(1) Average trade receivables equal the average of the trade receivables of continuing operations at the beginning of the period plus trade receivables of continuing operations at the end of the period. Average trade receivable turnover days equals average trade receivables divided by revenue and then multiplied by the number of days in the period.

We maintain strict control over our outstanding receivables. Overdue balances are reviewed regularly by senior management.

Our trade receivables increased from US$117.8 million as of December 31, 2022 to US$142.3 million as of December 31, 2023, and decreased to US$118.2 million as of December 31, 2024. The changes were primarily due to the changes in the outstanding amount of trade receivables generated from the sales of gold concentrates as of the year end. Compared to sales of gold ingots and gold doré, we generally grant longer credit period for customers of gold concentrates.

Our average trade receivable turnover days increased from 15 days to 21 days as of December 31, 2022 and 2023, respectively, primarily because the refined gold ores had a longer billing period in 2023. Our average trade receivable turnover days decreased from 21 days to 16 days as of December 31, 2023 and 2024, respectively, primarily due to a decrease in sales of gold concentrate as of the end of year 2024.

The credit period of trade receivables (not subject to provisional pricing) is generally of 30 days. Trade receivables (not subject to provisional pricing) are non-interest-bearing.

An aging analysis of the trade receivables (not subject to provisional pricing) as of dates indicated is as follows:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Less than one year	115,585	131,421	111,403
Over one year	18	10	65
Total	**115,603**	**131,431**	**111,468**

As of December 31, 2022, 2023, and 2024, the aging of all the receivables were primarily within one year and no trade debtors were determined to be impaired. We do not hold any collateral or other credit enhancements over these balances.

As of May 31, 2025, US$114.8 million, or 96.8%, of our trade receivables as of December 31, 2024, had been settled.

Prepayments, Other Receivables and Other Assets

Our prepayments, other receivables and other assets include prepaid accounts, other receivables eligible for tax refunds, and related party receivables.

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Prepayments	38,128	56,845	37,328
Value-added tax refundable	9,778	28,203	39,917
Deposits in related party[(1)]	124,290	134,339	233,443
Amounts due from related parties	15,291	32,670	16,893
Income tax recoverable	8,434	66,998	51,189
Other assets	12,370	42,955	25,536
Less: Impairment of other receivables	(1,629)	(1,696)	(1,767)
Total	**206,662**	**360,314**	**402,539**

Note:

(1) According to the physical cash pooling agreements signed with Zijin International Capital Company Limited, a subsidiary of Zijin Mining Group, we deposited idle cash to bank accounts of Zijin International Capital Company Limited with interest rate between 0.3% and 5.1% per annum, which were unsecured and had no fixed terms of repayment. As of December 31, 2022, 2023 and 2024, the balance of such deposit of idle cash amounted to US$124.3 million, US$134.3 million and US$233.4 million, respectively.

Our prepayments, other receivables and other assets increased from US$206.7 million as of December 31, 2022 to US$360.3 million as of December 31, 2023, and further increased to US$402.5 million as of December 31, 2024, primarily because our interest-bearing deposits of cash pooling with the related party Zijin International Capital Company increased.

Our income tax recoverable increased from US$8.4 million as of December 31, 2022 to US$67.0 million as of December 31, 2023, primarily due to increases in income tax prepayments in 2023 of Zeravshan and Rosebel and income tax recoverable.

As of May 31, 2025, we had collected US$199.2 million, or 49.5%, of our prepayments, other receivables and other assets outstanding as of December 31, 2024. Our Directors confirm that we did not have any default in payment of prepayments, other receivables and other assets during the Track Record Period.

Financial Assets at Fair Value through Profit or Loss

Our financial assets at fair value through profit or loss represented our equity investments in listed company. We recorded financial assets at fair value through profit or loss of US$1.7 million, US$1.0 million and US$1.5 million as of December 31, 2022, 2023 and 2024, respectively, primarily due to changes in stock value of our listed equity investment.

Restricted cash

Our restricted cash represented mine environmental restoration deposit. We recorded restricted cash of US$4.9 million, US$6.1 million and US$6.7 million as of December 31, 2022, 2023 and 2024, respectively, primarily attributable to our mine restoration plans at certain sites, which necessitated a higher provision amount in accordance with government-mandated provisioning ratios.

Cash and Cash Equivalents

As of December 31, 2022, 2023 and 2024, our cash and cash equivalents amounted to US$86.5 million, US$154.8 million and US$234.6 million, respectively. Our cash and cash equivalents primarily consist of cash held at banks and other financial institutions, readily accessible on demand to support our operational and liquidity needs.

Trade Payables

The following table sets forth the components of our trade payables as of the dates indicated and the average trade payable turnover days as of the dates indicated.

	As of December 31,		
	2022	2023	2024
	(US$ in thousands, except turnover days)		
Total	**155,370**	**306,667**	**244,768**
Trade payables turnover days(1)	38	51	54

Note:

(1) Calculated by dividing the average balance of trade payables by cost of sales for the relevant period multiplied by the number of days during the period. Average balance equals the sum of the beginning balance and ending balance for the period divided by two.

Our trade payables increased from US$155.4 million as of December 31, 2022 to US$306.7 million as of December 31, 2023, primarily because of the acquisition of the Suriname Rosebel Gold Mine and the increase in mining and stripping activities in the Guyana Aurora Gold Mine in 2023 and hence the increased payables. Our trade payables decreased to US$244.8 million as of December 31, 2024, which was due to the settlement of the payments relating to the mining and stripping activities in 2023 in the Guyana Aurora Gold Mine.

As of May 31, 2025, US$237.9 million, or 97.2%, of our trade payables as of December 31, 2024 had been subsequently settled.

The trade payables are non-interest-bearing and are normally settled on one-year terms. The following table sets forth the aged analysis of our trade payables, net, as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Less than one year	141,383	289,373	233,902
Over one year	13,987	17,294	10,866
Total	**155,370**	**306,667**	**244,768**

Other Payables and Accruals

The following table sets forth the components of our other payables and accruals as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Payables and accruals	64,410	102,742	118,903
Contract liabilities	572	1,590	—
Current portion of contract liabilities -metals streaming agreement	1,232	2,537	3,229
Due to related parties	213,334	545,956	377,455
Total	**279,548**	**652,825**	**499,587**

Our other payables and accruals increased from US$279.5 million as of December 31, 2022 to US$652.8 million as of December 31, 2023, primarily due to the increased payables and accruals in 2023 related to the acquisition of the Suriname Rosebel Gold Mine, and then decreased to US$499.6 million as of December 31, 2024, primarily due to the repayment to related parties in 2024.

As of May 31, 2025, US$288.2 million, or 57.7%, of our other payables and accruals as of December 31, 2024 had been subsequently settled.

Income Tax Payables

We recorded income tax payable of US$29.6 million, US$24.1 million and US$73.7 million as of December 31, 2022, 2023 and 2024, respectively. The significant increase in 2024 was primarily due to the increased profit in 2024.

As of May 31, 2025, US$70.9 million, or 96.2%, of our income tax payable as of December 31, 2024 had been subsequently settled.

Convertible Debentures

Our convertible debentures represented the US$50,000,000 convertible debentures issued on December 13, 2019. The interest rate is 5%, payable semi-annually. For more details, see note 34 to the Accountants' Report set out in Appendix I to this Document. As of December 31, 2022, 2023 and 2024, we recorded convertible debentures of US$62.0 million, US$67.7 million and US$70.9 million, respectively, as current portion.

Derivative Financial Liabilities

As of December 31, 2023 and 2024, we recorded total derivative financial liabilities of US$30.8 million and US$32.0 million, respectively, primarily attributable to the power purchase agreement between Suriname Rosebel Gold Mine and Suriname Power Company.

The following table sets forth our derivative financial liabilities as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Derivative Financial Liabilities			
Current portion	—	4,959	5,484
Non-current portion	—	25,842	26,520
Total	—	30,801	32,004

Interest-bearing Bank and Other Borrowings

We recorded interest-bearing bank and other borrowings of US$607.9 million, US$655.2 million and US$610.8 million as of December 31, 2022, 2023 and 2024. We recorded bank loans-unsecured, current, of US$13.5million, US$13.7 million and nil as of December 31, 2022, 2023 and 2024, respectively. We recorded interest-bearing borrowings from the related parties, current, of nil, nil and US$41.7 million as of December 31, 2022, 2023 and 2024, respectively. We recorded interest-bearing borrowings from the related parties, non-current, of US$594.4 million, US$641.5million and US$569.1 million as of December 31, 2022, 2023 and 2024, respectively. For details of the effective interest rates and the maturity, see note 32 to the Accountant's Report set out in Appendix I of this Document.

For more discussion on our bank loans, see "— Indebtedness."

As of May 31, 2025, US$19.4 million, or 3.2%, of our bank loans as of December 31, 2024 had been subsequently settled.

Lease Liabilities

Our lease liabilities were mainly generated from lease contracts for various items of leasehold land, buildings, machinery, motor vehicles and other equipment used in our operations. The following table sets forth a breakdown of our lease liabilities balance as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Lease liabilities	20,336	12,166	51,257
Non-current portion	9,995	4,124	32,270
Current portion	10,341	8,042	18,987

For details of maturity analysis of lease liabilities, see note 46 to the Accountant's Report set out in Appendix I of this Document.

Our lease liabilities decreased from US$20.3 million as of December 31, 2022 to US$12.2 million as of December 31, 2023, primarily due to the payment of rentals, and then increased to US$51.3 million as of December 31, 2024, primarily due to the increase in Rosebel's financial lease business for transportation equipment.

As of May 31, 2025, US$5.2 million, or 10.1%, of our lease liabilities as of December 31, 2024 had been subsequently settled.

Deferred Tax Liabilities

Our deferred tax liabilities consisted of differences in depreciation policies, differences in exploration and development cost amortization policies, dividend withholding tax, and merger and acquisition amortization. The following table sets forth a breakdown of our deferred tax liabilities as of the dates indicated[1]:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Depreciation in excess of depreciation allowance	57,968	172,710	194,786
Fair value adjustment on acquisition	343,204	328,128	307,227
Withholding tax	31,486	34,062	65,142
Others	95,462	56,216	77,244
Total	**528,120**	**591,116**	**644,399**

Our deferred tax liabilities increased from US$528.1 million as of December 31, 2022 to US$591.1 million as of December 31, 2023, primarily due to the increase in differences in depreciation policies of Suriname Rosebel Gold Mine.

Our deferred tax liabilities increased from US$591.1 million as of December 31, 2023 to US$644.4 million as of December 31, 2024, primarily due to higher withholding tax on dividends, which resulted from an increase in retained profit of the year.

Provisions

Our provisions consisted of environmental rehabilitation and litigation. Pursuant to the regulations of the governmental authorities in the places where the mines are located, we recognize provision for environmental rehabilitation and restoration of mines. The amount of provision is an estimate based upon the mine closure plan, size and scale of the mining operation, Life of Mine and mining methods.

The following table sets forth a breakdown of our provisions as of the dates indicated:

	As of December 31,		
	2022	2023	2024
		(US$ in thousands)	
Rehabilitation	91,016	226,064	230,604
Litigation	2,503	2,545	2,502
Total	**93,519**	**228,609**	**233,106**

Our provisions increased from US$93.5 million as of December 31, 2022 to US$228.6 million as of December 31, 2023, and further increased to US$233.1 million as of December 31, 2024, primarily due to the acquisition of the Suriname Rosebel Gold Mine in 2023.

Other Non-current Liabilities

Our other non-current liabilities represented contract liabilities pursuant to a metals streaming agreement entered into on June 25, 2019 between CGI and Triple Flag Precious Metals Corp. ("**Triple Flag**"). CGI obtained a prepayment of US$100 million from Triple Flag. CGI shall satisfy its delivery obligations with 2.1% of the future gold production of the Colombia Buriticá Gold Mine (the "**Gold Delivery Obligation**") and silver production equals to 1.84 times of the Gold Delivery Obligation (the "**Silver Delivery Obligation**"). For each ounce of products delivered under the agreement, Triple Flag would pay 10% and 5%, respectively, of the gold and silver market prices prevailing at the time of delivery. The agreement also stipulates that CGI might choose to repurchase the Gold Delivery Obligation in advance before December 31, 2021, and the consideration would be US$80 million less 90% of the value of the gold delivered. We redeemed the Gold Delivery Obligation in advance in 2020 and have begun to fulfil the Silver Delivery Obligation.

Our other non-current liabilities represent the contract liabilities arising from the Metal Streaming Arrangement.

The following table sets forth the components of our other non-current liabilities as of the dates indicated:

	As of December 31,		
	2022	**2023**	**2024**
		(US$ in thousands)	
Contract liabilities — metals streaming agreement	124,733	118,325	114,659
Total	**124,733**	**118,325**	**114,659**

For more details on the balance of our metals streaming agreement as of December 31, 2022, 2023 and 2024, see note 35 to the Accountant's Report set out in Appendix I of this Document.

LIQUIDITY AND CAPITAL RESOURCES

Our principal source of liquidity has been, and is expected to continue to be, cash generated from operating activities together with available credit facilities and bank borrowings. Our liquidity requirements primarily relate to funding our working capital requirements and our capital expenditures. We had cash and cash equivalents of US$86.5 million, US$154.8 million and US$234.6 million as of December 31, 2022, 2023 and 2024, respectively. As of May 31, 2025, the latest practicable date for determining our indebtedness, we had cash and cash equivalents of US$663.5 million.

Sufficiency of Working Capital

Taking into account the financial resources available to us, including our cash and cash equivalents, available borrowings, and the estimated net [REDACTED] from the [REDACTED], our Directors are of the opinion that we have sufficient working capital required for 125% of our present requirements, that is for at least the next 12 months from the date of this Document. Going forward, we believe our liquidity requirements will be satisfied by using funds from a combination of our cash and cash equivalents, bank and other borrowings and net [REDACTED] from the [REDACTED]. The majority of our projects under development are expansion projects of our current mines. We believe that we are able to finance such projects using net operating cash flow from our existing operations.

Net Current Assets and Net Current Liabilities

As of December 31, 2022 and 2024, we recorded net current assets of US$186.1 million and US$245.9 million, respectively. As of December 31, 2023, we recorded net current liabilities of US$13.1 million. As of May 31, 2025, we recorded net current assets of US$716.2 million.

The following table sets forth our current assets/(liabilities) as of the dates indicate:

	As of December 31,			As of May 31,
	2022	2023	2024	2025
	(US$ in thousands)			
				(unaudited)
CURRENT ASSETS				
Inventories	313,795	400,272	437,362	477,126
Trade receivables	117,802	142,279	118,224	216,824
Prepayments, other receivables and other assets	206,662	360,314	402,539	193,963
Derivative financial assets	5,269	—	—	—
Financial assets at fair value through profit or loss	1,666	1,020	1,514	7,454
Restricted cash	4,881	6,136	6,650	100,575
Cash and cash equivalents	86,458	154,754	234,585	663,479
TOTAL CURRENT ASSETS	**736,533**	**1,064,775**	**1,200,874**	**1,659,421**
CURRENT LIABILITIES				
Trade payables	155,370	306,667	244,768	194,436
Convertible debentures	62,042	67,666	70,859	73,138
Derivative financial liabilities	—	4,959	5,484	5,684
Other payables and accruals	279,548	652,825	499,587	409,582
Income tax payables	29,561	24,057	73,665	199,157
Interest-bearing bank and other borrowings	13,536	13,690	41,650	41,650
Lease liabilities	10,341	8,042	18,987	19,605
TOTAL CURRENT LIABILITIES	**550,398**	**1,077,906**	**955,000**	**943,253**
NET CURRENT ASSETS/ (LIABILITIES)	**186,135**	**(13,131)**	**245,874**	**716,169**

We recorded net current assets of US$186.1 million as of December 31, 2022 and net current liabilities of US$13.1 million as of December 31, 2023, primarily attributable to an increase in other payables and accruals and an increase in trade payables, partially offset by an increase in prepayments, other receivables and other assets and increase in cash and cash equivalents.

We recorded net current liabilities of US$13.1 million as of December 31, 2023 and net current assets of US$245.9 million as of December 31, 2024, primarily attributable to a decrease in other payables and accruals, a decrease in trade payables, an increase in cash and cash equivalents, an increase in prepayments, other receivables and other assets and an increase in inventories.

Combined Statements of Cash Flow

The following table sets forth a summary of our cash flows for the periods indicated:

	As of December 31,		
	2022	2023	2024
	(US$ in thousands)		
Net cash flows from operating activities	714,749	924,874	876,455
Net cash flows used in investing activities	(453,412)	(720,992)	(399,633)
Net cash flows used in financing activities	(346,560)	(135,633)	(396,959)
Net (decrease)/increase in cash and cash equivalents	(85,223)	68,249	79,863
Cash and cash equivalents at beginning of year	171,228	86,458	154,754
Effect of foreign exchange rate changes, net	453	47	(32)
Cash and cash equivalents at end of year	86,458	154,754	234,585

Net Cash from Operating Activities

In 2024, we had net cash flows from operating activities of US$876.5 million, which was primarily attributable to our profit before tax of US$937.0 million, adjusted by (i) depreciation of property and plant and equipment and investment properties of US$296.5 million, (ii) amortization of intangible assets of US$102.4 million and (iii) finance costs of US$43.2 million. The amount was further adjusted by changes in working capital, which primarily comprised (i) an increase in prepayments, deposits and other receivables of US$132.8 million, (ii) a decrease in other payables and accruals of US$123.9 million, (iii) an increase in inventories of US$71.1 million and (iv) a decrease in trade payables of US$61.9 million.

In 2023, we had net cash flows from operating activities of US$924.9 million, which was primarily attributable to our profit before tax of US$414.7 million, adjusted by (i) depreciation of property and plant and equipment and investment properties of US$285.6 million, (ii) amortization of intangible assets of US$105.7 million and (iii) finance costs of US$50.9 million. The amount was further adjusted by changes in working capital, which primarily comprised (i) an increase in other payables and accruals of US$175.2 million, (ii) an increase in trade payables of US$129.4 million, and (iii) a decrease in other non-current assets of US$90.8 million, partially offset by an increase in prepayments, deposits and other receivables of US$103.6 million.

In 2022, we had net cash flows from operating activities of US$714.7 million, which was primarily attributable to our profit before tax of US$427.4 million, adjusted by (i) depreciation of property and plant and equipment and investment properties of US$239.4 million, (ii) amortization of intangible assets of US$98.9 million and (iii) finance costs of US$57.0 million. The amount was further adjusted by changes in working capital, which primarily comprised (i) an increase in other payables and accruals of US$140.3 million, (ii) an increase in trade payables of US$62.0 million, and (iii) a decrease in inventories of US$48.2 million, partially offset by (i) an increase in trade receivables of US$89.5 million, and (ii) an increase in prepayments, deposits and other receivables of US$88.3 million.

Net Cash Flows Used in Investing Activities

In 2024, we had net cash flows used in investing activities of US$399.6 million, which was primarily attributable to (i) purchase of items of property, plant and equipment of US$474.2 million and (ii) advances to related-parties of US$81.4 million, partially offset by advances from related-parties of US$165.3 million.

In 2023, we had net cash flows used in investing activities of US$721.0 million, which was primarily attributable to (i) purchase of items of property, plant and equipment of US$422.2 million and (ii) acquisition of Suriname Rosebel Gold Mine of US$269.6 million.

In 2022, we had net cash flows used in investing activities of US$453.4 million, which was primarily attributable to (i) purchase of items of property, plant and equipment of US$497.3 million and (ii) advances to related-parties of US$105.1 million.

Net Cash Flows Used in Financing Activities

In 2024, we had net cash flows used in financing activities of US$397.0 million, which was primarily attributable to capital reduction of a subsidiary resulting in return of the capital contribution of US$215.0 million to its shareholders, repayment of bank and other loans of US$139.3 million and dividends paid to non-controlling shareholders of US$83.7 million, partially offset by new bank and other loans of US$94.9 million.

In 2023, we had net cash flows used in financing activities of US$135.6 million, which was primarily attributable to repayment of bank and other loans of US$115.2 million, dividends paid to non-controlling shareholders of US$122.3 million and interest paid of US$47.6 million, partially offset by new bank and other loans of US$162.4 million.

In 2022, we had net cash flows used in financing activities of US$346.6 million, which was primarily attributable to repayment of bank and other loans of US$402.2 million, dividends paid to non-controlling shareholders of US$93.3 million and interest paid of US$54.6 million, partially offset by new bank and other loans of US$212.5 million.

INDEBTEDNESS

As of December 31, 2022, 2023 and 2024 and May 31, 2025, our indebtedness included convertible debentures, interest-bearing bank and other borrowings and lease liabilities. The following table sets forth the breakdown of our indebtedness as of the dates indicated:

	As of December 31,			As of May 31
	2022	2023	2024	2025
	(US$ in thousands)			
Current				
Convertible debentures . . .	62,042	67,666	70,859	73,138
Interest-bearing bank and other borrowings	13,536	13,690	41,650	41,650
Lease liabilities.	10,341	8,042	18,987	19,605
Non-current				
Interest-bearing bank and other borrowings	594,359	641,527	569,147	608,053
Lease liabilities.	9,995	4,124	32,270	28,481

Convertible Debentures

For more details, see "— Discussion on Key Items of Combined Statements of Financial Position — Convertible Debentures" in this section and note 34 to the Accountants' Report in Appendix I to this Document.

Interest-bearing Bank and Other Borrowings

Our interest-bearing bank borrowings represented unsecured bank loans and interest-bearing borrowings from the related parties.

We recorded total interest-bearing bank and other borrowings of US$607.9 million as of December 31, 2022, comprising total unsecured bank loans of US$13.5 million and interest-bearing borrowings from the related parties of US$594.4 million. We recorded total interest-bearing bank and other borrowings of US$655.2 million as of December 31, 2023, comprising total unsecured bank loans of US$13.7 million and interest-bearing borrowings from the related parties of US$641.5 million. We recorded total interest-bearing bank and other borrowings of US$610.8 million as of December 31, 2024, all of which were interest-bearing borrowings from the related parties. We recorded total interest-bearing bank and other borrowings of US$649.7 million as of May 31, 2025, which are all interest-bearing borrowings from related parties.

Our unsecured bank loans, current were US$13.5 million, US$13.7 million, nil and nil as of December 31, 2022, 2023 and 2024 and May 31, 2025, respectively. The effective interest rates were 2.61% and 5.66% as of December 31, 2022 and 2023, respectively. We didn't record any non-current bank loans as of December 31, 2022, 2023 and 2024 and May 31, 2025, respectively.

Our interest-bearing borrowings from the related parties, current, were nil, nil, US$41.7 million and 41.7 million as of December 31, 2022, 2023 and 2024 and May 31, 2025, respectively. As the loan is due within one year, a loan of US$41.7 million from Zijin International Capital Company is reclassified from non-current to current. We have not incurred additional current borrowings from the related parties as of May 31, 2025 as compared to December 31, 2024. The effective interest rates were 11.39% as of December 31, 2024 and May 31, 2025, respectively.

Our interest-bearing borrowings from the related parties, non-current, were US$594.4 million, US$641.5 million, US$569.1 million and US$608.1 million as of December 31, 2022, 2023 and 2024 and May 31, 2025, respectively. The increase was primarily due to the increased intragroup borrowings in 2023. The decrease in 2024 was primarily due to the repayment of certain intragroup borrowings. The effective interest rates were 4.16%–10.55%, 4.16%–11.46%, 4.16–11.39% and 4.16–11.39% as of the same periods.

As of May 31, 2025, nil of our bank loans as of December 31, 2024 had been subsequently settled. As of May 31, 2025, US$19.4 million, or 3.2%, of our interest-bearing borrowings from the related parties as of December 31, 2024 had been subsequently settled.

For details of the effective interest rates and maturity, see note 32 to the Accountant's Report set out in Appendix I of this Document.

As of December 31, 2024, we had unutilized credit facilities of US$45.8 million. As of May 31, 2025, we had unutilized credit facilities of US$46.6 million.

During the Track Record Period, the bank borrowing agreements that we entered into with banks and financial institutions were subject to general and customary covenants commonly found in lending arrangements with financial institutions. If we were to breach the covenants, the loans would become payable on demand. We regularly monitor our compliance with these covenants. Agreements for our bank borrowings do not contain any material covenants that may have a material adverse effect on our ability to obtain additional borrowings or issue debt or equity securities in the future. Our Directors confirmed that we have not defaulted in the repayment of the principal bank borrowings and relevant interest expenses during the Track Record Period and up to the Latest Practicable Date. We did not experience any difficulty in obtaining bank loans and other borrowings during the Track Record Period and up to the Latest Practicable Date, and there has not been any material change in our indebtedness since May 31, 2025 and up to the date of this Document.

Lease Liabilities

We recognized total lease liabilities of US$20.3 million, US$12.2 million and US$51.3 million as of December 31, 2022, 2023 and 2024, respectively. For more details, see "— Discussion on Key Items of Combined Statements of Financial Position — Lease Liabilities" in this section and note 17(b) to the Accountants' Report in Appendix I to this Document.

As of May 31, 2025, US$5.2 million, or 10.6%, of our lease liabilities as of December 31, 2024 had been subsequently settled.

CAPITAL EXPENDITURES

During the Track Record Period, our capital expenditure primarily consisted of (i) purchase of items of property, plant and equipment; and (ii) purchase of intangible assets.

The table below sets forth our capital expenditure for the periods indicated:

	As of December 31,		
	2022	2023	2024
	(US$ in thousands)		
Purchase of items of property, plant and equipment	497,343	422,216	474,229
Purchase of intangible assets	21,083	14,704	12,819
Total	**518,426**	**436,920**	**487,048**

We had total cash outflow of purchase of property, plant and equipment and intangible assets of US$518.4 million, US$436.9 million and US$487.0 million in 2022, 2023 and 2024, respectively. We funded the capital expenditures mainly with our operating cashflows and the interest-bearing bank and other borrowings.

Following the [REDACTED], we will continue to incur capital expenditure to grow our business. We plan to fund our planned capital expenditure primarily with cash flows generated from our operations, interest-bearing bank borrowings, and the net [REDACTED] received from the [REDACTED]. See "Future Plans and Use of [REDACTED]." We may adjust our capital expenditure for any given year according to our development plans or in light of market conditions and other factors we believe to be appropriate.

CONTRACTUAL OBLIGATIONS

Capital Commitments

Our capital commitments contracted but not provided for as of the end of each Track Record Period primarily related to our purchase of property, plant and equipment and purchase commitment. As of December 31, 2022, 2023 and 2024, our capital commitments amounted to US$114.7 million, US$250.3 million and US$176.8 million, respectively.

We had various lease contracts that had not yet commenced as of December 31, 2024. The future lease payments for these non-cancellable lease contracts are US$12.7 million due within one year and US$35.9 million due in the second to fourth years.

Contingent Liabilities

As of December 31, 2022, 2023 and 2024 and May 31, 2025, we did not have any material contingent liability, guarantee or any litigation or claim of material importance, pending or threatened against us or any member of our Group that is likely to have a material and adverse effect on our business, financial condition and result of operations.

CASH OPERATING COSTS

Cash operating costs for our mines primarily consist of mining operation costs and processing costs. A majority of these costs relate to the costs of workforce employment, consumables and fuel, electricity, water and other services.

The tables below set forth a summary of historical and forecast of the cash operating costs per gram of gold produced of the Tajikistan Jilau/Taror Gold Mines, the Kyrgyzstan Taldybulak Levoberezhny Gold Mine, the Australia Norton Gold Mine, the Guyana Aurora Gold Mine, the Colombia Buriticá Gold Mine, the Suriname Rosebel Gold Mine and the Ghana Akyem Gold Mine respectively, for the periods indicated, based on the SRK Reports.

The following table is based on the SRK Report and sets forth the cash operating costs of Tajikistan Jilau/Taror Gold Mines:

	Unit	2022	2023	2024	LOM	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037
Mining cost	US$ million	55	59	64	474	62	72	73	67	60	47	41	31	9	5	4	3	0
Processing cost	US$ million	70	79	149	1,004	87	85	111	108	112	90	78	66	64	63	62	65	13
Others	US$ million	82	77	70	919	115	100	131	139	124	76	54	36	34	33	31	35	13
Cash operating cost	**US$ million**	**207**	**216**	**283**	**2,397**	**264**	**257**	**314**	**313**	**297**	**213**	**174**	**133**	**107**	**101**	**97**	**102**	**26**

The following table is based on the SRK Report and sets forth the cash operating costs of Kyrgyzstan Taldybulak Levoberezhny Gold Mine:

	Unit	2022	2023	2024	LOM	2025	2026	2027	2028	2029	2030	2031	2032	2033

KEY FINANCIAL RATIOS

The following table sets forth our key financial ratios as of and for the years indicated:

	As of and for the year ended December 31,		
	2022	2023	2024
		(US$ in thousands)	
Rates of return			
Return on assets[(1)] (%)	6.9	6.2	11.5
Return on equity[(2)] (%)	12.3	12.4	21.4
Liquidity ratios			
Current ratio[(3)] (times)	1.34	0.99	1.26
Quick ratio[(4)] (times)	0.77	0.62	0.80
Gearing ratio[(5)] (times)	0.29	0.28	0.25
Profit margin			
Gross profit margin[(6)] (%)	34.1	26.2	37.9
Net profit margin[(7)] (%)	16.0	14.2	20.8

Notes:

(1) Return on assets ratio is calculated using the profit for the year divided by total assets at the end of the year, multiplied by 100%.

(2) Return on equity ratio is calculated using the profit for the year divided by total equity at the end of the year, multiplied by 100%.

(3) Current ratio is calculated using total current assets divided by total current liabilities.

(4) Quick ratio is calculated using total current assets less inventories divided by total current liabilities.

(5) Gearing ratio is calculated by dividing total debt (which includes current and non-current portions of convertible debentures, interest-bearing bank and other borrowings, and lease liabilities) by total equity.

(6) Gross profit margin is calculated based on the gross profit for the year divided by the total revenue for the respective year and multiplied by 100%. See the paragraphs headed "Period to period comparison of results of operations" above in this section for more details on our gross profit margins.

(7) Net profit margin is calculated based on the profit for the year divided by the total revenue for the respective year and multiplied by 100%. See the paragraphs headed "Period to period comparison of results of operations" above in this section for more details on our net profit margins.

RELATED PARTY TRANSACTIONS

We enter into transactions with our related parties from time to time. For details of our related party transactions, see note 43 to the Accountants' Report set out in Appendix I to this Document.

Our Directors confirmed that each of the related party transactions set out in note 43 to the Accountants' Report set out in Appendix I to this Document was conducted in the ordinary course of business on an arm's length basis and with normal commercial terms between the relevant parties. Our Directors also confirmed that our related party transactions during the Track Record Period would not distort our track record results or cause our historical results to become non-reflective of our future performance.

OFF-BALANCE SHEET COMMITMENTS AND ARRANGEMENTS

As of the Latest Practicable Date, we did not enter into any off-balance sheet arrangements. We also have not entered into any financial guarantees or other commitments to guarantee the payment obligations of third parties. In addition, we have not entered into any derivative contracts that are indexed to our equity interests and classified as owners" equity. Furthermore, we do not have any retained or contingent interest in assets transferred to an unconsolidated entity that serves as credit, liquidity or market risk support to such entity. We do not have any variable interest in any unconsolidated entity that provides financing, liquidity, market risk or credit support to us or that engages in leasing, hedging or research and development services with us.

FINANCIAL RISKS DISCLOSURE

We are exposed to various risks in relation to financial instruments in our daily operations, mainly credit risk, liquidity risk and market risk (including interest rate risk, exchange rate risk and commodity price risk). Our major financial instruments include cash and cash equivalents, financial assets at fair value through profit or loss, derivative financial assets, trade receivables, other non-current assets, short-term and long-term loans, financial liabilities at fair value through profit or loss, trade payables, other payables and accruals, etc. We also enter into certain derivative transactions, including interest rate swaps, commodity future contracts and forward exchange contracts. The purpose is to manage the interest rate risk, commodity price risk and currency risks arising from our operations and its sources of finance. We manage the market risks of derivatives based on the difference between the metal price in the market and the target metal price pre-determined by management. Risks in connection with such financial instruments, and the risk management strategies adopted by us to mitigate such risks are summarized as follows.

Interest Rate Risk

Our exposure to the risk of changes in market interest rates relates primarily to our long-term debt obligations with a floating interest rate. For a sensitivity analysis of interest rate risk, see note 46 to the Accountants' Report set out in Appendix I to this Document.

Foreign Currency Risk

We have transactional exchange rate risk exposures mainly arising from sales or purchases by subsidiaries in currencies other than the subsidiaries' functional currencies. These subsidiaries have transactions in currencies other than their functional currencies. In addition, we have exchange rate exposures arising from foreign currency borrowings. We adopt an overall management on our foreign exchange business, and reduce our exchange rate exposures using forward currency contracts based on the market trend as necessary. For a sensitivity analysis of foreign currency risk, see note 46 to the Accountants' Report set out in Appendix I to this Document.

Credit Risk

We only deal with approved and reputable third parties. According to our policy, all customers who require credit transactions are subject to credit review. In addition, we continuously monitor the balance of trade receivables to ensure that we are not exposed to significant bad debt risks. Since counterparties of cash and bank balances are banks with good reputation and high credit ratings, credit risk arising from these financial instruments is insignificant. Our other financial assets include receivables and some derivatives. The credit risk on these financial assets arises from the default of counterparties, with a maximum exposure equal to the carrying amounts of these instruments. We only deal with approved and reputable third parties, so no need for collateral. Credit risk is managed centrally based on customers/counterparties, geographic regions and industries. As of December 31, 2022, 2023 and 2024, we had a specific concentration of credit risk. 25.9%, 63.2%, and 67.3% of our trade receivables were from the largest customers in terms of trade receivable balances, 87.8%, 97.3% and 96.7% of our trade receivables were from the top five customers in terms of trade receivable balances during the same periods. The balance of our trade receivables did not hold any collateral or other credit enhancements. For more details on our credit risk, see note 46 to the Accountants' Report set out in Appendix I to this Document.

Liquidity Risk

Our objective is to maintain a balance between continuity of funding and flexibility through the use of loans and bank borrowings. For details of the maturity profile of our financial liabilities as of the end of each of the Track Record Periods, based on the contractual undiscounted payments, see note 46 to the Accountants' Report set out in Appendix I to this Document.

Capital Management

The primary objective of our capital management is to ensure that it maintains strong credit rating and healthy capital ratios in order to support its business and maximize shareholders' value.

We regard total equity as our capital and manage our capital structure and make adjustments to it, in light of changes in economic conditions. To maintain or adjust the capital structure, we may adjust the dividend payment to shareholders, return capital to shareholders or issue new shares. No changes were made in the objectives, policies and processes during the Track Record Periods.

During the Track Record Periods, our strategy was to maintain the gearing ratio at a healthy level in order to monitor capital. The principal strategies adopted by us include, but are not limited to, reviewing future cash flow requirements and the ability to meet debt repayment schedules when they fall due, maintaining a reasonable level of available banking facilities and adjusting investment plans and financing plans, if necessary, to ensure that we have a reasonable level of capital to support its business.

DIVIDENDS

We do not currently have a dividend policy. We did not declare or pay any dividend during the Track Record Period. We may only pay dividends out of the profits of the Company available for distribution and we may only pay dividends after recovery of accumulated losses. The Company may by ordinary resolution declare dividends but no dividend shall exceed the amount recommended by the Board. The declaration, payment and amount of any future dividends will depend on our earnings and financial condition, operating requirements, capital requirements and any other conditions that our Directors may deem relevant.

Our Board may declare dividends by considering our results of operations, cash flows and financial conditions, operating and capital requirements and other relevant factors. The payment of any dividends will also depend on the availability of dividends, if any, received from the entities, which is the immediate subsidiary of the Company and the holding vehicle of our operating subsidiaries in each region. In addition to capital injection, such entities may also provide our operating subsidiaries with shareholder loans, which will be repaid to those entities.

The ability of our operating subsidiaries to declare dividends is subject to compliance with the local laws. Besides, as we expect our operations to generate positive cash flow in the future, it is expected that the operating subsidiaries would be able to repay the shareholder loans back to the immediate subsidiary of the Company which holds vehicle of our operating subsidiaries in each region, which will also enable such immediate subsidiary to pay dividend to the Company. Accordingly, since our Company derives all of its earnings and cash flows from dividends paid by these immediate subsidiaries, we will only be able to pay dividends to our shareholders subject to compliance with the local laws. See "Risk Factors — Risks Related to Doing Business in Jurisdiction in which We Operate — We may rely to a significant extent on dividends and other distributions on equity paid by our principal operating subsidiaries to fund cash and financing requirements. Any limitation on the ability of our operating subsidiaries to make payments to us could have a material adverse effect on our ability to conduct our business."

DISTRIBUTABLE RESERVES

As of December 31, 2024, our reserves were US$2,255.7 million, which represented our distributable reserve as of the same date.

[REDACTED]

NO MATERIAL ADVERSE CHANGE

Our Directors have confirmed that up to the date of this Document there has been no material adverse change in our financial or trading position or prospects since December 31, 2024, being the end date of the periods reported in Appendix I to this Document, and there is no event since December 31, 2024 that would materially affect the information as set out in the Accountants" Report in Appendix I to this Document.

DISCLOSURE REQUIRED UNDER THE LISTING RULES

Our Directors confirm that, as of the Latest Practicable Date, there was no circumstance that would give rise to a disclosure requirement under Rules 13.13 to 13.19 of the Listing Rules.

[REDACTED]

FUTURE PLANS

See "Business — Business Strategies" in this Document for a detailed description of our future plans.

USE OF [REDACTED]

Assuming that the [REDACTED] is not exercised, after deducting the [REDACTED] commissions and other estimated [REDACTED] payable by us in connection with the [REDACTED], and assuming an [REDACTED] of [REDACTED] (being the [REDACTED] of the indicative [REDACTED] range of [REDACTED]), we estimate that we will receive [REDACTED] of approximately [REDACTED] from the [REDACTED].

We intend to use the [REDACTED] from the [REDACTED] for the purposes and in the amounts set forth below, subject to adjustments based on our evolving business needs and changing market conditions:

(i) Approximately [REDACTED] of the [REDACTED], or [REDACTED], is expected to be used to repay the bridge loan for financing the acquisition of the Kazakhstan Raygorodok Gold Mine. Please see "History, Reorganization and Corporate Structure" for details.

(ii) Approximately [REDACTED] of the [REDACTED], or [REDACTED], is expected to be used over the next five years for the upgrade and construction project of existing mines to fully enhance our production capabilities. See "Business — Growth Strategies — Enhancing production capacity and mineral resource recovery through technological upgrades and operational improvements" for details of our development and expansion plan.

- Approximately [REDACTED] or [REDACTED] is expected to be allocated to our Ghana Akyem Mine for mine development. In particular, we plan to (1) expand the open-pit boundaries and increase the open-pit service life and resource utilization rate, and (2) conduct the processing plant's technological renovation to increase processing capacity, boost production volume, and extend the Life of Mine.

- Approximately [REDACTED] or [REDACTED] is expected to be allocated to our operations in Suriname Rosebel Mine, including, but not limited to, multiple equipment investments and tailings storage projects. Specifically, we plan to purchase equipment including vehicles, small mobile equipment, and relevant land and buildings to enhance our mining capacities. Such undertakings are expected to expand processing capacity and production volume, provide stable tailings storage capacities. We plan to increase its annual processing capacity to 11–13 million tonnes, and thereby raise its annual gold production volume, significantly enhancing the mine's production capacity and competitiveness.

(iii) Approximately [REDACTED] of the [REDACTED], or [REDACTED], is expected to be used over the next five years for the exploration activities to fully realize our growth potential. We will continue intensifying geological exploration efforts and expanding exploration activities within existing mines while exploring new mines surrounding our mineralization areas. For more details, please see "Business".

(iv) Approximately [REDACTED] of the [REDACTED], or [REDACTED], is expected to be used for general corporate purposes.

In the event that the [REDACTED] is set at the maximum [REDACTED] or the minimum [REDACTED] of the indicative [REDACTED] range, the net [REDACTED] of the [REDACTED] will increase to approximately [REDACTED] or decrease to approximately [REDACTED].

The additional net [REDACTED] that we would receive if the [REDACTED] was to be exercised in full would be: (i) [REDACTED] (assuming an [REDACTED] of [REDACTED] per Share, being the maximum [REDACTED] of the indicative [REDACTED] range); (ii) [REDACTED] (assuming an [REDACTED] of [REDACTED] per Share, being the mid-point of the indicative [REDACTED] range); and (iii) [REDACTED] (assuming an [REDACTED] of [REDACTED] per Share, being the minimum [REDACTED] of the indicative [REDACTED] range.

The following is the text of a report, prepared for inclusion in this document, received from the independent reporting accountants of the Company, Ernst & Young, Certified Public Accountants, Hong Kong.

[To insert the firm's letterhead]

ACCOUNTANTS' REPORT ON HISTORICAL FINANCIAL INFORMATION TO THE DIRECTORS OF ZIJIN GOLD INTERNATIONAL COMPANY LIMITED, MORGAN STANLEY ASIA LIMITED AND CITIC SECURITIES (HONG KONG) LIMITED

INTRODUCTION

We report on the historical financial information of Zijin Gold International Company Limited (the "Company") and its subsidiaries (together, the "Group") set out on pages [•] to [•], which comprises the combined statements of profit or loss, the combined statements of comprehensive income, the combined statements of changes in equity and the combined statements of cash flows of the Group for each of the years ended 31 December 2022, 2023 and 2024 (the "Relevant Periods"), and the combined statements of financial position of the Group and the statements of financial position of the Company as at 31 December 2022, 2023 and 2024 and material accounting policy information and other explanatory information (together, the "Historical Financial Information"). The Historical Financial Information set out on pages [•] to [•] forms an integral part of this report, which has been prepared for inclusion in this document of the Company dated [Date] (the "Document") in connection with the initial [REDACTED] of the shares of the Company on the Main Board of The Stock Exchange of Hong Kong Limited (the "Stock Exchange").

DIRECTORS' RESPONSIBILITY FOR THE HISTORICAL FINANCIAL INFORMATION

The directors of the Company are responsible for the preparation of the Historical Financial Information that gives a true and fair view in accordance with the basis of presentation and basis of preparation set out in note 2 to the Historical Financial Information, respectively, and for such internal control as the directors determine is necessary to enable the preparation of the Historical Financial Information that is free from material misstatement, whether due to fraud or error.

REPORTING ACCOUNTANTS' RESPONSIBILITY

Our responsibility is to express an opinion on the Historical Financial Information and to report our opinion to you. We conducted our work in accordance with Hong Kong Standard on Investment Circular Reporting Engagements 200 *Accountants' Reports on Historical Financial Information in Investment Circulars* issued by the Hong Kong Institute of Certified Public Accountants ("HKICPA"). This standard requires that we comply with ethical standards and plan and perform our work to obtain reasonable assurance about whether the Historical Financial Information is free from material misstatement.

Our work involved performing procedures to obtain evidence about the amounts and disclosures in the Historical Financial Information. The procedures selected depend on the reporting accountants' judgement, including the assessment of risks of material misstatement of the Historical Financial Information, whether due to fraud or error. In making those risk assessments, the reporting accountants consider internal control relevant to the entity's preparation of the Historical Financial Information that gives a true and fair view in accordance with the basis of presentation and preparation set out in note 2 to the Historical Financial Information in order to design procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Our work also included evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by the directors, as well as evaluating the overall presentation of the Historical Financial Information.

We believe that the evidence we have obtained is sufficient and appropriate to provide a basis for our opinion.

OPINION

In our opinion, the Historical Financial Information gives, for the purposes of the accountants' report, a true and fair view of the financial position of the Group and the Company as at 31 December 2022, 2023 and 2024 and of the financial performance and cash flows of the Group for each of the Relevant Periods in accordance with the basis of presentation and preparation set out in note 2 to the Historical Financial Information, respectively.

REPORT ON MATTERS UNDER THE RULES GOVERNING THE [REDACTED] OF SECURITIES ON THE STOCK EXCHANGE AND THE COMPANIES (WINDING UP AND MISCELLANEOUS PROVISIONS) ORDINANCE

Adjustments

In preparing the Historical Financial Information, no adjustments to the Underlying Financial Statements as defined on page I-3 have been made.

Dividends

We refer to note 15 to the Historical Financial Information which states that no dividends have been paid by the Company in respect of the Relevant Periods.

I. HISTORICAL FINANCIAL INFORMATION

Preparation of Historical Financial Information

Set out below is the Historical Financial Information which forms an integral part of this accountants' report.

The financial statements of the Group for the Relevant Periods, on which the Historical Financial Information is based, were audited by Ernst & Young in accordance with Hong Kong Standards on Auditing issued by the HKICPA (the "Underlying Financial Statements").

The Historical Financial Information is presented in United States Dollar ("USD") and all values are rounded to the nearest thousand (USD'000) except when otherwise indicated.

COMBINED STATEMENTS OF PROFIT OR LOSS

	Notes	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
		USD'000	USD'000	USD'000
Revenue	7	1,817,981	2,262,365	2,989,935
Cost of sales		(1,197,527)	(1,669,689)	(1,855,611)

II. NOTES TO THE HISTORICAL FINANCIAL INFORMATION

1. CORPORATE INFORMATION

The Company is a limited liability company incorporated in Hong Kong on 22 October 2007. Its registered office is located at Unit 7508, Level 75, International Commerce Centre, 1 Austin Road West, Kowloon, Hong Kong.

In the opinion of the directors, the Company's holding company is Zijin Mining Group Co., Ltd. ("Zijin Mining" or the "Holding Company"), a company established in the People's Republic of China ("PRC") and listed both on the Main Board of the Stock Exchange of Hong Kong Limited and the Shanghai Stock Exchange. The Company's ultimate holding company is Minxi Xinghang State-owned Assets Investment Company Limited, which is established in the PRC.

During the Relevant Periods, the Company was acting as an investment holding company and its subsidiaries (together, the "Group") were involved in the mining of gold and non-ferrous metal. The main products are gold bars, alloy gold and gold concentrate. The Group's principal operations and geographical markets are outside Mainland China.

As at the date of this report, the Company is planning to establish the Group as defined below to hold direct and indirect interests in its subsidiaries, all of which are private limited liability companies, the particulars of which are set out below:

Name*	Place and date of incorporation/ registration and place of operations	Registered capital	Percentage of equity attributable to the Company		Principal activities
			Direct	Indirect	
Altynken Limited Liability Company ("Altynken LLC", note (a))*	Kyrgyzstan 2006/4/5	KGS10,000	—	60%	Mining processing, and sales
Continental Gold Inc. ("CGI")	Canada 2015/4/27	USD 1,335,786,132	—	68.77%	Investment holding
Continental Gold Limited Sucursal Colombia (note (b))*	Colombia 2007/5/23	COP 11,238,405,220	—	68.77%	Exploration, mining, processing, and sales
AGM Inc. (note (c))*	Guyana 2011/11/16	USD63,000,500	—	100%	Exploration, mining, processing, and sales
Rosebel Gold Mines N.V. ("Rosebel GM", note (d))*	Suriname 2002/5/8	USD 8,000,000	—	95%	Exploration, mining, processing, and sales
Zeravshan (note (e))*	Tajikistan 2008/12/23	TJS73,474,747	70%	—	Exploration, mining, processing, and sales
Norton Gold Fields Pty Limited ("Norton Gold" note (f))*	Australia 2004/12/21	AUD 186,845,000	—	100%	Exploration, mining, processing, and sales

Notes:

The above table lists the subsidiaries of the Company which, in the opinion of the directors, principally affected the results for the Relevant Periods or formed a substantial portion of the revenue/assets of the Group. To give details of other subsidiaries would, in the opinion of the directors, result in particulars of excessive length.

(a) The statutory financial statements for the years ended 31 December 2022, 2023 and 2024, prepared under IFRS Accounting Standards were audited by Ernst & Young Kyrgyzstan.

(b) A subsidiary of Zijin (America) Gold Mining Company Limited, of which the combined basis are disclosed in note 2 to the Historical Financial Information. The statutory financial statements for the years ended 31 December 2022, 2023 and 2024 prepared under local Financial Reporting Standards were audited by PricewaterhouseCoopers LLP, certified public accountants registered in Colombia.

(c) The statutory financial statements for the years ended 31 December 2022, 2023 and 2024 prepared under IFRS Accounting Standards were audited by TSD LAL & CO.

(d) The statutory financial statements for the year ended 31 December 2023 and 2024 prepared under IFRS Accounting Standards were audited by Ernst & Young Caribbean.

(e) The statutory financial statements for the year ended 31 December 2022 prepared under IFRS Accounting Standards were audited by RSM Tajikistan, and the statutory financial statements for the year ended 31 December 2023 and 2024 prepared under IFRS Accounting Standards were audited by Baker Tilly Tajikistan.

(f) The statutory financial statements for the years ended 31 December 2022, 2023 and 2024 prepared under Australian Accounting Standards — Simplified Disclosures were audited by Ernst & Young Australia.

2. REORGANISATION AND BASIS OF PREPARATION AND PRESENTATION OF HISTORICAL FINANCIAL INFORMAITON

Pursuant to the Reorganisation, as more fully explained in the paragraph headed "Reorganisation" in the section headed "HISTORY, REORGANISATION AND CORPORATE STRUCTURE" in the Document, the Company was incorporated on 22 October 2007. The Company and the subsidiaries now comprising the Group were under the common control of Zijin Mining before and after the Reorganisation.

Contractual Arrangement

In June 2025, the Company entered into a series of arrangements (the "Contractual Arrangements") under the relevant laws and regulations in the Colombia with Zijin America and its direct controlling shareholder, Gold Mountain (H.K.) International Mining Company Limited ("GMHK", Nominee Shareholder) which mainly holds the Buriticá Gold Mine in Colombia ("Colombia Mine"), including Entrusted Operations Agreement, Return Swap Agreement and Undertaking by Zijin Mining as more fully explained in the paragraph headed "Clear Delineation of Business" in the section headed "RELATIONSHIP WITH ZIJIN MINING" in the Document. These Contractual Arrangements cannot be terminated and last until the expiry of the mine life of the Colombia Mine, or until GMHK's equity interests in Zijin America are transferred to the Group, whichever is earlier.

The Contractual Arrangements enable the Company to exercises effective control Zijin America and have the abilities to affect those returns through its power over Zijin America, given that:

a) the Contractual Arrangements has commercial substance;

b) the relevant activities of Zijin America will be focusing on the directing the operation of Columbia mine to enjoy the relevant economic benefit, while the Group are authorised, to the extent and within the capacity of GMHK, to make normal course of business decision of Zijin America including without limitation, the daily operation, the management of its affiliated companies, the investment and financing decisions, and other activities which would significantly impact the operation of Colombia mine and correspondingly the return of Zijin America;

c) the Group has the irrevocably practical ability to direct the exploration, development, extraction, processing, sales, transportation, and environmental restoration activities with the exclusive management and operation of the Colombia Mine, and the management and decision making of the exploration work of other potential projects. The Group can independently make business decisions and manage operations on these relevant activities;

d) the Group are entitled to the cash dividend, distribution, or consideration that the GMHK actually receives from Zijin America which constitutes substantially all of the economic benefits of Zijin America;

e) Zijin Mining undertakes to the Group that, i) at the appropriate time when conditions for a transfer are considered favourable, Zijin Mining will enter into a transaction to enable the Group to acquire the GMHK's equity interests in Zijin America at a fair and reasonable price (on a net-off basis) at the time of the transaction (which will be determined with the value derived from the Entrusted Operations Agreement and the fair value of the Return Swap Agreement to be unwound at the time of transaction (on one hand), and to be partially off-set by the fair value of GMHK's interests in Zijin America based on arm's length negotiation (on the other hand)). ii) Zijin Mining will not dispose any assets that belong to the Colombia Mine, nor will hold any collateral against Colombia Mine.

The combined statements of profit or loss, statements of comprehensive income, statements of changes in equity and statements of cash flows of the Group for the Relevant Periods include the results and cash flows of all companies now comprising the Group from the earliest date presented or since the date when the subsidiaries and/or businesses first came under the common control of Zijin Mining, where this is a shorter period. The combined statements of financial position of the Group as at 31 December 2022, 2023 and 2024 have been prepared to present the assets and liabilities of the subsidiaries using the existing book values from Zijin Mining's perspective. No adjustments are made to reflect fair values or recognise any new assets or liabilities as a result of the Reorganisation.

All intra-group transactions and balances have been eliminated on combination.

The Historical Financial Information has been prepared in accordance with IFRS Accounting Standards, which comprise all standards and interpretations approved by the International Accounting Standards Board (the "IASB"). All IFRS Accounting Standards effective for the accounting period commencing from 1 January 2024, together with the relevant transitional provisions, have been early adopted by the Group in the preparation of the Historical Financial Information throughout the Relevant Periods.

The Historical Financial Information has been prepared under the historical cost convention except for equity investments designated at fair value through other comprehensive income and certain financial instruments which have been measured at fair value at the end of each of the Relevant Periods.

3. ISSUED BUT NOT YET EFFECTIVE IFRS ACCOUNTING STANDARDS

The Group has not applied the following new and revised IFRS Accounting Standards, that have been issued but are not yet effective. The Group intends to apply these new and revised IFRS Accounting Standards, if applicable, when they become effective.

IFRS 18	*Presentation and Disclosure in Financial Statements*[3]
IFRS 19	*Subsidiaries without Public Accountability: Disclosures*[3]
Amendments to IFRS 9 and IFRS 7	*Amendments to the Classification and Measurement of Financial Instruments*[2]
Amendments to IFRS 9 and IFRS 7	*Contracts Referencing Nature-dependent Electricity*[2]
Amendments to IFRS 10 and IAS 28	*Sale or Contribution of Assets between an Investor and its Associate or Joint Venture*[4]
Amendments to IAS 21	*Lack of Exchangeability*[1]
Annual Improvements to IFRS Accounting Standards — Volume 11	*Amendments to IFRS 1, IFRS 7, IFRS 9, IFRS 10 and IAS 7*[2]

1 Effective for annual periods beginning on or after 1 January 2025
2 Effective for annual periods beginning on or after 1 January 2026
3 Effective for annual/reporting periods beginning on or after 1 January 2027
4 No mandatory effective date yet determined but available for adoption

The Group is in the process of making an assessment of the impact of these new and revised IFRS Accounting Standards upon initial application. So far, the Group considers that these new and revised IFRS Accounting Standards may result in changes in accounting policies but are unlikely to have a significant impact on the Group's results of operation and financial position.

4. MATERIAL ACCOUNTING POLICIES

Subsidiaries

A subsidiary is an entity (including a structured entity), directly or indirectly, controlled by the Company.

Control is achieved when the Group is exposed, or has rights, to variable returns from its involvement with the investee and has the ability to affect those returns through its power over the investee (i.e., existing rights that give the Group the current ability to direct the relevant activities of the investee).

When the Company has, directly or indirectly, less than a majority of the voting or similar rights of an investee, the Group considers all relevant facts and circumstances in assessing whether it has power over an investee, including:

(a) the contractual arrangement with the other vote holders of the investee;

(b) rights arising from other contractual arrangements; and

(c) the Group's voting rights and potential voting rights.

The Group reassesses whether or not it controls an investee if facts and circumstances indicate that there are changes to one or more of the three elements of control described above. A change in the ownership interest of a subsidiary, without a loss of control, is accounted for as an equity transaction. The results of subsidiaries are included in the Company's profit or loss to the extent of dividends received and receivable. The Company's investments in subsidiaries are stated at cost less any impairment losses.

Investments in associates

An associate is an entity in which the Group has a long term interest of generally not less than 20% of the equity voting rights and over which it has significant influence. Significant influence is the power to participate in the financial and operating policy decisions of the investee, but is not control or joint control over those policies.

The Group's investments in associates are stated in the combined statement of financial position at the Group's share of net assets under the equity method of accounting, less any impairment losses.

The Group's share of the post-acquisition results and other comprehensive income of associates is included in the combined statement of profit or loss and combined other comprehensive income, respectively. In addition, when there has been a change recognised directly in the equity of the associate, the Group recognises its share of any changes, when applicable, in the combined statement of changes in equity. Unrealised gains and losses resulting from transactions between the Group and its associates are eliminated to the extent of the Group's investments in the associates, except where unrealised losses provide evidence of an impairment of the assets transferred. Goodwill arising from the acquisition of associates is included as part of the Group's investments in associates.

If an investment in an associate becomes an investment in a joint venture or vice versa, the retained interest is not remeasured. Instead, the investment continues to be accounted for under the equity method. In all other cases, upon loss of significant influence over the associate, the Group measures and recognises any retained investment at its fair value. Any difference between the carrying amount of the associate upon loss of significant influence and the fair value of the retained investment and proceeds from disposal is recognised in statement of profit or loss.

Business combinations of entities under common control

Business combinations of entities under common control are accounted for using the pooling of interests method. The results of subsidiaries are combined from the beginning of the Relevant Periods or the date on which a subsidiary first came under the common control of the controlling shareholders, whichever is later, and continue to be combined until the date that the Company's control ceases. The assets and liabilities of the combining entities are reflected at their existing carrying values at the date of combination. No amount is recognised in respect of goodwill or excess of the acquirer's interest in the net fair value of the acquiree's identifiable assets, liabilities and contingent liabilities over cost at the time of common control combination, which, instead, is recorded as part of equity.

Business combinations (other than business combinations of entities under common control) and goodwill

Business combinations are accounted for using the acquisition method. The consideration transferred is measured at the acquisition date fair value which is the sum of the acquisition date fair values of assets transferred by the Group, liabilities assumed by the Group to the former owners of the acquiree and the equity interests issued by the Group in exchange for control of the acquiree. For each business combination, the Group elects whether to measure the non-controlling interests in the acquiree at fair value or at the proportionate share of the acquiree's identifiable net assets. All other components of non-controlling interests are measured at fair value. Acquisition-related costs are expensed as incurred.

The Group determines that it has acquired a business when the acquired set of activities and assets includes an input and a substantive process that together significantly contribute to the ability to create outputs.

When the Group acquires a business, it assesses the financial assets and liabilities assumed for appropriate classification and designation in accordance with the contractual terms, economic circumstances and pertinent conditions as at the acquisition date. This includes the separation of embedded derivatives in host contracts of the acquiree.

Any contingent consideration to be transferred by the acquirer is recognised at fair value at the acquisition date. Contingent consideration classified as an asset or liability is measured at fair value with changes in fair value recognised in profit or loss. Contingent consideration that is classified as equity is not remeasured and subsequent settlement is accounted for within equity.

Goodwill is initially measured at cost, being the excess of the aggregate of the consideration transferred, the amount recognised for non-controlling interests and any fair value of the Group's previously held equity interests in the acquiree over the identifiable assets acquired and liabilities assumed. If the sum of this consideration and other items is lower than the fair value of the net assets acquired, the difference is, after reassessment, recognised in profit or loss as a gain on bargain purchase.

After initial recognition, goodwill is measured at cost less any accumulated impairment losses. Goodwill is tested for impairment annually or more frequently if events or changes in circumstances indicate that the carrying value may be impaired. The Group performs its annual impairment test of goodwill as at 31 December. For the purpose of impairment testing, goodwill acquired in a business combination is, from the acquisition date, allocated to each of the Group's cash-generating units, or groups of cash-generating units, that are expected to benefit from the synergies of the combination, irrespective of whether other assets or liabilities of the Group are assigned to those units or groups of units.

Impairment is determined by assessing the recoverable amount of the cash-generating unit (group of cash-generating units) to which the goodwill relates. Where the recoverable amount of the cash-generating unit (group of cash-generating units) is less than the carrying amount, an impairment loss is recognised. An impairment loss recognised for goodwill is not reversed in a subsequent period.

Where goodwill has been allocated to a cash-generating unit (or group of cash-generating units) and part of the operation within that unit is disposed of, the goodwill associated with the operation disposed of is included in the carrying amount of the operation when determining the gain or loss on the disposal. Goodwill disposed of in these circumstances is measured based on the relative value of the operation disposed of and the portion of the cash-generating unit retained.

Fair value measurement

The Group measures certain of its financial assets and financial liabilities at fair value at the end of each of the Relevant Periods. Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. The fair value measurement is based on the presumption that the transaction to sell the asset or transfer the liability takes place either in the principal market for the asset or liability, or in the absence of a principal market, in the most advantageous market for the asset or liability. The principal or the most advantageous market must be accessible by the Group. The fair value of an asset or a liability is measured using the assumptions that market participants would use when pricing the asset or liability, assuming that market participants act in their economic best interest.

A fair value measurement of a non-financial asset takes into account a market participant's ability to generate economic benefits by using the asset in its highest and best use or by selling it to another market participant that would use the asset in its highest and best use.

The Group uses valuation techniques that are appropriate in the circumstances and for which sufficient data are available to measure fair value, maximising the use of relevant observable inputs and minimising the use of unobservable inputs.

All assets and liabilities for which fair value is measured or disclosed in the Historical Financial Information are categorised within the fair value hierarchy, described as follows, based on the lowest level input that is significant to the fair value measurement as a whole:

Level 1 — based on quoted prices (unadjusted) in active markets for identical assets or liabilities
Level 2 — based on valuation techniques for which the lowest level input that is significant to the fair value measurement is observable, either directly or indirectly
Level 3 — based on valuation techniques for which the lowest level input that is significant to the fair value measurement is unobservable

For assets and liabilities that are recognised in the Historical Financial Information on a recurring basis, the Group determines whether transfers have occurred between levels in the hierarchy by reassessing categorisation (based on the lowest level input that is significant to the fair value measurement as a whole) at the end of each of the Relevant Periods.

Impairment of non-financial assets

Where an indication of impairment exists, or when annual impairment testing for an asset is required (other than inventories, deferred tax assets and financial assets), the asset's recoverable amount is estimated. An asset's recoverable amount is the higher of the asset's or cash-generating unit's value in use and its fair value less costs of disposal, and is determined for an individual asset, unless the asset does not generate cash inflows that are largely independent of those from other assets or groups of assets, in which case the recoverable amount is determined for the cash-generating unit to which the asset belongs. In testing a cash-generating unit for impairment, a portion of the carrying amount of a corporate asset (e.g., a headquarters building) is allocated to an individual cash-generating unit if it can be allocated on a reasonable and consistent basis or, otherwise, to the smallest group of cash-generating units.

An Impairment loss is recognised only if the carrying amount of an asset exceeds its recoverable amount. In assessing value in use, the estimated future cash flows are discounted to their present value using a pre-tax discount rate that reflects current market assessments of the time value of money and the risks specific to the asset. An impairment loss is charged to the statement of profit or loss in the period in which it arises in those expense categories consistent with the function of the impaired asset.

An assessment is made at the end of each of the Relevant Periods as to whether there is an indication that previously recognised impairment losses may no longer exist or may have decreased. If such an indication exists, the recoverable amount is estimated. A previously recognised impairment loss of an asset other than goodwill is reversed only if there has been a change in the estimates used to determine the recoverable amount of that asset, but not to an amount higher than the carrying amount that would have been determined (net of any depreciation/amortisation) had no impairment loss been recognised for the asset in prior years. A reversal of such an impairment loss is credited to the statement of profit or loss in the period in which it arises.

Related parties

A party is considered to be related to the Group if:

(a) the party is a person or a close member of that person's family and that person:

(i) has control or joint control over the Group;

(ii) has significant influence over the Group; or

(iii) is a member of the key management personnel of the Group or of a parent of the Group;

or

(b) the party is an entity where any of the following conditions applies:

(i) the entity and the Group are members of the same group;

(ii) one entity is an associate or joint venture of the other entity (or of a parent, subsidiary or fellow subsidiary of the other entity);

(iii) the entity and the Group are joint ventures of the same third party;

(iv) one entity is a joint venture of a third entity and the other entity is an associate of the third entity;

(v) the entity is a post-employment benefit plan for the benefit of employees of either the Group or an entity related to the Group;

(vi) the entity is controlled or jointly controlled by a person identified in (a);

(vii) a person identified in (a)(i) has significant influence over the entity or is a member of the key management personnel of the entity (or of a parent of the entity); and

(viii) the entity, or any member of a group of which it is a part, provides key management personnel services to the Group or to the parent of the Group.

Property, plant and equipment and depreciation

Property, plant and equipment, other than construction in progress, are stated at cost less accumulated depreciation and any impairment losses. The cost of an item of property, plant and equipment comprises its purchase price and any directly attributable costs of bringing the asset to its working condition and location for its intended use.

Expenditure incurred after items of property, plant and equipment have been put into operation, such as repairs and maintenance, is normally charged to the statement of profit or loss in the period in which it is incurred. In situations where the recognition criteria are satisfied, the expenditure for a major inspection is capitalised in the carrying amount of the asset as a replacement. Where significant parts of property, plant and equipment are required to be replaced at intervals, the Group recognises such parts as individual assets with specific useful lives and depreciates them accordingly.

Depending on the nature of the item of property, plant and equipment, depreciation is calculated on the straight-line basis to write off the cost of each asset over its estimated useful life or it is calculated on the units-of-production ("UOP") basis to write off the cost of the asset proportionately to the extraction of the proven and probable mineral reserves. The estimated useful lives and annual depreciation rates for the assets depreciated on the straight-line basis are as follows:

	Estimated useful lives	**Annual depreciation rates**
Buildings	8 to 20 years	5.00% to 12.50%
Plant, machinery and equipment	5 to 15 years	6.67% to 20.00%
Motor vehicles	4 to 15 years	6.67% to 25.00%
Power generation and transmission equipment	8 to 30 years	3.33% to 12.50%
Office equipment, electronic equipment and others	3 to 10 years	10.00% to 33.33%
Mining properties	5 to 40 years	2.50% to 20.00%

Where parts of an item of property, plant and equipment have different useful lives, the cost of that item is allocated on a reasonable basis among the parts and each part is depreciated separately. Residual values, useful lives and the depreciation method are reviewed, and adjusted if appropriate, at least at the end of each of the Relevant Periods.

An item of property, plant and equipment including any significant part initially recognised is derecognised upon disposal or when no future economic benefits are expected from its use or disposal. Any gain or loss on disposal or retirement recognised in the statement of profit or loss in the year the asset is derecognised is the difference between the net sales proceeds and the carrying amount of the relevant asset.

Construction in progress is stated at cost less any impairment losses, and is not depreciated. It is reclassified to the appropriate category of property, plant and equipment when completed and ready for use.

Intangible assets

Intangible assets acquired separately are measured on initial recognition at cost. The cost of intangible assets acquired in a business combination is the fair value at the date of acquisition. The useful lives of intangible assets are assessed to be either finite or indefinite. Intangible assets with finite lives are subsequently amortised over the useful economic life and assessed for impairment whenever there is an indication that the intangible asset may be impaired. The amortisation period and the amortisation method for an intangible asset with a finite useful life are reviewed at least at the end of each of the Relevant Periods.

Exploration and evaluation assets

Exploration and evaluation assets are stated at cost less impairment losses. Exploration and evaluation assets includes costs of geological prospecting for technical consultancy and costs of feasibility study for commercial development which incurred in the surroundings, outer ring and deep areas of the existing or externally acquired mineral properties, and costs of drilling, trench sampling and other associated activities. Such expenditures may be capitalised when the mineral properties are reasonably determined to be commercially available and recognised as mining rights after obtaining mining rights or permits, which will be amortised under the UOP method. If any construction was terminated in the development phase or belongs to the productive exploration, all costs shall be written off and recognised in the statement of profit or loss for the period in which it arises.

Impairment reviews of exploration and evaluation assets are undertaken if events or changes in circumstances indicate a potential impairment. The carrying value of exploration and evaluation assets is compared to the recoverable amount, which is the higher of value-in-use and the fair value less costs of disposal. For the purposes of assessing impairment, assets are grouped at the lowest levels for which there are separately identifiable cash-generating units. Exploration and evaluation assets that suffered impairment are reviewed for possible reversal of the impairment at the end of each of the Relevant Periods.

Exploration and mining rights

Exploration rights are stated at cost less impairment losses. Exploration rights include the cost of acquiring exploration rights.

Mining rights are stated at cost less accumulated amortisation and any impairment losses. Mining rights include the cost of acquiring mining licenses, exploration rights and exploration and evaluation assets upon determination that an exploration property is capable of commercial production, and the cost of acquiring interests in the mining reserves of existing mining properties. The mining rights are amortised in accordance with the production plans of the entities concerned and the proven and probable mineral reserves of the mines using the UOP method. Mining rights are written off to the statement of profit or loss if the mining property is disposed.

Leases

The Group assesses at contract inception whether a contract is, or contains, a lease. A contract is, or contains, a lease if the contract conveys the right to control the use of an identified asset for a period of time in exchange for consideration.

Group as a lessee

The Group applies a single recognition and measurement approach for all leases, except for short-term leases and leases of low-value assets. The Group recognises lease liabilities to make lease payments and right-of-use assets representing the right to use the underlying assets.

(a) Right-of-use assets

Right-of-use assets are recognised at the commencement date of the lease (that is the date the underlying asset is available for use). Right-of-use assets are measured at cost, less accumulated depreciation and any impairment losses, and adjusted for any remeasurement of lease liabilities. The cost of right-of-use assets includes the amount of lease liabilities recognised, initial direct costs incurred, and lease payments made at or before the commencement date less any lease incentives received. Right-of-use assets are depreciated on a straight-line basis over the shorter of the lease terms and the estimated useful lives of the assets as follows:

Leasehold land	7 to 10 years
Buildings	2 to 5 years
Machinery and equipment	2 to 10 years
Motor vehicles	2 to 15 years

If ownership of the leased asset transfers to the Group by the end of the lease term or the cost reflects the exercise of a purchase option, depreciation is calculated using the estimated useful life of the asset.

(b) Lease liabilities

Lease liabilities are recognised at the commencement date of the lease at the present value of lease payments to be made over the lease term. The lease payments include fixed payments (including in-substance fixed payments) less any lease incentives receivable, variable lease payments that depend on an index or a rate, and amounts expected to be paid under residual value guarantees. The lease payments also include the exercise price of a purchase option reasonably certain to be exercised by the Group and payments of penalties for termination of a lease, if the lease term reflects the Group exercising the option to terminate the lease. The variable lease payments that do not depend on an index or a rate are recognised as an expense in the period in which the event or condition that triggers the payment occurs.

In calculating the present value of lease payments, the Group uses its incremental borrowing rate at the lease commencement date because the interest rate implicit in the lease is not readily determinable. After the commencement date, the amount of lease liabilities is increased to reflect the accretion of interest and reduced for the lease payments made. In addition, the carrying amount of lease liabilities is remeasured if there is a modification, a change in the lease term, a change in lease payments (e.g., a change to future lease payments resulting from a change in an index or rate) or a change in assessment of an option to purchase the underlying asset.

(c) Short-term leases and leases of low-value assets

The Group applies the short-term lease recognition exemption to its short-term leases of plant equipment and motor vehicles (that is those leases that have a lease term of 12 months or less from the commencement date and do not contain a purchase option). It also applies the recognition exemption for leases of low-value assets to leases of office equipment and laptop computers that are considered to be of low value. Lease payments on short-term leases and leases of low-value assets are recognised as an expense on a straight-line basis over the lease term.

Group as a lessor

When the Group acts as a lessor, it classifies at lease inception (or when there is a lease modification) each of its leases as either an operating lease or a finance lease.

Leases in which the Group does not transfer substantially all the risks and rewards incidental to ownership of an asset are classified as operating leases. When a contract contains lease and non-lease components, the Group allocates the consideration in the contract to each component on a relative stand-alone selling price basis. Rental income is accounted for on a straight-line basis over the lease term and is included in revenue in the statement of profit or loss due to its operating nature. Initial direct costs incurred in negotiating and arranging an operating lease are added to the carrying amount of the leased asset and recognised over the lease term on the same basis as rental income. Contingent rents are recognised as revenue in the period in which they are earned.

Leases that transfer substantially all the risks and rewards incidental to ownership of an underlying asset to the lessee are accounted for as finance leases.

Investments and other financial assets

Initial recognition and measurement

Financial assets are classified, at initial recognition, as subsequently measured at amortised cost, fair value through other comprehensive income, and fair value through profit or loss.

The classification of financial assets at initial recognition depends on the financial asset's contractual cash flow characteristics and the Group's business model for managing them. With the exception of trade receivables that do not contain a significant financing component or for which the Group has applied the practical expedient of not adjusting the effect of a significant financing component, the Group initially measures a financial asset at its fair value plus in the case of a financial asset not at fair value through profit or loss, less transaction costs. Trade receivables that do not contain a significant financing component or for which the Group has applied the practical expedient are measured at the transaction price determined under IFRS 15 in accordance with the policies set out for "Revenue recognition" below.

In order for a financial asset to be classified and measured at amortised cost or fair value through other comprehensive income, it needs to give rise to cash flows that are solely payments of principal and interest ("SPPI") on the principal amount outstanding. Financial assets with cash flows that are not SPPI are classified and measured at fair value through profit or loss, irrespective of the business model.

The Group's business model for managing financial assets refers to how it manages its financial assets in order to generate cash flows. The business model determines whether cash flows will result from collecting contractual cash flows, selling the financial assets, or both. Financial assets classified and measured at amortised cost are held within a business model with the objective to hold financial assets in order to collect contractual cash flows, while financial assets classified and measured at fair value through other comprehensive income are held within a business model with the objective of both holding to collect contractual cash flows and selling. Financial assets which are not held within the aforementioned business models are classified and measured at fair value through profit or loss.

Purchases or sales of financial assets that require delivery of assets within the period generally established by regulation or convention in the marketplace are recognised on the trade date, that is, the date that the Group commits to purchase or sell the asset.

Subsequent measurement

The subsequent measurement of financial assets depends on their classification as follows:

Financial assets at amortised cost (debt instruments)

Financial assets at amortised cost are subsequently measured using the effective interest method and are subject to impairment. Gains and losses are recognised in profit or loss when the asset is derecognised, modified or impaired.

Financial assets designated at fair value through other comprehensive income (equity investments)

Upon initial recognition, the Group can elect to classify irrevocably its equity investments as equity investments designated at fair value through other comprehensive income when they meet the definition of equity under IAS 32 Financial Instruments: Presentation and are not held for trading. The classification is determined on an instrument-by-instrument basis.

Gains and losses on these financial assets are never recycled to the statement of profit or loss. Dividends are recognised as other income in the statement of profit or loss when the right of payment has been established, except when the Group benefits from such proceeds as a recovery of part of the cost of the financial asset, in which case, such gains are recorded in other comprehensive income. Equity investments designated at fair value through other comprehensive income are not subject to impairment assessment.

Financial assets at fair value through profit or loss

Financial assets at fair value through profit or loss are carried in the statement of financial position at fair value with net changes in fair value recognised in the statement of profit or loss.

This category includes derivative instruments and equity investments which the Group had not irrevocably elected to classify at fair value through other comprehensive income. Dividends on the equity investments are also recognised as other income in the statement of profit or loss when the right of payment has been established.

Financial assets at fair value through profit or loss

Financial assets at fair value through profit or loss are carried in the statement of financial position at fair value with net changes in fair value recognised in the statement of profit or loss.

This category includes derivative instruments and equity investments which the Group had not irrevocably elected to classify at fair value through other comprehensive income. Dividends on the equity investments are also recognised as other income in the statement of profit or loss when the right of payment has been established.

A derivative embedded in a hybrid contract, with a financial liability or non-financial host, is separated from the host and accounted for as a separate derivative if the economic characteristics and risks are not closely related to the host; a separate instrument with the same terms as the embedded derivative would meet the definition of a derivative; and the hybrid contract is not measured at fair value through profit or loss. Embedded derivatives are measured at fair value with changes in fair value recognised in the statement of profit or loss. Reassessment occurs if there is a change in the terms of the contract that significantly modifies the cash flows.

A derivative embedded within a hybrid contract containing a financial asset host is not accounted for separately. The financial asset host together with the embedded derivative is required to be classified in its entirety as a financial asset at fair value through profit or loss.

Derecognition of financial assets

A financial asset (or, where applicable, a part of a financial asset or part of a group of similar financial assets) is primarily derecognised (i.e., removed from the Group's combined statements of financial position) when:

- the rights to receive cash flows from the asset have expired; or
- the Group has transferred its rights to receive cash flows from the asset or has assumed an obligation to pay the received cash flows in full without material delay to a third party under a "pass-through" arrangement; and either (a) the Group has transferred substantially all the risks and rewards of the asset, or (b) the Group has neither transferred nor retained substantially all the risks and rewards of the asset, but has transferred control of the asset.

When the Group has transferred its rights to receive cash flows from an asset or has entered into a pass-through arrangement, it evaluates if, and to what extent, it has retained the risk and rewards of ownership of the asset. When it has neither transferred nor retained substantially all the risks and rewards of the asset nor transferred control of the asset, the Group continues to recognise the transferred asset to the extent of the Group's continuing involvement. In that case, the Group also recognises an associated liability. The transferred asset and the associated liability are measured on a basis that reflects the rights and obligations that the Group has retained.

Continuing involvement that takes the form of a guarantee over the transferred asset is measured at the lower of the original carrying amount of the asset and the maximum amount of consideration that the Group could be required to repay.

Impairment of financial assets

The Group recognises an allowance for expected credit losses ("ECLs") for all debt instruments not held at fair value through profit or loss. ECLs are based on the difference between the contractual cash flows due in accordance with the contract and all the cash flows that the Group expects to receive, discounted at an approximation of the original effective interest rate. The expected cash flows will include cash flows from the sale of collateral held or other credit enhancements that are integral to the contractual terms.

General approach

ECLs are recognised in two stages. For credit exposures for which there has not been a significant increase in credit risk since initial recognition, ECLs are provided for credit losses that result from default events that are possible within the next 12 months (a 12-month ECL). For those credit exposures for which there has been a significant increase in credit risk since initial recognition, a loss allowance is required for credit losses expected over the remaining life of the exposure, irrespective of the timing of the default (a lifetime ECL).

At the end of each of the Relevant Periods, the Group assesses whether the credit risk on a financial instrument has increased significantly since initial recognition. When making the assessment, the Group compares the risk of a default occurring on the financial instrument as at the end of each of the Relevant Periods with the risk of a default occurring on the financial instrument as at the date of initial recognition and considers reasonable and supportable information that is available without undue cost or effort, including historical and forward-looking information. The Group considers that there has been a significant increase in credit risk when contractual payments are more than 90 days past due.

The Group considers a financial asset in default when contractual payments are 90 days past due. However, in certain cases, the Group may also consider a financial asset to be in default when internal or external information indicates that the Group is unlikely to receive the outstanding contractual amounts in full before taking into account any credit enhancements held by the Group.

A financial asset is written off when there is no reasonable expectation of recovering the contractual cash flows.

Financial assets at amortised cost are subject to impairment under the general approach and they are classified within the following stages for measurement of ECLs except for trade receivables which apply the simplified approach as detailed below.

Stage 1 — Financial instruments for which credit risk has not increased significantly since initial recognition and for which the loss allowance is measured at an amount equal to 12-month ECLs;

Stage 2 — Financial instruments for which credit risk has increased significantly since initial recognition but that are not credit-impaired financial assets and for which the loss allowance is measured at an amount equal to lifetime ECLs;

Stage 3 — Financial assets that are credit-impaired at the end of each of the Relevant Periods (but that are not purchased or originated credit-impaired) and for which the loss allowance is measured at an amount equal to lifetime ECLs.

Simplified approach

For trade receivables that do not contain a significant financing component or when the Group applies the practical expedient of not adjusting the effect of a significant financing component, the Group applies the simplified approach in calculating ECLs. Under the simplified approach, the Group does not track changes in credit risk, but instead recognises a loss allowance based on lifetime ECLs at the end of each of the Relevant Periods. The Group has established a provision matrix that is based on its historical credit loss experience, adjusted for forward-looking factors specific to the debtors and the economic environment.

Financial liabilities

Initial recognition and measurement

Financial liabilities are classified, at initial recognition, as financial liabilities at fair value through profit or loss, loans and borrowings, or payables, as appropriate.

All financial liabilities are recognised initially at fair value and, in the case of loans and borrowings and payables, net of directly attributable transaction costs.

The Group's financial liabilities include interest-bearing bank and other borrowings, trade payables, derivative financial liabilities, covertbile debentures, other payables and accruals, other non-current liabilities.

Subsequent measurement

The subsequent measurement of financial liabilities depends on their classification as follows:

Financial liabilities at fair value through profit or loss

Financial liabilities at fair value through profit or loss include financial liabilities held for trading and financial liabilities designated upon initial recognition as at fair value through profit or loss.

Financial liabilities are classified as held for trading if they are incurred for the purpose of repurchasing in the near term. This category also includes derivative financial instruments entered into by the Group that are not designated as hedging instruments in hedge relationships as defined by IFRS 9. Separated embedded derivatives are also classified as held for trading unless they are designated as effective hedging instruments. Gains or losses on liabilities held for trading are recognised in the statement of profit or loss. The net fair value gain or loss recognised in the statement of profit or loss does not include any interest charged on these financial liabilities.

Financial liabilities designated upon initial recognition as at fair value through profit or loss are designated at the initial date of recognition, and only if the criteria in IFRS 9 are satisfied. Gains or losses on liabilities designated at fair value through profit or loss are recognised in the statement of profit or loss, except for the gains or losses arising from the Group's own credit risk which are presented in other comprehensive income with no subsequent reclassification to the statement of profit or loss. The net fair value gain or loss recognised in the statement of profit or loss does not include any interest charged on these financial liabilities.

Financial liabilities at amortised cost (trade payables, other payables and interest-bearing bank and other borrowings)

After initial recognition, payables and loans are subsequently measured at amortised cost, using the effective interest rate method unless the effect of discounting would be immaterial, in which case they are stated at cost. Gains and losses are recognised in the statement of profit or loss when the liabilities are derecognised as well as through the effective interest rate amortisation process.

Amortised cost is calculated by taking into account any discount or premium on acquisition and fees or costs that are an integral part of the effective interest rate. The effective interest rate amortisation is included in finance costs in the statement of profit or loss.

Derivative financial instruments

The Group uses derivative financial instruments, such as forward currency contracts and sales contracts with provisional pricing arrangements. Such derivative financial instruments are initially recognised at fair value on the date on which a derivative contract is entered into and are subsequently remeasured at fair value. Derivatives are carried as assets when the fair value is positive and as liabilities when the fair value is negative.

Any gains or losses arising from changes in fair value of derivatives are taken directly to the statement of profit or loss, except for the effective portion of cash flow hedges, which is recognised in other comprehensive income and later reclassified to profit or loss when the hedged item affects profit or loss.

Convertible debentures

The convertible debentures issued by CGI were designated upon initial recognition at fair value through profit or loss. It is initially recognised at fair value. Any directly attributable transaction costs are recognised as finance costs in profit or loss.The component of fair value changes relating to the issuer's own credit risk is recognised in other comprehensive income. Amounts recorded in other comprehensive income related to credit risk are not subject to recycling in profit or loss, but are transferred to retained earnings when realised. The net fair value changes relating to market risk are recognised in profit or loss which do not include any interest charged on these financial liabilities.

Inventories

Inventories are stated at the lower of cost and net realisable value. Cost is determined on the weighted average basis and, in the case of work in progress and finished goods, comprises direct materials, direct labour and an appropriate proportion of overheads. Net realisable value is based on estimated selling prices less any estimated costs to be incurred to completion and disposal.

Cash and cash equivalents

Cash and cash equivalents in the combined statement of financial position comprise cash on hand and at banks, and short-term highly liquid deposits with a maturity of generally within three months that are readily convertible into known amounts of cash, subject to an insignificant risk of changes in value and held for the purpose of meeting short-term cash commitments.

For the purpose of the combined statement of cash flows, cash and cash equivalents comprise cash on hand and at banks, including term deposits, and assets similar in nature to cash, which are not restricted as to use.

Provisions

A provision is recognised when a present obligation (legal or constructive) has arisen as a result of a past event and it is probable that a future outflow of resources will be required to settle the obligation, provided that a reliable estimate can be made of the amount of the obligation.

When the effect of discounting is material, the amount recognised for a provision is the present value at the end of each of the Relevant Periods of the future expenditures expected to be required to settle the obligation. The increase in the discounted present value amount arising from the passage of time is included in finance costs in the statement of profit or loss.

Provisions for the Group's obligations for environmental rehabilitation and restoration of mines are based on estimates of required expenditure at the mines in accordance with the local rules and regulations where the mines are located. The Group estimates its liabilities for final reclamation and mine closure based upon detailed calculations of the amount and timing of the future cash expenditure for the required work. Spending estimates are escalated for inflation, then discounted at a discount rate that reflects current market assessments of the time value of money and the risks specific to the liability such that the amount of provision reflects the present value of the expenditures expected to be required to settle the obligation. The Group records a corresponding asset in the period in which the liability is incurred. The liability is accreted to the projected expenditure date. As changes in estimates occur (such as mine plan revisions, changes in estimated costs, or changes in the timing of the performance of reclamation activities), the revisions to the obligation and the asset are recognised at the appropriate discount rate.

Income tax

Income tax comprises current and deferred tax. Income tax relating to items recognised outside profit or loss is recognised outside profit or loss, either in other comprehensive income or directly in equity.

Current tax assets and liabilities are measured at the amount expected to be recovered from or paid to the taxation authorities, based on tax rates (and tax laws) that have been enacted or substantively enacted by the end of each of the Relevant Periods, taking into consideration interpretations and practices prevailing in the countries in which the Group operates.

Deferred tax is provided, using the liability method, on all temporary differences at the end of each of the Relevant Periods between the tax bases of assets and liabilities and their carrying amounts for financial reporting purposes, except that deferred tax is not recognised for the Pillar Two income taxes.

Deferred tax liabilities are recognised for all taxable temporary differences, except:

- when the deferred tax liability arises from the initial recognition of goodwill or an asset or liability in a transaction that is not a business combination and, at the time of the transaction, affects neither the accounting profit nor taxable profit or loss and does not give rise to equal taxable and deductible temporary differences; and

- in respect of taxable temporary differences associated with investments in subsidiaries and associates, when the timing of the reversal of the temporary differences can be controlled and it is probable that the temporary differences will not reverse in the foreseeable future.

Deferred tax assets are recognised for all deductible temporary differences, and the carryforward of unused tax credits and any unused tax losses. Deferred tax assets are recognised to the extent that it is probable that taxable profit will be available against which the deductible temporary differences, and the carryforward of unused tax credits and unused tax losses can be utilised, except:

- when the deferred tax asset relating to the deductible temporary differences arises from the initial recognition of an asset or liability in a transaction that is not a business combination and, at the time of the transaction, affects neither the accounting profit nor taxable profit or loss and does not give rise to equal taxable and deductible temporary differences; and

- in respect of deductible temporary differences associated with investments in subsidiaries and associates, deferred tax assets are only recognised to the extent that it is probable that the temporary differences will reverse in the foreseeable future and taxable profit will be available against which the temporary differences can be utilised.

The carrying amount of deferred tax assets is reviewed at the end of each of the Relevant Periods and reduced to the extent that it is no longer probable that sufficient taxable profit will be available to allow all or part of the deferred tax asset to be utilised. Unrecognised deferred tax assets are reassessed at the end of each of the Relevant Periods and are recognised to the extent that it has become probable that sufficient taxable profit will be available to allow all or part of the deferred tax asset to be recovered.

Deferred tax assets and liabilities are measured at the tax rates that are expected to apply to the period when the asset is realised or the liability is settled, based on tax rates (and tax laws) that have been enacted or substantively enacted by the end of each of the Relevant Periods.

Deferred tax assets and deferred tax liabilities are offset if and only if the Group has a legally enforceable right to set off current tax assets and current tax liabilities and the deferred tax assets and deferred tax liabilities relate to income taxes levied by the same taxation authority on either the same taxable entity or different taxable entities which intend either to settle current tax liabilities and assets on a net basis, or to realise the assets and settle the liabilities simultaneously, in each future period in which significant amounts of deferred tax liabilities or assets are expected to be settled or recovered.

Revenue recognition

Revenue from contracts with customers

Revenue from contracts with customers is recognised when control of goods or services is transferred to the customers at an amount that reflects the consideration to which the Group expects to be entitled in exchange for those goods or services.

When the consideration in a contract includes a variable amount, the amount of consideration is estimated to which the Group will be entitled in exchange for transferring the goods or services to the customer. The variable consideration is estimated at contract inception and constrained until it is highly probable that a significant revenue reversal in the amount of cumulative revenue recognised will not occur when the associated uncertainty with the variable consideration is subsequently resolved.

When the contract contains a financing component which provides the customer with a significant benefit of financing the transfer of goods or services to the customer for more than one year, revenue is measured at the present value of the amount receivable, discounted using the discount rate that would be reflected in a separate financing transaction between the Group and the customer at contract inception. When the contract contains a financing component which provides the Group with a significant financial benefit for more than one year, revenue recognised under the contract includes the interest expense accreted on the contract liability under the effective interest method. For a contract where the period between the payment by the customer and the transfer of the promised goods or services is one year or less, the transaction price is not adjusted for the effects of a significant financing component, using the practical expedient in IFRS 15.

Sale of mineral products

Revenue from the sale of products is recognised at the point in time when control of the asset is transferred to the customer, generally on delivery of the products. A portion of the Group's sales of metal in concentrate allow for price adjustments based on the market price at the end of the relevant quotation periods ("QP") stipulated in the contract. These are referred to as provisional pricing arrangements and are such that the selling price for metal in concentrate is based on prevailing spot prices on a specified future date after shipment to the customer. Adjustments to the sales price occur based on movements in quoted market prices up to the end of the QP. The QPs can range between one and two months post shipment and final payment is due within 30 days after the end of the QP.

Revenue is recognised when control passes to the customer, which occurs at a point in time when the metal in concentrate is physically transferred onto a vessel, train, conveyor or other delivery mechanism.

Metal streaming arrangement

There is a metal streaming arrangement in CGI since 2020. In this arrangement, CGI received an upfront amount in cash from an investor and the investor in return received the right to purchase a certain proportion of future gold and silver production for the life of the mine at a price of a certain proportion of the market price at the time of delivery.

This upfront amount is considered to be a partial prepayment for the future delivery of an unknown but estimable amount of gold and silver ounces, with each ounce presenting a separate performance obligation. Upon receipt, the upfront amount is recognised as a contract liability. The upfront consideration is considered to represent variable consideration, on the basis that the portion of the upfront amount to be allocated to each future ounce will depend on the number of ounces estimated to remain in the mine. Revenue is recognised at the point in time when control of the goods is transferred. In addition, the transaction price is considered to contain a significant financing component, given the long-term nature of the upfront payment and the period of time between the receipt of the upfront cash, and the satisfaction of the future performance obligations. Given this, when the underlying production profile of the mine changes and the reserves and resources are updated, the variable portion of the transaction price allocated to each ounce will need to be updated relating to changes in variable transaction price in accordance with the requirements in IFRS 15. The change in transaction price per unit will therefore result in a cumulative catch up adjustment to revenue in the period in which the change is made, reflecting the updated number of ounces expected to be delivered under the streaming arrangement. There will also be a corresponding adjustment to the interest charge.

Revenue from other sources

Rental income is recognised on a time proportion basis over the lease terms. Variable lease payments that do not depend on an index or a rate are recognised as income in the accounting period in which they are incurred.

Other income

Interest income is recognised on an accrual basis using the effective interest method by applying the rate that exactly discounts the estimated future cash receipts over the expected life of the financial instrument or a shorter period, when appropriate, to the net carrying amount of the financial asset.

Contract liabilities

A contract liability is recognised when a payment is received or a payment is due (whichever is earlier) from a customer before the Group transfers the related goods or services. Contract liabilities are recognised as revenue when the Group performs under the contract (i.e., transfers control of the related goods or services to the customer).

Share-based payments

The Holding Company operates certain restricted A share incentive scheme and employee stock ownership scheme. Employees (including directors) of the Group receive remuneration in the form of share-based payments, whereby employees render services in exchange for equity instruments ("equity-settled transactions") of the Holding Company. The cost of equity-settled transactions with employees is measured by reference to the fair value at the date at which they are granted, further details of which are given in note 38 to the financial statements.

The cost of equity-settled transactions is recognised in employee benefit expense, together with a corresponding increase in equity, over the period in which the performance and/or service conditions are fulfilled. The cumulative expense recognised for equity-settled transactions at the end of each Relevant Periods until the vesting date reflects the extent to which the vesting period has expired and the Group's best estimate of the number of equity instruments that will ultimately vest. The charge or credit to the statement of profit or loss for a period represents the movement in the cumulative expense recognised as at the beginning and end of that period.

Service and non-market performance conditions are not taken into account when determining the grant date fair value of awards, but the likelihood of the conditions being met is assessed as part of the Group's best estimate of the number of equity instruments that will ultimately vest. Market performance conditions are reflected within the grant date fair value. Any other conditions attached to an award, but without an associated service requirement, are considered to be non-vesting conditions. Non-vesting conditions are reflected in the fair value of an award and lead to an immediate expensing of an award unless there are also service and/or performance conditions.

For awards that do not ultimately vest because non-market performance and/or service conditions have not been met, no expense is recognised. Where awards include a market or non-vesting condition, the transactions are treated as vesting irrespective of whether the market or non-vesting condition is satisfied, provided that all other performance and/or service conditions are satisfied.

Where the terms of an equity-settled award are modified, as a minimum an expense is recognised as if the terms had not been modified, if the original terms of the award are met. In addition, an expense is recognised for any modification that increases the total fair value of the share-based payments, or is otherwise beneficial to the employee as measured at the date of modification. Where an equity-settled award is cancelled, it is treated as if it had vested on the date of cancellation, and any expense not yet recognised for the award is recognised immediately.

Other employee benefits

Pension schemes

The Group operates a defined contribution Mandatory Provident Fund retirement benefit scheme (the "MPF Scheme") under the Mandatory Provident Fund Schemes Ordinance for all of its employees in Hong Kong. The assets of the MPF Scheme are held separately from those of the Group in an independently administered fund. Contributions are made based on a percentage of the employees' basic salaries and are charged to the statement of profit or loss as and when the contributions fall due.

The employees of the Group's subsidiaries which operate overseas are required to participate in a central pension scheme operated by the local municipal government. Contributions are made based on a percentage of the employees' salaries and are charged to the statement of profit or loss as they become payable. The contributions are charged to the statement of profit or loss as they become payable in accordance with the rules of the central pension scheme.

Termination benefits

Termination benefits are recognised at the earlier of when the Group can no longer withdraw the offer of those benefits and when the Group recognises restructuring costs involving the payment of termination benefits.

Borrowing costs

Borrowing costs directly attributable to the acquisition, construction or production of qualifying assets, i.e., assets that necessarily take a substantial period of time to get ready for their intended use or sale, are capitalised as part of the cost of those assets. The capitalisation of such borrowing costs ceases when the assets are substantially ready for their intended use or sale. All other borrowing costs are expensed in the period in which they are incurred. Borrowing costs consist of interest and other costs that an entity incurs in connection with the borrowing of funds.

Events after the Relevant Periods

If the Group receives information after the Relevant Periods, but prior to the date of authorisation for issue, about conditions that existed at the end of each of the Relevant Periods, it will assess whether the information affects the amounts that it recognises in its financial statements. The Group will adjust the amounts recognised in its financial statements to reflect any adjusting events after the Relevant Periods and update the disclosures that relate to those conditions in light of the new information. For non-adjusting events after the Relevant Periods, the Group will not change the amounts recognised in its financial statements, but will disclose the nature of the non-adjusting events and an estimate of their financial effects, or a statement that such an estimate cannot be made, if applicable.

Dividends

Final dividends are recognised as a liability when they are approved by the shareholders in a general meeting. Proposed final dividends are disclosed in the note 15 to the Historical Financial Information.

Foreign currencies

The Historical Financial Information is presented in United States Dollar ("USD"), which is the Company's functional currency. Each entity in the Group determines its own functional currency and items included in the financial statements of each entity are measured using that functional currency. Foreign currency transactions recorded by the entities in the Group are initially recorded using their respective functional currency rates prevailing at the dates of the transactions. Monetary assets and liabilities denominated in foreign currencies are translated at the functional currency rates of exchange ruling at the end of each of the Relevant Periods. Differences arising on settlement or translation of monetary items are recognised in the statement of profit or loss.

Non-monetary items that are measured in terms of historical cost in a foreign currency are translated using the exchange rates at the dates of the initial transactions. Non-monetary items measured at fair value in a foreign currency are translated using the exchange rates at the date when the fair value was measured. The gain or loss arising on translation of a non-monetary item measured at fair value is treated in line with the recognition of the gain or loss on change in fair value of the item (i.e., translation difference on the item whose fair value gain or loss is recognised in other comprehensive income or profit or loss is also recognised in other comprehensive income or profit or loss, respectively).

In determining the exchange rate on initial recognition of the related asset, expense or income on the derecognition of a non-monetary asset or non-monetary liability relating to an advance consideration, the date of initial transaction is the date on which the Group initially recognises the non-monetary asset or non-monetary liability arising from the advance consideration. If there are multiple payments or receipts in advance, the Group determines the transaction date for each payment or receipt of the advance consideration.

The functional currencies of certain overseas subsidiaries and associates are currencies other than the USD. As at the end of each of the Relevant Periods, the assets and liabilities of these entities are translated into USD at the exchange rates prevailing at the end of each of the Relevant Periods and their statements of profit or loss are translated into USD at the exchange rates that approximate to those prevailing at the dates of the transactions.

The resulting exchange differences are recognised in other comprehensive income and accumulated in the exchange fluctuation reserve, except to the extent that the differences are attributable to non-controlling interests. On disposal of a foreign operation, the cumulative amount in the reserve relating to that particular foreign operation is recognised in the statement of profit or loss.

For the purpose of the combined statement of cash flows, the cash flows of overseas subsidiaries are translated into USD at the exchange rates that approximate to those prevailing at the dates of the transactions. Frequently recurring cash flows of overseas subsidiaries which arise throughout the year are translated into USD at the weighted average exchange rates for the year.

5. SIGNIFICANT ACCOUNTING JUDGEMENTS AND ESTIMATES

The preparation of the Group's Historical Financial Information requires management to make judgements, estimates and assumptions that affect the reported amounts of revenues, expenses, assets and liabilities, and their accompanying disclosures, and the disclosure of contingent liabilities at the end of each of the Relevant Periods. Uncertainty about these estimates and assumptions could result in outcomes that could require a material adjustment to the carrying amount of the assets or liabilities affected in the future.

Judgements

In the process of applying the Group's accounting policies, management has made the following judgements, apart from those involving estimations, which have the most significant effects on the amounts recognised in the financial statements:

Consolidation of affiliated entities through contractual agreements

The Group executive effective control over Zijin America by entering into a series of contractual arrangements. Nevertheless, the contractual arrangements and other measures may not be as effective as direct legal ownership in providing the Group with direct control over Zijin America and uncertainties presented by possible litigation could impede the Group's beneficiary rights of the results, assets and liabilities of Zijin America. The directors of the Company, based on the advice of its legal counsel, consider that the contractual arrangements in relation to Zijin America are in compliance with the relevant laws and are legally enforceable.

Corporate income tax

As a result of the fact that certain matters relating to the corporate income taxes have not been confirmed by the local tax bureau as at the end of the Relevant Periods, objective estimates based on currently enacted tax laws, regulations and other related policies are required in determining the provision for corporate income tax expenses to be made for the each of the Relevant Periods. Where the final tax outcome of these matters is different from the amounts originally recorded, the differences will be accounted for in the income tax expenses in the period in which the differences are realised.

Estimation uncertainty

The key assumptions concerning the future and other key sources of estimation uncertainty at the balance sheet date, that have a significant risk of causing a material adjustment to the carrying amounts of assets and liabilities within the future accounting periods, are described below.

Impairment of financial assets

The Group has adopted the expected credit loss model to evaluate the impairment of financial assets. The application of the expected credit loss model requires significant judgements and estimates and the consideration of all reasonable and soundly based information, including forward-looking information. In making such judgements and estimates, the Group estimates the projected movements of the debtor's credit risk according to past repayment records, economic policies, macro-economic indicators and industry risks, etc. Different estimates may affect the impairment provision, and the amount of impairment provision may not equal to the actual amount of impairment loss in the future.

Impairment of non-current assets other than financial assets (excluding goodwill)

The Group assesses whether there are any indicators of impairment for non-current assets other than financial assets at the end of the each of the Relevant Periods. Other non-current assets other than financial assets are tested for impairment when there are indicators that the carrying amounts may not be recoverable. An impairment exists when the carrying value of an asset or asset group exceeds its recoverable amount, which is the higher of its fair value less costs of disposal and its value in use. The calculation of the fair value less costs of disposal based on available data from binding sales transactions in an arm's length transaction of similar assets or observable market prices less incremental costs for disposing of the asset. When value in use calculations are undertaken, management must estimate the expected future cash flows from the asset or asset group and choose a suitable discount rate in order to calculate the present value of those cash flows. These estimates and judgements may be recognised affected by changes in future market or economic conditions.

Exploration expenditures

After determining the capitalisation amount of exploration expenditures, the Group will regularly evaluate the exploration results. If the reviewed geological exploration report shows that there are no prospecting results or no economically recoverable reserves, or that the economic benefits of mining cannot be achieved and further exploration is unnecessary due to low grade and difficulties in mining and processing, the exploration and development costs previously collected will be expensed and included in the statement of profit and loss for the current period in a lump sum.

Proved mineral reserves

Proved mineral reserves are estimated based on professional knowledge, experience and industry practice. Generally, the mineral reserve volume estimated based on probing and estimation may not be very accurate. The estimation is updated in accordance with new technologies and new information. Any changes in estimation will have impacts on the amounts of mining assets' depreciation and mining rights' amortisation using the UOP method, on the stripping ratio which was used in the capitalisation of stripping costs, and on each of the transaction prices of the metal streaming arrangement, etc. This may result in changes of or impacts on the Group's development and operation plan, and hence the Group's operations and operating results.

Deferred tax assets

To the extent that it is probable that there are sufficient taxable profits to offset the deductible losses, deferred tax assets shall be recognised for all unused deductible losses. Substantial management's judgements regarding the timing, amount of future taxable profit as well as tax planning strategies are needed when estimating the amount of deferred tax assets. Further details are included in note 21 to the Historical Financial Information.

Provision for environmental rehabilitation and restoration of mines

Pursuant to the regulations of the governmental authorities of the places where the mines are located, the Group recognises provision for environmental rehabilitation and restoration of mines. The amount of provision is an estimate based upon the life of mining rights, timing of mine closure and cost of such rehabilitation. When this estimate changes, it may affect the Group's operations and performance. Further details are included in note 33 to the Historical Financial Information.

Leases — Estimating the incremental borrowing rate

The Group cannot readily determine the interest rate implicit in a lease, and therefore, it uses an incremental borrowing rate ("IBR") to measure lease liabilities. The IBR is the rate of interest that the Group would have to pay to borrow over a similar term, and with a similar security, the funds necessary to obtain an asset of a similar value to the right-of-use asset in a similar economic environment. The IBR therefore reflects what the Group "would have to pay", which requires estimation when no observable rates are available (such as for subsidiaries that do not enter into financing transactions) or when it needs to be adjusted to reflect the terms and conditions of the lease (for example, when leases are not in the subsidiary's functional currency). The Group estimates the IBR using observable inputs (such as market interest rates) when available and is required to make certain entity-specific estimates (such as the subsidiary's stand-alone credit rating).

6. OPERATING SEGMENT INFORMATION

The Company identifies operating segments and prepares segment information based on the regular internal financial information reported to the executive directors for their decisions about resources allocation to the Group's business components and for their review of the performance of those components. The business components in the internal financial information reported to the executive directors are determined following the Group's major product lines.

During the Relevant Periods, the Group was principally engaged in exploration and mining of gold and non-ferrous metal. Management reviews the operating results of the businesses as a single operating segment to make decisions about resources to be allocated. Therefore, the executive directors regard that there is only one segment which is used to make strategic decisions.

Geographical information

(a) Revenue from external customers

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024

The following table shows the amounts of revenue recognised in the Relevant Periods that were included in the contract liabilities at the beginning of each of the Relevant Periods:

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
	USD'000	USD'000	USD'000
Revenue recognised that was included in contract liabilities at the beginning of each of the Relevant Periods:			
Sale of goods	1,443	572	1,590
Sale of silver from metal streaming arrangement (note 35)	5,876	8,616	10,473
	7,319	9,188	12,063

(b) Information about the Group's performance obligations

Sale of goods:

The Group recognises revenue when customers gain the control of goods. Prepayments received from customers before delivery of goods are recognised as contract liabilities in the combined financial statements. Among them, the sales arrangement related to the metal streaming arrangement is detailed in note 35.

The Group has elected the practical expedient as described in IFRS 15.121(b) to not disclose the remaining performance obligations for these types of contracts.

8. OTHER INCOME AND GAINS

		—	263	—	—	263

The emoluments of Wang Chun, Zhang Yan and Fan Cheung Man in relation to their services rendered for the Group for the Relevant Periods were borne by Zijin Mining and not allocated to the Group as management of the Company considers there is no reasonable basis for such allocation.

(i) Shen Shaoyang was appointed as a Chairman on 2 January 2020 and resigned on 30 May 2025.
(ii) Wang Chun was appointed as a Non-Executive Director on 8 October 2021.
(iii) Fan Cheung Man was appointed as a Director on 12 November 2021 and resigned on 21 March 2023.
(iv) Zhang Yan was appointed as a Director on 7 March 2023 and resigned on 30 May 2025.
(v) Guo Xianjian was appointed as Chief Executive Officer and Executive Director on 29 April 2025.
(vi) Yiu Kai was appointed as Chief Financial Officer and Executive Director on 29 April 2025.
(vii) Huang Zhihua was appointed as Chief Operating Officer and Executive Director on 17 June 2025.
(viii) Lin Hongfu was appointed as a Non-Executive Director on 17 June 2025.
(ix) Jian Shiming was appointed as a Non-Executive Director on 17 June 2025.
(x) Xie Shaobo was appointed as an Independent Non-Executive Director on 17 June 2025.
(xi) Hui Lai Kwan was appointed as an Independent Non-Executive Director on 17 June 2025.
(xii) Chan Hon was appointed as an Independent Non-Executive Director on 17 June 2025.

12. FIVE HIGHEST PAID EMPLOYEES

The five highest paid employees who are neither a director nor chief executive of the Company during the Relevant Periods are as follows:

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
	USD'000	USD'000	USD'000
Salaries, allowances and benefits in kind	1,448	1,805	1,901
Performance related bonuses	985	480	539
Pension scheme contributions.	63	35	29
Share-based payment expenses	—	129	147
	2,496	2,449	2,616

The numbers of non-director and non-chief executive highest paid employees whose remuneration fell within the following bands are as follows:

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
Nil to HKD1,000,000	—	—	—
1,000,000 to HKD3,500,000	1	2	3
3,500,000 to HKD7,000,000	4	3	2
	5	5	5

13. INCOME TAX

Hong Kong profits tax has been provided at the rate of 16.5% on the estimated assessable profits arising in Hong Kong during the year. Taxes on profits assessable elsewhere have been calculated at the rates of tax prevailing in the jurisdictions in which the Group operates.

Pillar Two income taxes

The Group is within the scope of the Pillar Two model rules. The Group has applied the mandatory exception to recognizing and disclosing information about deferred tax assets and liabilities arising from Pillar Two income taxes, and will account for the Pillar Two income taxes as current tax when incurred. Pillar Two legislation has been enacted or substantively enacted but not yet in effect as at 31 December 2024 in certain jurisdictions in which the Group operates.

The Group has assessed its potential exposure based on the information available regarding the financial performance of the Group in the Relevant Periods. As such, it may not be entirely representative of future circumstances. Based on the assessment, the Group's effective tax rates in all jurisdictions in which it operates are above 15% and the directors of the Company are not currently aware of any circumstances under which they might change. Therefore, the Group does not expect potential exposure to Pillar Two "top-up" taxes. The Group continues to follow Pillar Two legislative developments, as more countries prepare to enact the Pillar Two model rules, to evaluate the potential future impact on its financial statements.

List of other corporate income tax rates applicable to the Group's subsidiaries:

Countries and regions	Rates
Kyrgyz Republic (note i)	10.00%
The Republic of Colombia	35.00%
Cooperative Republic of Guyana	25.00%
Republic Suriname	36.00%
The Republic of Tajikistan	18.00%
The Commonwealth of Australia	30.00%

(i) In accordance with the latest local tax law regulations dated 18 January 2022 in the Kyrgyz Republic, the subsidiary of the Company located there is subject to the following tax rates: Corporate income tax rate for enterprises engaged in mining activities and selling gold concentrate is 10%; Corporate income tax rate for enterprises engaged in gold dore and gold bullion is 0%.

An analysis of the Group's provision for tax is as follows:

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
	USD'000	USD'000	USD'000
Current — Hong Kong	10,208	18,372	12,769
Current — Elsewhere	118,679	101,981	189,299
Deferred (note 21)	8,201	(27,773)	114,332
Total	137,088	92,580	316,400

A reconciliation of the tax expense applicable to profit before tax at the statutory rates for jurisdictions in which the Company and the majority of its subsidiaries are domiciled and/or operate to the tax expense at the effective tax rates are as follows:

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
	USD'000	USD'000	USD'000
Profit before tax	427,404	414,741	936,955
Tax at the statutory tax rate of 16.5%	70,522	68,432	154,598
Effect of different tax rates available to different jurisdictions	15,791	38,779	110,007
Non-deductible expenses	33,768	36,281	28,358
Tax losses utilised from previous periods	(2,634)	(320)	(15)
Income not subject to tax	(33,556)	(40,322)	(39,370)
Adjustments in respect of current tax of previous periods	—	965	2,339
Effect of non-monetary items with a tax base determined in a different currency (note i)	18,075	(31,921)	11,782
Effect of withholding tax on the interest income and dividend income from overseas companies	34,324	20,567	48,348
Tax losses not recognised	798	119	353
Tax charge at the effective rate	137,088	92,580	316,400

(i) A subsidiary of the Group with major business operating in the Republic of Colombia adopts USD as its functional currency, while make tax declaration and annual filing in Columbian Peso("COP") for the operating activities in The Republic of Colombia in accordance with local tax regulations in The Republic of Colombia. Non-monetary items including inventories and fixed assets of such enterprises on the balance sheet are recognised and subsequently measured at historical exchange rate, resulting temporary difference between their tax bases and carrying amounts upon tax accounting, the Company accordingly recognise the relevant temporary difference as a deferred tax asset/liability and charged or credited to profit or loss in accordance with IAS 12.58.

14. EARNINGS PER SHARE ATTRIBUTABLE TO ORDINARY EQUITY HOLDERS OF THE PARENT

The calculation of the basic earnings per share amounts is based on the profit for each of the Relevant Periods attributable to ordinary equity holders of the parent, and the weighted average number of ordinary shares of 546,000,000, 546,000,000 and 546,000,000 for each of the Relevant Periods, respectively. as adjusted to reflect the rights issue during each of the Relevant Periods.

The calculation of the diluted earnings per share amounts is based on the profit for the year attributable to ordinary equity holders of the parent.The weighted average number of ordinary shares used in the calculation is the number of ordinary shares in issue during the year, as used in the basic earnings per share calculation, and the weighted average number of ordinary shares assumed to have been issued at no consideration on the deemed exercise or conversion of all dilutive potential ordinary shares into ordinary shares.

The Group had no potentially dilutive ordinary shares outstanding for each of the Relevant Periods.

The calculations of basic and diluted earnings per share are based on:

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
	USD'000	USD'000	USD'000
Earnings			
Profit attributable to ordinary equity holders of the parent, used in the basic earnings per share calculation:	183,680	230,383	481,371

		Number of shares	
	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
Shares			
Weighted average number of ordinary shares in issue for each of the Relevant Periods used in the basic earnings per share calculation	546,000,000	546,000,000	546,000,000

15. DIVIDENDS

No dividends were declared or distributed by the Company in the Relevant Periods.

17. LEASES

The Group as a lessee

The Group has lease contracts for various items of leasehold land, buildings, machinery, motor vehicles and other equipment used in its operations. Lump sum payments were made upfront to acquire the leased land from the owners with lease periods of 7 to 10 years, and no ongoing payments will be made under the terms of these land leases. Leases of building and motor vehicles generally have lease terms between 2 and 15 years, while machinery and vehicles generally have lease terms between 2 and 10 years. Other equipment generally has lease terms of 12 months or less and/or is individually of low value. Generally, the Group is restricted from assigning and subleasing the leased assets outside the Group.

(a) Right-of-use assets

The carrying amounts of the Group's right-of-use assets and the movements are as follows:

	Leasehold land	Buildings	Machinery and equipment	Motor vehicles	Total
	USD'000	USD'000	USD'000	USD'000	USD'000
As at 1 January 2022	3,605	650	10,634	—	14,889

(b) Lease liabilities

The carrying amounts of lease liabilities and the movements are as follows:

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
	USD'000	USD'000	USD'000
Carrying amount at 1 January	14,158	20,336	12,166
New leases	15,538	6,577	53,461
Modification	—	(2,368)	(610)
Accretion of interest recognised during the year	761	648	2,411
Payments	(9,078)	(12,952)	(16,049)
Exchange realignment	(1,043)	(75)	(122)
Carrying amount at 31 December	20,336	12,166	51,257
Analysed into:			
Current portion	10,341	8,042	18,987
Non-current potion	9,995	4,124	32,270

(c) The amounts recognised in profit or loss in relation to leases are as follows:

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024
	USD'000	USD'000	USD'000
Interest on lease liabilities	761	648	2,411
Depreciation charge of right-of-use assets	6,558	11,039	13,323
Expense relating to short-term leases and leases with low-value assets	7,833	5,112	5,323
Total amount recognised in profit or loss	15,152	16,799	21,057

The maturity analysis of lease liabilities is disclosed in note 46 to the Historical Financial Information.

The Group as a lessor

The Group leases its equipment in Cooperative Republic of Guyana under operating lease arrangements. Rental income recognised by the Group during the Related Periods was USD1,014,000, USD1,945,000 and USD3,657,000, respectively, details of which are included in note 7 to the Historical Financial Information.

18. INTANGIBLE ASSETS

	Exploration and mining rights	Software	Exploration and evaluation assets	Total
	USD'000	USD'000	USD'000	USD'000
31 December 2022

19. INVESTMENT IN AN ASSOCIATE

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Share of net assets	13,536	13,690	12,540

Particulars of the associate are as follows:

Name	Particulars of issued shares held	Place of incorporation/ registration and business	Percentage of ownership interest attributable to the Group	Principal activities
Yilgiron Pty Ltd. ("Yilgiron")	Ordinary shares	Australia	35%	Mining

In accordance with the investment agreement, the Group enjoys 35% voting rights of Yilgiron. As at 31 December 2024, Yilgiron was still under the stage of preliminary exploration with no material business undertaking, and the share of profit or loss on Yilgiron was insignificant.

20. INVESTMENTS IN SUBSIDIARIES

The Company	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Investment costs	37,382	104,768	104,768
Less: provision for impairment	—	—	—
	37,382	104,768	104,768

21. DEFERRED TAX

The movements in deferred tax assets and liabilities during the Relevant Periods, without taking into consideration the offsetting of the balance within the same tax jurisdiction, are as follows:

Deferred tax assets	Tax losses	Unrealised profit	Accruals and other provisions	Rehabilitation provision	Others	Total
	USD'000	USD'000	USD'000	USD'000	USD'000	USD'000
At 1 January 2022	48,624	9,515	4,054	21,618	764	84,575
Credited/(charged) to the combined statement of profit or loss (note 13)	(2,776)	1,590	(312)	1,731	4,817	5,050
Gross deferred tax assets at 31 December 2022	45,848	11,105	3,742	23,349	5,581	89,625
Credited/(charged) to the combined statement of profit or loss (note 13)	4,691	(404)	(1,666)	4,231	(11,290)	(4,438)
Acquisition of a subsidiary	47,667	—	—	—	12,788	60,455
Gross deferred tax assets at 31 December 2023	98,206	10,701	2,076	27,580	7,079	145,642
Credited/(charged) to the combined statement of profit or loss (note 13)	(72,506)	(563)	1,952	(2,600)	12,668	(61,049)
Gross deferred tax assets at 31 December 2024	25,700	10,138	4,028	24,980	19,747	84,593

Deferred tax liabilities	Depreciation in excess of depreciation allowance	Fair value adjustment on acquisition	Withholding taxes	Others	Total
	USD'000	USD'000	USD'000	USD'000	USD'000
At 1 January 2022	104,598	367,268	13,966	29,037	514,869
Charged/(credited) to the combined statement of profit or loss (note 13)	(46,630)	(24,064)	17,520	66,425	13,251
Gross deferred tax liabilities at 31 December 2022	57,968	343,204	31,486	95,462	528,120
Charged/(credited) to the combined statement of profit or loss (note 13)	28,902	(24,443)	2,576	(39,246)	(32,211)
Acquisition of a subsidiary	85,840	9,367	—	—	95,207
Gross deferred tax liabilities at 31 December 2023	172,710	328,128	34,062	56,216	591,116
Charged/(credited) to the combined statement of profit or loss (note 13)	22,076	(20,901)	31,080	21,028	53,283
Gross deferred tax liabilities at 31 December 2024	194,786	307,227	65,142	77,244	644,399

For presentation purposes, certain deferred tax assets and liabilities have been offset in the statements of financial position. The following is an analysis of the deferred tax balances of the Group for financial reporting purposes:

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Net deferred tax assets recognised in the combined statement of financial position	16,545	21,754	10,138
Net deferred tax liabilities recognised in the combined statement of financial position	455,040	467,228	569,944

Deferred tax assets have not been recognised in respect of the following item:

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Tax losses	2,506	1,858	3,164

The above tax losses are available for offsetting against future taxable profits of the companies in which the losses arose, subject to certain tax rules of the countries/jurisdictions in which the Group operates. Deferred tax assets have not been recognised in respect of the above items as it is not considered probable that taxable profits will be available against which the above item can be utilised.

22. OTHER NON-CURRENT ASSETS

The Group

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Stockpiled ore (note i)	37,587	89,127	108,272
Value-added tax refundable	22,340	31,807	19,184
Advance payment for equipment	50,148	8,773	5,252
Underground development costs	2,692	4,462	5,942
Others	8,395	13,181	11,888
	121,162	147,350	150,538

(i) If the ore stockpile is not expected to be processed in 12 months after the reporting date, it is included in non-current assets.

23. DUE FROM A SUBSIDIARY

The Company

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Amount due from a subsidiary	130,371	188,576	215,690
Analysed into:			
Current portion	37,758	95,957	215,690
Non-current portion	92,613	92,619	—

24. INVENTORIES

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Raw materials	180,746	261,319	273,598
Work in progress	100,648	123,375	138,339
Finished goods	32,401	15,578	25,425
	313,795	400,272	437,362

25. TRADE RECEIVABLES

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Trade receivables (subject to provisional pricing) — fair value (note i)	2,199	10,848	6,756
Trade receivables (not subject to provisional pricing) — amortise cost	115,965	131,864	111,833
Impairment	(362)	(433)	(365)
	117,802	142,279	118,224

(i) Trade receivables (subject to provisional pricing) are non-interest bearing, but as discussed in note 4 above, are exposed to future commodity price movements over the QP and, hence, fail the SPPI test and are measured at fair value up until the date of settlement. Approximately 95%–100% of the provisional invoice (based on the provisional price) is received in cash when the goods are loaded onto the ship, which reduces the initial receivable recognised under IFRS 15. The QPs can range between one and two months post shipment and final payment is due within 30 days after the end of the QP.

Trade receivables (not subject to provisional pricing) are non-interest-bearing and generally have a credit period within 30 days.

An ageing analysis of the trade receivables (not subject to provisional pricing) as at the end of each of the Relevant Periods, based on the invoice date and net of loss allowance, is as follows:

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Less than 1 year	115,585	131,421	111,403
Over 1 year	18	10	65
	115,603	131,431	111,468

Set out below is the information about the credit risk exposure on the Group's trade receivables using a provision matrix:

As at 31 December 2022

	Expected credit loss rate	Gross carrying amount USD'000	Expected credit losses USD'000	Net carrying amount USD'000
Provision on collective basis				
Aged less than 1 year	0.29%	115,939	336	115,603
Aged 1 to 2 years	30.00%	—	—	—
Aged 2 to 3 years	50.00%	—	—	—
Aged over 3 years	100.00%	26	26	—
At end of year	0.31%	115,965	362	115,603

As at 31 December 2023

	Expected credit loss rate	Gross carrying amount USD'000	Expected credit losses USD'000	Net carrying amount USD'000
Provision on collective basis				
Aged less than 1 year	0.32%	131,849	418	131,431
Aged 1 to 2 years	30.00%	—	—	—
Aged 2 to 3 years	50.00%	—	—	—
Aged over 3 years	100.00%	15	15	—
At end of year	0.33%	131,864	433	131,431

As at 31 December 2024

	Expected credit loss rate	Gross carrying amount	Expected credit losses	Net carrying amount
		USD'000	USD'000	USD'000
Provision on collective basis				
Aged less than 1 year	0.30%	111,759	332	111,427
Aged 1 to 2 years	30.00%	59	18	41
Aged 2 to 3 years	50.00%	—	—	—
Aged over 3 years	100.00%	15	15	—
At end of year	0.33%	111,833	365	111,468

26. PREPAYMENTS, OTHER RECEIVABLES AND OTHER ASSETS

The Group

	Note	31 December 2022	31 December 2023	31 December 2024
		USD'000	USD'000	USD'000
Prepayments		38,128	56,845	37,328
Value added tax refundable		9,778	28,203	39,917
Deposit in related party (note i)	43	124,290	134,339	233,443
Amounts due from related parties	43	15,291	32,670	16,893
Income tax recoverable		8,434	66,998	51,189
Other assets		12,370	42,955	25,536
Less: Impairment of other receivables		(1,629)	(1,696)	(1,767)
		206,662	360,314	402,539

(i) According to the physical cash pooling agreements signed with Zijin International Capital Company Limited ("ZIC"), a fellow subsidiary, the Group deposited idle cash to ZIC's bank accounts with interest rate between 0.3% and 5.1% per annum, which were unsecured and have no fixed terms of repayment. As at 31 December 2022, 2023 and 2024, the balance of such deposited idle cash were equal to USD124,290,000, USD134,339,000 and USD233,443,000, respectively.

The Company

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Deposit in related party	90,723	106,289	169,380
Other assets	156	156	156
Less: Impairment of other receivables	(129)	(203)	(359)
	90,750	106,242	169,177

Other receivables are unsecured. An impairment analysis is performed at the end of each of the Relevant Periods. The credit quality of the financial assets included in the line items of prepayments, other receivables and other assets is considered to be normal unless they are past due and there is no information indicating that the financial assets had a significant increase in credit risk since initial recognition.

27. FINANCIAL ASSETS AT FAIR VALUE THROUGH PROFIT OR LOSS

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Listed equity investments, at fair value	1,666	1,020	1,514

The above equity investments were classified as financial assets at fair value through profit or loss as they were held for trading.

28. CASH AND CASH EQUIVALENTS, AND RESTRICTED CASH

The Group

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Cash and bank balances	91,339	160,890	241,235
Less: restricted cash	(4,881)	(6,136)	(6,650)
Cash and cash equivalents	86,458	154,754	234,585

Cash at banks earns interest at floating rates based on daily bank deposit rates. The bank balances and restricted cash are deposited with creditworthy banks with no recent history of default.

The Company

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Cash and bank balances	3,061	2,513	2,641
Less: restricted cash	—	—	—
Cash and cash equivalents	3,061	2,513	2,641

Cash at banks earns interest at floating rates based on daily bank deposit rates. The bank balances and restricted cash are deposited with creditworthy banks with no recent history of default.

29. DERIVATIVE FINANCIAL INSTRUMENTS

Derivative financial asset:

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Forward currency	5,269	—	—

Derivative financial liability:

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Power purchase agreement	—	30,801	32,004
Analysed into:			
Current portion	—	4,959	5,484
Non-current portion	—	25,842	26,520

In 2023, the Group acquired Rosebel Gold Mines N.V. ("Rosebel"). According to the power purchase agreement signed between Rosebel and the Suriname Electricity Company, the electricity price paid by Rosebel is linked to the gold price. The Group identified it as a derivative financial instrument measured at fair value and with its changes recognised in the statements of profit and loss.

30. TRADE PAYABLES

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Trade payables	155,370	306,667	244,768

The trade payables are non-interest-bearing and are normally settled on 30-day terms.

An ageing analysis of trade payables as at the end of each of the Relevant Periods is as follows:

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Within 1 year	141,383	289,373	233,902
Over 1 year	13,987	17,294	10,866
	155,370	306,667	244,768

31. OTHER PAYABLES AND ACCRUALS

The Group

	31 December 2022 USD'000	31 December 2023 USD'000	31 December 2024 USD'000
Payables and accruals	64,410	102,742	118,903

Subtotal	594,359	641,527	610,797
Total	607,895	655,217	610,797

33. PROVISIONS

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Rehabilitation *(note i)*	91,016	226,064	230,604
Litigation	2,503	2,545	2,502
Total	93,519	228,609	233,106

(i) Pursuant to the regulations of the governmental authorities of the places where the mines are located, the Group recognises provision for environmental rehabilitation and restoration of mines. The amount of provision is an estimate based upon the life of mining tenements, timing of mine closure and cost of such rehabilitation. The management will update the estimation basis annually. The movements in the present value of the provision for rehabilitation are as follows:

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Beginning balance	98,050	91,016	226,064
Acquisition of a subsidiary (note 39)	—	103,765	—
Additions	1,305	33,866	32,455
Increase in-discounted amounts arising from the passage of time (note 10)	1,656	2,674	2,992
Payment during the year	(9,826)	(5,226)	(30,880)
Exchange differences	(169)	(31)	(27)
Ending balance	91,016	226,064	230,604

34. CONVERTIBLE DEBENTURES

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Convertible debentures	62,042	67,666	70,859

On 13 December 2019, CGI issued convertible debentures to GMHK, for a total of USD50,000,000. The key terms and conditions of the agreements are as follows:

- Maturity date of 16 December 2024, which was extended to 16 December 2025 by a renewal agreement in 2024.
- Interest of 5%, payable semi-annually.
- The debentures being convertible, at the option of the Debenture Holder, GMHK, and at any time prior to the maturity date, into common shares of the Continental Gold Inc. based on a conversion price of CAD4.50 per share.

The convertible debentures contain embedded derivatives relating to the conversion option, a foreign currency feature (since the conversion price is in CAD), the anti-dilutive provision, a voluntary redemption option and a change of control feature. The convertible debentures issued by CGI are designated as financial liabilities at fair value through profit or loss and were subsequently measured at fair value, which was calculated using the Black-Scholes option pricing model.

	2022	2023	2024
	USD'000	USD'000	USD'000
At beginning of year	57,059	62,042	67,666
Fair value change	4,983	5,624	3,193
At end of year	62,042	67,666	70,859

35. OTHER NON-CURRENT LIABILITIES

	31 December 2022	31 December 2023	31 December 2024
	USD'000	USD'000	USD'000
Contract liabilities — metal streaming arrangement (note i)	124,733	118,325	114,659

(i): On 25 June 2019, CGI entered into a metal streaming arrangement with Triple Flag Precious Metals Corp. ("Triple Flag") and obtained a prepayment of USD100,000,000 from Triple Flag. CGI shall satisfy its delivery obligations with 2.1% of the future gold production of the Columbia Mine (the "Gold Delivery Obligation") and silver production equals to 1.84 times of the Gold Delivery Obligation (the "Silver Delivery Obligation"). For each ounce of product delivered under the agreement, Triple Flag would pay 10% and 5%, respectively, of the gold and silver market prices prevailing at the time of delivery. Besides, the agreement also stipulated that CGI might choose to repurchase the Gold Delivery Obligation in advance before 31 December 2021, and the consideration would be USD80,000,000 less 90% of the value of the gold delivered (the "Redemption Right of the Gold Delivery Obligation"). The Group redeemed the gold delivery obligation in advance in 2020 and began to fulfill the silver delivery obligation.

Issued and fully paid:			
546,000,000 ordinary shares	69,706	69,706	69,706

37. RESERVES

The Group

The amounts of the Group's reserves and the movements therein for the Relevant Periods are presented in the combined statements of changes in equity of the Historical Financial Information.

Merger reserve

The merger reserve of the Group represents the difference between the aggregate of the paid-up share capital and capital reserve of the subsidiaries now comprising the Group.

Awarded shares reserve

Awarded shares reserve represents the share-based compensation reserve due to equity-settled share award, details of which were set out in note 38 to the Historical Financial Information.

Exchange fluctuation reserve

The exchange fluctuation reserve comprises all foreign exchange differences arising from the translation of the financial statements of foreign operations with functional currency other than USD. The reserve is dealt with in accordance with the accounting policies set out in note 4 to the Historical Financial Information.

The Company

A summary of the Company's reserves is as follows:

	Retained profits
	USD'000
At 1 January 2022	65,193
Profit for the year	61,875
At 31 December 2022 and 1 January 2023	127,068
Profit for the year	135,055
At 31 December 2023 and 1 January 2024	262,123
Profit for the year	98,164
At 31 December 2024	360,287

38. SHARE BASED PAYMENTS

The share-based payments to the Group's employees are granted under Zijin Mining 2020 Restricted A Share Incentive Scheme and Zijin Mining 2023 Employee Stock Ownership Scheme as historically the Group did not have its own share incentive plan. The Historical Financial Information includes allocation of the expenses recorded at Zijin Mining based on the Group's employees participating under Zijin Mining 2020 Restricted A Share Incentive Scheme for 2020 and Zijin Mining 2023 Employee Stock Ownership Scheme.

The Group accounted for the Zijin Mining 2020 Restricted A Share Incentive Scheme and Zijin Mining 2023 Employee Stock Ownership Scheme by measuring the fair value of the restricted shares in accordance with the requirement applicable to equity-settled share-based payment transactions in accordance with IFRS 2, and recognised a corresponding increase in equity as a deemed contribution from Zijin Mining.

The Group recognises share-based payments in its combined statements of profit or loss based on shares ultimately expected to vest, after considering estimated forfeitures conditions of the Group. Forfeitures are estimated based on the historical experience and revised in the subsequent periods if actual forfeitures differ from those estimates. The total expense recognised for the Relevant Periods arising from share-based payment are USD1,130,000, USD659,000 and USD1,307,000, respectively.

Zijin Mining 2020 Restricted A Share Incentive Scheme

The restricted A shares are generally market-based and service-based, which were granted by Zijin Mining on 13 January 2021, and the registration completed on 28 January 2021. If the unlocking conditions of the restricted A shares as stipulated in the scheme are met, the participants under the scheme can apply to unlock the A shares on 28 January 2023, 28 January 2024 and 28 January 2025, respectively, with the upper limit of 33%, 33% and 34% of the number of A shares granted under the Zijin Mining 2020 Restricted A share Incentive Scheme. If the unlocking conditions of the restricted A shares are not met, the unlocked restricted A shares will be repurchased and cancelled by Zijin Mining at the grant price plus the bank deposit interest for the same period.

The following table summarises the Company's involvement in Zijin Mining 2020 Restricted A Share Incentive Scheme activities during the Relevant Periods:

	Number of Restricted A shares
Outstanding as of 1 January 2022 and as of 31 December 2022	4,178,100
Vested during the year	(1,405,800)
Outstanding as of 31 December 2023	2,772,300
Vested during the year	(1,415,700)
Outstanding as of 31 December 2024	1,356,600

The estimated compensation cost of restricted A shares was based on the fair value of Zijin Mining's ordinary shares on the date of the grant. The Group recognises the compensation cost, net of estimated forfeitures, over the vesting term of the restricted A shares.

Zijin Mining 2023 Employee Stock Ownership Scheme

Zijin Mining operates 2023 Employee Stock Ownership Scheme for the purpose of providing incentives and rewards to eligible participants who contribute to the success of the Zijin Mining's operations, including certain employees of the Group. Zijin Mining granted the related A shares on 26 February 2024, and the registration completed on 16 April 2024. If the unlocking conditions of the employee stock ownership as stipulated in the scheme are met, the participants under the scheme can apply to unlock the shares on 16 April 2025. If the unlocking conditions of the A shares are not met, the unlocked employee stock ownership will be repurchased and cancelled by Zijin Mining at the grant price plus the bank deposit interest for the same period.

The following table summarises the Company's involvement in Zijin Mining 2023 Employee Stock Ownership Scheme activities during the Relevant Periods:

	Number of Restricted A shares
Outstanding as of 1 January 2022, as of 31 December 2022 and as of 31 December 2023	—
Granted	2,269,700
Forfeited	(155,000)
Outstanding as of 31 December 2024	2,114,700

39. BUSINESS COMBINATION

Acquisitions of Rosebel GM

On 1 February 2023, Silver Source Group Limited, a subsidiary of the Group, acquired 95% equity interest in Rosebel GM, at a total consideration of USD371,532,000, including USD309,426,000 for equity interest and USD62,106,000 for assuming shareholder's loans.

The Group has elected to measure the non-controlling interests in Rosebel GM at the non-controlling interest's proportionate share of Rosebel GM identifiable net assets.

The fair values of the identifiable assets and liabilities of Rosebel GM as at the date of acquisition were as follows:

	Notes	Fair value recognised on acquisition
		USD'000
Property, plant and equipment	16	381,016
Intangible assets	18	96,140
Other non-current assets		65,431
Cash and cash equivalents		39,781
Trade receivables		301
Prepayments, deposits and other receivables		15,660
Inventories		100,650
Provisions	33	103,765
Deferred tax liabilities	21	34,752
Other non-current liabilities		9,348
Trade payables		21,903
Other payables and accruals (note i)		203,500
Total identifiable net assets at fair value		325,711
Non-controlling interests		16,286
Satisfied by cash		309,425

(i) Other payables included shareholder loans of USD62,106,000.

Analysis of net cash outflows of cash and cash equivalent in respect of the acquisition of the subsidiary is as follows:

	2023
	USD'000
Cash consideration	(309,425)
Cash and bank balances acquired	39,781
Total net cash outflow	(269,644)

Since the acquisition, Rosebel GM contributed USD468,823,000 to the Group's revenue and a profit of USD93,708,000 to the Group's combined profit for the year ended 31 December 2023.

Had the combination taken place at the beginning of the year ended 31 December 2023, the revenue from continuing operations of the Group and the profit of the Group for the year ended 31 December 2023 would have been USD2,309,710,000 and USD311,724,000, respectively.

40. PARTLY-OWNED SUBSIDIARIES WITH MATERIAL NON-CONTROLLING INTERESTS

	Year ended 31 December 2022	Year ended 31 December 2023	Year ended 31 December 2024

	1,320,373	102,863	1,423,236

45. FAIR VALUE AND FAIR VALUE HIERARCHY OF FINANCIAL INSTRUMENTS

Management has assessed that the fair values of cash and cash equivalents, trade receivables not subject to provisional pricing, financial assets included in prepayments, other receivables and other assets, trade payables, financial liabilities included in other payables and accruals, and due within one year approximate to their carrying amounts largely due to the short-term maturities of these instruments.

The fair values of interest bearing bank and other loans, lease liabilities and financial liabilities included in other payables and accruals were determined by discounting the expected future cash flows using market rates of return currently available for other financial instruments with similar terms, credit risk and remaining maturities or incremental borrowing rate. The Group's own non-performance risk for short-term and long-term loans was assessed to be insignificant. The listed equity investments is determined based on quoted market prices.

The Group's finance department headed by the finance manager is responsible for determining the policies and procedures for the fair value measurement of financial instruments. The finance manager reports directly to the chief financial officer and the audit committee. At the end of each of the Relevant Periods, the finance department analyses the movements in the values of financial instruments and determines the major inputs applied in the valuation. The valuation is reviewed and approved by the chief financial officer. The valuation process and results are discussed with the audit committee twice a year for interim and annual financial reporting.

Fair value hierarchy

The following tables illustrate the fair value measurement hierarchy of the Group's financial instruments:

Assets measured at fair value:

As at 31 December 2022

	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	USD'000	USD'000	USD'000	USD'000
Trade receivables subject to provisional pricing	—	2,199	—	2,199
Derivative financial instruments	—	5,269	—	5,269
Financial assets at fair value through profit or loss	1,666	—	—	1,666
Equity investments designated at fair value through other comprehensive income	—	—	137	137
	1,666	7,468	137	9,271

As at 31 December 2023

Equity investments designated at fair value through other comprehensive income	—	—	137	137
	1,020	10,848	137	12,005

As at 31 December 2024

	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	USD'000	USD'000	USD'000	USD'000
Trade receivables subject to provisional pricing	—	6,756	—	6,756
Financial assets at fair value through profit or loss	1,514	—	—	1,514
Equity investments designated at fair value through other comprehensive income	—	—	137	137
	1,514	6,756	137	8,407

Liabilities measured at fair value:

As at 31 December 2022

	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	USD'000	USD'000	USD'000	USD'000
Convertible debentures	—	—	62,042	62,042
	—	—	62,042	62,042

As at 31 December 2023

	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	USD'000	USD'000	USD'000	USD'000
Convertible debentures	—	—	67,666	67,666
Derivative financial instrument-power purchase agreement	—	—	30,801	30,801
	—	—	98,467	98,467

As at 31 December 2024

	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	USD'000	USD'000	USD'000	USD'000
Convertible debentures	—	—	70,859	70,859
Derivative financial instrument-power purchase agreement	—	—	32,004	32,004
	—	—	102,863	102,863

During the Relevant Periods, there were no transfers between Level 1 and Level 2, or transfers into or out of Level 3 for both financial assets and financial liabilities. The Group's policy is to recognise transfers between levels of the fair value hierarchy as at the end of each of the Relevant Periods in which they occur.

46. FINANCIAL RISK MANAGEMENT OBJECTIVES AND POLICIES

The Group is exposed to various risks in relation to financial instruments in its daily operations, mainly credit risk, liquidity risk and market risk (including interest rate risk, exchange rate risk, and commodity price risk). The Group's major financial instruments include cash and cash equivalents, financial assets at fair value through profit or loss, derivative financial assets, trade receivables, financial assets included in prepayments, other receivables and other assets, interest-bearing bank and other borrowings, derivative financial liabilities, convertible debentures, trade payables and other payables and accruals. The Group also enters into certain derivative transactions, including forward currency contracts. The purpose is to manage currency risks arising from the Group's foreign currency borrowings. Risks in connection with such financial instruments, and the risk management strategies adopted by the Group to mitigate such risks are summarised as follows.

Interest rate risk

The Group's exposure to the risk of changes in market interest rates relates primarily to the Group's long-term debt obligations with a floating interest rate.

The following table demonstrates the sensitivity to a reasonably possible change in interest rate, with all other variables held constant, of the Group's profit after tax (through the impact on floating rate borrowings) and the Group's equity.

	Increase/ (decrease) in basis points	Increase/ (decrease) in profit before tax
		USD'000
2022		
United States dollar	100/(100)	(4)/4
2023		
United States dollar	100/(100)	(8)/8
2024		
United States dollar	100/(100)	—

Foreign currency risk

The Group has transactional exchange rate risk exposures mainly arising from sales or purchases by subsidiaries in currencies other than the subsidiaries' functional currencies. These subsidiaries have transactions in currencies other than their functional currencies. In addition, the Group has exchange rate exposures arising from foreign currency borrowings. The Group adopts an overall management on its foreign exchange business, and reduces its exchange rate exposures using forward currency contracts based on the market trend as necessary.

The following tables present a sensitivity analysis of exchange rate risk, reflecting the impact that a reasonable and probable change in the exchange rates of COP, CAD, KGS, AUD, CNY, TJS, with all other variables remain constant, would have on net profit or loss and other comprehensive income, net of tax.

	Increase/ (decrease) in exchange rate USD'000	Increase/ (decrease) in profit before tax USD'000
2022		
If USD weakens against AUD	5%	980
If USD strengthens against AUD	(5%)	(980)
If USD weakens against COP	5%	(1,239)
If USD strengthens against COP	(5%)	1,239
If USD weakens against KGS	5%	(101)
If USD strengthens against KGS	(5%)	101
If USD weakens against TJS	5%	30
If USD strengthens against TJS	(5%)	(30)
If USD weakens against RMB	5%	(332)
If USD strengthens against RMB	(5%)	332
If USD weakens against CAD	5%	893
If USD strengthens against CAD	(5%)	(893)
2023		
If USD weakens against AUD	5%	251
If USD strengthens against AUD	(5%)	(251)
If USD weakens against COP	5%	(1,286)
If USD strengthens against COP	(5%)	1,286
If USD weakens against KGS	5%	1,150
If USD strengthens against KGS	(5%)	(1,150)
If USD weakens against TJS	5%	1,306
If USD strengthens against TJS	(5%)	(1,306)
If USD weakens against RMB	5%	1,391
If USD strengthens against RMB	(5%)	(1,391)

If USD strengthens against AUD	(5%)	308
If USD weakens against COP	5%	(963)
If USD strengthens against COP	(5%)	963
If USD weakens against KGS	5%	1,120
If USD strengthens against KGS	(5%)	(1,120)
If USD weakens against TJS	5%	478
If USD strengthens against TJS	(5%)	(478)
If USD weakens against RMB	5%	(280)
If USD strengthens against RMB	(5%)	280
If USD weakens against CAD	5%	139
If USD strengthens against CAD	(5%)	(139)

Credit risk

The Group only deals with approved and reputable third parties. According to the Group's policy, all customers who require credit transactions are subject to credit review. In addition, the Group continuously monitors the balance of trade receivables to ensure that the Group is not exposed to significant bad debt risks.

Since counterparties of cash and bank balances are banks with good reputation and high credit ratings, credit risk arising from these financial instruments is insignificant.

Other financial assets of the Group include receivables and some derivatives. The credit risk on these financial assets arises from the default of counterparties, with a maximum exposure equal to the carrying amounts of these instruments.

The Group only deals with approved and reputable third parties, so no need for collateral. Credit risk is managed centrally based on customers/counterparties, geographic regions and industries. As at 31 December 2022, 2023 and 2024, the Group had a specific concentration of credit risk. 25.93%, 63.16% and 67.35% of the Group's trade receivables were from the largest customers. And 87.80%, 97.30% and 96.73% of the Group's trade receivables were from the top five customers. The balance of trade receivables of the Group did not hold any collateral or other credit enhancements.

Determination of significant increase in credit risk

At the end of each of the Relevant Periods, the Group assesses whether the credit risk on the relevant financial instruments has increased significantly since initial recognition. When determining whether the credit risk has increased significantly since initial recognition, the Group considers reasonable and supportable information that is relevant and available without undue cost or effort, including qualitative and quantitative analysis based on historical data of the Group, external credit risk ratings and forward-looking information.

Definition of credit-impaired financial assets

In order to determine whether credit impairment occurs, the defined criteria adopted by the Group are consistent with the internal credit risk management objectives for relevant financial instruments, both of which incorporate quantitative and qualitative indicators. When assessing whether a debtor has suffered a credit impairment, the Group usually considers the following factors:

(1) significant financial difficulty of the issuer or the debtor;

(2) breach of contract by the debtor, such as default or overdue payment in interest or principal repayment;

(3) a concession granted by the creditor to the debtor due to economic or contractual considerations related to the debtor's financial difficulty, which will not be granted under any other circumstances;

(4) possible bankruptcy or other financial reorganisation of the debtor;

(5) disappearance of an active market for the financial asset due to financial difficulty of the issuer or the debtor;

(6) financial assets purchased or sourced at large discounts indicating credit losses have occurred.

Financial assets may be credit-impaired due to the joint effects of multiple events rather than separately identifiable events.

Liquidity risk

The Group's objective is to maintain a balance between continuity of funding and flexibility through the use of loans and bank borrowings.

The maturity profile of the Group's financial liabilities as at the end of each of the Relevant Periods, based on the contractual undiscounted payments, is as follows:

	As at 31 December 2022			
	Within 1 year	1 to 2 years	2 to 5 years	Total
	USD'000	USD'000	USD'000	USD'000

Capital management

The primary objective of the Group's capital management is to ensure that it maintains strong credit rating and healthy capital ratios in order to support its business and maximise shareholders' value.

The Group regards total equity as its capital and manages its capital structure and makes adjustments to it, in light of changes in economic conditions. To maintain or adjust the capital structure, the Group may adjust the dividend payment to shareholders, return capital to shareholders or issue new shares. No changes were made in the objectives, policies and processes during the Relevant Periods.

During the Relevant Periods, the Group's strategy was to maintain the gearing ratio at a healthy level in order to monitor capital. The principal strategies adopted by the Group include, but are not limited to, reviewing future cash flow requirements and the ability to meet debt repayment schedules when they fall due, maintaining a reasonable level of available banking facilities and adjusting investment plans and financing plans, if necessary, to ensure that the Group has a reasonable level of capital to support its business. Gearing ratio is calculated by dividing total interest-bearing debt (which includes current and non-current portions of convertible debentures, interest-bearing bank and other borrowings and lease liabilities) by total equity.

The gearing ratios at the end of each of the Relevant Periods were as follows:

	31 December 2022 (USD'000)	31 December 2023 (USD'000)	31 December 2024 (USD'000)
Convertible bonds	62,042	67,666	70,859
Interest-bearing bank and other borrowings	607,895	655,217	610,797
Lease liabilities	20,336	12,166	51,257
	690,273	735,049	732,913
Total equity	2,364,079	2,591,330	2,902,091
Gearing ratio	29%	28%	25%

47. EVENTS AFTER THE RELEVANT PERIODS

On 14 March 2025, the Company further allotted 1,171,000,000 Shares to GMHK at approximately HKD6.7 per share. On 6 May 2025, the Company further allotted 558,000,000 Shares to GMHK at approximately HKD28.5 per share. Immediately after such share allotments, the Company was held as to 24% and 76% by Zijin Mining Group Northwest Co., Ltd and GMHK respectively.

On 29 April 2025, the Company entered into a share purchase agreement with the fellow subsidiaries Jinyu (H.K.) International Company Limited ("Jinyu (H.K.), pursuant to which the Company agreed to acquire 50% of the equity interest in Porgera Jersey Limited from Jinyu (H.K.) ("Porgera Jersey"), at a consideration of USD60,000,000, subject to post-completion adjustment with reference to the net asset value of Porgera Jersey on 30 June 2025.

On 9 October 2024, Zijin Mining and a fellow subsidiary Gold Source International Holdings Company Limited entered into a share purchase agreement (the "Akyem SPA") with Newmont Corporation ("Newmont") and Newmont Golden Ridge Ltd (a wholly-owned subsidiary of Newmont, "Newmont Golden Ridge" Pursuant to the Akyem SPA, Gold Source acquired 100% of the equity interest in Newmont Golden Ridge for a consideration of USD1 billion (the "Akyem Acquisition"). The Akyem Acquisition was completed on 16 April 2025. Following the completion of the Acquisition. Newmont Golden Ridge became a wholly-owned subsidiary of Gold Source and was subsequently renamed as Zijin Golden Ridge after the completion of the Akyem Acquisition on 30 April 2025.

48. SUBSEQUENT FINANCIAL STATEMENTS

No audited financial statements have been prepared by the Company, the Group or any of its subsidiaries in respect of any period subsequent to 31 December 2024.

Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

Term / Abbreviation	Meaning / Definition
%	percent
°	degree, angle of inclination
°C	degrees of temperature
/	per
3D	Three-dimensional
AAS	atomic absorption spectrometry
AER	Annual Environmental Report
Ag	The chemical symbol for silver
AISC	All-in sustaining cost; the cost consists of cash cost, taxations and fees (excluding income tax), and sustaining Capex
AN/FO	Ammonium nitrate / fuel oil
ARD	Acid rock drainage
As	The chemical symbol for arsenic
ASL	above sea level
Au	the element symbol of gold
Au Eq.	Gold equivalent; including gold, and other elements salable converted into gold equivalent
AusIMM	Australasian Institute of Mining and Metallurgy
B.Eng.	Bachelor of Engineering
B×H	breadth × height
BD	bulk density
Capex	capital expenditure(s)
CIL	carbon-in-leach, a continuous agitation cyanide leaching process with active carbon in the leaching tanks to adsorb resolved gold and silver.
CIP	carbon-in-pulp, similar with CIL, there is pre-leaching operation before carbon adsorption. Most of the time, the two processes are not distinguished in expressions.
CIT	corporate income tax
cm	centimetres
COG	cut-off grade
CPR	Competent Person's Report
DCF	discounted cash flow
Dr.	Doctor of Philosophy
E	East
EIA	Environmental Impact Assessment
EPMP	Environmental Protection and Management Plan
FAusIMM	Fellow of the Australasian Institute of Mining and Metallurgy

Term / Abbreviation	Meaning / Definition
Exploration Results	Data and information generated by mineral exploration programs that might be of use to investors, but which do not form part of a declaration of Mineral Resources or Ore Reserves
Exploration Target	A statement or estimate of the exploration potential of a mineral deposit in a defined geological setting where the statement or estimate, quoted as a range of tonnes and a range of grade (or quality), relates to mineralisation for which there has been insufficient exploration to estimate a Mineral Resources
FS or Feasibility Study	A Feasibility Study is a comprehensive technical and economic study of the selected development option for a mineral project that includes appropriately detailed assessments of applicable Modifying Factors together with any other relevant operational factors and detailed financial analysis that are necessary to demonstrate at the time of reporting that extraction is reasonably justified (economically mineable). The results of the study may reasonably serve as the basis for a final decision by a proponent or financial institution to proceed with, or finance, the development of the project. The confidence level of the study will be higher than that of a Pre-Feasibility Study
FY	financial year
G&A	general and administration
g	gram
g/cm^3	gram(s) per cubic centimetre
g/t	gram per tonne
ha	hectare(s)
HKEx	Hong Kong Exchanges and Clearing Ltd.
Indicated Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit
Inferred Mineral Resource	That part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
Intertek	Intertek Laboratory in Beijing
IP	Induced Polarisation, which is an exploration technique whereby an electrical current is pulsed through the ground and the response from the sub surface measured in order to identify minerals of interest. Strong IP responses may be a result of sulphide which may be associated with gold mineralisation
IPO	Initial Public Offering
IRR	internal rate of return
JORC Code	2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves prepared by the Joint Ore Reserves Committee of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
JORC Committee	Joint Ore Reserves Committee
K	the element symbol of potassium
kg	kilogram, equivalent to 1,000 grams
km	kilometres, equivalent to 1,000 metres
km^2	square kilometres
kt	thousand tonnes
ktpa	thousand tonnes per annum

Term·/·Abbreviation	Meaning·/·Definition
kV	kilovolts, equivalent to 1,000 volts
kVA	kilovolt ampers
kW	kilowatt, equivalent to 1,000 watts
kWh	kilowatt hours
L	litres
Li	the element symbol of lithium
LHD	load-haul-dump
L/s	litres per second
LoM	life-of-mine
M	million
m	metres
m^2	square metre
m^3	cubic metre
MAusIMM	member of the Australasian Institute of Mining and Metallurgy
m ASL	metres above sea level
m/s	metres per second
Measured Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit.
Mineral Resource	A concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.
ML	megalitres (million metres); Mining Licence
mg	milligram
mm	millimeter(s)
MRE	Mineral Resource estimate
Mt	million tonnes
Mtpa	million tonnes per annum
MW	megawatts
MWh	megawatts hours
NPV	net present values
NSR	net smelter return
OK	Ordinary Kriging
OHS	occupational health and safety
Opex	operating expenditure(s)/cost(s)
Ore Reserve	The economically mineable part of a Measured and/ or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that

Term / Abbreviation	Meaning / Definition
	include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified
ORM	Ore Reserves Model
PFS	A Preliminary Feasibility Study (Pre-Feasibility Study) is a comprehensive study of a range of options for the technical and economic viability of a mineral project that has advanced to a stage where a preferred mining method, in the case of underground mining, or the pit configuration, in the case of an open pit, is established and an effective method of mineral processing is determined. It includes a financial analysis based on reasonable assumptions on the Modifying Factors and the evaluation of any other relevant factors which are sufficient for a Competent Person, acting reasonably, to determine if all or part of the Mineral Resources may be converted to an Ore Reserve at the time of reporting. A Pre-Feasibility Study is at a lower confidence level than a Feasibility Study
PPE	Personal protective equipment
ppm	parts per million, equivalent to gram(s) per tonne (g/t)
Probable Ore Reserve	the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve
Projects	Taror and Jilau Gold Projects
Proved Ore Reserve	the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors
QA/QC	quality assurance/quality control
RC	reverse circulation
ROM	run-of-mine
RPEEE	reasonable prospects for eventual economic extraction
S	South, also the element symbol of sulphur
SG	specific gravity
SRK	SRK Consulting China Ltd.
Stock Exchange	The Stock Exchange of Hong Kong Ltd., a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd. ("HKEx")
t	tonnes
t/d or tpd	tonnes per day
t/m^3	tonnes per cubic metre
TSF	tailings storage facilities
US$	United States dollar
VALMIN Code	2015 edition of the Australasian Code for the Public Reporting of Technical Assessments and Valuations of Mineral Assets.
WRD	waste rock dump
VAT	value-added tax
Zijin Gold International	Zijin Gold International Company Limited
Zijin Mining	Zijin Mining Group Co., Ltd. (紫金矿业集团股份有限公司)

Executive Summary

Introduction

SRK Consulting China Ltd. ("**SRK**") was commissioned by Zijin Gold International Company Limited. ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of the Taror and Jilau Gold Projects (collectively "**Zeravshan Project**" or the "**Project**") which is located in Sughd Region, Tajikistan. The Zeravshan Project is operated by the Joint Venture Zeravshan Limited Liability Company ("**Zeravshan LLC**") between Tajikistan Government (30%) and Zijin Mining Group Co., Ltd. ("**Zijin Mining**") which has 70% shares. Zijin Gold International is wholly-owned by Zijin Mining.

It is SRK's understanding that the independent technical assessment on the Zeravshan Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of Zijin Gold International on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd. ("**HKEx**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on *the Stock Exchange of Hong Kong Limited* (the "***Listing Rules***") including the Chapter 18 requirements and other relevant regulations of the Stock Exchange and HKEx.

This Report does not express an opinion as to the value of the minerals or other assets involved.

Summary of Principal Objectives

The principal objective of this Report is to provide Zijin Gold International and potential equity investors and future shareholders of Zijin Gold International with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserves, mining methodologies, processing and metallurgical technologies, environmental and social aspects of the Zeravshan Project based on all available technical data, as of the Effective Date of this report. It is understood that the aim of this Report will be used by Zijin Gold International for the proposed listing on the Stock Exchange and HKEx.

Outline of Work Programme

The work program for this project consisted of:

- Review of dataset and Mineral Resource models provided by Zeravshan LLC and Zijin Gold International, and preparation of the data verification plan which will be conducted during site inspection.
- A site visit between 14 and 18 April 2025 to the Projects, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.

- Review of all available documents, including operating licences and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating expenses ("**Opex**"), etc.
- Discussion with Zeravshan LLC and Zijin Gold International management and technical personnel, as well as the professionals of Zijin (Xiamen) Engineering Design Co., Ltd. ("**Zijin Xiamen**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Zeravshan Project.
- Preparation of a draft report in accordance with the JORC Code guidelines and the requirements of the Chapter 18 on the Stock Exchange and other regulations of the HKEx, where the declaration date of Mineral Resources and Ore Reserves is 31 December 2024.
- Submission of the draft to Zijin Gold International and Zeravshan LLC and related third party for comments and finalisation of the draft Report based on the feedback.

Results

Overall

The Taror Gold Project (the "**Taror Project**" or "**Taror Mine**") has one mining licence, located in Panjakant, Republic of Tajikistan. It is about 31 km southeast of Panjakant city and 13 km northwest from Jilau Gold Project. Jilau Gold Project has three mining licences, including Jilau, Olympic, and Khirshona mining licences (collectively referred as "the **Jilau Projects**" of "**Jilau Mine**"). The Jilau Projects are located 18 km southeast of Panjakant city, under the jurisdiction of Panjakant City, Sughd State, Republic of Tajikistan.

SRK conducted Mineral Resource verification in accordance with the requirements of the JORC Code guidelines, based on the database acquired in previous exploration programs on the Projects. The following tables summarise the Mineral Resources as of 31 December, 2024.

Table ES-1: Mineral Resource Statement[1, 2], Zeravshan Project, Prepared by SRK Consulting China Limited, 31 December 2024[3]

Mine	Category	Tonnage (Mt)	Grade Au (g/t)	Grade Ag (g/t)	Grade Cu (%)	Au Metal Contained (kg)	Au Metal Contained (koz)	Ag Metal Contained (kg)	Cu Metal Contained (t)
Taror	Measured	10.59	2.95	13.11	0.60	31,233	1,004	138,764	63,769
	Indicated	7.45	2.67	12.03	0.49	19,923	641	89,629	36,810
	Measured + Indicated	18.04	2.84	12.66	0.56	51,156	1,645	228,392	100,579
	Inferred	3.50	2.19	13.41	0.54	7,649	246	46,919	18,860
	Subtotal	21.54	2.73	12.78	0.55	58,806	1,891	275,311	119,439
Jilau	Measured	22.67	0.82			18,592	598		
	Indicated	3.55	0.74			2,625	84		
	Measured + Indicated	26.22	0.81			21,218	682		
	Inferred	1.73	0.57			985	32		
	Subtotal	54.17	0.80			43,420	1,396		

Mine	Category	Tonnage (Mt)	Grade Au (g/t)	Grade Ag (g/t)	Grade Cu (%)	Au Metal Contained (kg)	Au Metal Contained (koz)	Ag Metal Contained (kg)	Cu Metal Contained (t)
Khirshona	Measured	15.19	0.66			10,027	322		
	Indicated	3.50	0.68			2,377	76		
	Measured + Indicated	18.69	0.66			12,404	399		
	Inferred	2.88	0.39			1,122	36		
	Subtotal	40.25	0.64			25,930	834		
Total	Measured	48.45	1.24			59,852	1,924	138,764	63,769
	Indicated	14.50	1.72			24,925	801	89,629	36,810
	Measured + Indicated	62.95	1.35			84,778	2,726	228,392	100,579
	Inferred	8.10	1.20			9,756	314	46,919	18,860

Notes:

1 All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

2 The information in this report which relates to Mineral Resource is based on information compiled by Mr. Liang Li and Dr. Anshun Xu who are full time employee of SRK Consulting China Ltd. Mr. Li is a member of AusIMM and Dr. Xu is a Fellow of AusIMM. Mr. Li and Dr. Xu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Li and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

3 Open pit Mineral Resources of the Taror Mine are reported at a cut-off grade is 0.6g/t, the Jilau and Khirshona Mine at 0.2g/t.

Taror Mine has been operating since 2001. It is an open pit mine at a capacity of 3,000 tonnes per day ("**tpd**") (990 thousand tonnes per annum ("**ktpa**") feed ore. It is planned to be expanded to 4,500 tpd (1,500 ktpa) in 2027.

Based on current Mineral Resources, SRK reviewed the open pit optimization and converted the qualified Mineral Resources into Ore Reserves. As of 31 December 2024, Taror Project possesses 10.06 Mt of Proved Ore Reserves averaging 2.94 g/t gold ("**Au**"), 12.80 g/t silver ("**Ag**") and 0.57% copper ("**Cu**"); and 7.30 Mt of Probable Ore Reserves averaging 2.71 g/t Au, 11.63 g/t Ag, and 0.49% Cu. The Ore Reserves can support 13 years or more of mining production.

The Jilau Projects (including Jilau open pit and Khirshona open pit) has been operating since 2012. It is currently run by ZRV as an open pit mine at a capacity of 12,000 tpd (4,000 ktpa) feed ore.

Based on current Mineral Resources, SRK reviewed the open pit optimization and converted the qualified Mineral Resources into Ore Reserves. As of 31 December 2024, the Jilau Project possesses 33.34 Mt of Proved Ore Reserves averaging 0.70 g/t Au, and 6.57 Mt of Probable Ore Reserves averaging 0.64 g/t Au. The Ore Reserves can support 7 years or more of mining production.

Previous Capex invested into the project with a total net value of about US$ 231.2 million as of 31 December 2024, has established the facilities for the project to produce saleable final products of gold doré bullions, silver doré bullions and copper cathodes from its mining, ore processing, and smelter production. By reviewing the production records in previous years, and the FS 2025, and considering the sustaining Capex of about US$ 76.8 million for technical upgrade and expansions of the TSF, and using a discounted cash flow method, SRK assessed that the project has a net present value ("**NPV**") of about US$ 1.50 billion at a discount rate of 10%, over a life of mine for 13 years. The all-in-sustaining cost ("**AISC**") over the life of the mine is about US$1,314/ oz gold. The analysis indicates that the project is financially viable and supports the Ore Reserve statements.

Operational Licences and Permits

The Company has obtained four mining licences to carry out mining, processing and smelting. In addition, it has other approvals and permits including a business licence, land use permits, and a water use permit.

Accessibility, Climate, Local Resources, Infrastructure and Physiography

Taror Project is located in Panjakant, Republic of Tajikistan. It is about 31 km from southeast of Panjakant city and 13 km northwest from Jilau Project. The Jilau Project is located in the Northern Slope of The Zeravshan Mountains in the western section of the Southern Tianshan Mountains, 18 km southeast of Panjakant city, under the jurisdiction of Panjakant City, Sughd State, Republic of Tajikistan. The Jilau Mine is centred at approximately 67°43′28″East and 39°20′20″North.

The mine is connected by tarred roads to Dushanbe, the capital city of Tajikistan, and Khujand, the capital city of the State of Sughd State, and the mining area is connected internally with gravel roads. The distance between the mining area and Dushanbe is about 270 km, and the distance from site to Khujand is about 250 km. The distance from Khujand to Kashgar in Xinjiang is about 2,600 km through Karasu port. It takes 40-hours for vehicles to pass through. Both Dushanbe and Khujand have commercial flights connected to Urumqi, China. The transportation is convenient.

The climate of the region is continental. It is dry and warm in summer, and there is precipitation and snow in spring, autumn and winter. The maximum precipitation (below 120 mm) occurs from March to April, and the minimum precipitation (0~18 mm) occurs from July to August. The average annual precipitation is 308.4 mm.

Tajikistan's manufacturing industry is poorly developed, and mining materials are scarce. Most of the production equipment and parts need to be imported from China, and diesel fuel is mostly purchased from Russia. Food, vegetables and fruits are in sufficient supply.

Sughd State, where the mining area is located, is in the northwest of Tajikistan, adjacent to Uzbekistan in the West and North, and bordering with Kyrgyzstan in the East.

The industry of Sughd State is dominated by the mining industry, supplemented by agricultural products processing industry. There are 214 deposits discovered, explored and mined. The rich mineral resources support the rapid development of mining economy. The processing industry of agricultural products has wool spinning, canned fruit and other enterprises.

History

In 2003, Taror Mine and Jilau Mine were acquired by London listed Avocet Mining Plc ("**Avocet**").

In 2007, Zijin acquired 75% share of JV Zeravshan LLC held by Avocet and renamed it as Sino-Tajik Zeravshan Corporation Limited. In 2008, 5% was transferred out. For now, Zijin holds 70% while Tajik government holds 30%.

The following geological investigations have been undertaken on Taror-Jilau Project areas.

Taror Mine

In 1937, Taror Mine was discovered and exploited as an Arsenic ("As") mine from 1937 to 1946.

1951-1978, Tajik Geological Brigade conducted prospecting and exploration at Taror mine.

1999, Nelson built model using Datamine software for Taror Mine.

2010-2012, Zijin conducted mineral evaluation and studies, and geological exploration at Taror Mine.

Jilau-Olympic Mine

In 1949, Jilau Mine was discovered by placer survey. Between 1949 and 1952, Tajik Geological Bureau conducted tungsten prospecting activity at Jilau Mine.

1956-1985, Tajik Geological Brigade conducted prospecting and exploration activities at Jilau mine.

1994-2007, British Nelson Company and Avocet conducted production exploration at Jilau mine. In 2005, Avocet prepared an updated Mineral Resource and Ore Reserve.

2007-2014, Zijin Mining Group acquired Jilau mine and conducted production exploration and prospecting at Jilau and Olympic mines.

2015-2019, Zeravshan LLC commissioned Zijin Northwest Mineral Geological Institute to conduct Mineral Resource verification and modelling using Surpac software at Jilau and Olympic mine.

Khirshona Mine

In 1948, Tajik Geological Brigade conducted geological survey at Khirshona mine.

1949-1983, Tajik Geological Brigade conducted prospecting and exploration at Khirshona mine.

1995-2001, Marcion Geological Brigade and Zeravshan LLC conducted geological exploration at Khirshona mine.

2010, Jinfeng Company of Zijin Group conducted Mineral Resource verification at Khirshona mine.

2010-2012, Zijin conducted deep geological exploration at Khirshona mine.

Geological Setting and Gold Mineralisation

The Taror-Jilau Projects are located in the Zeravshan-Ghizar Inter-arc Basin, the South Tienshan orogenieic belt, northern margin of the Tarim-Karakum Plate. The projects are part of Kizilkuli-Alai Mountain, which are of femic-salic fold formation.

Regional strata occur as Silurian-Carboniferous carbonate rocks, sandstone and shale, Jurassic, Tertiary, and Quaternary. Magmatic rocks are developed while granodiorites dominate, and the secondary are diorite and gabbro. Dykes consist of granite-porphyry dykes, porphyrite dykes and quartz veins.

The gold mineralization of Taror Mine is hosted by the skarn rocks between the Devonian and the granodiorite, controlled and altered by the faults.

The Jilau Projects is located in the eastern side of Chinoise granodiorite. Intrusive rocks are part of the Chinoise granodiorite, and they are closely related with the gold mineralization. The gold mineralization is primarily hosted by the intrusive rocks and controlled by faults and joints.

Deposit Types

The deposit type of Taror Mine is typical Au-Cu-Ag-As polymetallic contact-metasomatic deposit formed by the interaction of intermediate-acidic magmatic rocks and carbonate rocks. Au-Cu-Ag-As enrichment occurs along the skarn rocks and breccia.

The deposit type of the Jilau Projects is of hydrothermal deposit type. Au mineralisation develops along the joints and fractures.

Exploration

The deposit has been explored with geophysics and geochemical studies, exploration, geological mapping, surveying and drilling by Geological Institute of Tajik Geological Bureau, Avocet and Zijin.

Drilling, Trenching and Underground Channelling

At Jilau Mine, a total of 1,141 diamond drill holes have been completed at the exploration and production stages, with an aggregate length of 117,992.01 m. Drilling was conducted by Avocet between 1995 and 2006. between 2007 and 2019, drilling was conducted by Zijin. A total of 107,430 samples were collected from the surface diamond drilling.

At Khirshona mine, a total of 189 diamond drill holes have been completed with an aggregate length of 36,294.33 m. At Taror mine, a total of 424 diamond drill holes have been completed at the exploration and production stages, with an aggregate length of 51,948.02 m.

Surface trenches were completed at the prospecting and exploration stage. Bench trenches were used at the production stage:

- At Taror mine, a total of 31 bench trenches have been completed at the production stage, with an aggregate length of 2,735.879 m. A total of 90 surface trenches have been completed at the exploration stage, with an aggregate length of 3,360.72 m.
- At Jilau mine, a total of 298 bench trenches have been completed at the production stage, with an aggregate length of 11,413.38 m.
- At Khirshona mine, a total of 178 surface trenches have been completed at the exploration stage, with an aggregate length of 16,733.83 m.

Adit channel samples are designed and carried out for prospecting and geological exploration.

Sample Preparation, Analyses, and Quality Assurance and Quality Control ("QA/QC")

All samples of Taror mine, Jilau-Olympic mine, and Khirshona mine were logged and then shipped to the central laboratory of Zeravshan LLC.

Specific gravity ("SG") samples for Jilau mine and Khirshona mine were collected and analysed by the central laboratory of Zeravshan LLC. Density, humidity and gold grade were determined. A density of 2.65 t/m^3 is adopted for the Mineral Resource estimation. SG samples for Taror mine were collected and analysed by the central laboratory of Zeravshan LLC. Densities of 2.74 t/m^3 and 2.65 t/m^3 are adopted for ore and waste, respectively.

All samples of Taror mine, Jilau-Olympic mine and Khirshona mine, were logged and were then shipped to the central laboratory of Zeravshan LLC.

Sample preparation was performed for routine chemical assays by the laboratory of Zeravshan LLC following a standard rock preparation procedure of drying, weighing, crushing, splitting, and pulverization. The pulverized pulps were about 74 microns ("µm", Tyler 200 mesh).

Samples from Jilau-Olympic mine and Taror mine are assayed using fire with wet assay methodology. Samples of Khirshona mine are assayed using flame atomic absorption spectrometry method ("AAS").

Duplicates and Umpire Duplicates

The duplicates and umpire duplicates performance are generally acceptable, most pairs are within ±20%, although some low-grade samples shown greater bias due to the sensitivity of numbers.

Blanks

Only blank assay samples were adopted in the laboratory, and coarse blanks were not applied thus the sample preparation contamination is not monitored.

CRMs

All the CRMs in Taror, Jilau and Khirshona sample streams are within 2 Standard Deviations ("SDs") which demonstrated the assay performances are robust.

In general, the QA/QC performance of Taror, Jilau and Khirshona project are considered of industry best practices, which provide reliable assay data for Mineral Resource estimation.

Mineral Resource Estimation

The Mineral Resource estimation methodology involved consolidating and verifying borehole and topographic data. Wireframe models delineated mineralisation boundaries based on assay data and lithology. Mineral Resource domains were defined, and sample results were composited and capped for analysis. Block models were interpolated, and Mineral Resources classified and validated to determine economic prospects and cut-off grades.

SRK reviewed the databases of the Taror project, Jilau project and Khirshona project, and modified the Mineral Resource models accordingly. As of 31 December 2024, the Mineral Resources of the projects are reported (see Table ES-1 for details) as follows:

- At a cut-off grade of 0.6 g/t Au, the Taror Mine is estimated to contain 10.59 million tonnes ("Mt") of Measured Mineral Resources with an average grade of 2.95 g/t Au, 13.11 g/t Ag, and 0.60 % Cu, containing 1,004 koz of Au, 138,764 kg of Ag, and 63,769 t of Cu, 7.45 Mt of Indicated Mineral Resources with an average grade of 2.67 g/t Au, 12.03 g/t Ag, and 0.49 % Cu, containing 641 koz of Au, 89,629 kg of Ag, and 36,810 t of Cu, and 3.50 Mt of Inferred Mineral Resources with an average grade of 2.19 g/t Au, 13.41 g/t Ag, and 0.54 % Cu, containing 246 koz of Au, 46,919 kg of Ag, and 18,860 t of Cu.
- At a cut-off grade of 0.2 g/t Au, the Jilau Mine is estimated to contain 22.67 Mt of Measured Mineral Resources with an average grade of 0.82 g/t Au, containing 598 koz of Au, 3.55 Mt of Indicated Mineral Resources with an average grade of 0.74g/t Au, containing 84 koz of Au, and

1.73 Mt of Inferred Mineral Resources with an average grade of 0.57g/t Au, containing 32 koz of Au.

- At a cut-off grade of 0.2 g/t Au, the Khirshona Mine is estimated to contain 15.19 Mt of Measured Mineral Resources with an average grade of 0.66 g/t Au, containing 322 koz of Au, 3.50 Mt of Indicated Mineral Resources with an average grade of 0.68 g/t Au, containing 76 koz of Au, and 2.88 Mt of Inferred Mineral Resources with an average grade of 0.39 g/t Au, containing 36 koz of Au.

Exploration Potential

Outside the mining pit boundary, there are still some sections with good mineralization potential and favorable mineralization, and some exploration drill holes have revealed promising mineralization information. It is recommended to carry out further geological studies and mineability assessments (including metallurgical testing and preliminary economic evaluations) to better define the potential of these mineralized material.

Ore Reserves

SRK has estimated the Ore Reserves for the Taror, Jilau, and Khriskhona deposits in accordance with the guidelines outlined in the JORC Code. These Ore Reserve estimates are underpinned by modifying factors based on technical studies and ongoing operational records, which meet the minimum of a Pre-Feasibility Study level of confidence. The key factors applied in the estimation process include design slope, open pit optimization, open pit design, mining losses, and dilution. Additional considerations include processing capabilities, marketing conditions, as well as environmental, legal, and political constraints, or any other factors that may affect the quantity and classification of the Ore Reserves.

The economically mineable portions of the Measured and Indicated Mineral Resources within the designed open pits, inclusive of diluting material and allowances for losses, have been classified as Proved Ore Reserves and Probable Ore Reserves, respectively.

Table ES-2: Ore Reserve Statement for the Zeravshan Project as of 31 December, 2024 by SRK Consulting China Ltd.

Category	Tonnes	Grade			Contained Metal			
	Mt	Au (g/t)	Ag (g/t)	Cu (%)	Au (kg)	Au (koz)	Ag (kg)	Cu (t)
Open Pit								
Proved	43.40	1.22	2.97	0.14	52,917	1,701	128,698	59,554
Probable	13.09	1.75	6.14	0.26	22,953	738	80,401	34,344
Sub-total open pit	56.49	1.34	3.70	0.17	75,870	2,439	209,099	93,898
Stockpile								
Proved								
Probable	0.78	1.36	5.83	0.17	1,063	34	4,575	1,314
Sub-total open pit	0.78	1.36	5.83	0.17	1,063	34	4,575	1,314
Total								
Proved	43.40	1.22	2.97	0.14	52,917	1,701	128,698	59,554

Category	Tonnes	Grade			Contained Metal			
	Mt	Au (g/t)	Ag (g/t)	Cu (%)	Au (kg)	Au (koz)	Ag (kg)	Cu (t)
Probable	13.88	1.73	6.12	0.26	24,016	772	84,976	35,658
Total Ore Reserves	57.28	1.34	3.73	0.17	76,933	2,473	213,674	95,212

Sources: SRK

Notes:

[1] The information in this report which relates to Ore Reserve is based on information compiled by Mr Donghao Luo and Mr Falong Hu, who are full time employee of SRK Consulting China Ltd. Mr Falong Hu is Fellow of AusIMM and he supervised the Ore Reserve estimation. Both have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Both consent to the reporting of this information in the form and context in which it appears.

[2] Numbers were rounded to the second significant digit to reflect the uncertainties in estimate.

[3] Total may not add due to rounding discrepancies

[4] For Taror Mine, mining dilution (waste rock and Inferred Mineral Resources) rate is 4.7%. Mining loss rate is 3.4%.

[5] For Jilau pit at Jilau Mine, mining dilution (waste rock and Inferred Mineral Resources) rate is 4.6%. Mining loss rate is 3.6%.

[6] For Khirshona pit at Jilau Mine, mining dilution (waste rock and Inferred Mineral Resources) rate 4.8%. Mining loss rate is 3.7%.

[7] The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources

Mining Assessment

The Company owns two mines comprising three pits: the Taror open pit at the Taror Mine and the Jilau open pit and Khirshona open pit at the Jilau Mine. All three pits are currently planned as open pit mining operations. As of 31 December, 2024, these open pits remain operational for open pit mining."

Processing and Metallurgy

Zeravshan LLC has constructed and operated the No.1 Processing Plant (Taror Processing Plant), No.2 Processing Plant (Jilau Processing Plant), Heap leach plant, Copper Smelter, Gold Smelter, and Tailings Wastewater Treatment Plant. These facilities adopted a combined mineral processing and metallurgy flow to treat gold ore from the various mines, producing gold bullion, silver bullion, and cathode copper. The combined process offers flexibility suitable for adapting to variations in ore properties and has achieved stable recovery rates.

The ore from Taror Mine contains copper and arsenic, making it a refractory ore, which is processed at the No.1 Processing Plant. The No.1 Processing Plant employs a flotation and Carbon-in-Pulp ("CIP") process to recover copper, gold, and silver, with an annual processing capacity of 1.5 Mt. The products include Cu-Au-S mixed concentrate and gold-loaded carbon, which are sent to the copper smelter and gold smelter, respectively, for further processing.

The ores from the Jilau, Khirshona, and Olympic Mines are easily cyanidized and processed at the No.2 Processing Plant. The No.2 Processing Plant uses a CIP process to extract gold and silver, with an annual processing capacity of 4.0 Mt. The product, gold-loaded carbon, is sent to the gold smelter for further processing.

The Heap leach plant processes low-grade waste rock generated from open pit stripping operations, with a flexible production capacity of up to 2 Mt annually. The product, gold-loaded carbon, is sent to the gold smelter for further processing.

The copper smelter is dedicated to processing Taror's Cu-Au-S mixed concentrate with an annual processing capacity of 165,000 tonnes. It employs the Pressure Oxidation ("**POX**") – Counter-Current Decantation ("**CCD**") – Solvent Extraction ("**SX**") – Electrowinning Process ("**EW**") ("**POX-CCD-SX-EW Process**") along with the CIP process to produce cathode copper and gold-loaded carbon. Arsenic is converted into insoluble precipitate and discharged into the Taror TSF. Cathode copper is a final mine product, while gold-loaded carbon is sent to the gold smelter for further processing.

The gold smelter utilizes the elution-electrowinning-refining process to treat gold-loaded carbon from various production units, producing gold bullion and silver bullion (purity greater than 99.99%). The stripped carbon is returned to the production units for reuse. The gold smelter has an annual processing capacity of 10,000 tonnes of gold-loaded carbon and a refining capacity of 6 tonnes of gold per year.

Taror Mine flotation tailings contain copper and arsenic, which are partially leached during cyanidation, impacting the adsorption of gold and silver onto activated carbon. The cyanidation tailings wastewater contains elevated levels of copper, arsenic, gold, silver, and cyanide. The tailings wastewater treatment plant applies the sulfidation-acidification-recycling-thickening process ("**SART process**") to treat cyanidation tailings wastewater from the Taror Mine, recovering copper, gold, silver, and sodium cyanide. The recovered sodium cyanide is reused in the No.1 Processing Plant, while the precipitate containing copper and other metallic impurities (up to 50% copper content) is treated as Cu-Au concentrate and sent to the copper smelter for further processing. The wastewater treatment plant has a treatment capacity of 2 million m³ per year. Production data for 2024 is shown in Table ES-3.

Table ES-3: Processing and Metallurgical Production summary for 2024

Index Description	Unit	No.1 Plant	No.2 Plant	Heap Leach Plant

Index Description	**Unit**	**Copper Smelter**	**Gold Smelter**	**Tailings Water Treatment Plant**
Material Processed[1]	t	146,082	9,066	1,745
Metal in Product[2]	Au kg	2,482	***5,401***	58
	Ag kg	4,655	***4,820***	1,741
	Cu t	***4,905***	-	579
	NaCN t	-	-	***1,258***
Metals Recovery	Au %	92.36	99.99	29.78
	Ag %	41.73	83.07	91.63

Cu %	90.67	-	91.74
NaCN	-	-	78.75

Note:

[1] Feed material of the copper smelter is copper concentrate, weight unit is kilo-tonnes dry basis. Feed material of the gold smelter is gold loaded carbon, weight unit is tonne dry basis. Feed material of the Tailings wastewater treatment plant is tailings wastewater of Taror TSFs, volume unit is kilo-stere.

[2] The black italicized figures are the final product output. Others are the intermediate product output.

Overall, the project had processed ores of 5.17 Mt averaging 1.36g/t Au, 5.55 Mt averaging 1.29g/t Au, and 5.97 Mt averaging 1.20 g/t Au, in 2022, 2023, and 2024, respectively; and produced 6,317 kg, 6,276, and 5,401kg gold, achieving recoveries of 89.68%, 87.91%, and 75.31%, in 2022, 2023, and 2024.

Environmental and Social Impacts

The sources of inherent environmental and social risk are project activities that may cause potential environmental and social impacts. The environmental and social risks for the Project are mainly as:

- Impacts to the local ecological system due to significant land disturbance
- Cyanide pollution from the TSFs,
- Heavy metal pollution from the waste rock dumps and TSFs; and
- OHS training and inspection concerns.

The above risks are categorised as moderate/ tolerable risks (i.e., requiring risk management measures). It is SRK's opinion that these risks for the project can be generally managed if the Company make efforts in solving the issues.

Capital Expenditures and Operating Costs

Capital Expenditure(s)

SRK reviewed the information provided by the mine regarding Capex invested into the project. As of 31 December 2024, the assets formed by the Capex of existing production facilities have a net value of about US$ 231.2 million.

Recently, the Company made a plan of further investments of US$76.8 Million for technical improvement and some new projects. Table ES-4 summarize the aspects of the technical improvement and new projects and their investments. SRK will consider the new investment to be invested in the first four years (i.e. from 2025 to 2028). In addition, the Company also prepared a plan of further investments of US$ 24.7 million and US$ 9.8 million for the capitalisation of parts of stripped wastes in years 2025 and 2026 respectively to keep the strip ratio less than 25 t/t.

Table ES-4: Further Capex Needed According to Usage (US$ in Thousand)

Item	Amount
Engineering fee	**33,776**
Geological	*481*
Mining	*7,600*
General layout	*2,464*

Item	Amount
Tailings storage	*27,304*
No. 4 TSF	*30,549*
Other Engineering	**4,586**
Contingency	**3,836**
Total	**76,820**

The working capital needed for reaching the designed capacity is estimated at US$41.2 Million in total, which will be invested in two years, i.e. US$37.4 Million in 2025, and US$3.8 Million in 2026. Table ES-5 gives the investment plan for the project.

Table ES-5: Further Investment Plan (US$ in Million)

Item	Unit	2024	2025	2026	2027	2028
Sustaining Capex	US$ Million	231.2	12.0	5.0	29.3	30.5
			24.7	9.8	-	-
Working capital	US$ Million		37.4	3.8	-	-
Total	US$ Million	231.2*	74.1	18.6	29.3	30.5

Note: * The value of Capex invested as of 31 December 2024

Operating Costs

SRK reviewed the Opex of the recent years of production, and the Opex proposed in the FS 2025. Table ES-6 provides details about the Opex SRK will use to project future production.

Table ES-6: Summary of Opex to be Used by SRK (Modified from FS 2025 and the Company)

Category	Cost Centre	Unit	Amount
Mining	Taror Mine	$/t ore	1.1
	Jilau Mine	$/t ore	1.4
	Khirshona Mine	$/t ore	1.4
Striping	Taror Mine	$/t waste	1.1
	Jilau Mine	$/t waste	1.4
	Khirshona Mine	$/t waste	1.4
Ore Processing	No. 1 Plant	$/t ore	34.13
	No. 2 Plant	$/t ore	9.18
Heap Leaching	Heap Leaching	$/t ore	1.91
Tailings Water Processing	Tailings Processing	$/t copper	829
Gold Smelter	Gold Smelter	$/kg gold	**650**

Economic Analysis

By using the discounted cash flow ("**DCF**") method and various economic and technical parameters, SRK has projected the mine economy of the project. For a life of mine of about 13 years, the project will have a NPV of about USD 1.50 billion at 10% discount rate, and NPV of USD 1.38 billion and USD 1.64 billion at 12%, and 8% discount rate, respectively. The sensitivity analysis shows that the changes in Opex have smaller effect on the Project's NPV than that of changes in prices, while the changes of Capex have least effect on NPV.

The analysis above shows that the Zeravshan Project is economically viable, and the Ore Reserves statement can satisfy with the requirements of JORC Code.

Risk Assessment

SRK considered various technical aspects which may affect the future cash flow of the Zeravshan Project. SRK's final Risk Assessment is presented in the following Table ES-9.

Table ES-9: Risk Assessment for Zeravshan Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Unlikely	Moderate	Low
Unexpected Groundwater Ingress	Possible	Moderate	High
Significant Unexpected Geological Faulting	Possible	Moderate	High
Mining			
Significant imbalance stripping ratio leading ore feed instability	Likely	Minor	Medium
Unable to achieve ore plan due to lack of previously stripping	Possible	Moderate	Medium
Significant Geological Structure leading slope failure	Likely	Moderate	High
Unable to achieve mine plan due to lack of skilled labor or equipment	Unlikely	Moderate	Low
Bad WRD management leading mine plan failure	Unlikely	Moderate	Low
Poor Mine Plan leading production shortfalls	Possible	Moderate	Medium
Poor Road Transportation/Safety	Unlikely	Minor	Low
Ore Processing and Metallurgy			
Process Adaptability	Unlikely	Moderate	Low
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Possible	Moderate	Moderate
Low Plant Reliability	Rarely	Moderate	Negligible
Environmental and Social			
Impact to the local ecological system due to the significant land disturbance	Possible	Moderate	Medium
Cyanide pollution from the TSFs	Possible	Moderate	Medium
Heavy metal pollution from the waste rock dumps and TSFs	Possible	Moderate	Medium
OHS training and inspection concerns	Possible	Moderate	Medium
Capital and Operating Costs			
Project Timing Delay	Unlikely	Moderate	Low
Capital Cost Increases	Unlikely	Moderate	Low
Capital Costs- Ongoing	Unlikely	Moderate	Low
Operating Cost Underestimated	Possible	Moderate	Medium

Recommendations

SRK offers the following recommendations:

- The internal duplicates, CRMs and assay blanks' performances were generally acceptable. Coarse blanks are recommended to be applied in the sample stream before sending samples to laboratory to monitor the potential contamination during sample preparation.
- It should be noted that Zijin Xiamen has proposed a further expansion of the mine's planned processing capacity to 1.5 Mtpa of feed ore. Based on SRK's review of the mine schedule, the plan anticipates a peak total material movement (TMM) of 35 Mtpa, with this production rate

sustained for approximately 7 years. SRK considers this projected life-of-mine schedule to represent high-intensity mining operations.

- SRK recommends maintaining the routine monitoring of metal balance for each processing facility and further improving the company-wide metal balance management for Zeravshan LLC. Considering the varied characteristics of water usage and wastewater across production units, as well as the overlapping water utilization among units, SRK suggests establishing a comprehensive water balance system for the entire mining area (and all company operations) and enhancing overall water balance management.

1 Introduction and Scope of Report

SRK Consulting China Ltd. ("**SRK**") was commissioned by Zijin Gold International Company Limited. ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of the Taror and Jilau Gold Projects ("**Zeravshan Project**" or the "**Project**") which is located in Sughd Region, Tajikistan. The Zeravshan Project is operated by the Joint Venture Zeravshan Limited Liability Company ("**Zeravshan LLC**") between Tajikistan Government(30%) and Zijin Mining Group Co., Ltd. ("**Zijin Mining**") which has 70% of shares. Zijin Gold International is wholly-owned by Zijin Mining.

It is SRK's understanding that the independent technical assessment on the Zeravshan Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of Zijin Gold International on the Main Board of the Stock Exchange of Hong Kong Ltd. (the "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd. ("**HKEx**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "**JORC Code**") and in accordance with the rules governing the listing of securities on *the Stock Exchange of Hong Kong Limited* (the "***Listing Rules***") including the Chapter 18 requirements and other relevant regulations of the Stock Exchange and HKEx.

This Report does not express an opinion as to the value of the minerals or other assets involved.

2 Program Objectives and Work Program

2.1 Purpose of the Report

The purpose of this Report is to provide an independent technical assessment for inclusion in a prospectus to be issued by Zijin Gold International to support the proposed listing on the Stock Exchange and the HKEx. The SRK report provides an unbiased technical assessment of the risk and opportunities associated with the reviewed project.

2.2 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "**Valmin Code**"). The Valmin Code incorporates the JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy ("**AusIMM**") members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the JORC Code.

2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that the Client has 100% ownership of its underlying tenements and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Client has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Client and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

2.4 Effective Date

The effective date for this CPR is deemed to be 31 May 2025 (the "Effective Date"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as of 31 December 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK.

2.5 Work Program

- Review of dataset and Mineral Resource models provided by Zeravshan LLC and Zijin Gold International, and preparation of the data verification plan which will be conducted during site inspection.
- A site visit between 14 and 18 April 2025 to the Projects, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold ("**Au**") mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("**TSF**"), water source and power supply station, the office and living areas, and other infrastructure, etc.
- Review of all available documents, including operating licences and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating expenses ("**Opex**"), etc.
- Discussion with Zeravshan LLC and Zijin Gold International management and technical personnel, as well as the professionals of Zijin (Xiamen) Engineering Design Co., Ltd. ("**Zijin Xiamen**"), who conducted either the geology and exploration or the 2025 feasibility study ("**FS 2025**") on the Zeravshan Project.
- Preparation of a draft report in accordance with the JORC Code guidelines and the requirements of the Chapter 18 on the Stock Exchange and other regulations of the HKEx with the declaration date of Mineral Resources and Ore Reserves at 31 December 2024.
- Submission of the draft to Zijin Gold International and Zeravshan LLC and the related third party for comments and finalisation of the draft Report based on the feedback.

2.6 SRK Experience

The SRK Consulting Group ("**SRK Consulting**") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience in providing Independent Expert Reports to mining companies for successfully listing on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/ or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-1.

Table 2-1: SRK's Reports for Listing on the HKEx

Company	Year	Nature of Transaction
Yanzhou Coal Ltd. (listed in HKEx)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on the HKEx and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on the HKEx
Lingbao Gold Ltd.	2005	IPO Listing on the HKEx

2.7 Project Team

The SRK project team and responsibilities are shown in Table 2-2.

Table 2-2: SRK Project Team

Consultant	Title	Discipline and Task
Dr. Anson Xu	Corporate Consultant (Geology)	Project Manager, whole report, Competent Person ("**CP**")
Liang Li	Senior Consultant (Geology)	Geology, Mineral Resource Estimation
Shaobo Dai	Senior Consultant (Geology)	Geology, Mineral Resource Estimation
Feng Li	Principal Consultant (Geology)	QA/QC
Falong Hu	Principal Consultant (Mining)	Mining and Ore Reserve Review
Donghao Luo	Consultant (Mining)	Mining and Ore Reserve Review
Lanliang Niu	Principal Consultant (Processing)	Processing and Metallurgical Review
Chao Ding	Consultant (Processing)	Processing Review
Dr. Yuanhai Li	Principal Consultant (Environment)	Environment, Social, and Permitting
Hongchen Huang	Project Coordinator	Project Coordination and Translation
Dr. Yonglian Sun	Corporate Consultant (Geotech)	Internal Peer Review and Quality Control

Dr Anshun (Anson) Xu, ***PhD, FAusIMM,*** is a Corporate Consultant (Geology) who specialises in the exploration of mineral deposits. He has more than 30 years' experience in the exploration and development of various types of mineral deposits, including Cu-Ni sulphide deposits related to ultra-basic rocks, tungsten and tin deposits, diamond deposits, and especially deep expertise in various types of gold deposits, including vein-type, fracture-breccia zone type, alteration type, and Carlin type. He was responsible for the resource estimations of several diamond deposits and for reviews of resource estimations for several gold deposits. He recently completed for clients from both China and overseas several due diligence projects, including technical review projects, such as Canadian NI43-101 reports and HKEx IPO technical reports.

Liang (Elian) Li, **MEng,** is a Senior Consultant (Geology) at SRK China. Prior to joining SRK, he worked as an on-site geologist for certain mining companies and has gained lots of experiences and expertise in mine geology, grade control and optimization, and resources/reserves management. He is familiar with Chinese procedures and principles for metallic ore deposits prospecting and specialises in geological statistics for resources and reserves estimation. Liang Li is a proficient user of the Surpac modelling software.

Shaobo Dai, holds a bachelor's degree and is a Senior Consultant at SRK China. With 18 years of experience in mine geology, he has worked on-site at the Yangla Copper Mine of Yunnan Copper Group, the Shiganghe Tin-Tungsten Mine of Jiangxi Tungsten Haoyuan, the Zhaxikang Polymetallic Mine of Huayu Mining, and the Longxing Tashetek Polymetallic Mine of Zijin Mining Group. He is well-versed in the geological and digital work procedures and technical requirements in mining production. He has participated in resource verification and due diligence for multiple projects in

China, Russia, and Tajikistan. His project experience covers precious metals (gold, silver), base metals (copper, lead, zinc), and iron ore. He is proficient in the application of software such as Surpac, Datamine RM, Mineplan, Leapfrog, 3DMine, MapGIS, and AutoCAD.

Feng (Frank) Li, *BEng, MSc*, *MAuIMM*, is a Principal Consultant (Geology). He joined SRK in 2010 and has been involved in more than one hundred projects, including project coordination, exploration management, geological logging and mapping, data verification, resource modelling and estimation. the projects located in China, Mongolia, Southeast Asia, Africa and South America; the projects include gold, silver, lead, zinc, iron, nickel, vanadium, magnesium, marble, bauxite, etc. He has a deep understanding of analysis and mineral resource reporting conversions between of Chinese and JORC Code standards and has abundant experience in exploration management and quality control.

Falong Hu, *MBA, B.Eng, FAusIMM, Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Chinese Certified Consulting Engineer (Investment)*, is a Principal Consultant (Mining). He obtained his Bachelor's degree in mining engineering from Central South University and Master of Business Administration (MBA) in China University of Geosciences (Beijing). Before joining SRK he worked as an on-site and head office mining engineer in 2 different international mining companies which were called Sino Gold Mining Limited (later merged with Eldorado Gold Corp.) and Silvercorp Metals Inc. He is familiar with underground and open pit mines' production systems and has been involved in mining engineering and development design, scheduling, long-hole blasting and production operation, rock mechanics, ventilation, back-fill; and cost accounting. After take part in SRK, he accumulated extensive experience in ore reserve estimation, economic analysis, project valuation, mining assessment, scoping/pre-feasibility/feasibility studies and so on. Minerals include gold, silver, lead, zinc, copper, iron, bauxite, laterite-nickel, sylvine, phosphate and graphite, as well as quartzite, marble, bentonite and so on. He is a modeler on both technical and economic and also proficient in digital modelling by using Surpac, Whittle, Minesched, Datamine and AutoCAD.

Donghao Luo, *BEng,* Consultant (Mining) at SRK China. He obtained his Bachelor's degree in mining engineering from Laurentian University. He has three years of experience in underground mining, having worked as a headquarters engineer at Silvercorp Metals Inc. His expertise includes production planning, production management, and the design of development and mining engineering projects.

Lanliang Niu, B.Eng, MAusIMM, is a Principal Mineral Processing Engineer, who graduated in 1987 from Beijing University of Science and Technology majoring in ore processing. He has worked on the industrial testing of gold leaching with low grade ores, managed or participated in processing and metallurgical testing for more than 10 precious and non-ferrous metals projects. With SRK, he has been responsible for the ore processing and metallurgical scope of work and involved in many key projects.

Chao Ding*, M Eng.,* Consultant (Mineral Processing) at SRK China. Prior to joining SRK, he worked for Weihai Haiwang Cyclone Co., Ltd. And Ramu NiCo Management Co., Ltd. He has accumulated certain experience in mineral dressing test research and has a certain understanding and mastery of plant design; in addition, he has accumulated rich experience in production and management of hydrometallurgy of nickel laterite ore.

Yuanhai (Andy) Li, Ph.D, MAusIMM, is a Principal Consultant (Environmental) with SRK China. He earned his doctorate degree in Environmental Engineering from the Florida State University in USA.

He has over 16 years' experience in the environmental engineering field, and has worked in various environmental projects in USA, China, and the Great Asia Area and Africa. He has particular expertise in environmental due diligence reviews, environmental compliance and impact assessments for mining, mineral processing, refining, smelting and infrastructure/hydropower project. He has wide work experiences in compliance with internationally recognized environmental requirements, such as Equator Principles (EP), World Bank/International Finance Corporation (WB/IFC), and U.S. Environmental Protection Agency (USEPA) legislations, etc. Furthermore, he also has extensive experience in contaminated site assessments and remedial design, wetland and landfill rehabilitation, water/wastewater treatment design, water distribution systems, and storm water management system design.

Dr Yonglian Sun, *BEng, PhD, FAusIMM, FIEAust*, is a Corporate Consultant and a Practice Leader of SRK China. Dr Sun has over 30 years' experience in geotechnical engineering and mining engineering in five countries across four continents. He also has extensive international experience in mining project evaluation for project financing and overseas stock market listings. Over the last decade, Dr Sun has led and coordinated dozens of due diligence projects for many mining companies and most of them have been successfully financed or listed on the HKEx. Dr Sun provided internal peer review to ensure the quality of the report meets the required standard.

2.8 Warranties

Zijin Gold International has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

2.9 Indemnities

As recommended by the VALMIN Code, Zijin Gold International has provided SRK with an indemnity under which SRK is to be compensated for any liability and/ or any additional work or expenditure resulting from any additional work required:

- Which results from SRK's reliance on information provided by Zijin Gold International or to Zijin Gold International not providing material information; or
- Which relates to any consequential extension workload through queries, questions or public hearings arising from this Report.

2.10 Compliance Statement

The information in this report that relates to Mineral Resources/ Ore Reserves is based on information compiled by Dr. Anson Xu, a Competent Person who is a Fellow of AusIMM, and Mr Falong Hu, a Competent Person who is a Fellow of the AusIMM. Both are full-time employees of SRK. Dr. Xu is the main Competent Person and takes overall responsibility for the whole report, as well as the Competent Person for the Mineral Resources. Mr. Hu is the Competent Person for the Ore Reserves.

This Report is a Competent Person's Report in line with the Listing Rules of the Stock Exchange and HKEx.

Dr. Anson Xu and Mr Falong Hu have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code.

Dr. Anson Xu and Mr Falong Hu consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Dr. Yonglian Sun, *FAusIMM (CP*), a Corporate Consultant (Geotech & Project Evaluation).

2.11 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Zijin Gold International or Zijin Gold International's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

2.12 Consent

SRK consents to this Report being included, in full, in the Zijin Gold International prospectus, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

2.13 Forward Looking Statement

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

3 Operating Licences and Permits

SRK relied on the information provided by the Client and SRK understands that a legal due diligence review of this project has been undertaken by the Client's legal advisors.

3.1 Mining Licences

Details of the Mining licence for the Project are presented in Table 3-1 and scanned original copies are provided in the appendix of this report. It is noted that the Project comprises of four mining licences, which are Jilav Mine, Olimpi Mine, Hirshonai Mine, and Taror Mine.

Table 3-1: Mining Licences

Name of Mine	**Jilav**	**Taror**
Mining Licence No.	0000117	0000118
Issued To	JV Zeravshan LLC	JV Zeravshan LLC
Issued By	Government of the Republic of Tajikistan	Government of the Republic of Tajikistan
Issue Date	29 November 2023	29 November 2023
Expiry Date	29 November 2028	29 November 2028

Issued To	JV Zeravshan LLC	JV Zeravshan LLC
Issued By	Government of the Republic of Tajikistan	Government of the Republic of Tajikistan
Issue Date	31 October 2022	31 October 2022
Expiry Date	31 October 2027	31 October 2027

3.2 Other Operational Permits

SRK was provided a certificate of state registration for the Project with details shown in Table 3-2.

Table 3-2: Certificate of State registration

Project	Zeravshan Project
Licence No.	6010000728
Issued To	JV Zeravshan LLC
Issued By	Tax Committee of the Republic of Tajikistan
Issue Date	23 December 2008
Expiry Date	Long Term

The Company states that it has obtained proper land use accesses to carry out mining and processing activities, and related land use permits have also been provided to SRK for review. In addition, the Company plans to obtain additional land use permits for the future mining and processing. Table 3-3 summarises the details of the land use permits.

Table 3-3: Land Use Permits

Land Use Permit No.	0349518	004079
Issued To	JV Zeravshan LLC	JV Zeravshan LLC

According to the Company, it has obtained a proper water use permit, and an original copy was provided to SRK as evidence. Table 3-4 provides the details of this permit.

Table 3-4: Water Use Permit

Water Use Permit No.	0012474
Issued To	JV Zeravshan LLC
Issued By	Environmental Protection Committee of Republic of Tajikistan
Issue Date	11 June 2024
Expiry Date	Permanent

Type of Water Source	Water from Mogiyon River and Shing River and associated groundwater nearby
Water Allocation	15,159,500 m^3/year

4 Regional Description

4.1 Location and Accessibility

The Jilau Mine is located in the Northern Slope of the Zeravshan Mountains in the western section of the Southern Tianshan Mountains, 18 km southeast of Panjakant city, under the jurisdiction of Panjakant City, Soghd State, Republic of Tajikistan. The Jilau Mine is centred at approximately 67°43′28″East and 39°20′20″North.

The mine is connected by tarred roads to Dushanbe, the capital city of Tajikistan, and Khujand, the capital city of the State of Sughd State, and the mining area is connected internally with gravel roads. The distance between the mining area and Dushanbe is about 270 km, and the distance from site to Khujand is about 250 km. The distance from Khujand to Kashgar in Xinjiang is about 2,600 km through Karasu port. It takes 40 hours for vehicles to pass through. Both Dushanbe and Khujand have commercial flights connected to Urumqi, China. The transportation is convenient.

Taror Mine is located in Panjakant, Republic of Tajikistan. It is about 31 km from southeast of Panjakant city and 13 Km from northwest Jilau. Administratively it belongs to the city of Panjakant. Taror Mine is centred at approximately 67°46′15″East and 39°18′10″North.

Taror Mine is connected with the nearest railway station in Samargant city. The railway runs through Panjakant, the central city of the region. The 75 Km road from Panjakant to Samargant is paved with asphalt. The rest of the road (44 km from Panjakant to Taror Project) is a dirt road in good condition.

The location of both the Jilau and Taror projects are shown in Figure 4-1.

Figure 4-1: Project Location and Accessibility

4.2 Climate

The climate of the region is continental. It is dry and warm in summer, and there is precipitation and snow in spring, autumn and winter. The maximum precipitation (below 120 mm) occurs from March to April, and the minimum precipitation (0~18 mm) occurs from July to August. The average annual precipitation is 308.4 mm. In winter, the temperature is usually no less than -20 degree Celsius ("**°C**"). It snows in October and melts in April. The snow cover is 10~15 cm thick and the soil permafrost is 5~10 cm deep. The monthly average temperature in January was 0.4 °C and that in July was 25.2 °C. In summer, the temperature difference between day and night is large, reaching above 10.5 °C. There is less wind in the area, the wind direction is mostly westerly, and the maximum wind speed is less than 15 m/s. There are often rainstorms in spring.

4.3 Local Resources

Tajikistan's manufacturing industry is poorly developed, and mining materials are scarce. Most of the production equipment and parts need to be imported from China, and diesel fuel is mostly purchased from Russia. Food, vegetables and fruits are in sufficient supply.

Sughd State, where the mining area is located, is in the northwest of Tajikistan, adjacent to Uzbekistan in the West and North, and bordering with Kyrgyzstan in the East. The state is the most economically developed region in Tajikistan, with a population of about 2 million, accounting for about one third of the total population of Tajikistan. The main cities are Khujand, Urotrppa, Panjakant, and Kairakum.

The industry of Sughd State is dominated by the mining industry, supplemented by the processing industry of agricultural products. There are 214 deposits discovered, explored and mined. The rich mineral resources support the rapid development of mining economy. The processing industry of agricultural products has wool spinning, canned fruits and other enterprises. Agriculture includes wheat, cotton, vegetables, fruits, cattle, sheep, and silkworm. The state has a large agricultural population (about 70%) and abundant labour resources. At the same time, due to the development of several mineral deposits in the region, industrial workers with certain mining technology are relatively sufficient.

The mine is located in a relatively complete power grid. There are 5 substations within the Projects, including 110 kV Taror substation, 110 kV substation of No. 2 concentrator, 35/ 6kV substation of Taror mining plant, 35/ 6kV substation of Taror mining plant and 35/ 10/ 6kV substation of Jilau mining plant.

4.4 Physiography

This area has strong terrain cutting, developed gullies and many bedrock outcrops. The upper terrain is high in the South and low in the north. The carbonate rock development is in the south, with the altitude over than 2,100 m. The terrain is steep, and the slope gradient is 40-50 degrees. The middle part is the granodiorite exposed area, with the altitude of about 1,700 m above sea level ("**ASL**"), and the terrain is relatively flat compared with the South. The north is the Paleozoic sandy shale sedimentary layer and Mesozoic Cenozoic conglomerate distribution. The area is flat with low mountains and hills. Most of the areas are covered by Quaternary alluvial proluvial and slope deposits with thickness of 0.5-5 m.

Within the entire Taror-Jilau Projects area, there are South-North gullies, and most of them have seasonal water flowing in them. The regional water network of the mining area belongs to the river basin of Zeravshan, and the tributary to the right of Majian Dalia river is Shengge river. Shengge river is the main river in the mining area. It is a typical high mountain river with rapid flow, summer flood and significant difference in water volume between day and night. The maximum water flow occurs from August to September (20-40 m^3/s), and the minimum flow occurs from January to February (4-5 m^3/s). Annual plants are distributed in the hillsides and valleys, and rare perennial trees are distributed on both sides of the valley.

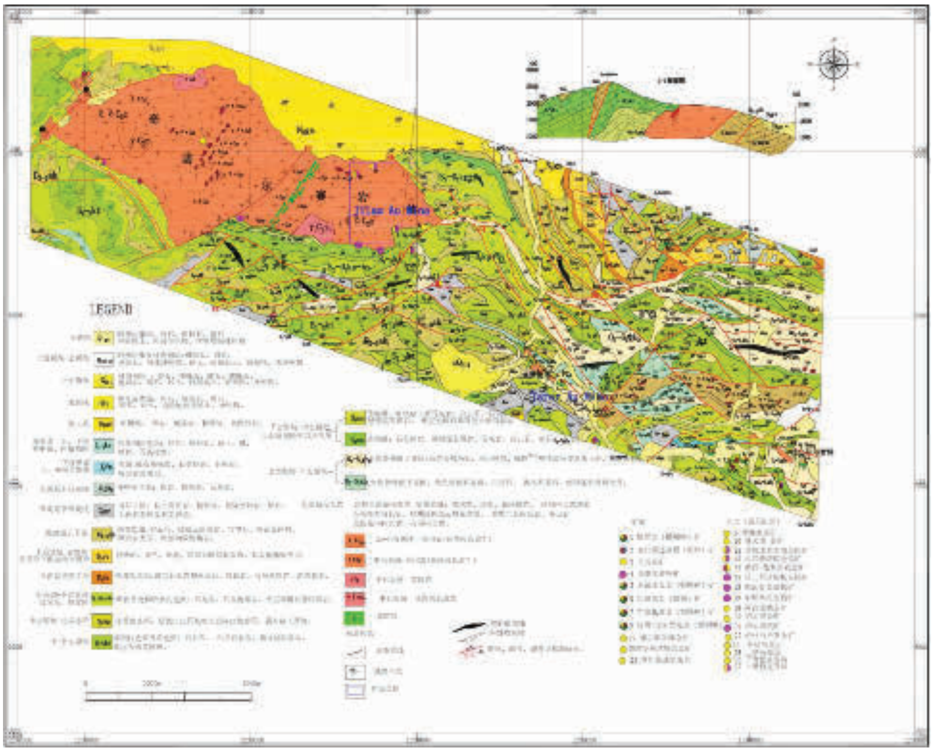
5 Geological Setting and Mineralisation

5.1 Regional Geology

Taror-Jilau Projects are located in the Zeravshan-Ghizar Inter-arc Basin, the South Tienshan orogenieic belt, northern margin of the Tarim-Karakum Plate. The project is part of Kizilkuli-Alai Mountain, which is of femic-salic fold formation (Figure 5-1).

Regional strata occur as Silurian-Carboniferous carbonate rocks, sandstone and shale, Jurassic, Tertiary, and Quaternary. Magmatic rocks are developed while granodiorites dominate, and the secondary are diorite and gabbro. Dykes consist of granite-porphyry dykes, porphyrite dykes and quartz veins.

Figure 5-1: Regional Geology of Taror-Jilau Project



Structures consist of folds and faults. Regionally, northwest trending faults control the intrusion of granite-porphyry. Locally magmatic rocks are superposed by faults and hydrothermal gold deposits occur. Jilau Mine is of this type of Skarn type deposits, like Taror Mine, developed at the contact with the carbonate rocks.

5.2 Property Geology

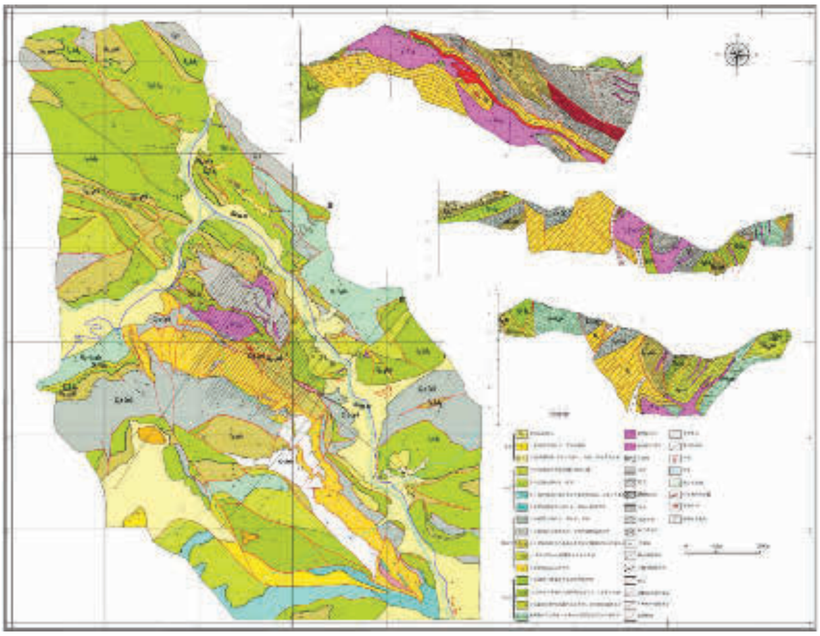
Taror Mine

Exposed strata of Taror Mine primarily consist of the upper Ordovician-lower Silurian Cabelout formation, the middle Silurian Sign formation, the middle Silurian Ludlov formation, the Devonian limestone , the middle Devonian Aifil Majian formation, the Devonian Akbar formation, the lower Carboniferous Donecex and Margu formation (Figure 5-2).

The lower Jurassic Taror formation, the middle-lower Jurassic Keshtudak, Cretaceous and Quaternary are exposed partially. The gold mineralization is hosted by the skarn rocks between the Devonian and the granodiorite, controlled and altered by the faults.

Intrusive rocks are not well developed and consist of granodiorite. Intrusive rocks in the mine site are controlled by the northwest trending faults and are developed at Carboniferous. The intrusive rocks are closely related with the gold mineralization.

Figure 5-2: Geology Map of Taror Gold Mine



Folds and faults are well developed at Taror mine. The middle linear anticline develops at Hercynian, whose core consists of limestone. The northeast wing consists of silicified shale, and the southwest wing consists of limestone, shale, sandstone etc. The length of the anticline is greater than 1,000 m, striking at 135° , plunging to southeast at the angle of 35° . The northeast wing dips north at the angle of 30-60° , and the southwest wing dips south at the angle of 35-65° .

The anticline is broken by the northwest and nearly east-west trending faults. The intrusive rocks are developed along the core of the anticline. The skarn and gold mineralization occur at the contact.

Metamorphism consists of regional metamorphism, contact metamorphism, and dynamic metamorphism.

Wall-rock alterations are well developed and consist of silicification, beresitization, chloritization, carbonatization, and kaolinization.

Jilau-Olympic-Khirshona Mine

Jilau, Olympic and Khirshona Mine is located at the eastern side of Chinoise granodiorite. Strata occur at the south of Jilau Mine section and east of the mine site. Exposed strata primarily consist of the upper Ordovician-lower Silurian Cabelout formation, the middle-lower Silurian Wanlock formation, the middle Silurian Ludlov formation, the Devonian Akbar formation, and the lower Carboniferous Margu formation. The Cenozoic and Quaternary occur locally. The Wanlock and Ludlov formation are the wall rocks of gold mineralization at Jilau Mine section. Only Quaternary occurs at Khirshona mine. Figure 5-3 is the geology map of Jilau Mine and Figure 5-4 is of Khirshona Mine.

Figure 5-3: Geology Map of Jilau Gold Mine

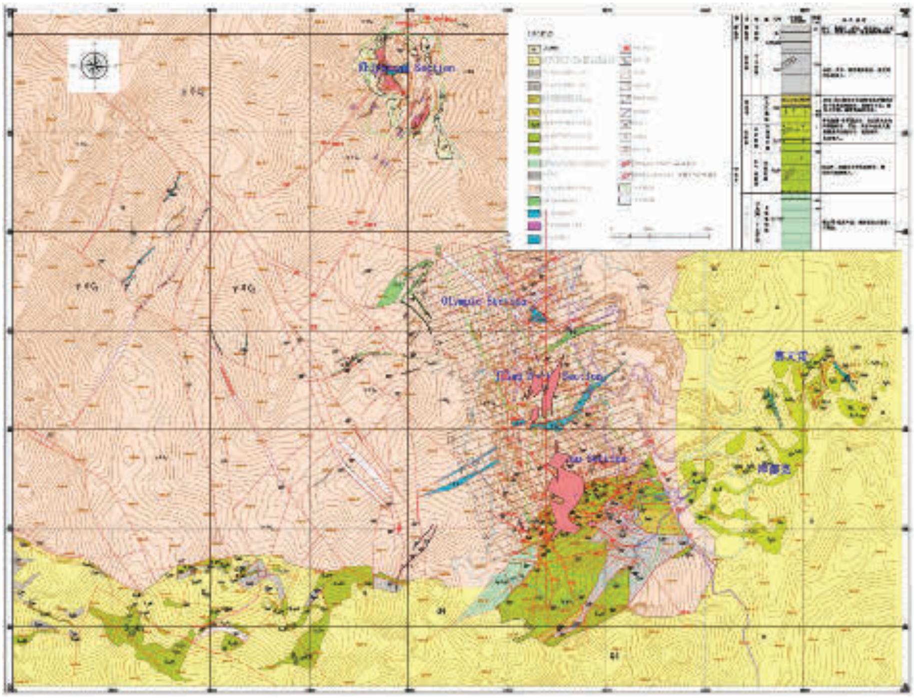


Figure 5-4: Geology Map of Khirshona Mine

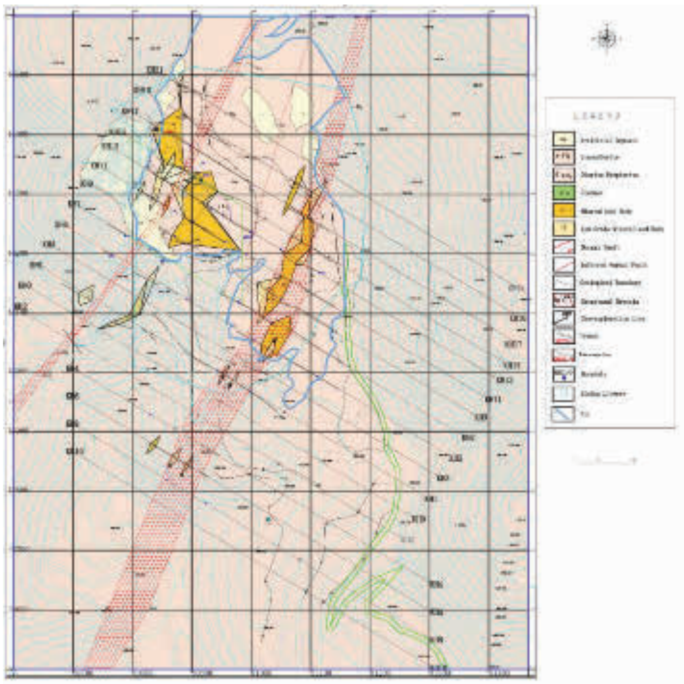


Intrusive rocks are well developed, occurring as stocks and consisting of Carboniferous medium-fine grained granodiorite, minor diorite and diorite porphyrite dykes. Intrusive rocks in the mine site are part of the Chinoise granodiorite, and they are closely related with the gold mineralization. The gold mineralization is primarily hosted by the intrusive rocks and controlled by faults and joints.

Structures develop at Jilau and Olympic Mine, which can be divided into 4 groups: northwest trending, east-west trending, north northwest trending, and nearly south-north trending.

Metamorphism consists of regional metamorphism, contact metamorphism, and dynamic metamorphism.

Wall rock alterations are developed and consist of silicification, carbonatization, chloritization, epidotization, and kaolinization.

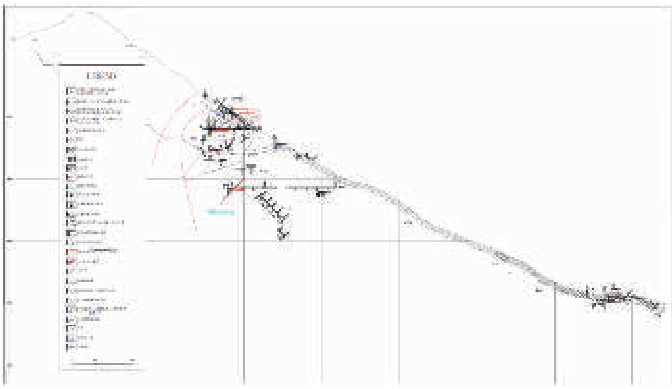
5.3 Mineralised Zones

Taror Mine

The gold mineralization of the Taror deposit is hosted by the skarn rocks between the Devonian limestone and the granodiorite. The major mineralisation zones of Taror mine are about 1,000 m in length, from 26 m to 448 m in thickness and from 860 m to 1,715 m in elevation. The mineralisation zones occur in the shape of layer-like, semilunar, plates, or lens. The mineralisation zones strike northwest-southeast, plunge southeast with plunge angle of 35°, and dip southwest with dip angle of

5-45°. Figure 5-5 shows the geometry of major mineralisation zones and small veins at Cross-section #11 of Taror deposit.

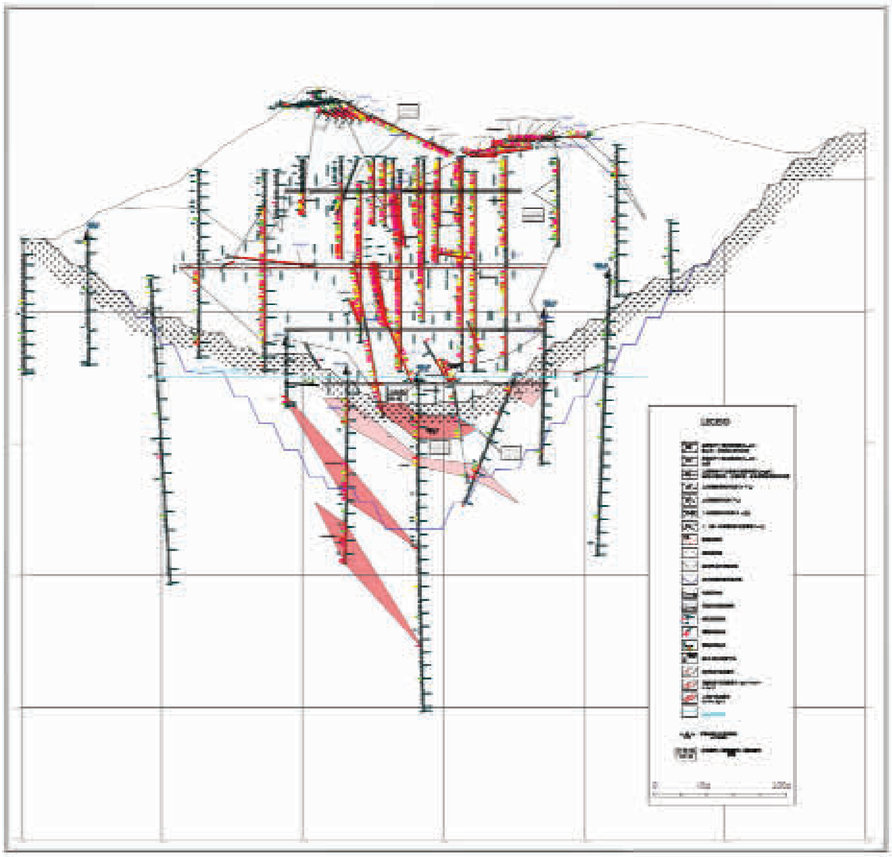
Figure 5-5: Cross-section #11 of Taror Gold Deposit



Jilau-Olympic Mine

The major mineralisation zones of Jilau-Olympic vary from 80 m to 620 m in length, from 26 m to 448 m in width, from 1.32m to 124m in thickness, and from 1,495 m ASL to 2,055 m ASL in elevation. The mineralisation zones occur in the shape of tubes, plates, or lens. The mineralisation zones strike from north northwest to north northeast and dip northeast with dip angle of 31-72° at large. Figure 5-6 shows the geometry of major mineralisation zones and small veins at Cross-section #0, which is the centre of Jilau deposit.

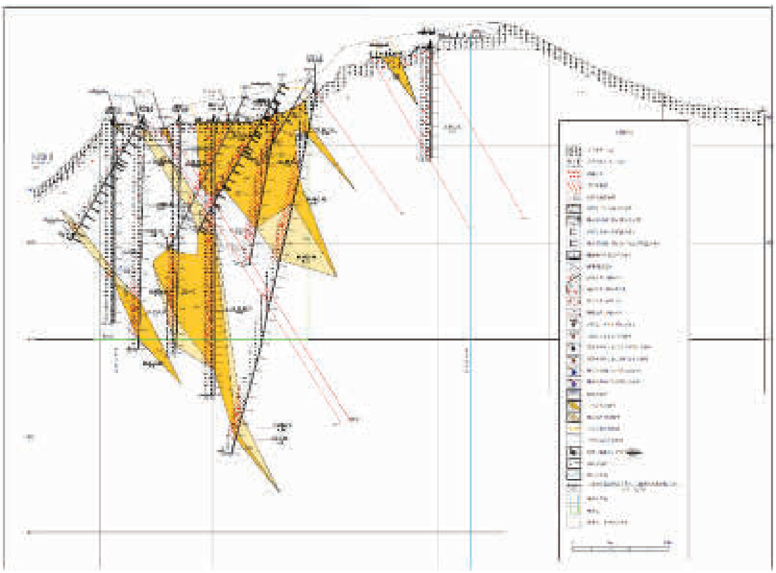
Figure 5-6: Cross-section #0 of Jilau Gold Deposit



Khirshona Mine

The major mineralisation zones of Khirshona are about 640 m in length and vary from 1,323 m to 1,814 m ASL in elevation. The mineralisation zones occur in the shape of big lens and small veins. The mineralisation zones strike 0-40° and mostly 20° and dip southeast with dip angle of 35-70°. Figure 5-7 shows the geometry of major mineralisation zones and small veins at Cross-section #K11, which is at the centre of Khirshona deposit.

Figure 5-7: Cross-section #K11 of Khirshona Gold Deposit



The mineralisation of Jilau-Olympic-Khirshona gold deposits is mainly hosted by granodiorites, partially by skarns at the contact between limestone and granodiorites at the southeast of the deposit.

The ore types consist of oxidized and primary gold ore, which are separated by at 1,850 m ASL. The mineralogy of wall-rock is similar with the ore. The contact between the wall-rock and the mineralised body is not clearly defined.

Ore minerals in the oxidized ore of Jilau-Olympic-Khirshona gold deposits consist of mainly pyrite, arsenopyrite, scorodite, limonite, conichalcite, natural gold, and malachite, etc. Gangue minerals are mainly quartz, felspar, calcite, chlorite, and kaolin.

Ore minerals in the primary ore of Jilau-Olympic-Khirshona gold deposits consist of mainly pyrite, arsenopyrite, natural gold, limonite, chalcopyrite. Gangue minerals are mainly quartz, orthoclase, K-felspar, calcite, chlorite, and kaolin.

The ore textures consist of xenomorphic, semi-euhedral textures. The ore structures consist of fine veined and fine-veined disseminated structures.

The primary component is gold, silver ("**Ag**"), tungsten ("**W**") and copper ("**Cu**"), and other accompanying elements include; arsenic ("**As**") bismuth, selenium, and cobalt.

5.4 Deposit Types

The deposit type of Taror mine is typical Au-Cu-Ag-As polymetallic contact-metasomatic deposit formed by the interaction of intermediate-acidic magmatic rocks and carbonate rocks. Au-Cu-Ag-As enrichment occurs along the skarn rocks and breccia.

The deposit type of Jilau Mine and Khirshona Mine is of hydrothermal deposit type. Au mineralisation develops along the joints and fractures.

6 Exploration

6.1 Exploration History

Taror Mine

In 1937, Taror Mine is discovered and exploited as As mine from 1937 to 1946.

In 1951 and from 1954 to 1957, Middle Asis Non-ferrous Trust Geological Brigade conducted prospecting at Taror Mine.

From 1958 to 1961, Tajik Geological Brigade conducted detailed geological exploration at Taror Mine.

From 1962 to1967 and from 1969 to 1974, Tajik Geological Brigade conducted supplementary geological exploration at Taror Mine.

From 1977 to 1978, Marcion Geological Brigade conducted supplementary geological exploration at Taror Mine.

In 1999, Nelson built model using Datamine software at Taror Mine.

From 2010 to 2012, Zijin conducted mineral evaluation and study and geological exploration at Taror Mine.

Jilau-Olympic Mine

In 1949, Jilau Mine is discovered by placer survey. In 1949-1952, Tajik Geological Bureau conducted tungsten prospecting at Jilau Mine.

From 1956 to 1965, Marcion Geological Brigade conducted supplementary exploration for skarn Scheelite at Jilau Mine.

From 1969 to 1973, Middle Asia Geological Brigade conducted geological, geochemical, and geophysical surveying, and trenching, adit and exploration drilling at Jilau Mine .

From 1976 to 1980, Marcion Geological Brigade conducted re-sampling and re-evaluation at Jilau mine.

From 1981 to 1983, Marcion Geological Brigade conducted detailed exploration at Jilau mine.

In 1985, Marcion Geological Brigade prepared exploration report based on the previous exploration activities at Jilau Mine.

From 1994 to 2007, British Nelson Company and London listed Avocet Mining Plc ("**Avocet**") conducted production exploration at Jilau mine. In 2005, Avocet prepared a Mineral Resource and Ore Reserve update.

From 2007 to 2014, Zijin Mining Group acquired Jilau mine and conducted production exploration and prospecting at Jilau and Olympic Mine.

In 2010, Zeravshan LLC commissioned Jinfeng International Mining Company to conduct Mineral Resource verification at Jilau and Olympic mine.

In 2015, Zeravshan LLC commissioned Zijin Northwest Mineral Geological Institute to conduct Mineral Resource verification and modelling using SURPAC software at Jilau and Olympic mine.

In 2019, Zeravshan LLC commissioned Zijin Northwest Mineral Geological Institute to build resource model using Surpac software at Jilau and Olympic mine.

Khirshona Mine

In 1948, Tajik Geological Brigade conducted geological survey at Khirshona Mine.

From 1949 to 1952, Tajik Geological Brigade conducted prospecting at Khirshona mine.

From 1950 to 1967, Marcion Geological Brigade conducted geological mapping and geochemical survey and at Khirshona mine.

From 1968 to 1970, Marcion Geological Brigade conducted geological mapping at Khirshona mine.

From 1968 to 1969, Marcion Geological Brigade conducted prospecting at Khirshona mine.

From 1969 to 1974, Middle Asia Geological Brigade conducted supplementary exploration at Khirshona mine.

From 1978 to 1983, Marcion Geological Brigade conducted technical and economic study at Khirshona mine.

From 1995 to 2001, Marcion Geological Brigade and Zeravshan LLC Company conducted geological exploration at Khirshona mine.

In 2010, Jinfeng Company of Zijin Group conducted Mineral Resource verification at Khirshona mine.

From 2010 to 2012, Zijin conducted deep geological exploration at Khirshona mine.

The geological exploration engineering was conducted at each stage at Taror Mine, Jilau-Olympic Mine, and Khirshona Mine that is summarized below. Table 6-1 lists the key exploration work at Taror Mine up to 2018.

Table 6-1: Exploration Work at Taror Mine

Update at	Type	Number	Meters	Sample Number	Sample Meters
2018	Diamond Drilling (DD)	424	51,948.02	18116	24053.08

Table 6-3 lists the key exploration work at Khirshona Mine up to 2015.

Table 6-3: Exploration Work at Khirshona Mine

Update at	Type	Number	Meters	Sample Number	Sample Meters
2015	Diamond Drilling (DD)	189	36,294.33	30410	36046.25
	RC Drilling (RC)	93	6,246.00	6246	6,246.00
	Surface Trenching (TR)	178	16,733.83	13869	15416.85
	Total	**460**	**59,274.16**	**50,525**	**57,709.10**

6.2 Trenching and Tunnelling Exploration

6.2.1 Trenching

Surface trenching was conducted at the prospecting and exploration stage. Bench trenching in the open pit are used at the production stage:

- At Taror Mine, a total of 31 bench trenches have been completed at the production stage, with an aggregate length of 2,735.879 m. A total of 90 surface trenches have been completed at the exploration stage, with an aggregate length of 3,360.72 m. The surface and bench trenches are designed and carried out for Mineral Resource verification.
- At Jilau-Olympic Mine, a total of 298 bench trenches have been completed, with an aggregate length of 11,413.38 m. A total of 367 surface trenches have been completed at the exploration stage, with an aggregate length of 14,514.25 m. Bench trenches are designed as grade control samples, while diamond drill hole and reverse-circulation ("**RC**") drill samples are primarily used for resource verification.
- At Khirshona Mine, a total of 178 surface trenches have been completed at the exploration stage, with an aggregate length of 16,733.83 m. Surface trenches are designed and carried out to control the mineralization zones.

6.2.2 Underground Channelling

Adit channel samples are designed and carried out for prospecting and geological exploration:

- At Taror Mine, a total of 874 adits have been completed at the production stage, with an aggregate length of 14,046.95 m.

- At Jilau-Olympic mine, a total of 1,639 channel samples have been completed at the production stage, with an aggregate length of 31,804.59 m.

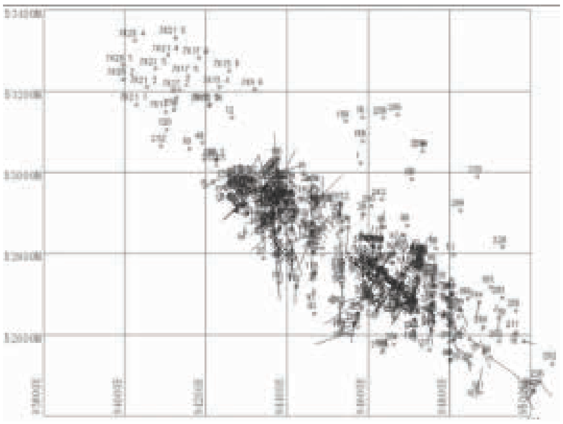
6.3 Drilling Exploration

Taror Mine

At Taror mine, a total of 424 diamond drill holes have been completed at the exploration and production stages, with an aggregate length of 51,948.02 m.

In 2011 and 2012, drilling was conducted by Zijin. A total of 18,116 samples were collected from the surface diamond drilling. Figure 6-1 shows distribution of the drill holes of the production stage by Zijin conducted at Taror mine.

Figure 6-1: Drillholes of Taror Mine Conduct by Zijin



In 2011 and 2012, the holes were drilled with dip angle from -2° to -90°, and a few were drilled vertically (dip angle of -90 °). Onram diamond drill rigs were utilised. All the boreholes commence at Φ110-130mm and terminate at Φ91mm.

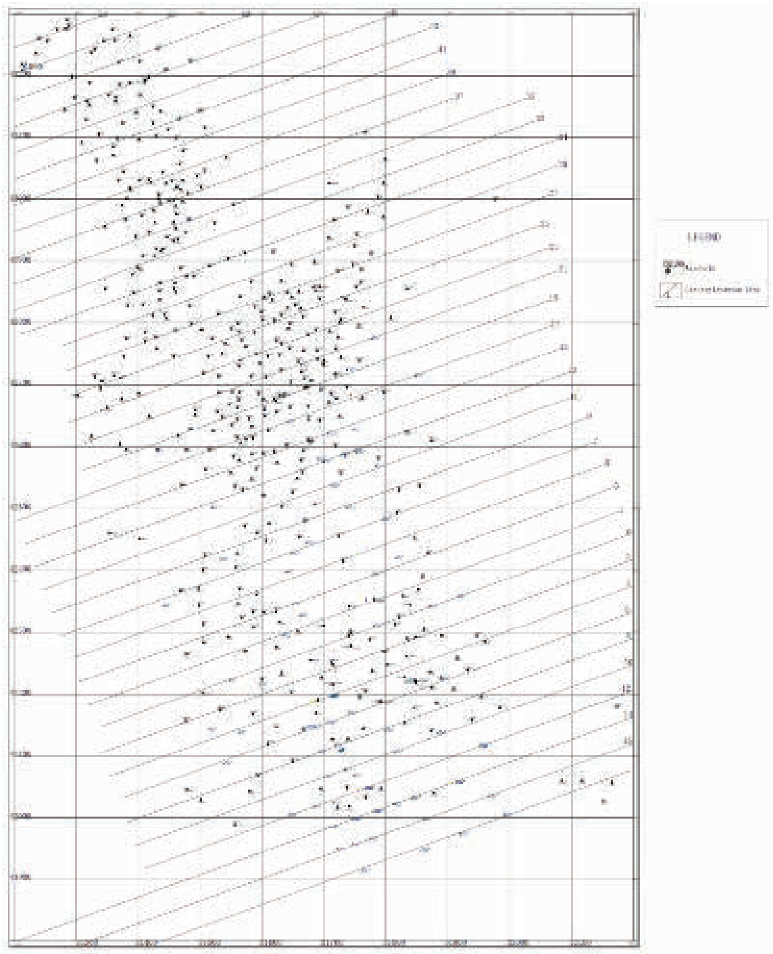
Core recoveries generally averaged at about 84% and recoveries of mineralised intervals were about 87%. The statistics and calculations were performed by Zijin. SRK believes that Core recoveries meet the requirements for resource estimation.

Jilau-Olympic Mine

At Jilau mine, a total of 1,141 diamond drill holes have been completed at the exploration and production stages, with an aggregate length of 117,992.01m.

Drilling was conducted by British company from 1995 to 2006. From 2007 to 2019, drilling was conducted by Zijin. A total of 107,430 samples were collected from the surface diamond drilling. Figure 6-2 shows distribution of the drill holes conducted at Jilau-Olympic mine.

Figure 6-2: Drillholes of Jilau-Olympic Mine



More than half of the holes were drilled with dip angle from -80° to -90 °, and a few were drilled vertically (dip angle of -90 °). Diamond drill rig models utilised consisted of; LY38, Onram, Boyles, SKB4, XY-4. RC drill rig models consisted of MD650, GryPhon.

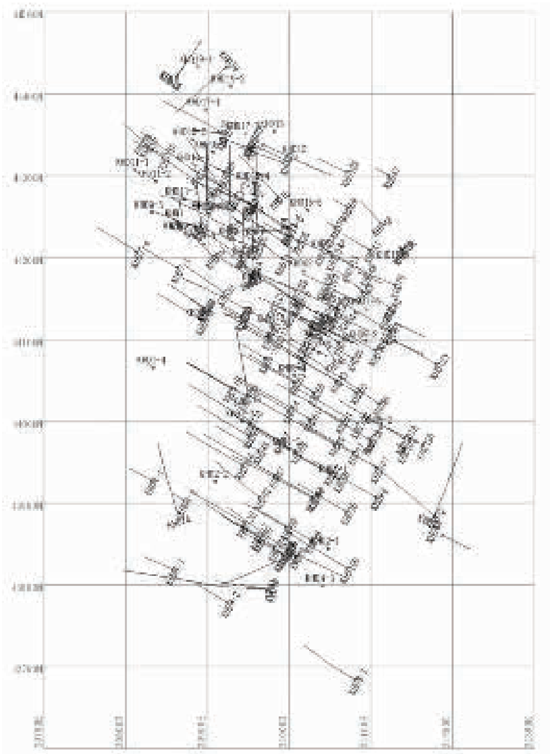
Core recoveries generally averaged at about 86% and recoveries of mineralised intervals were about 85%. The statistics and calculations were performed by Zijin. SRK believes that Core recoveries meet the requirements for resource estimation.

Khirshona Mine

At Khirshona mine, a total of 189 diamond drill holes have been completed by Tajik Geological Brigade exploration stages and the 2011-2012 exploration stages, with an aggregate length of 36,294.33 m.

Drilling was conducted by Tajik Geological Brigade from 1978 to 1983 and from 1995 to 2001. In 2011 and 2012, drilling was conducted by Zijin. A total of 30,410 samples were collected from the surface diamond drilling. Figure 6-3 shows distribution of the drill holes conducted at Khirshona mine.

Figure 6-3: Drillholes of Khirshona Mine



In 2011 and 2012, more than half of the holes were drilled with dip angle from -75° to -87 °, and a few were drilled vertically (dip angle of -90 °). Diamond drill rig models used were the XY-4, XY-5.

Core recoveries generally were above 81%. The statistics and calculations were performed by Zijin.

SRK believes that the Core recoveries are slightly lower, and the Core recoveries largely satisfy the requirements for resource estimation.

6.4 Sampling, Sample Preparation and Analyses

6.4.1 Drill Core Samples

Drill core was logged by mine site staff; core samples were obtained by cutting the core into two halves. One half of each core was placed in sample bags that were then shipped to the central laboratory of Zeravshan LLC. The basic length of drill core samples was about 1 m. The other half-core that was not sampled was placed back in the core box and stored on site.

6.4.2 Underground Channel Samples

Underground channel samples were collected by the Tajik Geological Brigade at the prospecting and exploration stage. Sampling, sample preparation and assay are undertaken under the former Soviet Union procedure. Zijin used the previous underground channel samples in the Mineral Resource verification report.

6.4.3 Specific Gravity Samples

Specific gravity ("SG") samples for Jilau mine and Khirshona mine were collected and analysed by the central laboratory of Zeravshan LLC. Density, humidity and gold grade were determined. A density of 2.65 t/m^3 is adopted for the Mineral Resource estimation. SG samples for Taror mine are collected and analysed by the central laboratory of Zeravshan LLC. Densities of 2.74 t/m^3 and 2.65 t/m^3 are adopted for ore and waste, respectively.

6.4.4 Sampling and Sample Preparation

All samples of Taror mine, Jilau-Olympic mine and Khirshona mine, were logged and were then shipped to the central laboratory of Zeravshan LLC.

Sample preparation was performed for routine chemical assays by the laboratory of Zeravshan LLC following a standard rock preparation procedure of drying, weighing, crushing, splitting, and pulverization. The pulverized pulps were about 74 microns ("**μm**", Tyler 200 mesh).

Samples of Jilau-Olympic mine and Taror mine are assayed using a fire with wet methodology. Samples of Khirshona mine are assayed using flame atomic absorption spectrometry method ("AAS").

6.5 Quality Assurance and Quality Control Programs

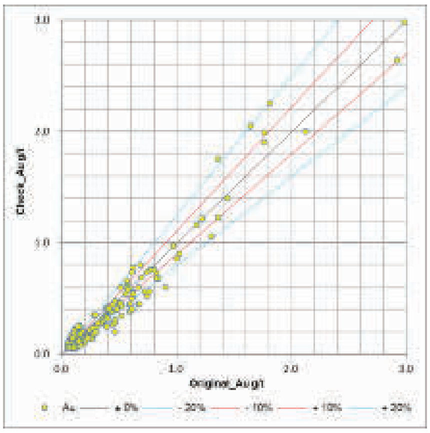
QA/QC programs including Certificated Reference Materials ("CRMs"), blanks and duplicates were implemented in the chemical analysis to monitor the quality of sample preparation and sample analysis.

6.5.1 Duplicates

Taror Mine

The samples of drilling campaign 2011, 2012, 2013, 2014, 2021, 2022 and 2024 were sent to the central laboratory of Zeravshan LLC. A total of 755 pairs of internal check samples were applied, and the data performance is shown in Figure 6-4 below.

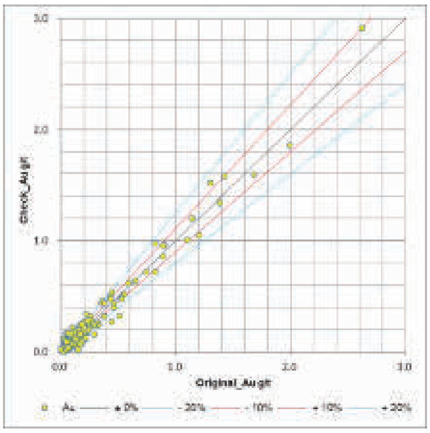
Figure 6-4: Internal Check of Taror



Jilau-Olympic Mine

The samples of the drilling campaign from 2012 to 2024 of the Jilau Mine, were sent to the central laboratory of Zeravshan LLC. A total of 3,926 pairs of internal check samples were applied, the data performance is shown in Figure 6-5 below.

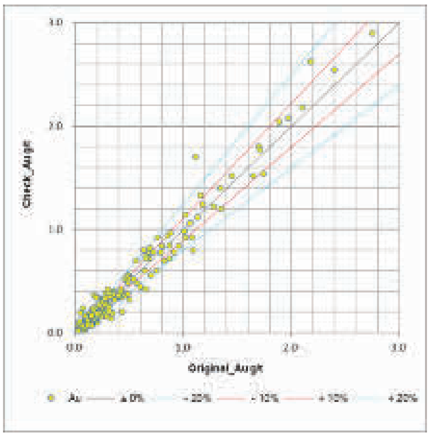
Figure 6-5: Internal Check of Jilau



Khirshona Mine

The samples of the drilling campaign from 2012 to 2013 and from 2023 to 2024 of the Khirshona Mine were sent to the central laboratory of Zeravshan LLC. A total of 1,747 pairs of internal check samples were applied, and the data performance is shown in Figure 6-6 below.

Figure 6-6: Internal Check of Khirshona



6.5.2 CRMs

CRMs bought from commercial institute were introduced into the sample stream in the laboratory. A total of seven CRMs of different grade were utilised. The performance of CRMs is shown in Figure 6-7 below.

Figure 6-7: CRM Performance of Zeravshan Project

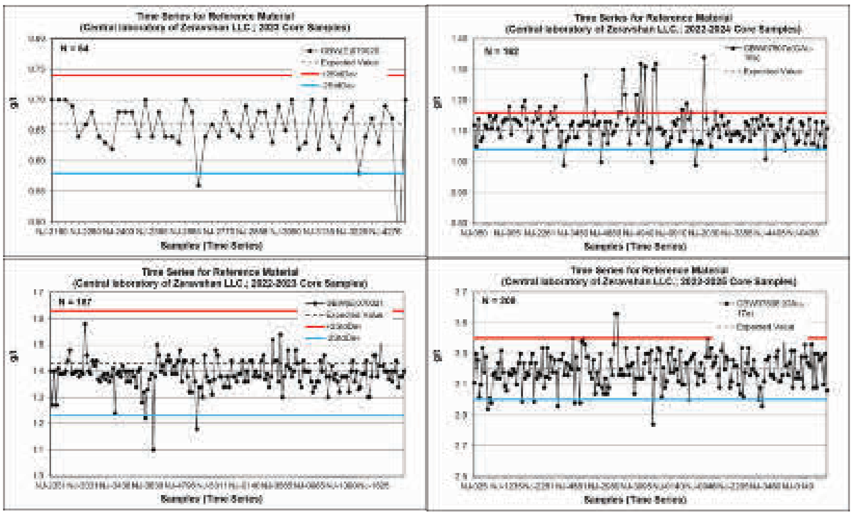


Figure 6-7: CRM Performance of Zeravshan Project

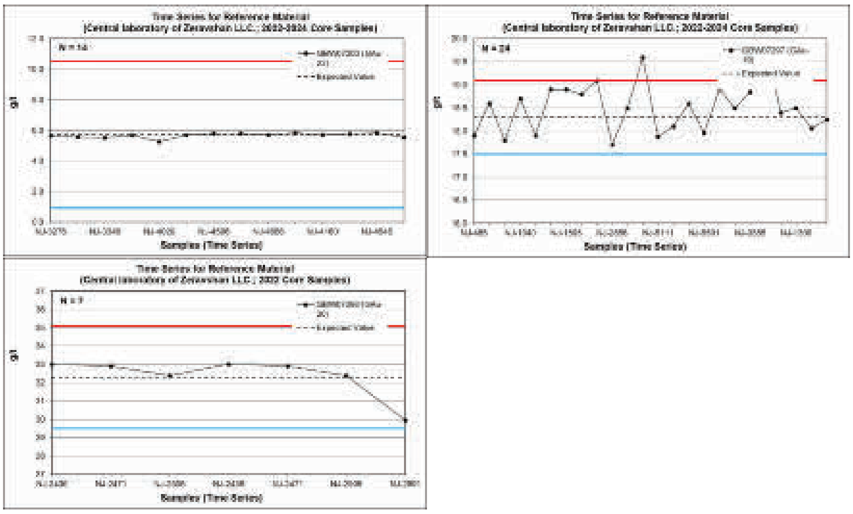
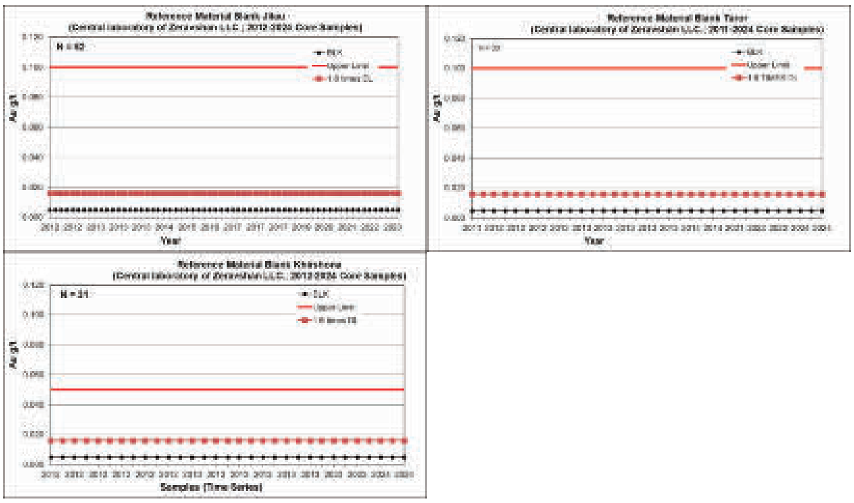


6.5.3 Blanks

Purified water is used as blank samples during analysis in the laboratory. One blank sample is used in each batch samples, and all of the blank samples are below detection limit (0.01g/t Au)

Figure 6-8: Blank Sample Performance of Zeravshan Project



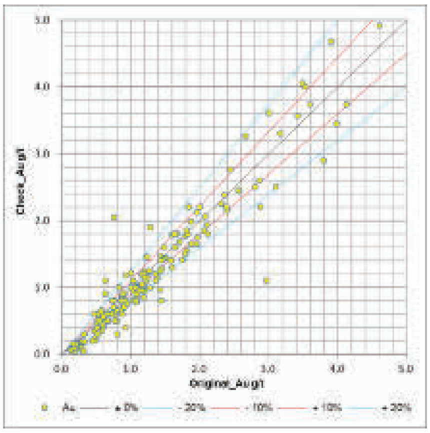
6.5.4 Umpire Check

Umpire check samples were sent to The Magian Prospecting Expedition laboratory ("MPE Lab") located in Panjakant city, which was accredited with ISO71025-2019 certificate.

Taror Mine

The samples of drilling campaign from 2012 to 2024 were sent to the MPE Lab for umpire checks. A total of 319 pairs of umpire check samples were submitted, and the performance is shown in Figure 6-9 below.

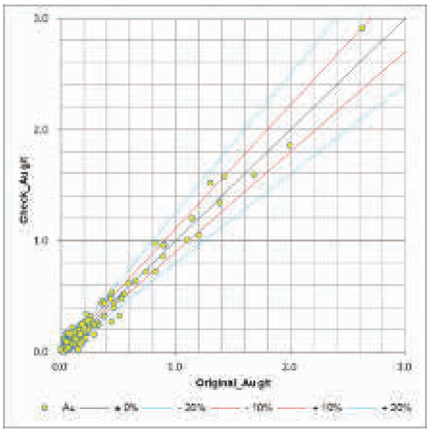
Figure 6 9: Umpire Check of Taror Mine from 2012 to 2024



Jilau Mine

The samples of drilling campaign from 2012 to 2024 for the Jilau Mine were sent to the MPE Lab for umpire checks. A total of 1,410 pairs of umpire check samples were submitted, and the performance is shown in Figure 6-9 below.

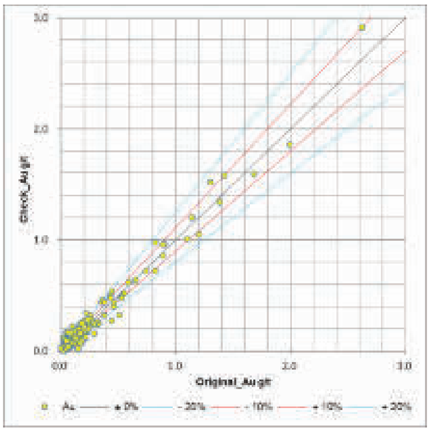
Figure 6-9: Umpire Check of Jilau Mine from 2012 to 2024



Khirshona Mine

The samples of drilling campaign from 2012 to 2024 at the Khirshona Mine were sent to the MPE Lab for umpire checks. A total of 997 pairs of umpire check samples were submitted, and the data performance is shown in Figure 6-10 below.

Figure 6-10: Umpire Check of Khirshona Mine from 2012 to 2024



6.6 SRK Data Verification

SRK senior geologist Shaobo Dai visited the Taror and Jilau Project between 14 and 16 April, 2025. The site visit included the following aspects:

- Observation of the drill cores showing mineralisation.

- The historical drilling sites and the marked collar positions of the completed holes, and a number of locations that were confirmed with hand-held global positioning device, GPS during the site visit.
- The core storage facility was also visited. The trays were stacked in stacking shelves of good dimension to prevent core tipping out. All the sampled intersections are available and showed the sampling intervals, and the numbers were clearly marked on the core with permanent markers.
- All available drillhole data including geological logging, collar data, downhole surveying, sampling and analytical results were reviewed and checked.

Figure 6-11: Site Visit to Core Storage

Verification samples were randomly collected during the site visit, samples were sent to MPE Lab for external checks, the performance of the verification samples are shown in Figure 6-12, greater bias could be observed when sample grade are below 1g/t, it is advised to change umpire laboratory to cross check laboratory performance.

Table 6-4: Verification Samples taken during Site visit

Project	Borehole No.	Sample No.	Original Result (g/t)	Check No.	Check Result (g/t)

7 Mineral Resource Estimates

7.1 Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for Taror mine, Jilau-Olympic mine, and Khirshona mine in accordance with the JORC Code guidelines.

The effective date of the Mineral Resource statement is 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold Mineral Resources found in the Zeravshan Project at the current level of sampling. The Mineral Resources are reported in accordance with JORC Code guidelines. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserves.

The database used to estimate Taror mine, Jilau-Olympic mine("**Jilau**"), and Khirshona mine Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralization and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The solid models were prepared in GEOVIA Surpac 2020.1 software ("**Surpac**") and Leapfrog 2021.1 software ("**Leapfrog**"), and the Inverse Distance Weighting Cubed (**"IDW3"**) estimation techniques was used in Surpac. The entire estimate procedure, consisting of database compilation, mineralised domains construction, the grade interpolation as well as the Mineral Resources classification, were completed by SRK.

7.2 Resource Estimation Procedures

The Mineral Resource evaluation methodology involved the following procedures:

- Database compilation and verification
- Construction of wireframe models for the boundaries of the gold mineralisation
- Definition of Mineral Resource domains
- Data conditioning (compositing and capping) for geostatistical analysis
- Block modelling and grade interpolation
- Mineral Resource classification and validation
- Assessment of "reasonable prospects for eventual economic extraction" ("RPEEE") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement

7.3 Resource Database

SRK converted the database provided by Zijin into CSV format, validated data and removed repeated samples. The database used in the Mineral Resource estimation for Taror, Jilau and Khirshona mine consists of 349,253.94 m, and 5,562 drill holes/ trenches/ underground channel samples. The database contains 263,348 gold samples in total. The drillholes' distribution is shown in Figure 7-1.

Table 7-1: Summary of Database Records of Taror, Jilau and Khirshona Mine

Type	Number	Length (m)	Samples
Taror	1,497	85,701.85	37,604
Jilau	3,548	197,134.61	170,799
Khirshona	517	66,417.48	54,945
Total	**5,562**	**349,253.94**	**263,348**

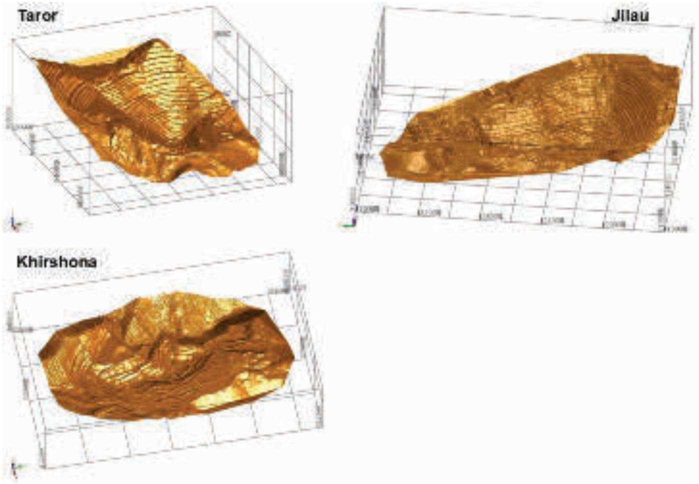
The topographic map of Taror, Jilau and Khirshona mine uses the WGS 1984 coordinates system. Figure 7-2 is the terrain of Taror, Jilau and Khirshona mine.

Figure 7-2: Terrains of Taror, Jilau and Khirshona Mine



Sources: SRK

7.4 Solid Body Modelling

SRK was provided with the Surpac format orebody wireframes of all mineralized domains. SRK has reviewed the orebody wireframes according to the wireframes provided by the client and they are acceptable for the estimation.

The mineralization wireframes for the Jilau and Khirshona mine were constructed based on sectional interpretations using a cut-off grade of 0.2 g/t Au, while a higher cut-off grade of 0.5 g/t Au was applied for the Taror mine. A minimum mining width of 1.0 m was enforced, with internal waste (barren gaps) limited to a maximum thickness of 2.0 m to ensure continuity in the Mineral Resource estimation, as shown in Figure 7-3. A total of 8 mineralized domains were constructed.

Validation of each orebody wireframes triangulation was performed using standard Surpac check routines and by slicing sections through the individual wireframes for comparisons against the drill holes database.

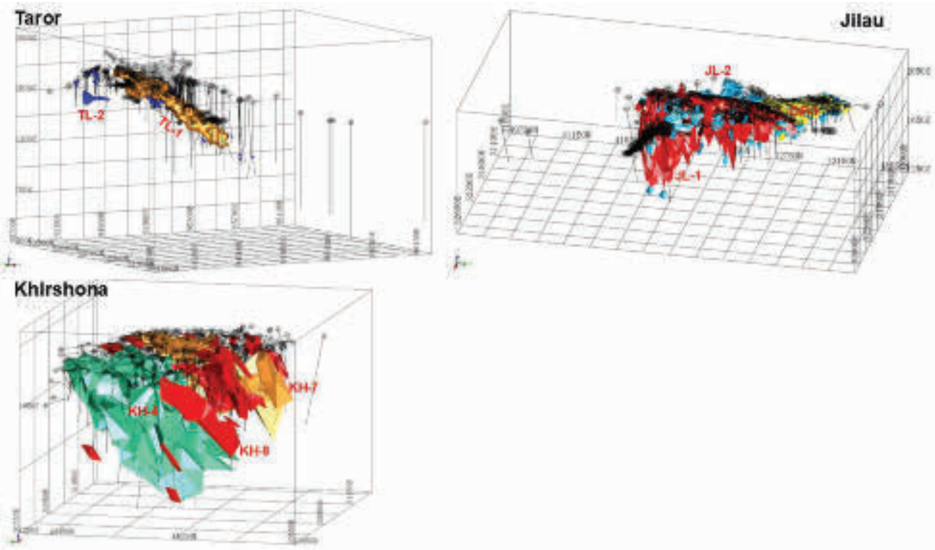
7.5 Specific Gravity

The specific gravity values applied in the Mineral Resource estimation were derived from average SG data provided by the client, as shown in Table 7-2.

Table 7-2: The Specific Gravity Values of Taror, Jilau and Khirshona Mine

SG(t/m^3)	Taror	Jilau	Khirshona
Ore	2.78	2.65	2.65
Waste	2.65	2.65	2.65

Figure 7-3: The Mineralization Wireframes of Taror, Jilau and Khirshona Mine



Sources: SRK

7.6 Compositing

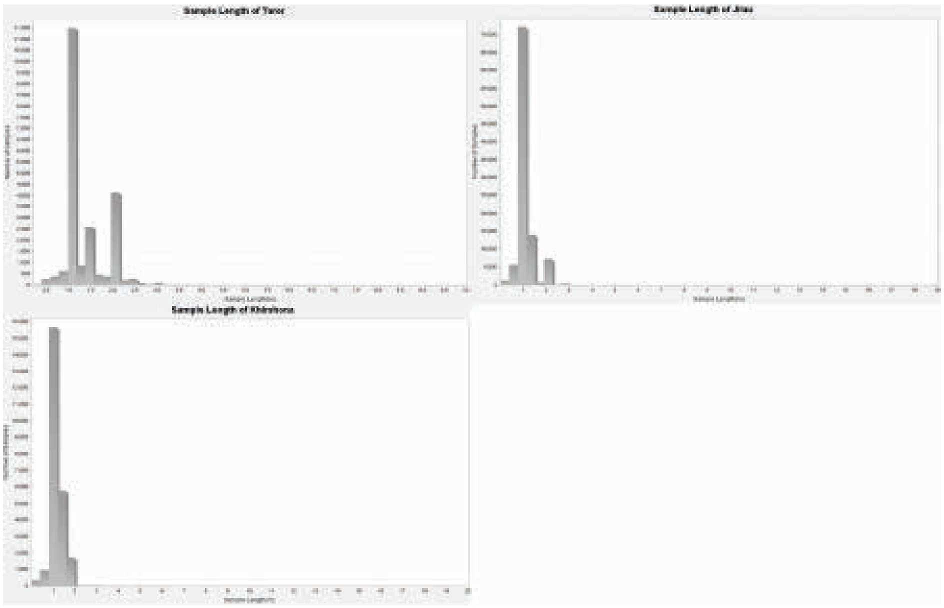
Prior to the statistical analysis, the samples that were generally combined to the length of each sample were basically equivalent. The basic statistics of geological sampling length of original samples were carried out by SRK, as showed in Table 7-3.

Table 7-3: Statistics of Sample Length of Each Domain

Mine	Domain	Samples	Min	Max	Mean	Median	SD	Kurtosis	Skewness
Taror	TL-1	21,393	0.2	10.0	1.3	1.0	0.5	2.1	18.1
	TL-2	612	0.2	3.4	1.3	1.2	0.4	0.9	5.0
Jilau	JL-1	93,883	0.0	19.0	1.1	1.0	0.4	8.4	255.6
	JL-2	3,252	0.0	7.6	1.1	1.0	0.4	4.8	52.8
	OP-1	4,546	0.0	32.6	1.1	1.0	1.0	23.8	678.0
Khirshona	KH-4	15,107	0.0	10.0	1.2	1.0	0.4	2.1	30.7
	KH-7	6,594	0.0	20.0	1.1	1.0	0.5	17.7	522.2
	KH-8	2,798	0.0	18.5	1.1	1.0	0.5	13.6	425.3

For the Zeravshan Project, detailed in Figure 7-4, the result indicates that most of the sample intervals are 1 m, and a 1 m interval composite length was selected for compositing. All raw samples were composited to 1 m downhole lengths, with a minimum of 0.75 m for each composite sample. A 1 m interval composite length was applied by SRK for subsequent statistic and grade interpolation.

Figure 7-4: Histogram of the Sample Length of the Zeravshan Project



Sources: SRK

SRK summarised statistics of composites against raw samples gold grades for each domain as listed in Table 7-4.

Table 7-4: Summary Statistic of Composites against Raws of Each Domain

Mine	Domain	Type	Counts	Min	Max	Mean	Variance	SD	Cov

7.7 Evaluation of Outliers

The composite grade distributions of each deposit were examined via histograms and cumulative probability plots to determine if capping was required, and if so at what level. Figure 7-5 shows the histogram and cumulative probability curve of the composites Au for each domain.

Figure 7-5: Histogram and Cumulative Probability Curve of Au for the Zeravshan Project

Sources: SRK

Table 7-5 and Figure 7-6 contain the outlier value details.

Table 7-5: Capping Values Statistics of the Zeravshan Project

Mine	Domain	Assay Cap Au (g/t)	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t)		Difference (%)
					Before Capping	After Capping	
Taror	TL-1	78.4	28	0.10	3.84	3.80	-0.97
	TL-2	78.4	2	0.25	2.33	1.73	-25.80

7.8 Block Model and Grade Estimation

The block model of each domain was created using Surpac, which was used to estimate tonnage and grade. Appropriate block cell size was selected for the deposits.

For Zeravshan Project, a block size of 5 and 6 m easting by 5 and 6 m northing by 5 and 6 m elevation was used. The block model used the same coordinate system as that was used in data collection. A summary of the block model specifications is listed in Table 7-6. The attributes and descriptions are presented in Table 7-7.

Table 7-6: Block Model Specifications of Zeravshan Project

Mine	Coords	Min	Max	Block Size	Sub Block Size	Rotation
Taror	N	52,100	53,600	5	2.5	0
	E	93,600	95,300	5	2.5	0
	Z	800	2,000	5	2.5	0
Jilau	N	41,600	43,604	6	3	0
	E	31,000	32,602	6	3	0
	Z	1,200	2,202	6	3	0
Khirshona	N	43,700	44,600	6	3	0
	E	30,600	31,302	6	3	0
	Z	1200	1,902	6	3	0

Table 7-7: Attributes and Descriptions of Zeravshan Project

Attribute	Description
domain	TL-1, TL-2, JL-1, JL-2, OP-1, KH-4, KH-7, KH-8
au	Gold grade
category	1=Mea, 2=Ind, 3=Inf
sg	Specific gravity

The IDW3 method was used for grade estimation via Surpac in the block model. The parameters of the searching ellipsoid were thus manually optimized, and the parameters are summarized in Table 7-8 and Table 7-9. According to the general dipping trend, different dip angles were adopted. The Domain, Category, SG and Depletion attribute were assigned directly using the solid models.

Table 7-8: Search Parameters Used in Zeravshan Project Estimation

Mine	Domain	Bearing	Plunge	Dip	Major/semi-major	Major/minor
Taror	TL-1	305	30	10	1.13	1.65
	TL-2	305	30	10	1.13	1.65
Jilau	JL-1	350	0	-70	1	1

Sources: SRK

7.9 Model Validation

Model validation is a common approach for determining whether grade estimation has been performed as expected. SRK has undertaken a through validation of the resultant interpolated model, including statistical validation, visual inspection, and swath plot validation as well.

SRK compared the composites and block grade distribution, as shown in Table 7-10. The relative error between the grade interpolation results of the average block model and average composites is approximately within 25.5%, indicating that the interpolation method is reasonable.

Table 7-10: Comparison between Composites and Blocks Grade

Mine	Composites Average	Blocks Average	Relative Difference	Relative Error
Taror	3.74	2.8	-0.94	-25.13
Jilau	0.96	0.79	-0.17	-17.71
Khirshona	0.59	0.62	0.03	5.08

Visual inspection provides a validation of the interpolated block model on a local block scale, using visual assessments of sample grades versus estimated block grades. The details of visual inspection for each mine can be seen in Figure 7-8.The details of swath plot validation for each mine can be seen in figures from Figure 7-9.

Figure 7-8: Visual Inspection of Each Mine

7.10 Mineral Resource Classification

Block model quantities and grade estimates for the Zeravshan Project were classified according to the JORC Code by Liang Li, a Senior Consultant and a member of AusIMM (No. 3089397) and/ or under the supervision of Anshun Xu, a Corporate Consultant and a fellow of the FAusIMM (No. 224861). They are appropriate Competent Persons for the purpose of JORC Code.

Mineral Resource classification is typically a subjective concept. The industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

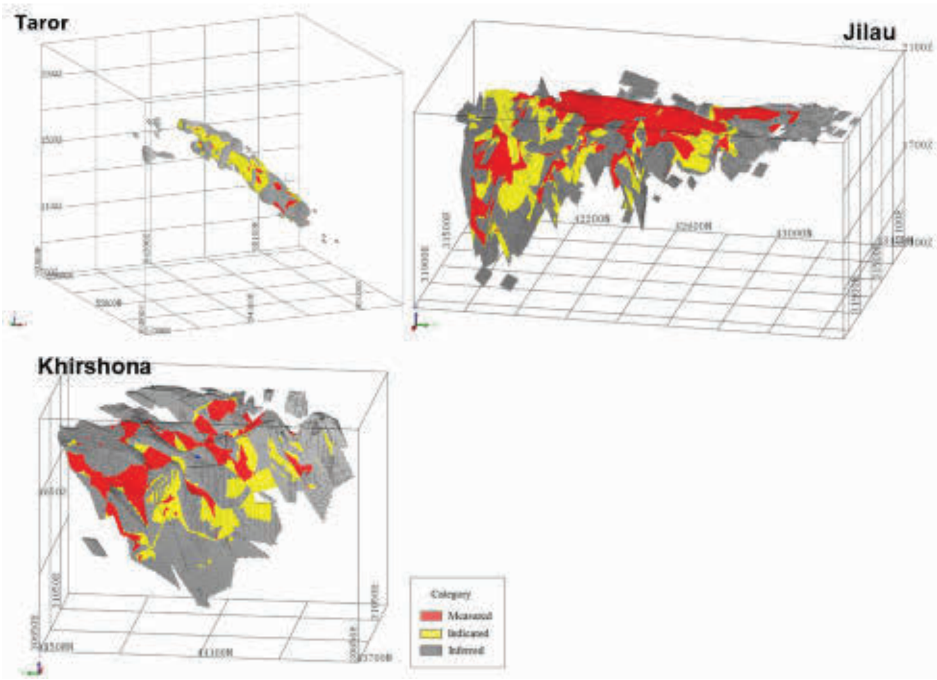
Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the Guideline of the JORC Code.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For Taror mine, the blocks within 40 m × 40 m grid were classified as Indicated Resources and the blocks within 20 m × 20 m grid were classified as Measured Resources. For Jilau and Khriskhona mine, the blocks within 80 m × 80 m grid were classified as Indicated Resources and the blocks within 40 m × 40 m grid were classified as Measured Resources. Figure 7-10 shows the Mineral Resource classification.

Conversely, other blocks beyond the grid in the main mineralised zones and all blocks in the small mineralised zones should be classified as Inferred Mineral Resources, because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters or support an evaluation of economic viability.

Figure 7-10: Mineral Resource Classification



Sources: SRK

7.11 Mineral Resource Statement

The JORC Code defines a Mineral Resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

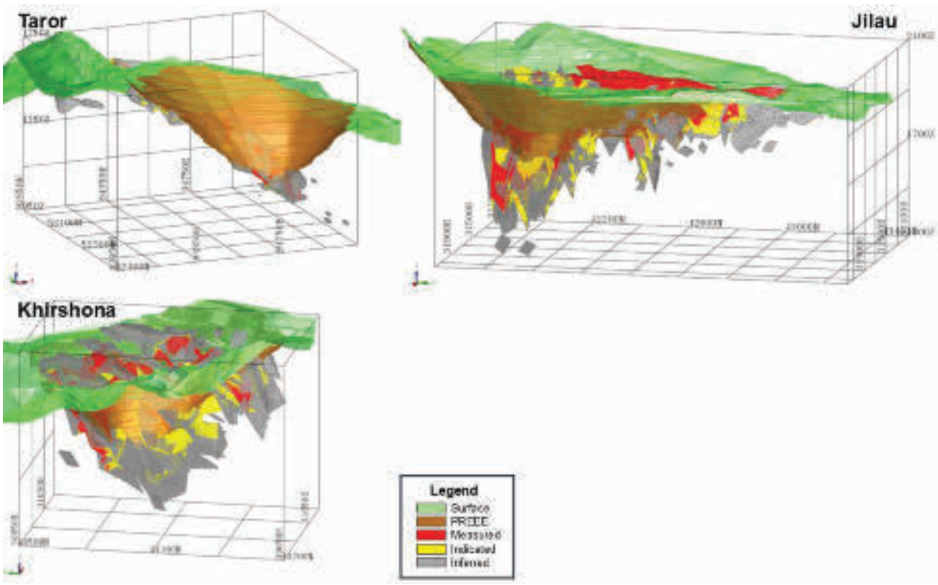
The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Zeravshan are amenable for open pit mining.

The conceptual parameters used to estimate the cut-off grade for the Zeravshan Project are summarised in Table 7-11. Figure 7-11 shows spatial relationship between RPEEE and block model.

Table 7-11: Assumptions Considered for the Zeravshan Project

Parameter	Value			Unit
	Taror	Jilau	Khirshona	
Gold Price		2,700		US$ per ounce
Mining Cost	1.13	1.61	1.14	US$ per tonne mined
Processing	31.20	8.90	8.90	US$ per tonne of feed
General and Administrative	3.61	3.60	3.61	US$ per tonne of feed
Mining Dilution	4.62	4.60	2.73	Percent
Mining Loss	3.61	3.60	3.72	Percent
Process Recovery	80.61	79.70	79.73	Percent
In Situ Cut-Off-Grade	0.60	0.20	0.20	grams per tonne

Figure 7-11: Spatial Relationship between RPEEE and Block Model



Sources: SRK

As of 31 December 2024 and at a cut-off grade of 0.6 g/t Au, the Taror Mine is estimated to contain 10.59 million tonnes ("Mt") of Measured Mineral Resources with an average grade of 2.95 g/t Au, 13.11 g/t Ag, and 0.60 % Cu, containing 1,004 koz of Au, 138,764 kg of Ag, and 63,769 t of Cu, 7.45 Mt) of Indicated Mineral Resources with an average grade of 2.67 g/t Au, 12.03 g/t Ag, and 0.49 % Cu, containing 641 koz of Au, 89,629 kg of Ag, and 36,810 t of Cu, and 3.50 Mt of Inferred Mineral Resources with an average grade of 2.19 g/t Au, 13.41 g/t Ag, and 0.54 % Cu, containing 246 koz of Au, 46,919 kg of Ag, and 18,860 t of Cu.

As of 31 December 2024 and at a cut-off grade of 0.2 g/t Au, the Jilau Mine is estimated to contain 22.67 Mt of Measured Mineral Resources with an average grade of 0.82 g/t Au, containing 598 koz of Au, 3.55 Mt of Indicated Mineral Resources with an average grade of 0.74g/t Au, containing 84 koz of Au, and 1.73 Mt of Inferred Mineral Resources with an average grade of 0.57g/t Au, containing 32 koz of Au.

As of 31 December 2024 and at a cut-off grade of 0.2 g/t Au, the Khirshona Mine is estimated to contain 15.19 Mt of Measured Mineral Resources with an average grade of 0.66 g/t Au, containing 322 koz of Au, 3.50 Mt of Indicated Mineral Resources with an average grade of 0.68 g/t Au, containing 76 koz of Au, and 2.88 Mt of Inferred Mineral Resources with an average grade of 0.39 g/t Au, containing 36 koz of Au (see Table 7-12).

Table 7-12: Mineral Resource Statement[1], Zeravshan Project, Prepared by SRK Consulting China Limited, 31 December 2024[2]

Mine	Category	Tonnage (Mt)	Grade Au (g/t)	Grade Ag (g/t)	Grade Cu (%)	Au Metal Contained (kg)	Au Metal Contained (koz)	Ag Metal Contained (kg)	Cu Metal Contained (t)

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr. Liang Li and Dr. Anshun Xu who are full time employee of SRK Consulting China Ltd. Mr. Li is a member of AusIMM and Dr. Xu is a Fellow of AusIMM. Both Mr. Li and Dr. Xu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Li and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

[3] Open pit Mineral Resources of the Taror Mine are reported at a cut-off grade is 0.6g/t, the Jilau and Khirshona Mine at 0.2g/t.

7.12 Grade Sensitivity Analysis

The Mineral Resources of the Zeravshan Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Table 7-13 to Table 7-15 at various cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Table 7-13 presents this sensitivity as grade tonnage curves.

Table 7-13: Global Block Model Quantities and Grade Estimates[1], Taror Mine at Various Cut-off Grades.

Cut-off Grade Gold (g/t)	Quantity (Mt)	Grade Gold (g/t)	Au Metal Content (kg)	Au Metal Content (koz)
0.1	47.03	2.71	127,222	4,090
0.2	47.01	2.71	127,209	4,090

Sources: SRK

7.13 Exploration Potential and Recommendations

Outside the mining pit boundary, there are still some sections with good mineralization potential and favorable mineralization, and some exploration drill holes have revealed promising mineralization information. It is recommended to carry out further geological studies and mineability assessments (including metallurgical testing and preliminary economic evaluations) to better define the potential of these mineralized material.

For the solid model, SRK recommends delineating the mineralized body based on geological domains to ensure the model accurately reflects the spatial distribution and geological controls of the mineralization.

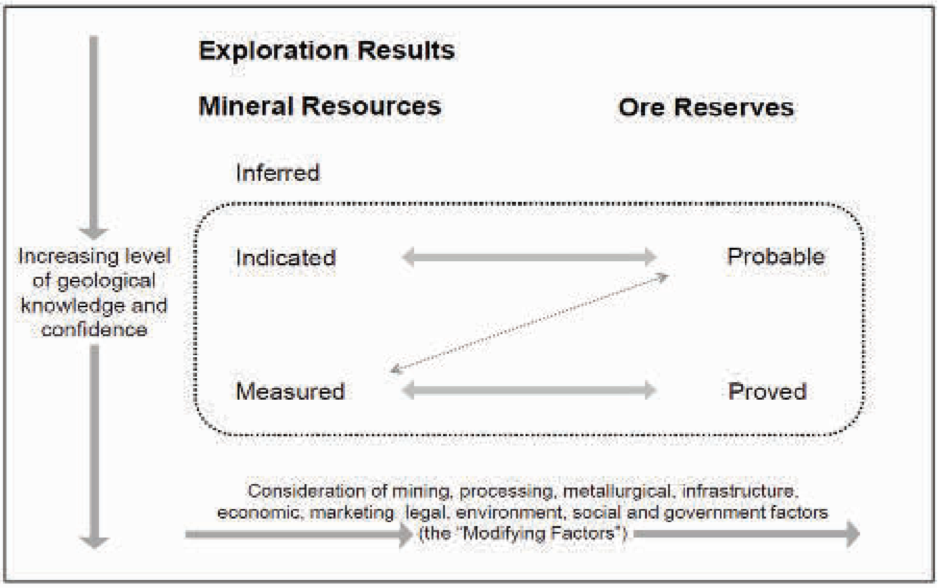
8 Ore Reserve Estimation

The definition of Ore Reserves in accordance with the JORC Code is as follows:

An 'Ore Reserve' is the economically mineable part of a Measured and/ or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.

The conversion from Mineral Resources to is Ore Reserves is presented in Figure 8-1.

Figure 8-1: General Relationship between Mineral Resources and Ore Reserves



Sources: JORC Code (2012)

The Ore Reserves for the Mines have been estimated by SRK in compliance with the JORC Code guidelines. These estimates are based on technical studies and operational data, with the work conducted to a pre-feasibility study standard, ensuring a reliable assessment of the project's economic and technical viability.

8.1 Technical Studies

SRK has reviewed the relevant technical studies, operation data and the current mining plan for the mines to demonstrate that, at the time of reporting, mining of the Mineral Resources would be technically and economical viable. The technical studies reviewed are:

- The Feasibility Study on Zeravshan Tarro and Jilau gold mines; by Zijin Xiamen in May 2025 ("**FS 2025**").

The FS 2025 is the update of previous studies. The last feasibility study was completed in 2019 ("**FS 2019**"). The updates mostly consider the gold price changing and equipment updates.

SRK reviewed technical studies, as well as the current mining plan and actual operation data, and supportive studies, the level of accuracy of the Modifying Factors proposed in the studies and/ or modified by the Company, are considered by SRK to be akin to a pre-feasibility level study ("PFS"), which are suitable for the Ore Reserve Estimates.

8.2 Cut-off Grade

The Mineral Resources of the Taror Mine primarily consist of gold, which serves as the main saleable product. Silver and copper are considered by-product credits, contributing to revenue through the sale of silver bullion and cathode copper. However, these by-products account for approximately 12% of the total revenue. Gold is the primary economic driver; therefore, it is key factor in defining material as "ore" or "waste."

Both Taror and Jilau Mine have been studied and designed using an open pit mining method. The marginal Cut-off Grade ("COG") for gold in the run-of-mine ("ROM") feed has been calculated using the following formula.

$$A = \frac{C_p + C_g}{(P * P_a * (1 - R_t) - R_c) * P_r * R_r}$$

The parameters used in estimating the COG are detailed in the Table 8-1. The preferred COG value is rounded up to the nearest 0.1 for practical application.

Table 8-1: Estimated for Cut-off Grades for Taror, Jilau and Khirshona by SRK Consulting China Ltd.

Item	Unit	Taror	Jilau	Khirshona	Description
Preferred COG	%	0.9	0.2	0.2	Round up to nearest 0.1
A	%	0.892	0.246	0.246	Estimated feed COG of Au
Cp	USD/t Feed Ore	31.0	8.9	8.9	Processing cash cost
Cg	USD/t Feed Ore	3.2	2.8	2.8	Total General & Administration cash cost, incl. sale expenses and transport cost
P	USD/oz	2,200	2,200	2,200	Forecast Au billion price, excl. VAT
Pa	%	81	99.7	99.7	Payable of the element
Rt	%	6	6	6	Royalty to revenue
Rc	USD/kg Gold	163	637.1	637.1	Refine cost
Pr	%	80.6	79.7	79.7	Processing recovery for Au in concentrate
Rr	%	89	92	92	Refine recovery for Au

Sources: Zijin

Notes:

[1] The payable rate for the Taror Mine is calculated as a weighted average, based on the product weight and corresponding payable rates for bullion and concentrate.

[2] The variation in refining costs between the Taror Mine, Jilau Mine, and Khirshona Mine is attributed to differences in processing methods. Further details are provided in the Processing section.

8.2.1 Taror Mine

Based on the parameters and assumptions described, SRK considers that material with an average Au grade exceeding the COG of 0.9 g/t Au has the potential to be economically viable under the stated conditions. A review of the processing and refining methods and historical operational data indicates that recovery rates decline noticeably as the ROM grade decreases. To enhance processing efficiency, the company has implemented a strategy to stockpile ROM material and segregate it into separate stockpiles based on both rock type and grade.

- Oxide - high grade ("4A"): 5 g/t ⩽ Au < 10 g/t
- Oxide - low grade ("5A"): 0.7 g/t ⩽ Au < 2 g/t
- Fresh - high grade ("5B"): Au ⩾ 10 g/t
- Fresh - medium grade ("4B"): 2 g/t ⩽ Au < 5 g/t
- Fresh - low grade ("6"): 0.7 g/t ⩽ Au < 1.2 g/t

8.2.2 Jilau Mine (Including Jilau open pit and Khirshona open pit)

Based on the parameters and assumptions described, SRK considers that material with an average Au grade exceeding the COG of 0.2 g/t Au has the potential to be economically viable under the stated conditions. A review of the processing and refining methods and historical operational data indicates that recovery rates decline noticeably as the ROM grade decreases. To optimize processing efficiency, the company has implemented a strategy to stockpile ROM material and segregate it into separate stockpiles categorized by processing requirements.

- Heap Leach ("LG"): 0.2 g/t ⩽ Au < 0.5 g/t
- Milling ("HG"): Au ≥ 0.5 g/t

8.3 Modifying Factors

In accordance with the JORC Code, Mineral Resources are converted to Ore Reserves by applying appropriate modifying factors. The key factors applied to the Ore Reserve estimation include mining design, open pit optimization, open pit design, mining losses, and mining dilution. Additional factors include processing capabilities, market conditions, and environmental, legal, and political constraints. All of which can influence the quantity and classification of the Ore Reserve. Details of the modifying factors used for the Taror, Jilau and Khirshona Ore Reserve estimates are as follows:

- Mining design:
  - The Ore Reserve is constrained within the boundaries of the mining licence.
  - The Ore Reserve is based on the open pit mining methods.
  - Only Measured and Indicated Mineral Resources, along with ore in the stockpile, are included in the Ore Reserve estimate

  - The effective date is 31 December 2024.
- Open pit optimization:
  - Open pit optimization incorporates mining costs, processing expenses, general and administrative costs, gold price, processing recovery rate, refining recovery rate, refining charges, payability, royalties, and overall slope angle.
  - The optimal open pit shell is derived from the Measured and Indicated Resources to identify the economic surface mining potential.
- Open pit design:
  - Open pit designs are guided by slope parameters, including bench height, batter face angle, berm width, minimum mining width, and haul road design, that are consistent with the results of the open pit optimization.
- Mining dilution:
  - The Taror Mine has recorded dilution rates ranging from 4.5% to 4.9%.
  - The Jilau Mine has recorded dilution rates ranging from 4.5% to 4.9 %.
  - The Khirshona Mine has recorded dilution rates ranging from 4.6% to 4.8%.
  - Based on observed operational practices, SRK has applied mining dilution factors of 4.7% for the Taror Mine, 4.6% for the Jilau open pit, and 4.8% for the Khirshona open pit in the Ore Reserve estimates.
- Mining Loss:
  - The Taror Mine has recorded loss rates ranging from 3.4% to 3.6%.
  - The Jilau Mine has recorded loss rates ranging from 3.5% to 3.8%.
  - The Khirshona Mine has recorded loss rates ranging from 3.7% to 3.8%.
  - Based on observed operational practices, SRK has applied mining loss factors of 3.4% for the Taror Mine, 3.6% for the Jilau open pit, and 3.7% for the Khirshona open pit in the Ore Reserve estimates.

8.4 Ore Reserve Statement

SRK Consulting has estimated the Ore Reserves for the Taror Mine in accordance with the guidelines specified by the JORC Code. These Ore Reserve estimates are based on technical studies and operational records, which are considered to be at the level of a Pre-Feasibility Study.

The Company operates two distinct mining operations: the Taror Mine and the Jilau Mine. The economically mineable portions of Measured and Indicated Mineral Resources within the designed open pits have been classified as Proved and Probable Ore Reserves, respectively, inclusive of allowances for dilution and mining losses. The Ore Reserve estimation was determined with the reference point at the stockpile preceding the crusher feed, in line with best practice under the JORC Code guidelines.

8.4.1 Taror Mine

As of 31 December 2024, the Ore Reserves for the Taror Mine open pit consist of 16.78 Mt at an average grade of 2.88 g/t Au, 12.46 g/t Ag, and 0.56 % Cu, containing 48,393 kg of Au, 209,099 kg of Ag, and 93,898 t of Cu.

As of 31 December 2024, the Ore Reserves for the Taror Mine stockpile consist of 0.58 Mt at an average grade of 1.66 g/t Au, 7.86 g/t Ag, and 0.23 % Cu, containing 965 kg of Au, 4,575 kg of Ag, and 1,314 t of Cu.

Table 8-2: Ore Reserve Statement for the Open Pit at Taror Mine as of 31 December 2024

Type	Category	Tonnes	Grade			Contained Metal			
		Mt	Au (g/t)	Ag (g/t)	Cu (%)	Au (kg)	Au (koz)	Ag (kg)	Cu (t)
Open pit	Proved	10.06	2.94	12.80	0.59	29,553	950	128,698	59,554

Notes:

[1] The information in this Report which relates to the Stockpile Ore Reserve is based on information provided by the Client,

[2] The cut-off grades used to stockpile is Au of ⩾ 0.9 g/t.

[3] The Ore Reserves are reported as metric dry tonne basic.

[4] The Ore Reserves are reported at the reference point at the stockpile.

[5] The Ore Reserves are reported inclusive of Mineral Resources.

[6] The Ore Reserves are effective as of 31 December 2024.

8.4.2 Jilau Mine

As of 31 December 2024, the Ore Reserves for the Jilau open pit consist of 19.80 Mt at an average grade of 0.75 g/t Au, containing 17,142 kg of Au.

As of 31 December 2024, the Ore Reserves for the Jilau Mine stockpile consist of 0.2 Mt at an average grade of 0.48 g/t Au, containing 98 kg of Au.

As of 31 December 2024, the Ore Reserves for the Khirshona open pit at Jilau Mine consist of 16.84 Mt at an average grade of 0.61 g/t Au, containing 10,335 kg of Au.

9 Mining Assessment

9.1 Taror Mine

9.1.1 Mine Operating Status

The Taror Mine is an active mining operation that has transitioned from underground mining to open pit mining. The key operational details are summarized as follows:

- Historical Mining Method (Underground):
  - Initially the sublevel caving mining method was utilized.
  - Mine development and ore extraction were conducted using ramps, blind shafts, and horizontal adits.
  - Due to poor ground conditions and high operational costs, mining was transitioned from an underground method to open pit operation in 2011.
  - During the transition, underground workings were systematically decommissioned as they intersected the boundary of the open pit excavation.
- Original Open Pit Design (2011):

  Original Pit
  - Plan dimensions (length × width): 580 m × 560 m.
  - Bench height: 10 m.
  - Maximum open pit depth: 320 m (elevations between 1,540 m ASL and 1,860 m ASL).
  - Production capacity: 2,000 t/ d.

  Expanded Open Pit Design (FS 2019)
  - Plan dimensions (length × width): 1,110 m × 1,000 m.
  - Bench height: 12 m.
  - Maximum elevation: 1,904 m ASL.
  - Access elevation: 1,520 m ASL.
  - Minimum elevation (pit bottom): 1,280 m ASL.
  - Production capacity: 3,000 t/d.

Mining and stripping operations are fully managed by the company.

The past 3 years operation records are presented in Table 9-1.

Table 9-1: Annual Mine Production Schedule for Taror

Item	Unit	2022	2023	2024
Total Material Movement	Mt	15.74	20.82	21.90
Waste	Mt	14.50	19.28	20.37

Strip Ratio	t/t	11.65	12.46	13.29

Sources: Taror Gold Mine

9.1.2 Hydrogeology

There are no significant surface water bodies in the mining area. The only river flowing through the mining area is the Xingge River that has a small flow rate and low riverbed elevation, providing no recharge to the mining area. The groundwater in the mining area relies solely on recharge from atmospheric precipitation. However, the mining area is located in an arid region with scarce rainfall, where the annual precipitation is between 246.5–499.6 mm, resulting in limited recharge.

9.1.3 Geotechnical Conditions

The last geotechnical study was conducted by Changsha Institute of Mining Research Co., Ltd. in 2009. There were no material changes since the last study (by Zijin Xiamen, "**FS 2019**")) as reviewed by Zijin Xiamen in 2019 and 2025.

The summary of the geotechnical study, where the regional geological situation, and the rock mass mechanical property were studied. The rock mass quality based on rock mass rating system ("**RMR**") was classified. The parameters and their ratings are presented in Table 9-2 below.

Table 9-2: Classification Parameter and RMR of Taror Mine

Parameters			Shale	Conglo-merate	Grano-diorite	Lime-stone
1	Uniaxial compressive strength	MPa	29.8	20.63	104.31	84.41
	Rating		4	2	12	7

Sources: FS 2019 by Zijin Xiamen. Rating in the Table refers to the RMR.

The FS 2019 verified the slope stability for the open pit design considering

- rock mass shear strength;
- influence coefficient of blasting vibration; and
- influence coefficient of earthquake.

The analysed section is presented in Figure 9-1. The factor of safety ("FOS") has been calculated and presented in Table 9-3. The verification of slope stability shows that the FOSs are all within the limit.

[3] Case 2 is gravity stress, ground water and blasting vibration situation, and the FOS limit is 1.18

[4] Case 3 is gravity stress, ground water, blasting vibration and earthquake vibration situation, and the FOS limit is 1.15

The geological structure of the mining area is moderately developed, and the lithology of the surrounding rock of the ore body is relatively simple. Both the roof and floor lithology consist of granodiorite, which is classified as weak rock. The rock is relatively fractured, and the degree of bonding at structural planes is considered well-bonded, with moderate stability. The primary concern is the potential for sliding and collapsing along weak structural planes associated with fractures. It is essential to enhance management and implement protective measures accordingly.

9.1.4 Mine Design and Planning

Open Pit Optimization

Block Model

The mine design and Mineral Resource estimation within the open pit design were based on the Mineral Resource model ("**MRM**") developed by Zijin Xiamen, with an effective date of 31 December 2024. The model was provided in Surpac (.mdl) format.

Key parameters of the block model are outlined in Table 9-4 below.

Table 9-4: Resource Block Model Parameters for Taror

Range	Min	Max
Easting	93,600	95,300
Northing	52,100	53,600
Elevation	800	2,000
X size	2.5	
Y size	2.5	
Z size	2.5	
Rotation	-	

Sources: the Company

Open Pit Optimization Inputs Parameters

The transformation of a Mineral Resource into an open pit Ore Reserve begins with the process of open pit optimization. During this stage, physical, technical, and economic parameters are applied to the mineralized area to determine the optimal geometry for open pit excavation. If the economic evaluation of the resulting optimal open pit shell is positive, this shell serves as a reference for the subsequent open pit design.

Zijin Xiamen employed Whittle software with the Pseudoflow algorithm to conduct the open pit optimization. Whittle adjusts the base input price using a range of revenue factors ("**RF**"), both above and below the base value of 1. For each RF value, the software generates a three-dimensional open pit shell that maximizes the intrinsic value based on all input parameters and the adjusted prices. Lower RF values produce smaller open pit shells, while higher RF values generate larger ones. This methodology results in a series of 'nested' open pit shells, with each shell entirely contained within the next larger one.

A summary of the open pit optimization parameters for Taror Mine are presented in Table 9-5.

Table 9-5: Open Pit Optimization Parameters for Taror Mine

Item	Unit	Taror
Overall Slope Angle	Degree	Geotech Zones
Mining		
Mining Cost	USD/t ROM	1.65
Stripping Cost	USD/t Waste	1.65
Ore Rehandle	USD/t ROM	2.5

Item	Unit	Taror
Mining Dilution	%	5%
Mining Recovery	%	95%
Processing		
Processing Cost	USD/t ROM	26.6
Processing Recovery Au	%	82%
Processing Recovery Ag	%	65%
Processing Recovery Cu	%	70%
General and Administration

Payable (Sliver in Concentrate)	%	33.5%
Payable (Copper in Concentrate)	%	42.5%
Bullion	%	98%
Royalty	%	6%

Sources: Zijin Xiamen

Notes:

[1] The geological model contains oxide materials but lacks metallurgical studies.

Optimization Results

A series of nested open pit shells were generated using Whittle software based on a range of RF applied to gold, silver, and copper prices. Preliminary cash flows were estimated using a 10% discount rate and the nominal commodity prices of US$2,700/ oz for gold, US$35/ oz for silver, and US$4.00/lb for copper. It is important to note that while relative values are useful for selecting the optimal open pit shell, absolute values have no significance during this evaluation stage.

Whittle automatically generated three open pit optimization scenarios as follows:

- Best Case: Open pit shells are mined sequentially, one after the other.
- Worst Case: The final open pit is mined bench by bench.
- Specified Case: Predefined pushback geometries are applied to guide the open pit sequencing.

The results of the open pit optimization for the Taror Mine are summarized in Table 9-6. Based on the maximum Net Present Value ("**NPV**") in the Specified Case, an RF of 0.84 was selected as the final open pit design limit. This RF of 0.84 corresponds to gold, silver, and copper prices of approximately US$2,268/oz, US$29.4/oz, and US$3.36/lb, respectively.

An open pit-by-open pit graph illustrating the preliminary cash flows for Taror Mine is also presented in Figure 9-2.

Table 9-6: Whittle Pit Optimization Results for Taror Mine

Pit Shell	Revenue Factor	Best Case	Specified Case	Worst Case	ROM	Au Grade	Au Metal	Ag Grade	Ag Metal	Cu Grade	Cu Metal	Waste
		US$M	US$M	US$M	kt	g/t	kg	g/t	kg	%	t	kt

Mine Design

The detailed mine design was carried out during FS 2019 and was modified by the Company in 2020 then was updated in 2025 by Zijin Xiamen, using the selected LG 3D pit shell (RF 0.84, US$2,268/ oz gold) as a guide, and all inputs are based on the updated assumptions in 2025. The basic gold price is US$2,700/ oz assumed by Zijin Xiamen. The proposed open pit design includes the practical geometry required in a mine, including open pit access and haulage ramp to all open pit benches, open pit slope design, benching configurations, smoothed open pit walls and catch berms.

The major design parameters used are described in Table 9-7 below. The plan view of the open pit design is presented in Figure 9-3, and the designed open pit results are summarised in Table 9-8.

Table 9-7: Mine Design Parameter of Taror Mine

Item	Unit	Parameter
Bench height	m	24
Operation flitch	m	12
BFA	degree	65
Catch berm width above closed circle	m	10

Item	Unit	Parameter
Catch berm width below closed circle	m	8
Geotechnical berm width	m	15-30
Geotechnical berm interval	N/A	every 3 catch berms
Ramp width-single lane	m	10
Ramp width-dual lane	m	14.5

Table 9-8: Summary of the Open Pit Design Results of Taror Mine

Item	Unit	Parameter			
Wall zone	NA	North	East	South	West
Overall Slope Angle ("**OSA**")	degree	39～43.5	43～45	40.5～44	38～42
Stack height	m	85～360	240～310	240～740	504～648
Pit size (length × width)	m	1,130×1,090			
Bottom size (length × width)	m	90×30			

Item	Unit	Parameter
Crest of pit wall	m ASL	1,929
Pit bottom elevation	m ASL	1,184
Closed circle elevation	m ASL	1,544

Sources: FS 2025 by Zijin Xiamen

The open pit design indicated that the closed circle of the open pit is at 1,544 m ASL. The open pit bottom is at 1,184 m ASL. Material above 1,544 m ASL will be mined as hilltop casting and the material below the closed circle will be excavated as an open pit. The open pit accesses are at on both east and north of the open pit edge.

Mining Methods

The conventional mining sequence proceeds downwards, and the working flitch is 12 m height, 2 benches would be combined to form the permanent bench.

The usual procedure comprises drilling, blasting, loading, and haulage. The mine is run as owner operating scenario. Drilling is done with 9 sets of Ø165 mm down-the-hole drills ("**DTH**"). Drill patterns are 5 m × 4.5 m for ore mining and 5 m × 5 m for waste stripping. Each hole is 13.2 m deep with 1.2 m of sub-drilling.

ANFO (ammonium nitrate and fuel oil) or Emulsion explosives, which is depending on presence of water in the drill hole, are used for multi-row (5-6 rows) blasting with millisecond delay. Explosives are made in the explosives mixing and charging trucks and are detonated non-electrically.

Ore and waste loading is done by 1 set of 2.6 m^2 hydraulic excavator and 11 sets of 4.6 m^3 hydraulic excavators into 40 t truck (ore) or 60 t truck (waste), assisted by bulldozer and front-end loader to clean and pile the working face.

The transportation of mined material is entirely carried out using trucks. Roads connecting the open pit's eastern and northern sides to the processing plant and waste rock dumps ("**WRD**") have already been established. The average transportation distance for open pit ore is 18.5 -19.5 km, while for waste rock, it is from 1.3 to 4.1 km.

Mining Service

Natural drainage is employed above the 1,424 m ASL and the first mobile pump drainage will be added when the open pit is extended down to 1,364 m ASL then at 1,244 m ASL and at 1,184 m ASL respectively. A fixed pump station with a maximum dewatering capacity of 85 cubic metres per hour ("m^3/ h") is planned at the 1,304 m bench. Two relay pump stations with maximum 140 m^3/ h dewatering capacity each are arranged at the 1,328 m ASL bench.

The mining equipment maintenance workshop has been established on site which can meet the requirements of repair and regularly maintenance. A fuel refill station has also been constructed, which is presented in Figure 9-4.

Figure 9-4: Taror Workshop and Fuel Station

Sources: SRK site visit on April 2025

Mining Equipment

Taror Mine has purchased mining equipment as presented in Table 9-9 below. The existing equipment can maintain a total material movement ("**TMM**") of about 30 Mtpa as stated by the mine management. The FS 2025 estimated that an expansion peak mining capacity of 40 Mtpa which will rely on the eleven 60 t truck fleet employed.

9.1.5 Mine Production Plan

The Life of Mine ("LoM") production schedule for the Taror Mine has been developed using Deswik software, incorporating the open pit design provided by Zijin. The Deswik software suite aggregates the open pit inventory by stage, bench, and predefined separate grade stockpiles, allowing for detailed production planning and prioritization of early gold production. To support this approach, multiple grade stockpiles have been defined for both oxide and fresh materials, as follows:

- Oxide - Au grade ("5A"): 0.9 g/t ⩽ Au
- Fresh – Very high grade ("5B"): Au ⩾ 10 g/t
- Fresh - high grade ("4A"): 5 g/t ⩽ Au < 10 g/t
- Fresh - medium grade ("4B"): 2 g/t ⩽ Au < 5 g/t
- Fresh - low grade ("6"): 0.9 g/t ⩽ Au < 2 g/t

Operating Schedule and Production Capacity

The production schedule has been designed on an annual basis and incorporates the following assumptions:

- Only blocks classified as Measured and Indicated Mineral Resources with a Au grade above 0.9 g/t are considered as ROM material.
- Blocks classified as Inferred Mineral Resources, as well as those with a gold grade below 0.9 g/t and sterilized material, are treated as waste/ zero grade.
- A single cutback strategy is implemented to ensure a stable supply of ROM material throughout the mine's life.
- The maximum annual TMM is capped at 35 Mtpa.
- During the first three years of operation, the vertical lag between mining phases is limited to 144 m to accommodate the production ramp-up period; this is reduced to a maximum of 96 m once the target production rate is achieved.
- ROM feed prioritization focuses on processing higher-grade stockpiles to maximize early economic returns.

Production Plan and LoM

The results of the mine scheduling are presented in Figure 9-5, Figure 9-6, and Table 9-10. The Life of Mine ("**LoM**") is estimated at 13 years, commencing in January 2025. The total ROM material is 16.78 Mt, with an average grade of 2.88 g/t Au, 12.46 g/t Ag, and 0.56% Cu. This equates to contained metal totals of 48,393 kg of Au, 209,099 kg of Ag, and 9,390 tonnes of Cu. The total waste material is estimated at 285.12 Mt, resulting in an average stripping ratio of 16.00.

9.2 Jilau Mine

9.2.1 Mine Operating Status

The Jilau Mining Area includes the Jilau and Khirshona deposits. The key parameters of the mining operations in the Jilau open pit are summarized as follows:

- Redesigned open pit (FS 2019):
  - Design Institute: Zijin Design Institute (Zijin Xiamen).
  - Planned open pit boundary dimensions (length × width): 1,610 m × 830 m.
  - Bench height: 20 m.
  - Maximum mining depth: 605 m (between elevations of 1,627 m ASL and 2,245 m ASL).
  - Planned production capacity: 10,000 t/d.
- Current Operations:
  - Current open pit dimensions (length × width): 1,200 m × 730 m.
  - Pit bottom elevation: 1,760 m.
  - Bench height:
    - 20 m, upper the 1,915 m ASL elevation.
    - 24 m, below the 1,915 m ASL elevation.
  - Maximum mining depth: 483 m.
  - Ore transport: A combination of haul trucks, ore chutes, and belt conveyors.
  - Waste rock transport: Exclusively by haul trucks.
  - Production capacity: 10,000 t/d.

The Khirshona Mine has completed its infrastructure development and is currently operating at a production capacity of 1,400 ktpa. The geometry and key boundary details of the open pit are as follows:

- Pit boundary dimensions (length × width): 710 m × 650 m.
- Maximum elevation of the open pit: 1,876 m ASL.
- Pit bottom elevation: 1,496 m ASL.

The average waste rock haulage distance within the Khirshona open pit boundary is 1.9 km, with all haul distances measuring less than 3 km.

Mining and stripping operations are owner operator.

The past 3 years operation records are presented in Table 9-11.

Table 9-11: Annual Mine Production Schedule for Jilau Mine

Mine Site	Item	Unit	2022	2023	2024
Jilau	Total Material Movement	Mt	15.67	20.15	21.36

9.2.2 Hydrogeology

Jilau Open Pit

The mining area is located in a mountainous region with an arid climate characterized by low precipitation and high evaporation, which is unfavourable for groundwater storage and recharge, making it a water-scarce area. The hydrogeological conditions of the ore deposit are relatively simple, with the primary aquifers being fractured in igneous rocks and Paleozoic sedimentary-metamorphic rocks, along with Quaternary unconfined aquifers. The permeability coefficient of the aquifers in igneous and sedimentary-metamorphic rocks ranges from 0.08 to 0.1 m/ d, with groundwater being recharged by atmospheric precipitation through contact zones and faults. Surface water systems have minimal impact on the mining operations.

Khirshona Open Pit

Khirshnona open pit is about 1.2 km apart from Jilau open pit. The hydrogeological conditions of the deposit are similar to those of Jilau Mine which are relatively simple, with the primary aquifers being fractured in igneous rocks and Paleozoic sedimentary-metamorphic rocks, along with Quaternary unconfined aquifers.

9.2.3 Geotechnical Conditions

Jilau Open Pit

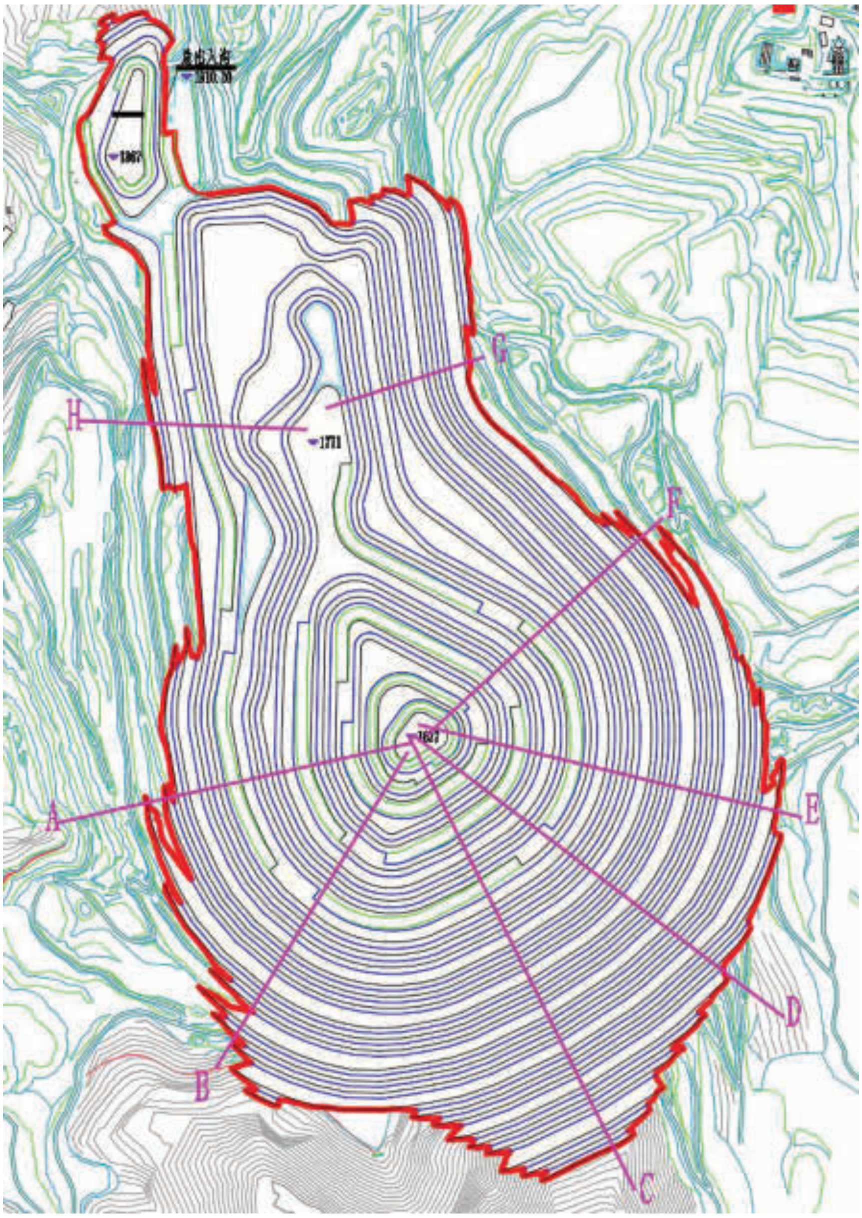
The most recent geotechnical study was conducted by Changsha Institute of Mining Research Co., Ltd. in January 2023 and was reviewed by Zijin Xiamen in 2025.

The FS 2025 verified the slope stability for the open pit design considering:

- rock mass shear strengths
- influence coefficient of blasting vibration; and
- influence coefficient of earthquake.

The analysed section is presented in Figure 9-7. The FOS has been calculated and presented in Table 9-12. The verification of slope stability shows that the FOSs are all within the limit.

Figure 9-7: Jilau Open Pit Slope Stability Analysed Sections by FS 2025



Sources: FS 2025 by Zijin Xiamen

Table 9-12: Slope Stability Estimates Result for Jilau Open Pit

Section	Stack Height	OSA	FOS		
N/A	(m)	(°)	Case1	Case2	Case3
A	435	43.3	1.435	1.331	1.37
B	448	44.4	1.399	1.294	1.335
C	631	47.3	1.294	1.205	1.239
D	528	46.8	1.265	1.175	1.213
E	471	46.4	1.322	1.23	1.265
F	420	46.7	1.324	1.227	1.262
G	224	49.3	2.369	2.22	2.271

Sources: FS 2025 by Zijin Xiamen

Notes:

[1] OSA: overall slope angle

[2] Case 1 is gravity stress and ground water situation, and the FOS limit is 1.20

[3] Case 2 is gravity stress, ground water and blasting vibration situation, and the FOS limit is 1.18

[4] Case 3 is gravity stress, ground water, blasting vibration and earthquake vibration situation, and the FOS limit is 1.15

Both the roof and floor lithology consist of granodiorite, which is classified as weak rock. The rock is relatively fractured, and the degree of bonding at structural planes is considered well-bonded, with moderate stability. The primary concern is the potential for sliding and collapsing along weak structural planes associated with fractures. It is essential to enhance management and implement protective measures accordingly.

Khirshona Open Pit

The regional geological situation, and the rock mass mechanical property is also similar to those of Jilau Mine. The last geotechnical study was conducted by Changsha Institute of Mining Research Co., Ltd. in January 2023 and reviewed by Zijin Xiamen in 2025.

The analysed section is presented in Figure 9-8. The FOS has been calculated and presented in Table 9-13. The verification of slope stability shows that the FOSs are all within the limit.

K	380	46.2	1.296	1.212	1.192

Sources: FS 2025 by Zijin Xiamen

Notes:

[1] OSA: overall slope angle

[2] Case 1 is gravity stress and ground water situation, and the FOS limit is 1.20

[3] Case 2 is gravity stress, ground water and blasting vibration situation, and the FOS limit is 1.18

[4] Case 3 is gravity stress, ground water, blasting vibration and earthquake vibration situation, and the FOS limit is 1.15

The geological structure of the mining area is moderately developed, and the lithology of the surrounding rock of the ore body is relatively simple. Both the roof and floor lithology consist of granodiorite, which is classified as weak rock. The rock is relatively fractured, and the degree of bonding at structural planes is considered well-bonded, with moderate stability. The primary concern is the potential for sliding and collapsing along weak structural planes associated with fractures. It is essential to enhance management and implement protective measures accordingly.

9.2.4 Mine Design and Planning

Jilau Open Pit

Open Pit Optimization

Block Model

The mine design and Mineral Resource estimation within the open pit design were based on the MRM developed by Zijin Xiamen, with an effective date of 31 December 2024. The model was provided in Surpac (.mdl) format.

Key parameters of the block model are outlined in Table 9-4 below.

Table 9-14: Resource Block Model Parameters for Jilau Open Pit

Optimization Results

A series of nested open pit shells were generated using Whittle software based on a range of RFs applied to gold prices. Preliminary cash flows were estimated using a 10% discount rate and the nominal commodity prices of US$2,700/ oz for gold. It is important to note that while relative values are useful for selecting the optimal open pit shell, absolute values have no significance during this evaluation stage.

Whittle automatically generated three open pit optimization scenarios as follows:

- Best Case: Open pit shells are mined sequentially, one after the other.
- Worst Case: The final open pit is mined bench by bench.
- Specified Case: Predefined pushback geometries are applied to guide pit sequencing.

The results of the pit optimization for the Jilau open pit are summarized in Table 9-16. Based on the maximum NPV in the Specified Case, an RF of 0.8 was selected as the final pit design limit. This RF of 0.8 corresponds to gold prices of approximately US$2,160/ oz.

An open pit-by-open pit graph illustrating the preliminary cash flows for Jilau open pit is also presented in Figure 9-9.

Table 9-16: Whittle Pit Optimization Results for Jilau Open Pit

Mine Design

The detailed mine design was carried out during FS 2023, then was updated in 2025 by Zijin Xiamen, FS 2025, using the selected LG 3D open pit shell (RF 0.8, US$2,160/ oz gold) as a guide, which inputs are based on the updated assumptions in 2025. The basic gold price is US$2,700/ oz assumed by Zijin Xiamen. The proposed open pit design includes the practical geometry required in a mine, including open pit access and haulage ramp to all open pit benches, open pit slope design, benching configurations, smoothed open pit walls and catch berms.

The major design parameters used are described in Table 9-17 below. The plan view of open pit design is presented in Figure 9-10, and the designed open pit results are summarised in Table 9-18 below.

Table 9-17: Mine Design Parameter of Jilau Open Pit

Item	Unit	Parameter
Bench height	m	24
Operation flitch	m	12
BFA	degree	70
Catch berm width	m	8-10
Geotechnical berm width	m	15-20
Geotechnical berm interval	N/A	every 3 catch berms
Ramp width-single lane	m	10
Ramp width-dual lane	m	14.5
Maximum road gradient	%	10
Minimum turning radius	degree	15

Item	Unit	Parameter
OSA	degree	45~49.5
Stack height	m	633

Item	Unit	Parameter
Pit size(length×width)	m	1,640×850
Bottom size(length×width)	m	70×60
Crest of pit wall	m ASL	2,260
Pit bottom elevation	m ASL	1,627

Sources: FS 2025 by Zijin Xiamen

The open pit design indicated that it is a high stack in the south slope wall with about 630 m height, and the OSA is no less than 45 degree. Through the study by Zijin Xiamen shows an acceptable FOS on that section, SRK opines that the risk of slope failure is existing. The batter faces has partial damage as observed during site visit. Some batters collapsed last year via the weak zone and the catch berm worked collecting rock falls. However, there are still some collapsed wastes at the bottom of the open pit waiting cleaning.

A further study on the slope stability is recommended and how to reduce the shallowness of the OSA by adopting more geotechnical berms should be studied.

Figure 9-11: South Wall of Jilau Open Pit

Sources: SRK site visit in April 2025

Mining Methods

The conventional mining sequence proceeds downwards, and the working sub-bench is 12 m height. Two benches would be combined together to form one permanent bench.

The usual procedure comprises drilling, blasting, loading, and haulage. The mine is an owner operating scenario. Drilling is done with Ø125 mm DTH drills with patterns of 4 m × 4.5 m for ore mining, the waste stripping is conducted by Ø165 mm DTH drills with patterns of 5 m × 5 m. Each hole is 13.2 m deep with 1.2 m of sub-drilling.

ANFO (ammonium nitrate and fuel oil) or Emulsion explosives, which is depending on presence of water in the drill hole, are used for multi-row blasting with millisecond delay. Explosives are made in the explosives mixing and charging trucks and are detonated non-electrically.

ROM loading is done by 2.5 m^3 hydraulic excavators into 40 t truck, assisted by bulldozer and front-end loader to clean and pile the working face. The waste is haul to the WRD by 60t truck loaded by 2.5 m3 excavators.

The transportation of mined material is carried out using trucks. The open pit features a single access ramp with a portal at 1,905 m ASL. The ROM ore from the Jilau open pit will feed the crusher then is transported to #2 processing plant via conveyor belt. The crusher feeder is strategically positioned 1.7 km north of the Jilau open pit boundary, where is about 0.5 km east of Khirshona open pit.

Mining Service

The atmospheric rainfall and groundwater seepage were accumulated at the bottom of the open pit. During the rainy season, the normal water volume in the pit is 1,796 m^3/ day, with a maximum of 12,798 m^3/ 3 days. Based on the mining characteristics of this site, the drainage facilities for the open pit mine are implemented in phases.

The submersible pump stations are used to drain accumulated water from the open pit to the external drainage ditch. As the mining levels deepen, the submersible pump stations are relocated downward accordingly. Based on the descent of the open pit mining levels, accumulated water is drained to the external drainage ditch through a relay system comprising submersible pump stations, temporary pump stations, and fixed pump stations. The drainage elevation of the external drainage ditch is at 1,915 m ASL. There is a minimum water at the bottom of the open pit and the temporary dewatering pump is installed, as presented in Figure 9-12.

Figure 9-12: Water at Jilau Open Pit Bottom and Dewatering System

Sources: SRK site visit in April 2025

The mining equipment maintenance workshop has been established on site which can meet the requirements of repair and regularly maintenance. A fuel refill station has also been constructed, which is presented in Figure 9-13. Jilau Mine has employed the battery-electric mining trucks (60t) for trail. The recharge station is constructing, and more electric trucks might be considered.

Figure 9-13: Jilau Workshop and Fuel Station

Mining Equipment

Jilau Mine has purchased mining equipment as presented in Table 9-19 below. The existing equipment could maintain a TMM of about 30 Mtpa as stated by the mine management. The FS 2025 estimated that an expansion peak mining capacity of 40 Mtpa which will rely on the 11 60t truck fleet employed.

Table 9-19: Jilau Mine Equipment Summary

Equipment Type	Model	Main Parameter	QTY Existing

Optimization Results

A series of nested open pit shells were generated using Whittle software based on a range of RFs applied to gold prices. Preliminary cash flows were estimated using a 10% discount rate and the nominal commodity prices of US$2,700/ oz for gold. It is important to note that while relative values are useful for selecting the optimal open pit shell, absolute values have no significance during this evaluation stage.

Whittle automatically generated three open pit optimization scenarios as follows:

- Best Case: Open pit shells are mined sequentially, one after the other.
- Worst Case: The final open pit is mined bench by bench.
- Specified Case: Predefined pushback geometries are applied to guide open pit sequencing.

The results of the open pit optimization for the Khirshona Open Pit are summarized in Table 9-22. Based on the maximum NPV in the Specified Case, an RF of 0.78 was selected as the final pit design limit. This RF of 0.78 corresponds to gold prices of approximately US$2,106/ oz.

An open pit-by-open pit graph illustrating the preliminary cash flows for the Khirshona Mine is also presented in Figure 9-14.

Table 9-22: Whittle Pit Optimization Results for Khirshona Open Pit

Mine Design

The detailed mine design was carried out during 2023 FS then was updated in FS 2025 by Zijin Xiamen, using the selected LG 3D open pit shell (RF 0.78, US$2,106/ oz gold) as a guide, which inputs are based on the updated assumptions in 2025.

The major design parameters used are described in Table 9-23 below. The plan view of open pit design is presented in Figure 9-15, and the designed open pit results are summarised in Table 9-24 below.

Since the excessive ROM ore mining in 2024, a kind of pushback existing giving more space for operation. However, the ROM mining should be delayed due the lack of stripping to expose the orebody.

Figure 9-16: South Wall of Khirshona Open Pit

Sources: SRK site visit in April 2025

Mining Methods

The mining method is the same as Jilau Mine and shared the main equipment, except the trucks. The transportation is outsourced (contracted) to local trucks fleet.

The transportation of mined material in the open pit is carried out using trucks. The ROM from Khirshona open pit will feed the crusher then is transported to #2 processing plant via conveyor belt.

Mining Service

The mine drainage system employs a multi-stage pumping approach utilizing submersible, temporary, and permanent pump stations in series to discharge accumulated water from the pit to the external interception ditch, which has a drainage elevation of 1,664 m ASL. With the ultimate open pit bottom elevation at 1,496 m ASL and bench height of 12 m, the initial mining phase relies on submersible pump stations to dewater the working area directly to the perimeter interception channel.

Mining Equipment

Khirshona Mine has purchased mining equipment as presented in Table 9-25 below. The existing equipment could maintain a TMM of about 30 Mtpa as stated by the mine management. The FS 2025 estimated that an expansion peak mining capacity of 40 Mtpa which will rely on the 11 60t truck fleet employed.

Table 9-25: Khirshona Mine Equipment Summary

Equipment Type	Model	Main Parameter	QTY Existing
DTH drill	SWDA165 or 152	φ165 or 152mm	6

9.2.5 Mine Production Plan

The LoM production schedule for the Jilau Mine (include Jilau Pit and Khirshona Pit) has been developed using Deswik software, incorporating the open pit design provided by Zijin. The Deswik software suite aggregates the open pit inventory by stage, bench, and predefined grade stockpiles, allowing for detailed production planning and prioritization of early gold production. As follows:

- Heap - Leach ("LG"): 0.2 g/t $\leqslant$ Au < 0.5 g/t
- Milling ("HG"): Au $\geq$ 0.5 g/t

Operating Schedule and Production Capacity

The production schedule has been designed on an annual basis and incorporates the following assumptions:

- Only blocks classified as Measured and Indicated Mineral Resources with a Au grade above 0.2 g/t are considered as ROM material.

- Blocks classified as Inferred Mineral Resources, as well as those with a gold grade below 0.2 g/t and sterilized material, are treated as waste/ zero grade.
- A single cutback strategy is implemented to ensure a stable supply of ROM material throughout the mine's life.
- The maximum annual TMM is capped at 35 Mtpa.
- During the first three years of operation, the vertical lag between mining phases is limited to 120 m to accommodate the production ramp-up period; this is reduced to a maximum of 96 m once the target production rate is achieved.
- ROM feed prioritization focuses on processing higher-grade stockpiles to maximize early economic returns.

Production Plan and LoM

Jilau Open Pit

The results of the mine scheduling are presented in Figure 9-17, Figure 9-18 and Figure 9-19, as well as Table 9-26 and Table 9-27. The LoM is estimated at 6 years, commencing in January 2025. The total ROM material is 22.87 Mt, with an average grade of 0.75 g/t Au. This equates to contained metal totals of 17,142 kg of Au. The total waste material is estimated at 79,910 kt, resulting in an average stripping ratio of 2.49.

Khirshona Open Pit

The results of the mine scheduling are presented in Figure 9-17, Figure 9-18 and Figure 9-19, as well as Table 9-26 and Table 9-28. The LoM is estimated at 7 years, commencing in January 2025. The total ROM material is 16.84 Mt, with an average grade of 0.61 g/t Au. This equates to contained metal total of 10,335 kg of Au. The total waste material is estimated at 59,031 kt, resulting in an average stripping ratio of 2.51.

10 Processing and Metallurgical Assessment

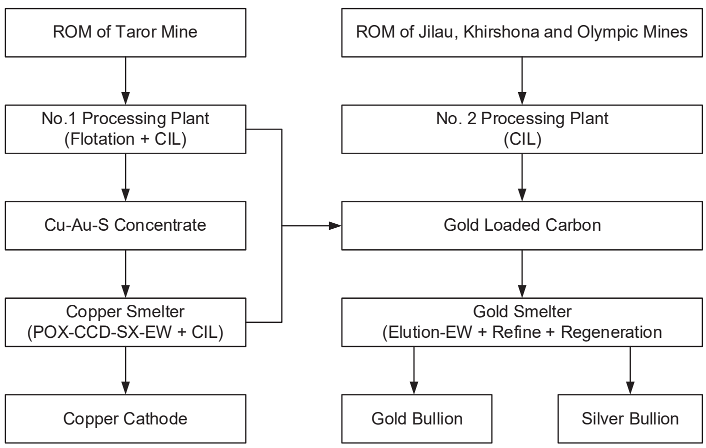
10.1 Overview

Zeravshan LLC built and operates the No. 1 processing plant, No. 2 processing plant, a heap leaching plant, a gold smelter and a copper smelter. The processing complex adopts the combined process of mineral processing and metallurgy forming a complete production chain capable of processing various types of ores to produce standard gold bullions, silver bullions and cathode copper.

Taror ore properties are relatively complex, in addition to the gold and silver, containing high copper and arsenic. Copper and arsenic have a negative impact on extraction of gold and silver. The No. 1 processing plant mainly processes Taror ore and has historically treated oxidized ore and transition zone ore using the carbon in leach ("**CIL**") process, ammonia-cyanide leaching process and the "flotation-ammonia-cyanide leaching process" to mitigate the impact of copper and arsenic. Since mining of the oxidized ore and transitional ore have been completed, the treatment of oxidized and transitional ores is not included in this report. From 2018 onward to present, the No.1 processing plant uses the "flotation - carbon in pulp ("**CIP**") process" to treat the primary ore of Taror mine, producing copper concentrate and gold-loaded carbon, and the copper concentrate is sent to the copper smelter, and the gold-loaded carbon is sent to the gold smelter. Jilau and Khirshona ore properties are simple, low copper and arsenic content, gold cyanide leaching performance easily. The No. 2 processing plant mainly processes the Jilau and Khirshona ores and uses the CIP process to produce gold-loaded carbon which is sent to the gold smelter. Copper smelter uses "POX-CCD-SX-EW process" to process Taror copper concentrate to produce cathode copper. The gold and silver in the copper leaching tailings are extracted with the use of the CIL process to produce gold-loaded carbon, which is sent to the gold smelter. Products from the processing plant and gold-loaded carbon from the copper smelter are sent to the gold smelter for processing, using the "elution - electrowinning - refining process" to produce standard-compliant gold and silver bullion.

The relationship between feed materials, products of plants and smelters is shown in Figure 10-1.

Figure 10-1: Relationship Among the Plants and Smelters



10.2 Taror Ore Metallurgical Tests

In order to support the technological transformation of Taror Processing Plant and to adapt to the change of ore from transition zone to primary zone, Zijin Mining and Metallurgy Design and Research Institute conducted a series of metallurgical tests on various composite samples of Taror sulfide ores from 2010 to 2014.

The samples for processing and metallurgical tests in August 2010 were collected from 1,420 m ASL Level, and two types of composite samples (low and high arsenic sulfide samples) were prepared, a master sulfide composite sample was formed at a proportion of 40%:60% of the two composite samples.

10.2.1 Flotation Tests

Based on a series of condition optimizing tests, the following two closed flotation flowsheets were tested:

- Cu-S (copper minerals - other sulfide minerals) co-flotation and then Cu-S separation flotation.
- Cu preferential flotation and then S flotation.

The flowsheet of the Cu-S co-flotation is shown in Figure 10-2 and the flowsheet of the Cu preferential flotation is shown in Figure 10-3. The test results are summarised in Table 10-1. Both flowsheets could obtain suitable copper concentrates with a Cu recovery of around 86% and Au recovery of around 36%.

Table 10-1: Cu-S Flotation Test Results

Flowsheet	Product	Yield (%)	Grade (%) Cu	Grade (%) Au(g/t)	Grade (%) As	Recovery (%) Cu	Recovery (%) Au	Recovery (%) As
Cu-S co-flotation – separation flotation	Cu Con.	3.95	**22.40**	**31.55**	0.41	**85.67**	**37.52**	1.60
	S-As Con.	11.83	0.61	**10.12**	6.67	6.96	36.05	77.73
	S-As Tailings	7.82	0.29	2.54	0.53	2.18	5.97	4.11
	Tailings	76.40	0.07	0.89	0.22	5.19	20.46	16.56
	Feed	100.0	1.03	3.32	1.01	100.0	100.0	100.0

Figure 10-2: Cu-S Co-Flotation Test Flowsheet

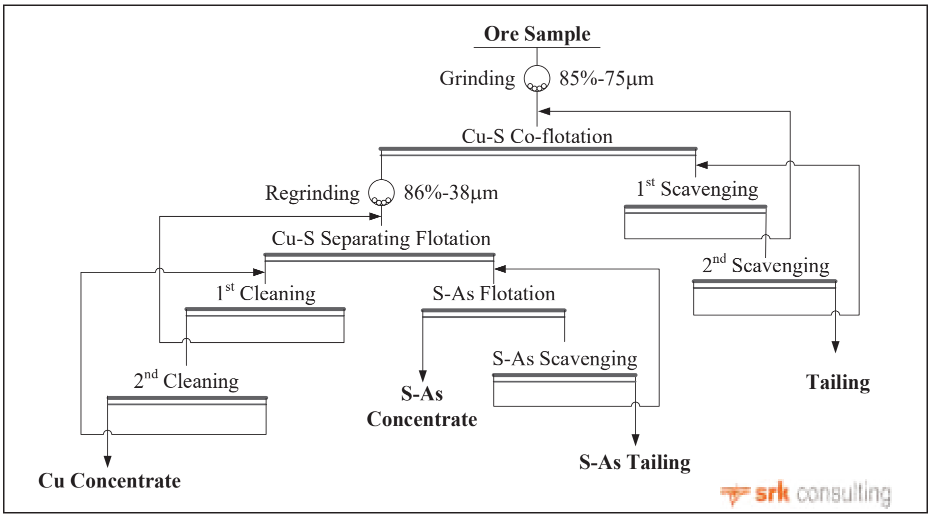

Figure 10-3: Cu Preferential Flotation Test Flowsheet

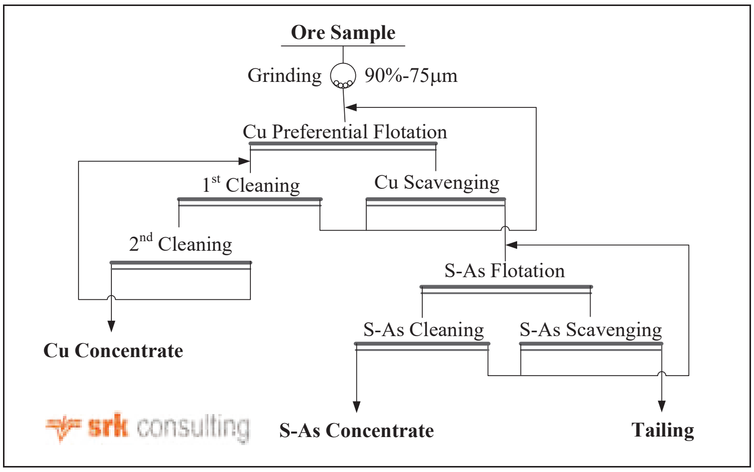

10.2.2 Cyanidation Test of Flotation Tailings

Cu-S co-flotation tailings, with gold grades ranging from 0.9 to 1.5 g/ t, were carried on standard whole ore cyanidation ("WOCN") for 40 hours and standard CIL cyanidation for 24-hours, and the test results of two typical samples are shown in Table 10-2. It is noted that gold extraction of CIL is higher than that of WOCN process.

Table 10-2: Cyanide Leach Results of Flotation Tailings

Test Sample	Residue Grade		Feed Grade		Extraction		Consumption (kg/t)	
	Au (g/t)	Cu (%)	Au (g/t)	Cu (%)	Au (%)	Cu (%)	CaO	NaCN
Cu-S co-flotation tailings	0.56	0.04	1.14	0.06	50.93	38.13		1.43
Cu preferential flotation tailings	0.62	0.05	1.21	0.07	48.63	32.66		1.28
Cu-S co-flotation tailings[1]	0.50		1.47	1.39	66.00			1.23
Cu-S co-flotation tailings[1]	0.61	0.11	1.66	0.13	63.21	17.77	3.0	0.85

Note:

[1] CIL cyanidation, leaching time 24 hours.

10.2.3 Gold Extraction from S-As Concentrate

The approximate grades of S-As concentrates were 10g/t Au, 0.6% Cu, and 6.0% As, and the effect of various pretreatment methods on the subsequent cyanide leaching was tested, with test results shown in Table 10-3. The gold extraction rate of direct leaching was only 30%, and the extraction rate could achieve 80% after oxidation roasting, and 95% of Au extraction and 97% of Cu extraction could be obtained after POX.

Table 10-3: Pre-oxidation-Cyanidation of S-As Concentrate

Pre-treatment	Residue Grade		Feed Grade		Extraction		Consumption	
	Au (g/t)	Cu (%)	Au (g/t)	Cu (%)	Au (%)	Cu (%)	CaO/ NaOH (kg/t)	NaCN (kg/t)
No treatment	6.25	0.39	8.90	0.49	29.79	20.68	4.8	4.23
Lime pretreatment for 24 hours	5.08	0.47	8.66	0.63	41.35	25.63	100	8.80
Caustic soda pretreatment for 24 hours	4.59	0.57	9.14	0.73	49.80	21.53	100	8.20
Oxidizing roasting	2.69	0.65	13.79	0.74	80.50	11.77		8.6
pressure oxidation			9.34	0.61	95.41	97.19		2.5

10.2.4 Cu-S Co-flotation

The ideal Au and Cu extraction rates were obtained by POX - cyanidation of S-As concentrate, implying that it is possible to obtain ideal Au and Cu extractions by POX - cyanidation of Cu-S concentrate as well. In January 2013, co-flotation, flotation tailings CIL and bulk concentrate POX - cyanidation tests were carried out on mixed samples of three lithological ores from Taror. The co-flotation process was "one roughing, two scavangings and two cleanings", as shown in Figure 10-4. With 2 kg/ t lime added for roughing and ammonium dibutyl dithiophosphate as the collector and without copper sulfate, the test results are shown in Table 10-4. In order to obtain enough feed materials of subsequent POX test, totally 85 tests were performed on 255 kg of samples according to the above process.

Figure 10-4: Co-flotation Flowsheet

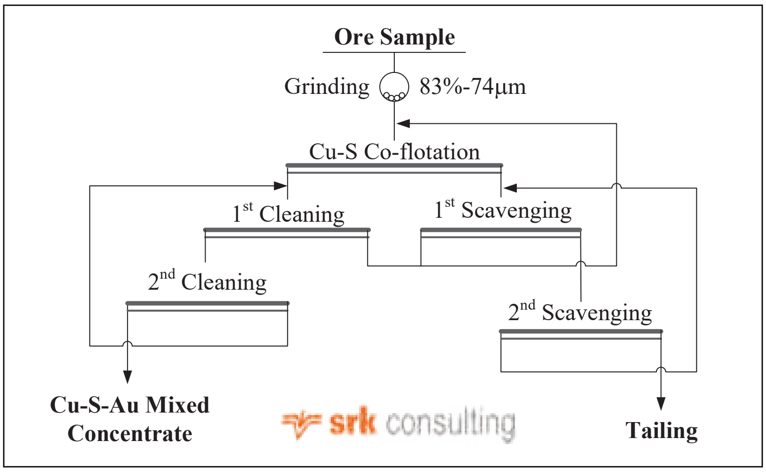

Table 10-4: Cu-S Co-flotation Test Results

Product	Yield	Grade (%)			Recovery (%)		
	(%)	Cu	Au(g/t)	As	Cu	Au	As

10.2.5 Pressure Oxidation - Cyanidation of Cu-S Bulk Concentrate

The concentrates produced from the master composite sample of three lithologies of Taror sulphide ores with lime by flotation contained 9.63% Cu, 19.02 g/ t Au and 2.06% As, and were POX for 2 hours at a temperature of 210°C, an oxygen partial pressure of 1.1 Mpa, a liquid-solid ratio of 5:1, a stirring speed of 700 rpm, with a pre-oxidation residue rate of 85.15%, copper extraction of 98.73%, arsenic extraction of 19.56%, and iron extraction of 21.36% were achieved. Pre-oxidation residue was controlled at a liquid-solid ratio of 3:1, a sodium cyanide concentration of 1,000 ppm, a pH of 10-11.5 for stirring cyanidation for 24-hours, and the total gold extraction was 99.22%, with a sodium cyanide consumption of 2.72 kg/ t, and a lime consumption of 400 kg/ t.

10.2.6 Flotation – POX - Cyanidation Index

The whole flowsheet recoveries of 88.18% Cu and 81%-83% Au were calculated according to the flotation index of the prepared POX, the mixed concentrates POX - cyanidation test index, and the tailings CIL test index (gold leach rates ranging from 59.3% to 63.2%). The comprehensive results are shown in Table 10-5.

Table 10-5: Flotation – POX - Cyanidation and -Tailings CIL Process Index

Product / Operation	Yield (%)	Grade Cu (%)	Au (g/t)	As (%)	Recovery (%) Cu	Au	As

Whole Flowsheet Recovery					88.18	82.03	

10.3 Jilau Ore Metallurgical Tests

Jilau ore is low sulphide gold ore. The gold minerals are dominated by silver-bearing native gold, with a low content of metallic sulphide minerals that account for 0.65%. Pyrite, arsenopyrite and pyrrhotite are the main sulphide minerals. The content of copper is low, dominated by chalcopyrite, tetrahedrite, digenite, covellite and bornite. Arsenic, a harmful element, mainly occurs as arsenopyrite. Gold is embedded in the ore in very fine grains.

In support of the development of metallurgical flowsheet and plant design criteria of Jilau deposit, Zijin Mining Metallurgy Research Institute conducted a series of metallurgical tests on Jilau sulphide composite samples in 2009 and 2011.

10.3.1 Column Leaching Test

The composite head grade is 1.1 g/ t Au. It is crushed to 100% minus 20 mm and then column leaching, the gold extraction is about 45%. The consumption of sodium cyanide is about 0.4 kg/ t.

A comparative column leaching test was conducted on products crushed by different crushing methods. The products were crushed to 100% less than 20 mm using a jaw crusher and a high-pressure grinding roller ("HPGR") respectively. The part smaller than 75 μm was WOCN, and the part larger than 75 μm was column leached. The results are shown in Table 9-6. The fine particle part achieved high extraction rate suggesting the ore size is the predominant factor that affects gold recovery.

Table 10-6: Column Leach Test

Crushing Method	Particle Size (mm)	Weight (%)	Au Grade (g/t)	Distrib'n (%)	Extraction (%)	Leach Time	NaCN Consumption (g/t)
Jaw Crusher	+0.075	96.10	1.13	94.64	**27.75**	20.3d	352
	-0.075	3.90	1.58	5.36	91.23	48h	281
	Overall	100.0	1.15	100.0	**31.15**		349
HPRG	+0.075	91.51	0.96	87.16	**48.92**	26.9d	442
	-0.075	8.49	1.52	12.84	90.28	24h	151
	Overall	100.0	1.01	100.00	**54.24**		417

10.3.2 Whole Ore Cyanidation and Carbon in Leach Tests

Under the grind size of 85% minus 75 μm, the gold extraction is 87% by WOCN process, the addition of sodium cyanide is 1.25 kg/ t.

Under two grinding sizes, the kinetic curves of gold extractions are shown in Figure 10-5. The CIL test results under optimized conditions are shown in Table 10-7. In the test, the amount of lime added is 1,000 g/ t. It indicates that the ore is easy to leach, and the leaching rate increases with the increase of grinding size and extension of leaching time. Under grinding size of 65%~90% at -75 μm and leaching time of 24~48 hours, the gold extraction rate is 87.2%~92.8%. Sodium cyanide consumption is very low at 120 g/ t~170 g/ t.

Figure 10-5: Gold Extraction Rate - Leaching Time of Jilau Sulfide Composite

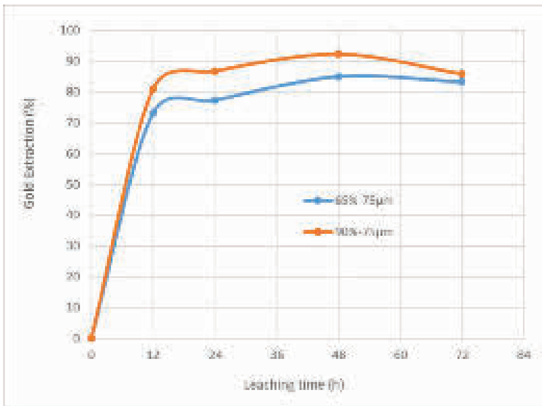

Table 10-7: CIL Test Results of Jilau Sulfide Composite

Grinding Size	Leaching Time (h)	Gold Extraction (%)	NaCN Consumption (g/t)
65%-75μm	24	87.25	157
	24	87.72	120
	48	89.19	122
	48	87.94	120
90%-75μm	24	89.90	157
	24	91.06	150
	48	92.82	150
	48	90.62	170

10.3.3 Flotation - Concentrate Cyanidation Test

Based on the detailed flotation condition tests, the optimum conditions of each factor are selected for open-circuit test, and then closed-circuit test. A closed-circuit of "one roughing + two scavenging + one cleaning" is adopted. The grinding size for roughing is 88% minus 75 μm. Lime and water are used as regulators, with consumptions of 1,000 g/ t each. Xanthate Y89 and ammonium dibutyl dithiophosphate are used as collectors and 2# oil is used as foaming agent.

Cyanidation leaching tests under various conditions are conducted to flotation concentrate. The test results show that alkaline pretreatment before cyanidation leaching or regrinding of flotation concentrate (with regrinding size of 90% minus 38 μm) has no significant influence on gold extraction. The optimum conditions and results are as follows:

- The initial concentration of sodium cyanide: 1,000 ppm
- Leaching time: 48-hours
- Gold leaching rate: 95%
- Consumption of sodium cyanide: 4.5 kg/ t concentrate, or 145 g/ t ROM.

The flotation-cyanidation comprehensive test results are shown in Table 10-8. The yield of flotation concentrate is 3.22%, and the gold recovery rate is 82.84%. The cyanidation leaching rate of flotation concentrate is 95.04%. The comprehensive recovery rate of flotation and concentrate cyanidation is 78.72%.

Table 10-8: The Test Results of Flotation-Concentrate Cyanidation

Operations	Products	Yield (%)	Gold Grade (g/t)	Gold Recovery (%)	
				Operations	ROM
Flotation	Feeding	100.0	1.07	100.0	100.0
	Concentrate	3.22	27.60	82.84	**82.84**
	Tailings	96.78	0.19	17.16	17.16
Concentrate Cyanidation	Pregnant Solution			**95.04**	**78.72**
	Leaching Residue		1.37	4.96	4.12
	Feeding		27.60	100.0	82.84

10.3.4 Gravity Separation Test

Although mineralogical studies have shown that the gold in the Jilau ore is inlaid with fine particles, which is not suitable for gravity separation, the gravity separation test was still conducted by using laboratory Knelson Concentrator, and the cyanide leach and floatation test were carried out for the gravity tailings. The test results are summarized in Table 10-9. The grade and recovery of the gravity concentrates are not high, indicating that the Jilau ore is not suitable for gravity separation process.

Table 10-9: Exploration Test Results of Gravity Separation - Tailings Cyanidation/Flotation

Process	Grind Fineness	Concentrate Yield (%)	Head Grade (g/t)	Concentrate Grade (g/t)	Tailings Grade (g/t)	Concentrate Recovery (%)
Gravity separation	56%-75 μm	0.23	0.80	45.38	0.69	13.04
	85%-75 μm	0.17	0.94	139.90	0.69	25.88
Tailings cyanidation	56%-75 μm		0.80		0.18	77.62
	82.4%-75 μm		0.85		0.19	77.53
	91.8%-75 μm		0.82		0.16	80.41
	61%-45 μm		0.75		0.16	78.53
	88%-45 μm		0.75		0.13	82.74

Process	Grind Fineness	Concentrate Yield (%)	Head Grade (g/t)	Concentrate Grade (g/t)	Tailings Grade (g/t)	Concentrate Recovery (%)
Tailings flotation	56%-75 μm	3.26	0.75	15.88	0.20	69.00
	91.8-75 μm	1.87	0.81	31.04	0.21	71.71
	85%-75 μm	2.90	0.70	18.80	0.16	86.61

10.4 Khirshona Ore Metallurgical Tests

The metal minerals in the sulfide ore mainly include pyrite, marcasite, chalcopyrite, limonite, arsenopyrite, trace electrum, natural gold, etc., with a content of about 1%. The gangue minerals mainly include potassium feldspar, plagioclase, quartz, followed by chlorite, calcite, sericite, biotite, kaolin, etc., with a content of about 99%.

Exploratory processing tests were carried out on oxide ore in 2011 and sulfide ore in 2012. The results are as follows:

- When the particle size of oxide ore is 100% minus 50 mm with column leaching, the gold extraction is 50.21%, and the sodium cyanide consumption is 204 g/t.
- When the grinding fineness of oxide ore is 92% minus 75 μm with WOCN, the gold extraction is 80%, and the sodium cyanide consumption is 100 g/t.
- When the grinding fineness of sulfide ore is 88.9% minus 74 μm with CIL, the gold leaching rate is about 87.01%, and the sodium cyanide consumption is about 210 g/t. and
- When the grinding fineness of sulfide ore is 85% minus 75 μm with a flotation flowsheet of "one roughing + one cleaning + one scavenging", the gold concentrate yield is 3.05% with a grade of 32.1 g/t, and the gold recovery rate is 84%. The cyanide leaching rate of gold concentrate after regrinding is 97.12%, and the overall recovery is about 81.5%.

The exploratory test results show that the use of WOCN in the Khirshona composite sample can obtain a relatively higher gold recovery, but the grinding fineness is relatively high.

As Khirshona ore was planned to be treated by CIL at the Jilau/ No. 2 processing plant, a processing and metallurgical test was carried out on the core samples of Khirshona sulfide ore in 2013, to determine the gold recovery of Khirshona sulfide ore under the operation conditions of the 10,000 tpd processing plant of Jilau. Jilau processing plant adopted CIL process, with a grinding fineness of 65%~70% minus 75 μm, and a leaching time of 48-hours.

At a grinding fineness of 65%~67% minus 75 μm, the relationship between leaching rate and leaching time is shown in Figure 10-6. At a leaching time of 48-hours, the relationship between leaching rate and grinding fineness is shown in Figure 10-7. At a grinding fineness of 65%~70% minus 75 μm, and treated by whole-slime cyanidation for 48-hours with the sodium cyanide concentration of 150 ppm, the gold grade of the residue can be controlled at about 0.13 g/t. The total gold leaching rate can reach 83%~86%, and the additional amount of sodium cyanide is about 0.3 kg/t ore, indicating that the Khirshona sulfide ore can use the 10,000 tpd Jilau sulfide ore process for production.

Figure 10-6: Gold Extraction – Leaching Time of Khirshona Sulfide Composite

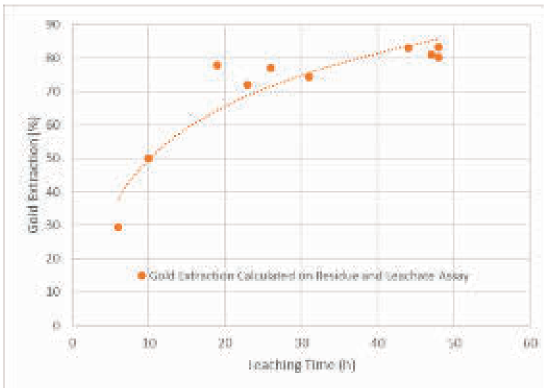

Figure 10-7: Gold Extraction Rate - Grinding Fineness of Khirshona Composite

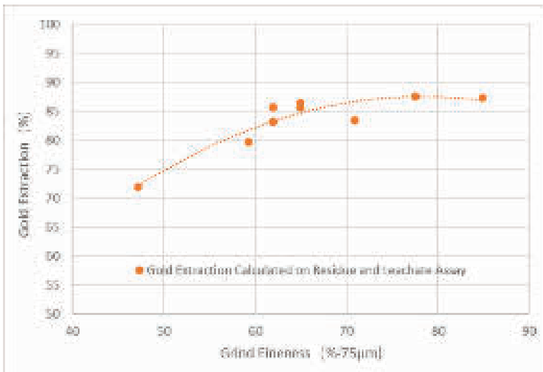


10.5 Conclusions and Recommendations on Metallurgical Tests

10.5.1 Taror

- The main factor affecting the processing of sulfide ores is the high sulfur and arsenic content in the ores. The technical indexes obtained from the two flowsheets (Cu-S combination-separating flotation and Cu preferential flotation) were basically the same. The copper concentrates contained about 22% Cu and 30 g/t Au, with a copper recovery of 86% and a gold recovery of 35%; the Au-S-As concentrates contained about 10 g/t Au and 6-7% As, with a gold recovery of about 35%. The flotation tailings with about 30% gold residue, were suitable for CIL, with a CIL leach rate of about 50% of gold, and cyanide residue contained about 0.6 g/t Au, with a sodium cyanide consumption of 1.3 kg/t (for ROM).
- The S-As concentrates produced from preferential flotation or co-separating flotation of sulfide ores still need further treatment, and the test showed that hot-pressure oxidation-cyanide leaching could achieve gold and copper leach rates of 95% and 97%, respectively. Although the

preferential flotation and co-separating flotation could obtain high comprehensive recoveries, the flowsheet was complex.

- The Cu-S bulk concentrate produced from the Cu-S co-flotation of sulfide ores by adopting POX - cyanidation can obtain ideal copper and gold recoveries. The gold remained in the flotation tailings could be extracted by CIL process. The gold and copper recoveries of the whole flowsheet were 82% and 88%, respectively.
- Taror ores generally contain high copper content, and the processing wastewater generally contains copper, which not only affects the process, but also causes copper loss. It is suggested that the process wastewater should be treated with environmental protection technology, and the dissolved copper in the solution should be recovered to produce metallic copper.

10.5.2 Jilau and Khirshona

- Jilau sulfide ore is amenable to cyanidation. At a grinding fineness of 65% minus 75 μm by WOCN for 48-hours, the gold extraction rate is 88%. At a grinding fineness of 90% at -75 μm by WOCN for 24-hours, the gold extraction rate is 90%.
- At a grinding fineness of 88% minus 75 μm by flotation, the concentrate yield is 3.22%. The gold recovery rate is 82.8%, the cyanide leaching rate of the flotation concentrate is 95.0%, and the overall recovery is 78.7%, much lower than the WOCN process.
- Khirshona sulfide ore is a low-sulfide and low-grade gold ore, suitable for cyanidation extraction. At a grinding fineness of 65%~70% minus 75 μm by CIL for 48-hours, the gold extraction rate is 83%~86%.
- The gold recovery rate of low-grade ore is sensitive to ore grade for both Jilau and Khirshona, but there is not enough test data to establish the relationship between recovery rate and grade. It is recommended to supplement the variability test of cyanidation to establish the response relationship between gold recovery and ore grade.

10.6 No. 1 Processing Plant (Taror Processing Plant)

10.6.1 Overview

No. 1 Processing Plant, located 10.5 km northwest of the Jilau Mine, was built in 1995 and was put into operation in 1997, using the CIL to process oxide ores, with a capacity of 720 ktpa of ore. In 1997, an expansion was carried out to expand one production line to form line #1 and #2 and to increase the processing capacity to 1.65 Mtpa (5,000 tpd) to process oxide ores from Taror and Jilau. After Zijin Mining took over, an ammonium cyanide gold extraction process was developed suitable for high copper content oxide ores in 2009. The oxide ores were processed by a heap leach method near the Mine, and the processing plant adopted a flotation - tailings cyanidation process to treat the sulphide ores from Taror Mine, and the products were copper concentrates and gold loaded carbon. In 2012, a new production line #3 was built, using the ammonium-cyanide leaching process adapted to high copper content ores, to treat Taror oxide ores, with a capacity of 660,000 tpa (2,000 tpd). In 2014, the Jilau processing plant was completely constructed, adopting the CIP process to treat ores from Jilau, Khirshona and Olympic deposits.

In 2016, as the mining elevation of Taror Mine descended and mining gradually entered the transitional zone. The sulfur content of the ore increased significantly. The original production process did not adapt to the changes with the ore and the gold recovery rate reducing significantly. Therefore, in February 2016, the old flotation production line built during the original Soviet period was overhauled and used for desulfurization operation of oxide ores, i.e. the ore was floated first to produce sulfide concentrate, and the flotation tailings then entered the ammonium-cyanide system for leaching.

In 2019 and 2023, the No. 1 processing plant conducted two phases of technical transformation to adapting to the changes of ore properties and expand the capacity to 3,000 tpd and 5,000 tpd respectively. The ammonium cyanidation circuit was cancelled, the process of "all sulfides flotation – tailing CIP" is applied for treating the sulfide ore of the Taror Mine to produce Cu-Au-S bulk concentrate and gold loaded carbon. Figure 10-8 is a panoramic photo of the complex of No.1 processing plant, copper smelter and gold smelter, and part of the TSFs.

Figure 10-8: Complex of No.1 Processing Plant, Copper Smelter and Gold Smelter

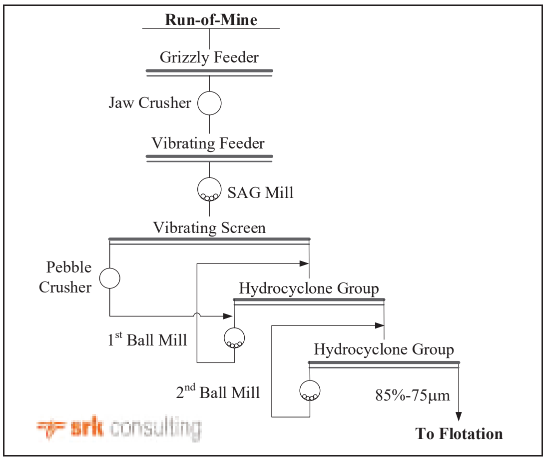
10.6.2 Processing Flowsheet

The principal flowsheet applied in No. 1 Processing Plant presently is Semi-Autogenous Ball mill Crusher/ SABC milling - bulk flotation – Tailings CIP, the final products are Cu-S-Au bulk concentrate and gold loaded carbon. There is a cyanide tailings water treatment plant close to the TSF to recover copper and cyanide from the tailings water. The flowsheet is briefly described as follows.

Crushing and Grinding Circuit

There are two crushing and grinding lines both adopting SAB-B process (primary crusher + semi autogenous mill + two stage ball mills) as shown in Figure 10-9. The product is ore slurry at fineness of 85% minus 75 μm. Both lines product flow together to flotation circuit.

Figure 10-9: Crushing and Grinding Circuit of No. 1 Processing Plant

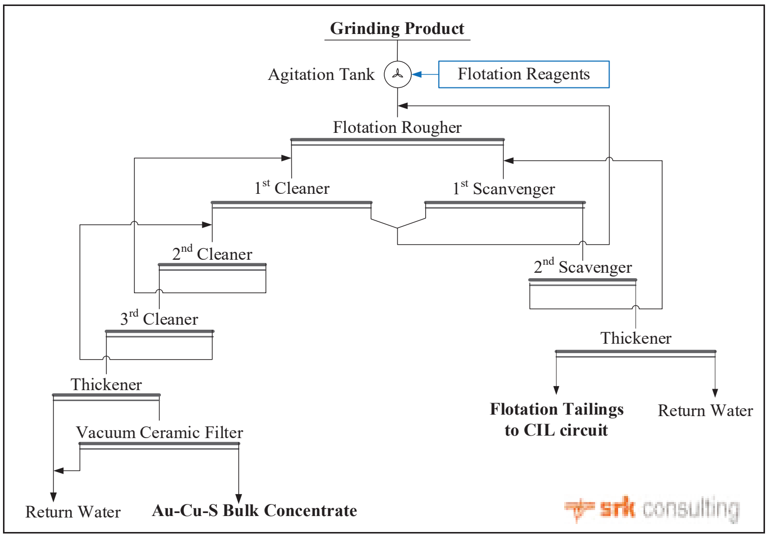


Flotation and Dewatering Circuit

Flotation circuit adopts "one roughing, three scavenging and three cleaning" flowsheets, producing Cu-S-Au bulk concentrate. The concentrate is thickened and then filtered and stored for sale before the construction completion of the Copper Smelter, and transported to the Copper Smelter by truck after the smelter commence production in July 2023.

The flotation tailings are thickened and pumped into CIP circuit. The flowsheet is shown as Figure 10-10.

Figure 10-10: Flotation Flowsheet of No. 1 Processing Plant



CIP Circuit

The tailings pulp flows through a train of agitation leaching tanks and a train of adsorption agitation tanks with active carbon moving counter current of the pulp flow. The total retention time is 48-hours with Sodium Cyanide/ NaCN concentration of 300 – 400 mg/L in first tank.

Cyanide Tailings Water Treatment Plant

About 30% of copper in the flotation tailings is leached out in the CIL process. The CIL tailings water contains dissolved copper and cyanide. There is a cyanide tailings water treatment plant on the TSFs area, which adopts SART process (Sulfidation, Acidification, Recycling and Thickening) to treat the TSF return water to recover copper as copper sulfide precipitate and cyanide as sodium cyanide. The copper sulfide contains 45% copper that is sent to copper smelter as copper concentrates, and the sodium cyanide is used in the CIL process. The treated water returned to No. 2 Processing Plant. The tailings treatment plant has a capacity of 250 m^3/h (6,000 m^3/d), achieving copper recovery of about 85% and cyanide recovery of around 65%.

10.6.3 Processing Facilities and Equipment

The No.1 Processing Plant was upgraded from the original plant through multiple phases of process improvements and equipment updates. The current process is suitable for the ore properties of Taror, enabling the comprehensive recovery of gold, silver, copper, and sulfur. The plant's equipment configuration is considered appropriate. The processing plant currently includes an ore stockpile, two coarse crushing facilities, two grinding facilities, a flotation facility, a CIL facility, and a copper concentrate dewatering facility. The primary mineral processing equipment in operation is detailed in Table 10-10. During SRK's site visit, it was observed that except for the secondary ball mill of the No.2 crushing and grinding line, which was repurposed equipment, all other equipment had been replaced or newly added.

10.6.4 Production Performance

The historical production data of the No.1 Processing Plant is shown in Table 10-11. Depending on the feed grade, flotation recovered 66%-75% of copper, 53%-63% of gold, and 38%-66% of silver. After leaching the flotation tailings, a portion of gold, silver, and copper could still be extracted. The total recovery rate (flotation + cyanidation) reached 70%-81% for gold and 41%-69% for silver. The leaching rate of copper from flotation tailings was 20%-30%. This leached copper is discharged into the TSF and subsequently recovered from the tailing's wastewater.

The Taror tailings wastewater treatment plant employs the SART process to treat the tailings wastewater and recover sodium cyanide, copper, gold, and silver. The precipitate produced by the wastewater treatment plant (copper precipitate) is rich in copper, gold, and silver, and is sent to the copper smelter as copper concentrate. The production data are shown in Table 10-12. In 2024, a total of 1.75 Mm³ of tailings wastewater was treated, recovering 1,258 t of sodium cyanide. The copper precipitate contained 579 t of copper, 58 kg of gold, and 1,740 kg of silver.

Total CN recovery	%	64.79	78.75

Based on the monthly production data from September 2023 to December 2024, the relationship between copper recovery rate and feed grade is illustrated in Figure 10-11. The flotation recovery rate of copper ranges from 55% to 82%, with an average of 73.8%. When the feed grade drops below 0.35%, a significant downward trend in copper recovery rate is observed.

According to the production data from January 2022 to December 2024, the relationship between gold recovery rate (flotation + cyanidation) and feed grade is shown in Figure 10-12. The relationship exhibits an approximately linear pattern, with gold recovery rates ranging from 72% to 86% and an average of 80%.

Figure 10-11: Relationship Between Copper Recovery Rate and Feed Grade

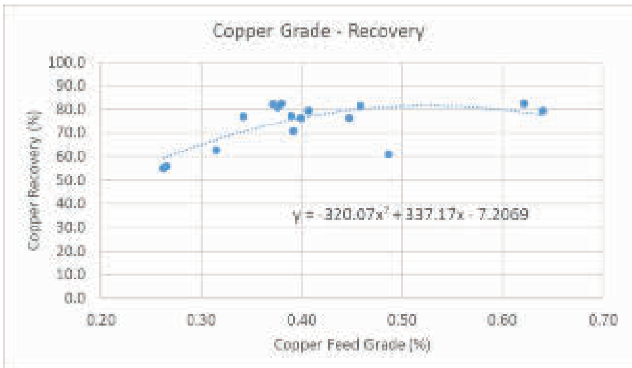

Figure 10-12: Relationship Between Gold Recovery Rate and Feed Grade

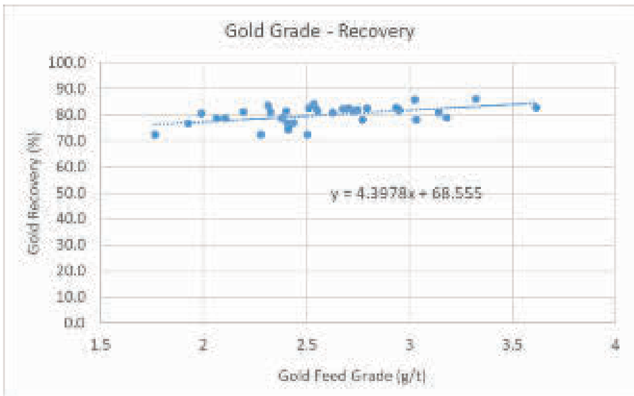

10.7 No. 2 Processing Plant (Jilau Processing Plant)

10.7.1 Overview

No. 2 Processing Plant is located on a hillside about 1,850 m north of Jilau open pit, with a designed processing capacity of 10 ktpd. It was completed and put into operation in July 2014. The CIP process is adopted to process the ores from Jilau, Olympic, Khirshona Mines, extracting gold and silver, and producing gold loaded carbon. Figure 10-13 shows a full view of the No. 2 processing plant.

Figure 10-13: A Panoramic Photo of the No. 2 Processing Plant

10.7.2 Processing Flowsheet

The No. 2 processing plant adopts a standard CIP process which includes the following circuits:

- Crushing: traditional 3-stage crushing with 1-stage screening closed circuit, and the ore size is crushed to 100% minus 12 mm.

- Grinding: 1-stage ball mill with a cyclone cluster classifying closed circuit, the crushed ore size is ground to 70% minus 75 μm as a slurry. Lime is added with the feed ore for increasing the slurry pH value to prevent sodium cyanide from decomposing. There are two grinding lines in parallel in grinding facility.
- Pre-leach thickening: two thickeners in parallel to condensing the grinding slurry to 45% w/w density.
- CIP: the condensed slurry is pumped to 4 agitation tank trains in parallel. Each has 10 agitation tanks with the first 4 tanks merely cyanide leaching and the last 6 implement leaching and adsorption. Active carbon moves counter currents of the pulp flow. Total retention time 48-hours.

10.7.3 Processing Facilities and Equipment

The main production facilities of the No. 2 Processing Plant include a ROM stock pad, a primary crushing station which on the top platform of the hill, a secondary and tertiary crushing facility, a screening facility, two fine ore bins, a grinding facility with two ball mill and cyclone clusters in parallel, two thickeners, a CIP facility, a lime milk preparation facility.

Cyanidation and adsorption tanks are arranged in steps outdoors, consisting of four series. An emulsification closed-circuit is composed of two Φ3.2×4 m ball mills and one linear screen in the lime milk preparation facility in order to guarantee the fineness of lime milk, preventing the pipeline from being blocked. One Φ8×8.5 m agitation tank is used as a storage buffer tank. The main production equipment of the No. 2 processing plant is shown in Table 10-13.

10.7.4 Production Performance

The production records of the Jilau Processing Plant for recent years are shown in Table 10-14. Based on the production data from January 2022 to December 2024, the relationship between gold recovery rate and feed grade is plotted in Figure 9-14. The gold recovery rate remains relatively stable, ranging from a minimum of 73.2% to a maximum of 84.2%, with an average of 79.7%.

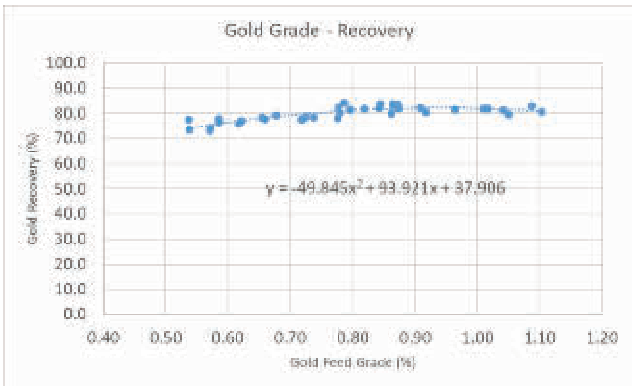
Figure 10-14: Relationship Between Jilau Gold Recovery Rate and Feed Grade



10.8 Heap Leach Plant

The heap leach plant is located in the Jilau, Khirshona, and Olympic mining areas. It was originally used to process low-grade oxidized ores from these areas and currently processes low-grade waste rock stockpiled during earlier stripping and currently mined out low-grade waste rock. Due to its simple facilities and equipment, low investment, and low operating costs, the processing capacity depends on the volume of low-grade waste rock and can reach up to 2 Mtpa. Figure 10-15 shows the solution storage tanks and the activated carbon adsorption tower group of the heap leach plant.

Figure 10-15: The Photo of Heap Leach Plant

The heap leaching process is relatively simple. Low-grade waste rock is either crushed or left uncrushed and stacked on an impermeable base liner (High Density Polyethylene ("**HDPE**") membrane). During the stacking process, lime is added using transport trucks as a protective alkali to prevent sodium cyanide decomposition. A spray pipe network is then installed, and a low-concentration sodium cyanide solution (0.03%) is sprayed onto the ore heap. As the cyanide solution infiltrates downward, gold and silver are leached from the ore. The pregnant leach solution ("**PLS**") containing gold is then collected and pumped to the PLS high-level storage tank, from where it flows by gravity through a series of adsorption tanks arranged in a stepwise manner. Gold is adsorbed onto activated carbon.

The adsorption system consists of 4 adsorption tanks. Fresh carbon is added to the last tank and periodically transferred to the previous tank using airlift pumps. Finally, loaded carbon is removed from the first tank in a counter-current sequence and sent to the gold smelter as gold-loaded carbon. After adsorption, barren solution is stored in barren solution tanks, replenished with sodium cyanide, and reused for spraying the ore heap.

The heap leaching data of recent years is presented in Figure 10-15. It is important to note that due to the long leaching cycle, the amount of metal produced (gold loading on carbon) does not directly correspond to the amount of metal stacked in the heap. Gold recovery rates range from 30% to 45%, with an average of 37%.

Table 10-15: Heap Leach Production Performance

Description	Unit	2022	2023	2024

Gold loaded in carbon	Au kg	256.3	209.1	170.3
Gold recovery (by loaded carbon)	Au %	44.08	31.52	36.31

10.9 Copper Smelter

To enhance copper and gold recoveries, the Taror processing plant employs a full sulfide flotation process, which produces mixed concentrates with low copper grades. These concentrates (Cu-Au-S mixed concentrate) were sold at a discounted price due to their low copper content. To achieve higher economic benefits, Zeravshan LLC invested in the construction of a copper smelter to process the low-grade copper concentrate produced by the Taror processing plant, generating cathode copper and gold-loaded carbon.

The copper smelter began construction in 2021 and was completed and put into operation in July 2023. It is designed to process 165,000 t of copper concentrate annually (500 tpd) and produce 5,000 t of cathode copper per year. The smelter adopts a hydrometallurgical copper refining process, with the principle flowsheet shown in Figure 10-16, briefly described as follows:

The Cu-Au-S mixed concentrate is first subjected to pre-acidification using acidic solution from the overflow of the CCD1 thickener, which decomposes carbonates and simultaneously leaches part of the copper. The acidified slurry then goes through solid-liquid separation in a thickener, and the underflow is pumped to an autoclave for POX leaching. After the leaching reaction is complete, the slurry in the autoclave releases pressure via a flash tank and then enters the basic ferric sulfate ("BFS") transformation process. The BFS-transformed slurry passes through a 5-stage CCD washing process. The CCD washing underflow is subjected to alkaline treatment and neutralization before entering the CIL cyanidation system. Overflow from the first CCD stage returns to the pre-acidification process. The overflow from the pre-acidification thickener is cooled and sent to the copper extraction-electrowinning system, producing cathode copper.

The establishment of the copper smelter has enabled Zeravshan LLC to form a complete mining, processing, and smelting production chain. The low-copper, high-arsenic gold concentrate has been effectively treated. Production performance since commissioning is shown in Table 10-16, demonstrating improved copper and gold recovery rates.

10.10 Gold Smelter

10.10.1 Overview

The products of Taror Processing Plant are Cu-Au-S mixed concentrate and gold-loaded carbon. The product of Jilau Processing Plant and Heap Leach Plant are gold-loaded carbon. The products of Copper Smelter are cathode copper and gold-loaded carbon. All the gold-loaded carbons are processed in Gold Smelter to produce standard gold bullion and silver bullion. The smelter includes four production circuits/ flowsheets: elution-electrowinning, refining and purification, activated carbon regeneration, and wastewater treatment. The annual processing capacity of gold-loaded carbon is 10,000 t, and the gold refining capacity is 6 tpa to produce gold with 99.99% purity.

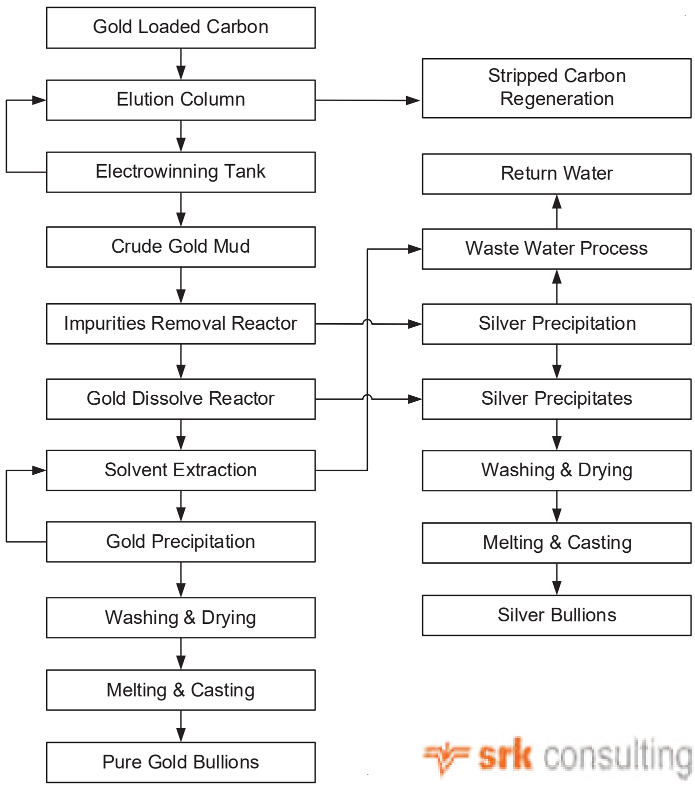
10.10.2 Smelting Process

The smelting flowsheet is shown as Figure 10-17, comprises of the flowing process:

1. Elution and electrowinning: high temperature elution and synthermal electrowinning (Zadra process), which strips gold from loaded carbon and deposited as gold mud. There are six sets of elution and electrowinning, each capacity is 2.8 t loaded carbon operated in batches and each batch lasts 10 to 12 hours at the temperature of 130℃ to 140℃.
2. Gold refining: nitric acid is used to dissolve silver and base metals from the crude gold mud, and aqua regia is used to dissolve gold. Pure gold-loaded organic phase is produced after solvent extraction and washing. Sodium sulfite is used to precipitate gold. After washing and drying, the gold sand is mixed with flux and transferred to a graphite crucible, to be heated and melted by an intermediate-frequency electric furnace, and is then cast into gold doré bars, weighed, marked, and stored. The product is #1 standard gold bullion, with a purity ≥99.99%.

   Silver refining: the main components of the leachate of the nitric acid removal operation are silver nitrate, copper nitrate and other base metal nitrates. When salt (sodium chloride) is added, the silver nitrate generates silver chloride precipitation, which is filtered and washed to obtain pure silver chloride. The precipitate is dried, melted and cast into silver bullion.
3. Activated carbon regeneration: the adsorbed inorganic and organic pollutants in the CIL operations will reduce the adsorption activity of the activated carbon and reduce the adsorption capacity and rate for gold and silver. Therefore, the elution tail carbon is regenerated before recycling to use in the adsorption operation to restore its activity. A two-stage regeneration process of hydrochloric acid washing and fire regeneration in an electrical heating rotary kiln.
4. Waste water treatment: all the wastewater solutions are treated in the wastewater facility by adding lime and alkali to precipitate metals and then filtered. The filtrate is returned to No. 1 Processing Plant, the precipitate contains a variety of metals including gold and silver, stored for further treatment to recover gold and silver.

Figure 10-17: Gold Smelting Flowsheet (Gold Loaded Carbon Treatment Flowsheet)



10.10.3 Smelting Equipment

The Gold Smelter currently has seven sets of elution-electrowinning units. Each unit can desorb one batch per day, and each unit can process 2.8 t of gold-loaded carbon per batch (on a dry basis). The processing capacity of the smelter is 10,000 tpa. The gold refining capacity is 6 tpa, which can meet the production needs of the processing plants. The main production equipment of the smelter is listed in Table 10-17, excluding variety of vessels and pumps.

Table 10-17: Main Production Equipment of the Gold Smelter

Equipment	Specifications	Number
Elution Column	Φ1200×6835mm	7
Electrowinning Tank	Φ1600×2600mm	7

10.10.4 Smelting Indicators

The production performance of the smelter over the past three years is shown in Table 10-18, and the product is 1# gold bullion with a purity of no less than 99.99%. The comprehensive smelting recovery (gold loaded carbon elution, electrowinning, refining, wastewater and residue treatment) is nearly 100% for gold and 84% for silver.

Table 10-18: Production Performance of Gold Smelter

Description	Unit	2022	2023	2024
Loaded carbon weight (dry basis)	t	5,682.71	6,393.93	9,066.31

Actual silver recovery	%		84.44	83.07

10.11 Tailing Storage Facilities ("TSF")

There are three Tailings Storage Facilities ("TSFs") that serve Taror Processing Plant, namely No. 1, No. 2 and No. 3 TSF. There is one TSF serving the Jiau Processing Plant. There is also one Tailings Wastewater Treatment Plant to process Taror tailings wastewater and recover the dissolved copper, gold, silver and cyanide. The TSF complex is in an area that is next to the complex of Taror Processing Plant, Copper Smelter and Gold Smelter as shown in Figure 10-18.

Figure 10-18: Complex of TSFs

10.11.1 Taror TSF

No.1 and No.2 TSF

The No.1 TSF is situated 1,500 m southwest of the No.1 Processing Plant, while the No.2 TSF is positioned directly adjacent to the eastern side of the No.1 TSF. Both TSFs are valley-type constructions, separated by a low ridge. The dams of both TSFs were constructed using locally sourced soil and rock materials, with a design crest elevation of 1,442 m ASL. In practical terms, the two TSFs have been integrated into a single consolidated TSF, with a maximum dam height of 60.5 m and a total storage capacity of 3.802 million m^3.

The No.1 TSF was completed and put into operation at the end of 2013, reaching its designed final crest elevation of 1,442 m ASL by May 2020. The No.2 TSF commenced operation in August 2018. In May 2020, when the tailings sediment elevation reached 1,420 m ASL, MCC CIE conducted the overall planning and design for the combined elevation-raising and capacity expansion project for the No.1 and No.2 TSFs at Taror. The design was to raise the dam crest elevation to 1,464 m ASL, with a maximum dam height of 82.5 m, and increase the total storage capacity to 8.297 million m^3. Locally sourced soil and rock materials were utilized, and the downstream dam construction method was adopted to thicken and heighten the base dam. The project was planned to be executed in two phases: Phase one involved raising the dam crest elevation by 5 m to 1,447 m ASL, creating an additional storage capacity of 1.009 million m^3; Phase two was intended to further raise the crest elevation by 17 m, augmenting the storage capacity by an additional 3.486 million m^3.

However, with the construction and commissioning of the No.3 TSF, the second phase of the elevation-raising project was not implemented. Currently, the crest elevation is at 1,447 m ASL, and the TSF remains in a decommissioned and maintenance state.

The combined catchment area of the No.1 and No.2 TSFs is 0.27 km^2. Interceptor ditches are constructed around the perimeter of the TSFs to facilitate the external discharge of clean water. Runoff water within the TSFs is collected and reused via a floating pump station. The dam structures of the No.1 and No.2 TSFs have been consolidated into a single entity, and a shoulder spillway has been installed on the eastern slope of the No.2 TSF to ensure flood control and drainage safety.

The TSFs are constructed with a full anti-seepage system comprising a 0.3-m-thick clay protective layer and a 2.0-mm-thick HDPE membrane. Gravel drainage channels are installed beneath the membrane to facilitate seepage discharge. Additionally, an interception dam is constructed downstream of the TSFs to control seepage.

In the phase one elevation-raising and capacity expansion project, the main dam section was thickened and elevated using the downstream construction method, achieving a final elevation of 1,447 m ASL, with the dam crest widened to 27.5 m. Wide berms, each 2 m wide, were constructed at elevations of 1,427 m ASL, 1,407 m ASL, and 1,387 m ASL to enhance stability. For the dam shoulders on both sides, a layer of geogrid was laid on the 1,442 m ASL platform, followed by the construction of an auxiliary dam above it using locally sourced soil and rock materials. This raised the dam to a crest elevation of 1,447 m ASL, with a final crest width of 20 m. Upon completion of the phase one expansion, the storage areas of the No.1 and No.2 TSFs were unified, increasing the total storage capacity to 4.811 million m^3. The height of the tailings dam was extended to 65.5 m.

An emergency flood spillway pool has been constructed downstream of the No.1 TSF to store clarified tailings water and seepage for reuse, as well as to retain floodwaters from the TSF. The dam of the emergency flood spillway pool is a compacted earth-rock structure, constructed with locally sourced soil and rock materials. It has a crest elevation of 1,366 m ASL, a height of 32 m, a total storage capacity of 498,000 m^3, a crest width of 5 m, and a dam axis length of 200 m. Full anti-seepage measures have been implemented throughout the pond to prevent seepage. Due to the low regional rainfall, the emergency flood spillway pool is primarily used to store wastewater generated on a daily basis from the three TSFs, which is then supplied to the wastewater treatment plant. The wastewater treatment plant employs the SART process to recover copper, gold, silver, and sodium cyanide from the wastewater. The treated water is subsequently supplied to the Jilau Processing Plant for reuse.

On the 1,442 m ASL platform, a layer of reverse-embedded drainage pipes has been installed. These drainage pipes are perforated, slotted pipes designed to channel seepage water from the dam's phreatic line to the exterior. All seepage collected by the drainage facilities is directed to the emergency flood spillway pool through pipelines.

The No.1 and No.2 TSFs are equipped with corresponded systems for flood prevention, flood drainage, seepage control, and seepage drainage, as well as monitoring systems. The key monitoring parameter includes dam displacement, phreatic line level, pond water level, dry beach length, and surrounding water quality.

No.3 TSF

The No.3 TSF is situated slightly downstream and adjacent to the western side of the No.1 TSF. It is a valley-type TSF, separated from the No.1 TSF by a ridge, and operates independently. The TSF was completed and commissioned in April 2023.

The initial dam is a compacted earth-rock structure with a height of 58.0 m, a crest elevation of 1,440 m ASL, and a crest width of 5.0 m, providing an initial storage capacity of 4.315 million m^3. Currently, the remaining initial storage capacity is 1.09 million m^3.

Above the initial dam, the design adopts the upstream dam construction method to construct sub-dams using tailings materials. To ensure a uniform elevation increase of the tailings dam during later stages, tailings discharge is required to be conducted using branch pipes to evenly distribute tailings.

Each sub-dam is constructed to a height of 2.0 m, with a final stacking elevation of 1,464 m ASL (consistent with the crest elevation of the second-phase design for the No.1 and No.2 TSFs), resulting in a stacking dam height of 24.0 m. Ultimately, the total dam height will reach 82.0 m, with a total storage capacity of 7.752 million m^3.

A diversion ditch is installed around the perimeter of the TSF, above the final stacking elevation of 1,464.0 m ASL, to achieve the separation of clean water and runoff. The internal flood drainage system adopts drainage chutes, with the outlets of the drainage chutes directed to a return water pond located at the toe of the dam. Additionally, drainage ditches shall be constructed at the junctions between the dam shoulders and the adjoining mountain slopes on both sides of the tailings dam.

A seepage interception dam is constructed downstream of the initial dam. This seepage interception dam is a compacted earth-rock structure with a crest elevation of 1,368.0 m ASL, a height of 12.0 m, and a crest width of 3.0 m. It is equipped with a geotextile layer and an HDPE geomembrane for seepage control. A spillway is constructed on the eastern shoulder of the seepage interception dam. Between the seepage interception dam and the initial dam, a return water pond with an approximate capacity of 23,000 m^3 has been established. A pump station is installed adjacent to the seepage interception dam to transfer collected seepage water to the emergency flood spillway pool of the No.1 TSF, where it is further utilized by the wastewater treatment plant.

Similar to the No.1 and No.2 TSFs, the No.3 TSF is equipped with comprehensive seepage control measures utilizing geotextile and HDPE geomembrane. Blind drainage ditches are installed both above and beneath the geomembrane at the bottom of the TSF. Within the stacking dam structure, embedded drainage materials and pipes are installed to discharge phreatic water from the dam and effectively lower the phreatic line.

The drainage pipes are connected to surface drainage ditches on the dam crest, which subsequently channel seepage water to the return water pond located downstream of the dam. Water from the No.3 TSF's return water pond flows by gravity through open channels and pipelines to the emergency flood spillway pool at the toe of the No.1 TSF's dam.

Artificial monitoring systems for displacement, phreatic line, and dry beach length have been installed on the tailings dam. Additionally, three groundwater quality monitoring wells have been established around the perimeter of the TSF.

Currently, the remaining storage capacity of the No.3 TSF is 1.09 million m^3, with a remaining service life of less than one year. Once the final dam height reaches the designed elevation of 58 m, the total remaining storage capacity will increase to 4.527 million m^3.

To expand storage capacity, Zeravshan LLC has proposed integrating the three TSFs into a single system once the No.3 TSF reaches a crest elevation of 1,447 m ASL. The combined TSF would then be further elevated to the final design elevation of 1,464 m ASL to accommodate the tailings storage requirements for the remaining life of the Taror mine. However, this proposal is still subject to a feasibility study.

10.11.2 Jilau TSF

Jilau TSF was originally a supporting facility of the Taror processing plant. It was built in the late 1980s, as a valley type TSF. The elevation of the TSF dam crest is originally designed at 1,260 m ASL. In 1995, Knight Piesold Consultants raised the dam to an elevation of 1,272 m ASL using the downstream construction method. In 1998, Knight Piesold Consultants further raised the dam to an elevation of 1,280 m ASL using the downstream construction method. Golder Associates conducted assessments on the TSF in 1999, 2000, 2003 and 2004, respectively. In 2002, the middle line method of dam construction was used to increase the dam height to an elevation of 1,290 m ASL (the dam height: 72.5 m), with total storage capacity reaching 16 million m^3. In 2013, CINF Engineering Co., Ltd. was appointed by Sino-Tajik Zeravshan Corporation Limited to carry out the TSF expansion by heightening the dam. A tailings stacking dam was built by the Changsha Institute using the upstream construction method. The dam was heightened to an elevation of 1,317 m ASL, with a total dam height of 99.5 m. The total storage capacity is 44.431 million m^3 and the effective storage capacity is 39.988 million m^3. At present, the remaining effective storage capacity is 7.74 million m^3. Calculated by an annual discharge of 3.3 million tons (2.23 million m^3) tailings, the remaining service life of the TSF is 3.47 years.

To heighten the dam and expand the capacity, auxiliary dams were built at two saddle backs with elevations below 1,317 m ASL. The No.1 auxiliary dam is located on the east side of the TSF, and roller-compacted rockfill method is adopted for dam building. It is 7 m high, 3 m wide at the crest and 100 m long along the axis of the dam. The No.2 auxiliary dam is located at the southeast corner of the TSF, and roller-compacted rockfill method is adopted for dam building. It is 5 m high, 3 m wide at the crest and 60 m long along the axis of the dam.

The TSF is classified as Class III, and the flood control standard used has considered once in every 500 year event. He flood draining facility of drainage chutes connected with drainpipes is adopted. Drainage chutes and drainpipes have circular reinforced concrete structures. The drainage chutes have a diameter of 1.2 m and a length of 250 m, with an inlet elevation of 1,285 m ASL. The drainpipes have a diameter of 1.2 m and a length of 570 m, with an outlet elevation of 1,270 m ASL. The outlet is connected to the water recycling tank. As tailings in the TSF increase, the drainage chutes are paved over.

Split flow of clean water and wastewater is adopted for seepage draining. Fishbone shape blind drains (with the structure of orifice tube and gravel, known as mattress type of drainpipes) are set under the impermeable layer at the bottom of TSF to collect groundwater. And then it is drained via a 150 mm-long drainpipe (corrugated pipe) to a water collection pool (clarification tank) downstream. Water seepage from tailings above the impermeable layer is collected in blind drain type of seepage collecting tank (filled with gravel). Collecting pipes with diameter of 400 mm and deep-well pump with lift of about 120 m are set for drainage. The deep-well pump is equipped with a switch with touch trigger. The pump can automatically drain the seepage when the water level rises to certain height.

A floating boat pumping station is set up in the clarification area, and the supernatant water is pumped back to the return water storage tanks of the Jilau processing plant as water for mineral processing production.

11 Workforce Assessment

11.1 Workforce Numbers

The organization structure of the Zeravshan LLC that is operating the Project includes a head office, Technical/ workers and Administration personnel. The number of employees of each ’Centre’ has been provided in Table 11-1 in details.

Table 11-1: Worker Force of Zaravshan

Centre	Admin. Personnel		Technical Personnel		Workers		Total	
	CN	TJ	CN	TJ	CN	TJ	CN	TJ
High level managerial personnel	11	2	-	-	-	-	11	2
GM Office	9	16	-	-	2	117	11	133
Planning and accounting dept.	4	15	-	-	-	-	4	15
Human resource dept.	2	9	-	-	-	1	2	10
Surveillance and Auditing dept.	1	2	-	-	-	-	1	2
Geology and mining dept.	2	6	1	4	-	22	3	32
Production technology dept.	2	19	2	14	-	111	4	144
Logistics dept.	5	37	-	-	-	67	5	104
Security and environmental protection dept.	3	7	2	6		38	5	51
Defend dept.	-	6	-	-	-	91		97
Construction dept.	1	18	2	-	-	80	3	98
Equipment and power dept.	3	20	2	17	-	270	5	307
Jilau Mine- Khirshona Mine	1	28	1	25	-	442	2	495
Taror Mine	2	33	1	26	-	480	3	539
No.1 ore processing plant	3	33	3	11	-	282	6	326
No. 2 ore processing plant	-	36	1	8	-	153	1	197
Heap leaching facility	-	6	-	-	-	34	-	40
Gold smelter	2	13	-	2	1	66	3	81
Copper smelter	3	6	8	1	9	130	20	137
Total	**54**	**312**	**23**	**114**	**12**	**2384**	**89**	**2810**

Note: CN- from China side; TJ – from Tajikistan side.

Among the 2,899 employees, there are 13 senior management personnel, and 11 of them are Chinese and 2 are Tajikistan. For other 2,886 personnel, 2,808 are Tajikistan mostly from the communities around the project area, and 78 are from China.

11.2 Working Schedules

For the production, the working schedule is 8 hours/ shift, 3 shifts/ day and 330 days/ year. There are four-shifts personnel ready, with one shift on standby.

The managemental and service personnel also work 24-hours/ 7 days per week, to serve the production, with adjustments according to the actual requirements of the mine production.

11.3 Assessment of Workforce

It is SRK’s opinion that the number of the employees and their compositions are reasonable. There are also sufficient manpower available around the project area.

12 Project Infrastructure

12.1 Electricity Supply

All the Project's electricity is supplied by the State Grid Corporation of Tajikistan. Ayni, a city in central Tajikistan, has a 220 kV substation, which is built from Khujand with a length of about 90 km. The transmission line is a single-circuit wire with a diameter of 400 mm. At present, this substation supplies power to the Panjakant area with a power supply voltage of 220 kV.

There is a 220 kV regional substation in Panjakant city, and the maximum power load during peak periods accounts for about 50% of the main transformer capacity. The power supply from this 220 kV regional substation of Panjakant to the 110 kV substation of Taror mining area and the 110 kV substation of the No. 2 processing plant is 110 kV, and the transmission line is about 20 km long with dual-circuit power supply and a diameter of 120 mm.

There are five substations within the project area, namely Taror 110 kV substation (located next to the company's office building), the 110 kV substation of the No. 2 Processing Plant, the 35/ 6 kV substation of Taror Mining Plant (riverside), the open pit 35/ 6 kV substation of Taror Mining Plant, and the 35/ 10/ 6 kV substation of Jilau Mining Plant.

The Taror 110 kV substation (located next to the company's office building) is mainly transformed into two 16 MVA, 110/ 35/ 10 KV on-load voltage regulating power transformers. The Taror 110 kV substation (located next to the company's office building) supplies power to Taror Mining Plant, the No. 1 Processing Plant and other units in the mining area with 35 kV and 10 kV voltage levels, respectively.

The No. 2 Processing Plant is equipped with a 110 kV substation, with two 31.5 MVA main power transformers, and the output voltage of the main transformer is 10 kV.

The 35/ 10/ 6 kV substation of Jilau Mining Plant is equipped with two TMH-2500 2,500 kVA and 35/ 6 kV transformers. The power supply is drawn from the Taror 110 kV substation via two 35 kV overhead lines on the same pole. The substation supplies power to all power sites in Jilau mining area via 6 kV overhead lines.

The 35/ 6 kV substation of Taror Mining Plant (riverside) is equipped with two TMH-4000 4,000 kVA,35/ 6 kV transformers. The power supply is drawn from Taror 110 kV substation via two 35 kV overhead lines on the same pole, passing through the 35/ 6 kV transformers and then outputting via 6 kV overhead lines to supply power to the office building, Taror Open Pit, and the surrounding power sites.

Zeravshan LLC. consumed 263.757 million kWh of electricity in 2024.

12.2 Water Supply

The water source of the Project is set on the right bank of Marcion River, which flows through the mining area. Marcion River is a mountainous river with a flow of 30 ~ 40 m^3/s during the rainy season from June to July, and 4-5 m^3/s during the dry season from January to February, which can meet the water needs for production and living. This water source is responsible for supplying fresh water for the No. 1 Processing Plant, the No. 2 Processing Plant, the office area and the living area. The company area has a relatively complete domestic water supply and drainage system.

The water source is equipped with eight water intake wells that each has a water flow of 120 m^3/ hour, two sets of water supply equipment and water supply lines:

One set of water supply system is used independently by the No. 2 Processing Plant. The river water is collected to the sump through four collecting wells. A water intake pump house (L×B×H=12×9×6m) is set up next to the sump. The configurations inside the pump house: two D450-60×9-level water pumps, one for use and the other for backup; flow Q=450 m^3/h; head H=540 m; power N=1,000 kW. The pressurized water is pumped to the new water head tank of the No. 2 Processing Plant through the D400 seamless steel pipes with a length of about 4.4 km.

The other set of water supply system is shared by the No. 1 Processing Plant, the office area, and the living area. The river water is collected to the sump through four collecting wells. A water intake pump house (L×B×H=9×6×6m) is set up next to the sump. The configurations inside the pump house: two D280-45×7-level water pumps, one for use and the other for backup; flow Q=280 m^3/h; head H=315 m; power N=355 kW. The pressurized water is pumped to the upper new water head tank of the No. 1 Processing Plant through the D273 seamless steel pipes with a length of about 5.7 km, and then flows from the head tank to each unit, office area and living area for use.

Zeravshan LLC. consumed 5.96 million m^3 of water in 2014.

The water used by the company comes from its own water source, which is free of charge. Only the electricity tariffs for pumping water are different. The production water is priced at the production electricity rate, and the domestic water is priced at the domestic electricity rate.

12.3 External and Internal Transportations

The Mine is connected to the main neighbouring cities - Panjakant, Ayni, Dushanbe, and Khujand, by asphalt roads, which are well maintained and in good condition.

Internal transportation: the internal access to the Mine is basically gravel road in good condition.

12.4 Office and Living Facilities

The Company's main office building is a four-story brick structure with a building area of 5,390 m^2, and the company's managers and administrative personnel all work there. In addition, three mining sites, two mineral processing plants, smelter, equipment power department, safety and environment department and infrastructure department all have their own separate offices there. The living facilities are described below.

1. **Canteen**

There are 7 canteens, all equipped with modern kitchen equipment and facilities. Among them, six canteens are for the Tajik staff (serving Tajikistan style meals), namely the canteen of Jilau Mining Site, the canteen of Taror Mining Site, the canteen of Equipment Power department, the canteen of Processing Plant No. 1, the canteen of Processing Plant No. 2, and the canteen of Administrative Office Building Centre.

There is one canteen for Chinese staff, located in the camp where Chinese staff live, which mainly serves Chinese style food.

2. Dormitory and Activity Room

The Company's Chinese camp covers an area of 60 hectares and has three dormitories for Chinese employees, with a total building area of 2,470 m^2. There are independent bathrooms indoors, and each room is uniformly equipped with an air conditioner, a bed, a closet and other necessary living facilities. There is a meeting room in the building, furnished with a projector and video equipment, which can meet the needs of life and office.

The Company has built an activity room in the Chinese camp with a billiard room, a table tennis room, various fitness equipment, a basketball court, a badminton court, and an outdoor soccer field.

13 Environmental Studies, Permitting, Social or Community Impact, and Occupational Health and Safety

13.1 Environmental, Social, and Occupational Health and Safety Review Objective

The objective of this review is to identify and verify the existing and potential Environmental, Social, and Occupational Health and Safety ("OHS") liabilities and risks and assess any associated proposed remediation measures for the Project.

13.2 Environmental and Social Review Process, Scope and Standards

The process for the verification of the environmental compliance and conformance for the Project comprised a review and inspection of the Project's environmental management performance against:

- Tajikistan national environmental regulatory requirements; and
- Equator Principles (World Bank/International Finance Corporation ("**IFC**") environmental and social standards and guidelines) and internationally recognised environmental management practices.

13.3 Status of Environmental Approvals and Permits

The following laws are adopted in Tajikistan to protect the environment and to provide sustainable natural resource management:

- Law on Environmental Protection
- Law on Animal World Conservation and Use
- Law on Mineral Resources
- Law on Air Protection
- Law on Natural Area of Preferential Protection
- Law on Energy
- Law on Plant Quarantine
- Law on Energy Saving
- Law on Production and Consumption Waste
- Law on Hydrometeorological Activities
- Law on Ecological Expertise
- Land Code
- Forest Code; and
- Water Code

An Environmental Impact Assessment report ("**EIA**") for the Project was submitted to the main State Environmental Expertise Committee in 2019 by the Company. The Company obtained the associated approval by this committee on 25 July 2019. In addition, another EIA was submitted in April 2024, and the approval was obtained on 1 May 2024. SRK sighted these EIA reports with the approvals.

The significant environmental and social aspects for the Project are associated with the mining, mineral processing, and smelting activities at the Project site. The environmental and social review identified the most significant current and potential environmental management and legislative compliance liabilities that relate to operation and further development of the Project and defined gaps in operational management as relates to industry best practices. The following sections identify the environmental and social aspects that have been addressed in the EIA reports mentioned above and other related documents, as well as those environmental and social aspects that have not been addressed.

13.4 Environmental Aspects

Site Ecological Assessment

The landform and topography in the Project's areas is commonly changed by mining, WRDs, TSFs, haul roads, office buildings and dormitories, and other ancillary facilities. The development of the Project may also result in impacts to or loss of flora and fauna habitat. If effective measures are not taken to manage and rehabilitate the disturbed areas, the surrounding land can become polluted and the land utilization function will be changed, causing an increase in water loss and soil erosion. The Company should determine the extent and significance of any potential impacts to flora and fauna habitat.

The EIA reports for the Project indicate that no rare or endangered flora and fauna were identified within the Project area. The feasibility study report also states the mining operation will have little impact on the ecological environment if the appropriate preventive measures are taken. The feasibility study report contains proposed measures for controlling and monitoring soil erosion and minimising loss of flora and fauna habitat. These proposed measures include water and soil conservation, geological hazard protection and ecological restoration.

SRK recommends baseline assessments along with predictions of potential impacts to floral and faunal communities in the surrounding area of influence be conducted to fully understand the Project's potential ecological environmental risk. In addition, SRK recommends a land disturbance and rehabilitation registry be developed for recording areas and extent of disturbances and remediation work that has been conducted to allow for effective rehabilitation planning to reduce the impact to the ecological environment.

Waste Rock and Tailings Management

The feasibility study report states that most of the waste rock mined out will be used as construction material. During the construction period, the waste rock will be stored on a designated surface and then transported by trucks to a construction material facilities. The feasibility study report also suggests making a full use of the waste rock and the waste rock will not have serious impact on the environment.

No sulphur levels have been provided for the waste rock, although it is stated in the feasibility study report that pyrite and pyrrhotite are present. There has been no comprehensive characterisation of the waste rock undertaken to determine the actual potential for acid generation. Therefore, there is some potential for small volumes of high sulphur/ potentially acid forming waste rock to be encountered throughout the life of project. It is noted that acid drainage can release naturally contained heavy metals in the surrounding environment, and it can cause heavy metal pollution to the surface water body, soil and groundwater. SRK recommends that a comprehensive waste rock characterisation program is required to fully define the risk for waste rock acid generation and to provide the basis for any required management of potentially acid forming material. Encapsulation of any potential acid forming material should be considered if the acid rock drainage is expected to impact the environment.

There are four TSFs for the Project, which are Taror No.1 and No. 2 TSF, newly expanded Taror No.3 TSF and Jilau TSF. Tailings are generated from the processing plants containing cyanide. However, the cyanide is not destroyed prior to being pumped to the TSFs. The Company has placed fences surrounding the TSFs to prevent the goats or cows from entering the TSF areas. It is noted that cyanide is lethal chemical to animals and human beings, and therefore, SRK opines that cyanide shall be destroyed in the processing plants before being sent to the TSF. In addition, the tailings have the same acid drainage issue as the waste rock, therefore a comprehensive geochemical characterisation is required. Limestone neutralization should be considered for the tailings if acid will be generated from the tailings. The Company placed vibration wire piezometers, inclinometers and displacement sensors in the various locations along the dams to monitor the safety performance, which is in compliance with international practice. During this site visit, SRK noted that some residents live in the potentially dam failure inundation area downstream, and SRK recommends that the Company set up limit boundaries to prevent the locals from moving into the area.

Water Management

The Company states that the water from the open pits is collected in sumps and pumped to a treatment plant for sedimentation treatment, and is used for dust suppression. Processing water and domestic wastewater is treated in various facilities.

Each processing plant has a sedimentation tank to treat and recycle processing water in the processing plant, in which overflow from the weirs is returned to the processing plant, and the thickened tailings on the bottom is pumped to the TSFs. Therefore, they can save a significant amount of water for the Project. In addition, the SART process plant is located near the Jilau TSF and Taror TSFs to recover copper and cyanide from cyanide solutions in the supernatant of the TSFs. It involves precipitating copper as a sulfide, acidifying the solution to release cyanide, and then recycling the recovered cyanide back into the gold leaching process. A significant amount of cyanide has been saved by this process. The treated water from the SART process is sent to the Jilau processing plant for reuse of the CIP process, but is not suitable for flotation process in Taror processing plant due to residual cyanide.

The Company states that all domestic wastewater on site is treated biologically with a facility and the treated wastewater is used for site irrigation. During this site visit, SRK notes that this facility is quite aged and may need sustainable maintenance. SRK recommends upgrading this facility with membrane bioreactors (MBR) technology, which is a proven technique by the market to ensure high quality treated wastewater after treatment for make-up water use in the processing plant.

No comprehensive groundwater and surface water quality monitoring program has been sighted for the Project. SRK recommends that quality monitoring be undertaken on the groundwater and surface water resources within the Project area (including upstream and downstream of the Project area), and also any site water discharges. This water quality monitoring should form part of a broader site environmental monitoring program. SRK also recommends the construction of an effective drainage system to divert run-off water from undisturbed areas around disturbed areas. In addition, some prevention measures, such as surface hardening, second containment facility and accident pool, are recommended to mitigate the water pollution risks.

Dust and Gas Emissions

The fugitive dust emission sources for the Project are mainly from blasting, mining, crushing, loading, waste rock storage and handling, and movement of vehicles and mobile equipment. SRK recommends the Project adopt the following dust and gas management measures:

- Water sprinkling for drilling, blasting, waste rock stockpile and industrial site
- Haul road maintenance and watering
- Speed limitation to the vehicles, and
- Conduct greening on site

SRK also recommends including ambient air quality monitoring as part of a site environmental monitoring program.

Noise Emissions

The main sources of noise emissions for the Project are blasting, rock drills, crushing, loaders, pumps, mobile equipment, air compressors, and other noise-making equipment and machinery. SRK recommends the Project implement the following noise management measures:

- Use of low-noise equipment
- Enclosures for noisy equipment
- Setup the speed limit for vehicles
- Optimization of the layout, and
- Install muffler on equipment

SRK also recommends including ambient noise monitoring as part of a site environmental monitoring program.

Hazardous Materials Management

Hazardous materials planned to be used during Project operations are processing reagents including cyanide, explosives, and a range of hydrocarbons. The Project's EIA reports do not include an assessment or measures for storage and handling of these materials. Dedicated storage areas for reagents, cyanide, and explosives should be constructed on site.

Explosives and detonators are stored in a secured magazine, and cyanide and other processing reagents are stored in a separate warehouse near the TSF with security and a video surveillance system. SRK notes that all hazardous material storage and handling facilities for the Project be constructed with secondary containment (i.e., lined and bunded areas) and in accordance with Tajikistan national environmental requirements and recognised international industry practices. However, SRK observed that waste oils were dumped into an unlined pit or burnt, which may pose a threat to the environment. SRK recommends correcting such an improper practice, and collecting the waste oils in tanks and send to a certified organization for recycling.

Site Closure Planning and Rehabilitation

There is currently no conceptual or operational closure planning process in place for the Project, but conceptual measures for closure have been prescribed within the EIA reports although they do not constitute a closure plan.

The recognised international industry practice for managing site closure and rehabilitation is to develop and implement an operational site closure and rehabilitation planning process and document this through an operational Closure and Rehabilitation Plan. This operational closure planning process generally includes the following components:

- Identify all site closure stakeholders (e.g. government, employees, community, etc.)
- Undertake stakeholder consultation to develop agreed site closure criteria and post operational land use
- Maintain records of stakeholder consultation
- Establish a site rehabilitation objective in line with the agreed post operational land use
- Describe/ define the site closure liabilities (i.e. determined against agreed closure criteria)
- Establish site closure management strategies and cost estimates (i.e. to address/reduce site closure liabilities)
- Establish a cost estimate and financial accrual process for site closure
- Describe the post site closure monitoring activities/program (i.e. to demonstrate compliance with the rehabilitation objective/closure criteria)

SRK suggests that conceptual rehabilitation measures stated in the Project's EIAs be followed and an operational closure planning process be developed and implemented for the Project in line with Tajikistan national legislative requirements and which incorporates recognised international industry practices.

13.5 Social Aspects

The land use for the general area surrounding the Project site is a mix of agricultural and pastoral activities. The Company stated that the population of the surrounding area is made up of predominately Tajiks and Uzbeks in the Project area. The Company also reported that there are no significant cultural heritage sites, cemeteries, or nature reserves within or surrounding any of the project site.

The Company stated they had received no official notices of public complaints in relation to the activities of the Project and that they maintained a positive relationship with the local communities. SRK notes that the positive effects to the surrounding local communities are mainly direct employment of local contractors and use of local suppliers and service providers where practical. In addition, the Company has made efforts on the social development measures amongst local communities including water and electricity supplies, schools, the development of local infrastructure, and the like. SRK visited the resettlement area 3 km southeast of Penjikent City, where 47 families impacted by the Taror No. 3 TSF expansion were relocated. Each family has been assigned a parcel of 600 m^2 with a budget of 400 k Tajikistani Somoni equivalent to USD38.6 k to build a house, which is a suitable amount of money for such a construction. In addition, this new resettlement area is closer to the Penjikent City for greater business or employment opportunities for better livelihood restoration. SRK recommends avoiding cash compensation to the residents, rather providing houses and furniture for these locals instead, and/ or moving assistance.

As part of this review, SRK has not sighted any documentation in relation to any actual or potential impacts of non-governmental organizations on the sustainability of this project.

13.6 Occupational Health and Safety

SRK has sighted the OHS management system and procedures, which provide the following summary in respect to the proposed OHS management measures for the Project:

- OHS administration
- Establishment of an emergency response plan
- Regular OHS training for relevant employees
- Safety and hazard signage
- Dust/ gases monitoring and control within the workplace
- Distribution of Personal Protective Equipment ("PPE") to all relevant employees
- Fire prevention and fire fighting
- Lightning strike prevention
- Mining, crushing, blasting and explosives handling
- Traffic management
- Waste rock disposal
- Sanitary provision
- Power provision, and
- Labour and supervision.

Table 13-1 summarizes the historical OHS incident records for the past four years. One incident happened on 7 October 2024 in the Jilau open pit area when a vice manager died after being hit by a caterpillar truck when he was on a blind spot. On 24 March 2023, two welders died in a fall from a crane basket, caused by broken cables during the construction of the POX plant. On 9 January 2023, one truck driver was hit and died by another truck in the Taror open pit when he tried to escape from his truck by jumping. Incident analysis reports for these injuries were provided to SRK for review. These reports analysed the cause of fatality/ injury and identified measures to prevent recurrences.

Table 13-1: Historical OHS Incident Records

2022 OHS Incident Statistics	2023 OHS Incident Statistics	2024 OHS Incident Statistics	2025 OHS Incident Statistics
Minor (0), serious (3), fatality (0)	Minor (2), serious (3), fatality (3)	Minor (7), serious (0), fatality (1)	Minor (0), serious (0), fatality (0)

SRK opines that the Company should make more efforts to train the employees and provide more frequent safety inspections in regard to the PPE for the employees and safe driving. It is noted that continuous retraining, real-time monitoring, and safety audits to address risks like equipment failures including fall protection equipment and safety driving for life are needed.

13.7 Evaluation of Environmental and Social Risks

The sources of inherent environmental and social risks are project activities that may result in potential environmental and social impacts. The environmental and social risks for the Project are:

- Impacts to the local ecological system due to significant land disturbance;
- Cyanide pollution from the TSFs;
- Heavy metal pollution from the WRDs and TSFs; and
- OHS training and inspection concerns.

The above risks are categorised as moderate/ tolerable risks (i.e., requiring risk management measures). It is SRK's opinion that these risks for the project can be generally managed if the Company makes efforts in solving the issues.

14 Capital Expenditures and Operating Expenses

14.1 Capital Expenditures

Historically Capex refer to those invested into the project that have been provided by the Company. SRK has summarized the Capex in following tables. The Capex includes the investment for the mining operations (Table 14-1), No.1 Processing Plant (Table 14-2), No. 2 Processing Plant (Table 14-3), as well as for the intangible assets (Table 14-5).

Table 14-1: Capex Invested for Mines (US$ in Thousand)

Item	Original Value
Communication facility	4,9
Officing and electronic equipment	1,356.5
Electricity system	16,125.6
Buildings	27,999.8
Machinery equipment	50,823.5
Structures and buildings	50,434.2
Fitment finish	24.8
Transportation facilities	4,839.5
Total	151,608.6

Table 14-2: Capex Invested for No. 1 Processing Plant (Taror) (US$ in Thousand)

Item	Original Value
Communication facility	6.8
Officing and electronic equipment	300.6
Electricity system	419.0
Buildings	910.5
Machinery equipment	12,542.2
Structures and buildings	20,514.5
Transportation facilities	3,610.4
Total	38,304.0

Table 14-3: Capex Invested for No. 2 Processing Plant (Jilau) (US$ in Thousand)

Item	Original Value
Communication facility	33.5
Officing and electronic equipment	35.8
Electricity system	6,238.4
Buildings	10,484.6
Machinery equipment	70,351.5
Structures and buildings	62,746.4
Fitment finish	1,2
Transportation facilities	7,554.9
Total	157,446.4

Table 14-4: Total Capex Invested for the Fixed Assets (US$ in Thousand)

Item	Original value
Communication facility	45.1
Officing and electronic equipment	1,692.9
Electricity system	22,783.0
Buildings	39,394.9

Item	Original value
Machinery equipment	133,717.3
Structures and buildings	133,695.1
Fitment finish	26.0
Transportation facilities	16,004.7
Total	**347,359.1**

Table 14-5: Total Capex Invested for the Intangible Assets (US$ in Thousand)

Item	Original Value
Software	331.2
Mining right of Jilau gold mine	2,534.2
Mining right of Taror gold mine	1,553.1
Mining right of Khirshona gold mine	2,908.8
Land using right	4,027.2
Total	**11,354.6**

From the tables above, it can be seen that the total Capex invested in the project includes about US$347.4 million for the fixed assets and about US$11.4 million for the intangible assets. In addition, there was Capex for the smelters and the Khirshona open pit mine. Table 14-6 provides the current value of each facility and intangible assets.

Table 14-6: Current Value of Capex Invested Assets (US$ in Thousand)

Item	Current Value
Copper Smelter	80,272
No. 1 Processing Plant (Taror)	32,727
No. 2 Processing Plant (Jilau)	25,237
Taror Open pit Mine	39,159
Jilau Open pit Mine	34,518
Khirshona Open pit Mine	1,547
Gold Smelter	3,419
Others	14,329
Total	**231,208**

SRK considers the Capex invested as sunk capital, while its net value is further used for depreciation and amortization.

Recently, the Company prepared a plan of further investments of US$76.8 million for technical improvement and some new projects. Table 14-7 summarizes the aspects of the technical improvements and new projects and the investment. SRK considers the new investment will be invested in the first four years (i.e. year 2025, 2026, 2027 and 2028). In addition, the Company also prepared a plan of further investments of US$ 24.7 million and US$ 9.8 million for the capitalisation of parts of stripped wastes in years 2025 and 2026 respectively to keep the strip ratio less than 25 t/t.

Table 14-7: Further Capex Needed According to Usage (US$ in Thousand)

Item	Amount
Engineering fee	**68,398**

Item	Amount
Geological	*481*
Mining	*7,600*
General layout	*2,464*
Tailings storage	*27,304*
No. 4 TSF	*30,549*
Other Engineering	**4,586**
Contingency	**3,836**
Total	**76,820**

The working capital needed for reaching the designed capacity is estimated at US$41.2 million in total, which will be invested in two years, i.e. US$37.4 Million in 2025, and US$3.8 Million in 2026. Table 14-8 gives the investment plan for the project.

Table 14-8: Further Investment Plan (US$ in Million)

Item	Unit	2024	2025	2026	2027	2028	Total
Sustaining Capex	US$ Million	231.2	12.0	5.0	29.3	30.5	308.0
Expansion Capex	US$ Million		24.7	9.8	-	-	34.5
Working capital	US$ Million		37.4	3.8	-	-	41.2

14.2 Operating Expenses

SRK was provided detailed data for the production and operating expenses in recent years. Table 14-9 summarizes the overall production data.

Table 14-9: Summary of the Production from 2022 to 2024 of the Project

Item	Unit	2022	2023	2024
Cash cost-mining	$	54,742,054	51,007,536	47,002,920
Cash cost- processing	$	66,688,479	64,314,745	91,086,982
Cash cost- supportive	$	35,410,289	26,360,194	13,209,222
Cash cost- smelter	$	2,864,394	15,020,358	58,181,331
Cash cost- sales	$	5,956,457	748,649	383,952

The cash operating costs in different production centres in 2022, 2023 and 2024 are given in Table 14-10.

Table 14-10: The Cash Operating Costs from 2022 to 2024 of the Project (USD)

Cost Centre	2022	2023	2024
Mining cost	54,742,054	59,280,933	63,653,152

Processing cost	69,552,873	79,335,103	149,268,313
Others	82,237,095	76,900,626	69,753,786
Cash operating cost	**206,532,022**	**215,516,662**	**282,675,251**

For the Opex of future production, the FS 2025 proposed the Opex as at Table 14-11.

Table 14-11: Summary of the Opex Proposed by FS 2025, and Used by SRK

Category	Cost Center	Unit	Amount (FS)	Amount (SRK)
Mining	Taror Mine	$/t ore	1.1	1.1
	Jilau Mine	$/t ore	1.4	1.4
	Khirshona Mine	$/t ore	1.4	1.4
Striping	Taror Mine	$/t waste	1.1	1.1
	Jilau Mine	$/t waste	1.4	1.4
	Khirshona Mine	$/t waste	1.4	1.4
Ore Processing	No. 1 Plant	$/t ore	34.13	34.13
	No. 2 Plant	$/t ore	9.18	9.18
Heap leaching	Heap leaching	$/t ore	1.91	1.91
Tailings water processing	Tailings processing	$/t copper	-	829
Gold smelter	Gold smelter	$/t ore	0.83	650

Supportive cost	Supportive cost	$/t ore	2.11	4.2
G & A	G & A	$/t ore	2.60	2.60
Sales cost	Sales cost	$/t ore	0.06	0.06

* Including the cost of purchasing concentrates

By comparing the Opex proposed in FS 2025 with the production data, SRK opines that the proposed Opex in FS 2025 is general reasonable and acceptable. SRK will use the Opex with some adjustments, also listed in the table.

The cash costs estimated for production centres over the mine life are show in Table 14-12.

Table 14-12: The Cash Operating Costs over the Life of Mine of the Project

Item	Unit	2025	2026	2027	2028	2029	2030	2031

15 Economic Analysis

15.1 Metal Prices

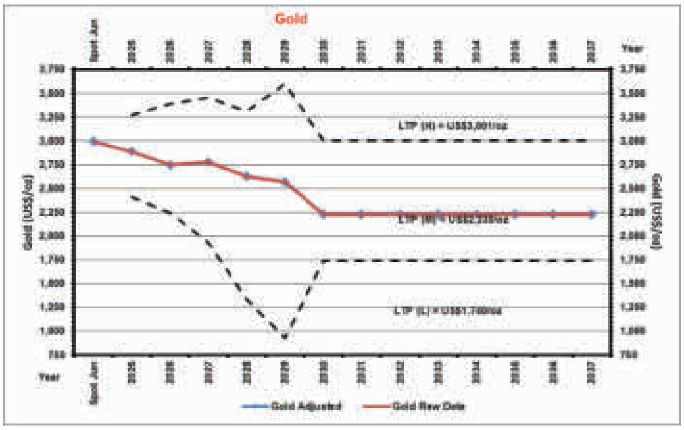
Valuable metallic elements for the project include; gold, silver and copper.

The historical gold price trend is shown in Figure 15-1. The price forecast of Consensus Market Forecast ("CMF") is shown in Figure 15-2.

Figure 15-1: Gold Price Trend in History

Sources: goldprice.org

Figure 15-2: Gold Price Forecast



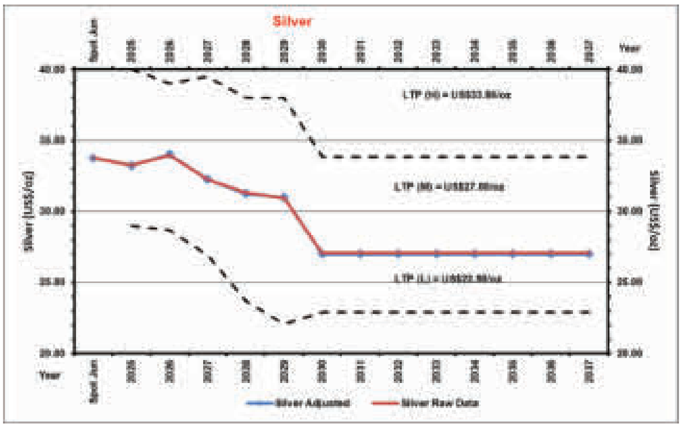
Sources: CMF on 17 March 2025

The historical silver price trend is shown in Figure 15-3. The silver forecast of CMF is shown in Figure 15-4.

Figure 15-3: Silver Price Trend in History

Sources: silverprice.org

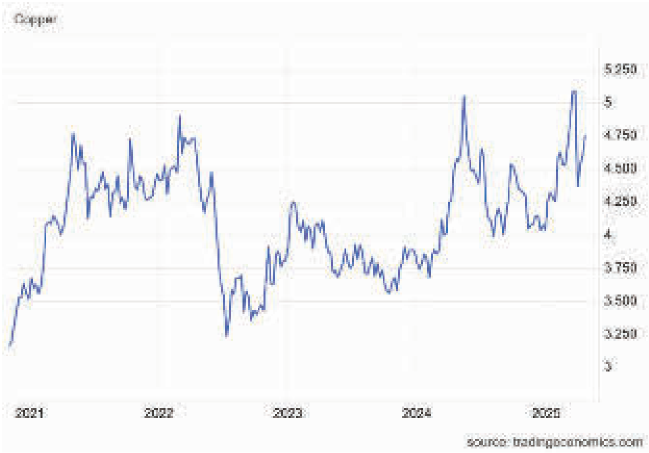
Figure 15-4: Silver Price Forecast



Sources: CMF on 17 March 2025

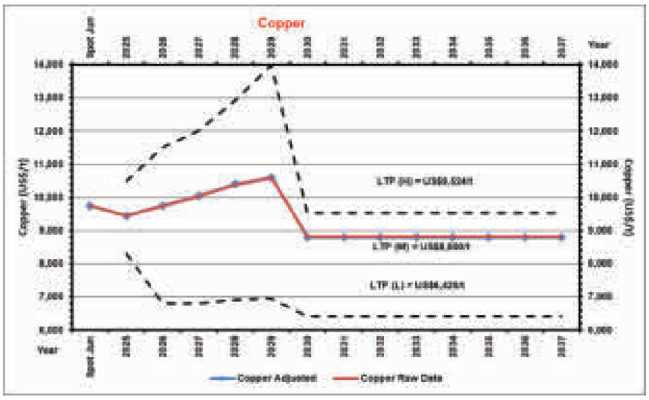
The historical copper price trend is shown in Figure 15-5. The copper forecast of CMF is shown in Figure 15-6.

Figure 15-5: Copper Price Trend in History



Sources: https://tradingeconomics.com/commodity/copper

Figure 15-6: Copper Price Forecast



Sources: CMF on 17 March 2025

Table 15-1 lists the prediction on prices of gold, silver and copper as used by SRK in the 2nd quarter of 2025, which is based on CMF predictions, considering various forecasts made by other professional institutions. Gold price predictions were updated by using latest data (see Appendix C).

Table 15-1: Forecasted Metal Prices by SRK in the 2nd Quarter of 2025

Metal	Unit	2025	2026	2027	2028	2029	2030	2031and After
Gold	US$/ oz	3016	3000	2800	2751	2500	2500	2,275
Gold	US$/ g	96.97	96.45	90.02	88.45	80.38	80.38	73.14
Silver	US$/ oz	33.25	34.00	32.25	31.25	31.00	27.00	27.00
Silver	US$/ g	1.07	1.09	1.04	1.00	1.00	0.87	0.87
Copper	US$/ t	9,450	9,750	10,050	10,400	10,600	8,800	8,800
Copper	US$/ lb	4.29	4.42	4.56	4.72	4.81	3.99	3.99

15.2 Sales Contracts

The Company provided SRK with existing contracts on purchase and sales, electricity supplies and transportation.

The gold doré bullions produced from the project will be sold to Tajikistan National Bank. SRK was provided with the sales/ purchase contract. The following are some key parameters from the contract:

- Gold purity: at least 999.5/ 1,000;
- Trade at the morning price of London Gold Exchanges on the trading day;
- Paid by Tajikistan currency at the exchange rate between US dollar and Tajikistan currency at the trading day;
- US$0.15/ oz will be charged for refinery, US$4.12/ oz will be charged for insurance and transportation, and the National Bank will charge 0.5% of the price for processing fee.

The silver doré bullions produced from the project will be sold to Chinese buyers. SRK was provided with the sales/ purchase contract. The followings are some key parameters from the contract:

- Silver purity: at least 99.9%;
- Trade price is based on CIP Shanghai port/ Warehouse BRINKS in Hong Kong;
- A deduction of Chinese RenMinBi Yuan (RMB) 90/ kg from the base price and 13% of value added tax (VAT) will be charged. The amount (RMB) = (base price – RMB90)/ (1+13%).

The copper cathodes produced from the project will be sold to Chinese buyers. SRK was provided with the sales/ purchase contract. The followings are some key parameters from the contract:

- Copper purity: at least 99.95%;
- The benchmark price is based on Shanghai Futures Exchange (SHFE);
- A deduction of RMB180/ t from the price benchmark and 13% of VAT will be charged. The amount (RMB) = (benchmark price – RMB180)/ (1+13%).

15.3 Tax Obligations

According to the data provide from the Company, SRK has summarized the taxes and other fees in Table 15-2.

Table 15-2: Main Taxes Obligations in Tajikistan

Item	Unit	Amount	Remarks
Income tax	%	18	On taxable income or 1% of revenue, whichever is larger.
Resource tax	%	6	Total value of metals mined in the ore
Tax for low grade	%	0.60	Total value of metals leached for the low grade
Vehicle use fee	US$'000/ a	78	
Property tax	US$'000/ a	958	
Land use tax	US$'000/ a	1,800	

Item	Unit	Amount	Remarks
Environmental fee	US$'000/ a	4,550	

15.4 Technical and Economic Analysis

It should be emphasised that the economic analysis presented in this section is based purely on the results of the technical review provided in previous sections together with some key assumptions. It is mainly provided for Ore Reserve estimation purposes as required by JORC Code.

15.4.1 Principal Assumptions

As discussed in previous sections, various technical and economic parameters have been reviewed. The discount cash flow ("DCF") model has been used in the economic analysis of the Project and the following simplifications and assumptions are made:

- The production rates are as planned on a yearly basis and ore quality are evenly distributed over a production year (average grades were used);
- The final products will be gold doré bullions, silver doré bullions and copper cathodes for Taror project and gold doré bullions doré bullions for Jilau project and Khirshona project;
- US dollar (US$) is used as the currency and inflation is not considered in the model (real-term model);
- Unit cash costs are also considered constants over the LoM; and the cash costs do not include depreciation and amortization;
- Product prices are based on the CMF forecasts for gold, silver and copper;
- The exchange rate between US$ and RMB is assumed be US$1 = RMB 7.20;
- Previous capital investment (sunk Capex) and newly investments have been considered as capital costs;
- The net value of the sunk Capex will be considered for depreciation and amortization; and the newly investment will be fully depreciated and amortized;
- The Capex will be depreciated and/ or amortized evenly over a 15-year period; and
- Discount rate of 10% will be used in base case, and the WACC assumptions are given in Table 15-3.

Table 15-3: Discount Rate Calculation (WACC Method)

Assumptions	Units	Value
Corporate Tax Rate	(%)	18.00%
Long Term Inflation	(%)	2.00%
Target Debt as a % of Capital	(%)	35.00%
Cost of Debt		
Pre-tax cost of debt - LT	(%)	5.22%
Less: tax shield	(%)	-0.94%

Assumptions	Units	Value
After-tax cost of debt	(%)	4.28%
Cost of Equity		
Risk-free rate	(%)	2.52%
Country Risk	(%)	1.70%
Beta-weighted market risk premium		
- Equity market risk premium	(%)	6.00%
- Proxy beta	(%)	0.97%
Estimated return of equity	(%)	10.04%
Project Risk Premium	(%)	6.50%
Cost of Equity	(%)	16.54%
Weighted Average Cost of Capital		
Debt		1.50%
Equity		10.75%
WACC (Nominal)		12.25%
WACC (Real)		10.05%

15.4.1 Summary of the Cash flow Projection

For the economic analysis of the Project, SRK adopted a DCF analysis based on assumptions and parameters as discussed in previous sections. The production schedules for the project have been discussed in previous chapters, Table 15-4 summarizes the mining and processing production schedules. Detailed cash flow projection has been given in Table 15-5.

Table 15-4: Production Schedules of Mining and Processing of the Project

15.4.2 Results of the Discount Cash flow Projection of the Project

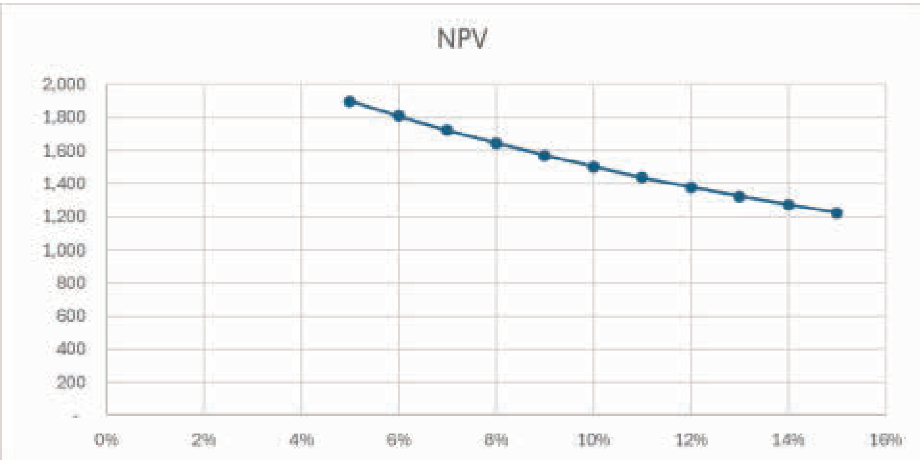
Table 15-6 below presents the NPV for the Project as calculated using SRK's DCF analysis. SRK estimated the NPV in a range of US$ 1.38 billion (at 12% discount rate) to US$ 1.64 billion (at 8% discount rate), with a base case of US$ 1.50 billion using a discount rate of 10%.

Figure 15-7 shows the NPV varies with the discount rate.

Table 15-6: NPV Projections

Item	Upper Case	Base Case	Lower Case
Discount Rate	8%	**10%**	12%
NPV (US$ billion)	1.64	**1.50**	1.38

Figure 15-7: NPV Vs Discount Rate



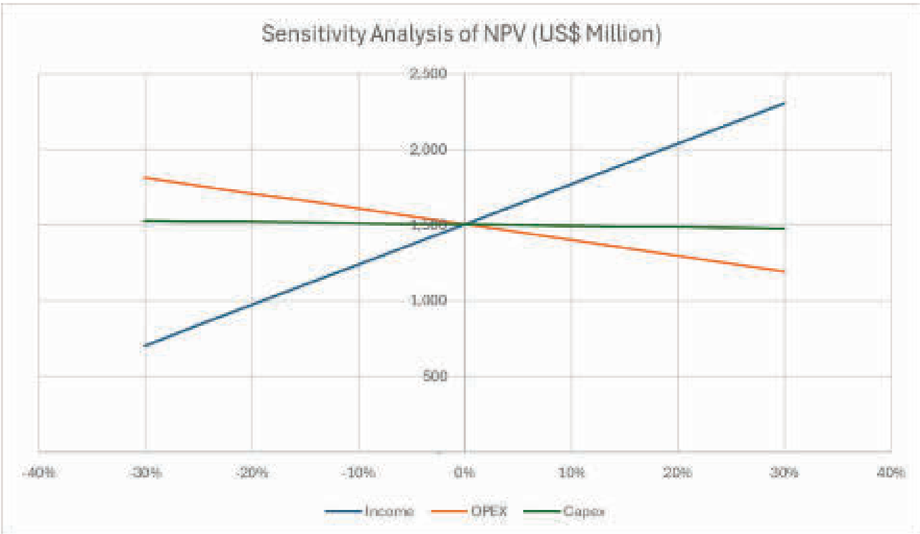
15.5 Sensitivity Analysis

SRK applied a single factor method for the sensitivity analysis. Many parameters can affect the Project's NPV. To simplify the calculations, and the products' prices or income, Opex, and Capex were selected as the essential variable factors on cash flow. The effects of these essential factors on the NPV were analysed within a ±30% range. The results are shown in Table 15-7 and Figure 15-8.

Table 15-7: Sensitivity Study of NPV (at 10% Discount Rate, in US$ Mln)

Changes	Income	Opex	Capex
30%	2,303	1,192	1,476
25%	2,169	1,244	1,481
20%	2,036	1,296	1,485
15%	1,903	1,347	1,490
10%	1,770	1,399	1,494
5%	1,636	1,451	1,499
0%	1,503	1,503	1,503
-5%	1,370	1,555	1,507
-10%	1,236	1,607	1,512
-15%	1,103	1,659	1,516
-20%	970	1,710	1,521
-25%	837	1,762	1,525
-30%	703	1,814	1,530

Figure 15-8: Univariate Sensitivity Analysis of NPV (10% Discount)



As shown in the Figure 15-8, changes in Opex have smaller effect on the Project's NPV than that of changes in income (prices), while the changes of Capex have less effect on NPV.

The analysis above shows that the project is economically viable, and the Ore Reserves statement can satisfy with the requirements of JORC Code guidelines.

16 Risk Assessment

This section presents risks that were identified and described in sections above. Risks have been classified from major to minor, defined as follows:

- **Major risk**: The factor poses an immediate danger of a failure which, if uncorrected, will have a material effect (>15% to 20%) on the project cash flow and performance and could potentially lead to project failure.
- **Moderate risk:** The factor, if uncorrected, could have a significant effect (10% to 15–20%) on the project cash flow and performance unless mitigated by some corrective action.
- **Minor risk:** The factor, if uncorrected, will have little or no effect (<10%) on project cash flow and performance.

In addition to the risk factor, the likelihood of risk must also be considered. Likelihood of occurrence within a 7-year timeframe can be considered as:

- likely: will probably occur.
- possible: may occur.
- unlikely: unlikely to occur.

Table 16-1: Risk assessment Matrix

Likelihood	Consequence		
	Minor	**Moderate**	**Major**
Likely	Medium	High	High
Possible	Low	Medium	High
Unlikely	Low	Low	Medium

SRK completed a risk assessment of the specific risks identified for the Zeravshan Project in relation to their likelihood of occurrence within the LoM and consequence in accordance with the listing rules of the Stock Exchange and the HKEx.

In general, the risk of a project decreases from exploration, through development, to the production stage. The Zeravshan Project is an advanced project.

SRK considered various technical aspects which may affect the feasibility and future cash flow of the Zeravshan Project. SRK's final Risk Assessment is presented in the following table.

Table 16-2: Risk Assessment for Zeravshan Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource & Ore Reserves			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Unlikely	Moderate	Low
Unexpected Groundwater Ingress	Possible	Moderate	High
Significant Unexpected Geological Faulting	Possible	Moderate	High
Mining			
Significant imbalance stripping ratio leading ore feed instability	Likely	Minor	Medium

Risk Source/Issue	Likelihood	Consequence	Risk
Unable to achieve ore plan due to lack of previously stripping	Possible	Moderate	Medium
Significant Geological Structure leading slope failure	Likely	Moderate	High
Unable to achieve mine plan due to lack of skilled labor or equipment	Unlikely	Moderate	Low
Bad WRD management leading mine plan failure	Unlikely	Moderate	Low
Poor Mine Plan leading production shortfalls	Possible	Moderate	Medium
Poor Road Transportation/Safety	Unlikely	Minor	Low
Processing and Metallurgy			
Process Adaptability	Unlikely	Moderate	Low
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Possible	Moderate	Moderate
Low Plant Reliability	Rarely	Moderate	Negligible
Environmental and Social			
Impact to the local ecological system due to the significant land disturbance	Possible	Moderate	Medium
Cyanide pollution from the TSFs	Possible	Moderate	Medium
Heavy metal pollution from the WRDs and TSFs	Possible	Moderate	Medium
OHS training and inspection concerns	Possible	Moderate	Medium
Capital and Operating Costs			
Project Timing Delay	Unlikely	Moderate	Low
Capital Cost Increases	Unlikely	Moderate	Low
Capital Costs- Ongoing	Unlikely	Moderate	Low
Operating Cost Underestimated	Possible	Moderate	Medium

17 Conclusions and Recommendations

17.1 Geology

The deposit type of Taror mine is typical Au-Cu-Ag-As polymetallic skarn deposit. Au-Cu-Ag-As enrichment occurs along the skarn rocks.

The deposit type of Jilau and Olympic mine and Khirshona mine is of hydrothermal deposit type. Au-W mineralisation develops along the joints and fractures.

17.2 QA/QC

SRK reviewed the QA/QC information, and conclude:

- The internal duplicates, CRMs and assay blanks' performances were generally acceptable.
- Coarse blanks are recommended to be applied in the sample stream before sending samples to laboratory to monitor the potential contamination during sample preparation.

17.3 Resource Estimation

SRK reviewed the databases of Taror project, Jilau project and Khirshona project, and modified the resource models accordingly. As of 31 December 2024, the Mineral Resources of the projects are:

- At a cut-off grade of 0.6 g/t Au, the Taror Mine is estimated to contain 10.59 Mt of Measured Mineral Resources with an average grade of 2.95 g/t Au, 13.11 g/t Ag, and 0.60 % Cu, containing 1,004 koz of Au, 138,764 kg of Ag, and 63,769 t of Cu, 7.45 Mt of Indicated Mineral Resources with an average grade of 2.67 g/t Au, 12.03 g/t Ag, and 0.49 % Cu, containing 641 koz of Au, 89,629 kg of Ag, and 36,810 t of Cu, and 3.50 Mt of Inferred Mineral Resources with an average grade of 2.19 g/t Au, 13.41 g/t Ag, and 0.54 % Cu, containing 246 koz of Au, 46,919 kg of Ag, and 18,860 t of Cu.
- At a cut-off grade of 0.2 g/t Au, the Jilau Mine is estimated to contain 22.67 Mt of Measured Mineral Resources with an average grade of 0.82 g/t Au, containing 598 koz of Au, 3.55 Mt of Indicated Mineral Resources with an average grade of 0.74g/t Au, containing 84 koz of Au, and 1.73 Mt of Inferred Mineral Resources with an average grade of 0.57g/t Au, containing 32 koz of Au.
- At a cut-off grade of 0.2 g/t Au, the Khirshona Mine is estimated to contain 15.19 Mt of Measured Mineral Resources with an average grade of 0.66 g/t Au, containing 322 koz of Au, 3.50 Mt of Indicated Mineral Resources with an average grade of 0.68 g/t Au, containing 76 koz of Au, and 2.88 Mt of Inferred Mineral Resources with an average grade of 0.39 g/t Au, containing 36 koz of Au.

17.4 Mining and Ore Reserves

17.4.1 Taror Mine

Taror Mine has been operating since 2001. It is currently run by ZRV as an open pit mine at a capacity of about 1.5 Mtpa feed ore. The total material movement could achieve at about 35 Mtpa.

Based on current Mineral Resource basis, SRK reviewed the mine plan and converted remained qualified Mineral Resources into Ore Reserves

As of 31 December 2024, the total Ore Reserves at the mine are as follows:

- Proved: 10.06 Mt grading 2.52 g/t Au, 12.80 g/t Ag, and 0.59 % Cu containing 29,553 kg of gold, 128,698 kg of silver, and 59,554 t of copper.
- Probable: 7.30 Mt grading 2.71 g/t Au, 11.63 g/t Ag, and 0.49 % Cu containing 19,805 kg of gold, 84,975 kg of silver, and 35,658 t of copper.
- Proved and Probable: 17.36 Mt grading 2.84 g/t Au, 12.31 g/t Ag, and 0.55 % Cu containing 49,358 kg of gold, 213,674 kg of silver, and 95,212 t of copper.

It should be noted that Zijin Xiamen has proposed a further expansion of the mine's planned processing capacity to 1.5 Mtpa of feed ore. Based on SRK's review of the mine schedule, the plan anticipates a peak total material movement (TMM) of 35 Mtpa, with this production rate sustained for approximately 7 years. SRK considers this projected life-of-mine schedule to represent high-intensity mining operations.

17.4.2 Jilau – Khirshona Mine

Jilau Mine has been operating since 2012 and the nearby (satellite) open pit Khirshona commenced in 2023. It is currently run by ZRV, with a TMM capacity of 35 Mtpa and the ROM is about 1.8-2.6 Mtpa feeding Jilau processing plant.

Based on current Mineral Resource basis, SRK reviewed the open pit optimization and converted remained qualified Mineral Resources into Ore Reserves.

As of 31 December 2024, the total Ore Reserves at the mine are as follows:

- Proved: 33.34 Mt grading 0.70 g/t Au, containing 23,364 kg of gold.
- Probable: 6.57 Mt grading 0.64 g/t Au, containing 4,211 kg of gold.
- Proved and Probable: 39.91 Mt grading 0.69 g/t Au, containing 27,575 kg of gold.

The Ore Reserves can support 6 years for Jilau LoM and 7 years for Khirshona LoM.

17.5 Processing and Metallurgy

- Zeravshan LLC has constructed and operates the Taror Processing Plant, Jilau Processing Plant, Heap leach plant, Copper Smelter, Gold Smelter, and Tailings Wastewater Treatment Plant. The company employs an integrated mineral processing and metallurgical process for a complete production chain. This production chain processes ores from the Taror, Jilau, Khirshona, and Olympic gold mines, achieving efficient recovery of gold, silver, and copper while maximizing resource utilization. The final products include gold bullion, silver bullion, and cathode copper. The Taror sulfide ore contains copper and arsenic, classifying it as a refractory gold ore. Using an integrated process that combines flotation, CIP, POX, SX-EW, and cyanidation, the company effectively addresses the challenges of processing refractory ores and achieves comprehensive recovery of copper and gold. Laboratory tests and operational practices have confirmed that this combined process is technically viable, well-suited for processing Taror ore, and highly adaptable to variations in ore characteristics.

- SRK recommends maintaining the routine monitoring of metal balance for each processing facility and further improving the company-wide metal balance management for Zeravshan LLC. Considering the varied characteristics of water usage and wastewater across production units, as well as the overlapping water utilization among units, SRK suggests establishing a comprehensive water balance system for the entire mining area (and all company operations) and enhancing overall water balance management.

17.6 Environmental and Social Risks

The sources of inherent environmental and social risks are project activities that may result in potential environmental and social impacts. The environmental and social risks for the Projects are:

- Impacts to the local ecological system due to significant land disturbance
- Cyanide pollution from the TSFs,
- Heavy metal pollution from the WRDs and TSFs; and
- OHS training and inspection concerns.

The above risks are categorised as moderate/ tolerable risks (i.e., requiring risk management measures). It is SRK's opinion that these risks for the Projects can be generally managed if the Company makes efforts to solve the issues.

17.7 Mine Economy

Previous Capex invested into the project has established the facilities of an operation for mining, ore processing and smelter to produce saleable doré bullions of gold and silver, and copper cathodes. For a life of mine of about 13 years, considering sustaining Capex the project will have a NPV of about USD1.50 billion at 10% discount predicted by using the DCF method. The overall average cash Opex is US$1,274/ oz gold. The all-in sustaining cost (AISC) is US$1,314 oz gold.

Closure

This report, Competent Person's Report of the Jilau and Taror Gold Projects in Sughd Region, Tajikistan, was prepared by

Dr Anson Xu, Corporate Consultant

and reviewed by

Dr. Yonglian Sun, Corporate Consultant

All data used as source material plus the text, tables, figures, and attachments of this document have been reviewed and prepared in accordance with generally accepted professional engineering and environmental practices.

Давлатали Саид

Appendix B JORC Code Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• After logging, the on-site geologist defined intervals to be sampled and recorded "cut from/ to" intervals in a sampling sheet kept on site. In general, only mineralised portions of the drill core was sampled for assaying including some samples of wall rocks. The core was manually cut in half lengthways using a saw splitter. • Geologists perform geological logging first then mark sample location to ensure sample representivity. • Geologists observe the drill core then mark cut line to ensure the core cutting is even.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Diamond drill rig models consist of Onram. All the boreholes commence at φ110-130mm and terminate at φ91mm.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Core recovery was calculated by drilling engineer by measuring core length vs drilling depth per run, then logged, photo'd and recorded in the database. • Decreased footage per run in fractured strata to ensure the core recovery is meet the requirement. • For the mineralisation zone is more fracture, the core recovery is relatively lower.

Criteria	JORC Code explanation	Commentary
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Most core was geologically and geotechnical logged, and simple hydrology observation was conducted for all new holes. • Logging is qualitative in nature; all cores were photographed. • The logging has provided adequate coverage of the full length of each sample the project.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Cores are sawn half through axis line. • All samples were crushed into size of not more than 2 mm in diameter by jaw crusher. After split by riffle splitter, half sample were pulverised by ring mill until more than 95% materials would pass through the 200mesh, which were then split by riffle splitter for assaying. • Each machine, sample pan, and work area were cleaned using compressed air between sample runs. • Sample grain size were calculated with the empirical formula to have appropriate representative.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Samples of Jilau-Olympic mine and Taror mine are assayed using fire with wet method. Samples of Khirshona mine are assayed using flame atomic absorption spectrometry method ("AAS"). • The main laboratory adopted their own internal quality control management systems. All samples delivered for assaying were inserted quality control/ QC samples including blank samples, Certificated Reference Materials (CRMs), internal duplicates and umpire check samples.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Mr. Shaobo Dai visited the site between 14th to 16th April. • No twin hole used. • Mr. Dai discussed with site geologists respond for geological logging, sampling and data management.

Criteria	JORC Code explanation	Commentary
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• RTK (Real - time kinematic) GPS was adopted to survey the drillhole location after the hole was completed. • The coordinate system of this Project is based on the UTM (WGS 1984 Datum) projection system. • RTK GPS is sufficient to provide accurate survey data to support geological modelling.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Not applicable for exploration results. • The drillhole spacing is sufficient to support Mineral Resource estimation and classification. • All data from the database containing the flagged raw sample intervals were composited to 1.0 m downhole lengths, with a minimum length of 0.5 m required to create a composite used for grade interpolation.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Most drill holes were almost vertical to the mineralisation. No material biased sampling result was recognised. • Not applicable to this project.
Sample security	• *The measures taken to ensure sample security.*	• Chain of custody was managed by site staff. geologists managed the process from sampling to sample delivery to preparation facility. All operational information was recorded, and each sample and assay have traceable record.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• A review of the sampling techniques and data was carried out by SRK as part of the Mineral Resource estimate and the database is considered to be sufficient quality to carry out the Mineral Resource estimation.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• The Zeravshan Project are located within Business Licence No. 6010000728, Mining Licences No. 0000047 and 0000046. • SRK have not independently verified the standing of the tenements.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• See Section 6.1.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The deposit type of Taror mine is typical Au-Cu-Ag-As polymetallic contact-metasomatic deposit formed by the interaction of intermediate-acidic magmatic rocks and carbonate rocks. Au-Cu-Ag-As enrichment occurs along the skarn rocks and breccia. • The deposit type of Jilau mine and Khirshona mine is of hydrothermal deposit type. Au mineralisation develops along the joints and fractures.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• SRK's estimation of the Mineral Resources documented in this report is informed by data from 5,562 drill holes/ trenches/ underground channel, for a combined length of 349,253.94 m. The boundary of the estimation is the Zeravshan Business Licence and Mining Licences.

Criteria	JORC Code explanation	Commentary
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• The main ore body outlier value samples has been capping. • For Zeravshan Project, all raw samples were composited to 1 m downhole lengths, with a minimum of 0.75 m for each composite sample. • No metal equivalents are reported.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• SRK was provided with the Surpac format orebody wireframes of all mineralized domains. SRK has reviewed the solid models provided by the client and they are acceptable for the Mineral Resource estimation.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Please refer to the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• No other exploration results for the project.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• SRK is not aware of any material or substantive exploration data that has not been reported.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• SRK suggests that further geological studies and mineability assessments (including metallurgical testing and preliminary economic evaluations) should be conducted to better define the potential of these mineralized material.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• SRK was provided with the Csv format tables and the Mdl format database of all drill holes/ trenches/ underground channel samples. SRK has reviewed the tables and database provided by the client and they are acceptable for the Mineral Resource estimation. • The data validation process involves: Setting restrictions in the database to ensure validation, such as checking for duplicate/ exact sampling intervals, ensuring sampling intervals do not exceed the maximum hole depth, validating geological codes, and addressing missing assays. Inspecting for errors in the import of Collar, Survey, and Assay data through a 3D view.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The site visit was conducted during 14 to18 April 2025.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Geological interpretation is based on information such as collar, survey, lithology, and assay data. It is also supported by surface geological mapping and trenching. • The mineralized domains were interpretated by the samples collected based on a cut-off grade of 0.2 g/t Au for the Jilau and Khirshona mine, a higher cut-off grade of 0.5 g/t Au was applied for the Taror mine. • The data used for the Mineral Resource estimation is derived from reliable exploration reports and laboratory analysis. • A total of 8 mineralized domains were constructed in the Zeravshan Project.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• Extrapolation was limited to approximately half of the level interval and the drill spacing. Internal interpolation was normally 80 m, with a maximum of 160 m.

Criteria	JORC Code explanation	Commentary
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	• A block size of 6 m easting by 6 m northing by 6 m elevation was used for the Jilau and Khirshona mine, and a block size of 5 m easting by 5 m northing by 5 m elevation was used for the Taror mine. The block model used the same coordinate system as that was used in data collection. • The Inverse Distance Weighting Cubed (IDW3) method was used for grade estimation via Surpac software in the block model. • Conduct three sets of search interpolations, employing a minimum of 3 and a maximum of 30 composite samples per block for grade interpolation, with the search radius progressively increasing from 20m or 40m to 120m or 160m. • SRK performed a thorough validation of the interpolation model results, which included visual examination and "Swath Plots" analysis.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• Specific gravity (SG) ore samples sealed and sent to the laboratory for both Au and SG analysis, the tonnages are estimated on a dry basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• A cut-off grade of 0.2 g/t Au for the Jilau and Khirshona mine, a higher cut-off grade of 0.6 g/t Au for the Taror mine was used to report the in situ Mineral Resources. This cut-off grade is estimated to be the minimum grade required for economic extraction at current prices.

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• For Zeravshan Project, open pit mining is adopted. • Mining factors have been applied to the Mineral Resource: – Mining Dilution of 4.60% for the Jilau mine, 2.73% for the Khirshona mine, 4.62% for the Taror mine. – Mining Loss of 3.60% for the Jilau mine, 3.72% for the Khirshona mine, 3.61% for the Taror mine.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• Taror sulfide ore is refractory to direct cyanidation, series of metallurgical tests were carried out to support the technological transformation of No. 1 processing. Flotation and tailings CIL process was adopted in the plant transformation. The plant products are Cu-Au-S bulk concentrate and gold loaded carbon. The plant performance agreed well with the metallurgical test results. production recoveries of gold, silver and copper are used for the resource estimation. • Sulfide ores of Jilau, Khirshona and Olympic mines are amenable to direction, CIL process is applied in the No.2 processing plant producing gold loaded carbon. The plant production recovery of gold is used for the resource estimation.
Environmen-tal factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• This is an operational mine site, and wase rock and tailings have been disposed of in waste rock dumps and tailings storage facilities. Please refer to the section 12.

Criteria	JORC Code explanation	Commentary
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The specific gravity values applied in the resource estimation were derived from average SG data provided by the client.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• Drillhole spacing distance was used as the basis for classification. • For Taror mine, SRK considers that blocks estimated with an average drillhole spacing of less than 20 m can be classified in the Measured Mineral Resource category and less than 40 m can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code guidelines for Mineral Resources and Ore Reserves. • For Jilau and Khriskhona, SRK considers that blocks estimated with an average drillhole spacing of less than 40 m can be classified in the Measured Mineral Resource category and less than 80 m can be classified in the Indicated Mineral Resource category within the meaning of JORC Code guidelines for Mineral Resources and Ore Reserves. • Blocks excluded by Indicated Mineral Resource category and within the mineralized domains should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters or to enable an evaluation of economic viability.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• The results was peer reviewed inside of SRK

Criteria	JORC Code explanation	Commentary
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• The tonnes and grades for the Indicated Mineral Resources are estimated to a certain acceptable level of confidence, based on the data density observed by the Competent Person. • The tonnes and grades for the Inferred Mineral Resources are estimated to a low-level confidence, as sparse data cannot support a precise estimation of the deposit. • SRK's Mineral Resource estimation is a global estimates.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• The Mineral Resource estimate was reviewed by SRK in-house geologist(s) which is the basis of Ore Reserve Estimate dated 31 December 2024 • Reported Mineral Resource is inclusive of potential Ore Reserve material.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• Mr. Falong Hu, the Competent Person for this Ore Reserve statement is a full-time employee of SRK Consulting (China) Ltd. Mr Falong Hu is Fellow of AusIMM. • Mr. Falong Hu and a team including geologist Dr. Anson Xu, Mr. Shaobo Dai; processing engineer Mr. Lanliang Niu; and environmental scientist Dr. Yuanhai Li, conducted the site visit from 14 to 18 April 2025.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• This project is an operating mine with 2 processing plants and 1 heap leach pad, fed from 3 open pits. • The Feasibility Study/ technical study was updated by Zijin Xiamen in 2025. • SRK reviewed technical studies, as well as the current mining plan and actual operation data, and supportive studies, the level of accuracy of the Modifying Factors proposed in the studies and/ or modified by the Company, are considered by SRK to be akin to a pre-feasibility level study ("PFS"), which are suitable for the Ore Reserve Estimates.

Criteria	JORC Code explanation	Commentary
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Due to the different mineralization type and applied different processing methodology to Taror or Jilau mines, different inputs for the Cut-off grade (COG) estimates were employed.

Item	Unit	Taror	Jilau	Khirshona	Description
Preferred COG	%	0.9	0.2	0.2	Round up to nearest 0.1
A	%	0.892	0.246	0.246	Estimated feed COG of Au
Cp	USD/t Feed Ore	31.0	8.9	8.9	Processing cash cost
Cg	USD/t Feed Ore	3.2	2.8	2.8	Total General & Administration cash cost, incl. sale expenses and transport cost
P	USD/oz	2,200	2,200	2,200	Forecast Au billion price, excl. VAT
Pa	%	81	99.7	99.7	Payable of the element
Rt	%	6	6	6	Royalty to revenue
Rc	USD/kg Gold	163	637.1	637.1	Refine cost
Pr	%	80.6	79.7	79.7	Processing recovery for Au in concentrate
Rr	%	89	92	92	Refine recovery for Au

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• The open pit mining method is applied to Taror, Jilau and Khirshona mines. The open pit optimization, detail design, scheduling processes were considered during the mine plan. • Zijin Xiamen optimized the open pit shell support the mine design review using Whittle program package. The optimized pit shell was generated using the Lerchs-Grossman 3D or Psuedoflow algorithm. The open pit design was guided by optimization parameters and input criteria before being manually refined by engineers. The inputs parameters have been reviewed. • The slope parameters were provided during the previously studied and not updated this time, The last geotechnical study was conducted by Changsha Institute of Mining Research Co., Ltd. in 2009. There were no material changes since the last study as reviewed by Zijin Xiamen in 2019 and 2025. The overall slope angle was in range of 41 to 45 degree in different open pit wall zones. • Based on reviewing the operational practices, SRK has applied mining dilution factors of 4.7% for the Taror Mine, 4.6% for the Jilau open pit, and 4.8% for the Khirshona open pit in the Ore Reserve estimates. • Based on operational practices, SRK has applied mining loss factors of 3.4% for the Taror Mine, 3.6% for the Jilau Pit, and 3.7% for the Khirshona open pit in the Ore Reserve estimates. • The minimum mining width is 35 meters. • End of month survey ("EOM") of 31 December 2024 is the latest data source for the cut-off date. • Inferred Mineral Resources are excluded during open pit shell generated nor in the Ore Reserves conversion. • All open pits are operating, and various facilities are well developed. All necessary mining infrastructure, such as the explosives magazine, mine drainage, and waste rock dump, is fully established. All necessary infrastructure accounted for to support mining operations

Criteria	JORC Code explanation	Commentary
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.* • *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Taror sulfide ore is refractory to direct cyanidation, series of metallurgical tests were carried out to support the technological transformation of No. 1 processing. Flotation and tailings CIL process was adopted in the plant transformation. The plant products are Cu-Au-S bulk concentrate and gold loaded carbon. The plant performance agreed well with the metallurgical test results. Production recoveries of gold, silver and copper are used for the Mineral Resource and Ore Reserve estimations. • Sulfide ores of Jilau, Khirshona and Olympic mines are amenable to direction cyanidation, CIL process is applied in the No.2 processing plant, producing gold loaded carbon. The plant production recovery of gold is used for the resource and reserve estimations. • The metallurgical complex of the project comprises No.1 processing plant, No.2 processing plant, a heap leach plant copper smelter, gold smelter and a cyanide tailings wastewater treatment plant, which forms a complete production chain. The final products are purified gold bullions, silver bullions and cathode copper. The historical production performances of project are used in the Mineral Resource and Ore Reserve estimations.
Environmen-tal	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• The Environmental Impact Assessment/ EIA report dated April 2024 with associated approval by the government dated May 2024 has been sighted by SRK. • The sources of inherent environmental and social risks are project activities that may result in potential environmental and social impacts. The environmental and social risks for the Project are: – Impacts to the local ecological system due to significant land disturbance; – Cyanide pollution from the TSFs; – Heavy metal pollution from the waste rock dumps and TSFs; and – OHS training and inspection concerns. • The above risks are categorised as moderate/ tolerable risks (i.e., requiring risk management measures). It is SRK's opinion that these risks for the project can be generally managed if the Company makes efforts in solving the issues.

Criteria	JORC Code explanation	Commentary
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• The Zeravshan Project is an operating project with well-established infrastructure, including road network, water supply, electricity supply, as well as supportive facilities for production.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• The invested/ Sunk Capex has established the production and supportive facilities, and the proposed sustaining Capex for technical upgrade and TSF expansions are reasonable • The historical production records on Opex have been reviewed and are the basis for future Opex estimates • The sales contracts and records have been reviewed, and show that the final products were saleable according to the contracts • Royalties or Resource taxes and other fees have been considered
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Sensitivity analysis has been conducted against the changes of production prices (or incomes), Opex and Capex. • The project has its own smelters, and can produce saleable gold and silver products, and copper cathodes in the market
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Tajikistan national bank will purchase the gold products, and silver and copper products will be sold to Chinese purchasers • The buy-sell relationship has been established solidly. The amount pf the products will not affect the market.

Criteria	JORC Code explanation	Commentary
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• The inputs to the economic analysis of the project include the production schedules of mining, ore processing and smelters, various Opex of different production centres. The Ore Reserve statements and mining production scheduling were estimated and arranged according to JORC Code guidelines. Discount cash flow method was used for the Project economic analysis. A discount rate of 10% was used as the base case, considering Tajikistan is a developing country. • At 10% discount, the project has a NPV of US$1.21 billion. The NPVs are US$1.12 billion and US$1.32 billion at 12% and 8% discount rate
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The Company obtained social licence via various communications, a corporate social responsibility program and a proper resettlement action. Please refer to section 12.5.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• The project has been operating project for many years. SRK was not aware of the risks on governmental permitting and approvals.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• Measured Mineral Resource in the mine blocks are classified as Proved Ore Reserves. Indicated Mineral Resource in the mine blocks are classified as Probable Ore Reserves. • The classification of Ore Reserves appropriately reflects the Competent Person's view of the deposits.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• The results was peer reviewed inside of SRK

Criteria	JORC Code explanation	Commentary
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Usually, the Ore Reserve estimate is reported on the basis of some technical and economic assumptions which have been understood well to date. These assumptions could change as time goes on, so different Ore Reserve can be produced • SRK considers the level of sampling work carried out by the client is sufficient for Proved and Probable Ore Reserves in accordance with the JORC Code • SRK expects that the future mining operations will allow the accuracy of both Mineral Resource and Ore Reserve estimates to be refined

Appendix C Details of Latest Gold Price Predictions

Appendix D Compliance with Chapter 18

Chapter 18				Sections in SRK's Report
18.01	**DEFINITIONS AND INTERPRETATION**			
18.02-18.04	**CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES**			
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.			
18.03	A Mineral Company must:—			
	(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—		3.1
		(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or	
			Note: 'control over a majority' means an interest greater than 50%.	
		(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which gives it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
	(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—		
		(a)	Indicated Resources; or	7.11
		(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
	(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—		14.2
		(a)	workforce employment;	
		(b)	consumables;	
		(c)	fuel, electricity, water and other services;	
		(d)	on and off-site administration;	
		(e)	environmental protection and monitoring;	
		(f)	transportation of workforce;	
		(g)	product marketing and transport;	
		(h)	non-income taxes, royalties and other governmental charges; and	
		(i)	contingency allowances;	
		Note:	*A Mineral Company must:* *• set out the components of cash operating costs separately by category;* *• explain the reason for any departure from the list of items to be included under cash operating costs; and* *• discuss any material cost items that should be highlighted to investors.*	
	(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—		14.1
		(a)	general, administrative and operating costs;	
		(b)	property holding costs; and	
		(c)	the cost of any proposed exploration and/or development; and	
		Note:	*Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest*	

Chapter 18				Sections in SRK's Report
			and loan repayments must be included.	
	(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has sufficient available working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.		
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.			
	Not e:	*A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.*		
18.05-18.08	**CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS**			
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—			
	(1)	a Competent Person's Report;		Whole report
	(2)	a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;		2.4
	(3)	the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;		3
	(4)	a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;		
	(5)	disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and		16
	(6)	if relevant and material to the Mineral Company's business operations, information on the following:—		
		(a)	project risks arising from environmental, social, and health and safety issues;	
		(b)	any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	
		(c)	compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	
		(d)	sufficient funding plans for remediation, rehabilitation and closure and removal of facilities in a sustainable manner;	
		(e)	environmental liabilities of its projects or properties;	

Chapter 18				Sections in SRK's Report
		(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	
		(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	
		(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	
18.06-18.08	***Additional disclosure requirements that apply to certain new applicant Mineral Companies***			
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.			14.2
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.			
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.			
18.09-18.13	**RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS**			**not applicable**
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—			
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;		
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;		
		Note: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.		
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and		
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.		
	Not e:	*Material liabilities that remain with the issuer on a disposal must also be discussed.*		
18.10-18.11	***Requirements that apply to listed issuers***			**not applicable**
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.			
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.			

Chapter 18		Sections in SRK's Report
18.12-18.13	***Requirements that apply to Mineral Companies and listed issuers***	**not applicable**
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.	
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.	
18.14-18.17	**CONTINUING OBLIGATIONS**	**not applicable**
18.14	***Disclosure in reports***	
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.	
18.15-18.17	***Publication of Resources and Reserves***	
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.	
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.	
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18.	
	Note: Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.	
18.18-18.27	**STATEMENTS ON RESOURCES AND/OR RESERVES**	
18.18	***Presentation of data***	
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.	7.11; 8.4
18.19	***Basis of evidence***	
18.19	All statements referring to Resources and/or Reserves:—	
	(1) in any new applicant listing document or circular relating to a Relevant Notifiable	Whole report

Chapter 18			Sections in SRK's Report
		Transaction must be substantiated in a Competent Person's Report which must form part of the document; and	
	(2)	in all other cases, must at least be substantiated by the issuer's internal experts.	
18.20	***Petroleum Competent Persons' Reports***		**not applicable**
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.		
18.21-18.22	***Competent Person***		
18.21	A Competent Person must:—		
	(1)	have a minimum of five years' experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	2.10
	(2)	be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	2.10
	(3)	take overall responsibility for the Competent Person's Report.	
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—		2.11
	(1)	have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2)	not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3)	in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4)	in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
18.23	***Additional requirements of Competent Evaluators***		**not applicable**
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—		
	(1)	have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2)	have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3)	hold all necessary licences.	
	Not e:	*A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.*	

Chapter 18				Sections in SRK's Report
18.24	***Scope of Competent Persons' Reports and Valuation Reports***			
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—			2.2
	(1)	be addressed to the Mineral Company or listed issuer;		2.1
	(2)	have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and		2.4
	(3)	set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.		2.2
18.25-18.26	***Disclaimers and Indemnities***			
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.			2.3
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.			2.9
18.27	***Obligations of sponsor***			
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.			
18.28-18.34	**REPORTING STANDARD**			
18.28-18.30	***Mineral reporting standard***			
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.			
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—			
	(1)	under:		
		(a)	the JORC Code;	2.2
		(b)	NI 43-101; or	
		(c)	the SAMREC Code,	
		as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		

Chapter 18				Sections in SRK's Report
	Note:	*The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.*		
18.30	A Mineral Company must ensure that:—			
	(1)	any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;		8; 9; 10; 11; 12; 13; 14
	(2)	estimates of mineral Reserves and mineral Resources are disclosed separately;		7.10; 7.11
	(3)	Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;		8
	(4)	for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—		15.1; 15.2
		(a)	the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	
		(b)	if a contract for future prices of mineral Reserves exists, the contract price is used; and	
	(5)	for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.		15.4; 15.5
18.31-18.33	***Petroleum reporting standard***			**not applicable**
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.			
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—			
	(1)	under PRMS as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		
	Note:	*A Reporting Standard applied to specific assets must be used consistently.*		
18.33	A Mineral Company must ensure that:—			
	(1)	where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;		8; 9
	(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;		15.4; 15.5

Chapter 18			Sections in SRK's Report
	(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	8; 9
	(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	15.1; 15.2
		Note: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.	
	(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
		Note: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.	
	(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
	(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	15.4
18.34	***Mineral or Petroleum Asset Valuation Reports***		**not applicable**
18.34	A Mineral Company must ensure that:—		
	(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
	(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
	(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
	(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

Appendix E Chapter 2.6 of the Guide for New Listing Applicants

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	7.10; 7.11; 7.12; 8
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	**N/A**
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	Yes
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	4.1
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	8; 9
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	10; 15.4
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/ oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	**N/A**
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	16

Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

Term / Abbreviation	Meaning / Definition
%	per cent
°	degree, angle of inclination
°C	degrees of temperature
3D	Three-dimensional
AAS	atomic absorption spectrometry
AIG	Australian Institute of Geoscientists
AISC	all-in sustaining cost, including the operating cost and sustaining capital cost
ALS Lab	ALS Mineral Laboratory
Altynken LLC	Altynken Limited Liability Company (奥同克有限责任公司)
ARD	Acid rock drainage
ASL	above sea level
Au	the element symbol of gold
AusIMM	Australasian Institute of Mining and Metallurgy
Capex	capital expenditure(s)
Central Laboratory	State Agency for Geology and Mineral Resource of Kyrgyz Republic
CIL	carbon-in-leach
CIT	corporate income tax
cm	centimetres
CoG	cut-off grade
Company	Zijin Gold International Company Limited
CPR	Competent Person's Report
DCF	discounted cash flow
E	East
EIA	Environmental Impact Assessment
EPMP	Environmental Protection and Management Plan
FAusIMM	Fellow of the Australasian Institute of Mining and Metallurgy
Exploration Results	Data and information generated by mineral exploration programs that might be of use to investors, but which do not form part of a declaration of Mineral Resources or Ore Reserves
Exploration Target	A statement or estimate of the exploration potential of a mineral deposit in a defined geological setting where the statement or estimate, quoted as a range of tonnes and a range of grade (or quality), relates to mineralisation for which there has been insufficient exploration to estimate a Mineral Resources
FS or Feasibility Study	A Feasibility Study is a comprehensive technical and economic study of the selected development option for a mineral project that includes appropriately detailed assessments of applicable Modifying Factors together with any other relevant operational factors and detailed financial analysis that are necessary to demonstrate at the time of reporting that extraction is reasonably justified (economically mineable). The results of the study may reasonably serve as the basis for a final decision by a proponent or financial institution to proceed with, or finance, the development of the project. The confidence level of the study will be higher than that of a Pre-Feasibility Study
FY	financial year
G&A	general and administration
g	gram
g/cm^3	gram(s) per cubic centimetre
g/t	gram per tonne

Term / Abbreviation	Meaning / Definition
ha	hectare(s)
HKEX	Hong Kong Exchanges and Clearing Ltd
IDW	inverse distance squared
Indicated Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit
Inferred Mineral Resource	That part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
JORC Code	2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves prepared by the Joint Ore Reserves Committee of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
JORC	Joint Ore Reserves Committee
kg	kilogram, equivalent to 1,000 grams
km	kilometres, equivalent to 1,000 metres
km^2	square kilometres
kt	thousand tonnes
ktpa	thousand tonnes per annum
kV	kilovolts, equivalent to 1,000 volts
kVA	kilovolt ampers
kW	kilowatt, equivalent to 1,000 watts
kWh	kilowatt hours
Kyrgyz Gold	Kyrgyz Gold Company Ltd
Kyrgyzstan	Kyrgyz Republic
L	litres
Li	the element symbol of lithium
LHD	load-haul-dump
L/s	litres per second
LoM	life-of-mine
M	million
m	metres
m^2	square metre
m^3	cubic metre
MAusIMM	member of the Australasian Institute of Mining and Metallurgy
m ASL	metres above sea level
Measured Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit.
Mineral Resource	A concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.
ML	megalitres (million metres); Mining Licence
mm	millimetres(s)
MRE	Mineral Resource estimate

Term / Abbreviation	Meaning / Definition
Mt	million tonnes
Mtpa	million tonnes per annum
MW	megawatts
MWh	megawatts hours
NPV	net present values
NSR	net smelter return
O.K.	Ordinary Kriging
Opex	operating expenditure(s)/cost(s)
Ore Reserve	The economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified
ORM	Ore Reserves Model
PFS	A Preliminary Feasibility Study (Pre-Feasibility Study) is a comprehensive study of a range of options for the technical and economic viability of a mineral project that has advanced to a stage where a preferred mining method, in the case of underground mining, or the pit configuration, in the case of an open pit, is established and an effective method of mineral processing is determined. It includes a financial analysis based on reasonable assumptions on the Modifying Factors and the evaluation of any other relevant factors which are sufficient for a Competent Person, acting reasonably, to determine if all or part of the Mineral Resources may be converted to an Ore Reserve at the time of reporting. A Pre-Feasibility Study is at a lower confidence level than a Feasibility Study
PPE	Personal protective equipment
Probable Ore Reserve	the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve
Proved Ore Reserve	the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors
QA/QC	quality assurance/quality control
RC	reverse circulation
ROM	run-of-mine
RPEEE	reasonable prospects for eventual economic extraction
S	South, also the element symbol of sulphur
SG	specific gravity
SRK	SRK Consulting China Ltd
SEHK or Stock Exchange	The Stock Exchange of Hong Kong Limited, a wholly-owned subsidiary of Hong Kong Exchanges and Clearing Limited ("**HKEX**")
Summer Gold	Summer Gold (Kazakhstan) Limited Liability Partnership
Superb Pacific	Superb Pacific Limited Company (Hongkong)
t	tonnes
t/d or tpd	tonnes per day
t/m^3	tonnes per cubic metre
the *Listing Rules*	The Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited
TSF	tailings storage facilities
US$	United States dollar
VALMIN Code	2015 edition of the Australasian Code for the Public Reporting of Technical Assessments and Valuations of Mineral Assets.
WRD	waste rock dump
VAT	value-added tax
Zijin Gold International	Zijin Gold International Company Limited(紫金黄金国际有限公司)
Zijin Mining	Zijin Mining Group Company Limited (紫金矿业集团股份有限公司)

Executive Summary

Introduction

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Limited ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of the Taldybulak Levoberezhny Gold Project ("**Levoberezhny Project**" or the "**Project**") which is located in Kemin Region, Chuy Province, Kyrgyz Republic ("**Kyrgyzstan**").

The Levoberezhny Project includes the Taldybulak Levoberezhny Underground Gold Mine ("**Levoberezhny Mine**") and associated ore processing and metallurgical plant ("**Levoberezhny Plant**"). It is operated by the Altynken Limited Liability Company ("**Altynken LLC**"), a subsidiary company of Zijin Mining Group Company Ltd ("**Zijin Mining**"). Zijin Gold International is wholly owned by Zijin Mining.

It is SRK's understanding that the independent technical assessment on the Levoberezhny Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of Zijin Gold International on the Main Board of The Stock Exchange of Hong Kong Limited (the "**SEHK**" or "**Stock Exchange**"), a wholly-owned subsidiary of Hong Kong Exchanges and Clearing Limited ("**HKEX**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "***JORC Code***") and in accordance with the *Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited* (the "***Listing Rules***") including the *Chapter 18* requirements and other relevant regulations of HKEX.

This Report does not express an opinion as to the value of mineral or other assets involved.

Summary of Principal Objectives

The principal objective of this Report is to provide Zijin Gold International and potential equity investors and future shareholders of Zijin Gold International with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserves, mining methodologies, processing and metallurgical technologies, environmental and social aspects, and etc. of the Levoberezhny Project based on all available technical data, as of the Effective Date of this report. It is understood that the aim of this Report will be used by Zijin Gold International for the proposed listing on SEHK.

Outline of Work Programme

The work program for the Levoberezhny Project consisted of:

- review of dataset and Mineral Resource models provided by Altynken LLC and Zijin Gold International, and preparation of data verification plan which will be conducted during the site inspection;
- a site visit between 12 and 16 April 2025, to the Levoberezhny Project, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities (flotation and cyanidation) ("**TSFs**"), water source and power supply station, the office and living areas, and other infrastructure, etc.;

- review of all available documents, including operating licences and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.;
- discussion with Altynken LLC and Zijin Gold International management and technical personnel, as well as the professionals of Zijin (Xiamen) Engineering Co., Ltd ("**Zijin Xiamen**"), who conducted either the geology and exploration or the *Feasibility Study Report on the Mining, Processing and Metallurgy Engineering at Taldybulak Levoberezhny Gold Mine* (《塔尔德布拉克左岸金矿采选冶工程可行性研究报告》, the "***FS 2025***") on the Levoberezhny Project;
- preparation of a draft report in accordance with the *JORC Code* guidelines and the requirements of the *Chapter 18* and other regulations of the HKEX (the Mineral Resources and Ore Reserves were reported as of 31 December 2024); and
- submission of the draft to Zijin Gold International and Altynken LLC and the related third party for comments and finalise the draft based on the feedback.

Results

Overall

The Levoberezhny Project is located approximately 120 kilometres ("**km**") east of Bishkek, the capital city of Kyrgyzstan, and is under the administrative jurisdiction of Kemin Region, Chuy Province. All properties including the Levoberezhny Mine and Levoberezhny Plant and other supporting facilities are about 12 km south of the Orlovka town, or 26 km southeast of the Kemin railway station. Access to these properties is easy via paved roads.

The Levoberezhny Project is an operating underground gold mine, with one mining licence (No. 471AE) covering an area of 98.0 hectares ("**ha**") or 0.98 square kilometres ("**km^2**"). The Levoberezhny Project is wholly owned and operated by Altynken LLC, a joint venture company of Summer Gold (Kazakhstan) Limited Liability Partnership ("**Summer Gold**") and Kyrgyz Gold Company Ltd ("**Kyrgyz Gold**").

Currently, Altynken LLC is 60 per cent ("**%**") owned by Zijin Mining Group Company Ltd ("**Zijin Mining**") through Superb Pacific Limited Company (Hongkong) ("**Superb Pacific**") and 40% owned by Kyrgyz Gold, respectively. The Superb Pacific is a company incorporated in the British Virgin Islands with limited liability and a wholly-owned subsidiary of Zijin Mining, holds the Altynken LLC 60% from Summer Gold. Zijin Gold International is wholly owned by Zijin Mining.

The production capacity and status of the Levoberezhny Mine and the Levoberezhny Plant are listed in Table ES-1.

Table ES-1: Details of the Levoberezhny Mine and Associated Processing and Plant

Company	Mine/Plant	Products	Unit	Production Capacity		Status
				Designed [1]	2024 actual [2]	
Altynken LLC	Levoberezhny Mine	Raw Ore	tpa	924,000	972,260	Production
	Levoberezhny Plant	Raw Ore	tpa	924,000	990,200	Production
		Concentrate	tpa	29,463	34,521	Production
		Gold Bullion	kg/a	457.32	551.33	Production

Sources: Altynken LLC

Notes:

[1] Designed mining and processing capacity refers to the production scale proposed in the *FS 2025*.

[2] Actual mining and processing capacity refers to the production scale that the Levoberezhny Project can achieve.

Both Levoberezhny Mine and Levoberezhny Plant are relatively integrated and well managed operations, and the operating standards generally follow the Kyrgyzstan national mining industrial practice.

Based on a reasonable cut-off grade ("**CoG**") of gold ("**Au**"), SRK has estimated the Mineral Resources and Ore Reserves for the Levoberezhny Project. As of 31 December 2024, the Mineral Resources and Ore Reserves of the Levoberezhny Project, as per the *JORC Code* guidelines were listed in Table ES-2.

Table ES-2: Mineral Resource and Ore Reserve Statement for the Levoberezhny Project as of 31 December 2024 by SRK Consulting China Ltd

Category	Cut-off Grade (Au g/t)	Tonnes (Mt)	Au (g/t)	Au (kg)	Au (koz)
		Mineral Resources [1, 2, 3]			
Measured		2.1	4.0	8,400	270
Indicated		9.2	3.7	34,000	1,100
Measured + Indicated	1.3	**11.3**	**3.7**	**42,400**	**1,370**
Inferred		3.1	4.8	10,500	340
Total		**14.4**	**3.7**	**52,900**	1,700
		Ore Reserves [4, 5, 6, 7, 8]			
Proved		1.3	4.0	5,200	170
Probable	2.0	6.3	3.6	23,000	740
Total		**7.6**	**3.7**	**28,000**	**910**

Sources: SRK

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr Liu is a Member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "*Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves*", the *JORC Code*. Mr Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported inclusive of Ore Reserves.

[4] The information in this report which relates to Ore Reserve is based on information compiled by Mr Yonggang Wu, MAusIMM, and Dr Yiefei Jia, FAusIMM (CP. Geo), who are full time employees of SRK Consulting China Ltd. Both Dr Jia and Mr Wu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Person as defined in the 2012 edition of the "*Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves*", the *JORC Code*. Dr Jia and Mr Wu consent to the reporting of this information in the form and context in which it appears.

[5] Number was rounded to the second significant figure to reflect the uncertainties in estimate.

[6] Total may not add due to rounding discrepancies

[7] Mining dilution rate, including waste rock and Inferred Mineral Resources, is 8.2%. Mining loss rate is 7.4%.

[8] The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

The Levoberezhny Mine is developed as an underground mine. The mine development system includes the main decline, shaft and adit. The overhand drift and fill is used as the mining method with the mining loss rate of 7.4% and mining dilution rate of 8.2%.

Based on the production schedule for the Levoberezhny Project, over its remaining mine life, life of mine ("**LoM**") is 9 years, the total sustaining Capex are about United States Dollars ("**US$**") 104.9 million, and the total forecasted Opex are about US$1,308.0 million.

SRK estimated the Levoberezhny Project's net present value ("**NPV**") using the discount cashflow method. At a discount rate of 8%, the NPV for the Levoberezhny Project is about US$549 million.

Operational Licences and Permits

The Levoberezhny Project currently holds the necessary operation licences such as the air emission permit, solid waste emission permit, and land use permit.

Geology and Mineralogy

Tectonically, the Levoberezhny Project is located in the Early Palaeozoic Jelskoy Island arc chain in the Northern Tianshan of Kyrgyzstan, and it lies within the Tianshan metallogenic belt, a key gold-producing region in Central Asia, known for its complex geological history. The region's geology is defined by Precambrian basement rocks overprinted by the Caledonian-Hercynian and later tectonic events, influenced by dominant northwest-west ("**NWW**") fracture systems.

The Cenozoic mountain-building processes have created folds, faults, anticlines, and graben structures, while widespread medium-to-acidic granitoid intrusions, controlled by fracture zones, play a critical role in mineralisation. This dynamic tectonic and magmatic history has shaped the distribution of gold deposits and established the region as a vital component of the Central Asian metallogenic belt.

The Levoberezhny gold deposit exhibits complex geology marked by diverse stratigraphy, structures, igneous activity, and extensive metamorphic alterations. The exposed stratigraphy consists of the Neoproterozoic to Cambrian schists, amphibolites, and gneisses, with pervasive metasomatism forming hybrid rocks over 2,000 metres ("**m**") thick. Gold mineralisation is closely related to intense tectonic hydrothermal events, particularly the Caledonian-age metasomatism.

The structural framework is dominated by northwest ("**NW**")-oriented composite anticlines and ductile shear zones, with the Taldybulak ductile shear zone acting as the key ore-controlling structure. This shear zone hosts interlayer deformation zones where a series of gold deposits are developed.

Magmatic activity was significant, featuring dykes of diorite, monzonite porphyry, and felsite intrusions. Extensive host rock alterations include silicification, tourmalinisation, and carbonatisation, strongly associated with gold mineralisation.

The Levoberezhny gold deposit displays a fan-shaped planar distribution with mineralised zones primarily oriented NW-NNW, dipping gently to the southwest. The mineralised zone extends approximately 1,300 m in length and hosts 12 main mineralised zones, with primary mining targets categorised as C1, C2, and C100 domains. The geometries of the mineralised zones vary, including lenticular, columnar, stratiform, and tubular forms, with grades generally higher in central zones.

The ore minerals are natural Au and silver ("**Ag**"), pyrite, chalcopyrite, arsenopyrite, zoisite, galena, natural bismuth and plagioclase bismuth. The gangue minerals are mainly quartz, muscovite/sericite, carbonate, tourmaline, chlorite, barite and apatite.

The ore structure is characterised by sparse disseminated, disseminated and fine veinlets disseminated textures according to the distribution of sulphides, and the mineral structure is mainly massive structure.

The main useful element is Au. The other elements that can be comprehensively recovered are Ag (6-30 grams per tonne ("**g/t**")) and copper (0.01-0.6%)). The remained elements, such as bismuth (0.001-0.01)%, lead (0.007-0.11%), zinc (0.001-0.04%) and tin (0.001-0.012%) have too low grades to be economically recovered. The deleterious element is mainly arsenic (0.004-0.15%) in the form of arsenopyrite.

Exploration, Sampling, Analytical Procedures and Quality Assurance and Quality Control

The Levoberezhny Project area has been systematically explored by various geological brigades since 1963.

As of 31 December 2024, a total of 1,056 diamond drillholes with an aggregate length of approximately 253,938 m, and a total of 14,181 exploration tunnels/ adits and crosscuts with an aggregate length of about 175,421 m have been completed at the Levoberezhny gold deposit. The collars of drillholes were properly surveyed. The down-hole surveys were undertaken at approximately a 100 m interval for vertical boreholes and a 50 m interval for inclined boreholes. The drilling core recoveries were measured daily by geologists. The recovery rates for all cores varied from 91.1% to 100.0% with an average of 98.4%, and for all mineralised drilling cores varied from 86.7% to 100.0% with an average of 98.3%. In SRK's opinion, this is acceptable for reporting a Mineral Resource.

The drilling core was stored in core trays, and the core trays were clearly marked with box and hole numbers with starting and ending depths. It was then transported to the core warehouse, where the preliminary logging was carried out by a geologist to record various aspects including weathering, texture, lithology, alteration and structure. After logging, all the core was digitally photographed. Samples were taken from halves of drill cores by a saw splitter and each sample was generally taken at the 1 – 2 m long sampling interval along the mineralised cores. The samples were placed in sample bags labelled with appropriate tags, and the remaining core halves were stored in boxes and re-organised for long-term storage at the core warehouse. Tunnel samples were taken by channelling method, and each sample was about 2 m long.

All samples collected from the Levoberezhny gold deposit were prepared and analysed by the Stewart Assay and Environmental Laboratory LLC ("**Stewart Laboratory**"). The Kyrgyzaltyn Central Research Laboratory ("**Central Laboratory**") based in Bishkek was used for the external umpire laboratory. An atomic absorption spectrometry ("**AAS**") was used for the determination of both gold and silver by both laboratories. The Stewart Laboratory and Central Laboratory are accredited for compliance with the international standard ISO 17025-2017 and ISO/ IEC 17025-2008, respectively. Both laboratories have quality assurance and quality control ("**QA/QC**") protocols, including insertion of the internal and external duplicate samples, certified reference materials ("**CRMs**") and blank samples to evaluate the accuracy of the analysis.

Approximately 10% of the total number of samples were chosen from the coarse rejects and were re-analysed in the original laboratory for internal checks from 2015 to 2024. In 2019, about 5% of the total number of samples, and a total of 335 samples in 2023 were taken to Central Laboratory for the external checks. All results displayed a relatively good correlation with the original samples, with only a small number of samples returning relatively large deviation, except for the relatively poor consistency with the original ones in 2015 and 2023. The CRMs and blank sample analysis results were not provided to SRK.

During the period of site visit carried out between 12 and 16 April 2025, SRK selected 20 pulp duplicates to verify the reliability of historical analysis of grades.

Overall, SRK is satisfied with the quality and result of the sample preparation and assay conducted by related analytical laboratories. The analytical procedures are consistent with generally accepted industry practices and the primary sample results are therefore suitably reliable for use in Mineral Resource estimation.

Mineral Resource Estimation

The Mineral Resource estimation was prepared for the Levoberezhny Project in accordance with the *JORC Code* guidelines. The date of the Mineral Resource was reported as of 31 December 2024.

The database used for estimation of Mineral Resources was audited by SRK. SRK is of the opinion that the current exploration information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation. Details of the database used for the Mineral Resource estimation ("**MRE**") are listed in Table ES-3.

Table ES-3: Resource Database Statistics

Type	Number	Length (m)	Samples
Core Drilling	1,056	253,938.0	103,630
Percussion Drilling	1,239	28,469.9	25,242
Tunnels	3,864	131,451.7	49,880
Adits/Crosscuts	10,317	43,969.1	11,210
Others	2	4,760.0	468
Total	**16,478**	**462,588.7**	**190,430**

Sources: SRK

The wireframe models of mineralised zones were prepared in GEOVIA Surpac V6.3 ("**Surpac**") software. The grade was interpolated with Ordinary Kriging ("**O.K.**") estimation techniques using Leapfrog 2023.1 ("**Leapfrog**") software. The entire estimate procedure, consisting of database compilation, mineralised zones interpretation, the grade interpolation as well as the Mineral Resources classification, were completed by Altynken LLC and reviewed by SRK.

As of 31 December 2024, and at a cut-off grade of 1.3 g/t Au, the Levoberezhny Project, after deducting the previously mined-out areas, was estimated to contain 2.1 million tonnes ("**Mt**") of Measured Mineral Resources with an average grade of 4.0 g/t Au, 9.2 Mt of Indicated Mineral Resources with an average grade of 3.7 g/t Au, and 3.1 Mt of Inferred Mineral Resources with an average grade of 4.8 g/t Au, the details are summarised in Table ES-2.

Ore Reserve Estimation

SRK estimated the Ore Reserves for the Levoberezhny Project in accordance with the *JORC Code* guidelines and based on Levoberezhny Mine's mining recovery rate and dilution rate as well as other modifying factors cited either from the historical mining records, the prefeasibility or feasibility study, and/ or mine designs.

The Ore Reserve statement is shown in Table ES-2. As of 31 December 2024, the Proved Ore Reserves have a tonnage of about 1.3 Mt and an average gold grade of about 4.0 g/t, while the Probable Ore Reserves have a tonnage of about 6.3 Mt and an average gold grade of about 3.6 g/t.

Mining Assessment

The Levoberezhny Mine has been and will be developed as an underground mine. The planned ore mining capacity is 924 thousand tonnes per annum ("**ktpa**" or "**kt/a**"). There is no further mine plan in place to modify the existing mining capacity, mining method, development system, ventilation, dewatering and drainage.

The development system includes the main decline, the No. 2 adit, the cage shaft, the transfer adit connecting the mining area and the Levoberezhny Plant, several surface and underground ventilation shafts, and the ten haulage levels at 1,674 m above sea level ("**ASL**"), 1,614 m ASL, 1,566 m ASL, 1,518 m ASL, 1,470 m ASL, 1,422 m ASL, 1,374 m ASL, 1,326 m ASL, 1,278 m ASL and 1,230 m ASL. The average level interval is 48 m. Each level is usually subdivided into three 16 m high sublevels.

The overhand drift and fill mining have been utilised for several years. This method will be continually used in future due to its simple stope development and flexibility.

The Ore Reserves can support a nine-years life of mine, including six-years full-production period and a three-years ramp-down period, based on SRK's mining model.

Metallurgical and Processing

Mineralogical and metallurgical studies on ore samples from the Levoberezhny Mine were conducted by different institutes; the results show that the gold is mainly embedded in sulphide minerals with fine particles. Pyrite is the most abundant sulphide mineral, and there is also a small amount of chalcopyrite.

The processing capacity of the Levoberezhny Plant is 2,800 tonnes per day ("**tpd**" or "**t/d**") or 924 ktpa, adopting "whole sulphide flotation – Cu-S separation flotation – S concentrate cyanidation" process. The final products are gold concentrate and gold Doré bullion. The historical production technical indicators of the Levoberezhny Plant are presented in Table ES-4. The aggregated gold produced in years 2022, 2023 and 2024 are respectively 130.7 thousand troy ounces ("**koz**"), 129.0 koz, and 119.9 koz.

Table ES-4: Historical Production Indices for the Levoberezhny Plant

Indicator	Unit	2022	2023	2024
Ore Processed				
Tonnage	kt	1,014.4	1,059.7	990.2
Head grade	g/t Au	4.48	4.19	4.17

Sources: Altynken LLC

Environmental and Social Impacts

The environmental impact assessment ("**EIA**") report for the Levoberezhny Project was compiled in 2015. The EIA report was approved by State Agency for Environmental Protection and Forestry in 2016.

The EIA report for the Levoberezhny Project makes the statement in relation to the flora and fauna baseline study. In the study area there are four plant species listed in the *Red Book of Kyrgyzstan*. No species of animals listed in the *Red Book of Kyrgyzstan* were found at the Levoberezhny Project and adjacent territories.

At present, the Levoberezhny Project takes water from the nearby Taldybulak River and Zim Bulak gully as the water source. The polluted wastewater generated from the mining and processing of the Levoberezhny Project is reused in production and not discharged outside. Both TSFs are equipped with anti-seepage layers to reduce the risk of groundwater pollution. SRK recommends that quality monitoring be undertaken of the groundwater and surface water resources within the Levoberezhny Project area (including upstream and downstream of the tailings storage facilities and waste rock dumps).

Development funds have been set up for community development. The Levoberezhny Project has also carried out a series of donations and consolation activities for the surrounding towns and communities. In addition, it regularly organises community activities such as sports events, board games competitions, and tree planting with the nearby communities.

Capital Expenditures and Operating Costs

Capital Expenditures

The net value of sunk Capex is about US$192.0 million as of 31 December 2024, including US$189.1 million for the fixed assets and US$3.0 million for the intangible assets. In addition to the sunk Capex, there are about US$168,000 of long-term investment in stocks, and US$1.063 million of construction in progress as of 31 December 2024.

The investments in the future years are accounted in the sustaining Capex. Altynken LLC planned to invest US$249 thousand in 2029 to expand the TSF, and US$19 thousand in 2030 to reclaim the waste rock dumps. SRK included an additional sustaining Capex per year based on the 4% of original value of fixed assets. The total sustaining Capex is about US$104.9 million over the life of mine.

Working capital is about US$78 million as of 31 December 2024. SRK estimated future years' working capital based on experiences, which is about the 30% of the Opex.

Operating Costs

The Opex records show that Altynken LLC spent respectively US$129.84 per tonne ("**/t**") of run-of-mine ("**RoM**"), 137.70 US$/t of RoM, and 161.27 US$/t of RoM in years 2022, 2023 and 2024. SRK excluded the non-income taxes, royalties and other government charges, the Opex are respectively 89.39 US$/t of RoM, 86.93 US$/t of RoM and 87.11 US$/t of RoM in 2022, 2023 and 2024, which are overall stable at about 88 US$/t of RoM. SRK estimated future years' Opex based on the average Opex in years 2022 to 2024. The average Opex is about 172.0 US$/t of RoM over the life of mine. The short-term operating costs of historical and forecasted are shown in Table ES-5 for the Levoberezhny Project.

Table ES-5: Short-term Opex Records and Forecasts

Notes: The character "A" stands for the actual values in years 2022 to 2024. The character "F" stands for the forecasts in future years.

Economic Analysis

The economic analysis presented here is based on the results of the technical review. Some key assumptions are made for technical evaluation and Ore Reserve estimation purposes only. The Levoberezhny Project economic analysis was conducted using the discount cash flow ("**DCF**") method and is based on assumptions of technical and economic parameters from actual historical production data and the feasibility study and/ or mine design of the mine with some adjustments by SRK.

The overall economics are shown in Table ES-6, showing a positive NPV, indicate that the Levoberezhny Project is economically viable.

Table ES-6: Summary of Overall Economics

Item	Unit	Value	Remarks

Risk Assessment

SRK completed a risk assessment of the risks identified for the Levoberezhny Project in relation to their likelihood of occurrence and consequence in accordance with the *Listing Rules* of HKEX.

SRK considers various technical aspects which may affect the feasibility and future cash flow of each operating mine and conducts risk assessments for the Levoberezhny Project, which have been summarised in Table ES-7.

Table ES-7: Risk Assessment for Levoberezhny Project

Risk Source/Issue	Likelihood	Consequence	Overall
Geology and Mineral Resources			
Lack of Significant Mineral Resources	Unlikely	Major	Low
Lack of Significant Ore Reserves	Unlikely	Major	Low
Unexpected Groundwater Ingress	Rarely	Moderate	Medium
Significant Unexpected Geological Faulting	Rarely	Moderate	Medium
Ore Reserve and Mining			
Lack of Significant Ore Reserves	Unlikely	Minor	Low
Significant Geological Structures	Possible	Moderate	Medium

Recommendations

SRK offers the following recommendations:

- It is recommended to conduct in-fill drilling to improve deep mineralised zone delineation and upgrade the Mineral Resource classification. Specifically for Mineralised Zones numbered as 4 and 5, where mineralised zone branching and grade variability are significant, the current grid spacing of 20-40 m × 20-40 m should be further infilling to 10 m × 10 m using strategically placed production drill holes. This will enhance Mineral Resource definition and improve confidence in classification at deeper levels of the mineralised zone. The strict QA/QC procedures should be applied, in order to obtain data of demonstrable quality as required by the *JORC Code* guidelines.
- The flowsheet designed and equipment of the Levoberezhny Plant used are reasonable, which can also recover copper mineral. Due to the low copper grade in the ore, the output copper concentrate grade is also low. Therefore, it cannot be sold as copper concentrate, but only as gold concentrate. SRK suggests that the flotation test study on copper concentrate to be conducted to improve the copper grade of the copper concentrate until it reaches the standard of qualified copper concentrate, in order to increase the sales revenue of copper.
- The EIA for the Levoberezhny Project was completed in 2015 and approved by the State Agency for Environmental Protection and Forestry in 2016. The EIA includes a baseline study of local flora and fauna, identifying four plant species listed in *Red Book of Kyrgyzstan*, but no listed animal species.
- The Levoberezhny Project sources water from a nearby Taldybulak River and spring water in the Zim Bulak gully. Wastewater from mining and processing is reused on-site and not discharged. Tailings storage facilities are equipped with anti-seepage layers to minimise groundwater pollution. SRK recommends ongoing monitoring of surface and groundwater around the site.
- The Levoberezhny Project has established community development funds and regularly conducts donations, outreach, and events such as sports, games, and tree planting with local communities. SRK recommends that Altynken LLC develop a grievance mechanism to receive and address specific concerns raised by displaced persons or members of host communities in a timely fashion.

1 Introduction and Scope of Report

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Limited ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of the Taldybulak Levoberezhny Gold Project ("**Levoberezhny Project**" or the "**Project**") which is located in Kemin Region, Chuy Province, Kyrgyz Republic ("**Kyrgyzstan**").

The Levoberezhny Project includes the Taldybulak Levoberezhny Underground Gold Mine ("**Levoberezhny Mine**") and associated ore processing and metallurgical plant ("**Levoberezhny Plant**"). It is operated by the Altynken Limited Liability Company ("**Altynken LLC**"), a subsidiary company of Zijin Mining Group Company Ltd ("**Zijin Mining**").

It is SRK's understanding that the independent technical assessment on the Levoberezhny Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of Zijin Gold International on the Main Board of The Stock Exchange of Hong Kong Limited (the "**SEHK**" or "**Stock Exchange**"), a wholly-owned subsidiary of Hong Kong Exchanges and Clearing Limited ("**HKEX**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "***JORC Code***") and in accordance with the *Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited* (the "***Listing Rules***") including the *Chapter 18* requirements and other relevant regulations of the HKEX.

The Levoberezhny Project is an operating underground gold mine, which is wholly owned by Altynken LLC, a joint venture company of Summer Gold (Kazakhstan) Limited Liability Partnership ("**Summer Gold**") and Kyrgyz Gold Company Ltd ("**Kyrgyz Gold**"). Currently, Altynken LLC is 60% owned by Zijin Mining through Superb Pacific Limited Company (Hongkong) ("**Superb Pacific**") and 40% owned by Kyrgyz Gold, respectively. The Superb Pacific is a company incorporated in the British Virgin Islands with limited liability and a wholly owned subsidiary of Zijin Mining, holds the Altynken LLC 60% from Summer Gold. Zijin Gold International is wholly owned by Zijin Mining.

This Report does not express an opinion as to the value of mineral or other assets involved.

2 Program Objectives and Work Program

2.1 Purpose of the Report

The purpose of this Report is to provide an independent technical assessment for inclusion in a prospectus to be issued by Zijin Gold International to support the proposed listing on SEHK. SRK's report is proposed to provide an unbiased technical assessment of the risk and opportunities associated with the reviewed Levoberezhny Project.

2.2 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "***VALMIN Code***"). The *VALMIN Code* incorporates the *JORC Code* for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy ("**AusIMM**") members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the *JORC Code.* However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the *JORC Code*, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the *JORC Code*.

2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that Zijin Gold International has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that Zijin Gold International has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of Zijin Gold International and/ or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

2.4 Effective Date

The effective date for this CPR is deemed to be 31 May 2025 (the "**Effective Date**"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as at 31 December 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK.

2.5 Work Program

The work program for the Levoberezhny Project consists of:

- review of dataset and Mineral Resource models provided by Altynken LLC and Zijin Gold International, and preparation of data verification plan which will be conducted during site inspection;
- a site visit between 12 and 16 April 2025, to the Levoberezhny Project, including the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the ore processing and metallurgical plant, ore and waste stockpiles, tailings storage facilities ("**TSFs**", flotation and cyanidation), water source and power supply station, the office and living areas, and other infrastructure, etc.;
- review of all available documents, including operating licences and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.;
- discussion with Altynken LLC and Zijin Gold International management and technical personnel, as well as the professionals of Zijin (Xiamen) Engineering Co., Ltd ("**Zijin Xiamen**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Levoberezhny Project;
- preparation of a draft report in accordance with the *JORC Code* guidelines and the requirements of the *Chapter 18* and other regulations of the HKEX (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024); and
- submission of the draft to Zijin Gold International and Altynken LLC and the related third party for comments and finalise the draft based on the feedback.

2.6 SRK Experience

The SRK Consulting Group ("**SRK Consulting**") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience in providing Independent Expert Reports to mining companies for successfully listing on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/ or acquired on SEHK, as shown in Table 2-1.

Table 2-1: SRK's Reports for Listing on the SEHK

Company	Year	Nature of Transaction
Yanzhou Coal Ltd (listed on SEHK)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on SEHK and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on SEHK
Lingbao Gold Ltd	2005	IPO Listing on SEHK
Yue Da Holdings Ltd (listed in HKEX)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on SEHK
Sino Gold Mining Ltd	2007	Dual Listing on SEHK
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on SEHK
Kiu Hung International Holding Ltd	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Ltd	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Ltd	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Ltd	2009	Acquisition of a molybdenum mining project in Shaanxi, China
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Ltd	2010	IPO Listing on SEHK
Citic Dameng Holdings Ltd	2010	IPO Listing on SEHK
China Hanking Holdings Ltd	2011	IPO Listing on SEHK
China Daye Non-Ferrous Metal Mining Ltd	2012	Very Substantial Acquisition on SEHK
China Nonferrous Mining Corporation Ltd	2012	IPO Listing on SEHK
Hengshi Mining Investments Ltd	2013	IPO Listing on SEHK
Future Bright Mining Holdings Ltd	2014	IPO Listing on SEHK
King Stone Energy Group Ltd	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte Ltd	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Ltd	2016	IPO Listing on SEHK
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Ltd	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Ltd	2022	IPO Listing on SEHK

Company	Year	Nature of Transaction
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on SEHK
Chifeng Jilong Gold Mining Co., Ltd	2025	IPO Listing on SEHK

Sources: SRK

2.7 Project Team

The SRK project team and responsibilities are shown in Table 2-2.

Table 2-2: SRK Project Team

Consultant	Title	Discipline and Task
Dr Yiefei Jia	Corporate Consultant (Geology)	Project Manager, whole report, CP
Zhuanjian (Leo) Liu	Principal Consultant (Geology)	Geology, Mineral Resource Estimation
Yonggang Wu	Principal Consultant (Mining)	Mining and Ore Reserve Review
Chao Ding	Consultant (Processing)	Processing Review
Lanliang Niu	Principal Consultant (Processing)	Processing and Metallurgical Review
Nan Xue	Principal Consultant (Environment)	Environment, Social, and Permitting
Qiong (Amy) Wu	Senior BD and Project Coordinator	Project Coordination and Translation
Pengfei Xiao	Principal Consultant (Geology)	Internal Peer Review and Quality Control
Alexander (Alex) Thin	Corporate Consultant (Mining)	Internal Peer Review and Quality Control

Sources: SRK

Yiefei Jia, ***Doctor of Philosophy ("PhD"), Fellow of the AusIMM ("FAusIMM", CP Geo),*** is a Corporate Consultant (Geology and Project Evaluation) with a specialty of exploration of mineral deposits. He has more than 25 years' experience in the field of exploration, development, and Mineral Resources estimate of precious metal (gold ("**Au**"), silver ("**Ag**"), and platinum group elements ("**PGE**")), non-ferrous metal (lithium ("**Li**"), lead ("**Pb**"), zinc ("**Zn**"), copper ("**Cu**"), vanadium ("**V**"), titanium ("**Ti**"), cobalt ("**Co**") and nickel ("**Ni**")), and black metal (iron ("**Fe**") and manganese ("**Mn**")) as well as non-metallic metal (potash, fluorite and graphite) and decorative stone (marble) ore deposits in different geological settings in Australia, Africa, China, and North and Central America. He also has over five years' experience in coal deposits exploration and due diligence in China, Indonesia and Mongolia. He has extensive experience in project management, exploration design and Mineral Resource assessment. In recent years, he, as Competent Person, has led and coordinated dozens of due diligence projects with technical reports either for fund raising or listing on overseas stock exchanges, such as SEHK.

Zhuanjian (Leo) Liu, ***Bachelor of Engineering ("BEng"), Member of the Australian Institute of Geoscientists ("MAIG"),*** is a Principal Consultant (Geology) with SRK China. Since graduated from the China University of Mining and Technology, He has been engaged in geological survey, due diligence and technical consulting in China, Indonesia and Mongolia for over 10 years. After joining SRK, he has provided consulting services for Peabody Energy (USA), SABIC (Saudi Arabia), Salim Group (Indonesia) and other large corporations. He participated in several successful cases of independent technical report/due diligence work in recent years, including China Unienergy IPO Listing on SEHK and Agritrade Resource acquisition of Shareholding in Indonesia.

Yonggang Wu, ***Master of Engineering ("MEng"), MAusIMM,*** is a Principal Consultant (Mining), joining SRK in 2007 after his graduation from the Jiangxi University of Science and Technology. He has acquired specialised knowledge of mining engineering and MineSight software and has been involved in a large number of projects to date. He has accumulated extensive experience in Mineral Resource/ Ore Reserve estimation, pit limit optimisation and design, underground-mining design, long-term production planning, and due diligence studies, with minerals including Au, Pb, Zn, Mn, Cu, Fe, fluorite, sylvine, alum, and phosphorus among many others. Yonggang has expertise in geological and mining modelling and is proficient in using MineSight, AutoCAD, and other specialised software packages.

Chao Ding***, MEng,*** Consultant (Mineral Processing) at SRK China. Prior to joining SRK, he worked for Weihai Haiwang Cyclone Co., Ltd and Ramu NiCo Management Co., Ltd. He has accumulated certain experience in mineral dressing test research and has a certain understanding and mastery of plant design; in addition, he has accumulated rich experience in production and management of hydrometallurgy of nickel laterite ore.

Lanliang Niu, ***BEng, MAusIMM***, is a Principal Mineral Processing Engineer, who graduated in 1987 from Beijing University of Science and Technology majoring in ore processing. He has worked on the industrial testing of gold leaching with low grade ores, managed or participated in processing and metallurgical testing for more than 10 precious and non-ferrous metals projects. With SRK, he has been responsible for the ore processing and metallurgical scope of work and involved in many key projects.

Nan Xue, ***Master of Science*** **("*****MSc"), MAusIMM,*** is a Principal Environmental Consultant with SRK Consulting China Ltd. He holds a master's degree in environmental sciences from Nankai University in Tianjin. He has four years' experience in environmental impact assessment, environmental planning, and environmental management. He has been involved in a number of large EIA projects and pollution source surveys for SINOPEC, as well as the environmental planning project funded by UNDP. He has particular expertise in construction project engineering analysis, pollution source calculations, and impact predictions. In recent years after he joined SRK, Nan Xue has been involved in a number of due diligence projects, such as the Fuguiniao Mining project in China.

Pengfei Xiao, ***MSc, FAusIMM, Member of the Australian Institute of Geoscientists ("MAIG"),*** is the Managing Director of SRK China. He is a Principal Consultant (Geology) with a specialty in mineral exploration applying comprehensive geological and geophysical methods; and his expertise also includes resource modelling and estimation. He is familiar with both theory and practice in sampling, sample preparation and chemical analysis. As a consulting geoscientist, he has been active in mining projects including due diligence reviews, exploration design, data verification and resource estimation in China, Mongolia, Africa, America, Southeast and Central Asia. His experience relates precious metal (Au, Ag, PGE), base metal (Cu, Ni, Pb, Zn) and other metal deposits (Fe, Mn, V, Mo, Co), and also includes a few non-metal projects (phosphorite, potash, gypsum). In the past ten years he has been working in geology and resource assessment with SRK, and co-authored dozens of technical reports aiding clients in successful property transactions; and more than half of them are published in stock exchanges.

Alexander (Alex) Thin, BEng (Hons), FAusIMM (CP Min), is a Corporate Consultant (Project Evaluation and Mining) with SRK. He is an experienced mining professional with over 30 years' experience. His strategy and leadership experience spans feasibility studies, mineral asset audits and evaluations, independent technical reports, techno-economic studies, capital raising, merger and acquisitions, managing joint ventures, local and international stock exchange compliance, business development and investor/ stakeholder relations. Alex's industry experience spans operational (underground and open pit), technical, consulting and corporate within the metalliferous resources sector, covering precious metals, base metals and bulk commodities.

2.8 Warranties

Zijin Gold International has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

2.9 Indemnities

As recommended by the *VALMIN Code*, Zijin Gold International has provided SRK with an indemnity under which SRK is to be compensated for any liability and/ or any additional work or expenditure resulting from any additional work required:

- Which results from SRK's reliance on information provided by Zijin Gold International or to Zijin Gold International not providing material information; or
- Which relates to any consequential extension workload through queries, questions or public hearings arising from this Report.

2.10 Compliance Statement

The information in this Report that relates to Mineral Resources/ Ore Reserves is based on information compiled by Doctor ("**Dr**") Yiefei Jia, a Competent Person who is a Fellow of AusIMM and a Chartered Professional in Geology ("**CP Geo**"), Zhuanjian (Leo) Liu, a Principal Consultant who is a member of the AIG, and Mr Yonggang Wu, a Competent Person who is a Member of the AusIMM. All are full-time employees of SRK.

This Report is a Competent Person's Report in line with the *Listing Rules* of the HKEX.

Dr Yiefei Jia, Zhuanjian (Leo) Liu and Mr Yonggang Wu have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the *JORC Code*.

Dr Yiefei Jia, Zhuanjian (Leo) Liu and Mr Yonggang Wu consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Pengfei Xiao, *FAusIMM and MAIG*, a Principal Consultant (Geology) and Alexander Thin, FAusIMM (CP Min), a Corporate Consultant (Mining).

2.11 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Zijin Gold International or Zijin Gold International's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

2.12 Consent

SRK consents to this Report being included, in full, in the Zijin Gold International prospectus, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

2.13 Forward Looking Statement

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this Report. Also provided in the Report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

3 Operating Licences and Permits

SRK relies on the information provided by Zijin Gold International and Altynken LLC, and SRK did not conduct a legal due diligence review of the Levoberezhny Project since such work is outside the scope of SRK's technical review.

3.1 Business Licences and Permits

The business licence details for the Levoberezhny Project are presented in Table 3-1. The Levoberezhny Project is wholly owned by Altynken LLC. Kyrgyz business license has no expiration date.

Table 3-1: Business Licences

Company	Altynken Limited Liability Company
Project Name	Taldybulak Levoberezhny Gold Project
Business Licence No.	22968-3308-OOO
Issued To	Altynken Limited Liability Company
Issued By	Ministry of Justice of the Kyrgyz Republic
Issue Date	5 April 2006

Sources: Altynken LLC

3.2 Mining Licence

The Levoberezhny Project is comprised of one mining licence (No. 471AE) covering an area of 98.0 hectares ("**ha**") or 0.98 square kilometres ("**km^2**"). The mining licence is currently held by Altynken LLC. Details of the mining licence for the Levoberezhny Project are presented in Table 3-2. Gold is the main mining Mineral Resource, with integrated use of silver and copper. A copy of the original mining permits with relevant agreements are provided in Appendix A. Pleased noted that the mining licence will expire soon. SRK was informed by Altynken LLC that the mining licence is currently undergoing renewal procedure, and it is planned to extend for 15 years, including mine closure reclamation.

The geographic coordinates of vertices for the mining licence are listed in Table 3-3. The mining licenced area is shown in Figure 3-1.

SRK notes that the geographic coordinates of the exploration tenement presented in Table 3-3 are converted from Gauss-Kruger projected coordinates with a Pulkovo 1942, GK Zone 13.

Table 3-2: Mining Licence

Company	Altynken Limited Liability Company
Project Name	Taldybulak Levoberezhny Gold Project
Mining Licence No.	471AE
Issued To	Altynken Limited Liability Company
Issued By	State Agency for Geology and Mineral Resources
Issued Date	7 April 2006
Expiry Date	5 January 2026
Mining Area (hectare)	98.0
Licenced Ore Type	Gold
Production Rate (tpa)	750,000

Sources: Altynken LLC

Table 3-3: Coordinates of Vertices for Levoberezhny Mining Permitted Area

Vertex ID	Longitude/Northing	Latitude/Easting
1	13,554,909.51	4,724,962.42
2	13,555,077.00	4,725,149.30
3	13,554,600.00	4,725,760.00
4	13,554,314.18	4,725,942.06
5	13,555,080.00	4,727,377.00
6	13,555,036.90	4,727,397.90
7	13,554,225.30	4,725,925.30
8	13,553,753.48	4,726,777.73
9	13,553,639.51	4,726,626.69
10	13,553,990.00	4,726,080.00
11	13,553,689.50	4,725,421.20

Sources: Altynken LLC

Note: all figures of northing and easting used in database are not as the same as the licences with the projection system of Gauss-Kruger, X Pulkovo1942, GK Zone 13, which were all transformed to Relative Coordinate System based on 1963 coordinate system in this Report, keeping the same as what Altynken LLC has done.

3.3 Operational Operating Permits

This section summarises key operational licences and permits. SRK relies on the information provided by Altynken LLC, and SRK does not intend to undertake a legal due diligence review since such work is outside the scope of technical review.

The construction and operation of facilities require a number of permits and licences depending on their type, capacity and location, as specified by Kyrgyzstan legislations. These permits and licences cover the aspects of land use permits, air emission, wastewater discharge, solid waste disposal, etc.

The Levoberezhny Project currently holds solid waste discharge and air emissions permits, both issued by the Kyrgyzstan Ministry of Natural Resources and Environment. The validity period for these permits is from 27 December 2024 to 27 December 2025, and they require annual renewal. Since the Levoberezhny Project currently does not discharge wastewater, there is no need to apply for a wastewater discharge permit. In addition, Altynken LLC has provided the payment receipts of surface water use and land use certificates for review.

Figure 3-1: Distribution of Exploration and Mining Licenced Area

4 Regional Description

4.1 Property Location

The Levoberezhny Project is located approximately 120 kilometres ("**km**") east of Bishkek, the capital city of Kyrgyzstan, and is under the administrative jurisdiction of Kemin Region, Chuy Province. The Levoberezhny Project is about 12 km south of the Orlovka town, or 26 km southeast of the Kemin railway station. The property is accessible via paved roads (Figure 4-1).

The central geographical coordinates of the Levoberezhny Project site are 75°40′0.39″ East longitude and 42°39′41.19″ North Latitude. The geographic coordinates of vertices for the mining licence are listed in Table 3-3.

Figure 4-1: Project Location

Sources: SRK

4.2 Accessibility

The Levoberezhny Project is accessed via a paved road from the Orlovka town, and a highway connecting the Orlovka town and Bishkek. The mine has a direct road link to the Kemin railway station about 26 km away, and there are two main cement roads running through the Zim and Tald areas of the mine, with a tunnel between them for trucks and small vehicles.

4.3 Local Resources and Infrastructure

The main inhabitants of the neighbourhood are ethnic Kyrgyzstan, Russians and Ukrainians. Most of residents are employed in industrial enterprises associated with the Kyrgyzstan mining-screening integrated plants; while a small proportion are engaged in hunting and farming activities. The nearest settlements in the working area are the small villages of Oktyolkha and Kashka. There are some forested vegetation estates, dairy farms, collective farms and beekeeping farms of state farms in Oktyolkha, Poldu, Almare valley. The economy of the region is very favourable for the development of mining industry.

The Taldybulak River, which flows through the Levoberezhny Project area, has a width of approximately 1.6 metres ("**m**"), the average depth of the water flow varies in the range of 0.07 to 0.20 m, and the average flow speed reaches 0.5 m per second ("**m/s**"), which can provide an adequate water supply for Project development.

The 220 kilovolts ("**kV**") and 110 kV power transmission lines run east-west from the northwest of the Levoberezhny Project about 7 km away. The Levoberezhny Project is connected to the 110 kV line from Bystrovka to Orlovka. The power supply can meet the power demand of the 3,000 tonnes per day ("**t/d**" or "**tpd**") mining capacity or processing throughput.

The town of Orlovka and the Kemin district in the north of the Levoberezhny Project have some capacity for the maintenance of machinery, electrical equipment, motors, transformers and mining vehicles.

The Kyrgyzstan has a population of more than 5 million people, which can meet the demand for labour for the construction and production of the Levoberezhny Project.

4.4 Physiography and Climate

The Levoberezhny Project is located in the east of the Chuy Valley on the north slope of the eastern section of the Kyrgyzstan mountains, and on the left bank of Taldybulak Valley. The Levoberezhny Project area belongs to the middle and low mountains, with altitudes ranging from 1,600 m to 2,300 m above sea level ("**ASL**"). The typical landscape in the Levoberezhny Project area is shown in Figure 4-2.

Figure 4-2: Landscape in the Levoberezhny Project Area

Sources: SRK, 13 April 2025

The Levoberezhny Project area is characterised by a typical continental climate. The coldest temperature reaches -33 degrees Celsius (**"°C"**) in December and January, while the warmest temperature of up to 40 °C is recorded in July and August. The average annual temperature is 9.6 °C. In winter, the snow cover ranges from 12 centimetres ("**cm**") to 34 cm, with an average of 20 cm, and the average depth of frozen soil is between 0.34 m and 1.00 m below the surface.

The precipitation ranges from 12 millimetres ("**mm**") in January to 80 mm in May, with average annual precipitation of 560 mm. Winds are generally north-westerly and south-easterly with a speed of 15 m/s, and the maximum wind speed can reach 30 m/s.

According to the Institute of Seismology of the Academy of Science of the Kyrgyz Republic, the Levoberezhny Project area lies within the zone of probable earthquakes with a magnitude of 9.0.

5 Geological Setting and Mineralisation

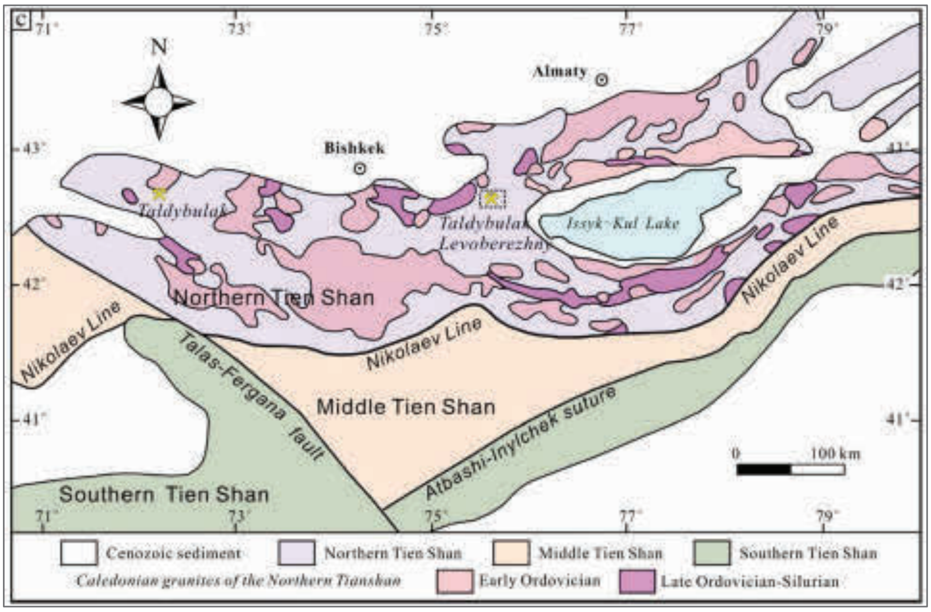
5.1 Regional Geology

Tectonically, the Levoberezhny Project area is located in the Early Palaeozoic Jelskoy Island arc chain in the Northern Tianshan of Kyrgyzstan, which forms part of the Tianshan metallogenic belt (Figure 5-1). This belt is a significantly geological structure within Kyrgyzstan and constitutes a critical segment of the broader Tianshan metallogenic belt than spans the Central Asian region. Known as the "Golden Heart of Central Asia", the Tianshan metallogenic belt extends for over 2,500 km from western Uzbekistan, through Tajikistan, Kyrgyzstan and southern Kazakhstan to western China. This belt hosts numerous gold deposits and occurrences, indicating its metallogenic importance.

In terms of tectonics, the region displays differences compared to other orogenic systems, such as the Andean orogenic belt formed by ocean-land subduction, and the Alpine-Himalayan orogenic belt formed by land-land collision. The Tianshan belt represents a unique geological formation resulting from the mosaic assembly of Cenozoic micro-landmasses and suture zones, coupled with the interaction between Middle Cenozoic basins and mountain ranges.

The geological complexity of gold mineralisation in the region is notable, characterised by multi-stage processes and superimposed mineralisation events. This complexity underscores the region's dynamic mineral-forming history and its significance within the Central Asian metallogenic framework.

Figure 5-1: Tectonic Map of the Kyrgyzstan, Northern Tianshan



Sources: Article "Re-Os Pyrite and U-Pb Zircon Geochronology from the Taldybulak Levoberezhny Gold Deposit" 2015

The Precambrian basement is widely distributed across the region and has undergone significant superposition by the Caledonian-Hercynian and later Variscan tectonic events. The bedrock is primarily organised as rock sheets, with stratigraphic structures predominantly controlled by northwest-west ("**NWW**") oriented fracture systems. Strata from the Proterozoic era are distributed along the NWW direction and manifest as fragmented rock flakes due to tectonic activity. Notably, mica schist and gneiss formations are extensively presented on the right bank of the Taldybulak River valley, with an aggregate thickness exceeding 2,000 m.

Regionally, the Northern Tianshan sedimentary range, belonging to the Ordovician sequence, experienced Garidon-Hercynian tectonism, followed by Hualixian structural overprints. The area underwent significant tectonic magmatism, often disrupting and eroding earlier Precambrian basement rocks. During the Cenozoic era, the region experienced pronounced mountain-building processes, creating a variety of structural features, including gently sloping fold structures and strike-slip fault displacement. Basement structures such as the Chuy River syncline, Oktolka, Kakju, and Bebichen-Saur syncline layers, along with the Oktolka and Gili Arek anticline layers, were further modified into basement-related anticlines and graben-anticline structures during this time.

The dominant regional fracture system trends in the NWW direction, with these primary fractures exerting significant control over the distribution of magmatic intrusions. Secondary fractures, which developed later, dissect the Proterozoic and Paleozoic metamorphic basement and associated magmatic rocks, creating complex, checkerboard-like patterns. Vertical fault movements during the Cenozoic orogeny are typically of the order of dozens of metres, occasionally reaching 100 m, while horizontal displacements range from approximately 100 m to as much as 2,000 m in some cases.

The spatial distribution of gold deposits in the region is strongly associated with fault-control zones, particularly along the Kemin suture. Gold occurrences such as the Kuranjaylau site, Kensou site, and Zheer Areksk group are situated along the Kensusk fault, while deposits like Boldu, Taldybulak Levoberezhny, and Taldybulak lead mines are predominantly influenced by the Kich-Keminsk and Konrongsk faults.

The intrusive rocks in the region play a crucial role in the region's geological framework and mineralisation processes, with widespread distribution primarily in the southwestern and northeastern portions of the area. These rocks are controlled by the NWW-trending fracture zones, intersected by the secondary, northeast-trending fractures, covering 50% of the entire region. Medium to acidic granitoid rocks are most common, accounting for 30% of the entire area, and are considered an important source of regional mineralisation.

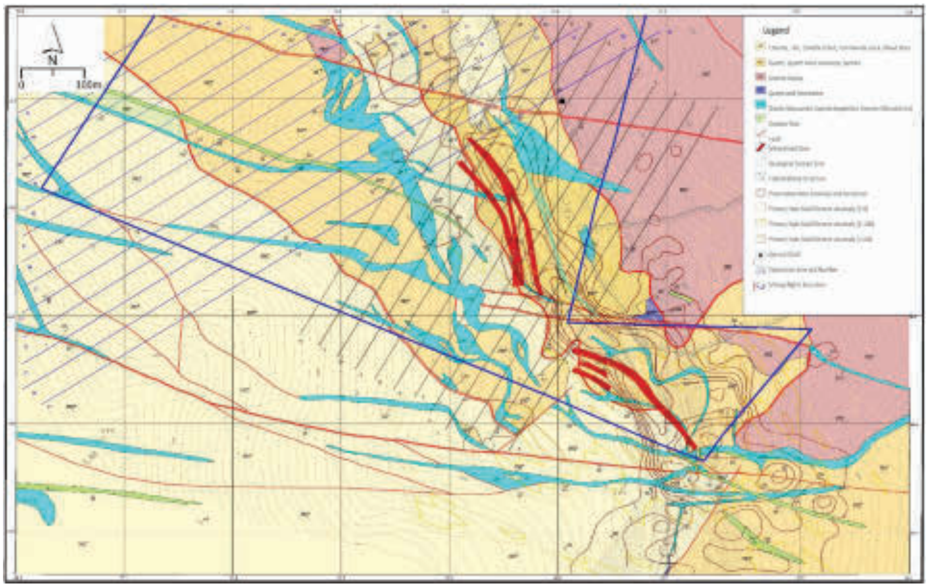
Tectonically, the intrusive rocks span multiple geological periods, including the Upper Riphean (Jinningian), Late Ordovician-Silurian (Garidonian), Permian (Hercynian), and Alpine (Indochinese). Among these, the Ordovician-Silurian granitoids dominate. These intrusions occur in various forms, such as beds, dikes, and veins, with veins being the most frequently observed.

5.2 Property Geology

5.2.1 Strata

The exposed stratigraphic sequence in the Levoberezhny Project area is composed of metamorphic rocks belonging to the Neoproterozoic-Cambrian Kupurelisay Group and Tegermenty Group. The Kupurelisay Group predominantly consists of schists, green schists, amphibolites, and biotite-amphibolites, while the Tegermenty Group is characterised by carbonate-altered and sericite-altered mica schists and migmatized gneisses. The stratigraphic contact between the two groups is structurally controlled and marked by faulting (Figure 5-2).

Figure 5-2: Geological Map of the Levoberezhny Project



Sources: SRK

The lithological units have undergone pervasive metasomatism, forming migmatites (or metasomatic hybrid rocks) with a cumulative thickness exceeding 2,000 m. Mica schists and gneiss units are predominantly distributed along the right bank of the Taldybulak River, while the mineralisation zone is dominated by green schists, including chlorite schists, talc-chlorite schists, along with amphibolites and serpentinites. The metasomatic transformation is closely associated with tectonothermal events from the Caledonian, Hercynian, and Alpine orogenic cycles, with ore-forming processes most strongly linked to Caledonian-age metasomatism, while Alpine metasomatic effects are spatially restricted.

The metasomatic rocks are classified into quartz-sericite metasomatites, quartz-sericite-pyrite metasomatites (fine-grained pyrite rocks), chromian mica-bearing quartz-carbonate-sericite metasomatites, and pyrite-bearing quartz-carbonate-chromian mica metasomatites (talc-magnesite schists), with pyrite disseminated within quartz-carbonate assemblages. These rocks constitute the principal ore-hosting lithologies. Early-stage quartz-carbonate metasomatites and late-stage fine-grained, microcrystalline black quartz-tourmaline-pyrite metasomatites are commonly enriched in high-grade mineralisation through superimposed ore-forming processes. Additionally, these metasomatites are notable for their elevated concentrations of copper, silver, and other ore-related elements, making them valuable for multi-metal resource extraction.

5.2.2 Structure

The structural framework of the Levoberezhny Project area is predominantly northwest ("**NW**")-oriented, later modified by multiple NWW-striking strike-slip faults, resulting in a rhomboidal grid-like structural pattern on a planar scale. The Precambrian metamorphic rocks in the Levoberezhny Project area are primarily controlled by a NW-trending, southwest ("**SW**")-dipping composite anticline with an average dip angle of approximately 45°. The lithological core of this anticline consists of gneisses and schists, forming a mixed complex, with gold deposits mainly occurring in the SW limb of the anticline.

The central part of the Taldybulak ore field is characterised by the Taldybulak ductile shear zone, which strikes NW and dips steeply to the SW at an average angle of 45°. This shear zone is the principal ore-controlling structure within the ore field. The lithology within the shear zone is highly complex, including quartz-metasomatites-carbonate rock layers, as well as metasomatites formed during the post-Caledonian plate magmatic activity.

The Taldybulak ore-controlling ductile shear zone is regarded as an interlayer structure and classified as a first-order major geological structure, located on the western limb of the composite anticline. Its thickness can reach up to 700 m, comprising highly folded zones with intricate multilayered structures. The shear zone can be divided into three local ductile shear zones: Upper Taldybulak, Middle Taldybulak, and Lower Taldybulak shear zones, extending from west to east. Late northeast ("**NE**")-striking and near-eastwest ("**EW**")-striking fractures traverse through brittle-ductile deformation zones. Weakly deformed or undeformed Kupurelisay Group schists, green schists, and amphibolites separate these deformation zones, while quartz-monzonite and diorite dykes intrude along the boundaries or are intersected by late-stage near-EW and NE-striking faults.

The Lower Taldybulak ductile shear zone is the thickest among the three, ranging from 150 to 400 m, and is classified as an interlayer ductile shear zone. The middle and upper shear zones, with thicknesses ranging from 50 to 200 m, can be regarded as intralayer ductile shear zones. The main Ore Reserves of the Taldybulak Left Bank deposit are distributed within the deformation zones of the Taldybulak folded belt. The Middle Taldybulak shear zone hosts the upper ore layers of the deposit, while the Upper Taldybulak shear zone controls the mineralisation at the Sikimbulak site.

5.2.3 Igneous Rocks

The Levoberezhny Project area is characterised by intense magmatic activity, predominantly manifesting as dykes and, locally, as small stocks. The lithologies include diabase, diorite, granodiorite porphyry, monzonite porphyry, and felsite, with monzonite porphyry being the most extensively exposed. The diabase is dated to the Triassic, while other dyke rocks were emplaced mainly during the Late Ordovician to Early Silurian periods.

Diorite: Exhibiting a medium- to fine-grained texture, the diorite is primarily composed of plagioclase (60–75%), amphibole (10–20%), and monoclinic pyroxene (2–5%). The plagioclase often displays polysynthetic twinning with grain sizes ranging from 0.1 to 0.5 mm. Most amphibole and monoclinic pyroxene have undergone alteration, forming fine-grained chlorite, epidote, and carbonate minerals.

Monzonite Porphyry: Typically presenting a medium- to coarse-grained texture, it consists of subhedral plagioclase (25–30%), potassium feldspar (30–35%), and interstitial quartz (20–25%). It also contains minor biotite (5–8%) and amphibole (about 2%).

5.2.4 Metamorphism and Alteration

The host rocks of the Levoberezhny gold deposit exhibit extensive and intense hydrothermal alterations, including migmatisation, sericitisation, chromian mica alteration, silicification, tourmalinisation, and carbonatisation, with localised occurrences of epidotisation, chloritisation, and potassic alteration. Among these, migmatisation, sericitisation, and chromian mica alteration are primarily pre-ore processes and are products of regional metamorphism. Silicification and tourmalinisation are the alterations most closely associated with gold mineralisation, while epidotisation and potassic alteration are observed only sporadically within dykes.

Early Ore-Forming Stage: This stage is characterised by extensive mineralisation, with silicification and carbonatisation dominating the alteration of host rocks, forming irregularly contorted quartz-carbonate veins. These veins are primarily controlled by ductile shear zones and develop along schistosity planes of the host rocks, with occasional cross-cutting phenomena observed. Mineralised zones are confined within the shear zones and rarely cross the shear zone boundaries. Banding and massive textures represent the typical ore structures of this stage, but these are only locally developed, and gold mineralisation is predominantly disseminated in the form. Metallic minerals are mainly pyrite, with trace amounts of chalcopyrite and galena in localised areas. Gold mineralisation during this stage is relatively weak, with average gold grades ranging between 0.1 and 2 grams per tonne ("**g/t**").

Main Ore-Forming Stage: This stage is superimposed on the early-stage mineralisation, with host rock alterations in the early phase of this stage characterised by intense penetration of vein-like and stockwork silicification and tourmalinisation of host rocks and pre-existing mineralised zones. Tourmalinisation generally precedes silicification and is marked by intense metasomatism of the host rocks, often forming typical quartz-tourmaline mineralised zones. Occasional breccia-like remnants of early disseminated ores are observed within the mineralisation. Metallic minerals in the ores are predominantly pyrite, followed by arsenopyrite. Gold mineralisation during this stage is more intense, with average gold grades ranging from 5 to 15 g/t. Gold deposits are spatially related to the quartz-tourmaline alteration zones, though not entirely confined to them, as some gold deposits occur at significant distances from these alteration zones. The later phase of this stage is characterised by silicification and carbonatisation, which is only locally developed. This phase mainly involves quartz-carbonate veins cutting across the host rocks and pre-existing ores. Mineralisation during this phase is dominated by chalcopyrite, characterised by highly uneven distribution, with disseminated mineralisation in sparse, fine veins being the most common form. In certain areas, coarse veins or massive ores may develop.

Both stages of gold mineralisation are accompanied by sericitisation and chromian mica alteration. However, due to the extensive development of sericitisation and chromian mica alteration during pre-mineralisation regional metamorphism, it is generally difficult to distinguish between pre-mineralisation and ore-forming mica alterations (especially during the early ore-forming stage), except for localised cross-cut relationships of micas from different stages. The intergrowth and replacement relationships between minerals and their assemblages indicate the presence of two distinct gold mineralisation stages in the Levoberezhny gold deposit.

5.3 Mineralisation

5.3.1 Mineralised Zones

The Levoberezhny gold deposit is characterised by a fan-shaped planar distribution, converging towards the southeast and diverging towards the northwest. The mineralised zones are primarily aligned in a NW-NNW direction, dipping gently towards the southwest and plunging to the northwest, with dip angles predominantly between 25° and 40°. The morphologies of the mineralised zones include lenticular, columnar, lentil-shaped, and stratiform forms.

The mineralised belt extends approximately 1,300 m in length and ranges in width from 80 to 450 m in the northeast. Its depth is yet to be fully defined. A total of 12 gold mineralisation zones, along with several smaller scattered mineralised zones, have been identified. Among these, mineralised zones 1, 2, and 3 are categorised as the C1 domain and serve as the primary mining targets. Mineralised zones 4, 5, 6, 7, 8, 9, 10, 11 and 12 have been classified under the C2 domain, while some peripheral scattered mineralised zones fall into the C100 domain. The following sections will provide detailed descriptions of the three mineralised zones of the C1 domain.

Mineralised Zone 1 (C1-1) has a tubular shape with a horizontally lenticular cross-section. Its thickness ranges from dozens of metres to over 100 m, with a width of 70–100 m. The mineralised zone spans an elevation range of approximately 1,710-1,490 m and is distributed between Lines 20 and 9. Its strike direction varies with elevation:

- Above 1,645 m: Strike is 305-320°.
- Between 1,600-1,645 m: Strike transitions from 295-310° to 330-332°.
- Below 1,600 m: Strike is 295-310°.

The dip angle is approximately 26°, and the gold grade displays a trend of decreasing from the top to the bottom.

Geometrically, the mineralised zone is controlled over a strike length of 540 m, with widths ranging from 60 to 120 m and a vertical extent of 210 m. The highest elevation is 1,717 m, and the lowest elevation is 1,506 m. The average grade from controlling engineering works is reported at 4.15 g/t Au, with a coefficient of variation ("**CoV**") of 1.49. The average apparent thickness is 20.68 m, with a CoV of 0.79. The gold grade is highest in the central portion of the mineralised zone, gradually tapering toward the edges.

Mineralised Zone 2 (C1-2) was originally part of the Mineralised Zone 1 but was displaced and deformed by a hinge fault located near Lines 7-9. It extends from Line 7 to Line 17 and can be subdivided into three structural sections based on variations in strike, dip, and plunge:

- Between Lines 7-13: The mineralised zone strikes NW, dips NE at about 30°, and plunges at about 30°.
- Between Lines 13-17: The strike remains NW but dips SW at about 5–10°, with a gentle plunge along strike.
- Between Lines 17-19: The strike transitions to SW, dipping southward at about 30°, with a plunge angle of about 20°.

Geometrically, Mineralised Zone 2 is controlled over a strike length of 207 m, with widths ranging from 20 to 112 m and a vertical extent of 177 m. The highest elevation is 1,551 m and the lowest elevation is 1,374 m. The ore grade is highest in the central portion of the mineralised zone, tapering off toward the edges.

Mineralised Zone 3 (C1-3) is located beneath the Mineralised Zone 2 and exhibits a NW-striking distribution between Lines 11 and 19. The mineralised zone dips SW at a relatively gentle angle, with both the dip and plunge angles ranging between about 5° and 10°.

Geometrically, Mineralised Zone 3 extends 150 m along strike, with widths ranging from 100 to 160 m and a vertical depth of 174 m. The highest elevation is 1,443 m, and the lowest elevation is 1,269 m. The average grade documented in controlling engineering works is 4.58 g/t Au, with a grade CoV of 132.7%. The average apparent thickness is 22.03 m, with a thickness CoV of 75.3%. The grade distribution within the mineralised zone lacks significant regularity.

As a result of supplementary exploration conducted between 2019 and 2023, substantial advancements were made in delineating the C2 mineralised zones 4, 5, 7, 9 and 11, located west of Exploration Line 19. These mineralised zones have demonstrated notable expansion in scale and significantly improved the level of geological confidence. A typical cross-section between Lines 21 and 22 of the Mineralised Zone 5 is illustrated in Figure 5-3.

The geometry characteristics of the large, mineralised zones are summarised in Table 5-1 below.

Table 5-1: Summary of the Geometry of Mineralised Zones

Mineralised Zone	Location	Occurrence	Length (m)	Width (m)	Average Thickness (m)	Remarks
1	Lines 20 to 9	Tubular, flat lens-shaped, dip angle 26°, trending 305-320°/295-310°	540	60-120	20.68	Higher grade at the centre, lower at the sides
2	Lines 7 to 17	Divided by hub fault, dip angle 5°-30°	207	20-112	-	Divided into left and right parts
3	Lines 11 to 19	Below II mineralised zone, trending NW, dip angle 5°-10°	150	100-160	22.03	Relatively flat distribution
4	Lines 21 to 43	Main mineralised zone trending N-S, thicker in the south, thinner in the north	390	95-370	6.65	Uneven grade distribution
5	Lines 21 to 43	Stable, trending NW, enrichment points spaced 40-80m apart	400	114-417	10.70	Grade-rich zones extend as bands
7	Lines 37 to 51	Stable, trending NW, plunge angle 32°	310	60-180	7.06	Relatively uniform grade distribution
9	Lines 37 to 51	Stable, trending NW, dipping towards NW	350	30-60	8.81	Lower grade at centre, higher at sides
11	Lines 35 to 51	Trending NW, string-like distribution	450	30-270	10.21	Enrichment centres in a bead-like pattern
12	Lines 10 to 18	Below I mineralised zone, trending NW, thicker in southeast, thinner in northwest	160	35-65	10.21	Small mineralised zone, stable thickness

Sources: SRK

5.3.2 Mineralogical Characteristics

There are four types of mineralised and altered mineral assemblages: quartz-sericite metasomatite and quartz-sericite-pyrite metasomatite, chromite-bearing quartz-carbonate-sericite metasomatite, pyrite-bearing quartz-carbonate-chromite metasomatite, and black and fined-grained quartz-tourmaline-pyrite metasomatite.

The ore minerals are natural gold and silver, pyrite, chalcopyrite, arsenopyrite, zoisite, galena, natural bismuth and plagioclase bismuth. The gangue minerals are mainly quartz (up to 60%), tourmaline (up to 50%), muscovite/sericite (up to 10%), chlorite (up to 10%), carbonate (1-10%), barite and apatite (0.1-1.0%).

The ore structure is characterised by sparsely disseminated and fine veinlets disseminated textures based on the distribution of sulphides, and the mineral structure is mainly massive structure.

The main economic element is gold, and the associated elements that can be comprehensively recovered are silver (6-30 g/t), and copper (0.01-0.6%). Other elements include bismuth (0.001-0.01)%, lead (0.007-0.11%), zinc (0.001-0.04%) and tin (0.001-0.012%), but are too low to be economically recovered. The deleterious element is mainly arsenic (0.004-0.15%) in the form of arsenopyrite.

6 Exploration

6.1 Exploration History

6.1.1 Prior to Zijin Mining's Acquisition

1963-1976: Kulanjaylou Exploration Brigade and Central Asian Institute of Geology and Mineral Material Science conducted initial exploration activities in the Levoberezhny Project area; they included trenching, shallow test pits, and 14 surface drillholes with an aggregate length of 2,682 m.

1977-1983: Oktoltoysk Exploration Brigade conducted a detailed exploration in the Levoberezhny region. A series of geological mapping and survey at scales of 1:10,000, 1:5,000 and 1:2,000 were completed, and the dispersion flow heavy mineral method, primary and secondary blue halo geochemical technique, and electric and magnetic surveys were utilised. A 2,636 m long tunnel at 1,690 m ASL level was developed, and seven (7) underground drillholes with an aggregate length of 966 m and 33 surface drillholes with an aggregate length of 10,858 m were conducted.

1986-1989: Oktorgoisk Exploration Brigade carried out a further tunnelling and drilling exploration at Taldybulak gold deposit. About 4,742 m length tunnel at 1,610 m ASL level, 11 raises with a length of 4,742 m and 128 surface drillholes with an aggregate length of 72,021 m were completed.

1990-1995: Oktorgoisk Exploration Brigade conducted a supplementary exploration drilling in the region. A total of 73 underground drillholes with an aggregate length of 73,686 m were completed. An exploration report, entitled *Early-Stage Exploration Results in Levoberezhny Gold Deposit and its Northwest Flank* was submitted during this period.

1996-2000: Malaysian Mining Corporation Berhad ("**MMC**") conducted a detailed exploration and technical and economic analysis at two mineralised zones (M1 and M2) of the Levoberezhny gold deposit. A total of 79 underground drillholes with an aggregate length of 10,612.5m were completed and a total of 6,149 samples were collected.

6.1.2 After Zijin Mining's Acquisition

2011-2017: Altynken LLC carried out an extensive production exploration. A total of 77 drillholes with an aggregate length of 6,312 m and 712 exploration tunnels with an aggregate length of 23,202 m was completed.

2019 to 2023: Zijin Mining conducted a supplementary production infilled drilling exploration, which primarily focused on a systematic exploration of deeper C2 mineralised zones between exploration lines 21 and 53 within the Levoberezhny Project area.

6.2 Trenching and Tunnelling Exploration

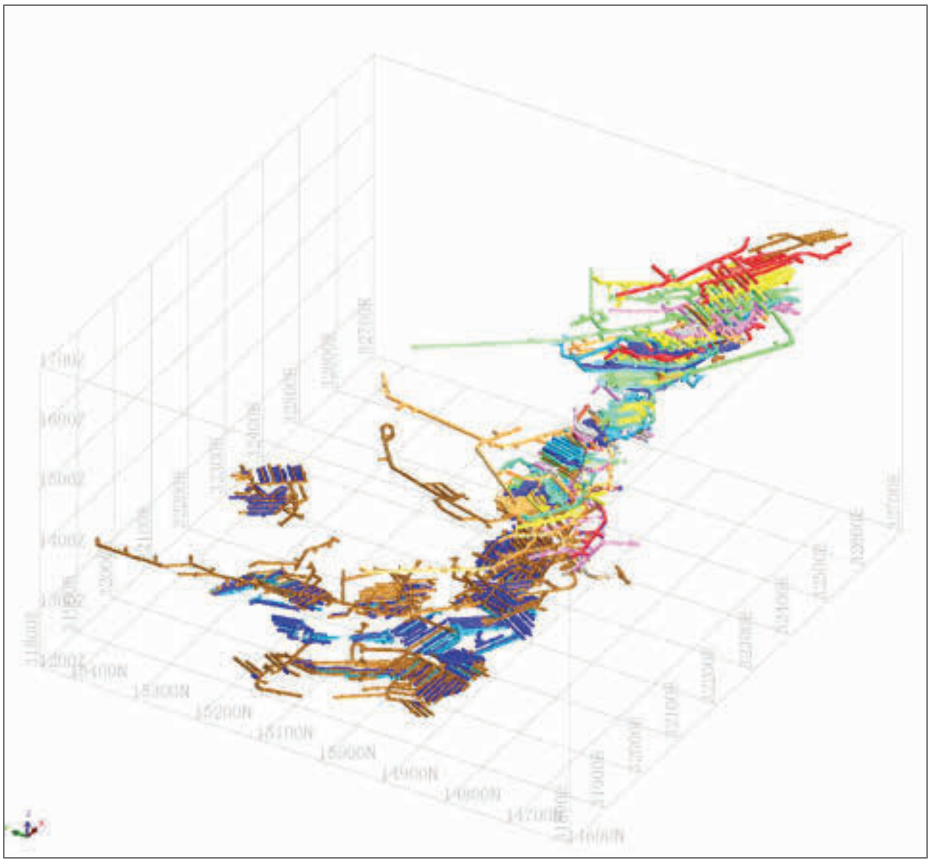
Trenching activities were primarily undertaken during the preliminary survey stages of the Levoberezhny Project in the 1960s and 1970s, aimed at collecting surface assay samples. The scope of work and results were limited, providing minimal contribution to the overall exploration effort.

Table 6-1: Summary of Tunnelling Activities Since 1979

Year	Length (m)	Location
1979	2,623.00	Mining Level 1690
1986-1989	4,742.00	Mining Level 1610
2011-2018	40,195.90	Between exploration Lines 4 and 21
2019	5,422.90	Eastern of Line 4 and Western of Line 21
2020-2024	78,467.93	Eastern of Line 43
Total	**131,451.73**	

Sources: Data from Resource/Reserve Verification Report (1999)

Figure 6-1: 3D Map of Tunnels of the Levoberezhny Project



Sources: SRK

Tunnelling has proven to be the most significant exploration method for the Levoberezhny Project. Since 1979, a total of 131,451.73 m of tunnels have been developed by multiple mining companies. From 2011 onwards, Zijin Mining's tunnelling exploration has been concentrated in the south zone of the mining licenced area. The tunnelling activities are summarised in Table 6-1 and spatially depicted in Figure 6-1.

6.3 Drilling Exploration

Various diamond drill rigs were employed by Altynken LLC and Kyrgyz Kench-Sylves LLC during different drilling programs, including models such as XY-44 (T), XY-42 (T), XZKD-95, and HYKD-5. Drillholes were initially opened at diameters of 89 mm or 110 mm and were tapered to 75 mm at completion, with the minimum core size being 47 mm. Downhole surveys were conducted using a compass inclinometer at intervals of every 50 m for inclined boreholes and every 100 m for vertical boreholes, with depth verification performed at 100 m intervals. All surveys were supervised by logging geologists and reported dip angle, azimuth, and depth verification. In SRKs opinion, these errors were within acceptable margins.

Upon completion of each borehole, it was sealed with cement, and a surface mark was inscribed on the seal. The mark was subsequently surveyed by a professional surveyor. Drill cores were stored in core trays, which were clearly labelled with box numbers, hole numbers, and the starting and ending depths. The core trays were transported to the drill core warehouse for long-term storage. Preliminary logging, conducted by geologists, captured vital data including weathering, texture, lithology, alteration, and structural information. Following logging, all core samples were digitally photographed for documentation.

As of 31 December 2024, a total of 1,056 diamond drillholes have been completed for the Levoberezhny Project, with a cumulative drill length of 253,937.99 m.

The latest exploration of the Levoberezhny gold deposit was carried out between 2019 and 2023, focusing on the infilling and upgrade of exploration controls for the deep C2 domain located west of the 19-exploration line in the Levoberezhny Project area. Detailed investigations were conducted to characterise the dimensions, occurrence, and spatial distribution of the primary mineralised zones, thereby enhancing the classification of the Mineral Resources. The exploration work during the 2019–2020 period, was undertaken by Zijin Mineral Geology Exploration Institute, while the 2021–2023 period was handled by China Nonferrous Metal and Zijin Geological Exploration (Beijing) Co., Ltd.

A total of 201 drill holes were completed during this phase. The positioning measurements and orientation corrections before drilling were conducted using Leica FlexLine TS06 or Leica FlexLine TS09 total stations. Similarly, post-drilling collar measurements employed the same instruments. All surveying activities were performed by professional staff from the Mine Survey Section under the Mine Geology Department. The measurement precision of the instruments reached 1.5 mm, ensuring the accuracy and reliability of all engineering survey data from the mining site and meeting geological industry standards.

Core recovery was achieved entirely with wireline core drilling. The rocks were relatively stable, resulting in high core recovery rates, ranging from 91.07-100.00%, with an overall average core recovery rate of 98.43%. Mineralisation intervals' recovery rates ranged from 86.68 to 100.00%, with an average mineralisation interval recovery rate of 98.28%. Both the wall rock and mineralisation intervals' recovery rates met the acceptable industry requirements, in SRKs opinion.

Of the 201 drill holes, 11 were vertical holes, while the remaining 190 were inclined holes. Deviation measurements were conducted for vertical holes every 100 m and at the final depth, including measurements of the dip angle and azimuth. For inclined holes, deviation measurements were conducted every 50 m and at the final depth, which involved measuring the dip angle and azimuth. Additional measurements of azimuth and inclination were performed upon reaching a depth of 25 m. The measurements were carried out using the Beijing Liuhe Greatness Technology Co., Ltd ("**Beijing Liuhe Greatness**") electronic borehole inclinometer LHE3710, with precision meeting industry requirements, and all results conforming to industry standards.

Core sampling was performed using a core cutting machine, which sawed the rock (ore) cores along the symmetrical central axis of mineralisation, with half of the core recovered as a sample.

Overall, the basic spacing for exploration drilling at the Levoberezhny gold deposit is 40-60 × 40-60 m, with an infill spacing of 20-30 × 20-30 m. In addition to exploration drill holes, the mine has a significant number of production drill holes, with a basic grid spacing of 20 × 20 m and an infill spacing reaching 10 × 10 m.

6.4 Sampling, Sample Preparation and Analyses

SRK has prepared an *Independent Technical Review of Taldybulak Levoberezhny Gold Project in Kemin Region, Chuy Province, Kyrgyzstan ("**SRK 2021 ITR**"),* in June 2021, the information of this section is derived from the *SRK 2021 ITR* unless otherwise noted.

6.4.1 Sampling

All samples were collected by site geologists of Altynken LLC. Tunnel samples were obtained through channel sampling, with each sample measuring approximately 2 m in length. Drill core samples were extracted by manually splitting the cores along their axes. Sample intervals, marked by geologists, ranged from 1 to 2 m in length. Wall rocks and mineralised intervals were sampled separately. One half of each core was selected for sampling and bagging, while the other half was stored in core trays and organised for long-term storage at the core warehouse (Figure 6-2). The bagged and labelled samples were dispatched to the Stewart Assay and Environmental Laboratories LLC ("**Stewart Laboratory**") for preparation and analysis.

Figure 6-2: Core Shed (Left) and Pulp Rejects (Right)

Sources: SRK, 13 April 2025

6.4.2 Sample Preparation and Analyses

Sample preparation and analysis were conducted by the Stewart Laboratory. The Stewart Laboratory is accredited for compliance with the international standard ISO 17025-2017 by the United Kingdom Accreditation Service ("**UKAS**"), United Kingdom ("**UK**"), and at the Kyrgyzstan Centre of Accreditation. The scope of accreditation includes most of the methods used.

The sample preparation methods employed at both laboratories are described below:

- Samples are weighed upon arrival;
- The samples were dried and then crushed using a jaw crusher to less than 4 mm in diameter;
- The first-time splitting (i.e., sub-sample) was carried out by a riffle splitter;
- The sub-sample with no less than 3.2 kg was further crushed by double roll crusher to all passing through 2 mm screen;
- The second time splitting, and the collected sample with no less than 0.8 kg was pulverised using a carbon to 200 mesh pulp;
- Normally 200 grams ("**g**") of pulp sample was bagged and labelled for assaying; and
- All pulverised reject samples were stored at the laboratories

The atomic absorption spectrophotometry ("**AAS**") was used for basic assaying for both gold and silver, and SRK was advised that the detection limits were 0.005% gold and 0.3 g/t silver, respectively.

The Kyrgyzaltyn Central Research Laboratory ("**Central Laboratory**") based in Bishkek, was used as the external umpire laboratory, which hosts a certificate of accreditation from the UKAS, also accredited under international standards ISO/IEC 17025-2009 and National Accreditation of Kyrgyzstan.

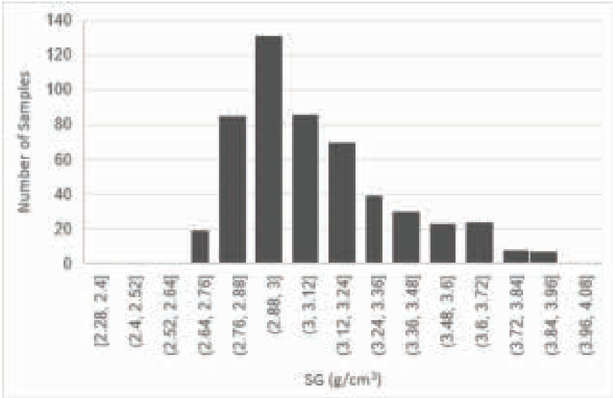
6.4.3 Bulk Density Data

The conventional density-immersion method was employed to achieve density determinations. A total of 528 small density samples, each with a volume of less than 0.125 cubic metres ("**m^3**"), were collected by Zijin Mining. The returned densities ranged from 2.28 to 4.03 grams per cubic centimetre ("**g/cm^3**"), with an average of 3.10 g/cm^3 and a median of 3.04 g/cm^3.

During the supplementary exploration of the C2 domain from 2019 to 2023, a total of 106 bulk density samples were collected and tested, with an average value of 3.08 g/cm^3.

The statistical analysis of the density data is illustrated in Figure 6-3, which demonstrates that the density values are clustered within the same population, exhibiting a minor positive skewed distribution. The quality of the data was deemed acceptable. Consequently, a specific gravity ("**SG**") value of 3.10 was adopted as the bulk density for the Mineral Resource estimation conducted by SRK.

Figure 6-3: Histogram Statistics for Specific Gravity



Sources: SRK

6.5 Quality Assurance and Quality Control Programs

In compliance with Chinese regulatory requirements and Kyrgyzstan national standards, analytical quality assurance and quality control ("**QA/QC**") protocols were established and implemented by both the Stewart Laboratory and the Central Laboratory. These protocols were designed to include internal and external duplicate samples for the evaluation of analytical precision. The laboratories have used certified reference materials ("**CRMs**") and blank samples for internal evaluating the accuracy of the analysis, however, the CRMs and blank sample analysis results were not provided to SRK.

For internal checks, pulp duplicates were selected, re-numbered, and sent to the original laboratory for re-analysis. For external checks, pulp duplicates were selected, re-numbered, and sent to an independent laboratory for assaying. Comparison between the duplicates and original samples is shown in Figure 6-4, Figure 6-5 and Figure 6-6 for the internal and external assays.

Between 2015 and 2024, approximately 10% of the total samples were selected and submitted to the original laboratory for internal re-analysis. In 2019, about 5% of the total samples were submitted to Central Laboratory for external checks. No external checks samples were submitted between 2020 to 2022 due to the corona virus disease 2019 ("**COVID-19**") restriction. A total of 335 external check samples were submitted in 2023.

Significant bias has been observed in 2023 internal check samples, SRK suggests submitting those samples greater than plus/ minus ("**+/ -**") 20% difference to umpire laboratory for re-analysis.

6.6 SRK Data Verification

SRK has visited the core shed and core and pulp rejects storage on site. A total of 20 pulp samples (Figure 6-2) have been taken and renumbered by SRK, the samples were sent to Central Laboratory for verification.

Table 6-2: Verification Samples taken by SRK during Site Visit

7 Mineral Resource Estimate

7.1 Introduction

The Mineral Resource statement presented herein represents Mineral Resource estimation prepared for the Levoberezhny Project in accordance with the *JORC Code* guidelines.

The Mineral Resource was reported as of 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarises the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the gold Mineral Resources found in the Levoberezhny Project at the current level of sampling. The Mineral Resources are reported in accordance with *JORC Code*. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Levoberezhny Project Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support the Mineral Resource estimation.

The wireframe models of mineralised zones were prepared in GEOVIA Surpac V6.3 ("**Surpac**") software. The grade was interpolated with Ordinary Kriging ("**O.K.**") estimation techniques using Leapfrog 2023.1 ("**Leapfrog**") software. The entire estimate procedure, consisting of database compilation, mineralised domains construction, the grade interpolation as well as the Mineral Resources classification, were completed by Altynken LLC and reviewed by SRK.

7.2 Mineral Resource Estimation Procedures

The Mineral Resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold mineralisation;
- Definition of Mineral Resource domains;
- Data conditioning (compositing and capping) for geostatistical analysis and Variography;
- Block modelling and grade interpolation;
- Mineral Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades ("**CoG**"); and
- Preparation of the Mineral Resource statement.

7.3 Resource Database

The primary database provided by Zijin Gold International includes an exploration report, digitised database, Chinese mineral resource estimate model, geological maps, mineralisation maps, and other relevant datasets. Additionally, the latest database integrates not only qualified drillhole, tunnel, and historical adit data from the Soviet era but also incorporates extensive production data collected since Zijin Mining acquired the Levoberezhny Project. This includes information from production drillholes, tunnels, access drift samples, rock powder drilling, and other sources. These comprehensive datasets form the foundation for subsequent Mineral Resource estimation.

SRK conducted a detailed review of the primary database, followed by a series of verification procedures, confirming that the integrated database is reliable and suitable for Mineral Resource estimation purposes. Based on this verified primary database, SRK constructed a Mineral Resource database composed of borehole collar data, survey data, lithology logs, assay results, and other relevant information. Key statistics and characteristics of the Mineral Resource database for the Levoberezhny Project area are summarised in Table 7-1.

Table 7-1: Mineral Resource Database Statistics

Type	Number	Length (m)	Samples
Coring Drilling	1,056	253,937.99	103,630
Percussion Drilling	1,239	28,469.90	25,242
Tunnels	3,864	131,451.73	49880
Working Faces	10,317	43,969.05	11210
Others	2	4,760.00	468
Total	**16,478**	**462,588.67**	**190,430**

7.4 Solid Body Modelling

The gold mineralisation in the Levoberezhny Project exhibits tubular and stratiform-like characteristics, striking in a NW direction and dipping NW at angles ranging between 15° and 25°. Mineralised zones have been delineated through a total of 690 drillholes positioned on a primary grid of 40 to 60 m by 40 to 60 m (strike/ dip), with additional infill drillholes placed on a grid of 20 to 30 m by 20 to 30 m (strike/ dip).

The mineralisation is predominantly composed of gold, with associated silver and copper. SRK noted that comprehensive assaying for silver and copper was not performed during the exploration phase.

All electronic data were imported into Surpac and Leapfrog databases for validation against tunnel, adit/ mining operation levels, borehole records, and topographic wireframes. Wireframes for mineralised zones were manually constructed based on a 1.0 g/t Au cut-off grade. The extrapolation distance was limited to one-quarter of the spacing between two boreholes, not exceeding 20 m, with mineralisation extrapolated up to approximately 10 m and wedging out in areas where borehole data were unavailable.

A total of 12 mineralised zones and one scattered mineralised zone were manually delineated, as shown in Figure 7-2 and Figure 7-3.

Partial high-grade mineralised zones (Au grade > 10.0 g/t) were identified within the main mineralised domains (C1_1 and C1_2). To minimise their impact on grade interpolation, these high-grade domains were outlined and interpolated separately. A model of the high-grade shell was constructed, as shown in Figure 7-4.

7.5 Bulk Density

See "6.4.3 Bulk Density Data".

7.6 Compositing

Before performing statistical analysis, samples were composited to equal lengths to ensure consistency in sample weighting. The basic sampling length statistics are shown in Table 7-2 and Figure 7-5, indicating that the majority of samples have a length of 2.0 m. Therefore, all assays were composited to 2.0 m downhole intervals with a minimum of 1.5 m for each composite sample. A 2.0 m interval composite length was applied by SRK for subsequent statistics and grade interpolation.

Table 7-2: Statistics of Sample Length

Item	Unit	Value
Sample Numbers	assays	189,538
Minimum ("**Min**")	m	0.02
Maximum ("**Max**")	m	360.00
Mean	m	2.16

7.7 Evaluation of Outliers

The raw gold grade distributions within the mineralised zones were analysed using histograms and cumulative probability plots to assess the necessity of capping and to determine appropriate thresholds when required.

Statistics for raw gold assays are presented in Table 7-4 and illustrated in Figure 7-6, which indicate that the raw Au grade distribution exhibits moderate skewness. Statistical analysis of the histograms revealed that certain samples deviated from the primary population distribution and were identified as outliers.

Based on cumulative frequency analysis and the distribution characteristics observed in the sample histograms, Au grades demonstrate a discontinuous distribution. Specific outlier thresholds for grade capping within the zones are detailed in Table 7-4 and were subsequently applied for compositing.

Table 7-4: Basic Statistics of Resource Database in Domains

Zone	Assay Cap Au (g/t)	Replaced Sample Numbers	Capped Ratio (%)	Au Mean (g/t) Before Capping	Au Mean (g/t) After Capping
C1-1	8	220	2.4	1.80	1.65
C1-2	10	113	2.4	2.15	1.84

7.8 Geostatistical Analysis and Variography

Variogram model for gold within mineralised zone 1 was generated based on the gold composites with capped value. The experimental variograms were fitted using a spherical variogram model, and the results display characteristics of geometric anisotropy. The direction with the longest continuity was identified as the major axis. Subsequently, the vertical plane perpendicular to the major axis was analysed to establish the direction and dip of the longest range, which was defined as the semi-major axis. The third direction, orthogonal to both the major and semi-major axes, was designated as the minor axis.

The structural details of the variograms are provided in Table 7-5 and Figure 7-7 to Figure 7-9.

Table 7-5: Au Variogram Structure within Mineralised Zone 1

Item	Unit	Value

7.9 Block Model and Grade Estimation

A rotated block model was developed using Surpac to estimate tonnage and grade. Appropriate parent and sub-block cell sizes were selected to ensure the model effectively captured the dipping mineralisation within the deposit.

For the defined mineralised solid, a parent block size of 2.0 m by 2.0 m by 2.0 m (Easting [X], Northing [Y], Elevation [Z]) was applied, with the smallest sub-block size set to 1.0 m by 1.0 m by 1.0 m. The block model follows the same relative coordinate projection system used during data collection. Table 7-6 presents a summary of the block model.

Table 7-6: Block Model Summary

Description	Unit	Easting (X)	Northing (Y)	Elevation (Z)
Minimum	m	29,800	14,900	1,000
Maximum	m	33,500	17,800	1,800
Block Size	m	2.0	2.0	2.0
Sub-block Size	m	1.0	1.0	1.0
Number of Parent Blocks	blocks	3,700	2,900	800
Rotation	degrees	34	-	-

Sources: SRK

The estimation of gold grades was conducted using different methods for each mineralised zone. For Mineralised Zone 1, the O.K. method was applied via Surpac in the block model.

Due to variations in the mineralised zone's structural characteristics, Mineralised Zone 2 was divided into two zones labelled as 2_M1 and 2_M2, and the grade estimation for these two zones was performed using the inverse distance squared ("**IDW**") method via Surpac. Similarly, Mineralised zones 3 to 12 were estimated using the IDW methodology. To reduce the smooth effect of the data, four passes of estimation were conducted for each mineralised zone. The parameters for the estimations were determined based on the structural characteristics of the mineralised zone.

The estimation process was carried out in three steps. First, the gold grade estimation of blocks within the 10.0 g/t mineralised zone was constrained using composites from within the 10.0 g/t boundary. Second, the gold grade estimation of blocks between the 2.0-10.0 g/t boundary but outside the 10.0 g/t mineralised zone was constrained using composite samples from the 2.0-10.0 g/t boundary zone. Finally, the gold grade estimation of blocks between the 1.0-2.0 g/t boundary but outside the 2.0 g/t boundary was constrained using composite samples from the 1.0-2.0 g/t boundary zone.

The parameters of the search ellipsoid were manually optimised, and the parameters are summarised in Table 7-7 and Table 7-8.

Table 7-7: Distance and Samples Used in Grade Estimation

Parameter	Unit	Pass 1	Pass 2	Pass 3	Pass 4
Maximum Search Distance	m	10	20	40	60
Minimum Number of Samples	composites	7	7	7	3

7.10 Model Validation and Sensitivity

Swath plots have been generated in three orthogonal (north, east, and vertical) directions at a certain distance for gold within mineralised zones, due to the number of mineralised zones, two representative mineralised zones (Mineralised Zone 1 and Mineralised Zone 5) were selected by SRK, each representing different grade interpolation methods and exploration time spans, as shown in Figure 7-10 to Figure 7-12 and Figure 7-13, respectively. The block models and the composites correspond well in all orthogonal directions. This comparison shows close consistency between the blocks and composites in terms of overall distribution as a function of X, Y, and Z coordinates.

7.11 Mineral Resource Classification

Block model quantities and grade estimates for the Levoberezhny Project were classified according to the *JORC Code* guidelines by Zhuanjian (Leo) Liu, a Principal Consultant and a Member of AIG and under the supervision of Yiefei Jia, *PhD*, a Corporate Consultant and a Fellow of the AusIMM and a Chartered Professional Geologist (FAusIMM CPGeo; No. 230607). They are appropriate Competent Persons for the purpose of the *JORC Code*.

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

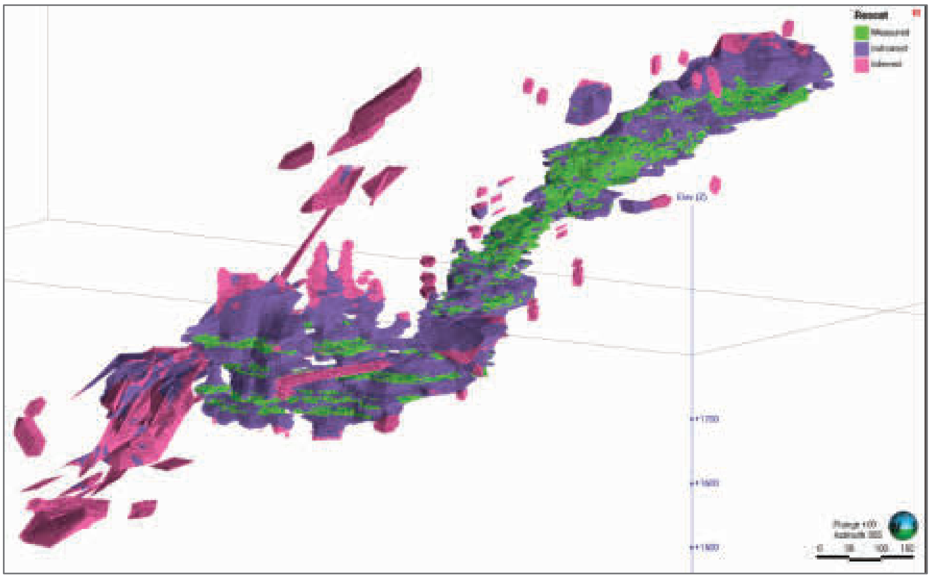
SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralisation exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified into the Measured Mineral Resource category, the second estimation run can be classified into the Indicated Mineral Resource category within the meaning of the *JORC Code* guidelines.

Conversely, blocks estimated during the third pass considering search neighbourhoods set at twice searching distance should be appropriately classified into the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters.

For the Levoberezhny Project, the Mineral Resource at the space of 10 m (strike) × 10 m (dip) is defined as Measured Mineral Resource, the Mineral Resource at the space of 20-40 m (strike) × 20-40 m (dip) is defined as Indicated Mineral Resource and the Mineral Resource at the space of 60-80 m (strike) × 60-80 m (dip) and greater is defined as Inferred Mineral Resource. Figure 7-14 shows the Mineral Resource category classification of the Levoberezhny Project.

Figure 7-14: Mineral Resource Categories of the Levoberezhny Project



Sources: SRK

7.12 Mineral Resource Statement

The 2012 Edition of the *JORC Code* defines a Mineral Resource as:

"(A) Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured categories".

"All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (i.e. more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource…"

The RPEEE requirement generally imply that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that considers extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Levoberezhny Project are amenable for underground mining.

The conceptual parameters used to estimate the cut-off grade for the Levoberezhny Project are summarised in Table 7-9.

Table 7-9: Assumptions Considered for the Levoberezhny Project

Parameter	Unit	Value
Gold Price [1]	US$ per troy ounce ("**US$/oz**")	2,700
Mining Cost	US$/t mined	50
Processing	US$/t feed	25
General and Administrative	US$/t feed	10
Mining Dilution	%	5
Mining Loss	%	5
Process Recovery	%	77
In Situ Cut-Off Grade	g/t	1.3

Sources: SRK

Notes:

[1] The price refers to the long-term prediction published by Consensus Market Forecasts in March 2025

As of 31 December 2024, and at a cut-off grade of 1.3 g/t Au, the Levoberezhny Project, after deducting the previously mined-out areas, is estimated to contain 2.1 million tonnes ("**Mt**") of Measured Mineral Resources with an average grade of 4.0 g/t Au, 9.2 Mt of Indicated Mineral Resources with an average grade of 3.7 g/t Au, and 3.1 Mt of Inferred Mineral Resources with an average grade of 4.8 g/t Au, the details is in Table 7-10.

Table 7-10: Mineral Resource Statement for the Levoberezhny Project as of 31 December 2024 by SRK Consulting China Ltd [1, 2, 3]

Category	Cut-off Grade (Au g/t)	Ore Tonnage (Mt)	Au (g/t)	Au (kg)	Au (koz)
Measured	1.3	2.1	4.0	8,400	270
Indicated	1.3	9.2	3.7	34,000	1,100
Measured + Indicated	**1.3**	11.3	3.7	**42,400**	**1,370**
Inferred	1.3	3.1	4.8	10,500	340
Total	1.3	14.4	3.7	52,900	1,700

Sources: SRK

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this report which relates to Mineral Resource is based on information compiled by Mr Zhuanjian Liu and Dr Yiefei Jia who are full-time employees of SRK Consulting China Ltd. Mr Liu is a Member of AIG and Dr Jia is a Fellow of the AusIMM (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "*Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves*", the *JORC Code*. Mr Liu and Dr Jia consent to the reporting of this information in the form and context in which it appears.

[3] The Mineral Resources are reported inclusive of Ore Reserves.

7.13 Grade Sensitivity Analysis

The Mineral Resources of the Levoberezhny Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Table 7-11 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-15 presents this sensitivity as grade tonnage curves.

Table 7-11: Global Block Model Quantities and Grade Estimates the Levoberezhny Project at Various cut-off Grades [1]

Cut-off Grade Au (g/t)	Quantity (Mt)	Grade Au (g/t)
0.0	14.39	3.67
0.5	14.39	3.67
1.0	14.39	3.67
1.5	13.62	3.8
2.0	11.23	4.24
2.5	9.01	4.73
3.0	7.26	5.21
3.5	5.79	5.72
4.0	4.59	6.23
4.5	3.63	6.76
5.0	2.83	7.33

Sources: SRK

Notes:

[1] The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

8 Ore Reserve Estimates and Mining Assessment

8.1 Ore Reserve Estimation

8.1.1 Technical Studies

Levoberezhny Mine is a producing underground mine at the Effective Date. The latest feasibility study entitled *Feasibility Study Report on the Mining, Processing and Metallurgy Engineering at Taldybulak Levoberezhny Gold Mine (塔尔德布拉克左岸金矿采选冶工程可行性研究报告,* the "***FS 2025***") was prepared for the Altynken LLC by the Zijin Xiamen and dated in April 2025.

After the review of the *FS 2025*, SRK noted that it mainly summarised the operating status of Project but with little sustaining designs to the existing operations. There is no further mine plan in place to modify the mining capacity, mining method, development system, ventilation, dewatering and drainage.

There is a difference in terms of the Mineral Resource base between what is presented in the *FS 2025* and what is reviewed and accepted by SRK in April 2025. To simplify the matter, the modifying factors based on the operating performances are mainly used for Ore Reserve estimate, accompanied by some assumptions of the *FS 2025* relating to the sustaining capital costs and public facilities.

8.1.2 Cut-off Grade

Only the gold grade was interpolated in the Mineral Resource model. There is no need to calculate an equivalent grade to define economic materials.

Assumptions to calculate cut-off grade are shown in Table 8-1. The calculated cut-off grade was rounded up to 2.0 g/t gold (calculated CoG is 1.99 g/t Au) at the Effective Date.

The cut-off grade shown in Table 8-1 was calculated by SRK based on assumptions derived from the actual mine performance. These assumptions were true at the time of calculation, but may change over time, so different cut-off grades can be produced. Sensitivity analysis of gold cut-off grade is shown in Figure 8-1, which indicates that the cut-off grade is mostly sensitive to the base price of gold and processing recovery rate.

Table 8-1: Assumptions of Cut-off Grade Estimation

Item	Unit	Value
Base price of gold [1]	US$/oz	2,200
Costs		
Mining cost [2]	US$/t mined	46
Processing and metallurgical cost [2]	US$/t run-of mine ("**RoM**")	15
Concentrates treatment [2]	US$/t RoM	8.5
Operating support cost [2]	US$/t RoM	7.0
Administration cost [2]	US$/t RoM	9.3

Item	Unit	Value
Marketing cost [2]	US$/t RoM	1.3
Treatment charge [3]	US$/dmt gold concentrates	192
Refining charge [3]	US$/oz recovered gold	5
Gold Ingot		
Concentrate grade [4]	g/t Au	97
Gold processing recovery rate [4]	%	77
Gold returned rate from the concentrates [5]	%	95.95
Gold ingot grade [3]	%	99.99
Price deduction [6]	US$/g payable gold	0.1506
Compensation of selling [6]	US$/oz gold	10.00

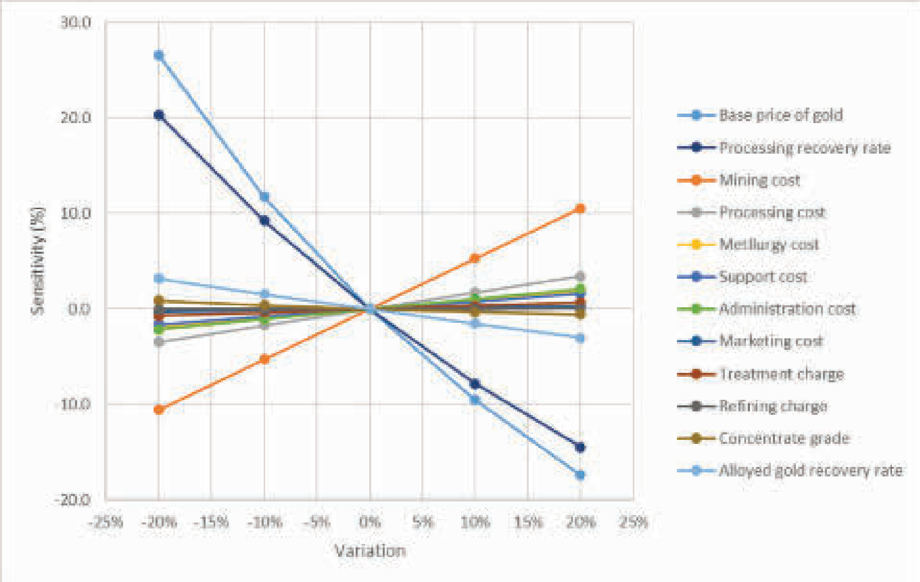
Figure 8-1: Sensitive Analysis of Gold Cut-off Grade



Sources: SRK

8.1.3 Ore Reserve Model

The latest Mineral Resource model ("**MRM**") was completed by Altynken LLC itself, then was reviewed and accepted by SRK in April 2025. The MRM is a global estimate of gold minerals for the gold mineralised zones interpreted with a cut-off grade of gold at 1.0 g/t. The mined-out areas as of 31 December 2024 has been depleted from the Mineral Resource model. The Mineral Resources are reported inclusive of the Ore Reserves.

Description of key fields in the MRM is shown in Table 8-2.

Table 8-2: Description of Key Fields in the Ore Reserve Model

Field	Unit	Description
au	g/t	Gold grade.
category	/	Mineral resource category. 1 = Measured. 2 = Indicated. 3 = Inferred.
zone	/	The integer code of a mineralised zone.
bd	t/m^3	Bulk density.
mined-out	/	An integer code of mined out area. 0 = not mined. 1 = mined out.
lic	/	An integer code of mining licence area. 0 = outside. 1 = inside.

Sources: SRK

8.1.4 Mineable Analysis

Steps are shown below:

- Thirteen domains were interpreted when estimating the Mineral Resources. The domains #7 and #12 are inclusive of just Inferred Mineral Resources. The domains #9, #10 and #11 cannot be accessed via planned development system. These domains were excluded from Ore Reserve estimate.
- SRK was provided with cut designs of mining method by the Altynken LLC. The design was reviewed and modified by SRK to match the MRM as of 31 December 2024. An example of original cut design and modification of SRK is shown in Figure 8-2. The minimum mining width is 4.2 m.
- Statistics of volume, tonnage and gold grade for each cut were reported in a spreadsheet. Just the Mineral Resources of Measured and Indicated categories were treated as ore, while the Inferred Mineral Resource and wall rocks were treated as waste materials with a zero grade.
- The mining recovery rate is about 92.6%, which was estimated based on the mining cut design in Figure 8-3, which has a three-centred arch profile. The waste material in a mining cut are treated as dilution (at zero grade). The mineable materials in the mining cuts are shown in Table 8-3.
- The spreadsheet was summarised to report the Ore Reserves.

Figure 8-2: Local Cuts Design at Slice 1370

Table 8-3: Mineable Materials as of 31 December 2024

Domain	Category	Tonnage (kt)	Grade Au (g/t)	Metal Au (kg)
1	Measured	122	2.81	342
1	Indicated	411	2.65	1,089
2	Measured	1	3.01	2
2	Indicated	3	2.87	8
3	Measured	476	5.02	2,387
3	Indicated	1,960	4.38	8,579
3	Inferred	29	3.36	98
4	Indicated	8	2.89	24
4	Inferred	< 1	4.30	< 1
5	Measured	541	4.28	2,316
5	Indicated	2,489	4.21	10,473
5	Inferred	5	2.61	13
6	Indicated	143	3.33	477
6	Inferred	6	4.02	22
8	Measured	56	2.74	155
8	Indicated	769	3.05	2,347
8	Inferred	5	3.07	17
100	Measured	< 1	1.64	< 1
100	Indicated	< 1	1.77	< 1
100	Inferred	< 1	3.34	< 1
Wall rock	Waste	582	-	-

Domain	Category	Tonnage (kt)	Grade Au (g/t)	Metal Au (kg)
Total	/	7,607	3.73	28,350

Sources: SRK

It should be noted that the tonnage of Inferred Mineral Resources account for about 10.1% of total tonnage of mineable materials in Table 8-3. These Inferred Mineral Resources must be mined during the ore extraction process. They cannot be selectively excluded from the Ore Reserves, but are treated at zero gold grade in the estimation.

8.1.5 Mining Loss and Dilution

The Ore Reserve was estimated by considering the following mining loss and dilution:

- Loss 1: all the mineralised materials located either below the 1,230 m ASL or above the 1,270 m ASL, which cannot be accessed via the planned development system;
- Loss 2: mineralised materials in domains #7, #9, #10, #11 and #12, which are inclusive of just Inferred Mineral Resources or located too far away the planned development tunnels to be accessed;
- Loss 3: mineralised materials outside of the mining cut;
- Loss 4: mineralised materials losses inside of the mining cut;
- Dilution 1: the low-grade mineralised materials with a grade below the 1.3 g/t gold; and
- Dilution 2: the Inferred Mineral Resource material and wall rocks inside the mining cut.

A summary of loss and dilution are shown in Table 8-4.

Table 8-4: Summary of Mining Loss and Dilution

Group	Material	Tonnage (kt)	Grade Au (g/t)	Metal Au (kg)
Mineral Resources	Measured	2,107	3.98	8,377
Mineral Resources	Indicated	9,218	3.69	34,026

Mining inventory	Total	7,607	3.73	28,350

Sources: SRK

Notes:

[1] The grade was set to zero when estimating Ore Reserves in "8.1.7 Ore Reserve Statement" to consider the intrinsic geological confidence level of Inferred Mineral Resources, which is lower than those of Measured and Indicated mineral resources, and the guidelines of the *JORC Code* and the *Listing Rules.*

8.1.6 Ore Reserve Classification

All of mined Measured and Indicated Mineral Resources, which include diluting materials and allowances of losses, were classified as Proved Ore Reserves and Probable Ore Reserves, respectively based on the mine development system, mining practices and *FS 2025*, as shown in Table 8-3.

8.1.7 Ore Reserve Statement

The Ore Reserve statement is shown in Table 8-5.

Table 8-5: Ore Reserve Statement for the Levoberezhny Project as of 31 December 2024 by SRK Consulting China Ltd [1, 2, 3, 4, 5]

Category	Cut-off Grade (Au g/t)	Tonnes (Mt)	Au (g/t)	Au (kg)	Au (koz)
Proved	2.0	1.3	4.0	5,200	170
Probable	2.0	6.3	3.6	23,000	740
Total	2.0	7.6	3.7	28,000	910

Sources: SRK

Notes:

[1] The information in this report which relates to Ore Reserve is based on information compiled by Mr Yonggang Wu, MAusIMM, and Dr Yiefei Jia, FAusIMM (CP. Geo), who are full time employees of SRK Consulting China Ltd. Both Dr Jia and Mr Wu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Person as defined in the 2012 edition of the "*Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves*", the *JORC Code.* Dr Jia and Mr Wu consent to the reporting of this information in the form and context in which it appears.

[2] Number was rounded to the second significant figure to reflect the uncertainties in estimate.

[3] Total may not add due to rounding discrepancies.

[4] Mining dilution rate, including waste rock and Inferred Mineral Resources, is 8.2%. Mining loss rate is 7.4%.

[5] The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

8.1.8 Previously Ore Reserve Estimate

No Ore Reserve estimate has been publicly reported for the Levoberezhny Mine.

8.2 Mine Operating Status

The Levoberezhny Mine commenced underground mining in May 2016. The production records in years 2022 to 2024 are shown in Table 8-6. Overall, the ore tonnage is slightly greater than the planned mining design capacity of 924 thousand tonnes per annum ("**ktpa**" or "**kt/a**").

Table 8-6: Mining Production Records

Item	Unit	2022	2023	2024
Ore tonnage	t	1,015,346	1,087,369	972,260
Au grade	g/t	4.53	4.19	4.24
Au content	kg	4,595	4,551	4,127
Driving	m^3	31,796	31,291	42,605
Filling	m^3	346,393	370,310	337,654
Strip ratio	m^3/t	0.03	0.03	0.04
Mining loss	%	5.94	5.92	5.89
Mining dilution	%	5.34	5.33	5.30

Sources: Altynken LLC

At the time of this report, the developed Mineral Resources are located between 1,230 m ASL and 1,710 m ASL. The development system is almost completed, except for some planned extension of existing tunnels. The existing underground infrastructure like developing, hauling and hoisting, ventilation and drainage will be continually used for the future exploitation of mine. The planned mining capacity will be same as the current 924 ktpa.

8.3 Hydrogeology

The region is typically belonging to the continental climate. A summary of weather data is shown in Table 8-7.

Table 8-7: Summary of Weather Data

Item	Unit	Value	Remarks
Annual temperature	degree Celsius	9.6/-33/40	mean/lowest/highest
Thickness of snow cover	cm	20/12/34	mean/minimum/maximum
Average thickness of permafrost	m	0.34-1.00	
Annual rainfall	mm	560	
Wind speed	m/s	15/30	general/maximum
Seismic intensity	degrees	9	

Sources: *FS 2025*

The Levoberezhny Mine is located in the left bank of Taldybulak River. Catchment area of Taldybulak River is about 78.6km^2. The river is mainly charged with seasonal melt water and groundwater. There is no significant hydraulic conductivity between the river and the deposit.

The terrain has an elevation ranging from 1,600 m ASL to 2,300 m ASL, and 20º – 40º dipping angles.

The major aquifers include the Quaternary sediment aquifer in the gully and piedmont, pore aquifer at gully alluvial and fissure aquifer in bedrock. The water bearing complex in the Palaeozoic and Proterozoic rock mass was widely spread in the area as an aquitard.

Groundwater is mainly charged with precipitation, seasonal melt water, and the leaks from alluvial sediments and overlaid rock mass.

There are two types of groundwater in the mine area, which include fissure water in the weathered joints in the surface rock, and the lode water in large sized faults. Deposit inflow is mainly charged with the lode water and has no hydraulic conductivity with the fissure water.

As of year-end 2024, the actual water inflow rate is measured at about 1,000 cubic metres ("**m^3**") per day ("**/d**") for the underground mine at the lowest level 1,230 m ASL. The designed inflow rates at the lowest level 1,230 m ASL are set to 2,310 m^3/d in normal case and 2,772 m^3/d in maximum case in the *FS 2025*, respectively.

8.4 Geotechnical Conditions

Anisotropy was found to be in orthogonal directions for both strength and elastic in all types of rock. The rock mass was classified based on their hardness, shown in Table 8-8.

Table 8-8: Rock Mass Classification

Type	Portion (%)	Rocks	Hardness (f)
Ore		**/**	
Soft	20	quartz-sericite metamorphic	3
Moderate	35	quartz-carbonate metamorphic and mineralised diorites-monzonite	8 - 9
Hard	45	quartz- tourmaline metamorphic	12 -15
Total	100		12
Wall Rock			
Soft	/	quartz- sericite, quartz-sericite chlorite shale	3
Moderate	/	quartz-carbonate, migmatite and diorite-monzonite	8 - 10
Hard	/	quartz-tourmaline metamorphic, amphibolite	12 - 15
Total			10

Sources: *FS 2025*

Quartz-tourmaline metamorphic and quartz carbonate are stable. Rock strength is about 54 - 60 mega pascals ("**MPa**"). Regularly support is unnecessary during the development of drives.

Quartz-sericite and quartz-sericite chlorite shale are unstable. Temporary support is necessary during the development of drives.

Other types of rocks are moderate hardness. Rock strength is about 32 - 48 MPa. Regular reinforcement is necessary during the development of drives.

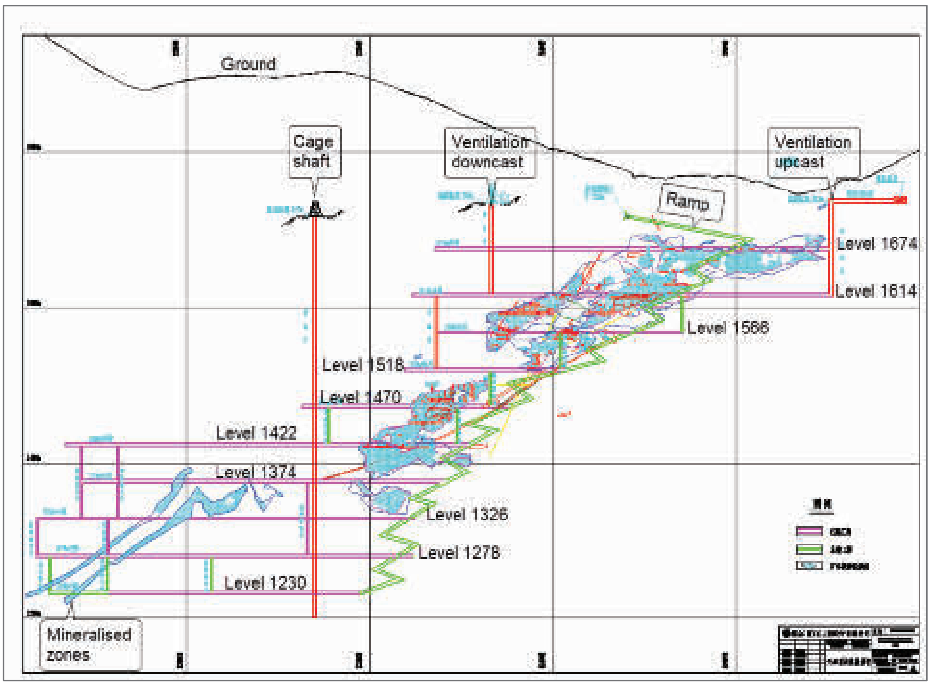
The fault zone is extremely unstable and hence additional support is required.

8.5 Mine Design and Planning

8.5.1 Development System

The purpose of development system is to provide accesses from surface to the mineralised zone to extract materials, as well as to provide ways for transport of rocks, ventilation, drainage, and so on. Usually, a development system consists of tunnels and bays for running and installation of equipment. The longitudinal view of development system is shown in Figure 8-4.

Figure 8-4: Longitudinal View of Development System



Sources: *FS 2025*

Notes: No. 2 adit, which is at level 1,614 m ASL, is not shown in the figure.

The development system includes the main decline, the number 2 ("**No. 2**") adit, the cage shaft, the transfer adit connecting the mining industrial area and the Levoberezhny Plant, several surface and underground ventilation shafts, and the ten haulage levels at 1,674 m ASL, 1,614 m ASL, 1,566 m ASL, 1,518 m ASL, 1,470 m ASL, 1,422 m ASL, 1,374 m ASL, 1,326 m ASL, 1,278 m ASL and 1,230 m ASL. The level main interval is 48 m. Each level is usually subdivided into three 16 m high sublevels. The portals of the main decline, adits and shafts are shown in Figure 8-5.

Figure 8-5: Portal of Main Tunnels for Hauling

Main decline

No. 2 adit

Cage shaft

Transfer adit

Sources: SRK, 13 April 2025

Three mining sections are set to realise the planned ore mining capacity of 924 ktpa. The mining section one served extraction of ore at levels 1,674 m ASL to 1,470 m ASL . The mining section two served extraction of ore between levels 1,422 m ASL and 1,374 m ASL. The mining section three served extraction of ore between levels 1,326 m ASL and 1,230 m ASL. Mining operations carried out simultaneously in the three mining sections.

The underground ore is accessed via a hybrid of decline and adit. Ore is hauled to the surface ore bin with trucks via the decline, the No. 2 adit, the surface road and the transfer adit connecting the underground mine and Levoberezhny Plant. The waste rock is hauled to the surface waste rock dump with trucks via the decline and No. 2 adit. There is also a cage shaft in place to hoist waste rocks, materials, equipment and men for levels at 1,470 m ASL, 1,374 m ASL, 1,278 m ASL and 1,230 m ASL.

The main decline has been developed down to the level 1,230 m ASL. It is located in the footwall of mineralised zone with a switch-back pattern. Parameters of the decline are listed below:

- portal coordinates: northing 15,014.931 m, easting 32,428.250 m, elevation 1,720 m ASL.
- length: about 5,052m.
- cross section: three centred arch, 4.2 m net width, 4.0 m net height.
- gradient: average 9.7%, maximum 10.51%.

The ventilation downcast includes multiple levels, which are 1,735~1,614 m, 1,614~1,566 m, 1,566~1,518 m, 1,518~1,470 m, 1,470~1,422 m, 1,422~1,374 m, 1,374~1,326 m, 1,326~1,278 m, 1,278~1,230 m. A cage was installed in the segment of 1,735~1,614 m with a loading capacity of 1.0 t or 13 persons and a running speed of 1.5 m/s. The parameters of the ventilation downcast are listed below:

- portal coordinates: northing 14,991.172, easting 32,514.993, elevation 1,735 m ASL.
- cross section: circle, 4.5 m net diameter.

The ventilation upcast includes multiple levels, which are 1,740~1,614 m, 1,614~1,566 m, 1,566~1,518 m, 1,518~1,470 m, 1,470~1,422 m, 1,422~1,374 m, 1,374~1,326 m, 1,326~1,278 m, 1,278~1,230 m. Parameters of the ventilation downcast are listed below:

- portal coordinates: northing 14,794.612, easting 32,615.844, elevation 1,740 m ASL.
- cross section: circle, 5.0 m net diameter.

The cage shaft has been driven down to the 1,201 m ASL. It is mainly worked together with the main decline to lift men, waste rocks and materials. A double-deck cage was installed in the cage shaft with a loading capacity of 16.0 t or 70 persons. Parameters of the cage shaft are listed below:

- portal coordinates: northing 15,207.001, easting 32,316.989, elevation 1,718 m ASL.
- depth: about 516 m.
- cross section: circle, 5.0 m net diameter.

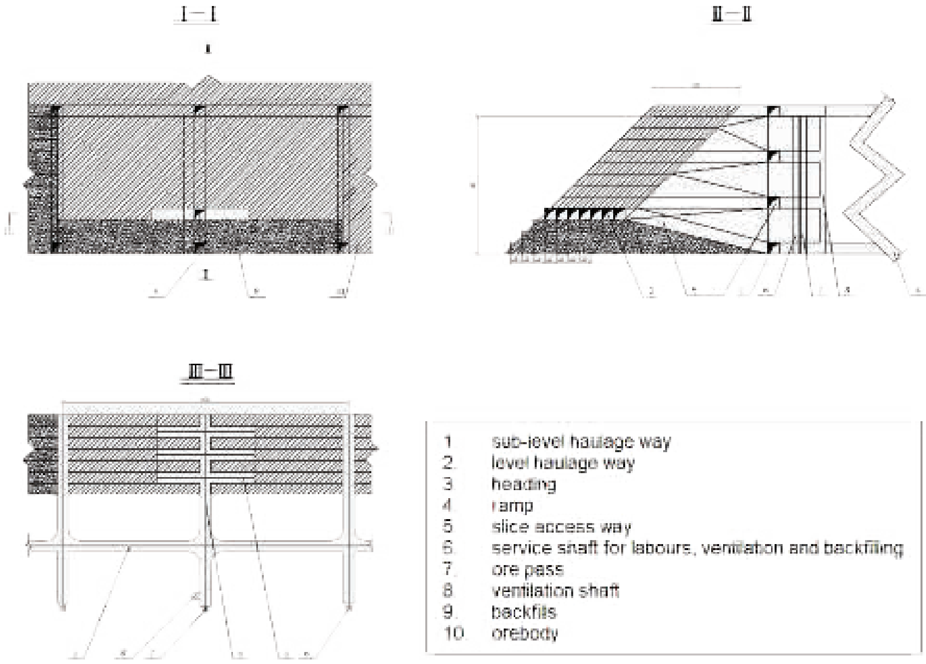
The parameters of No. 2 adit are shown below:

- portal coordinates: northing 16,259.768, easting 31,555.144, elevation 1,603 m ASL.
- cross section: three centred arch, 4.2 m net width, 4.0 m net height.
- length: 1,594 m.

8.5.2 Mining Methodology

Altynken LLC has practised several mining methods since commencing mining, and concluded that the overhand drift and fill mining is the appropriate mining method due to its flexibility and small working face. The first drift is developed in the ore, and is backfilled using cemented tailings fill. The second drift is driven adjacent to the first drift. This carries on until the ore zone is mined out to its full width, at which time the second cut is started atop of the first cut. The mine relied on the cement and tailings filling to the mined-out areas to maintain the stability of underground mine. The schematic diagram of overhand cut and fill mining is shown in Figure 8-6.

Figure 8-6: Schematic Diagram of Overhand Drift and Fill Mining



Sources: *FS 2025*

Stope development includes sub-level haulage ways, slice accesses, headings access, ore pass access, drainage well access, backfilling raise access and backfilling raise. Ore pass access, ore pass, drainage hole access and drainage hole are laid along a level way.

A sub-level consists of four 4 m high slices. Heading has a cross section of 4.2 m × 4.0 m. Two step mining is conducted to exploit a slice. Headings of the first step is filled with cemented tailings backfill to support hanging wall and the following second step exploitation, which usually occurs 2-3 days later, to allow curing of the cemented tailings backfill.

This mining method has been utilised for several years onsite. SRK was informed that this method would be continually used in future due to its simple stope development, limited waste mining and flexibility.

8.5.3 Mining Services

Mining Contracts

Major mining operations like stope mining, driving, deposit and stope developments have been outsourced to some contractors, while major consumptions like explosives, shock tubes, power and fuel are supplied by the Altynken LLC to support contractors' daily work. The mining contracts in years 2022 and 2024 were sighted by SRK.

Both the contractors Shijin Mine Construction Engineering Co., Ltd (*世金矿建工程有限责任公司*, the "**Shijin**") and Datang Mine Construction Engineering Co., Ltd (*大唐矿山建设工程有限责任公司*, the "**Datang**") were engaged to carry out the mining and developing works at the mine. The contractors charge RMB 84.28 per tonne ("**RMB/t**") of ore for the manually overhand drift and fill mining and 94.08 RMB/t of ore for the mechanically overhand drift and fill mining, respectively. The expenses of blasting materials should be deducted from the contractor charges. The contractors have incorporated subsidiary companies in Kyrgyzstan to fulfil the contract.

Backfilling

The mine plan relies on backfill as a ground support medium. The voids will be filled with cemented tailings. The picture of backfill plant, located near to the ventilation downcast, is shown in Figure 8-7. The picture of backfilled heading is shown in Figure 8-8.

Figure 8-7: Backfill Plant

Sources: SRK, 13 April 2025

Figure 8-8: A Backfilled Heading

Sources: SRK, 13 April 2025

The volume of mined-out area to be backfilled is estimated to be 903.2 m^3/d (or 298,064 m^3/a). The volume of backfilling paste demand is estimated to be 1,043 m^3/d.

The backfill plant includes two 942 m^3 upright tailings hoppers, a 245m^3 ash hopper, a 245m^3 cement hopper and two stirrers (SJ03.00 and GJ503). Each stirrer has a filing capacity of 60-80m^3/h.

Tailings, cement and ash are mixed in stirrers to produce 75-77% density backfill, which consists of 1,060 kg/m^3 flotation tailings, 200 kg/m^3 cement, 200 kg/m^3 ash and 440 kg/m^3 water to generate a strength of 1.5-2.5 MPa.

Backfilling paste is transferred to mined-out areas via pipes either laid in backfilling holes for those levels above and at 1,674 m ASL or laid in segments of the ventilation downcast for those levels below 1,674 m ASL by gravity. Stowing gradient is 3.32-10.35. Four backfilling holes of Φ250 mm are sunk down from surface at 1,720 m ASL to Level 1,674 m ASL with bimetal composite pipes of Φ159×15 mm installed. Steel pipe of 16 Mn and Φ127×8 mm are installed in level haulage ways. Polyethylene wear pipes of Φ110×10 mm are installed in stope developments.

Ventilation

The fresh air is drawn into the underground mine via the ventilation downcast, No. 2 adit and decline, then distributed to a drift via level crosscut, level haulage way, stope downcast and sublevel haulage way. The exhausted air is drawn out of the underground mine via stope upcast, upper-level ventilation way and the ventilation upcast.

Due to long-term cold days in winter, air heating is required to maintain a temperature greater than 2 °C in the downcast, the No. 2 adit and the decline.

The air volume demand was estimated to be 287 m^3 per second ("**/s**"), which includes 140 m^3/s in the ventilation downcast, 67 m^3/s in the No. 2 adit and 80 m^3/s in the decline.

The ventilation resistances were estimated to be 1,517 pascals ("**Pa**") and 3,121 Pa at the easy time and the hard time, respectively. The ventilation resistance varies with the length of tunnels. For an underground mine, the development tunnels are usually extended year by year in horizontal and vertical directions. Longer tunnel will have a greater resistance. When a ventilation design is carried out, the designers usually define the easy time as the time of completion of initial capital works, and the hard time as the time of completion of all development tunnels at the later years of life of mine.

Two axial-flow fans (MAF-3350/1900-1G) as shown in Figure 8-9 are installed at the portal of the ventilation upcast to draw out of the mine. The fan was driven either by an 800 kilowatts ("**kW**") electric motor at 600 revolutions per minute ("**rpm**") in easy time, or a 1,600 kW electric motor at 750 rpm in hard time.

The local ventilation takes air from the flow-through system and distributes it to the mine workings via temporarily local fans and duct system. It is estimated that 16 auxiliary fans (JK58-1No.3) are required for the auxiliary ventilation.

Figure 8-9: Ventilation Shaft

Sources: SRK, 13 April 2025

Notes: The ventilation downcast in Figure 8-4 was not sighted by SRK, as the technician didn't know the portal location at the time of site visit.

Mine Drainage and Dewatering

Three permanent water sumps are located at levels 1,518 m ASL, 1,374 m ASL and 1,230 m ASL. Temporary water sumps are at each sublevel. The groundwater firstly flows to the temporary sumps, then to the permanent sumps by gravity.

Water pumps are installed in each permanent sump to pump water to the upper permanent sump until to the surface sediment pool via two lines of seamless steel pipes in 194 mm external diameter and 10.5 mm wall thickness ("**Φ194×10.5 mm**"). Properties of water pumps are summarised in Table 8-9. Pictures of water sump facilities at level 1,518 m ASL are shown in Figure 8-10.

Table 8-9: Water Pump Properties

Item	Unit	MD85-45*3	MD155-67*3	MD155-67×7
Location		2 sets at level 1,518 m ASL	2 sets at level 1,518 m ASL 3 sets at level 1,230 m ASL	3 sets at level 1,374 m ASL

Water Supply

Groundwater is pumped out of underground mine to the sediment pool in Figure 8-11 that is close to the portal of No. 2 adit. The water is treated then supplied to the underground mine to support mining operations. Water demand is 500 m^3/d for mining operations.

Water is supplied from a surface water tank with a 0.4-0.7 MPa supply pressure. Water is distributed to a level via a seamless steel pipe of Φ133×6 mm installed in the ventilation downcast shaft, then to the working area via seamless steel pipe of Φ89×4.5 mm. Valves are installed to reduce supply pressure at level crosscuts.

Figure 8-11: Sediment Pool for Mining Water Supply

Sources: SRK, 13 April 2025

Compressed Air

Compressed air demand is estimated to be 74.24 m^3 per minute ("**/min**").

The compressed air station in Figure 8-12 is located near the portal of ventilation downcast. Seven fixed screw compressors, including five rated at 45.5 m^3/min capacity and two rated at 63.0 m^3/min capacity, were installed in the station. The working pressure is 0.8 MPa for the air tank. The compressed air is distributed to an active level along seamless steel pipes of Φ219×6 mm in the ventilation downcast, then to the workface along seamless steel pipes of Φ180×5.5 mm.

Figure 8-12: Air Compressors

Sources: SRK, 13 April 2025

Explosive Supply and Management

There are two explosive magazines belonging respectively to the Explosion Company (locally referred to as the ООО Взрывпром Компании, ООО КГТК) and Salut Company LLC (locally referred to as the OcOO «Салют Компани») in the Lower Seraphim Village, Issyk-Kul Akin Region and Chuy Province and the Red-October Village, Kemin Region, Chuy Province to store explosives and shock tubes bought by the Altynken LLC. These blasting materials are then transferred to the underground explosive magazine at Level 1,614 m ASL, which can store four tonnes of explosives and related detonators. The picture of underground explosive magazine is shown in Figure 8-13.

Figure 8-13: Underground Explosive Magazine

Sources: SRK, 13 April 2025

Several emulsion explosive supply contracts in years from 2022 and 2024 were sighted by SRK. The suppliers include Promtech Explosion LLC (locally referred to as the OcOO «Промтех взрыв») in 2022 and 2023, and Xinjiang Tianhe Chemical Industry Co. Ltd in 2024. The supplier is responsible to transport the shock tube to the aforementioned explosive magazines.

Several shock tube supply contracts in 2022 and 2023 were sighted by SRK. The suppliers include Aji-Service LLC (locally referred to as the OcOO «АДЖИ-СЕРВИС») and Geotechservice LLC (locally referred to as the OcOO «Геотехсервис») in 2022, and Salut Company LLC (locally referred to as the OcOO «Салют Компани») in 2023. The supplier is responsible to transport the shock tube to the aforementioned explosive magazines.

Other Facilities

There is a workshop/ repair chamber at Level 1,614 m ASL to provide maintenance service for trackless equipment.

There is a refuge chamber at Level 1,518 m ASL. During site visit between 13 and 15 April 2025, SRK was told that there is no other refuge facility in place or in plan.

8.5.4 Mining Equipment

In SRKs opinion, there is sufficient mining equipment in place to support mining operations, but most of them utilised are more than five years old. It is expected that the old equipment will be replaced with new one. The requirement of primary mining equipment is shown in Table 8-10.

Table 8-10: Primary Mining Equipment

8.6 Mine Production Plan

8.6.1 Operating Schedule and Production Capacity

The Levoberezhny Project has been and will be operated 8 hours per shift, 3 shifts per day and 330 days per year. Both the planned mining capacity and processing throughput is 2,800 tpa ore, or 924 ktpa.

8.6.2 Production Plan and LOM

The mining sequence of the *FS 2025* is summarised as following:

- Firstly, the levels are mined downward.

- Then, the mineralised zone in a level is mined from hanging wall to footwall.
- Finally, the sublevels in a stope are mined upward.

The mining sequence is straightforward and SRK opine that it is technically feasible.

The modified production schedule is shown in Table 8-11, based on SRK's modelling.

The life of mine ("**LoM**") is about nine years, including a seven-years full-production period and a two-years ramp-down period (see Table 8-11).

Table 8-11: LoM Production Schedule

Item	Unit	Total	2025	2026	2027	2028	2029	2030	2031	2032	2033
Ore Tonnage	kt	7,607	960	924	924	924	924	924	922	693	411

8.6.3 Production Expansion Options

There is no plan in place to expand the planned mining capacity of 924 ktpa.

9 Processing and Metallurgical Assessment

9.1 Processing and Metallurgical Testwork

9.1.1 Introduction

The Levoberezhny Plant, with a designed capacity of 2,500 tpd, was completed for commissioning in 2015 and now has expended to 2,800 tpd. Before that, metallurgical testing programs were conducted by different laboratories. The test results show that the RoM from the Levoberezhny Mine is uncomplicated to process, and satisfactory recovery rate can be achieved either by cyanidation, flotation or cyanidation of flotation concentrate. Zijin Xiamen has completed *FS 2025* and design of Levoberezhny Project. A process of flotation-cyanidation carbon-in-leach ("**CIL**") of flotation concentrate is designed for the Levoberezhny Plant. The designed processing parameters are as follows:

- Grade of flotation gold concentrate: 30 g/t;
- Gold flotation recovery: 95.0%;
- CIL recovery of gold concentrate: 96.0%; and
- Overall recovery: 91.2%.

Since the Levoberezhny Plant commenced its production, systematic process optimisation tests have been carried out from 2015 to address technical challenges such as the complex and variable nature of the ore and the recovery of gold from waste residues. Through continuous research into mineral characteristics, optimisation of flotation reagent ratios, and comprehensive multi-metal recovery tests, the adaptability of the processing system to changes in RoM properties has been effectively enhanced, further achieving the goal of maximising Mineral Resource utilisation. These tests were conducted by various professional entities, as listed below.

- *Taldybulak Levoberezhny Gold Mine Mineral Processing and Metallurgical Testing and Industrialisation Application Research*, Xiamen Zijin Mining and Metallurgy Technology Co., Ltd, October 2015.
- *Experimental Study on the Processing and Metallurgy of Taldybulak Levoberezhny Gold Mine*, Xiamen Zijin Mining and Metallurgical Technology Co., Ltd, February 2015
- *Experimental Study Report on the Mineral Processing of Taldybulak Levoberezhny Gold Sulphide Ore,* National Centre for Complex Processing of Mineral Raw Materials of the Republic of Kazakhstan, June 2017
- *Taldybulak Levoberezhny Gold Mine Mineral Processing Test Research Report,* Beijing General Research Institute of Mining and Metallurgy ("**BGRIMM**"), December 2018.
- *Mineral Processing Test Research Report for the C2 Mineralised Zone of Altogolch LLC*, BGRIMM Technology Group, August 2022.
- *Experimental Research on Gold Extraction Process Development from Altogolch Gold-Bearing Residues*, Xiamen Zijin Mining and Metallurgy Technology Co., Ltd, August 2022.

Metallurgy test results are summarised below.

9.1.2 Run of Mine Cyanidation Test

Mineralogy study indicates that the RoM of Levoberezhny Mine contains pyrite and small amount of chalcopyrite, and the gold is finely embedded in the ore. Gravity separation test achieved poor recovery result consistent with the mineralogical conclusion. So direct cyanidation and flotation tests were conducted.

Keeping the sodium cyanide concentration at 0.05% and cyanidation time of 24-hours, the results of the whole ore cyanidation ("**WOCN**") roll bottle test at different grinding fineness are shown in Table 9-1. The gold extraction rate reached 89%, indicating that the ores are suitable for cyanidation.

Table 9-1: Test Results of RoM WOCN Test

Item	Unit	P_{80} = 74 μm		P_{85} = 74 μm		P_{80} = 47 μm	
		Test 1	Test 2	Test 1	Test 2	Test 1	Test 2
RoM Grade	g/t	7.35	7.25	7.38	7.29	7.27	7.19
Au Grade of Leach Residue	g/t	1.00	0.90	0.92	0.80	1.12	0.96

9.1.3 Whole Sulphide Flotation Test

Based on optimised conditions, two closed circuit tests were conducted using a whole sulphide flotation circuit of "one roughing - one scavenging - one cleaning". The results are shown in Table 9-2. Whole sulphide flotation was intended to recover all sulphide minerals and precious metal minerals in a bulk concentrate. The concentrate has a gold recovery of 95% and a copper recovery of 88%. It is possible to further process qualified copper concentrates from the mixed concentrates.

Table 9-2: Test Results of Whole Sulphide Flotation Closed Circuit

Cleaning Time (minutes)	Product	Yield (%)	Grade		Recovery	
			Au (g/t)	Cu (%)	Au (%)	Cu (%)
5	Bulk Concentrates	17.08	40.70	1.45	95.46	88.57
	Tailings	82.90	0.40	0.04	4.54	11.43
	Feed	100.00	7.28	0.28	100.00	100.00
7	Bulk Concentrates	26.00	27.73	-	95.12	-
	Tailings	74.00	0.50	-	4.88	-
	Feed	100.00	7.58	-	100.00	-

Sources: Altynken LLC

9.1.4 Cyanidation Test on Flotation Concentrate

Two groups of WOCN tests were conducted, and the results are shown in Table 9-3. The results showed that the high sodium cyanide concentration did not improve the gold extraction rate. The finer grinding of the concentrate helped the gold leaching, which was consistent with the mineralogical conclusion that a small amount of gold was wrapped in the sulphides.

Table 9-3: Cyanidation Leach Test Results of Flotation Concentrates

Item	Unit	Test 1	Test 2	Test 3	Test 4
Flotation Concentrate Grade	g/t	43.32	43.94	42.20	48.90
Au Grade of Leach Residue	g/t	4.32	4.04	5.00	3.90
Au Extraction	%	90.03	90.80	88.15	92.02
Lime Consumption	kg/t	1.50	1.50	1.50	1.50
Sodium Cyanide Concentrates	%	0.10	0.20	0.10	0.10
Sodium Cyanide Consumption	kg/t			7.95	7.95
Grind Fineness	μm	P_{85} = 74 μm	P_{85} = 74 μm	P_{85} = 74 μm	P_{80} = 47 μm
Cyanide Time	h	24.00	24.00	24.00	24.00

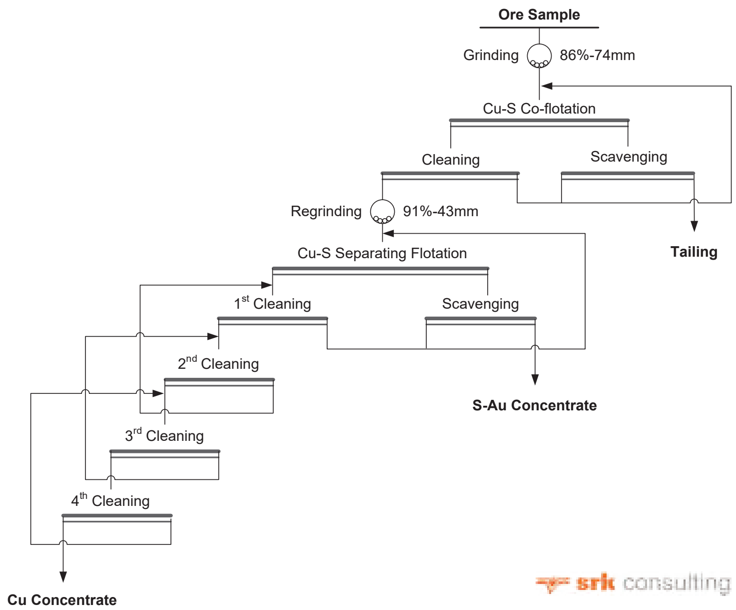
Sources: Altynken LLC

9.1.5 Cu-S Separating Flotation Test and Cu-S concentrate Cyanidation Test

The whole sulphide flotation achieved high gold and copper recoveries, but the overall gold recovery of flotation and concentrate cyanidation is estimated to 85.5%, a little bit lower than that of the ore direct WOCN. Copper minerals – sulphur separation flotation test on bulk concentrate was carried out to assess the possibility of producing a saleable copper concentrate.

The test flowsheet is shown in Figure 9-1. The results are shown in Table 9-4. The test obtained marketable copper concentrate, which contained 14% Cu and 167 g/t to 260 g/t Au, with recoveries of 91% to 93% Cu and 65% to 71% Au. The sulphur concentrate mass yield was 12% to 14%, containing 8.5 g/t to 9.3 g/t Au, with a gold recovery of 24% to 29%. The total gold recovery of the two concentrates is about 95%.

Figure 9-1: Cu-S Combination-Separation Flotation Test Flowsheet



Sources: SRK

Standard CIL testing of the S-Au concentrate was carried out resulting that the gold extraction achieved 53.16% under the sodium cyanide concentration of 0.01%. It is estimated the overall gold recovery (gold in Cu-Au concentrate and Doré bullion from S-Au concentrate cyanidation) is around 84%.

Table 9-4: Test Results of Cu-S Combination-Separating Flotation

Collector dosage	Product	Yield (%)	Grade		Recovery	
			Au (g/t)	Cu (%)	Au (%)	Cu (%)
High	Cu Concentrates	1.57	167.32	14.03	65.14	92.94
	Au Concentrates	13.97	8.46	0.056	29.39	3.31
	Tailings	84.47	0.26	0.01	5.46	3.75
	RoM	100.00	4.02	0.24	100.00	100.00

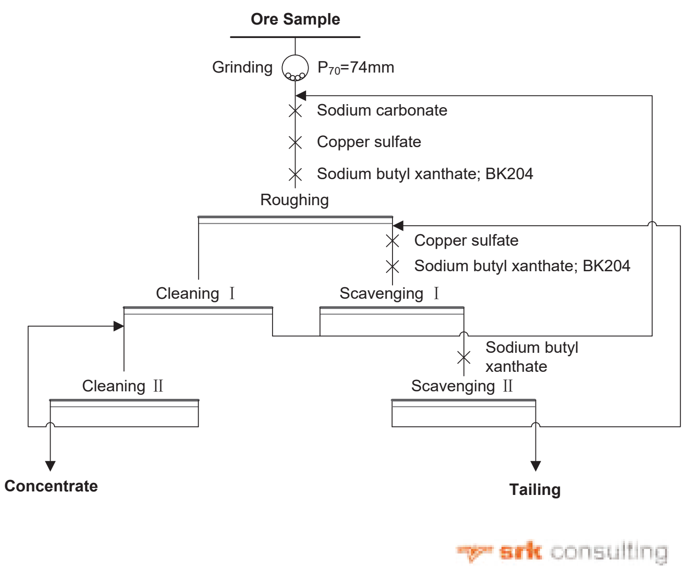
9.1.6 Metallurgical Test on Samples of C2 Mineralised Zone

Through systematic experimentation, a flotation process featuring "one roughing, two scavenging, two cleaning" (with sodium carbonate added) was ultimately established, as illustrated in Figure 9-2. Closed-circuit test results (shown in Table 9-5) demonstrated technical parameters: gold concentrate yield reached 13.60% with gold grade elevated to 38.48 g/t, achieving gold and copper recovery rates of 97.11% and 94.27% respectively. This optimised process exhibits distinct technical advantages including streamlined configuration, rational reagent regime, and controllable operational costs, providing a reliable technical foundation for industrial implementation.

Figure 9-2: Closed-Circuit Test Flowsheet



Sources: SRK

A closed flotation circuit featuring "one roughing - two scavenging - two cleaning" was applied in the test of the C2 mineralised zone sample based on a series of optimisation tests. The results are listed in Table 9-5, achieving gold and copper recovery rates of 97.11% and 94.27% respectively.

Table 9-5: The Results of Closed-Circuit Test

Name	Yield (%)	Grade			Recovery		
		Au (g/t)	Cu (%)	S (%)	Au (%)	Cu (%)	S (%)
Concentrates	13.60	38.48	1.15	39.52	97.11	94.27	95.69
Tailings	86.40	0.18	0.011	0.28	2.89	5.73	4.31

9.2 Levoberezhny Processing Plant

9.2.1 Introduction

Zijin Xiamen conducted the feasibility study, preliminary design and construction drawing design for the Levoberezhny Project from 2013 to 2015. The Levoberezhny Plant was completed and commissioned in 2015, and the technical renovation was carried out in the same year. It is currently in normal production.

The Levoberezhny Plant is located in the Chimbra Valley, 2 km northeast of the Levoberezhny Mine. The designed processing capacity is 2,500 tpd and the annual operating rate is 90.41%. The plant has expanded its processing capacity to 2,800 tpd (or 924,000 tpa) through continuous process optimisation, operational adjustments, and technological upgrades. It currently produces gold-copper concentrate and Doré bullion. Figure 9-3 shows the panoramic photos of the Levoberezhny Plant.

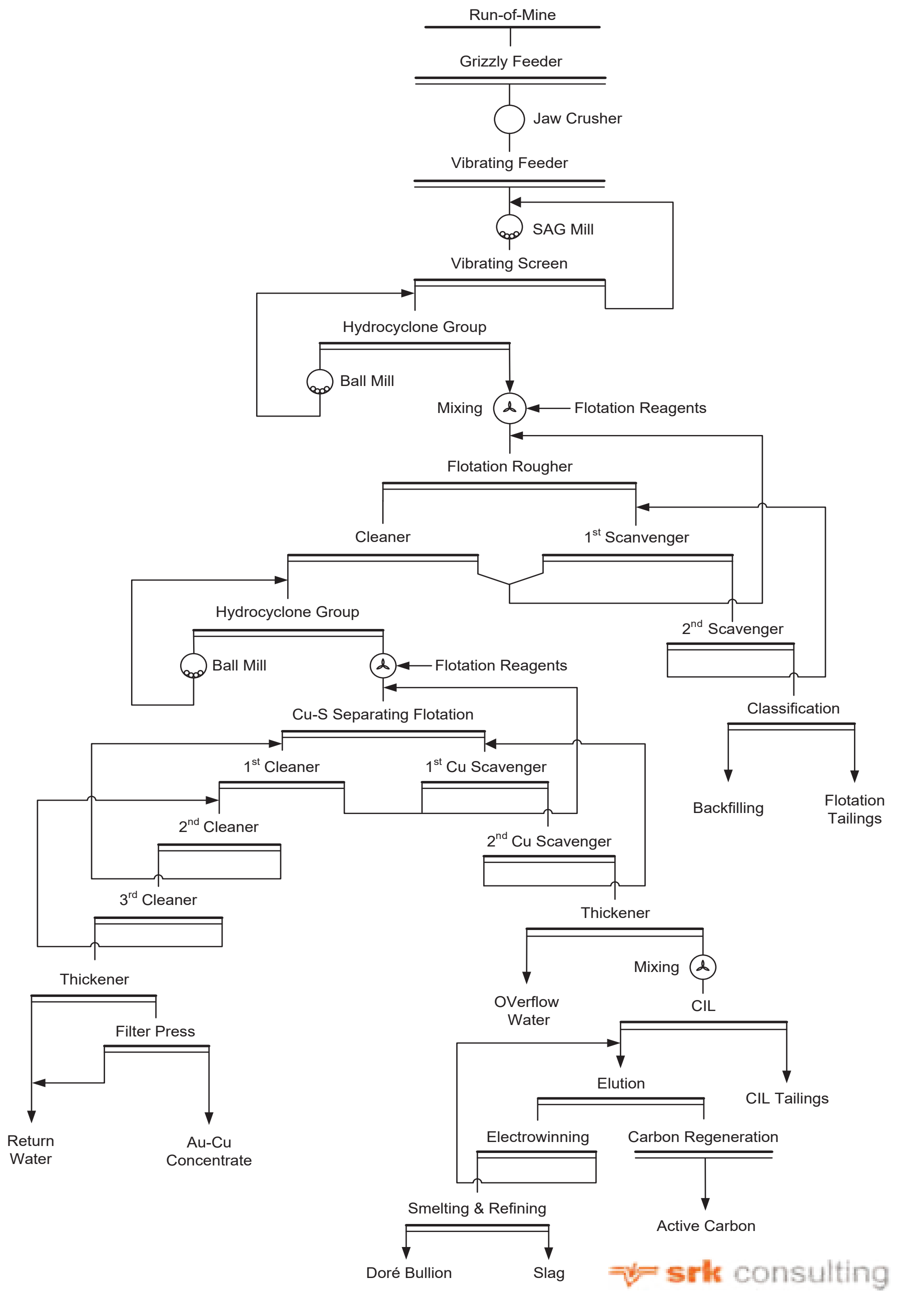
Figure 9-3: Overview of the Levoberezhny Plant and Key Workshops

Sources: SRK, 13 April 2025

9.2.2 Processing Flowsheet

The processing flowsheet includes crushing and grinding, whole sulphide flotation – Cu-S separation flotation, cyanide leaching and active carbon absorption, and elution-electrowinning, regeneration operations, shown in Figure 9-4.

Figure 9-4: Flowsheet of Levoberezhny Plant



Sources: SRK

The flowsheet is briefly described below:

Crushing and Grinding

The ore crushing and grinding circuit comprise a primary crushing and semi-autogenous mill and ball mill ("**SAB**") grinding to grind the ore to the target fineness of P_{75}=74μm.

Whole Sulphide Flotation and Concentrate Regrind

Whole Sulphide flotation adopts the flowsheet of "one-stage roughing + two-stage scavenging + one-stage cleaning" to produce mixed concentrate and tailings. The tailings are classified by a hydrocyclone group, the underflow is pumped to the cemented tailings backfill plant and the overflow flows automatically into the TSF. The bulk concentrate is ground to P_{92} = 45 μm through a regrinding circuit composed of a hydrocyclone group and a ball mill.

Cu-S Separating Flotation

The reground bulk concentrate is reported to Cu-S separation flotation circuit. The Cu-S separating circuit is composed of "one-stage roughing + three-stage cleaning + two-stage scavenging" to produce gold-copper concentrate and tailings. The gold-copper concentrate undergoes a two-stage dewatering process involving thickening and filter pressing, reducing its moisture content to below 12%. It is then packaged, stored, and prepared for sale. The tailings are S-Au concentrate, which is pumped into the CIL pre-leaching thickener.

Pre-leaching Thickening and CIL

The S-Au concentrate is thickened in the pre-leach thickener to a solid density of 40%~45% suitable for agitation leaching and pumped to the CIL leaching tanks in series to leach for 48-hours. Activated carbon is fed into the adsorption tank through a four-stage counter current CIL process, which simultaneously accomplishes gold leaching and adsorption, ultimately yielding gold-loaded carbon and cyanide tailings. The gold-loaded carbon is sent to the smelter, and the cyanide tailings pass through a safety screen to recover the mashy carbon and then flows into the decyanidation agitation tank.

Decyanidation of Cyanide Tailings

The CIL tailings are pumped to the cyanide TSF ("**CN TSF**"), where natural aeration achieves cyanide degradation. The treated process water is returned to cyanide deconstruction tanks in the cyanidation facility, undergoes secondary cyanide decomposition via hydrogen peroxide oxidation, and is ultimately conveyed to the flotation TSF ("**FL TSF**") for closed-loop recycling.

Recovery of Gold from Activated Carbon

The Zadra desorption process and advanced high-temperature desorption - isothermal electrowinning equipment is adopted to recovery gold from each 3 t of activated carbon. The gold is desorbed from the activated carbon and electrodeposited at a temperature of 140-150 °C, and the gold sludge is regularly taken out from the electrowinning cell, purified by a wet method, and smelted in an intermediate frequency furnace to form the Doré bullion with a content no less than 97%. After elution, the barren carbon is hydraulically transported to the acid pickling and regeneration process, washed with hydrochloric acid to remove calcium and magnesium impurities to restore its adsorption activity and returned to the CIL circuit.

9.2.3 Processing Facilities and Main Equipment

The main production facilities of the Levoberezhny Plant include the RoM bin, primary crushing facility, belt corridor, middling's bin, grinding facility, transfer station, reagent preparation room, flotation facility, pre-leaching thickener, leaching adsorption facility and smelting facility, etc., as well as the auxiliary machine repairing workshop, laboratory, head tank, and TSF.

The main processing equipment is summarised in Table 9-6. The Levoberezhny Plant is equipped with multiple belt conveyors and numerous slurry pumps to transport ore and slurry, which are excluded from Table 9-6. After a few years of actual operation, it is proved that the existing equipment is suitable for process requirements.

9.2.4 Historical Production Performance

The historical production statistics of the Levoberezhny Plant from 2022 to 2024 are detailed in Table 9-7. With technological upgrades and continuous operational optimisation, the Levoberezhny Plant has gradually achieved stable and sustainable production.

Table 9-7: Historical Production Indicators of Levoberezhny Plant

Indicator	Unit	2022	2023	2024

Sources: Altynken LLC

Notes:

[1] The gold-bearing residue deposited in the environmental protection pond is a byproduct formed during the long-term operation of the mineral processing system. The recovered metal quantity from the waste residue is not included in the annual production recovery rate statistics.

Au, Ag and Cu are beneficial elements in gold-copper concentrates that can be priced and sold. Pb, As, Zn, however, are deleterious elements, and exceeding its threshold will result in price penalties. Table 9-8 summarises the arithmetic average grades of 76 gold-copper concentrate sales samples from Levoberezhny Project in 2023 and 2024. The results indicate that the copper grade is much lower than the standard of saleable copper concentrate.

Table 9-8: The Results of Gold-Copper Concentrate

Item	Unit	Minimum	Maximum	Average

9.3 Tailing Storage Facilities

9.3.1 Introduction

The Levoberezhny Plant is equipped with a FL TSF and a CN TSF. Both TSFs adopt a one-step constructed dam method, with 2.0 mm high-density polyethylene ("**HDPE**") membranes installed across the base and side slopes to form an impermeable structure. Completed and commissioned in 2015, both TSFs have demonstrated through years of operational practice that they maintain safe and stable operational conditions.

The FL TSF is located in the downstream of the branch ditch of the Levoberezhny Plant, and it is a Valley-type TSF. The topography of the TSF is relatively flat, and the dam is an impermeable embankment dam, which is constructed by rolling materials excavated within the TSF. The designed dam crest elevation is 1,612 m ASL, the dam height is 78.7 m, the axis length of the crest is 289 m, the dam crest width is 8 m, and the total capacity is 4.6 million cubic metres ("**Mm^3**"). As of February 2025, the used capacity is 2.716 Mm^3, and the remaining capacity is 1.884 Mm^3.

The CN TSF is located in the upstream of the branch ditch of the Levoberezhny Plant, and it is a Valley-type TSF with steep terrain. The dam is an impermeable embankment dam, which is constructed by rolling materials excavated within the TSF. The designed dam crest elevation is 1,675 m ASL, the dam height is 45 m, the axis length of the crest is 220 m, the dam crest width is 6 m, and the total capacity is 1.30 Mm^3. which can meet the storage requirements of the cyanidation tailings during LoM. At present, the used capacity is 0.56 Mm^3, and the remaining capacity is 0.74 Mm^3.

According to the *FS 2025*, the Ore Reserves amount to 5.37 Mt, with total flotation tailings of 4.56 Mt, of which 1.90 Mt are used for the cemented tailings backfill and 2.66 Mt require storage in the FL TSF. Based on the calculation of the bulk density of 1.407 t/m^3, an effective FL TSF capacity of 1,891,969 m^3 is needed, and the total capacity of the FL TSF is 2,102,187 m^3 with the utilisation factor of 0.9. The technical assessment indicates that the FL TSF has insufficient capacity to accommodate tailings generated within the Levoberezhny Project's LoM. Therefore, a heightening and capacity expansion project is required.

The total cyanidation tailings during LoM are 2,261,100 t and based on the calculation of the bulk density of 1.94 t/m^3, an effective CN TSF capacity of 1,165,500 m^3 is required, and the total capacity of the CN TSF is 1,295,000 m^3 with the utilisation factor of 0.9.

Following SRK's on-site investigation and confirmation, the operational supervision of the TSFs is conducted by the National Kento Design and Research Institute in accordance with the *Operational Design for the Cyanidation and Flotation Tailings Storage Facility for the Taldybulak Levoberezhny Gold Mine.* SRK considered the risks related to the expansion and operating of TSFs can be controlled well.

The panoramic photos of the FL (bottom picture) and CN TSFs (top picture) are shown in Figure 9-5.

Figure 9-5: Overview of TSF

Sources: SRK, 13 April 2025

Notes: Top picture for the CN TSF. Bottom picture for the FL TSF.

9.3.2 Seepage Prevention and Drainage Control System

A rockfill prism was designed at the downstream slope toe in the TSF embankment dams to strengthen the drainage of the dam. The upstream slope of the rockfill prism was provided with a 50 cm gravel mattress + 400 grams per square metres ("**g/m^2**") non-woven geotextiles inverted filter. The rockfill prism height of the FL TSF is 40 m, the width of the dam crest is 50.1 m, and the top axis length is 176 m. The rockfill prism height of the CN TSF is 15 m, the width of the dam crest is 4 m, and the top axis length is 167 m.

The seepage resistance treatment for both FL TSF and CN TSF were carried out. The dam slope in the upstream of TSF together with the storage area are covered with 400 g/m^2 geotextile + 2 mm HDPE membrane for seepage prevention. In order to reduce the supporting effect of groundwater under the membrane on the geotextile in the TSF, blind drains are set in the main drains of the TSF, and flower tubes with a diameter of 200 mm are set in the blind drains, filled with gravel in the sides and top of the flower tube. It is then wrapped with non-woven geotextile, with 50 cm coarse sand filter layer laid on the geotextile. The blind drains passed through the FL TSF and CN TSF, and finally discharged into the seepage-prevention dam of the downstream TSF, where the water under the membrane is collected and discharged into the downstream catch basin, or discharged after environmental protection treatment and used for the processing production.

9.3.3 Flood Control System

The tailings are discharged evenly in front of the dam. A barge pumping station is set up in the clarification zone at the end of the dam to pump the supernatant into the backwater head tank of the Levoberezhny Plant.

The FL TSF is classified as a third-class one, based on a once-in-a-thousand-year flood control standard, the catchment area is 5.8 km^2. The CN TSF is classified as a fourth-class TSF, based on a once-in-a-hundred-years flood control standard, the catchment area is 2.58 km^2. After flood regulation calculation, the flood regulation capacity of the two TSFs can hold the total flood volume. After the flood water is stored in the TSF, it will be pumped back to the Levoberezhny Plant through the return water facilities in the TSF for recycling. And both TSFs are equipped with spillway as the emergency flood discharge facilities in order to ensure the safety of TSFs.

The spillway of the FL TSF is arranged on the left bank with the net section size of B×H = 1.4 m×1.4 m, and the designed flow rate is 4.6 m^3/s. The floor elevation of the spillway entrance is 1,610 m ASL. The net section size of the flood interceptor ditch on the right bank of FL TSF is B×H = 1.4 m×1.4 m, with the designed flow rate of 1.66 m^3/s.

The spillway of CN TSF is arranged on the left bank with the net section size of B×H = 1.4 m×1.4 m, and the designed flow rate is 3.22 m^3/s. The rectangular cross-section is adopted on the left bank of the circular flood interceptor ditch with the net section size of B×H = 0.7 m×0.7 m. The designed flow rate is 0.81 m^3/s, and the designed discharge velocity is 2.32 m/s. The spillway and interceptor dich are lined with C20 (compressive strength of 20 MPa) reinforced concrete with a thickness of 20 cm.

10 Workforce Assessment

10.1 Workforce Numbers

Workforce numbers at the Altynken LLC at the end of 31 December 2024 are shown in Table 10-1. SRK believes that the workforce number for each operating department, such as the mining, the processing and metallurgical plant, and the production technical services divisions is sufficient to match the current mining and processing capacity of the Levoberezhny Project.

Table 10-1: Workforce Number Statistics

Department	Chinese	Kyrgyzstan	Total
Joint actuator management committee	3	2	5
Production and operation management	2	0	2
Mining [1]	16	282	298
Levoberezhny Plant	7	262	269
Division of production technologies	9	123	132
Supply	4	25	29
Sales	1	6	7
Emergency and safety production	2	21	23
Environmental protection and ecology	2	4	6
Human resource	1	5	6
Planning and finance	5	9	14
Supervision and audit	1	3	4
General manager office	3	74	77
Security	0	61	61
Total	**56**	**877**	**933**

Sources: Altynken LLC

Note: Mining workers were employed by contractors. Altynken LLC is responsible for technical management.

The workforce expenses in years 2022 to 2024 are relatively stable at about US$12.7 million annually, while the workforce expenses in 2024 is about US$13.8 million, an increase of about 9% compared 2023. The workforce expenses consist of salaries, welfares and social funds.

10.2 Assessment of Workforce

Based on the labour law of Kyrgyzstan, all staff and employees of Altynken LLC have signed labour contracts. Altynken LLC also pays allowances, such as for working in different working environments, and annual bonus for employees.

Almost all labour from Kyrgyzstan, have joined the labour union that is independent of the Altynken LLC. The labour union stands with the local workforce and has the power to negotiate with Altynken LLC about the employment, remuneration, leave of absence, dismiss, etc. In SRKs opinion, overall, the interests of labour can be well guaranteed.

As of 31 December 2024, the workforce numbers at the Altynken LLC including management, technical, operational staff, and mining contractors in total was 933. SRK was informed during the site visit that the turnover rates of the last three years from 2022 to 2024 were approximately 11%, 8% and 12% respectively.

To ensure the safe and normal operation of the Levoberezhny Project, the regular training and continuing education should be carried out to improve the safety operation skills, technical level, and management level of key workers, technicians, and managers.

11 Project Infrastructure

Project infrastructures have been developed and maintained well in history. These facilities can support the operation well in future.

11.1 Road Access

Accessibility is described in "4.2 Accessibility".

Overall, access to the property is convenient via paved roads. Pictures of paved road and railway are shown in Figure 11-1.

Figure 11-1: Pave Road and Railway outside of Mine Area

Paved road

Single-lane railway

11.2 Power Supply

Power is supplied by the branch of OJSC "National Electric Grid of Kyrgyzstan" - Chui Electric Networks Enterprise (locally referred to as the Филиал ОАО «НЭСК» ЧуПЭС) at 26.458 megawatts ("**MW'**), according to the power supply contract dated on 31 December 2022. The contract is valid till the 31 December 2025.

The mine is supplied with power from two substations via 110 kV overhead feed lines. The type of power line is LGJ-120 mm^2. Descriptions of these two substations are shown below:

- The 220 kV Bystrovka Substation is located 9 km north of the Levoberezhny Project, which is equipped with two sets of 220/ 110/ 35 kV transformers with each having a rated capacity of 63 MVA.
- The 110 kV Orlovka Substation is located 12 km northwest of the Levoberezhny Project, which is equipped with two sets of 110/ 35/ 10 kV transformers. Rated capacities are 10 MVA and 6.3 MVA for these two transformers, respectively.

The 110 kV general substation shown in Figure 11-2 is located near the grinding facilities in the Levoberezhny Plant. It is equipped with two sets of SFZ10-12500 110kVA/ 10kV transformers and related power distributors. The footprint of the substation is 60×70 m. The power is supplied to the 10 kV distribution room for mining and distribution room of main building via a 10 kV radial overhead circuit. A special 10 kV overhead circuit is used to supply power to the floating pumping boat in the TSF, boiler bay in the Levoberezhny Plant, water treatment plant in the Levoberezhny Plant, and other auxiliary facilities.

Figure 11-2: General Substation and Standby Generator

General substation

Standby diesel generator

Sources: SRK, 13 April 2025

In additional to the general substation, two diesel generator sets are in place to supply power in case of outages. Descriptions are shown below:

- The primary diesel generator facility in Figure 11-2 is located near the portal of ventilation downcast of the mining site, equipped with two suits of 1,650 kW generators.
- The secondary diesel generator facility is constructed near the 110 kV Zim Substation, equipped with a diesel generator of 2,400 kW.

Surface power distribution is described below:

- The 10 kV distribution room for mining is located near the ventilation downcast, close to the air compressor shed. A SCB10-250 kVA 10/ 0.4kV transformer is installed to distribute power to the 10 kV electric motor in the air compressor shed, underground central substation, fan shed, exit shaft and air heating chambers in the ventilation downcast and the decline.
- The distributor in the fan shed gets power from the 10 kV distribution room for mining via two circuits of 10 kV. The output power is radially distributed to an 800 kW fan, a SG10-100 kVA 10/ 0.4 kV transformer and all other equipment.
- The substation in the backfill plant gets power from the 10 kV distribution room for mining. A transformer of SCB10-400 kVA 10/ 0.4 kV is installed to supply power to backfill facilities, water pumping room, water treatment facilities of mining and all equipment in the vehicle repairing workshop.

Underground substation chambers are described below:

- The central distribution chamber is located near the pumping chamber on Level 1,374 m ASL. It gets power from the 10 kV distribution room for mining via two circuits of 10 kV. The output power is radially distributed to a 560 kW pump and a transformer of KS11-400 kVA 10/ 0.4 kV in the pumping chamber on level 1,374 m ASL and all level substations.

- The level substation gets power from the central distribution chamber on Level 1,374 m ASL and adjacent level substation. It is equipped with a transformer of KS11-400 kVA 10/ 0.4 kV to supply power to all loads in this level.

Substations in the Levoberezhny Plant are described below:

- The distribution room of main building is located near the Levoberezhny Plant. It gets power from the 110/ 10 kV general substation via two circuits of 10 kV. The output power is distributed to an 1,800 kW semi-grinder, a 2,000 kW overflow ball grinder, two transformers of SCB-2,000 kVA 10/ 0.4 kV, main buildings, gold smelter, pumping complex, back up water pump in the CN TSF and repair workshop.
- The substation in the gold smelter gets power from the general substation of 110/ 10 kV. It is equipped with a transformer of SCB-1,000 kVA 10/ 0.4 kV to distribute power to all areas in this smelter. A 250 kW diesel generator is located near this substation to supply power to the 7.5 kW thickener and as a secondary power source.
- The mobile substation of 630 kVA is located near the floating pumping boat in the FL TSF. It gets power from the special 10 kV overhead circuit.

11.3 Fuel Supply

Altynken LLC relies on an existing fuel station to supply vehicles with fuel. The main facilities are three trucks. Two trucks, with each having a tank of 30,000 litres ("**L**"), are used for supplying heavy vehicles with diesel. A truck with an 8,000 L tank is used for supplying light vehicles with gasoline. The pictures of fuel station are shown in Figure 11-3.

Figure 11-3: Fuel Supply

Diesel trucks, 30,000 litres each

Gasoline truck, 8,000 litres

Sources: SRK, 13 April 2025

11.4 Water Supply

Daily water demand is shown in Table 11-1. The total water demand is about 10,116 m^3/d.

Table 11-1: Daily Water Demand (unit: m^3/d)

Item	Mining	Processing	Refining	Living	Water Boiler	Others	Total
Domestic	297	12	51	88	88	50	586
Fresh	620	1,168	-	-	-	-	1,788

Total	1,055	8,784	51	88	88	50	10,116

Sources: *FS 2025*

The surface water supply includes spring water in the Zim Bulak gully (Figure 11-4) and Taldybulak River. Following are descriptions of these two water sources:

- The flow rate is 0.9 L/s (77.76 m^3/d) from the spring in the Zim Bulak gully. The total dissolved solids ("**TDS**") is 0.5 g/L, including $Ca(HCO_3)_2$ and $CaSO_4$.
- The catchment area of Taldybulak River is about 78.6 km^2. The source of Taldybulak River is located in the watershed of Mount Okotolkoy with an elevation of 2,800 m ASL.

Water supply facilities are described below:

- Water supply for mining comes from two wells near the Taldybulak River. A 1 km long 200 mm diameter steel pipe is installed to connect these two wells and the 800 m^3 elevated tank in the mining area. Pipes are buried below the permafrost.
- Water supply for backfill plant comes from the elevated tank in the mining area, feed by gravity. Pipes are buried below the permafrost.
- Water supply for the Levoberezhny Plant comes from the elevated tank in the mining area, feed by gravity. A 2.74 km long 150 mm diameter steel pipe is installed to supply water to the elevated tank in the Levoberezhny Plant. Pipes are buried below the permafrost.
- Water recycling for Levoberezhny Plant consists of a pumping complex, a 270 m long 150 mm diameter steel pipe and a 1,000 m^3 elevated tank in the Levoberezhny Plant. Two sets of IS100-65-315(C) pumps are installed in the pumping facility, with each having a flow rate of 81 m^3/h, a waterhead of 82 m and a power of 45 kW to recycle 1,526 m^3/d water. Pipes are buried below the permafrost.
- Water recycling for the FL TSF consists of a boat and a 1 km long 250 mm diameter steel pipe. A boat is equipped with two D280-43×4 water pumps to pump water to the elevated tank of 1,000m^3 in the Levoberezhny Plant. Each water pump has a flow rate of 280 m^3/h, a waterhead of 172 m and a power of 200 kW. Pipes are buried below the permafrost.
- Water recycling for the CN TSF consists of a boat and a 0.2 km long 100 mm diameter steel pipe. A boat is equipped with two IS65-40-250 water pumps to pump water to the elevated tank of 1,000 m^3 in the Levoberezhny Plant. Each water pump has a flow rate of 25 m^3/h, a waterhead of 80 m and a power of 15 kW. Pipes are buried below the permafrost.

- Water recycling for the back fill plant consists of a water pump shed and a 2.77 km long 100 mm diameter steel pipe. Two suits of 75/50C-AH slurry pumps are installed in the water pump shed to pump water to the floating TSF. Each water pump has a flow rate of 30.24 m^3/h, a waterhead of 27.8 m and a power of 11 kW. Pipes are buried below the permafrost.
- Water recycling for underground mining operations consists of a horizontal sedimentation tank and a 2.74 km long 250 mm diameter steel pipe. The dimension of the horizontal sedimentation tank is 30 m long, 10 m wide and 3 m deep. Water drained outside of the underground flows to the sedimentation tank first, then it goes to the 1,000 m^3 elevated tank in the Levoberezhny Plant.

Domestic water system includes:

- Domestic water supply for mining consists of a150 m^3 elevated tank in the mining area and an 800 m^3 elevated tank near purification facility. The integrated water purification equipment is installed to purify water at 15 m^3/h capacity.
- Domestic water supply for the Levoberezhny Plant, consists of a 150 m^3 water tank in the Levoberezhny Plant and a purification station behind the Zim dormitory building. The integrated water purification equipment is installed to purify water at 15 m^3/h capacity.

Water supply of fire extinguishing system is described below:

- Water supply for the fire extinguishing system for the mining workshop is about 324 m^3. The water is stored in the 800m^3 elevated tank in the mining area. Several handheld dry powder extinguishers are put inside of buildings.
- Water supply for the fire extinguishing system for the processing workshops is about 162 m^3. The water is stored in the 800 m^3 elevated tank in the Levoberezhny Plant. Several handheld dry powder extinguishers are kept inside of buildings.
- Water supply for the fire extinguishing system for the living quarters in the Levoberezhny Plant is about 252 m^3. The water is stored in the 300 m^3 elevated tank in the living quarters. Several handheld dry powder extinguishers are kept inside of buildings.

11.5 Maintenance Facilitates and Communication

There is an existing workshop in the Levoberezhny Plant to provide maintenance and repair services for the mechanical equipment.

There is also an existing workshop in the mining area to provide maintenance and repair services for the trackless mining equipment. A picture of the mining contractor's maintenance workshop is shown in Figure 11-5.

Repairing of mechanical machinery, electric equipment, electric machinery, transformer and mine trucks is also performed locally in the Kemin Region, Orlovka County, north of the Levoberezhny Project.

Figure 11-5: Maintenance Workshop (left) and Communication Base Station (right)

Mining contractor's repairment workshop | A communication base station

Sources: SRK, 13 April 2025

The voice communication system for the Levoberezhny Project is connected to the local telecommunication system via a virtual host. A picture of communication base station at mining industrial area is shown in Figure 11-5.

Data communication for the Levoberezhny Project is connected to the local internet.

The television system of the Levoberezhny Project is connected to the local cable television network.

11.6 Office Buildings and Accommodation

Zim quarters has a head office, including 20 offices, two meeting rooms, 67 dormitories for employees and five guest rooms. There are six offices and one meeting room in the Levoberezhny Plant. Other facilities include an assembly hall and a gym. A picture of accommodation buildings is shown in Figure 11-6.

The Taldybulak quarters include a three-floors office and a five-floors dormitory, a meeting room, a gym, two canteens for Chinese and two canteens for Kyrgyzstan staff.

The Orlovka quarters include an office building, dormitories and a canteen. It can support 122 persons.

Bishkek office includes offices, meeting rooms and dormitories.

Figure 11-6: Accommodation Buildings at Tald Quarter (left) and Zim Quarter (right)

Sources: SRK, 13 April 2025

11.7 Conclusions and Recommendations

Project infrastructures have been developed and is maintained well. These facilities can support the operation proposed in the LoM.

Usually, the issues related to the infrastructures can be solved. SRK considered the risks related to the infrastructures can be controlled for a project.

12 Environmental Studies, Permitting, Social or Community Impact

12.1 Environmental, Permitting, and Social or Community Review Objective

The objective of this CPR is to identify and/ or verify the existing and potential environmental, permitting, and social or community liabilities and risks, and assess any associated proposed remediation measures for the Levoberezhny Project.

12.2 Environmental, Permitting, and Social or Community Review Process, Scope, and Standards

The process for the verification of the environmental compliance and conformance for the Levoberezhny Project comprised a review and inspection of the Levoberezhny Project's environmental management performance against:

- Kyrgyzstan national environmental regulatory requirements; and
- World Bank/ International Finance Corporation ("**IFC**") environmental standards and guidelines, and internationally recognised environmental management practices.

The methodology applied for this environmental review of the Levoberezhny Project consisted of a combination of documentation review, site visit and interviews with Altynken LLC technical representatives.

12.3 Status of Environmental Approvals

The Kyrgyzstan environmental legislation is mainly comprised of national laws, regulations, statutes and decisions. The key pieces of environmental legislation include:

- *Water Code (2005)*
- *Forest Code (1999)*
- *Land Code (1999)*
- *Law on Subsoil (1997)*
- *Law on Atmospheric Air Protection (1999)*
- *Law on Ecological Expertise (1999)*
- *Law on Environmental Protection (1999)*
- *Law on Production and Consumption Waste (2001)*
- *Law on Tailings and Mining Dumps (2001)*
- *Law on General Technical Regulation on Ensuring Environmental Safety (2009)*
- *Regulation on the Procedure for Conducting Environmental Impact Assessment in the Kyrgyz Republic (2015)*

At the highest level of legislation, Article 48 of the constitution establishes the rights to an environment favourable for a healthy life. The same article also sets out the right to compensation for any damage to health or property resulting from activities related to the use of nature.

The *Law on Ecological Expertise (1999)* regulates the relationship between the environment and the potentially negative impact of economic activities like mining. It states that it complements the constitution and *Law on Environmental Protection (1999)*.

Another key document is the *Regulation on the Procedure for Conducting Environmental Impact Assessment in the Kyrgyz Republic (2015)*, which establishes the procedures for impact assessment with the goal of preventing or mitigating impacts on the environment. This regulation is subject to the *Law on General Technical Regulation on Ensuring Environmental Safety (2009)*, which determines the permissible levels of impact on the environment.

SRK has sighted an EIA report for the Levoberezhny Project which was compiled in 2015. The EIA report was approved by State Agency for Environmental Protection and Forestry in 2016. Altynken LLC stated that when the company's operation involves new construction, alteration or expansion projects, it prepares an EIA update including the environmental protection part in the design together with the main project and submits it to government for review.

SRK has reviewed these documents against Kyrgyzstan legislation and recognised international industry environmental management standards, guidelines and practices. In the following sections, SRK provides summary and comments in respect to the Levoberezhny Project's proposed environmental management measures.

12.4 Key Environmental, and Social or Community Aspects

12.4.1 Site Ecological Assessment

The landform and topography in the Levoberezhny Project area is commonly changed by mining, waste rock dump and TSFs, haul roads, office buildings and dormitories, and other facilities. The development of the Levoberezhny Project may also result in impacts to loss of flora and fauna habitat. If effective measures are not taken to manage and rehabilitate the disturbed areas, the surrounding land can become polluted and the land utilisation function will be changed, causing an increase in land desertification, water loss and soil erosion. The Levoberezhny Project's EIA should determine the extent and significance of any potential impacts to flora and fauna habitat. Where these potential impacts to flora and fauna habitat are determined to be significant, the EIA should also propose effective measures to mitigate and manage these potential impacts.

The EIA reports for the Levoberezhny Project make the statement in relation to the flora and fauna baseline study. There are no species or plant communities unique to the study area on the territory of the deposit. Therefore, there is no threat to biodiversity as a whole in the event of the destruction of certain species or plant communities as a result of the work. There are no species endemic to Kyrgyzstan in the region; some species are subendemic to Kyrgyzstan and are found in other Central Asian Republics and adjacent regions of China. In the study area there are four species listed in the *Red Book of Kyrgyzstan*: Primula macrocalyx Bunge, Tulipa zenaidae Vved, Iridodictyum kolpakowskianum (Regel) Rodionenko, and Malus sieversii (Ledeb.) M.Roem.

The faunal composition in the studied areas is poor compared to other areas of the Kyrgyzstan Range. At the Levoberezhny Project, the vegetation cover is sparse due to overgrazing by livestock and is therefore unsuitable for the existence of a large species diversity of the wild animal. The presence and number of mammals at the site is insignificant. No species of animals listed in the *Red Book of Kyrgyzstan* were found at the deposit and adjacent territories.

The EIA report for the Levoberezhny Project also proposes the following measures to lower the adverse impacts on local flora and fauna:

- To restore herbaceous vegetation, sowing and planting of native plant species (dominants of associations, as well as abundant species) should be carried out in accordance with the nature of the habitat.
- When an endangered plant species is discovered at a work site, it needs to be transplanted to another suitable area.
- Prohibition of any hunting activity for both employees and local residents at the site and adjacent territories in order to increase the number of animals.
- Planting shrub thickets around the Levoberezhny Project and adjacent areas to attract birds as an additional nesting site and food source.

12.4.2 Water Management

The climate in this area is continental, with large temperature differences between day and night. The average snow thickness is 20 cm, the minimum thickness is 12 cm, and the maximum thickness is 34 cm. The annual rainfall is 560 mm (the minimum is 12 mm in January, and the maximum is 80 mm in May).

The Levoberezhny Project is located in the eastern part of the Chuysk River Valley on the northern slope of the eastern section of the Kyrgyzstan Mountains and on the left bank of the Taldybulak River Valley. The Taldybulak River flows from south to north into the Chuysk River and is the only long-flowing river in the Levoberezhny Project area, with an average flow of 0.14 m^3/s and a peak flow of 0.80 m^3/s. The Taldybulak River is the main source of water for this area. The river's main flow is provided by groundwater (springs). The river's sources are located near the Oktorkoy mountain watershed at an elevation of 2,800 m ASL.

Based on differences in rock water-richness and groundwater-bearing media, the aquifers (zones) in the Levoberezhny Project area can be divided from top to bottom into Quaternary loose rock porous water aquifers, weathered fissure permeable zones, weathered fissure phreatic water aquifers, bedrock fissure pressurised water aquifers and impermeable zones.

The main water source for the Levoberezhny Project is the Taldybulak River, which is fed by seasonal snowmelt and groundwater. Rainwater plays a major role during flood events. Throughout the year, the river's runoff can be divided into a high-flow period in spring and summer, and a low-flow period in autumn and winter.

A sedimentation basin is set up on the Taldybulak River for the Levoberezhny Project, with a water intake well located beside it. Valves are installed to control the water outlet. Approximately 1 km of steel piping has been laid to allow the water to flow by gravity to the 800 m^3 high-level freshwater tanks at Levoberezhny Mine and Plant site. The Taldybulak River's water is also used by the population of villages located north of the Levoberezhny Project to irrigate agricultural land and vegetable gardens. SRK recommends that the Levoberezhny Project should implement a sustainable water supply management plan to minimise its impact on natural systems through the management of water use, avoid the depletion of aquifers, and reduce the impact on water users. Alternative water sources can be provided if the development affects the surrounding community's access to water.

The potential negative impact of the Levoberezhny Project on surface water and groundwater is mainly due to the arbitrary discharge of untreated production and domestic wastewater. In addition, mining activities may also cause changes in groundwater levels. The main wastewater pollution sources of the Levoberezhny Project include mine dewatering water, processing wastewater, tailings and waste rock leachate, wastewater from maintenance workshop, industrial site rainwater, domestic sewage.

Domestic sewage treatment facilities have been established at both the Levoberezhny Mine and the Levoberezhny Plant. At the Levoberezhny Mine site, the No. 2 adit sedimentation pool has been constructed. All production wastewater and domestic sewage generated at the mining site are treated and discharged into the No. 2 adit sedimentation pool, where they undergo a three-stage sedimentation process. The treated water is then fully recycled for use in mining and beneficiation operations, as well as for site greening and dust suppression.

At the Levoberezhny Mine and Levoberezhny Plant, both production wastewater and domestic sewage are treated and subsequently discharged into the FL TSF. The clarified supernatant from the TSFs is continuously reused in the beneficiation and smelting process, ensuring closed-loop wastewater management.

The Levoberezhny Project has established an online monitoring station to continuously monitor the water quality of transboundary (passing) water. In addition, daily water sampling and monitoring are conducted at the transboundary water outlet. Furthermore, on a quarterly basis, a third-party environmental monitoring agency appointed by the government is invited to carry out comprehensive water quality monitoring at multiple locations, including the transboundary water outlet. Altynken LLC has provided monitoring reports from government agencies for all four quarters of 2024. The reports indicate that all water quality monitoring data remained within the limits of local regulatory standards.

SRK recommends that quality monitoring be undertaken of the groundwater and surface water resources within the Levoberezhny Project area (including upstream and downstream of the TSFs and waste rock dumps), and also any site water discharges. SRK considered the risks related to these new works can be controlled.

12.4.3 Waste Rock and Tailings Management

The waste rock generated by the Levoberezhny Project is dumped at the waste rock dump ("**WRD**"). Currently, the Levoberezhny Project has four waste rock dumps, three of which are already full. The waste rock generated by the Levoberezhny Project is currently being deposited in WRD No.4. The dumping operation uses a process involving truck transportation and bulldozer spreading. The EIA report suggested that the topsoil is temporarily stored and be used for rehabilitation operations in the areas where production activities are completed. During the site visit, SRK noted that a topsoil stockpile had been established next to WRD No.4.

The Levoberezhny Project has two TSFs: a FL TSF and a CN TSF. Both constructed in natural mountain valleys following the original terrain. The anti-seepage design of the tailings facilities complies with the Kyrgyzstan design standards for mine tailings storage and environmental protection requirements, while also referencing Chinese standards. From bottom to top, the anti-seepage system of the tailings dams consists of natural bedrock, a 1-metre-thick clay layer, geotextile, and a 2 mm-thick HDPE liner.

A portion of the flotation tailings produced by the Levoberezhny Plant is sent to the backfill station for underground backfilling, while the remaining flotation tailings and cyanide tailings are deposited in the FL TSF and the CN TSF, respectively. In the CN TSF, cyanide undergoes natural degradation, and the wastewater is returned to the leaching workshop, where hydrogen peroxide is added for a second stage of cyanide destruction. Once the cyanide concentration is reduced to the required level, the water is discharged to the FL TSF for recycling and reuse.

One potential risk to the environment from the WRD and tailings is acid rock drainage ("**ARD**"), that is created when reducing sulphide minerals are exposed to air, precipitation, bacteria and, through an oxidation reaction, producing sulphuric acid, during mining, transportation, processing, waste rock discharge, and tailings storage, etc. ARD has the potential to introduce acidity and dissolved metals into the water, which can be harmful to surface and groundwater. No geochemical characterisation of waste rocks or acid rock drainage assessment has been sighted as part of this review. SRK recommends Altynken LLC monitor surface water, groundwater and soil downstream of the WRD and TSF to ensure that environment is not affected.

12.4.4 Hazardous Substances Assessment

Hazardous materials have the characteristics of corrosive, reactive, explosive, toxic, flammable and potentially biologically infectious, which pose a potential risk to human and/ or environmental health. The hazardous materials will be generated mainly by the Levoberezhny Project's construction, mining, and processing operations and they include hydrocarbons (i.e. fuels, waste oils, and lubricants), processing reagents, chemical and oil containers, batteries, medical waste, and paint.

The main hazardous materials for the Levoberezhny Project's operations will comprise the storage and handling of waste oil, gasoline, diesel, processing reagents, cyanide, etc. Levoberezhny Project does not have a dedicated explosives storage facility on the surface. All explosives are delivered to the site by specialised contractors and are temporarily stored in the underground mining area.

At the mining site, a fixed fuelling station has been established, consisting of three fuel trucks that supply gasoline and diesel to the mine vehicles. In the Levoberezhny Plant area, there is a dedicated workshop for storing waste oil and oil drums, which are disposed of by a qualified third-party company. Cyanide used in the Levoberezhny Project is stored in a dedicated cyanide warehouse. The Levoberezhny Project also includes a designated solid waste storage area, where certain types of waste classified as hazardous according to Kyrgyzstan regulations are also stored. Altynken LLC has also developed a hazardous waste disposal protocol, which includes guidelines for the collection, storage, and transfer of hazardous waste. SRK recommends that the collected waste oil and processing reagents be stored with secondary containment which is in line with the recognised international industry management practices.

12.4.5 Air and Noise Emissions

The primary air emissions from the Levoberezhny Project's mining operations are dust generated during rock drilling, blasting, loading and unloading, and transportation, as well as gases such as CO and NOx from the blasting smoke. To effectively reduce dust emissions, wet drilling is used underground, and water spraying is applied to the blasted rock piles for dust suppression. During the loading and unloading of ore, spraying systems are employed to control dust, and dust suppression spray devices are installed at the stripping and loading points to effectively reduce dust generation during mining.

At the backfill plant, dust collectors have been installed to capture the dust, which is then directly deposited into a waste ash bin. The ore storage, crushing, and transportation processes at the Levoberezhny Plant generate significant amounts of dust. To prevent the spread of dust, dust control facilities have been installed at key points where dust is generated within the Levoberezhny Plant. Water trucks are also used to regularly spray water on the haul roads to suppress dust.

The metallurgical process generates various types of exhaust gases, including ammonia gas, reactor off-gas, induction furnace emissions, off-gas from the primary sedimentation tank of the wastewater system, and emissions from the acid-washing tank used for activated carbon regeneration. These process-related emissions are treated using equipment such as alkaline scrubbing tanks and acid mist purification towers.

The main sources of noise emissions for the Levoberezhny Project are from the operation of the Levoberezhny Mine and Levoberezhny Plant (drilling, blasting, loading, haulage, crushers, ball mills, draught fans, pumps and other processing equipment) and movement of vehicles/mobile equipment. Altynken LLC stated that enclosures for noisy equipment, muffler on equipment and greening were adopted to lower the boundary noise. During the site visit, SRK did not observe any significant noise emissions in the boundary of the Levoberezhny Plant area.

12.4.6 Occupational Health and Safety

A well developed and comprehensive safety management system comprises site inductions, site policies, safe work procedures, training, risk/hazard management (including signage), use of personal protective equipment ("**PPE**") emergency response process, incident/accident reporting, an onsite first aid/medical centre, designated safety responsibilities for site personnel, regular safety meetings and a work permit/tagging system.

SRK has reviewed the emergency response plan and safety production management system as provided by Altynken LLC and is of the opinion that the system covers items that are generally in line with recognised industry practices. During the site visit, SRK observed that safety signs were in place, safety provisions and rules were also displayed within the work areas, guard railings were installed on all gantries, and proper personal protection equipment was provided and was being used by the workers, such as hardhats and masks. Altynken LLC provided SRK with three years safety records (2022-2024) which indicate ten accidents with a total of one death occurred in June 2024. According to the investigation conclusion reached by the committee appointed under *Order No. 46-OD* dated 6 May 2024, of the Environmental and Technical Supervision Agency under the Ministry of Natural Resources, Ecology, and Technical Supervision of the Kyrgyz Republic, the accident was caused by the concealed collapse of a fault, classified as a non-technical casualty incident resulting from a natural disaster. Altynken LLC is required to strengthen its technical research and management practices to enhance resistance to natural disasters during underground rock mining operations.

12.4.7 Site Closure Planning and Rehabilitation

The recognised international industry practice for managing site closure and rehabilitation is to develop and implement an operational site closure and rehabilitation planning process and document this through an operational closure and rehabilitation plan. This operational closure planning process generally includes the following components:

- Identify all site closure stakeholders (e.g. government, employees, community, etc.).
- Undertake stakeholder consultation to develop agreed site closure criteria and post operational land use.
- Maintain records of stakeholder consultation.
- Establish a site rehabilitation objective in line with the agreed post operational land use.
- Describe/ define the site closure liabilities (i.e. determined against agreed closure criteria).
- Establish site closure management strategies and cost estimates (i.e. to address/reduce site closure liabilities).
- Establish a cost estimate and financial accrual process for site closure.
- Describe the post site closure monitoring activities/program (i.e. to demonstrate compliance with the rehabilitation objective/closure criteria).

According to the *Law on Subsoil of the Kyrgyz Republic*, upon termination of the right to use subsoil, subsoil users are required to liquidate mining property and reclaim the land plot in accordance with the procedure established by law.

Legal entities developing mineral resources on previously allocated land plots must carry out land reclamation activities in accordance with the *Regulation on the Reclamation of Disturbed Lands during the Use of Subsoil Resources*, approved by the *Resolution No. 517* of the Government of the Kyrgyz Republic dated 18 August 2017. Legal entities and individuals that disrupt the integrity of the land surface during the use of subsoil resources are obliged to utilise reclamation funds to restore the subsoil to a condition suitable for its intended use.

Relevant regulatory acts require that entities engaged in mineral resource development establish a reclamation fund, allocating funds annually for the reclamation of lands disturbed during subsoil use, and using the fund to bring the land back to a condition suitable for its intended purpose. According to the *Law on Subsoil of the Kyrgyz Republic*, the funds necessary for mine reclamation must be deposited in financial institutions located in the Kyrgyz Republic. In order to establish a mine reclamation fund, subsoil users are obligated to open a dedicated bank account for mine reclamation in a bank within the territory of the Kyrgyz Republic prior to commencing geological exploration or resource development activities.

Altynken LLC has provided a reclamation report prepared in 2024 by Geo Consult Group LLC. The land reclamation report comprises reclamation techniques, design, monitoring, safety and technical economy. This report estimates the total reclamation cost at approximately US$11,366,271, covering the dismantling and reclamation works related to the Levoberezhny Mine, Levoberezhny

Plant, TSFs, and other auxiliary infrastructure. Altynken LLC has informed that approximately US$6.2 million has already been deposited into the reclamation fund account, and has provided payment records for the past three years. According to these records, during the first three months of 2025, a monthly deposit of US$47,582 has been made.

12.4.8 Social Aspects

Altynken LLC has advised SRK that there are no natural reserves or significant cultural heritage sites within the Levoberezhny Project area. Based on the EIA report, no ancient relics have been found and the development of the Levoberezhny Project will not adversely affect it.

There are no large-scale settlements around the Levoberezhny Project. The nearest one is the Orlovka Town, which is 10 km away from the mine site. However, within a 2 km radius of the Levoberezhny Project site, there are several herder households residing. The EIA report provided the introduction of public participation survey in Kyrgyzstan. However, no survey results have been sighted in the EIA report. No other documented public consultation process for the development of the Levoberezhny Project has been sighted as part of this review. During the site visit, Altynken LLC informed SRK that it had not received any environmental complaints from nearby herders in the past three years. A stake holder engagement plan is recommended to ensure ongoing community engagement.

Altynken LLC stated that a Kemin future development fund was established for local development. It contributes US$7.50 per ounce of gold sold into this fund. In addition, 2% of the monthly gold sales revenue is deposited into the Kemin development fund. Altynken LLC has also carried out a series of donations and consolation activities for the surrounding towns and communities. In addition, it regularly organises community activities such as sports events, board games competitions, and tree planting with the nearby communities.

Altynken LLC provided SRK with records of some community issues from the past three years, including concerns from villagers about river pollution, maintenance of the road to the pasture, and the impact of ore transportation on nearby houses and pastures. According to the records, these issues have all been resolved. SRK recommends that Altynken LLC develop a grievance mechanism to receive and address specific concerns raised by displaced persons or members of host communities in a timely fashion.

13 Capital Expenditures and Operating Expenses

13.1 Sunk Capital Expenditures

As of 31 December 2024, the values of sunk Capex, including fixed and intangible assets, are shown in Table 13-1. The net value of sunk Capex is about US$192.036 million as of 31 December 2024. In addition to the sunk Capex, there are about US$168,000 of long-term investment in stocks, and US$1.063 million of construction in progress as of 31 December 2024.

Table 13-1: Fixed and Intangible Assets, as of 31 December 2024 (Unit: US$ k)

Asset	Original value	Net Value
Fixed Asset		
Mine civil engineering	311,041	175,895
Non-mine civil engineering	965	345
Buildings	9,349	4,925
Decoration	162	-
General equipment	16,645	2,617
Special equipment	12,558	3,792
Office and electric device	1,088	117
Vehicle	13,138	1,093
Power generation and transmission	7,555	287
sub-total	372,501	189,070
Intangible Assets		
Mining licence	4,519	2,505
Software	673	461
Sub-total	5,193	2,965
Total	377,694	192,036

Sources: Altynken LLC

13.2 Initial Capital Expenditures

It's not applicable since there is no further capital work in plan at the Effective Date.

13.3 Sustaining Capital Costs

Altynken LLC planned to invest US$249,000 in 2029 to expand the TSF, and US$19,000 in 2030 to reclaim the waste rock dumps. Sustaining Capex in years 2025 and 2026 are zero.

Besides of the investment plan of Altynken LLC, SRK think additional sustaining Capex is required. Sustaining Capex is usually used for the extension of existing tunnels/ development year by year to access the ore to be mined, for the replacement of equipment that cannot be used. Industrial practices suggested that the sustaining Capex is usually 3% to 5% of original value of fixed assets (Table 13-1). Therefore, it is likely that sustaining Capex will range from US$11.2 million to US$18.6 million per year. At the Effective Date, SRK assumed that sustaining Capex is 4% of original value of fixed assets. The SRK proposed sustaining Capex plan is summarised in Table 13-2. The total sustaining Capex is about US$104.9 million over the life of mine.

Table 13-2: Sustaining Capex Plan (Unit: US$ million)

Item	Total	2025	2026	2027	2028	2029	2030	2031	2032	2033
Expanding TSF [1]	0.249	-	-	-	-	0.249	-	-	-	-
Reclaiming waste rock dump [1]	0.019	-	-	-	-	-	0.019	-	-	-
Others [2]	104.6	-	-	14.9	14.9	14.9	15.0	15.0	15.0	15.0
Total	104.9	-	-	14.9	14.9	15.2	15.0	15.0	15.0	15.0

Sources: *FS 2025* and SRK estimate.

Notes:

1 *FS 2025*

2 SRK estimate.

13.4 Working Capital

Working capitals in the last three years are shown in Table 13-3. Overall, the working capital increased significantly year by year between years 2022 and 2024.

Table 13-3: Working Capital in Years 2022 to 2024

Year	Unit	2022	2023	2024
Current Asset [1]	US$ k	38,204	80,318	129,082
Current Liability [1]	US$ k	22,781	47,104	51,082
Working Capital [1]	US$ k	15,423	33,214	78,000
Operating cost [2]	US$ k	90,672	92,123	86,265
Percentage [3]	%	17	36	90

Sources: Altynken LLC

Notes:

1 Working capital equals to current asset minus current liability.

2 Operating costs are exclusive of non-income taxes, royalties and other government charges.

3 Percentage equals to working capital divided by operating cost.

13.5 Historical Operating Costs

The total Opex per year in years 2022 to 2024 are summarised in Table 13-4 and Table 13-5. The Opex consists of those directly spent on the mining, processing and metallurgical facilities and operating support departments, and those indirectly spent on the general and administrations ("**G&A**") sections. It should be noted that the depreciation and amortisation ("**DA**"), which are the non-cash costs, and the financing expenses, which are the cash expenses, but not the operating expenses, should be excluded from the Opex.

Table 13-4: Operating Costs in Years 2022 to 2024 by Cost Categories

Item	Unit	2022	2023	2024
Mining cash cost	US$	47,818,281	48,170,323	46,280,690

Item	Unit	2022	2023	2024
Processing cash cost	US$	23,199,582	27,169,069	22,629,693
Support service cash cost	US$	11,993,983	9,000,296	8,964,814
Metallurgical service cash cost	US$		-	-
Sales expenses	US$	951,965	1,387,416	1,542,435
GA On-site Cash Costs	US$	9,096,290	9,376,943	9,950,075
Treatment charge and refining charge	US$	-	-	-
Inventory movements	US$	-4,431,937	3,543,852	-620,822
By product credit	US$	7,158,376	6,080,870	5,791,685
C1 cost	**US$**	**81,469,789**	**92,567,028**	**82,955,200**

Sources: Altynken LLC

Altynken LLC analysed the expenses in years 2022 to 2024, and noted that:

- The following three types of expenses contributed most to the Opex, while the other expenses each contributed little to the Opex:
  - The consumables expenses in contribute about 38%, 34% and 28% of the total Opex in years 2022, 2023 and 2024, respectively.
  - The mining expenses contribute about 36%, 33% and 29% of the total Opex in years 2022, 2023 and 2024, respectively.

– The non-income taxes, royalties and other government charges in either contribute about 31%, 37% and 46% of the total Opex in years 2022, 2023 and 2024, respectively.

- The increase of total Opex in years 2022 to 2024 is mainly caused by the increase of non-income taxes, royalites and other government charges, which is closely related to the commodity prices.
- The total Opex increased from 129.84 US$/t of RoM in 2022 to 137.70 US$/t of RoM in 2023, then to 161.27 US$/t of RoM in 2024. If the non-income taxes, royalties and other government charges are excluded, the Opex are respectively 89.39 US$/t of RoM, 86.93 US$/t of RoM and 87.11 US$/t of RoM in 2022, 2023 and 2024, which are overall stable at about 88 US$/t of RoM.

13.6 Future Operating Costs

Considering that the there is no modification of the LoM plan, and that the Opex in years 2022 to 2024 are stable when excluding the non-income taxes, royalties and other government charges, SRK estimated future Opex based on the average Opex in years 2022 to 2024. The unit onsite Opex forecast of SRK is shown in Table 13-6. The LoM Opex forecast of SRK is shown in Table 13-7.

13.8 Conclusions and Recommendations

The net value of sunk Capex is about US$192.036 million as of 31 December 2024. Besides of the sunk Capex, there are about US$168,000 of long-term investment in stocks, and US$1.063 million of construction in progress as of 31 December 2024.

It's not applicable to disclose initial Capex as there is no further capital works at the Effective Date.

The total sustaining Capex is about US$104.9 million over the life of mine.

As of 31 December 2024, the working capital is about US$78 million. SRK assumed that the working capital is 30% of operating costs in future years.

Total Opex per year in years 2022 to 2024 were about US$134.1 million, US$148.9 million and US$162.8 million, respectively. SRK estimated future years Opex based on average of Opex in years 2022 to 2024. The Opex is estimated to be US$172.0 per tonne of mined.

14 Economic Analysis

14.1 Products and Client

The final products of the Levoberezhny Project, include gold concentrates and gold Doré. The gold concentrate is processed by Kazzinc Ltd ("**Kazzinc**"), a company in Republic of Kazakhstan, to produce gold ingots and sell the silver and copper recovered from the gold concentrates to Kazzinc, while the returned gold ingot and gold Doré are sold to Kyrgyzaltyn Joint Stock Company (the "Kyrgyzaltyn", locally referred to as the Открытое акционерное общество «Кыргызалтын»), a company in Kyrgyz Republic.

The historical sale records of products are shown in Table 14-1.

Table 14-1: Sales in Years 2022 to 2024

Item	Unit	2022	2023	2024
Quantity				
Gold in gold ingot	g	3,186,949	3,674,008	3,156,931
Gold in gold Doré	g	565,426	413,318	547,679
Silver in gold Doré	g	43	-	-
Gold in gold concentrates	g	82,948	-	-

Copper in gold concentrates	US$	4,738,980	4,906,958	4,736,761
Total	US$	222,625,412	257,013,392	285,606,780

Sources: Altynken LLC

Gold is one of the important commodities for Kyrgyzstan to earn foreign currencies. Individual exporting of gold is forbidden in Kyrgyzstan. All of the gold trading must be undertaken under control of the National Bank of the Kyrgyz Republic ("**NBKR**"). Most of the gold produced will go into the vault of NBKR. The silver and copper recovered from the gold concentrates are sold to Kazzinc based on the processing contracts. Historically, SRK considered the marketing channel has been built and maintained well by Altynken LLC. It can be reasonably expected that there will be no material market risk related to the selling of gold locally in Kyrgyzstan.

The grade interpolations of silver and copper are not available in the Mineral Resource model at the Effective Date. Considering the calculated and production records, it can be seen that the combined revenues of silver and copper are minimal when comparing them with gold revenue. SRK considered the economic viability of the Levoberezhny Project will not be materially affected by silver and copper. Therefore, the products involved in the economic analysis will include only the gold ingots and gold concentrates.

14.2 Gold Concentrate Processing Contracts

Several gold concentrates processing contracts and addendums in years 2022 to 2024 were sighted by SRK. The key information in the contracts are summarised below:

- Kazzinc is the processor of gold concentrates. Kazzinc returns refined gold at a grade of 99.99% to Altynken LLC in the form of bars or grains, and purchases the silver and copper contents in the concentrates.
- Concentrates delivered to Kazzinc should meet a predefined quality requirement. Otherwise, Kazzinc has the right to reject the concentrates.
- Treatment charge is 192 US$/t of dry concentrate. Gold refining charge is 5.0 US$/oz of recovered gold.
- The return rates of gold from the gold concentrates are shown in Table 14-2.

Table 14-2: Return Rates of Gold

Grade (g/t)	20.00-39.99	40.00-49.99	50.00-79.99	80.00-99.99	>=100.00
Recovery (%)	90.00	92.00	95.50	95.95	96.70

Sources: Altynken LLC

14.3 Sales Contracts

14.3.1 Gold Doré

Several gold Doré sales contracts and addendums between 2022 and 2025 were sighted by SRK. Summary of key information is shown below:

- Gold Doré is transported to a specified smelter in Kyrgyzstan, a subsidiary company of Kyrgyzaltyn, to produce refined gold and silver. Alloys transported to the smelter should meet a predefined quality requirement. Otherwise, the Kyrgyzaltyn has the right to charge additional fees or refuse to buy the gold alloys.
- The official quotations at London Bullion Market Association ("**LBMA**") on the previous night of the trading day are treated as the base prices of gold and silver.
- Selling and exporting costs of refined gold is paid by Altynken LLC, which is either 10.00 US$/oz or 4.68 US$/oz of gold bullion depending on the buyer of gold bullion.

- The smelting charges depend on the quantity of alloys, ranging from 0.35 to 2.01 US$/g of gold Doré.
- The smelting recovery rates of gold and silver from the gold Doré are shown in Table 14-3.

Table 14-3: Smelting Recovery Rates

Element	Grade (%)	Recovery (%)
Gold	>=75	99.90
Gold	60-75	99.80
Gold	50-60	99.65
Gold	30-50	99.50
Gold	<=30	99.30
Silver	<8	50.00
Silver	8-25	60.00
Silver	25-50	65.00
Silver	50-75	85.00
Silver	>=75	97.00

Sources: Altynken LLC

14.3.2 Gold Ingot

Several gold ingot sales contracts and addendums between 2022 and 2025 were sighted by SRK. Summary of key information is shown below:

- The gold ingot is transported to a specified smelter in Kyrgyzstan, a subsidiary company of Kyrgyzaltyn, to produce gold bullion.
- The quotation at LBMA on the previous night of the trading day is treated as the base price.
- Producing and certification charges are 0.0506 US$/g. Selling cost is 0.10 US$/g. Testing charge is KGS 11,481.60 per lot of ingots that is no more than 65 kg weight. These charges should be deducted from the base price.
- Selling and exporting costs of gold bullion is paid by Altynken LLC, which is either 10.00 US$/oz or 4.68 US$/oz of gold bullion depending on the buyer of gold bullion.
- The recovery rate of gold from the gold ingot is 99.955%.

14.3.3 Silver in Gold Concentrates

The silver recovered from the gold concentrates was sold to Kazzinc in years 2022 to 2024. The contracts numbered 50-17/2022-0014 and 50-17/2023-0038 and addendums were sighted by SRK. The key information in the contracts is summarised below:

- The quotation for LBMA Silver Price, averaged over the quotation period, is treated as the base price of silver.
- Silver refining charge is 0.50 US$/oz of payable silver.
- The payable silver is calculated below:

- In the case of silver grade less than 50 g/t in the gold concentrates, the silver is not payable.
- In the case of silver grade ranging from 50 g/t to 80 g/t in the gold concentrates, 85.00% of the silver in the goods or with a deduction of 30 g/t (the minimum of the two) shall be payable.
- In the case of silver grade no less than 80 g/t, 90.00% of the silver in the goods or with a deduction of 30 g/t (the minimum of the two) shall be payable.

14.3.4 Copper in Gold Concentrates

The copper recovered from the gold concentrates was sold to Kazzinc in years 2022 to 2024. The contracts numbered 50-17/2022-0014 and 50-17/2023-0038 and addendums were sighted by SRK. The key information in the contracts is summarised below:

- The official London Metal Exchange ("**LME**") Cash Settlement quotation for Copper Grade A, averaged for the quotation period, is treated as the base price of copper.
- Copper refining charge is 0.192 US$/lb of payable copper. The payable copper is calculated below:
  - In the case of copper grade less than 2.0% in the gold concentrates, the copper is not payable.
  - In the case of copper grade ranging from 2.0% to 3.0% in the gold concentrates, 90.00% of the copper in the goods or with a deduction of 1.1% (the minimum of the two) shall be payable.
  - In the case of copper grade no less than 3.0%, 95.00% of the copper in the goods or with a deduction of 1.1% (the minimum of the two) shall be payable.

14.4 Historical Price

The average price of gold sold in the last three years are shown in Table 14-1 for the Altynken LLC.

The World Bank monthly gold price data since January 2020, London afternoon fixing, average of daily rates, were used by SRK to draw the trend line shown in Figure 14-1. Summary statistics of gold prices is shown in Table 14-4. Overall, the gold price shows an increase trend in the last five years.

Figure 14-1: Gold Price Trend in History

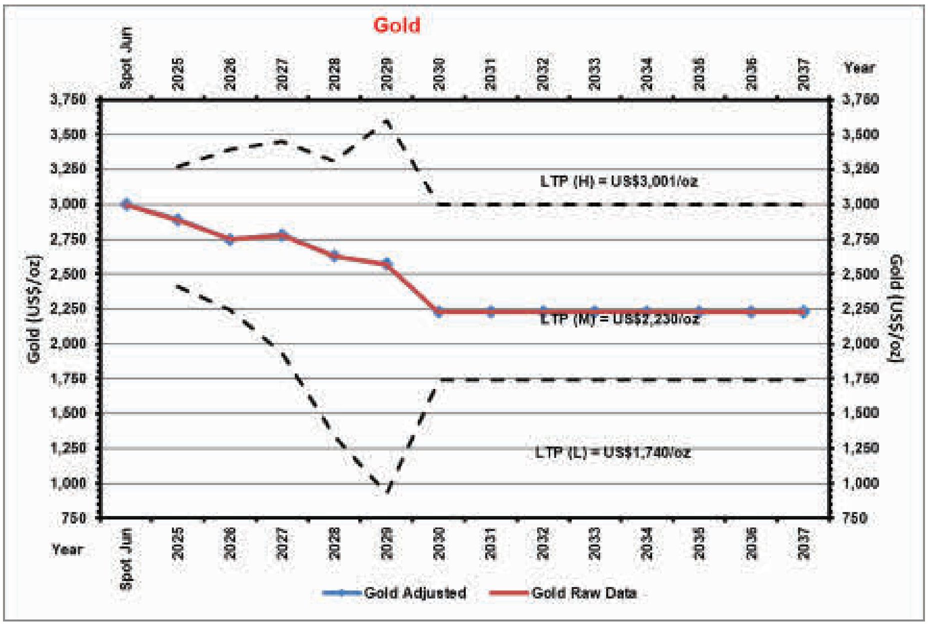
14.5 Price Forecast

The gold price forecast of Consensus Market Forecast ("**CMF**") published in March 2025 is shown in Figure 14-2 and Table 14-5. SRK was also provided with forecasts in Table 14-6 (detailed in Appendix B), which sourced from the Zijin Gold International.

Figure 14-2: Gold Price Forecasts of CMF



Sources: CMF forecasts in March 2025

Notes: Gold price in real US$.

Table 14-5: Gold Price Forecasts of CMF

Price Level	Unit	2025	2026	2027	2028	2029	Post-2029

Sources: Zijin Gold International
Notes: Gold price in real US$.

At the Effective Date, Zijin Gold International suggested that the long-term forecast of CMF was rounded to the second significant figure to estimate Ore Reserves, while the price forecasts of Zijin Gold International were used for economic analysis post year 2024. Comparison of Table 14-5 and Table 14-6 indicates that the long-term forecast of Zijin Gold Internation is about 2.0% higher than that of CMF, and that Zijin Gold International's forecasts are generally near to those of CMF's at the middle level. SRK accepted the suggestions due to similar forecasts of gold prices.

14.6 Tax Obligations

The taxes applied to the economic analysis are shown in Table 14-7. It is noted that the value-added tax ("**VAT**") and corporate income tax ("**CIT**") are not charged in Kyrgyzstan for a gold mine.

Table 14-7: Major Tax Rates

Item	Unit	Value
Royalties	% sales revenue	5
Gold Revenue Tax [1]	% gold sales revenue	1 to 20
Sale tax	% sales revenue	2
Kemin Development Fund	% sales revenue	2
Kemin Future Fund	US$/oz sold gold	7.5
Property tax [2]	US$/t feed	0.0105
Land use tax [2]	US$/t feed	0.0285
Vehicle and Vessel Use Tax [2]	US$/t feed	0.0033
Value-added tax ("VAT") [3]	% sales revenue	-
Corporate income tax ("CIT") [3]	% gross profit	-

Sources: Altynken LLC
Notes:

[1] The rate depends on gold price.
[2] Derived from sales taxes and surcharges in 2024.
[3] VAT and CIT are not charged in Kyrgyzstan.

14.7 Technical and Economic Analysis

14.7.1 Principal Assumptions

Assumptions to conduct economic analysis are shown below:

- The base date is assumed to be 31 December 2024. All the assumptions are subject to conditions obtained at the base date.

- The discounted cash flow method ("**DCF**") is selected as the foundation of economic analysis. Calculation of discount rate is shown in Table 14-8 using the weighted average cost of capital ("**WACC**") method. At the Effective Date, the discount rate of 8% is adopted.
- The LoM schedules are shown in Table 8-11.
- The base price is shown in Table 14-5. The price deductions, returned rates and payable rates are described in "14.2 Gold Concentrate Processing Contracts" for gold concentrates and gold Doré, respectively.
- Usually, the working capital is 25-30% of each year's Opex and will not be a material factor to do an economic analysis. Regarding the Levoberezhny Project, the working capital divided by the Opex varied between 17% to 90% between years 2022 and 2024. SRK considered the working capitals in years 2022 and 2023 are in line with normal expectations, while that in 2024 is higher than SRK would expect. At the Effective Date, SRK assumed that the working capital is 30% of Opex in future. SRK's calculated working capital increments are shown in Table 14-9.
- The investment plan of sustaining Capex is shown in Table 13-2. No further initial Capex is needed.
- Usually, the sunk Capex is used for CIT deduction in economic analysis by the means of DA. But the CIT is not charged in Kyrgyzstan for a gold mine, so there is no need to calculate DA during economic analysis.
- The LoM operating costs are shown in Table 13-7.
- The taxes applied to the economic analysis are shown in Table 14-7.
- All the ore mined is processed in the year of production and sold in the same year.

Table 14-8: Discount Rate Calculation (WACC Method)

Item	Unit	Value	Remarks
Risk free rate	%	5	Treasury bonds rate
Market risk premium	%	6	
Beta of the investment	/	1.5	
Cost of equity	%	14	
Debt margin	%	5	Policy rate

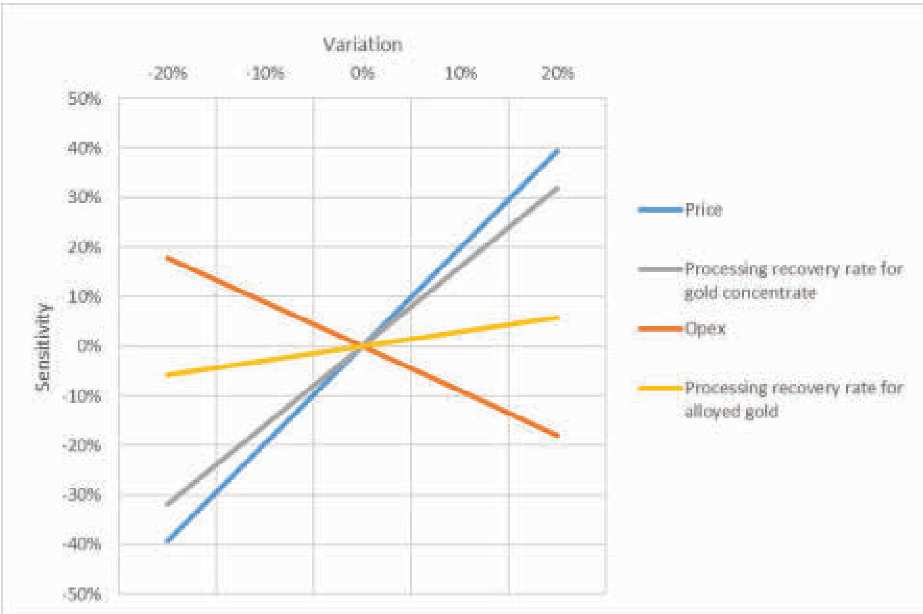
14.7.4 Sensitivity Analysis

Parameters selected for sensitivity analysis of NPV include gold price, processing recovery rates and Opex. The results are shown in Figure 14-3. The sensitivity analysis provides an indication that the NPV is most sensitive to the gold price.

Figure 14-3: Sensitivity Analysis of NPV (discount rate is 8%)



Sources: SRK

14.8 Conclusions and Recommendations

A summary of economic analysis is shown in Table 14-12. The positive NPVs indicate that the Levoberezhny Project is economically viable.

Table 14-12: Summary of Overall Economics

Item	Unit	Value	Remarks
Production capacity	ktpa ore	924.0

15 Risk Assessment

SRK completed a risk assessment of the specific risks identified for the Levoberezhny Project in relation to their likelihood of occurrence within the LoM and consequence in accordance with the *Listing Rules* of the HKEX.

In general, the risk of a project decreases from exploration, through development, to the production stage. SRK considers the Levoberezhny Project is an advanced project.

SRK considered various technical aspects which may affect the feasibility and future cash flow of the Levoberezhny Project. SRK's final risk assessment is presented in Table 15-1.

Table 15-1: Risk Assessment for Levoberezhny Project

Risk Source/Issue	Likelihood	Consequence	Overall
Geology and Mineral Resources			
Lack of Significant Mineral Resources	Unlikely	Major	Low
Lack of Significant Ore Reserves	Unlikely	Major	Low
Unexpected Groundwater Ingress	Rarely	Moderate	Medium
Significant Unexpected Geological Faulting	Rarely	Moderate	Medium
Ore Reserve and Mining			
Lack of Significant Ore Reserves	Unlikely	Minor	Low
Significant Geological Structures	Possible	Moderate	Medium
Production Shortfalls	Possible	Moderate	Medium
Unexpected Groundwater ingress	Possible	Minor	Low
Excessive Surface Subsidence	Possible	Minor	Low
Poor Mine Plan	Unlikely	Minor	Low
Ore Production Capacity is Optimistic	Unlikely	Minor	Low
Mineral Processing			
Process Adaptability	Unlikely	Moderate	Low
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Possible	Moderate	Moderate
Low Plant Reliability	Rarely	Moderate	Negligible
Environmental and Social			
Impact on Ecological System	Unlikely	Minor	Low
Water Management	Possible	Moderate	Medium
Waste Rock and Tailings Management	Possible	Moderate	Medium
Hazardous Materials Management	Possible	Moderate	Medium
Social Aspects	Unlikely	Moderate	Low
Capital and Operating Costs			
Project Timing Delay	Unlikely	Minor	Low
Poor Mine Management-Plan	Unlikely	Minor	Low
Capital Cost Increases	Unlikely	Minor	Low
Operating Cost Underestimated	Unlikely	Minor	Low

Sources: SRK

16 Conclusions and Recommendations

16.1 Geology and Resources

The exploration efforts conducted by Altynken LLC and Zijin Mineral Geology Exploration Institute have significantly advanced the geological work at the Levoberezhny Project. Through extensive drilling programs and integrated deposit studies, substantial foundational data has been collected, and the overall geological understanding of the Levoberezhny Project area has reached exploration-grade control standards. Systematic supplementary exploration has notably expanded the scale of the original C2-grade mineralised zones west of the exploration line 19.

These activities were carried out in compliance with industry standards and regulations, supported by a quality inspection system at the individual, project, and company levels. Geological data underwent regular quality checks, combining field inspections with office-based reviews, ensuring the consistency and reliability of the outcomes. The established quality management system proved effective, ensuring high standards were maintained throughout the supplementary exploration process. This approach has reinforced confidence in the geological interpretations and resource estimation within the Levoberezhny Project.

It is recommended to conduct in-fill drilling to improve deep mineralised zone delineation and upgrade the Mineral Resource classification. Specifically for Mineralised Zone 4 and Mineralised Zone 5, where mineralised zone branching and grade variability are significant, the current grid spacing of 20-40 m × 20-40 m should be further infilling to 10 m × 10 m using strategically placed production drill holes. This will enhance the Mineral Resource definition and improve confidence in the Mineral Resource classification at deeper levels. The strict QA/QC procedures should be applied to in order to obtain data of demonstrable quality as required by the *JORC Code* guidelines.

16.2 Processing

The Levoberezhny Plant has a capacity of 2,800 tpd, and uses the single-stage open-circuit crushing + two-stage closed-circuit grinding process to obtain a grind fineness of P_{75} = 74 μm. A combination-separating flotation process is adopted to produce gold-copper concentrate, sulphur-gold concentrate and tailings. The tailings are discharged into FL TSF, the gold-copper concentrate is sold as the final product. The sulphur-gold concentrate will be reground for CIL to produce gold-loaded carbon, which is treated after the process of desorption - electrolysis - refining to produce Doré bullions. The cyanidation tailings are discharged into the CN TSF after decyanidation.

The flowsheet designed and equipment of the Levoberezhny Plant used, are reasonable, which can also recover copper mineral. Due to the low copper grade in the ore, the output copper concentrate grade is also low. Therefore, it cannot be sold as copper concentrate, but only as gold concentrate. SRK suggests that the flotation test study on copper concentrate to be conducted to improve the copper grade of the copper concentrate until it reaches the standard of qualified copper concentrate, in order to increase the sales revenue of copper.

16.3 Mining Operation

The Levoberezhny Mine has been well developed to date. It's unlikely that the future operating will have material risks.

The Ore Reserves can support a nine-year life of mine, including a six-years full-production period and a three-years ramp-down period, based on SRK's mining model.

16.4 Infrastructure, Market Studies and Contracts

The Levoberezhny Project infrastructure has been developed and maintained well over its operation life and these facilities can serve the operation well in the future.

Sale records and contracts have been reviewed by SRK. Historically, a marketing channel has been built and is well maintained by Altynken LLC. It can be reasonably expected that there will be no material market risk related to the selling of gold locally in Kyrgyzstan.

16.5 Capital and Operating Expenditures

Net values of sunk Capex are about US$192.0 million.

It is not applicable to disclose initial Capex as there is no further capital works at the Effective Date.

SRK assumed that the sustaining capital is about US$104.9 million over the life of mine.

The working capital divided by the operating cost varied between 17% to 90% in years 2022 to 2024. SRK assumed that the working capital is 30% of operating costs in future.

Total Opex per year in years 2022 to 2024 were about US$134.1 million, US$148.9 million and US$162.8 million, respectively. SRK estimated future years Opex based on average of Opex in years 2022 to 2024.

16.6 Economic Analysis

The overall average Opex is US$172.0 per tonne of RoM. The all-in sustaining cost ("**AISC**"), including Opex and sustaining Capex, is US$1,794.6 per troy ounce of gold sold or US$57.7 per gram of gold sold.

The DCF method is selected as the foundation of economic analysis. The estimated NPV for the Levoberezhny Project is US$549 million at a discount rate of 8%. The base date is set on 31 December 2024.

The positive NPV indicates the Levoberezhny Project is economically viable. The sensitivity analysis indicates the NPV is most sensitive to the gold price.

16.7 Environmental and Social Aspects

The EIA for the Levoberezhny Project was completed in 2015 and approved by the State Agency for Environmental Protection and Forestry in 2016. The EIA includes a baseline study of local flora and fauna, identifying four plant species listed in *Red Book of Kyrgyzstan*, but no listed animal species.

The Levoberezhny Project sources water from the nearby Taldybulak River. Wastewater from mining and processing is reused on-site and not discharged. TSFs are equipped with anti-seepage layers to minimise groundwater pollution. SRK recommends ongoing monitoring of surface and groundwater around the site.

The Levoberezhny Project has established community development funds and regularly conducts donations, outreach, and events such as sports, games, and tree planting with local communities. SRK recommends that Altynken LLC develop a grievance mechanism to receive and address specific concerns raised by displaced persons or members of host communities in a timely fashion.

Closure

This report, "Competent Person's Report of the Taldybulak Levoberezhny Gold Project in Kemin Region, Chuy Province, Kyrgyzstan" was prepared by

Appendix C *JORC Code* Table 1

JORC Code, 2012 Edition – Table 1

Section 1: Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	*JORC Code* explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Sampling including drill core sampling and channel sampling is undertaken. Geologists perform geological logging, then mark the sample intervals before sampling to ensure appropriate sampling. • Mainly use tape metres for measurement. • Based on geologists' observation. • Sampling is mainly based on the sample mark made by geologists, trying to take unbiased samples.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• All samples were collected by Altynken LLC's site geologists. The tunnel samples were taken by channel sampling. Each sample was about 2m long.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Core length was measured against the core run to assess the core recovery. • Short runs to reduce drilling time was applied to maximise sample recovery. • Core recovery in broken/ fault zones are normally lower, however, still higher than 90% in general.

Criteria	*JORC Code* explanation	Commentary
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Core and channel samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies, pre-feasibility study. • Logging is qualitative in nature; all cores were photographed before and after cutting. All intervals were logged. • The logging has provided adequate coverage of the full length of each sample the project.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representativity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Core were sawn in half for sample and the other half stored. • Not applicable as no sample splitting was undertaken. • Sample preparation in Levoberezhny Project is considered at industry good practice. • Core duplicates, coarse duplicates and pulp duplicates have been applied to maximise representativity of samples. • Duplicates results were monitored by QA/QC geologists, QA/QC database was established. • Sample size is always the larger the better, the core samples and channel are appropriate to the grain size of the material being sampled.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The assaying and laboratory procedures is generally acceptable. • Internal and external duplicate samples for the evaluation of analytical precision are compliant with Chinese regulatory requirements and Kyrgyzstan national standards. The laboratories have used certified reference materials ("**CRMs**") and blank samples to evaluate the accuracy of the analysis, however, the CRMs and blank sample analysis results were not provided to SRK.

Criteria	*JORC Code* explanation	Commentary
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Check samples have been taken during SRK site visit, the samples were re-numbered and sent to Central Laboratory for re-analysis. • QA/QC database was established.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Survey information is good enough to support the Mineral Resource estimation. • Survey equipment are well operated and calibrated by professional surveyors.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Drill data spacing is a grid roughly of 20 – 30 m by 20 – 30 m along both strike and dip directions. • Data spacing and distribution are sufficient to establish the degree of geological and grade continuity. • Sample compositing has been applied to equal lengths for constant sample volume, in keeping with industry theories of sample support.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Boreholes and channels were designed considering the possible structures and mineralisation.
Sample security	• *The measures taken to ensure sample security.*	• Samples were marked and sealed after sampling, then freighted to laboratory by dedicated staff.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• The results are generally acceptable with some outstanding samples to be re-analysed.

Section 2: Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	*JORC Code* explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• See Sections 3.2 and 3.3.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Between 1986 and 1989, the Oktorgoisk Exploration Brigade carried out a further tunnelling and drilling exploration at the Levoberezhny Project. Two tunnels at 1,610 m ASL with respective lengths of 4,742 m and 426 m, and a total of 128 drillholes at surface with an aggregate length of 72,021m were completed. • Oktorgoisk Exploration Brigade conducted a supplementary exploration drilling from 1990 to 1995. A total of 73 drillholes were completed with an aggregate length of 73,686m. • MMC conducted a detailed exploration and technical and economic analysis at the M1 and M2 mineralised zones of the Levoberezhny Project from 1996 to 2000. A total of 79 underground drillholes with an aggregate length of 10,612.5m were completed and a total of 6,149 samples were collected.

Criteria	*JORC Code* explanation	Commentary
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Levoberezhny gold deposit is a structurally controlled hydrothermal deposit associated with ductile shear zones and intense metasomatism. • The deposit is hosted by Neoproterozoic-Cambrian metamorphic rocks of the Kupurelisay and Tegermenty Groups, which include schists, gneisses, amphibolites, and migmatites formed under tectonothermal events from Caledonian, Hercynian, and Alpine orogenic processes. • Gold mineralisation is closely linked to hydrothermal alterations, particularly silicification and tourmalinisation, occurring in ductile shear zones. Metallic minerals predominantly include pyrite, arsenopyrite, and, occasionally, chalcopyrite. Mineralisation is characterised by disseminated, vein-like, and stockwork ores enriched in gold, copper, and silver. • The primary ore-hosting lithologies are quartz-sericite metasomatites and talc-magnesite schists, with gold deposits concentrated in NW-striking deformation zones, particularly within the Taldybulak ductile shear zones. • The mineralised zones follow NW-NNW alignments, dipping SW at shallow to moderate angles and showing lenticular, stratiform, and columnar morphologies.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• As of 31 December 2024, a total of 1,056 diamond drillholes have been completed within the Levoberezhny Project, with a cumulative drill length of 253,938 m. • The collar of the drill hole was transformed to Relative Coordinate System based on 1963 coordinate system by Zijin Mining. • All tunnels, and drillholes were surveyed by Topcon electronic total station based on the same coordinate projection system as used in geological database and resource modelling. • The measurements of azimuth and inclination were carried out using the Beijing Liuhe Greatness electronic borehole inclinometer LHE3710, with precision meeting requirements, and all results conforming to industry standards. • All information of drillholes carried out so far in the Levoberezhny Project area are collected, including collar, elevation, depth, survey etc. Details are shown in section 7.3.

Criteria	*JORC Code* explanation	Commentary
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Exploration data is reported as the average sample grade over the mineralised intersection. The mineralised domain is defined at a lower cut-off Au grade of 1.0 g/t and a high-grade domain is defined at a cut-off grade of 10.0 g/t au. Top-cutting was used to report the exploration results. Details are shown in section 7.7.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• True width was calculated and as such only downhole lengths were reported. • Most boreholes are perpendicular to the mineralised zone and the tunnels are basically inside the mineralised zone.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Shown in the chapter 7.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Reporting was fully representative of the data provided at this stage.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• SRK is not aware of any other material or substantive exploration data that has not been reported.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• In areas where mineralised zone variations are complex, densified exploration is required to better control the spatial morphology of the mineralised zone. • The deeper parts of the mineralised zone still hold certain resource potential, and further work can be carried out to explore these areas.

Section 3: Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	*JORC Code* explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• The data provided by Altynken LLC in Access format was imported into Surpac (V6.3) and leapfrog Geo 2023.1 and validated. • Data validation steps included: Validation through constraints set in the database, e.g., overlapping/ missing intervals, intervals exceeding maximum depth, valid geology codes, missing assays. • Validation through 3D visualisation to check for any obvious collar, down-hole survey, or assay import errors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• SRK has conducted a site visit between 12 and 16 April 2025.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• The geological interpretation is specifically based on gold grade. • Mineralised domains were manually constructed based on a 1.0 g/t Au cut-off grade. The extrapolation distance was limited to one-quarter of the spacing between two boreholes, not exceeding 20 m, with mineralisation extrapolated up to approximately 10 m and wedging out in areas where borehole data were unavailable. • Partial high-grade mineralised domains (Au grade >10.0 g/t) were identified within the main mineralised domains (C1_1 and C1_2) to minimise their impact on grade interpolation.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• It is detailed in section 5.3.1.

Criteria	*JORC Code* explanation	Commentary
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	• A parent block size of 2.0 m by 2.0 m by 2.0 m (Easting [X], Northing [Y], Elevation [Z]) was applied, with the smallest sub-block size of 1.0 m by 1.0 m by 1.0 m. • The estimation of gold grade was conducted using different methods for each mineralised zone. For Mineralised Zone 1, the O.K. method was applied via Surpac in the block model. Mineralised Zones 2 to 12 were estimated to use the IDW method via Surpac. • All samples were composited to 2 m. • The distribution characteristics of the sample histogram were used to do the top capping. Outlier handling was applied for Au in each mineralised zone. • The estimation process was carried out in three steps. First, the Au grade estimation of block units within the 10.0 g/t mineralised zone was constrained using composite samples from within the 10.0 g/t boundary. Second, the Au grade estimation of block units between the 2.0-10.0 g/t boundary but outside the 10.0 g/t mineralised zone was constrained using composite samples from the 2.0-10.0 g/t boundary zone. Finally, the Au grade estimation of block units between the 1.0-2.0 g/t boundary but outside the 2.0 g/t boundary was constrained using composite samples from the 1.0-2.0 g/t boundary zone. • Model validation was performed using swath plot comparison.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• The tonnages are estimated on a dry basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The conceptual parameters are used to estimate the cut-off grade for the Levoberezhny Project. • Mineral Resources are reported at a cut-off grade of 1.3 g/t Au.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• The Levoberezhny Project is a producing mine utilising underground mining methods with a sublevel open stoping methodology. • The mining method, dilution factors, and economic costs are supported by feasibility studies and historical operational data from the mine. • Mining factors and parameters have been reasonably incorporated into the selection of the cut-off grade.

Criteria	*JORC Code* explanation	Commentary
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• A desktop review of a processing study report is conducted by SRK. SRK visited the Levoberezhny Plant and smelter and reviewed the historical production records. • The flowsheet and equipment configuration of the Levoberezhny Plant is reasonable and appropriate. • The ore properties are simple and easy to process. Levoberezhny Plant produces gold-copper concentrate and Doré bullion. The gold average grade of concentrate is over 85 g/t and the gold recovery (mineral processing) is about 90%. • Details are presented in Chapter 9.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• The Levoberezhny Project has undergone an environmental impact assessment, and the possible environmental impacts caused by the Levoberezhny Project's construction and operation have been evaluated, with mitigation measures proposed.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• Bulk density determinations were conducted using the conventional density-immersion method. Zijin Mining collected a total of 528 small samples before 2019, each with a volume of less than 0.125 m^3. The measured densities ranged from 2.28 to 4.03 g/cm^3, with an average value of 3.10 g/cm^3 and a median of 3.04 g/cm^3. • During the supplementary exploration of the C2 mineralised zone from 2019 to 2023, a total of 106 bulk density samples were collected and tested, with an average value of 3.08 g/cm^3. • Therefore, a specific gravity value of 3.10 g/cm^3 was adopted as the bulk density for the Mineral Resource estimate.

Criteria	*JORC Code* explanation	Commentary
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• SRK considers geological continuity, sampling interval, sampling data quality and variation range. • Mineralisation exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located. • For the Levoberezhny Project, the Mineral Resource at the space of 10 m (strike) × 10 m (dip) is defined as Measured Mineral Resource, the Mineral Resource at the space of 20 - 40 m (strike) × 20 - 40 m (dip) is defined as Indicated Mineral Resource and the Mineral Resource at the space of 60 - 80 m (strike) × 60 - 80 m (dip) and greater is defined as Inferred Mineral Resource.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• This report was internally peer reviewed by Pengfei Xiao, FAusIMM and MAIG, a Principal Consultant (Geology).
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• See chapter 7 and more specified sections 7.11 and 7.12.

Section 4: Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	*JORC Code* explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• See "8.1.3 Ore Reserve Model".
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• A site visit was conducted between 12 April and 16 April 2025. • SRK communicated all modification factors with technicians.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• See "8.1.1 Technical Studies" • After the review of the feasibility study, SRK noted that it mainly summarised the operating status but with little sustaining designs to the existing operations. There is no further mine plan in place to modify the mining capacity, mining method, development system, ventilation, dewatering and drainage.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• See "8.1.2 Cut-off Grade"

Criteria	*JORC Code* explanation	Commentary
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• The mining method is demonstrated in "8 Ore Reserve Estimates and Mining Assessment". • The mine is a producing underground mine. Therefore, it is not applicable to consider the factors related to an open pit property. The mining dilution and recovery factors are shown in Figure 8-2 and "8.1.5 Mining Loss and Dilution". • The minimum mining width is 4.2 m. • The Inferred Mineral Resource and wall rocks were treated as waste materials with a zero grade. • The tonnage of Inferred Mineral Resources account for about 10.1% of total tonnage of mineable materials in Table 8-3. These Inferred Mineral Resources must be mined during the ore extraction process. They cannot be selectively excluded from the Ore Reserves. • Infrastructure requirements are described in "8.5.3 Mining Services".
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.* • *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the mineralised zone as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• See "9 Processing and Metallurgical Assessment".

Criteria	*JORC Code* explanation	Commentary
Environmen-tal	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• The Levoberezhny Project has undergone an environmental impact assessment and obtained the government's approval. At present, the waste rock generated by the Levoberezhny Project is stored in the waste rock dump, and the tailings are respectively stored in the FL TSF and the CN TSF. Both TSFs are constructed with anti-seepage system.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• See "11 Project Infrastructure"
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• See "13 Capital Expenditures and Operating Expenses". • See "14.6 Tax Obligations".
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• See "14.2 Gold Concentrate Processing Contracts" and "14.3 Sales Contracts".
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• See "14.1 Products and Client". • See "14.4 Historical Price" and "14.5 Price Forecast"

Criteria	*JORC Code* explanation	Commentary
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• See "14.7 Technical and Economic Analysis".
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• Altynken LLC stated that it had not received any environmental complaints from nearby herders in the past three years. • Altynken LLC has established a development fund, provided financial support to the local community, and held social activities with the community.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• See "15 Risk Assessment".
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• See "8.1.6 Ore Reserve Classification"
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• This report has been peer reviewed by Alexander Thin, FAusIMM (CP Min), a Corporate Consultant (Mining and Project Evaluation).

Criteria	*JORC Code* explanation	Commentary
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• See "15 Risk Assessment". • See "8.1.3 Ore Reserve Model".

Appendix D Compliance with Chapter 18

Chapter 18				Sections in SRK's Report
18.01	**DEFINITIONS AND INTERPRETATION**			not applicable
18.02-18.04	**CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES**			not applicable
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.			
18.03	A Mineral Company must:—			
	(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—		3
		(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or	
			Note: 'control over a majority' means an interest greater than 50%.	
		(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which gives it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
	(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—		7.12
		(a)	Indicated Resources; or	
		(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
	(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—		13.5, 13.6
		(a)	workforce employment;	
		(b)	consumables;	
		(c)	fuel, electricity, water and other services;	
		(d)	on and off-site administration;	
		(e)	environmental protection and monitoring;	
		(f)	transportation of workforce;	
		(g)	product marketing and transport;	
		(h)	non-income taxes, royalties and other governmental charges; and	
		(i)	contingency allowances;	
		Note:	*A Mineral Company must:* *• set out the components of cash operating costs separately by category;* *• explain the reason for any departure from the list of items to be included under cash operating costs; and* *• discuss any material cost items that should be highlighted to investors.*	

Chapter 18				Sections in SRK's Report
	(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—		13.4
		(a)	general, administrative and operating costs;	
		(b)	property holding costs; and	
		(c)	the cost of any proposed exploration and/or development; and	
		Note:	*Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.*	
	(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has sufficient available working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.		13.4
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.			not applicable
	Note: A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.			
18.05-18.08	**CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS**			
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—			
	(1)	a Competent Person's Report;		Whole report
	(2)	a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;		2.4
	(3)	the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;		3.2
	(4)	a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;		3.2
	(5)	disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and		15

Chapter 18				Sections in SRK's Report
	(6)	if relevant and material to the Mineral Company's business operations, information on the following:—		12
		(a)	project risks arising from environmental, social, and health and safety issues;	
		(b)	any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	
		(c)	compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	
		(d)	sufficient funding plans for remediation, rehabilitation and closure and removal of facilities in a sustainable manner;	
		(e)	environmental liabilities of its projects or properties;	
		(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	
		(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	
		(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	
18.06-18.08	***Additional disclosure requirements that apply to certain new applicant Mineral Companies***			
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.			13.5, 13.6
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.			not applicable
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.			not applicable
18.09-18.13	**RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS**			**not applicable**
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—			
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;		
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;		
		Note: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.		

Chapter 18			Sections in SRK's Report
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and	
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.	
	Note: Material liabilities that remain with the issuer on a disposal must also be discussed.		
18.10-18.11	***Requirements that apply to listed issuers***		**not applicable**
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.		
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.		
18.12-18.13	***Requirements that apply to Mineral Companies and listed issuers***		**not applicable**
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.		
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.		
18.14-18.17	**CONTINUING OBLIGATIONS**		**not applicable**
18.14	***Disclosure in reports***		
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.		

Chapter 18			Sections in SRK's Report
18.15-18.17	***Publication of Resources and Reserves***		
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.		
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.		
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18.		
	Note: Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.		
18.18-18.27	**STATEMENTS ON RESOURCES AND/OR RESERVES**		
18.18	***Presentation of data***		
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.		7.12, 8.1.7
18.19	***Basis of evidence***		
18.19	All statements referring to Resources and/or Reserves:—		
	(1)	in any new applicant listing document or circular relating to a Relevant Notifiable Transaction must be substantiated in a Competent Person's Report which must form part of the document; and	Whole report
	(2)	in all other cases, must at least be substantiated by the issuer's internal experts.	not applicable
18.20	***Petroleum Competent Persons' Reports***		**not applicable**
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.		

Chapter 18			Sections in SRK's Report
18.21-18.22	***Competent Person***		
18.21	A Competent Person must:—		2.7
	(1)	have a minimum of five years' experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	
	(2)	be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	
	(3)	take overall responsibility for the Competent Person's Report.	
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—		2.11
	(1)	have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2)	not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3)	in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4)	in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
18.23	***Additional requirements of Competent Evaluators***		**not applicable**
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—		
	(1)	have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2)	have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3)	hold all necessary licences.	
	Note:	*A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.*	

Chapter 18			Sections in SRK's Report
18.24	***Scope of Competent Persons' Reports and Valuation Reports***		
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—		1, 2.2
	(1)	be addressed to the Mineral Company or listed issuer;	2.1
	(2)	have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	2.4
	(3)	set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	1, 2.2
18.25-18.26	***Disclaimers and Indemnities***		
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.		2.3
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.		2.9
18.27	***Obligations of sponsor***		not applicable
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.		
18.28-18.34	**REPORTING STANDARD**		**1, 2.2**
18.28-18.30	***Mineral reporting standard***		
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.		not applicable

Chapter 18				Sections in SRK's Report
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—			
	(1)	under:		
		(a)	the JORC Code;	1, 2.2
		(b)	NI 43-101; or	
		(c)	the SAMREC Code,	
		as modified by this Chapter; or		
	(2)	under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.		not applicable
	Note:	*The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.*		
18.30	A Mineral Company must ensure that:—			
	(1)	any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;		8.1.1
	(2)	estimates of mineral Reserves and mineral Resources are disclosed separately;		7.12, 8.1.7
	(3)	Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;		8.1.4, 14.7
	(4)	for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—		14.5
		(a)	the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	
		(b)	if a contract for future prices of mineral Reserves exists, the contract price is used; and	
	(5)	for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.		14.7.4

Chapter 18			Sections in SRK's Report
18.31-18.33	***Petroleum reporting standard***		**not applicable**
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.		
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—		
	(1)	under PRMS as modified by this Chapter; or	
	(2)	under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	Note: A Reporting Standard applied to specific assets must be used consistently.		
18.33	A Mineral Company must ensure that:—		
	(1)	where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;	
	(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
	(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	8; 9
	(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	
		Note: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.	
	(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
		Note: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.	

Chapter 18			Sections in SRK's Report
	(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
	(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	
18.34	***Mineral or Petroleum Asset Valuation Reports***		**not applicable**
18.34	A Mineral Company must ensure that:—		
	(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
	(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
	(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
	(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

Appendix E Chapter 2.6 of the Guide for New Listing Applicants

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	7.12, 8.1.2, 8.1.4, 6.4.3, 14.5
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	not applicable
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	5.3.2, 9.2.4
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	4.1
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	8.1
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	14.7.1, 14.7.2
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/ oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	not applicable
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	15

Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

Term / Abbreviation	Meaning / Definition
%	Per cent
′	Minute(s)
″	Second(s)
°	Degree(s)
°C	Degree(s) Celsius
3D	Three-dimensional
AAS	Atomic absorption assay
ActLabs Colombia	ActLabs laboratory based in Rionegro, Colombia
Ag	Silver
AIG	Australian Institute of Geoscientists
AISC	All-in sustaining cost; the cost consists of cash cost, taxations and fees, excluding income tax, and sustaining CAPEX
ALS Colombia	ALS Laboratory based in Medellin, Colombia
ALS Peru	ALS Laboratory based in Lima, Peru
ANFO	Ammonium nitrate / fuel oil
ANLA	the National Environmental Licence Agency
As	Arsenic
ASL	above sea level
Au	Gold
AuEq.	Gold equivalent; including gold, and other elements saleable converted into gold equivalent
AusIMM	Australasian Institute of Mining and Metallurgy
B.Sc.	Bachelor of science
BIC	Buritica intrusive complexes
BKF	Pulp blank
BKG	Coarse blank
BMZ	Broader Mineralised Zones
BQ	36.5 mm core diameter
Bullet Mining	Grupo de Bullet S.A.
Buritica Project	Buritica Gold-Silver Project
Capex	capital expenditure(s)
CCD	Continuous counter current decantation
CGI	Continental Gold Inc.
CIM Definition Standards	2014 edition of the *CIM Definition Standards for Mineral Resources & Mineral Reserves*, which was prepared by the CIM Standing Committee on Reserve Definitions
CIT	Corporate income tax
cm	Centimetre(s)
CMF	Consensus Market Forecasts
COG	Cut-off grade
CPR	Competent Person's Report
CRM	Certified reference materials
Cu	Copper
CV	Coefficient of variation

DA	Depreciation and amortisation
DANE	National Administrative Department of Statistics, locally referred to as the Departmento Administrativo Nacional de Estadistica
DCF	Discounted cash flow
DN	Diameter Nominal
DU	Field duplicate
DUG	Coarse duplicate
DUP	Pulp duplicate
ENE	East north-east
EPM	Medellin Public Companies, locally referred to as the Empresas Públicas de Medellín
FA	Fire assay procedure
FAusIMM	Fellow of the Australasian Institute of Mining and Metallurgy
Fe	Iron
Form 43-101F1	Form 43-101F1 Technical Report and Related Consequential Amendments
FS or Feasibility Study	A Feasibility Study is a comprehensive technical and economic study of the selected development option for a mineral project that includes appropriately detailed assessments of applicable Modifying Factors together with any other relevant operational factors and detailed financial analysis that are necessary to demonstrate at the time of reporting that extraction is reasonably justified (economically mineable). The results of the study may reasonably serve as the basis for a final decision by a proponent or financial institution to proceed with, or finance, the development of the project. The confidence level of the study will be higher than that of a Pre-Feasibility Study
G&A	general and administration
g	gram
g/cm^3	gram(s) per cubic centimetre
g/t	gram per tonne
GCL	Geosynthetic clay layer
GCR	Gran Colombia Resources Ltd
GIS	Geographic information system
HDPE	High density polyethylene
HKEX	Hong Kong Exchanges and Clearing Limited
HQ	63.5 mm core diameter
ICONTEC	International Certification Network for Geochemical Analysis for the Mining Sector
ICP-MS	Inductively Coupled Plasma – Mass Spectrometry
ID	Identities
ID^2	Inverse Distance Squared
IFC	International Finance Corporation
INACAL	National Institute of Quality
Indicated Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit
Inferred Mineral Resource	That part of a Mineral Resource for which quantity and grade (or quality) are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade (or quality) continuity. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
Jones PL	Ivor Jones Pty Ltd
JORC Code	2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* prepared by the Joint Ore Reserves Committee of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
JORC Committee	Joint Ore Reserves Committee
K	the element symbol of potassium

kg	kilogram, equivalent to 1,000 grams
km	kilometres, equivalent to 1,000 metres
km^2	square kilometres
kt	thousand tonnes
kt/a	Metric kiloton(s) per annum
ktpa	Metric kiloton(s) per annum
kV	kilovolts, equivalent to 1,000 volts
LHD	load-haul-dump
LiDAR	Light detection and ranging
Listing Rules	Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited
LoM	Life of mine
M	million
m	metres
m^2	square metre
m^3	cubic metre
MAusIMM	member of the Australasian Institute of Mining and Metallurgy
m ASL	metres above sea level
MA	Mining Associates Ltd
Ma	Million years
Measured Mineral Resource	That part of a Mineral Resource for which quantity, grade (or quality), densities, shape, and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit.
MHW	Minimum horizontal width
Mineral Resource	A concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade (or quality), and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.
mm	Millimetre(s)
mm/d	Millimetre(s) per day
MMW	Minimum mineable width
Mo	Molybdenum
Moz	Million troy oz
MRM	Mineral Resource model
Mt	Million tonne(s)
MVA	Megavolt(s) ampere
NCF	Net cash flow
NI 43-101	National Instrument 43-101, Standards of Disclosure for Mineral Projects
NPV	Net present value
NQ	47.6 mm core diameter
NW	Northwest
O.K.	Ordinary Kriging
OCF	Overhand cut and fill mining
OHS	Occupational Health and Safety
Opex	operating expenditure(s)/cost(s)
Ore Reserve	The economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include

	application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified
ORM	Ore Reserves Model
oz	troy ounce(s), 1 oz = 31.1035 grams.
Pb	Lead
PFS	A Preliminary Feasibility Study (Pre-Feasibility Study) is a comprehensive study of a range of options for the technical and economic viability of a mineral project that has advanced to a stage where a preferred mining method, in the case of underground mining, or the pit configuration, in the case of an open pit, is established and an effective method of mineral processing is determined. It includes a financial analysis based on reasonable assumptions on the Modifying Factors and the evaluation of any other relevant factors which are sufficient for a Competent Person, acting reasonably, to determine if all or part of the Mineral Resources may be converted to an Ore Reserve at the time of reporting. A Pre-Feasibility Study is at a lower confidence level than a Feasibility Study
PhD or Dr	Doctor of Philosophy
PPE	Personal protective equipment
Project	Buritica Gold-Silver Project
Probable Ore Reserve	the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve
Proved Ore Reserve	the economically mineable part of a Measured Mineral Resource. A Proved Ore Reserve implies a high degree of confidence in the Modifying Factors
QA/QC	quality assurance/quality control
Report	Independent technical report
RoM	run-of-mine
RPEEE	reasonable prospects for eventual economic extraction

Executive Summary

Introduction

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Limited ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of Buritica Gold-Silver Project (the "**Buritica Project**" or the "**Project**") which is located in Antioquia, Republic of Colombia ("**Colombia**") and operated by Continental Gold Limited Succursal Colombia ("**CGL Colombia**"). Zijin Gold International indirectly holds 68.8 per cent ("**%**") shares in CGL Colombia. The Buritica Project includes the Buritica Underground Gold Mine ("**Buritica Mine**") and the associated ore processing and smelter plant ("**Buritica Plant**").

It is SRK's understanding that the independent technical assessment on the Buritica Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Zijin Gold International on the Main Board of the Stock Exchange of Hong Kong Limited (the "**SEHK**" or "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Limited ("**HKEX**").

The Report has therefore been prepared following the requirements of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "***JORC Code***") and in accordance with the *Rules Governing the Listing of Securities on the Stock Exchange of Hong Kong Limited* (the "***Listing Rules***") including the *Chapter 18* requirements and other relevant regulations of HKEX.

Summary of Principal Objectives

The principal objective of this Report is to provide Zijin Gold International and potential equity investors and future shareholders of the Zijin Gold International with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserves, mining methodologies, processing and metallurgical technologies, environmental and social aspects, of the Buritica Project based on all available technical data provided to SRK at the time. It is understood that the aim of this Report will be used by the Zijin Gold International for the proposed listing on the Stock Exchange.

Outline of Work Programme

The work program for this project consisted of:

- review of data and Mineral Resource models provided by CGL Colombia and Zijin Gold International, and the preparation of a data verification plan which will be conducted during site inspection.
- a site visit between 15 and 20 May 2025, to the Buritica Project, including the inspections and observations of the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the Buritica Plant, ore and waste stockpiles, tailings storage facilities ("**TSFs**"), water source and power supply station, the office and living areas, and other associated infrastructure.

- review of all available documents, including operating licences and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.
- discussion with CGL Colombia and Zijin Gold International management and technical personnel, as well as the professionals of Zijin (Xiamen) Engineering Co., Ltd ("**Zijin Xiamen**"), who prepared either the geology and exploration or the feasibility study ("**FS**") on the Buritica Project.
- preparation of a draft report in accordance with the *JORC Code* guidelines and the requirements of the *Chapter 18* and other regulations of HKEX (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- submission of the draft report to Zijin Gold International and CGL Colombia and the related third party for comments and finalise the draft based on the feedback.

Results

Overall

The Buritica Project comprises of the Buritica Mine and Buritica Plant, sustaining a multiple-year life of mine ("**LoM**") with a current production capacity of approximately 4,000 tonnes per day ("**tpd**" or "**t/d**"), and an expansion to approximately 5,000 tpd, or equivalent to 1,650 thousand tonnes per annum ("**ktpa**" or "**kt/a**"). The production capacity and status of Buritica Mine and Buritica Plant are listed in Table ES-1.

Table ES-1: Details of Buritica Mine and Buritica Plant

Company	Mines/Plants	Products	Designed Mining Capacity (ktpa)	Status
CGL Colombia	Buritica Mine	Raw Ore	1,650	Production
	Buritica Plant	Feed Ore	1,650	Production
		Gold Bullion	/	Production

Sources: SRK

The Buritica deposit is a low to intermediate sulfidation epithermal vein type gold ("**Au**") – silver ("**Ag**") system, while retaining some characteristics of porphyry gold deposits. A total of 3,772 diamond drillholes, 25,081 channel samples, and 13 geotechnical drillholes were completed at the Buritica Project. As of 31 December 2024, the estimated Mineral Resources and Ore Reserves, as per the *JORC Code* guidelines, are listed in Table ES-2.

Table ES-2: Summary of Mineral Resources and Ore Reserves, as of 31 December 2024

	Cut-off Grade	Tonnes	Gold			Silver		
Category	(AuEq g/t)	(Mt)	Au (g/t)	Au (kg)	Au (koz)	Ag (g/t)	Ag (kg)	Ag (koz)
Mineral Resources								
Measured	2.0	10.1	7.7	78,200	2,500	23.4	236,800	7,600
Indicated	2.0	19.2	7.1	136,900	4,400	24.7	474,900	15,300
Measured + Indicated	2.0	29.4	7.3	215,100	6,900	24.2	711,700	22,900
Inferred	2.0	21.0	7.1	149,800	4,800	20.6	432,200	13,900
Total/Average	**2.0**	**50.4**	**7.2**	**364,900**	**11,700**	**22.7**	**1,143,900**	**36,800**
Ore Reserves

Probable	2.4	15.5	6.5	101,000	3,240	19.8	307,000	9,700
Total/Average	**2.4**	**22.5**	**6.9**	**154,500**	**4,980**	**20.2**	**455,000**	**15,000**

Sources: SRK

Notes:

1 Mineral Resources are inclusive of Ore Reserves in the table above, and they should not be double counted.

2 The Mineral Resources and Ore Reserves Statements in the table are reported according to the JORC Code guidelines. The Competent Persons are Mr. Huaixiang Li, Mr. Yonggang Wu, and Dr Anshun Xu. Please see details below in Mineral Resources and Ore Reserves sections.

3 AuEq = Au g/t + Ag g/t × 0.010086, based on metal prices of 2700 USD/oz Au and 35 USD/oz Ag and recovery rates of 87.63% Au and 68.18% Ag.

The Buritica Mine is a producing underground gold-silver mine. The current nominal ore mining capacity is 1,320 ktpa. At present, the Buritica Plant adopts the process of "primary crushing - semi-autogenous grinding - ball milling ("**SABC**")" to grind ores. The process of "priority flotation of copper/gold – then flotation of zinc/sulphur" is adopted to produce direct saleable copper-gold mixed concentrate and zinc-sulphur bulk concentrate that require further processing. After regrinding the zinc-sulphur concentrate, the "whole ore cyanidation – Counter Current Decantation ("**CCD**") – Merrill Crowe" process is adopted to extract gold and silver.

CGL Colombia plans to expand the mining capacity and processing throughput to 5,000 tpd or 1,650 ktpa from the start of year 2028. Currently there is no plan in place to be reviewed by SRK.

The sustaining Capex for the proposed expansion and other technical upgrades is about United States Dollar ("**USD**") 120.3 million. The overall average cash Opex is about USD 162.5/ t ore, or USD 817.9 per troy ounce ("**oz**") gold equivalent. The all-in sustaining cost ("**AISC**") is USD 840.9/ oz gold equivalent. Using the discounted cash flow ("**DCF**") method, the estimated net present value ("**NPV**") for the Buritica Project is about USD3.06 billion at a discount rate of 8%.

Operational Licences and Permits

CGL Colombia has obtained a mining concession contract to carry out mining, processing and smelting. In addition, it has other approvals and permits including work plans, water use permits, and land access permits, etc.

Geology and Mineralogy

The northern Andean Cordillera in Colombia was uplifted by the subduction of multiple oceanic plates, with major accretionary events forming volcanic-magmatic belts during the Jurassic, Cretaceous, and Tertiary periods. The Buritica Project lies within the Miocene-age Middle Cauca Belt, known for hosting numerous polymetallic porphyry and epithermal deposits. The region's geology is dominated by the Cretaceous Barroso Formation, consisting of pillow basalts, andesitic pyroclastics, dolerites, and mudstone layers. The area is intruded by Cretaceous Santa Fe Batholith tonalites and the Buritica Intrusive Complex ("**BIC**"), with radiometric dating (U/ Pb) indicating an age of 7.7±0.1 million annum ("**Ma**").

The Buritica Project hosts two major Au-Ag vein systems: the Yaragua and the Veta Sur. Yaragua trends ENE (75°–80°), is nearly vertical, and measures 1,350 metres ("**m**") in length, 1,660 m in depth, and 220 m in width, with 24 high-value mineralised veins ("**HVMs**") commonly 0.5–1.0 m wide. Veta Sur strikes NE (40°–50°), is also steeply vertical, spans 1,300 m in length, 1,600 m in depth, and 300 m in width, with 28 HVMs showing similar geometry to Yaragua. In addition to vein-style mineralisation, 4 low-grade pillar-like mineralised systems ("**BMZs**") have been defined. These BMZs are hosted vertically within Yaragua and Veta Sur and are irregular in shape, with diameters of 100 to 150 m and vertical extents of 300 to 600 m.

The area is transected by N-S to NNW-trending faults, including the Tonusco Fault system east of Yaragua and Veta Sur, which cuts off intrusive complexes and hydrothermal alteration zones, indicating post-intrusion and post-mineralisation activity. These faults were likely active during ore formation and persisted into the post-ore stage.

Mineralisation is primarily hosted within the BIC, composed of diorites and hydrothermal/ intrusive breccias, though some Au-Ag veins extend into wall rocks of the Cretaceous Barroso Formation. Au, Ag, and copper ("**Cu**") are economically recoverable based on metallurgical tests, with zinc ("**Zn**"), lead ("**Pb**"), and sulphur potentially recoverable. Arsenic levels do not significantly impact Au recovery.

Deposit Type

Recent geological observations and drilling data from CGL Colombia suggest the Buritica deposit is a low to intermediate sulfidation epithermal vein type Au-Ag system, while retaining some characteristics of porphyry gold deposits. Gold mineralisation in low-grade BMZs is associated with areas of increased veinlet density or disseminated mineralisation, sharing similarities with HVM mineralisation. BMZs are spatially related to the orientation of epithermal vein systems that crosscut the porphyry system.

The Buritica deposit is the northernmost major Au-Ag deposit in the Miocene Middle Cauca Belt, which hosts significant deposits such as the La Colosa Au-porphyry deposit (28 million troy ounces ("**Moz**") Au), the Nuevo Chaquiro Cu-Au porphyry deposit (3.6 million tonnes ("**Mt**") Cu and 5.6 Moz Au), and the Marmato deposit, identified as an intermediate-sulfidation epithermal gold system.

Exploration, Tunnelling and Drilling

Systematic exploration of the Buritica Project has been conducted by Continental Gold Inc. ("**CGI**") since 2007, utilising a variety of methods, including topographic and geological mapping, aerial magnetic and radiometric surveys, geochemical soil sampling, surface and underground drilling, and channel sampling, with a focus on the Yaragua and Veta Sur sections.

The Yaragua and Veta Sur sections include recent developments alongside historical tunnels in the Yaragua area. These tunnels consist of drifts primarily following veins, cross-cuts, raises, and other underground access points. Channel samples were collected at regular intervals, averaging 3 m along the drifts and raises, with a sampling width of 10 centimetres ("**cm**") and a depth of 3 cm, spanning approximately 1.5 m across the drifts (the advancing drift face).

Diamond drilling programs began in 2007, with resource-focused drilling starting in 2011. Drilling efforts in 2014–2015 aimed to convert Inferred Mineral Resources to Measured and Indicated Mineral Resource categories while also expanding overall Mineral Resources. From 2015 to 2017, infill drilling was conducted to improve confidence in Mineral Resource estimations. Since 2018, definition drilling has been prioritised to define Measured Mineral Resources. Since January 2019, drilling programs focused on surface drilling, definition drilling and channel sampling of tunnels (Table ES-3).

Table ES-3: Summary of Major Sample Workings as of 31 December 2024

	Collar	Depth (m)	Samples	Survey	Lithology
Surface Diamond Borehole	514	228,478	213,056	94,933	15,276
Underground Diamond Borehole	767	273,004	280,446	179,202	16,068
Definition Diamond Borehole	2,491	280,621	383,615	100,445	48,702
Channel	25,081	82,345	143,268	52,766	136,154
Geotechnical Drilling	13	4,244	2,385	778	276
Total	28,866	868,692	1,022,770	428,124	216,476

Sources: SRK

All surface and underground drilling operations were conducted in accordance with established technical protocols and outsourced to third-party contractors. Diamond core drilling equipment was utilised, primarily producing 63.5 millimetres ("**mm**") core diameter ("**HQ**") to 47.6 mm core diameter ("**NQ**") size cores, with some drill holes reduced to 36.5 mm core diameter ("**BQ**") size. Drill hole collars were surveyed using a Leica FlexLine TS09plus total station, manufactured in Switzerland, while downhole surveys employed Reflex Gyro and Dip Core instruments. Core recovery rates were satisfactory, with over 90% of boreholes achieving core recovery of no less than 92%.

Sample Preparation, Analyses and Security

Currently, the primary laboratory for analysing both exploration and definition samples is the internal Higabra laboratory, at the Buritica Project, while ALS Laboratory, Medellin, Colombia, serves as the external check laboratory.

Samples are analysed at the Higabra laboratory using a sampling protocol like that of ALS Laboratory, Peru. Typically, each sample is dried in ovens at 105 degrees Celsius ("**°C**") and crushed to approximately 10 mm. A subsample weighing between 1 kilogram ("**kg**") and 1.5 kg is split from the original sample using a riffle splitter and further crushed to achieve 90% passing less than 2 mm. Approximately 250 grams ("**g**") is then split off and pulverised to 95% passing 106 microns ("**μm**"). Assays include conventional fire assay ("**FA**") on 30 g sub-samples, with silver analysed by atomic absorption spectroscopy ("**AAS**") following an aqua regia digestion. Higher-grade samples are re-assayed using a gravimetric finish on 30 g sub-samples.

At the ALS Laboratory, Colombia, the same sample preparation procedure is followed. Each sample is dried in ovens at 105°C and crushed to approximately 10 mm. A subsample weighing between 1 kg and 1.5 kg is split using a riffle splitter and further crushed to 70% passing less than 2 mm. Approximately 250 g is pulverised to 85% passing 75 µm. Finally, about 100 g of the pulverised sample is sealed in packets and sent to ALS Peru for assaying.

As of 31 December 2024, a total of 13,034 core samples had been collected to measure dry bulk density using the conventional density-immersion method. These measurements were conducted by CGL Colombia geological technicians at the on-site core shed. The samples were randomly selected and externally re-measured by ALS Colombia monthly to ensure accuracy and consistency.

Quality Assurance and Quality Control

CGL Colombia has implemented quite comprehensive quality assurance and quality control ("**QA/QC**") program in Buritica Project. Certified reference materials ("**CRMs**") were purchased from international CRM suppliers, and the CRMs' performances are almost all in 3 standard deviations showing good accuracy. About 40% of field duplicates returned results within plus/minus ("**+/-**") 20% deviations comparing to the original assays, and about 59% of coarse duplicates returned assays within +/- 20% range comparing to the originals; and further about 78% of pulp duplicates returned results within +/- 20% deviations to the originals. The assay data indicate that coarse gold generates a remarkable nugget effect impaction against assaying precision. Coarse blank ("**BKG**") and pulp blank ("**BKF**") prepared by Higabra laboratory using non mineralised rocks were used as contamination control samples in Buritica Project, and all BKGs and BKFs are within 3 times of detection limit.

SRK considers the QA/QC management and performance meets industrial good practice and therefore believes that the current analysis data is acceptable for the purpose of Mineral Resource estimation.

Data Verification

SRK conducted the following verification procedures:

- Site inspection of the Au-Ag mineralisation style;
- Interviews with site geologists and mining engineer of CGL Colombia;
- Review of the primary database and all available relevant data provided by CGL Colombia;
- Overall data verification including cross checking between borehole collars and logging, between borehole collars and topography data, between assay and logging data, and between logging and interpretation, random checking assay reports issued by laboratory, data validation and integrity etc.;
- Cross checking on mined out stopes, and associated data;
- Assessment on specific gravity data and quality control data from 2019 to 2020;
- Assessment of metallurgical test data available to SRK; and

- Established SRK's geological model and block model for independent Mineral Resource estimates, and accordingly comparison with previous estimate and mining operation.

In SRK's opinion, the documented procedures and primary data are in general, acceptable by the industry practice even though some deficiencies were recognised, and SRK therefore believes that the current primary database is acceptable for the purpose of Mineral Resource estimation.

Mineral Resource Estimation

The Mineral Resource statement presented herein represents a Mineral Resource evaluation for the Buritica Project, prepared in accordance with the *JORC Code* guidelines. SRK has reviewed the Mineral Resource models, which were prepared by CGL Colombia, but has not re-modelled or re-estimated them.

SRK reviewed the drillhole database, mineralisation domain definitions, and grade estimation parameters based on the provided data and information for the Buritica Project. The validated Mineral Resource models were reported by SRK. Through cross-checking and validation of procedures and key parameters, SRK has determined that the reviewed models and Mineral Resource estimates were prepared using standard approaches that align with internationally accepted practices.

The Mineral Resource estimation documented in this Report is based on data from 3,772 diamond drillholes, totalling 782,103.5 m of drilling; 25,081 channel samples, totalling 82,345.3 m in length; and 13 geotechnical drillholes, totalling 4,243.8 m.

Mineralised veins were manually constructed using economic composites and natural boundaries, with a minimum horizontal width ("**MHW**") of 0.2 m for vein continuity. A 2 m halo zone on the hanging wall and footwall were separately modelled for grade estimation. The undiluted vein models were subsequently diluted to an MHW of 1.0 m for final Mineral Resource reporting. CGL Colombia combined lithological logs and assay data to define the boundaries of BMZs.

Grade capping was conducted by CGL Colombia based on Au and Ag distribution characteristics within the mineralised bodies, followed by sample length compositing. Vein-type mineralised bodies were composited to the length of 1 m, while BMZs were composited to 4 m.

Variograms were modelled, and the ordinary kriging ("**O.K.**") method was applied for Au and Ag grade estimation by CGL Colombia. SRK performed a thorough validation of the model, including visual inspection, comparison of Au and Ag grades between inverse distance squared ("**ID^2**") and O.K. methods, and swath plot analysis. These validations indicate that the block model constructed by CGL Colombia is acceptable.

The quality of the data, drillhole spacing, and continuity of vein-controlled grades allowed CGL Colombia to classify portions of the veins into the Measured, Indicated, and Inferred Mineral Resource categories.

Table ES-4 is a summary of Buritica Project's Mineral Resource statement as of 31 December 2024, in accordance with *JORC Code*.

Notes:

1 All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

2 The information in this Report which relates to Mineral Resource is based on information compiled by Dr Anshun Xu and Mr Huaixiang Li, who are both full time employee of SRK Consulting China Ltd. Dr Xu is a fellow of AusIMM and Mr Li is a member of AIG. Both Dr Xu and Mr Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the *JORC Code*. Dr Xu and Mr Li consent to the reporting of this information in the form and context in which it appears.

3 The Mineral Resources are reported for 1m minimum thickness at a cut-off grade of 2.0 g/t AuEq (AuEq = Au g/t + Ag g/t × 0.010086, based on metal prices of 2700 USD/oz Au and 35 USD/oz Ag and recovery rates of 87.63% Au and 68.18% Ag) considering an underground extraction. Cut-off grades are based on an Au metal price of USD 2,700/oz and USD 35/oz Ag, and one troy ounce is equal to 31.1035 gram.

4 Mining depletion includes CGL underground extraction as of 31 December 2024.

5 Mineral Resources are not Ore Reserves and do not have demonstrated economic viability.

Mining and Ore Reserves

SRK estimated the Ore Reserves for the Buritica Project in accordance with the *JORC Code* guidelines and are based on each section's mining recovery rate and dilution rate, as well as other modifying factors cited either from the historical mining records, the prefeasibility or feasibility study, and/ or mine designs.

The Ore Reserve statement is shown in Table ES-5.

Notes:

[1] The information in this Report which relates to Ore Reserve is based on information compiled by Mr Yonggang Wu, MAusIMM, and Dr Anshun Xu, FAusIMM, who are full time employees of SRK Consulting China Ltd. Both Dr Xu and Mr Wu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the *JORC Code*. Dr Xu and Mr Wu consent to the reporting of this information in the form and context in which it appears. AuEq = Au + 0.0095 * Ag + 0.5649 * Cu + 0.2202 * Zn.

[2] Number was rounded to the second significant digit to reflect the uncertainties in estimate.

[3] Total may not add due to rounding discrepancies

[4] Mining dilution rates, including waste rock and Inferred Mineral Resources, are 34.3% and 36.8% for sections V and Y, respectively. Mining loss rate rates are both 0.0%.

[5] The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

Mining Assessment

The Buritica Mine is an operating underground mine. The currently nominal ore mining capacity is 1,320 ktpa. CGL Colombia plans to expand the mining capacity and processing throughput to 5,000 tpd or 1,650 ktpa from the start of year 2028. Currently, there is no plan in place to be reviewed by SRK.

The development system includes the Higabra Adit, the V Decline, the Y Decline, the Decline 1150, the Central Ventilation Downcast, ore passes, the Water Plant Decline, the internal central ventilation downcast, Internal V and Y ramps, several internal ventilation shafts, the hauling levels down to the 345 m above sea level ("**ASL**") in 40 m spacing interval, and the crosscuts connecting the internal ramps and the hauling ways. Each level is usually subdivided into two 15m to 20 m high sublevels.

The sublevel open stoping ("**SLOS**") with delayed backfilling is being utilised. Due to its operational flexibility and compatibility with the mineralisation characteristics, this method will continue to be employed in the future.

The Ore Reserves can support a 15 year LoM, including a three-years ramp up period to expand mining capacity from the current 1,320 ktpa 1,650 ktpa, a nine-years full-production period and a three-years ramp-down period, based on SRK's mining model.

Mineral Processing and Metallurgy

The ore of the Buritica Project is of high gold grade, coarse grain size, and also contains silver, copper, lead, zinc and pyrite. The ore is amenable to cyanidation, as well as flotation for gold recovery. A series of metallurgical tests have been carried out in stages throughout the Project's life to support the flowsheet development, construction, technological transformation and operation optimisation of the Buritica Plant. As the grades of copper, lead, zinc and pyrite are low, the original processing plant was designed only to recover gold and silver adopting the process of "gravity separation – whole ore cyanidation ("**WOCN**")".

In order to improve the recoveries of gold and silver and recover copper, as well as expand the capacity from 3,000 tpd to 4,000 tpd, a technological transformation study of Buritica Plant was carried out during 2021. The flowsheet for "gravity separation – copper preferential flotation – zinc/pyrite flotation – zinc/pyrite bulk concentrate agitation cyanidation" was applied. The final products are copper/ gold concentrate and gold and silver doré bullion. The performance indicated the technological transformation and expansion of the Buritica Plant was successful.

The Buritica Plant historical performances after the technological transformation are summarised in Table ES-6.

Table ES-6: Historical Production Performance of Buritica Processing Plant

Environmental and Social Impacts

The sources of inherent environmental and social risk are project activities that may result in potential environmental and social impacts. The environmental and social risks for the Buritica Project are:

- Impacts to the local ecological system due to significant land disturbance;
- Heavy metal pollution from the waste rock dumps and TSF;
- Social concerns; and
- Occupational Health and Safety ("**OHS**") training and inspection concerns.

The above risks are categorised as moderate/ tolerable risks (i.e., requiring risk management measures). It is SRK's opinion that these risks for the Buritica Project can be generally managed if CGL Colombia put efforts to solve the issues.

Capital Expenditures and Operating Costs

Capital Expenditure(s)

SRK has reviewed the data provided by the mine and the *FS 2025* regarding the Capex for the Buritica Project. The Capex invested forming current facilities had a total net asset value of about USD 844.52 million. The mine management proposed the sustaining Capex needed for the Buritica Project, including the Capex for increasing the production to 5,000 tpd from current 4,000 tpd. Table ES-7 provides details about Capex for the Buritica Project. SRK is opined that the Capex proposed is reasonable.

Table ES-7: Sunk Capex and Sustaining Capex (USD Million) (from *FS 2025*, and Mine)

Item	2024	2025	2026	2027	2028	2029
Capex Invested	844.5*					
Sustaining Capex		47.89	23.27	13.45	9.52	8.81
Expansion Capex			12.31	5		

Sources: * The net value of the assets of the Buritica Project

Operating Costs

SRK has reviewed the Opex production data for the last three years, and the Opex proposed in the *FS 2025*. Considering the historical Opex, SRK considers the use the Opex estimated by the mine management, as listed in Table ES-8 for future production.

Table ES-8: Opex for 2025-2029 by the Mine Management

Category	Unit	2025	2026	2027	2028	2029	2030-2039
Mining	USD/ t mined ore	81.9	90.6	82.4	81.7	85.5	85.5
Processing	USD/ t feed ore	24.8	25.1	25.3	25.5	26.0	26.0

Economic Analysis

By using the DCF method and various economic and technical parameters, SRK has projected the mine economy of the Buritica Project. For a LoM of about 15 years, the Buritica Project has an NPV of about USD3.06 billion at 8% discount rate (based on the calculated weighted average cost of capital), and NPV of USD2.75 billion and USD3.43 billion at 10%, and 6% discount rate, respectively. The sensitivity analysis shows that the changes in Opex have smaller effect on the Buritica Project's NPV than that of changes in prices, while the changes of Capex have less effect on NPV.

The analysis above shows that the Buritica Project is economically viable, and the Ore Reserves statement can satisfy with the requirements of the *JORC Code* guidelines.

Risk Assessment

SRK considered various technical aspects which may affect the future cash flow of the Buritica Gold-Silver Project. SRK's final risk assessment is presented in Table ES-11.

Table ES-11: Risk Assessment for Buritica Gold-Silver Project

Risk Source/Issue	Likelihood	Consequence	Risk
Geology, Mineral Resource			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Unlikely	Major	Medium
Unexpected Groundwater Ingress	Unlikely	Moderate	Low
Significant Unexpected Geological Faulting	Possible	Moderate	Medium
Ore Reserve and Mining			
Lack of Significant Ore Reserves	Unlikely	Minor	Low
Significant Geological Structures	Possible	Moderate	Medium
Production Shortfalls	Possible	Moderate	Medium
Unexpected Groundwater ingress	Possible	Minor	Low
Excessive Surface Subsidence	Possible	Minor	Low
Poor Mine Plan	Unlikely	Minor	Low
Ore Production Capacity is Optimistic	Unlikely	Minor	Low
Processing and Metallurgy			
Process Adaptability	Possible	Minor	Low
Lower Throughput	Unlikely	Moderate	Low
Lower Recovery	Unlikely	Moderate	Low
Low Plant Reliability	Unlikely	Moderate	Low
Environmental and Social			
Impact on the local ecological system due to the significant land disturbance	Possible	Moderate	Medium
Heavy metal pollution from the waste rock dumps and TSFs	Possible	Moderate	Medium
Social concerns	Possible	Moderate	Medium
OHS training and inspection concerns	Unlikely	Moderate	Low
Capital and Operating Costs			
Project Timing Delay	Unlikely	Moderate	Low
Capital Cost Increases	Unlikely	Moderate	Low
Capital Costs- Ongoing	Unlikely	Moderate	Low
Operating Cost Underestimated	Possible	Moderate	Medium

Recommendations

Exploration and Mineral Resources

In consideration of vein-like mineralisation characteristics of the Buritica Project, it is recommended to apply a drilling program for controlling host fault structure and use tunnels to define Indicated and Measured Mineral Resources, and accordingly Probable and Proved Ore Reserves.

The primary laboratory used for the analysis of exploration and definition samples is currently the Buritica Project Higabra internal laboratory. SRK recommends conducting monthly analyses of external check samples, including not only pulp duplicates but also core duplicates and coarse rejects, rather than limiting checks to once every twelve months.

The nugget effect is remarkable, caused negative impact against assaying precession and Mineral Resource category. It is recommended to conduct trial sample preparation procedural to solve the problem of observed nugget effects.

Besides Au and Ag, other elements such as Zn, Cu, Pb, and sulphur ("**S**") may become associated with the Mineral Resources. It is recommended to have a systematic assaying on all associated elements, and to update the current Mineral Resource estimate.

SRK considers the capping methods are reasonable and aligned with industry practices. However, extreme high-grade values should be carefully monitored during grade interpolation to prevent local artificial high-grade blocks.

1 Introduction and Scope of Report

SRK Consulting China Ltd ("**SRK**") was commissioned by Zijin Gold International Company Limited ("**Zijin Gold International**" or the "**Company**") to undertake an independent assessment of all relevant technical aspects of the Buritica Gold-Silver Project (the "**Buritica Project**" or the "**Project**") which is located in Antioquia, Republic of Colombia ("**Colombia**") and operated by Continental Gold Limited Succursal Colombia ("**CGL Colombia**"). Zijin Gold International indirectly holds 68.8 per cent ("**%**") shares in CGL Colombia. The Buritica Project includes the Buritica Underground Gold Mine ("**Buritica Mine**") and the associated ore processing and smelter plant ("**Buritica Plant**").

It is SRK's understanding that the independent technical assessment on the Buritica Project is required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") suitable for inclusion in a prospectus prepared to support the proposed listing of the Zijin Gold International on the Main Board of the Stock Exchange of Hong Kong Limited (the "**SEHK**" or "**Stock Exchange**"), a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("**HKEX**").

The Report has therefore been prepared following the requirements/guidelines of the 2012 edition of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (the "***JORC Code***") and in accordance with the *Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited* (the "***Listing Rules***") including the *Chapter 18* requirements and other relevant regulations of HKEX.

2 Program Objectives and Work Program

2.1 Purpose of the Report

The purpose of this Report is to provide an independent technical assessment for inclusion in a prospectus to be issued by Zijin Gold International to support the proposed listing on the Stock Exchange. The SRK's report is proposed to provide an unbiased technical assessment of the risk and opportunities associated with the reviewed project.

2.2 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "***VALMIN Code***"). The *VALMIN Code* incorporates the *JORC Code* for the reporting of Mineral Resources and Ore Reserves and is binding upon all members of the Australasian Institute of Mining and Metallurgy ("**AusIMM**") and the Australian Institute of Geoscientists ("**AIG**").

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/or confirm that Zijin Gold International has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that Zijin Gold International has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of Zijin Gold International and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

2.4 Effective Date

The effective date for this CPR is deemed to be 31 May 2025 (the "**Effective Date**"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as of 31 December 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK.

2.5 Work Program

The work program for this project consisted of:

- review of data and Mineral Resource models provided by CGL Colombia and Zijin Gold International, and the preparation of a data verification plan which will be conducted during site inspection.

- a site visit between 15 and 20 May 2025, to the Buritica Project has been conducted. SRK observed and inspected the locations of exploration and production boreholes, drill cores and underground stopes showing the gold mineralisation, the Buritica Plant, ore and waste stockpiles, tailings storage facilities ("**TSFs**"), water source and power supply station, the office and living areas, and other associated infrastructure.
- review of all available documents, including operating licences and permits, geology reports and environmental impact assessment ("**EIA**") reports, mineral processing technology and mining methodologies, capital expenditures ("**Capex**") and operating costs ("**Opex**"), etc.
- discussion with CGL Colombia and Zijin Gold International management and technical personnel, as well as the professionals of Zijin (Xiamen) Engineering Co., Ltd ("**Zijin Xiamen**"), who conducted either the geology and exploration or the feasibility study ("**FS**") on the Buritica Project.
- preparation of a draft report in accordance with the *JORC Code* guidelines and the requirements of the *Chapter 18* on the Stock Exchange and other regulations of HKEX (the declaration date of Mineral Resources and Ore Reserves is 31 December 2024).
- submission of the draft report to Zijin Gold International and CGL Colombia and the related third party for comments and finalise the draft based on the feedback.

2.6 SRK Experience

The SRK Consulting Group ("**SRK Consulting**") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience in providing Independent Expert Reports to mining companies for successfully listing on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/ or acquired on SEHK, as shown in Table 2-1.

Table 2-1: SRK's Reports for Listing on SEHK

Company	Year	Nature of Transaction
Yanzhou Coal Limited (listed on SEHK)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on SEHK and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on SEHK
Lingbao Gold Limited	2005	IPO Listing on SEHK
Yue Da Holdings Limited (listed on SEHK)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on SEHK
Sino Gold Mining Limited	2007	Dual Listing on the SEHK
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on SEHK
Kiu Hung International Holding Limited	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Limited	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Limited	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Limited	2009	Acquisition of a molybdenum mining project in Shaanxi, China
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on SEHK
Citic Dameng Holdings Limited	2010	IPO Listing on SEHK
China Hanking Holdings Limited	2011	IPO Listing on SEHK
China Daye Non-Ferrous Metal Mining Limited	2012	Very Substantial Acquisition on SEHK
China Nonferrous Mining Corporation Limited	2012	IPO Listing on SEHK
Hengshi Mining Investments Limited	2013	IPO Listing on SEHK
Future Bright Mining Holdings Limited	2014	IPO Listing on SEHK
King Stone Energy Group Limited	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte LTD	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Limited	2016	IPO Listing on SEHK
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Limited	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Limited	2022	IPO Listing on SEHK
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on SEHK
Chifeng Jilong Gold Mining Co., Ltd	2025	IPO Listing on SEHK

2.7 Project Team

The SRK project team and responsibilities are shown in Table 2-2.

Table 2-2: SRK Project Team

Consultant	Title	Discipline and Task
Dr Anshun (Anson) Xu	Corporate Consultant (Geology)	Project Manager, Overall Responsibility
Yanfang (Bonnie) Zhao	Principal Consultant (Geology)	Geology, Mineral Resource Estimation
Feng (Frank) Li	Principal Consultant (Geology)	Exploration and QA/QC Review
Huaixiang (Hubert) Li	Senior Consultant (Geology)	Geology, Mineral Resource Estimation
Yonggang Wu	Principal Consultant (Mining)	Mining and Ore Reserve Review
Lanliang Niu	Principal Consultant (Processing)	Processing and Metallurgical Review
Yuanhai (Andy) Li	Principal Consultant (Environment)	Environment, Social, and Permitting
Linxia (Linda) Bian	Project Coordinator	Project Coordination and Translation
Pengfei Xiao	Principal Consultant (Geology)	Peer Review and Quality Control
Alexander (Alex) Thin	Corporate Consultant (Mining)	Peer Review and Quality Control

Sources: SRK

Dr Anshun (Anson) Xu, ***Doctor of Philosophy*** **("*PhD" or "Dr"), Fellow of AusIMM ("FAusIMM")*,** is a Corporate Consultant (Geology) who specialises in the exploration of mineral deposits. He has more than 30 years' experience in the exploration and development of various types of mineral deposits, including Copper ("**Cu**")-Nickel ("**Ni**") sulphide deposits related to ultra-basic rocks, tungsten ("**W**") and tin ("**Sn**") deposits, diamond deposits, and especially deep expertise in various types of gold deposits, including vein-type, fracture-breccia zone type, alteration type, and Carlin type. He was responsible for the resource estimations of several diamond deposits and for reviews of resource estimations for several gold deposits. He recently completed for clients from both China and overseas several due diligence projects, including technical review projects, such as *Canadian NI43-101* reports and SEHK IPO technical reports.

Yanfang (Bonnie) Zhao, ***Master of Engineering*** **("*MEng"), Member of AusIMM* ("*MAusIMM")*;** is a Principal Consultant at SRK China, she graduated in 2009 from the China University of Geosciences (Beijing) and has 16 years of experience geological modelling, mineral resource estimations, technical reporting, gap analysis and due diligence studies. As a consulting geoscientist, she has been active in over 70 mineral projects including due diligence reviews, exploration design, data verification, resource estimation and preparing Qualified Person Report in China, Mongolia, Indonesia, Cambodia, Malaysia, Serbia, Australia , Ecuador and many countries of Africa with minerals including Au, Ag, Cu, iron ("**Fe**"), lead ("**Pb**"), zinc ("**Zn**"), molybdenum ("**Mo**"), cobalt ("**Co**"), chromium ("**Cr**"), bauxite and coal. She is proficient in using geological and mining softwares, including Surpac, Minex, Leapfrog, ArcGIS, and AutoCAD etc.

Feng (Frank) Li, ***Bachelor of Engineering*** ("***BEng"), Master of Science ("MSc"), FAusIMM,*** is a Principal Consultant (Geology). He joined SRK in 2010 and has been involved in more than one hundred projects, including project management, exploration management, geological logging and mapping, data verification, resource modelling and estimation. the projects located in China, Mongolia, Southeast Asia, Africa and South America; the projects include gold, silver, lead, zinc, iron, nickel, vanadium ("**V**"), magnesium ("**Mg**"), marble, graphite, bauxite, etc. He has a deep understanding of analysis and mineral resource reporting conversions between of Chinese and *JORC Code* guidelines and has abundant experience in exploration management and quality control.

Huaixiang (Hubert) Li, *MEng, Member of AIG* ("*MAIG")*, is a senior consultant (geology) in SRK China. He graduated from the China University of Geosciences (Beijing) and used to work in a geological exploration company for more than 6 years and gained lots of experiences and expertise in geological and mineral resources exploration. As a consulting geologist, he has participated a number of metal mineral projects, including exploration design review, data verification, due diligence reviews and mineral resource estimation. He is familiar with the principles and methods for metal ore deposits prospecting and exploration including lithium ("**Li**"), gold, silver, platinum group elements ("**PGE**"), rare earth elements ("**REE**"), copper, lead, zinc, molybdenum, bauxite, etc. He is proficient in geological modelling, resources estimation, data processing and geographic information system and remote sensing ("**GIS/RS**") application.

Yonggang Wu, *MEng, MAusIMM,* is a Principal Consultant (Mining), joining SRK in 2007 after his graduation from the Jiangxi University of Science and Technology. He has acquired specialised knowledge of mining engineering and MineSight software and has been involved in a large number of projects to date. He has accumulated extensive experience in Mineral Resource/ Ore Reserve estimation, pit limit optimisation and design, underground-mining design, long-term production planning, and due diligence studies, with minerals including Au, Pb, Zn, manganese ("**Mn**"), Cu, Fe, fluorite, sylvite, alum, and phosphorus among many others. Yonggang has expertise in geological and mining modelling and is proficient in using MineSight, AutoCAD, and other specialised software packages.

Lanliang Niu, *BEng, MAusIMM, Member of the China Association of Mineral Resources Appraisers ("MCAMRA")*, is a Principal Consultant (Processing) in SRK China. He has over 30 years' experience in processing testing and studies, production management and technical consultancy service. Lanliang is actively involved with the new development and application of processing technologies, facilities, and reagents and has received two national awards for his achievements in this area. Since joining SRK, he has been involved in hundreds of independent technical review projects for fund raising and acquisition and has accumulated profound experience on technical review of mining project.

Yuanhai (Andy) Li, *PhD, MAusIMM*, is a Principal Consultant (Environmental) in SRK China. He earned his doctorate degree in Environmental Engineering from the Florida State University in USA. He has over 20 years' experience in the environmental engineering field, and has worked in various environmental projects in China, and the Great Asia Area, USA and Africa. He has particular expertise in environmental due diligence reviews, environmental compliance and impact assessments for mining, mineral processing, refining, smelting and infrastructure/hydropower project. He is familiar with various internationally recognised environmental requirements, such as Equator Principles ("**EP**"), International Finance Corporation/World Bank ("**IFC/WB**"), and U.S. Environmental Protection Agency ("**USEPA**") legislations, etc. Furthermore, he also has extensive experience in contaminated site assessments and remedial design and construction, wetland and landfill rehabilitation, potable water/wastewater treatment design, water distribution systems, and storm water management system design.

Pengfei Xiao, *Master of Science ("MSc"), FAusIMM, MAIG,* is the Managing Director of SRK China. He is a Principal Consultant (Geology) with a specialty in mineral exploration applying comprehensive geological and geophysical methods; and his expertise also includes resource modelling and estimation. He is familiar with both theory and practice in sampling, sample preparation and chemical analysis. As a consulting geoscientist, he has been active in mining projects including due diligence reviews, exploration design, data verification and resource estimation in China, Mongolia, Africa, America, Southeast and Central Asia. His experience relates precious metal (Au, Ag, PGE), base metal (Cu, Ni, Pb, Zn) and other metal deposits (Fe, Mn, V, Mo, Co), and also includes a few non-metal projects (phosphorite, potash, gypsum). In the past ten years he has been working in geology and resource assessment in SRK, and co-authored dozens of technical reports aiding clients in successful property transactions; and more than half of them are published in stock exchanges.

Alexander (Alex) Thin, *BEng (Hons), FAusIMM (CP Min)*, is a Corporate Consultant (Project Evaluation and Mining) in SRK. He is an experienced mining professional with over 30 years' experience. His strategy and leadership experience spans feasibility studies, mineral asset audits and evaluations, independent technical reports, techno-economic studies, capital raising, merger and acquisitions, managing joint ventures, local and international stock exchange compliance, business development and investor/ stakeholder relations. Alex's industry experience spans operational (underground and open pit), technical, consulting and corporate within the metalliferous resources sector, covering precious metals, base metals and bulk commodities.

2.8 Warranties

Zijin Gold International has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

2.9 Indemnities

As recommended by the *VALMIN Code*, Zijin Gold International has provided SRK with an indemnity under which SRK is to be compensated for any liability and/ or any additional work or expenditure resulting from any additional work required:

- Which results from SRK's reliance on information provided by Zijin Gold International or to Zijin Gold International not providing material information; or
- Which relates to any consequential extension workload through queries, questions or public hearings arising from this Report.

2.10 Compliance Statement

The information in this Report that relates to Mineral Resources/ Ore Reserves is based on information compiled by Dr Anshun (Anson) Xu, a Competent Person who is a Fellow of AusIMM and a Chartered Professional in Geology ("**CP Geo**"), Mr Huaixiang (Hubert) Li, a Competent Person who is a Member of the AIG, and Mr Yonggang Wu, a Competent Person who is a Member of the AusIMM. All are full-time employees of SRK.

This Report is a Competent Person's Report in line with the *Listing Rules* of HKEX.

Dr Anshun (Anson) Xu, Mr Huaixiang (Hubert) Li and Mr Yonggang Wu have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the *JORC Code* guidelines.

Dr Anshun (Anson) Xu, Mr Huaixiang (Hubert) Li and Mr Yonggang Wu consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Pengfei Xiao, *FAusIMM*, a Principal Consultant (Geology) and Alexander (Alex) Thin, *FAusIMM (CP Min)*, a Corporate Consultant (Mining).

2.11 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Zijin Gold International or Zijin Gold International's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

2.12 Consent

SRK consents to this Report being included, in full, in the Zijin Gold International prospectus, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

2.13 Forward Looking Statement

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this Report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

3 Operating Licences and Permits

SRK relied on the information provided by Zijin Gold International and SRK understands that a legal due diligence review of this project has been undertaken by Zijin Gold International's legal advisors, which is beyond of SRK's scope of work.

3.1 Mining Concessions

The Colombian Constitution of 1991 indicates that the subsoil and the non-renewable resources are state property, and it allows for individuals to acquire rights over those resources. The main regulation is the *Mining Code of 2001* regulating the legal relationships between the state and individuals at all stages of mining (i.e., exploration, construction and assembly, exploitation, processing, transport and marketing of minerals in the soil or subsoil). The *Mining Code of 2001* defines mining titles as mining concession contract that grants the concession holder exclusive and temporary right to explore and exploit minerals in the subsoil and within the contracted area.

The Buritica Project includes one mining concession with the contract number of 7495, and details of the information was obtained from Mining Registry Certificate dated 23 April 2025, which were summarised in Table 3-1. Scanned original copy is provided in the attachment of this Report. According to the related laws and regulations, the initial expiry date is counted thirty years from the mining concession contract entry date in the National Mining Registry. The locations of these concessions are shown on Figure 3-1.

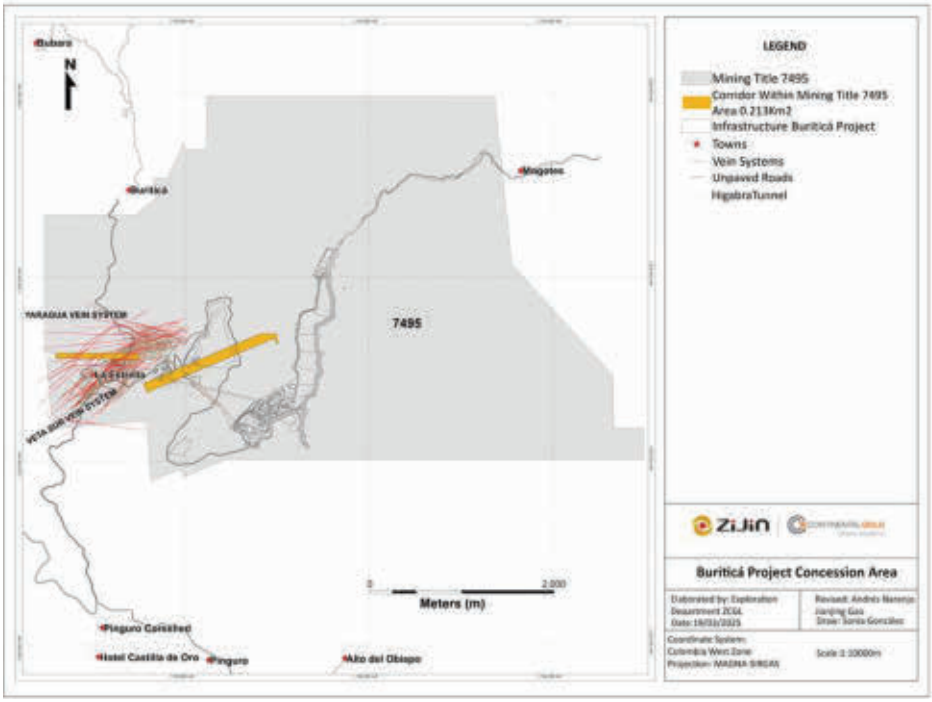
CGL Colombia states that the 6992 mining concession (H6992005 - Corridor) was relinquished, and by means of a resolution dated 4 October 2022, the National Mining Agency accepted such withdrawal. The integrated 8133 mining concession (FHWB - 02) registration update is pending. According to the National Mining Agency resolution of VCA - 0073 dated 12 March 2025 regarding strips or corridors incorporation into 7495 mining concession, the mining concessions of NIK-15421, JHR-08075X, RLF-081913X, SAO-16591, SIC-08591 and THE-08051 have been approved to be integrated into 7495 mining concession, but the incorporation of 6992 has been rejected.

Table 3-1: Summary of the Mining Concession

Project Name	Buritica Project
Concession Contract No.	7495
National Mining Registry Code	FHFB-01
Concession Holder	Continental Gold Limited Succursal Colombia
Granted By	Antioquia Government
Concession Signed Date	14 September 2011
National Mining Registry Entry Date	20 March 2013
Initial Expiry Date	20 March 2043
Type of Tenement	Mining concession contract
Minerals	Copper mineral, gold mineral, silver mineral, platinum mineral, lead mineral, zinc minerals
Area (hectares)	1,894.8412

Sources: Mining Registry Certificate dated 23 April 2025.

Figure 3-1: Concession of the Buritica Project Area



Sources: CGL Colombia

3.2 Other Operational Permits

The following work plans ("**P.T.O**" in Spanish) were approved by the Antioquia Government to develop and operate the Buritica Project:

- Approval of the modified P.T.O to increase the daily production from 3,000 tonnes per day ("**tpd**" or "**t/d**") to 4,000 tpd for mining concession contract 7495 (Resolution No. 2021060085036), Antioquia Government, 5 August 2021.
- Approval of the modified P.T.O for mining concession contract 7495 (Resolution No. 2019060148779), Antioquia Government, 14 August 2019; and
- Approval of the modified P.T.O for mining concession contract 7495 (Resolution No. 2016060074846), Antioquia Government, 14 August 2016.

CGL Colombia plans to obtain another approval of the modified P.T.O to increase the daily production capacity from 4,000 tpd to 5,000 tpd within two years period of time.

According to the Colombian land use regulations, a concession holder is required to obtain surface rights for the surface area to be disturbed for the Buritica Project. CGL Colombia states that approximately a total of 780 hectares ("**ha**") surface areas have been obtained to carry out mining, processing, and smelting activities for the Buritica Project. CGL Colombia plans to obtain additional surface area in the future if necessary, pending on the development of the Buritica Project.

In addition, CGL Colombia obtained water use permits, wastewater discharge permits, riverbed modification permits, and forest clearance permits under a global environmental licence (Resolution No. 1443 of 2016), dated on 30 November 2016. This licence has been modified in accordance with the changes of operational conditions, afterward including mining capacity upgrading and the existing TSF expansion.

4 Regional Description

4.1 Property Location

The Buritica Project is situated approximately 63 kilometres ("**km**") northwest of Medellin, the capital of Antioquia Province, and around 300 km northwest of Bogota, the capital of Colombia. The Buritica Project's geographic coordinates are 6° 41′ 27″ – 6° 43′ 43″ North latitude and 75° 54′ 57″ – 75° 51′ 24″ West longitude. Buritica Town, the closest town, falls under the administrative jurisdiction of the Buritica Township (municipality). The location of the Buritica Project is shown in Figure 4-1.

Figure 4-1: Location of the Buritica Project

Sources: SRK

4.2 Accessibility

Medellin is located at about 235 km northwest ("**NW**") of Bogota; Highway 56 connects Medellin and Bogota. There is about 20 km or two hours driving along NW Highway 62 before turning northward towards the Buritica Town on a minor paved road. The mine site is well developed in terms of infrastructure, with good road access, easy for driving.

Medellin is a regional city with an international airport, where the highway network can extend to major port cities of Cartagena and Barranquilla (Figure 4-1).

4.3 Local Resources and Infrastructure

Medellin is a regional city, about 2.38 million inhabitants according to the National Administrative Department of Statistics (locally referred to as the Departmento Administrativo Nacional de Estadistica, the "**DANE**") in 2018, where CGL Colombia is registered, with headquarters office being there.

Medellin is a modern city with well-developed local infrastructure including such facilities as post offices, telecommunication facilities, banks, hotels, schools (five universities), hospital facilities, and various markets. Most raw materials and domestic necessities can be purchased in Medellin. Overall, the region is economically well developed.

Local people are mainly engaged in agriculture. Agricultural products in the region include coffee, maize and beans.

Overall, the region is economically developed in Colombia with local manufacturing industries such as textile, clothing, food processing, cigar, furniture manufacture, cement, agricultural mechanical, iron processing/ smelting and chemical plant etc.

The national grid electricity has been extended to Buritica Town from Liborina, about 10 km southeast ("**SE**") of Buritica. The nearest 110 kilovolts ("**kV**") national power station is located at Chorodo on Highway 62, about 38 km NW of the Buritica Project.

4.4 Climate

The Buritica Project area has an overall tropical savanna climate, characterised by local temperate climate caused by elevation.

The annual average temperature ranges from +17 degrees Celsius ("**°C**") to +26°C depending on elevation, with an annual average precipitation of 1,690 millimetres ("**mm**"). This climate permits year-round exploration and mining operations.

Natural calamities that may occur in the area include landslide, mud-rock flow due to high rainfall, and earthquake etc.

4.5 Physiography

Regionally, the Buritica Project area is located in mountainous terrain of west to central Colombia, where the mountainous terrain is further divided into Eastern, Central and Western Cordillera, and the Buritica Project is situated in the west slope of Central Cordillera. It is characterised by steep-sided valleys and subdued peaks. Top elevations range from 600 metres ("**m**") to 2,200 m above sea level ("**ASL**") in the Buritica Project area with a drastic relief of more than 1,200 m.

The Buritica Project area is situated at the upper reach of branch stream, west bank of Cauca River, which drains down north, and finally flows into sea at Barranquilla.

The surface is covered by thick forest with small clearings for the cultivation of coffee, yucca, banana and other crops.

5 Geological Setting and Mineralisation

The following descriptions in this section were summarised from the *2024 CGL Internal Technical Report on Buritica Project* and *2021 SRK NI 43-101 Report*.

5.1 Regional Geology

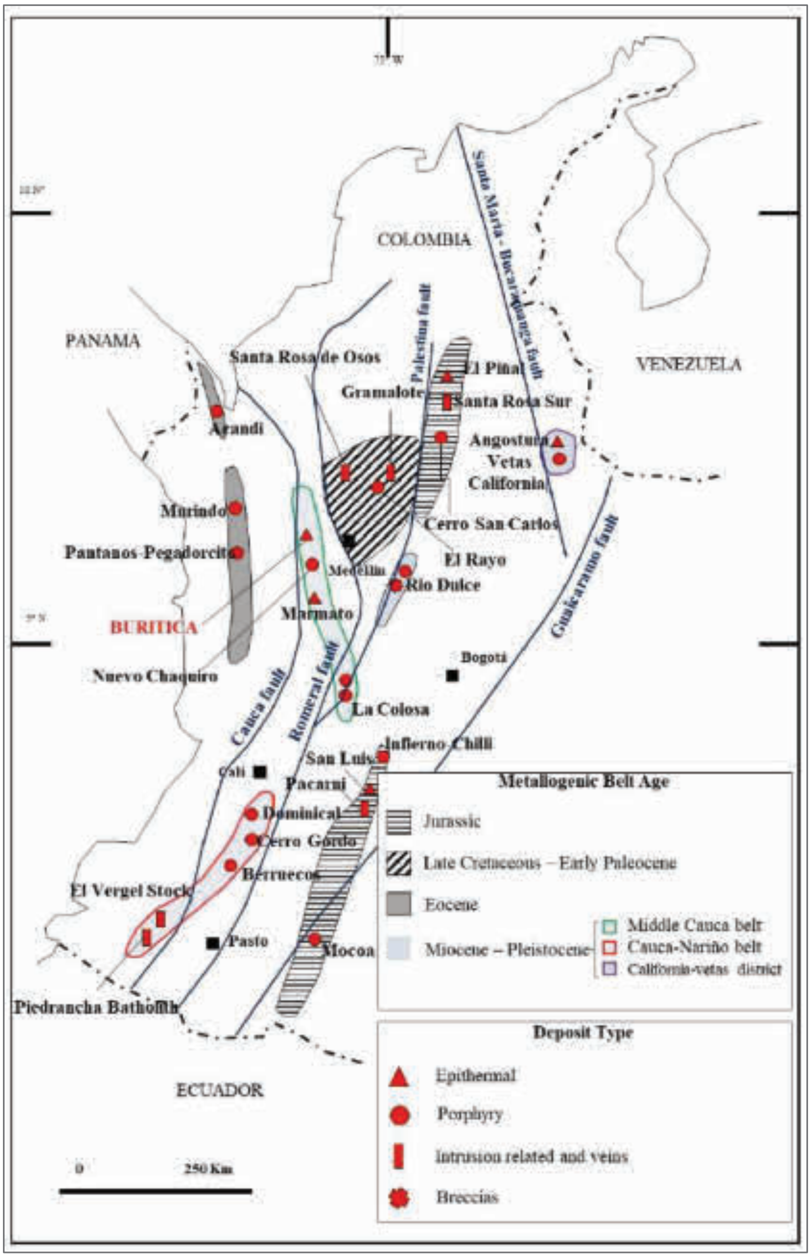
Tectonically, the northern Andean Cordillera in Colombia has been uplifted by the subduction of several oceanic plates. As shown in Figure 5-1, a series of major accretionary events occurred and led to the development of a number of volcanic belts during the Jurassic, Cretaceous and Tertiary periods, including a series of continental face overthrusts dipping to west and NW.

The Buritica Project is located in the Middle Cauca Belt, which is recognised as the Miocene belt, and the majority of polymetallic (gold and base metals) porphyry and epithermal deposits discovered so far are hosted in this belt (Figure 5-1).

The geology of the Buritica region is dominated by Cretaceous basalts, and occasional overlain Cretaceous volcanic and sedimentary sequences, with Cretaceous intrusions of gabbroic to ultramafic, and tonalite including sporadically occurred Miocene diorite porphyry stocks.

Cretaceous volcanic and sedimentary sequences present moderately to steeply dipping folds, with low-grade metamorphism of greenschist facies.

Figure 5-1: Magmatic and Mineralised Belts of Colombia



Sources: Naranjo et al, 2018.

5.2 Property Geology

The property area demonstrates a widespread Cretaceous Barroso Formation, which is mainly composed of pillow basalt lavas, pyroclastic rocks of andesite and dolerite, extrusive aphanitic to porphyritic texture, with minor north-south trending sedimentary rocks of calcareous mudstone, siltstone and chert, and volcanic sedimentary breccia, hyaloclastite as well. The Barroso Formation also includes Cretaceous diorite stocks and dikes.

The Barroso Formation is locally covered by Cretaceous Penderisco Formation, mainly composed of sedimentary rocks such as sandstone and siltstone.

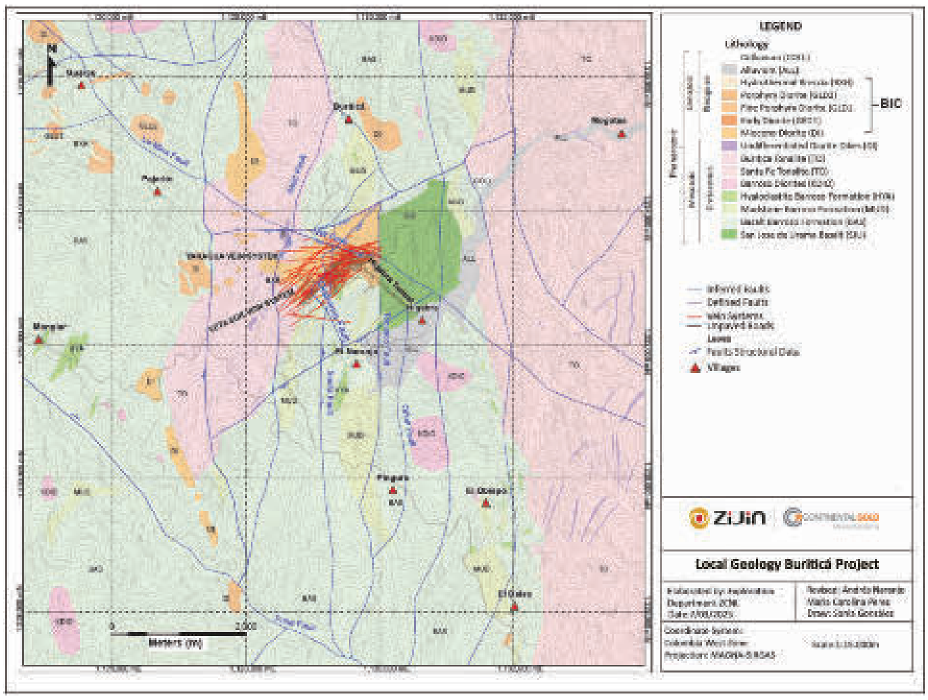
The property area is intruded by Cretaceous Santa Fe Batholith tonalite intrusions (east of the property), and Buritica Tonalite located to the west of Yaragua and Veta Sur mineralisation sections.

Miocene diorite porphyry stocks present occasionally, shallow-seated. Recent radiometric dating CGL Colombia has reported the age of the Buritica intrusive complexes at 7.7±0.1 (U/ Pb) million years ("Ma"). The Buritica Project mineralisation is mainly hosted in Buritica intrusive complex ("BIC"), which is characterised by magma-related and hydrothermal breccias occurred at the upper part and the contact zone. As shown in Figure 5-2, the BIC is composed of diorites, igneous and hydrothermal breccias. It is noted that some Au-Ag mineralised veins extend into wall rocks of Cretaceous Barroso Formation. The dominant hydrothermal alteration associated with mineralisation is phyllite with development of potassic alteration in deep areas and outer propylitic alteration typical zonation of porphyry-style mineralisation.

District-scale fault-fracture zones are broadly spaced and of east-northeast ("**ENE**"), NW, north-south and north-northwest ("**NNW'**) orientations. These fault-fracture zones do not appear to have involved large displacement, but the geometries and distribution of vein systems and alteration are compatible with the fault-fractures having been active during formation of mineralisation.

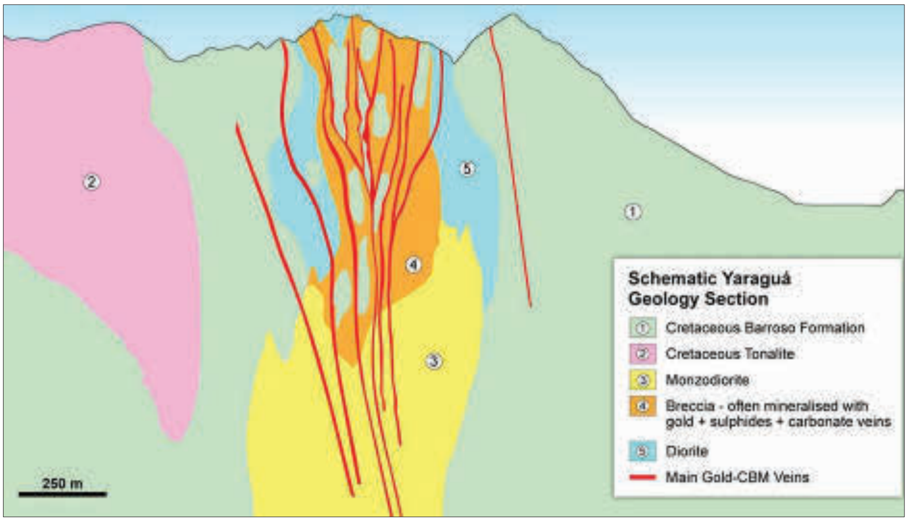
The Buritica Project area is cut across by a set of extensive north-south to NNW trending faults. To the east of the Yaragua and Veta Sur mineralised systems, the steeply dipping Tonusco Fault system cuts off the intrusion complex and related hydrothermal alteration envelopes, exhibiting the feature of postdating intrusion and alteration. It is assumed that all these faults were active during ore-forming process, persisted to post-ore stage.

Figure 5-2: Regional Geological Map Illustrating the Main Mineralisation in the Buritica Project



Sources: CGL Colombia, 2025.

Figure 5-3: Schematic Geological Section of Yaragua Mineralisation Section



Sources: Jones Pty Ltd, 2019.

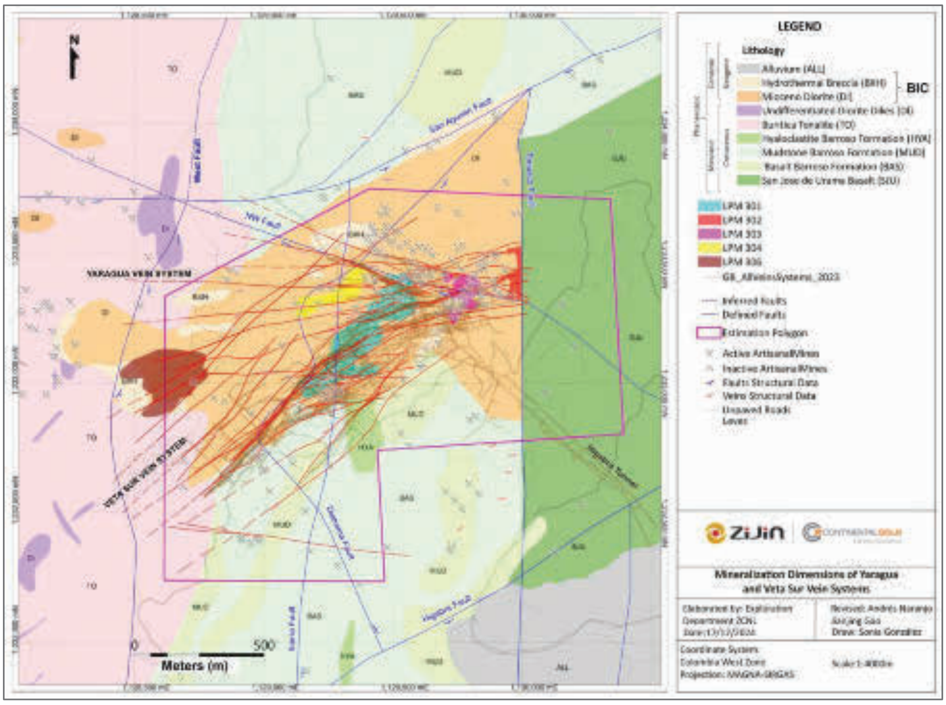
5.3 Mineralisation

The major Au-Ag mineralisation defined in the Buritica Project area is referred to as the Yaragua vein system and Veta Sur vein system, respectively. As exhibited in Figure 5-4 and Figure 5-5.

. The Yaragua vein system trending ENE 75 to 80°, presents almost vertically, 1,470 m long, 1,860 m deep and 220 m wide. The Veta Sur vein system trending north-east ("**NE**") 40 to 50°, demonstrates vertically, 1,370 m long, 1,710 m deep and 300 m wide.

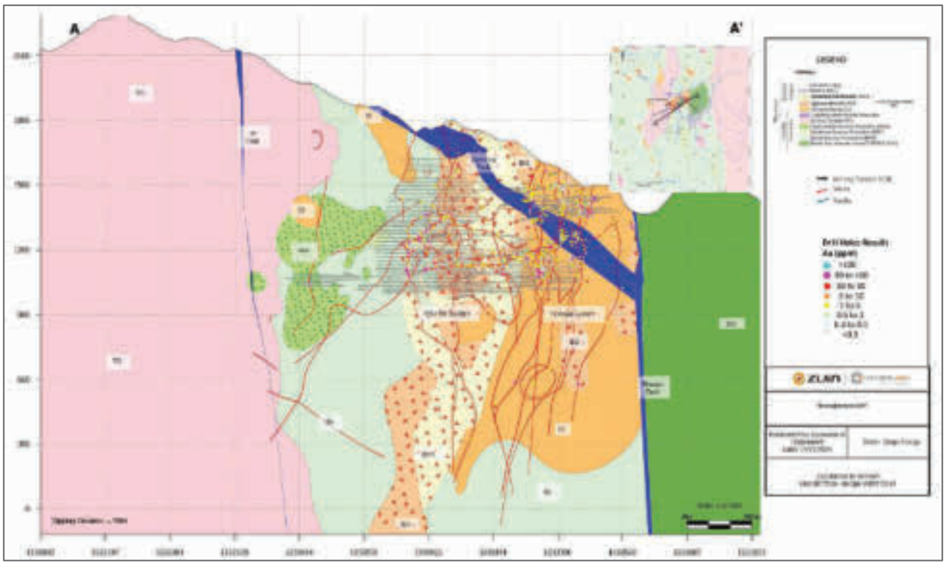
The Yaragua vein system is totally hosted in the BIC, and a total of 24 high-value mineralised veins ("**HVMs**") were defined. The Veta Sur vein system is partially hosted in Cretaceous Barroso Formation, the wall rocks of BIC, and a total of 28 HVMs were outlined.

Figure 5-4: Mineralisation Dimensions of Yaragua and Veta Sur Vein Systems



Sources: CGL Colombia, 2025.

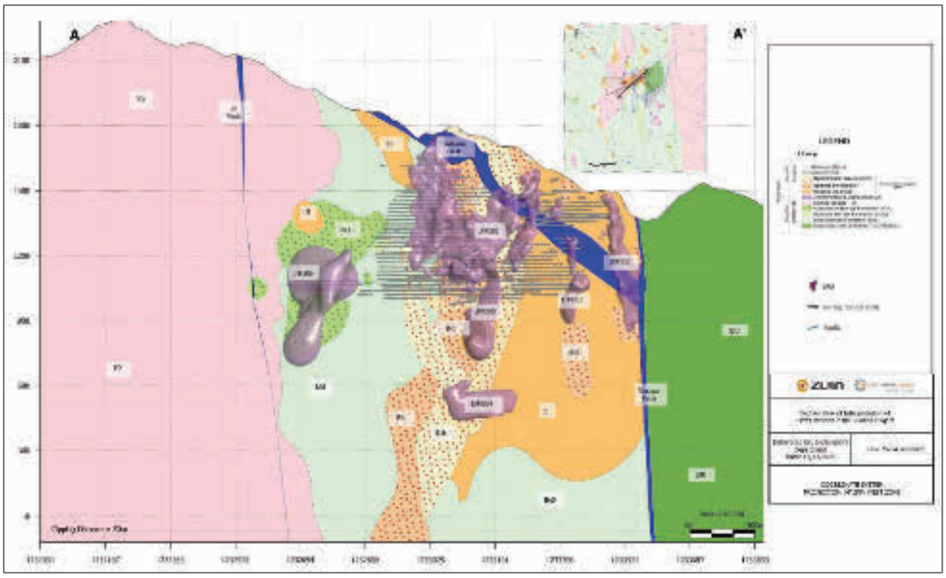
Figure 5-5: Interpretation Mineralisation HVM



Sources: CGL Colombia, 2025.

Additional to the HVMs, a disseminated model related to a Broader Mineralised Zones ("BMZs") was modelled, which is characterised by a mixed population of intermediate and low gold grade, focused mainly around 1,200 m ASL through 1,750 m ASL at the Yaragua and the Veta Sur vein systems. This gold-mineralisation is typically associated with areas of increased veinlet density or disseminated mineralisation. All BMZ-shells have a relationship to the orientation of the epithermal vein systems which crosscut the BIC and Barroso formation. As shown in Figure 5-6, all BMZs appear vertically in an irregular pillar-like shape each, with diameters of 100 to 150 m, and 300 to 600 m vertically, 493 m to 1,761 m ASL associated to intense phyllite alteration. BMZs include BMZ301, BMZ302, BMZ303, BMZ304 and BMZ BW (Figure 5-6).

Figure 5-6: Interpretation of BMZs



Sources: CGL Colombia, 2025.

All mineralisation defined in this model is based on updated infill sampling, tunnel mapping, geochemistry survey, field observation, and interpretation conducted by CGL Colombia resource geologists, mine geologists and mining engineer. A summary of mineralised domains conducted by CGL Colombia are listed in Table 5-1, Table 5-2 and Table 5-3.

The San Antonio vein (YR5) is the largest size vein defined in the Yaragua vein system, with a vein shape, and controlled by fault structure. The mineralised vein is totally hosted in the Miocene BIC, partly outcropped on the surface. It strikes 85° and plunges south-southeast ("SSE") down at 83°. As shown in Figure 6-1, a total of 849 exploration diamond drillholes, 826 definition diamond drillholes, and 3,875 channel samplings on a grid 3 – 100 m (strike) by 15 – 100 m (dip) have delineated the YR5 Vein for a length of 1,364 m along the strike and a plunge extension of 2,050 m, with an average true width of 0.66 m. The elevation of the Vein ranges from 1,900 m to -150 m ASL. The YR5 Vein, accounting for about 19% of the total Mineral Resources at Yaragua vein system, and is dominated by Au and Ag mineralisation grading 43.80 g/t Au with associated Ag grading 100.30 g/t.

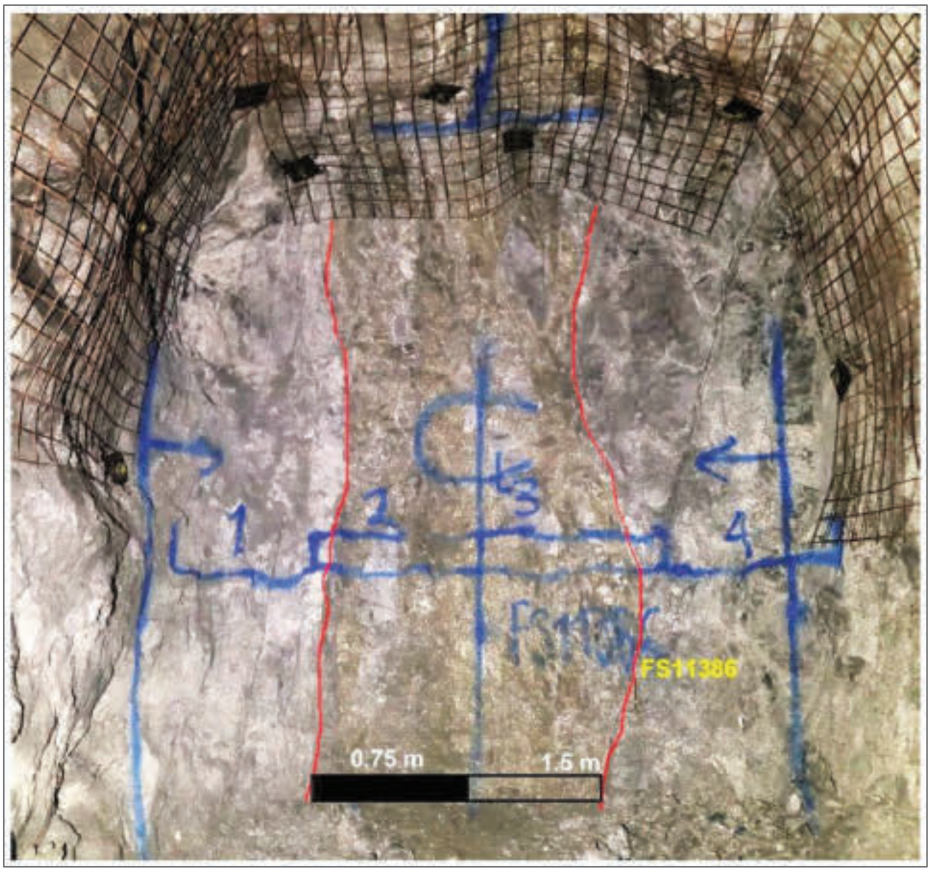
The Nemesis Vein (VS10) is an important vein within the Veta Sur vein system, with a vein shape, and controlled by fault structure. The mineralised zone is mainly hosted Cretaceous Barroso Formation, the wall rocks of the Miocene BIC, totally concealed below the ground. It strikes NW 48° and plunges NW down at 89°. As exhibited shown in Figure 7-1, a total of 1,614 exploration diamond drillholes, 2,711 definition diamond drillholes, and 11,929 channel sample workings on a grid 3 – 100 m (strike) by 20 – 100 m (dip) have delineated the VS10 Vein for a length of 1,243 m along the strike and a plunge extension of 1,800m, with an average true width of 1.24 m. The elevation of the Vein ranges from 1,875 m to 75 m ASL. The VS10 Vein, accounts for about 36% of the total Mineral Resource at Veta Sur and is dominated by Au and Ag mineralisation grading 21.31 g/t Au with associated Ag grading 69.15 g/t.

Based on current sampling information, all mineralisation discovered to date is controlled by fault structure, and appears vein-like, commonly 0.5 to 1.0 m wide, which is composed of intensified alteration rocks plus quartz veinlets set and characterised by high grades of pyrite and base metal sulphides, with a distinctive vein border (Figure 5-7). The host fault structure extends along both strike and dip. Based on tunnel mapping conducted by local geologist, the mineralised vein is commonly wavy, swelling, pinching out and reappearing, branched, and re-joining along both strike and dip. The Au grade often increases locally in both hanging wall and footwall due to existence of the small size of veinlets.

It notes that mineralised vein cuts across fault breccia, and the thickness of vein usually gets increased in more dilation space in the fault structure.

Different from mineralisation style of Yaragua and Veta Sur sections, BMZs is controlled by the intersection of NW trending vein system and Yaragua main vein system, and is characterised by dilation space, and intensified pervasive silicification, quartz veinlets stockwork and disseminated sulphides. As such, the diameter of pillar-like BMZs gets increased drastically, and the average grade of Au is thus decreased.

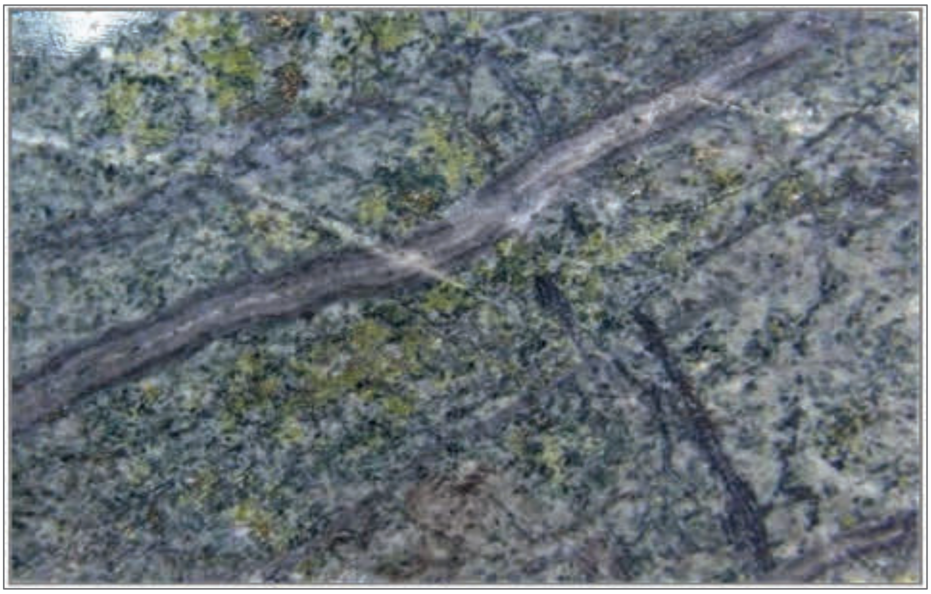
Figure 5-7: Mineralised Vein Set at VS_GA9255E, 1505 m ASL, Veta Sur Vein System



Sources: CGL Colombia, 2025.

As shown in Figure 5-8, banded quartz-carbonate veinlet + magnetite veinlets with potassic (biotite and K-feldspar) and propylitic (chlorite and epidote) alteration and disseminated sulphides are widespread developed in BIC, overprinted by later phyllite (chlorite, sericite and pyrite) alteration. Gold mineralisation is weak and developed locally with 0.3 to 1.0 g/t Au, and 0.1% to 0.3% copper ("**Cu**"). Alteration zoning within BIC is not well confirmed.

Figure 5-8: Core Photo at Busy 361D03 Veta Sur Vein System

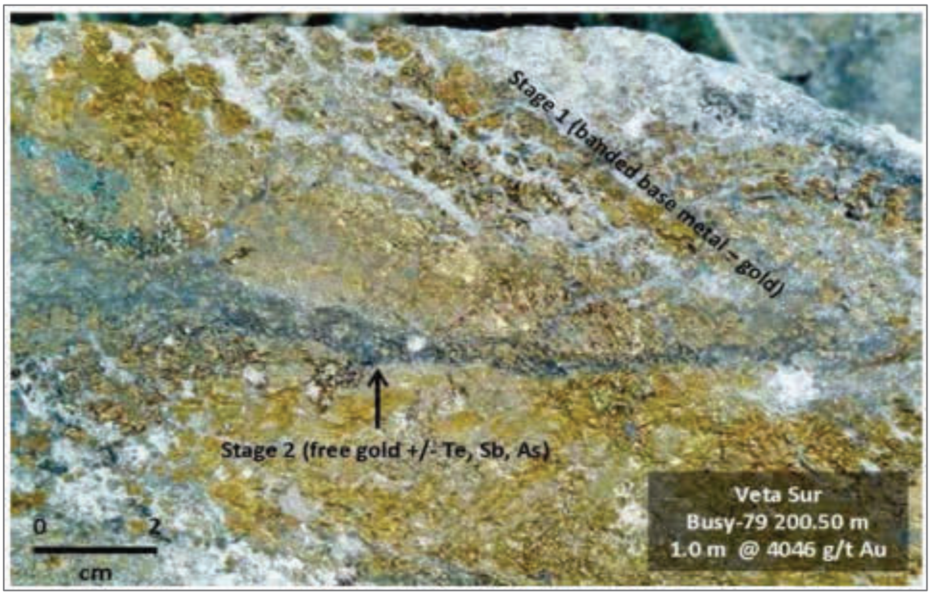


Sources: CGL Colombia, 2025.

Notes: exhibiting banded quartz veinlet + magnetite veinlets in matrix with disseminated chalcopyrite and pyrite. Propylitic alteration overprints earlier potassic alteration.

During ore-forming process, there were two stages; where stage I is characterised by banded base metal sulphides mineralisation with gangue minerals of quartz and carbonate, superimposed by stage II of abundant free gold with arsenopyrite, stibnite etc. grading tens g/t Au and Ag (Figure 5-9).

Figure 5-9: Core Photo at Busy 79 Veta Sur Vein System



Sources: CGL Colombia, 2025.

Notes: exhibiting banded base metal – Gold of stage I overprinted by free Gold + later calcite quartz veinlet + Sulphides of Stage II.

5.4 Deposit Type

The Buritica Project is the northernmost significant Au-Ag deposit known to date in the Miocene Middle Cauca belt, where the La Colosa porphyry style deposit has defined 28 million troy ounces ("**Moz**") of gold, the Nueveo Chaquiro porphyry style deposit has achieved 3.6 million tonnes ("**Mt**") of copper and 5.6 Moz of gold, and the Marnato is recognised as an epithermal gold deposit.

Based on more recent field observations and new drilling geological information, CGL Colombia believes that Buritica deposit is a low-intermediate sulphuration epithermal vein-type gold- silver deposit but it shares many characteristics with porphyry gold deposits. Overall, BMZ gold-mineralisation is typically associated with areas of increased veinlet density or disseminated mineralisation with similar mineralogy found in the HVM, and the BMZ shells have a relationship to the orientation of the epithermal vein systems which crosscut the porphyry system.

The characteristics of the mineralisation at the Buritica Project are summarised as follows:

- The mineralisation is mainly hosted in porphyry intrusion system, with mineral zoning related to porphyry ore-forming process, where the porphyry style mineralisation has not well developed in Buritica Project area.
- Later stage mineralisation is dominated by Au and Ag and controlled by fault structure appearing vein-like shape, with ratio of Ag/ Au of 2.8 to 6.3.
- Au-Ag mineralisation is usually associated with high grade of sphalerite, chalcopyrite and galena.
- Fluid inclusion, isotope studies, and rock geochemistry (Lesage et al, 2013, Aerne and Kretz, 2014) suggest a magmatic source for the gold bearing fluids with late stage mixing from meteoric waters.

6 Exploration

Systematic exploration for the Buritica Project area and the proximal outside area of the Buritica Project has been undertaken by CGI since 2007, including topographic, geological mapping, aerial magnetic and radiometric surveys, geochemical soil surveys, surface drilling, channel sampling, underground drilling, where drilling programs of both surface and underground, channel sampling etc. focused on both Yaragua and Veta Sur vein systems.

Light detection and ranging ("**LiDAR**") along with aerial photography were used for topographic survey with a resolution of 0.5 to 1.0 m, by applying projections of Magna Sirgas west. The database of all sample workings is consolidated to the same projection of Magna Sirgas west.

Since January 2019, drilling programs focused on surface drilling, definition drilling and channel sampling of tunnel. As shown in Table 6-1, a total of 3,785 diamond drill holes for a combined length of 786,347 m, and 143,268 channel sample workings for a total of 82,345 m were completed as of 31 December 2024. Most of these sample workings were concentrated in Yaragua and Veta Sur mineralised systems.

Table 6-1: Summary of Major Sample Workings as of 31 December 2024

Item	Collar	Depth	Samples	Survey	Lithology
Surface Diamond Borehole	514	228,478	213,056	94,933	15,276
Underground Diamond Borehole	767	273,004	280,446	179,202	16,068
Definition Diamond Borehole	2,491	280,621	383,615	100,445	48,702

Geotechnical Drilling	13	4,244	2,385	778	276
Total	28,866	868,692	1,022,770	428,124	216,476

Sources: SRK

6.1 Exploration History

6.1.1 Prior to Continental Gold Inc

Several surface mapping and sampling surveys have been conducted by different companies during the 1990s including Gran Colombia Resources Ltd ("**GCR**"). Only the following prospects, which are within the area of Buritica Project, and the outside of the Buritica Project area, were followed up by CGL Colombia for further prospecting:

- An area of hydrothermal alteration to the west of Yaragua Section, with reported grades up to 7.9 gram per tonne ("**g/t**") Au, now referred to as the area of Perseus.
- An area to the south of the Yaragua Section, with reported grades up to 5 g/t Au, 150 g/t Ag and 4.6% Zn, now referred to as the area of Laurel.
- La Estera prospect, which is located 2 km south of the Yaragua Section, with reported average grades up to 12 g/t Au, and 1,000 g/t Ag.
- San Agustin prospect, which is situated 1 km north of the Yaragua Section, with reported average grades of 1.45 g/t Au and 24.3 g/t Ag.

6.1.2 Prior to CGL Colombia

Since 2007, CGI focuses was widespread surface exploration, drilling and tunnelling. As of May 2015, the database included 162,664 m of surface drilling, 115,011 m underground drilling and 11,032 m of underground channel sampling of both Yaragua and Veta Sur sections. A total of 51 veins at Yaragua Section, and 38 veins at Veta Sur Section were defined, with final reported Mineral Resources in accordance with Canadian Institute of Mining Metallurgy and Petroleum, *CIM Definition Standards for Mineral Resources & Mineral Reserves* ("**CIM Definition Standards**"), which was conducted by Mining Associates Ltd in May 2015.

Based on the Mineral Resource estimate carried out by Mining Associates Ltd, JDS Energy & Mining Inc submitted *Buritica Project NI43-101 Technical Report Feasibility Study, Antioquia, Colombia* dated in March 2016.

In March 2019, Ivor Jones Pty Ltd ("**Jones PL**") submitted the *Continental Gold NI 43-101 Buritica Mineral Resource 2019-01, Antioquia, Colombia*.

6.1.3 History of CGL Colombia

In March 2020, Zijin Mining Group Company Ltd ("**Zijin Mining**") made the acquisition of the Continental Gold Ltd. Then, CGL Colombia fully takes over the Buritica Project, and keeps on conducting infill drilling programs in 2020.

In May 2021, SRK China submitted the *Independent Technical Report on the Buritica Gold-Silver Project, Antioquia, Colombia*.

In June 2022, BAW Mining Inc. submitted the *NI 43-101 Independent Technical Report of Buritica Project, Colombia*.

6.2 Tunnelling Exploration

Yaragua and Veta Sur sections have recent developments with some historical tunnels at Yaragua Section, comprising drifts mostly along veins, crosscuts, raise and other underground access.

The channel samples were collected along an average 3 m interval and 0.5 - 1.5 m across the drifts and raises, with a channel section 10 centimetres ("**cm**") wide by 3 cm deep.

6.3 Drilling Exploration

All drilling programs were diamond drilling, commencing in 2007.

Since 2011, drilling programs focused on the Buritica Project area with the objective of increasing the Mineral Resources.

Drilling in 2014 and 2015 focused on converting Inferred Mineral Resource into the Measured and Indicated categories, as well as expanding the overall Mineral Resources.

Drilling from 2015 to 2017 focused on infill drilling operation to increase the confidence in the Mineral Resource estimate.

Since 2018, the definition drilling was proposed for defining Measured Mineral Resources and supporting for mining operation.

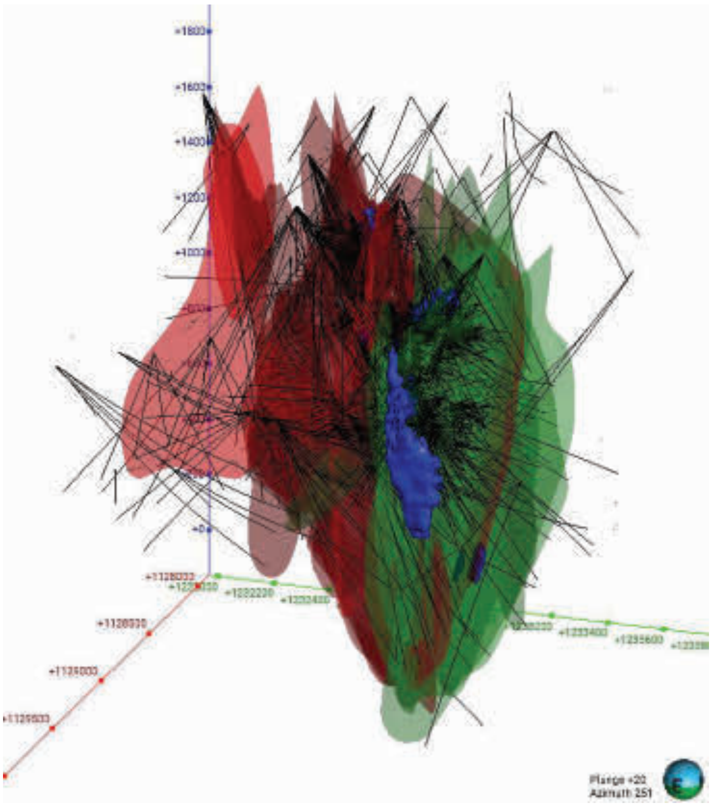
All surface and underground drilling guided by Buritica Project technical protocol was contracted to a third party for all aspects of the drilling services, with mainly HQ size core, some holes of which were reduced to BQ. All drill holes collars were surveyed by a total-station of Leica FlexLine TS09plus made in Switzerland, and downhole surveys utilised Reflex EZ-Trac, Reflex Gyro, or ACTIII instruments. Core recovery was satisfying with more than 90% boreholes with core recovery of not less than 92%.

Generally, after core was retrieved from the core barrel and placed in core trays, the core boxes were taken from the drill site to the core logging shed, where initial photos were taken before the core had been washed. The lengths were marked in core trays and wooden spacers inserted with downhole lengths added by a Buritica Project technician. The core trays were laid out in order of depth, the core loss was thus verified, and the correct depths were marked in the tray.

Logging was then entered into the log-chief system directly for lithological, alteration, mineralogy and geotechnical data. Sample intervals were then chosen based on lithology, alteration and mineralogy, with lithology changes, veins, alteration changes or anything else of note used to choose sampling limit.

As shown in Figure 6-1, the mineralised zone of both Yaragua and Veta Sur systems and BMZ were designed by systematic drillings and tunnelling locally. So far, drill data spacing is variable within each mineralised vein, but CGL Colombia aims for an intercept pattern of between 20 and 50 m along both strike and dip directions. Vertical interval of current tunnel level ranges from 15 m to 35 m, with distribution between 1,160 m to 1,560 m ASL at Yaragua vein system, and 1,160 m to 1,685 m ASL at Veta Sur vein system. For BMZs domains drill data spacing is variable, but CGL Colombia aims for an intercept pattern of between 50 and 65 m.

Figure 6-1: Map Showing the Distribution of Major Sample Workings



Sources: SRK.

Notes: Red-Veta Sur, Green-Yaragua, Blue-BMZ.

6.4 Sampling, Sample Preparation and Analyses

The most recent public reports for Buritica Project were *Independent Technical Report on the Buritica Gold-Silver Project, Antioquia, Colombia* by SRK Consulting China Ltd, May 2021, and *NI 43-101 Independent Technical Report of Buritica Project, Colombia* by BAW Mining Inc., June 2022, the descriptive information of this section is derived from these two reports unless otherwise noted.

6.4.1 Sampling

For drill core sampling, sample intervals were chosen based on lithology, alteration and mineralogy, with lithology changes, veins, alteration changes or anything else of note used to choose sampling limit. In general, the smallest interval chosen was 50 cm while the wall rock was sampled at 1.5 m intervals. Once sampling intervals had been determined, the core trays were photographed again with sample intervals shown by stickers indicating sample limits, downhole lengths, and drill hole names. Drill core was then marked for cutting by a geologist. Drill core was cut into halves lengthwise using a saw splitter at the core logging shed. However, the whole core sample of definition drilling was collected for sample preparation. After cutting, samples were then wrapped and sealed with packing tape and the geologist or technician signed off the sample sheet. A geologist would handle the sampling if there was mineralisation, otherwise a technician might prepare an apparently unmineralised sample.

Figure 6-2: Drill Core Sampling

Logging

Core Cutting

Sampling

Core Storage

Sources: SRK site visit

The channel samples were collected along an average 3 m interval and 0.5 - 1.5 m across the drifts and raises, with a channel section 10 cm wide by 3 cm deep.

For the channel samples, there were two forms of sampling which depend on the rock's hardness, if the rock was friable, the sample was extracted by sledgehammer and chisel, but if the sample was hard and out of fracture surface, it was necessary to take it out by a cutting disc, this tool permitted clean cuts and continuity of the channel. The channel sampling was performed by technicians under a geologist's supervision. Each wrapped sample was then placed into a polyweave bag, which was sealed with cable ties with the corresponding batch number written on it.

Figure 6-3: Channel Sampling

6.4.2 Sample Preparation and Analyses

Before the end of 2020, ALS Laboratory based in Medellin, Colombia ("**ALS Colombia**") was employed for sample preparation, and ALS Laboratory based in Lima, Peru ("**ALS Peru**") and ActLabs laboratory based in Rionegro, Colombia ("**ActLabs Colombia**") were used for both sample preparation and assaying focusing on definition drilling core, with SGS laboratories based in Colombia or Lima, Peru as umpiring laboratory. ALS Colombia is part of the ALS Group of laboratories that operate under a global quality management system in accordance with ISO/ IEC 9001. ALS Peru has ISO/ IEC 17025:2005 Accreditation by the Standards Council of Canada as a Testing Laboratory. ActLabs Colombia has ISO 9001:2015 certification by the International Certification Network for Geochemical Analysis for the Mining Sector ("**ICONTEC**"). SGS Peru has ISO9001:2015. It also has ISO/ IEC 17025:2006 certification by the National Institute of Quality ("**INACAL**"), Peru. SGS Colombia has ISO 9001:2005 certification.

Higabra laboratory was established in 2020 and was appointed as the primary laboratory for Buritica Project, Higabra laboratory is an ISO9001:2015 certificated laboratory.

Figure 6-4: Higabra Laboratory in Buritica Project

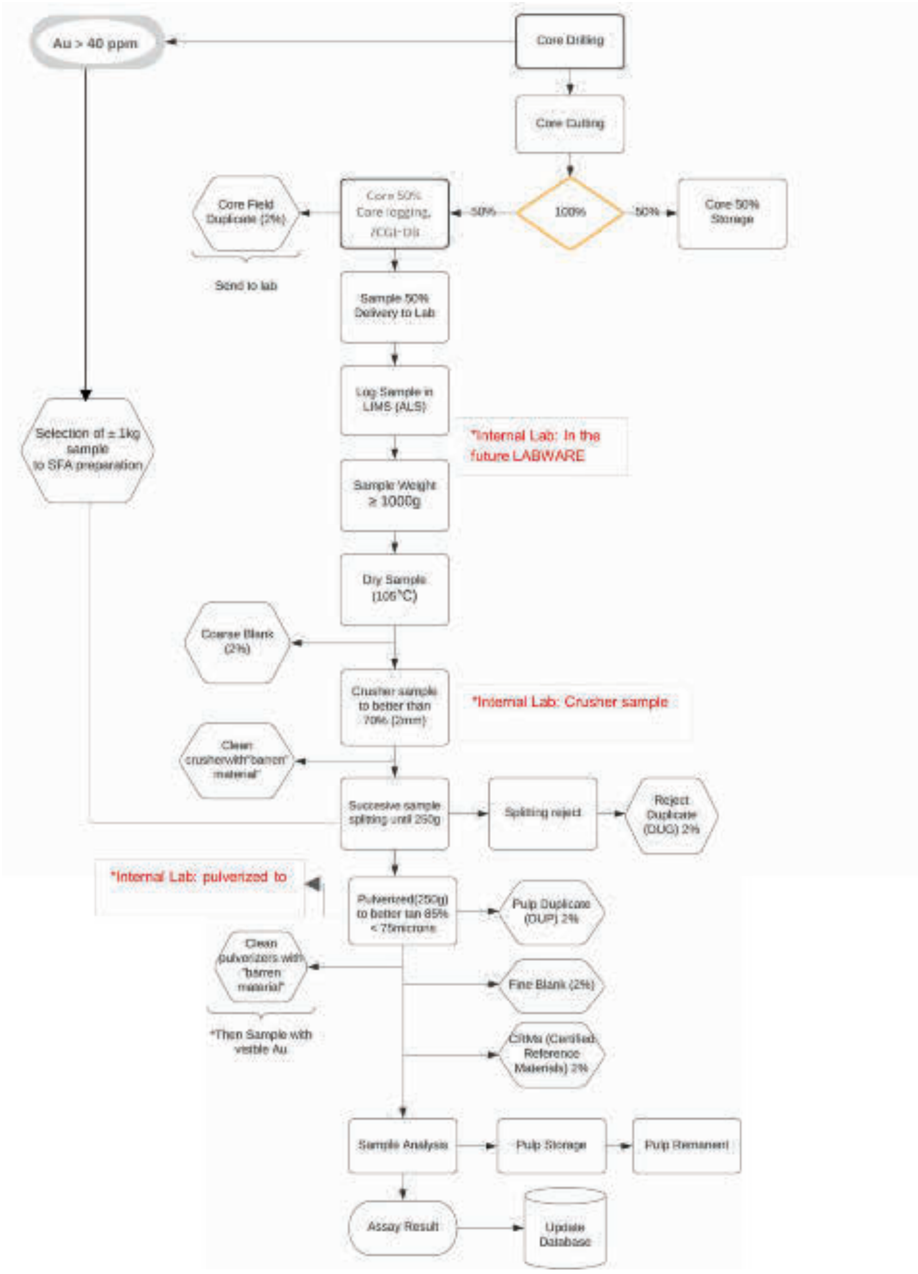
Sources: SRK site visit

ALS Colombia was contracted as umpire laboratory as of July 2024. Bureau Veritas Colombia Ltd ("**BV**") located in Itagui city, Antioquia province, Colombia was contracted as umpire laboratory since December 2024. BV is an INACAL certified laboratory.

In the Higabra laboratory, each sample is dried in ovens at 105°C, crushed to approximately 10 mm. Subsample weighed ranging between 1 kg and 1.5 kg split off from the sample using a riffle splitter, which was further crushed up to 90% less than 2 mm. Approximately 250 g split off for pulverizing up to 95% passing 106 microns ("**µm**"). Coarse rejects and pulp rejects are returned to the Buritica Project.

Quartz cleaning and compressed air cleaning were applied between each sample during sample preparation to reduce potential contamination.

Figure 6-5: Sample Preparation Flow in Higabra Laboratory



Sources: CGL Colombia

In the ALS Colombia and ActLabs Colombia laboratories, the same sample preparation procedure was conducted. In general, each sample was dried in ovens at 100°C, crushed to approximately 10 mm. Subsample weighed ranging between 1.0 kg and 1.5 kg split off from the sample using a riffle splitter, which was further crushed up to 70% less than 2 mm. Approximately 250 g split off for pulverizing up to 85% passing 75 μm. Finally, about 100 g of the pulverised sample was placed in sealed packets for assaying. Samples were analysed at ALS Peru for Au using a conventional fire assay procedure ("**FA**") on 30 g sub-samples, and for Ag by atomic absorption assay ("**AAS**") after a four acids digest. A gravimetric finish was used for higher grade sample. Since 2018, definition drilling samples were analysed at ActLabs Colombia for Au using a conventional FA on 50 g sub-samples, and for Ag by AAS after an aqua regia digest. The higher grade samples were re-assayed using a gravimetric finish on 50 g sub-samples. Meanwhile, the multi-element analysis was also conducted using Inductively Coupled Plasma – Mass Spectrometry ("**ICP-MS**") by ALS Peru, including Zn, Pb, Cu, Mo, Fe, arsenic, and S etc. It is noted that all mineralisation was controlled by assays of Au and Ag, but not totally covered by multi-elements.

6.4.3 Specific Gravity Data

As of December 2024, a total of 13,034 core samples were collected for measures of the specific gravity ("**SG**") using a conversional density – immersion method, operated by CGL Colombia geological technicians in the core shed on site (Figure 6-6). The samples were randomly selected and externally re-measured by ALS Colombia on a monthly base.

SRK reviewed the protocol for measuring SG, examined some SG data reports issued by ALS Colombia, and no material deficiency was found. Data review by SRK exhibit that SG samples have a sound representativeness in 3D space of the Buritica Project, with a statistic summary as listed in Table 6-2.

Figure 6-6: Sample Dipped in Paraffin and Sample Weighing

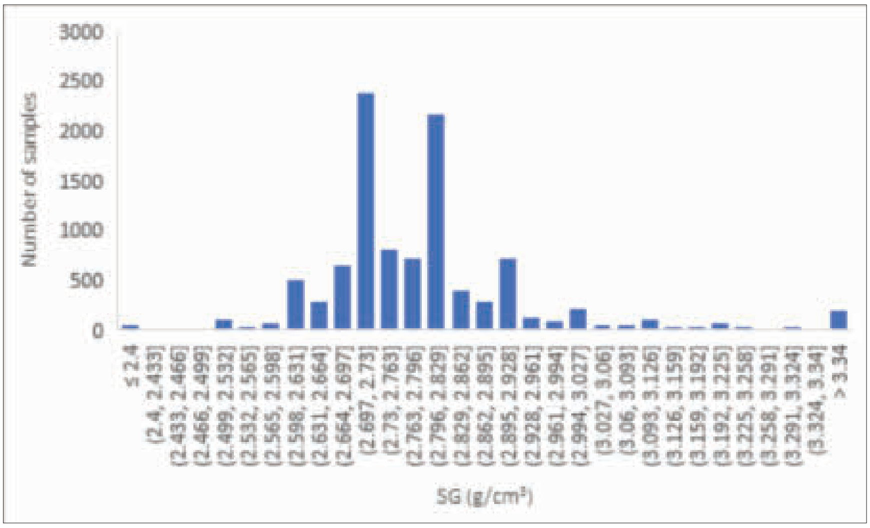
Sources: SRK 2020 Report

Table 6-2: Statistic Summary of Dry Specific Gravity Values

Rock Type	Number of Samples	Average SG
Vein Packages	663	3.10
Broader Mineralised Zones	382	2.95
Halos	1,976	2.80

Sources: SRK

Figure 6-7: Histogram Statistics for Specific Gravity



Sources: SRK

Field inspection conducted by SRK indicate that most high-grade Au-Ag mineralisation is usually associated with high grade of base metal sulphides. SRK thus believe that high grade of base metal sulphides will generate impaction against SG values. In order to verify SRK's view, histogram statistics were conducted. As indicated in Figure 6-7, SG values have two peaks, one is located at the range between 2.70 gram per cubic meter ("**g/ cm^3**") to 2.73 g/ cm^3, and the other is situated between 2.80 g/cm^3 to 2.83 g/cm^3. SRK believes that SG ranged between 2.70 g/ cm^3 to 2.73 g/ cm^3 are roughly representativeness of wall rocks, and the range between 2.80 g/ cm^3 to 2.83 g/ cm^3 is caused by Au-Ag mineralisation. It is thus concluded that Au-Ag mineralisation leads to increase of SG value.

As shown in Table 6-3, SG value has a weakly positive correlation with grade of Au, Ag, Zn, Pb, Cu, and S, but a moderately prominent correlation with grade of Fe, which may be mainly contributed by pyrite. It therefore suggests that the equation between SG and Fe should be established for Mineral Resource estimate.

Table 6-3: Statistic Correlation Coefficients of Multi-element Values

Element	Au	Ag	Fe	Zn	S	Zn + Pb + Cu
SG (g/cm^3)	0.184	0.241	0.630	0.210	0.430	0.250

Sources: SRK

Therefore, SG values as listed in Table 6-2 were adopted in SRK’s mineral resource estimate in this Report.

6.5 Quality Assurance and Quality Control Programs

Quality assurance and quality control (“**QAQC**”) programs were performed throughout the exploration process by CGL Colombia including:

- Certified reference materials (“**CRM**s”) supplied by Ore Research & Exploration Pty Ltd, Gestates Ltd, Oreas and Rocklabs, with low, medium and high-grade Au, low grade Ag, and low-grade Zn. About 5% CRMs of total samples were inserted into sample stream on site before delivering to ALS Colombia for sample preparation.
- Field duplicates (“**DU**”): a quarter core before 2019, and half core since 2019 were collected as field duplicates after regular half core was cut as a sample, also include duplicate samples collected from the underground working face. Overall, about 2% field duplicates of total samples were inserted into sample stream on site before delivering to ALS Colombia for sample preparation. No field duplicate procedure was applied for definition drill core samples.
- Coarse duplicate (“**DUG**”): SRK was told that the coarse rejects from the second time splitting during sample preparation process at materials sizing 2 mm was used as DUG. About 2% DUG of total samples were inserted into the sample preparation process, managed by ALS Colombia.
- Pulp duplicate (“**DUP**”): split pulps sizing 75 μm used as DUP, totally managed by ALS Colombia. After sample preparation, about 2% DUP of total samples were inserted into sample stream managed by ALS Colombia before delivering to ALS Peru for assaying.
- Coarse blank (“**BKG**”) and Pulp blank (“**BKF**”): both BKG and BKF were provided by SGS Colombia. However, for ActLabs Colombia, the field blanks were obtained in batches of 500 kg from a road aggregate quarry within the vicinity of the Buritica Project area, which were then crushed or pulverised to represent BKG and BKF respectively. The assays of all BKGs and BKFs have grades of 0.02 g/t Au, 0.01 g/t Ag, and 0.0002% Zn. Overall, about 5% BKG of total samples were inserted into sample stream on site before delivering to ALS Colombia for sample preparation. After sample preparation, about 5% BKF of total samples were inserted into sample stream managed by ALS Colombia before delivering to ALS Peru for assaying.

CRMs

In the Buritica Project, the CRMs for Au and Ag were inserted with an insertion rate of 2% of the total of the original samples, The CRMs used in the sample streams from 2022 to 2024 are listed in Table 6-4, the threshold/ rejection criteria are:

- Results within ± 2 Standard Deviations (“**SD**”) of the expected value (from the CRM certificates) are considered acceptable.

- Individual results between ± 2 SD and ± 3 SD of the expected value are also deemed acceptable, but monitoring was required.
- Any results outside ± 3 SD is considered as 'fails' and is examined for problems with sample number allocation and potential follow up with re-assaying of the entire batch were considered necessary.

The CRMs used are listed in Table 6-4, SRK has sighted them during site visit (Figure 6-8). The performances are shown in Figure 6-11, almost all CRMs are within 3 SD, the CRMs show good accuracy and consistency.

Table 6-4: CRMs Used in the Sample Stream from 2022 to 2024

2022			2023			2024		
CRMs	Ref value (g/t)	SD (g/t)	CRMs	Ref value (g/t)	SD (g/t)	CRMs	Ref value (g/t)	SD (g/t)
EPIT-04 Au	1.208	0.056	AuOx33 Au	1.684	0.118	AuOx33 Au	1.684	0.118
EPIT-04 Ag	35.4	3	AuOx33 Ag	554	28	AuOx33 Ag	554	28
EPIT-05 Au	4.112	0.24	EPIT-01 Au	7.623	0.404	EPIT-01 Au	7.623	0.404
EPIT-05 Ag	131	6	EPIT-01 Ag	13.1	1.2	EPIT-01 Ag	13.1	1.2
EPIT-20 Au	1.264	0.112	EPIT-05 Au	4.112	0.24	G908-4 Au	0.96	0.05

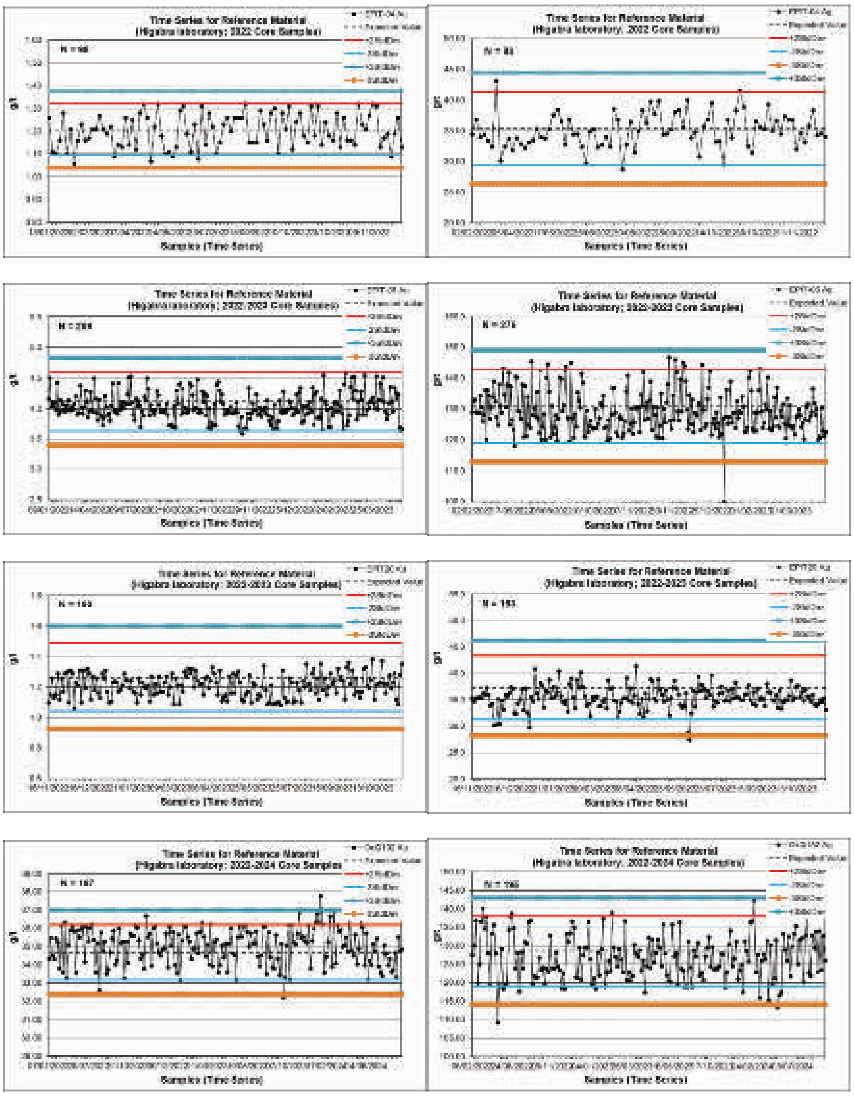
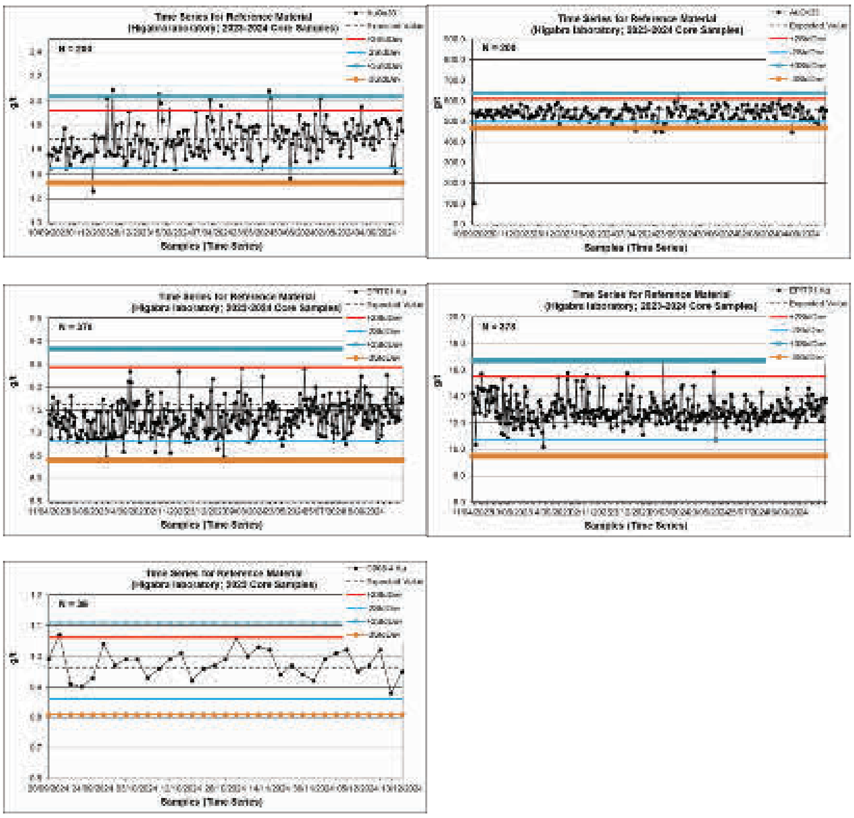
Figure 6-9: CRMs Performance from 2022 to 2024



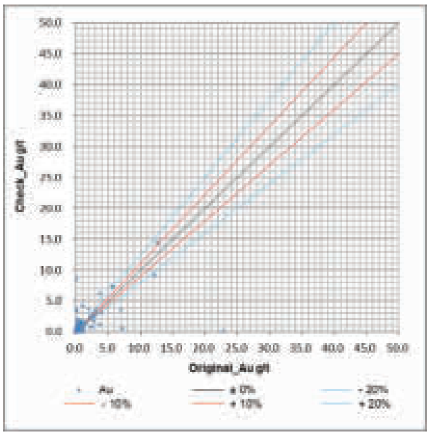


Sources: SRK

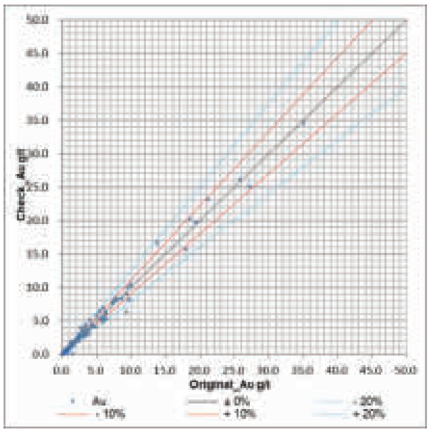
Duplicate samples

The DU, DUG and DUP are plotted in Figure 6-10, which exhibits that about 40% of field duplicates returned results within +20% and -20% of the originals, about 59% of coarse duplicates given assays within +20% and -20% of the originals, and about 78% of pulp duplicates returned results within +20% and -20% of the originals. The data indicate that coarse gold generates a remarkable nugget effect impaction against assaying precision.

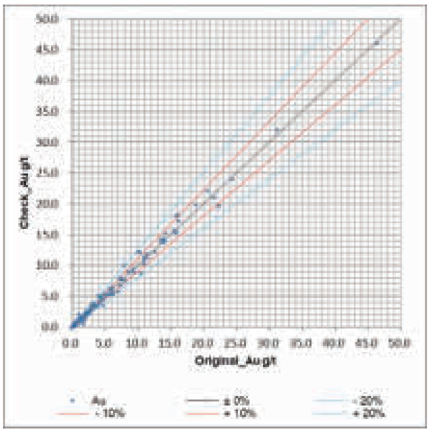
Figure 6-10: Duplicate Sample Performance from 2022 to 2024



DU from 2022 to 2024



DUG from 2022 to 2024



DUP from 2022 to 2024

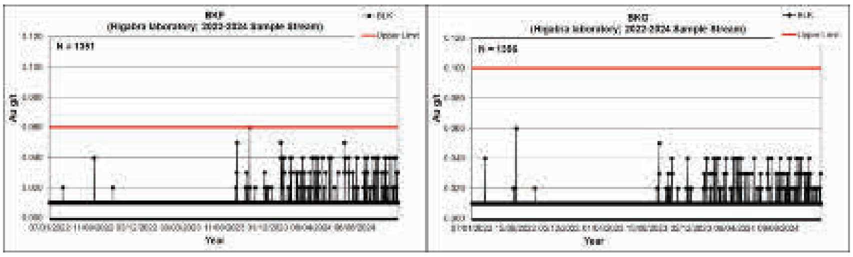
Sources: SRK

Blanks

BKG samples were collected from rocks outside of mineralised zones, and BKF were purchased from commercial CRM provider. Both BKG and BKF were used as contamination control samples in the Buritica Project. Overall, about 2% BKG of total samples were inserted into the sample stream on site before delivering to the Higabra Laboratory for sample preparation. After sample preparation, about 2% BKF of total samples were inserted into sample stream managed by the Higabra laboratory before delivering for assaying. For BKF, the upper limit is defined as three times the detection limit, whereas for BKG, the upper limit is established as five times the detection limit.

All assays of blanks from 2022 to 2024 are plotted in Figure 6-11, indicating that BKF and BKG has a similar trend showing greater Au value have been assayed after August 2023, but the contamination for both sample preparation process and assaying process is at an acceptable level.

Figure 6-11: BKF and BKG Performance from 2022 to 2024



Sources: SRK

6.6 SRK Data Verification

Grab samples were collected from the ore stockpile during SRK's site visit on 17 May 2025. The samples were sent to the Higabra Laboratory immediate after collected, the analysis results are shown in Table 6-5.

Table 6-5: Grab Samples Collected during SRK's Site Visit

No.	Au g/ton	Ag g/ton	Cu g/ton	Zn g/ton	Pb g/ton	Notes
YM-01	3.03	51.75	6439	204	67	Ore from drifting for mining preparation of Main zone, medium grade

6.7 SRK's Comments

Based on metallurgical tests, besides Au and Ag, elements of Zu, Cu, Pb may be recoverable and constitute the Mineral Resources. However, SRK finds that about 40% assays of Au and Ag are associated with Zn, Cu, Pb, which lead to difficulty for the Mineral Resource statements of Zn, Cu and Pb to be reported in compliance with the *JORC Code* guidelines. It therefore recommends having all left duplicates assayed for multi-elements.

The Nugget effect is remarkable, caused negative impaction against assaying precession and the Mineral Resource. It is recommended to conduct trial sample preparation procedural to solve the problem of observed nugget effects.

In SRK's opinion, the documented procedures and primary data may still be, in general, acceptable by the industry practice, and SRK has therefore assumed that no significantly material biases have been introduced, and the data collected is acceptable for the purposes of Mineral Resource estimation in this Report.

7 Mineral Resource Estimates

7.1 Introduction

The Mineral Resource statement presented herein represents a Mineral Resource evaluation prepared for the Buritica Project in accordance with the *JORC Code* guidelines. SRK has reviewed, but not re-modelled or re-estimated the Mineral Resources and the Mineral Resource models were prepared by CGL Colombia.

Leapfrog v2024.1 ("**Leapfrog**") and Datamine™ RM v1.13 ("**Datamine™**") software were used by CGL Colombia to construct the mineralised domains, prepare assay data for geostatistical analysis, construct the block model, geostatistical analysis, and variography, estimate metal grades. SRK was provided with borehole database, mineralised domains, composites, variogram models, Mineral Resource classification footprints and block models.

The Mineral Resource statement is declared as of 31 December 2024.

This section describes the Mineral Resource estimation methodology and summarises the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global gold and silver Mineral Resources found in the Buritica Project at the current level of sampling. The Mineral Resources are reported in accordance with *JORC Code* guidelines. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Buritica Project Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling and tunnelling information is sufficiently reliable to interpret with confidence the boundaries for gold-silver mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

SRK has reviewed the databases, wireframes, grade estimation parameters, Mineral Resource classification footprints, calculated an appropriate cut-off, reported and tabulated the Mineral Resources.

7.2 Resource Estimation Procedures

The Mineral Resource evaluation methodology involved the following procedures:

- Database compilation and verification;
- Review of the definition of the mineralised domains;
- Review of data conditioning (compositing and capping) for geostatistical analysis and Variography;
- Review of block modelling and grade interpolation;
- Mineral Resource classification review and validation;
- Assessment of "reasonable prospects for eventual economic extraction" ("**RPEEE**") and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

7.3 Mineral Resource Database

The database SRK received consist of assay, collar, density, lithological and alteration logs, and downhole survey data. They were loaded into Leapfrog software by SRK for the following validations.

- Checks for holes without samples
- Checks for duplicate samples
- Checks and adjusts the missing or wrong intervals

The Mineral Resource database was verified, and no major issues were found.

Table 7-1 summarises the Mineral Resource database covering the entire Buritica Project area, with assays of Au, Ag, Zn, Cu, Pb and S, detailed in Figure 7-1.

Table 7-1: Summary of Buritica Resource Database

Sampling Type	Collar	Depth (m)	Samples			
			Au	Ag	Cu	Zn
Channel Sampling	25,081	82,345.3	143,268	142,834	36,240	35,675
Diamond Drilling	3,772	782,103.5	877,116	877,084	428,247	430,246
Geomechanical	13	4,243.8	2,385	2,385	2,335	2,335
Total	28,866	868,692.6	1,022,769	1,022,303	466,822	468,256

Sources: SRK

In summary, the estimation of the Mineral Resources documented in this Report is informed by data from 3,772 diamond drillholes for a combined drilling meter of 782,103.5 m, 25,081 channel samplings for a total length of 82,345.3 m and 13 geotechnical sampling for a total length of 4,243.8 m in the Buritica Project area.

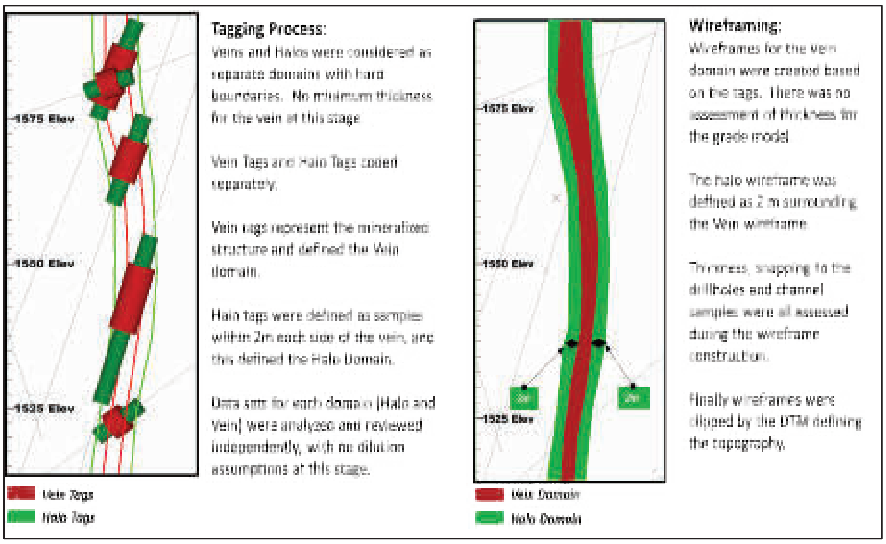
7.4 Solid Body Modelling

The mineralisation in the Buritica Project is characterised by vein-like occurrence controlled by fault structure, which is dominated by Au, associated by Ag, Zn, Cu, Pb, and S, etc. A total of 939,315 samples on an overall grid 20-50 m (strike) by 20-90 m (dip) have delineated mineralisation zones. Broader Mineralised Zones Mineralisation - BMZ associated to broader areas with intense phyllite alteration, increase of sulphide content associated to interception of Yaragua and Veta Sur vein systems.

All data has been imported into a Leapfrog for validation against the tunnel and borehole database and wireframes. In practice, drillholes were displayed, and the mineralisation domain wireframes were constructed manually based on economic composites and natural boundaries, where a minimum horizontal width ("**MHW**") at 0.2 m was initially required for the continuity of the vein with 2 m from the hard boundaries of the vein each at hanging-wall and footwall was defined as "Halo" respectively. A separate grade estimation was conducted for the Halo domains. At this stage, the vein wireframe was referred to as an undiluted model, which was then diluted to MHW at 1.0 m finally and referred to as diluted model. The diluted model was used for the Mineral Resource statement in this Report.

During the geological interpretation process, samples were tagged to represent each mineralised vein, and brief procedures for tagging are listed in Figure 7-2.

Figure 7-2: Summary of Sample Tagging Wireframing Process



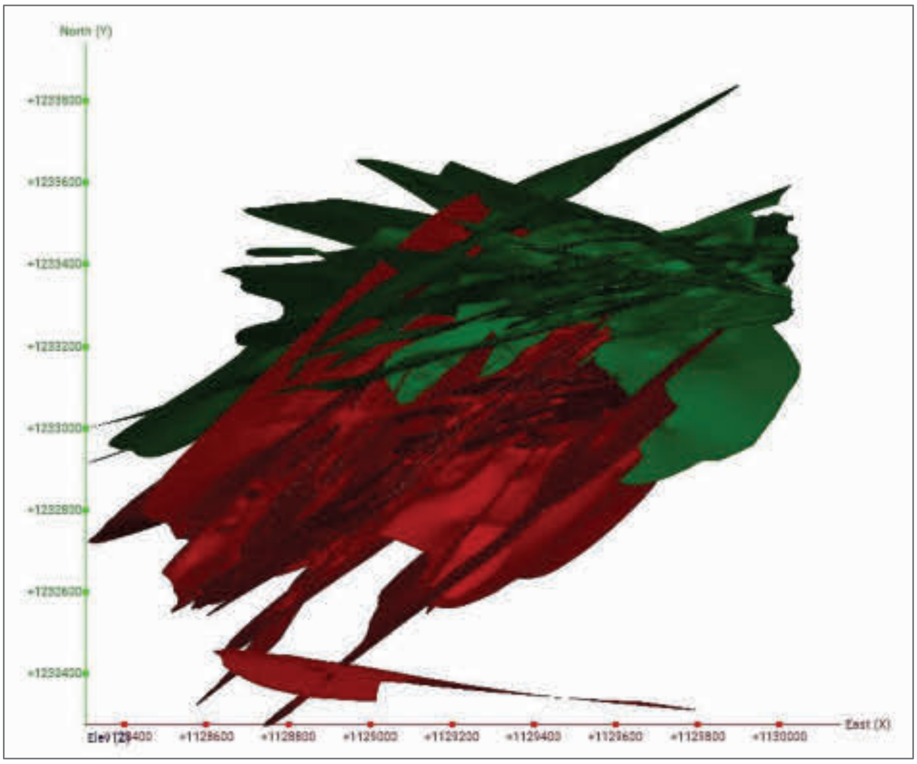
Sources: CGL Colombia, 2025.

In general, grade intervals greater than 2.0 g/t Au were tagged, however a few intervals with gold grade lower than 2.0 g/t were tagged within of vein. Gold grade in mineralised halos is usually less than 2.0 g/t Au. The mineralisation for each vein was extrapolated naturally following up the host structure, usually not more than 200 m, and pinched out by a plan at the end. However, the sampling grid within the mineralised vein wireframe was more than 200 m locally.

New drilling information has been used to rework the vein interpretations. In addition to the new drilling information, CGL Colombia has used new mapping from the underground workings, new information from channel samples, grade control models, and new structural measurements from mapping and from core logging, which allow a better understanding of structural geology in the Yaragua and Veta Sur vein systems.

Two mineralised vein systems (HVM) at Yaragua and Veta Sur were manually defined as shown in Figure 7-3, where Yaragua vein system includes a total of 24 mineralised domains and Veta Sur system has a total of 28 mineralised domains.

Figure 7-3: Plan View of Vein Mineralisation in the Buritica Project



Sources: SRK.
Notes: Red - Vein Veta Sur, Green - Vein Yaragua.

CGL Colombia has used a combination of the lithological log and the assays to define the limits of all BMZ grade shells models. Four major shells as shown in Figure 7-4 were generated using gold equivalent ("**AuEq**") (AuEq g/t = Au g/t + Ag g/t / 80, based on an Au metal price of USD 1,700/oz and USD 21/oz Ag) 0.3g/t cut-off grade to define the outer limit of mineralisation, using 4 m composites length. Table 7-2 shows the main parameters used for BMZ modelling and shell generation. Tags flagged as veins and channel samples associated with veins were removed from those coded as BMZ. BMZ's domains were integrated into new BMZ's domains. All geological surfaces were cut to the original topography.

Table 7-2: Summary of Parameters for BMZ's Modelling

Parameter	Value
ISO Value	AuEq 0.3 g/t
Average Grade for Economic Mining	> 0.8 g/t
Economic Composite Length	4 m
Minimum Mineable Width	6 m
Structural Trend Applied	N45E
Spheroidal Interpolant	Yes
Sill	30 m
Alpha	3
Base Range	100
Drift	Constant
Resolution	10
Discarded Volume	35 m^3

7.5 Specific Gravity

As detailed in Table 6-2 and reviewed by SRK, SG values 3.10 for vein systems, 2.95 for BMZ and 2.80 for Halo domains were adopted in the Mineral Resource estimate in this Report.

7.6 Evaluation of Outliers

CGL Colombia evaluated capping of outlier populations and compositing of variable-length data to minimise variance prior to the estimation as well as to obtain a more reasonable approximation of grades during the Mineral Resource estimation.

High grade capping is undertaken where data is no longer considered to be part of the main population. Upon review of the domain samples, CGL Colombia elected to apply the capping pre-compositing for the current Mineral Resource estimate.

Statistical analysis was completed by CGL Colombia, to evaluate the impact of grade capping by importing the geologically domain coded samples into Supervisor™ Datamine Software. The raw assay data (length weighted) was first plotted on histograms and cumulative distribution plots to understand its basic statistical distribution. To define the appropriate top capping values, Au and Ag grade distributions within the mineralised domains were examined via mean and variance graphs, histograms, and log probability plots using disintegration method. Samples for both channel and drillholes were considered in the analysis separately. Final top-capping values were supported by reconciliation against production data.

Data studies indicate that channel samples have prominently clustering along tunnels, and data distribution feature between channel samples and diamond drilling samples are different, with median grade of Au of channel samples are much higher than diamond drilling samples including definition drilling samples. To eliminate the clustering effect, an additional massive sub-domain introduced for top grade capping and grade estimation. Therefore, top capping values were applied for each subdomain and for each sampling working (drillholes and channels separately). For this model, mining reconciliations results were used to calibrate the top-capping values.

Overall, the 98th to 99th outlier value of composite distribution within each vein subdomain and halo domains were acceptable as the top-grade capping based on the characteristics of the mineralisation of Buritica deposit.

In general, the impact of the top-grade capping for grade estimation was less than 10% change in the mean value, however the highly positively skewed nature of the gold distributions and the very high values in some veins with extreme outliers, the change in the mean exceeds this value. The number of samples capped in any one vein generally did not exceed 10% of the total, except where there were a small number of samples.

Capped versus uncapped statistics were generated for gold and silver and are shown in Table 7-4, Table 7-5 and Table 7-6.

Table 7-4: Veta Sur Uncapped and Capped Sample Statistics

Sources: CGL Colombia, 2025.

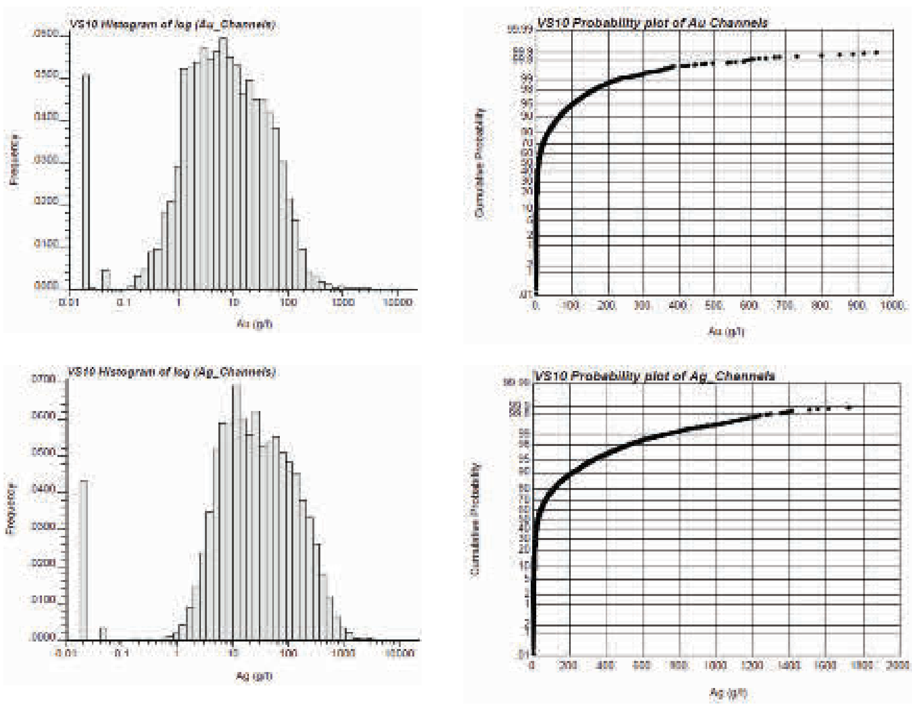
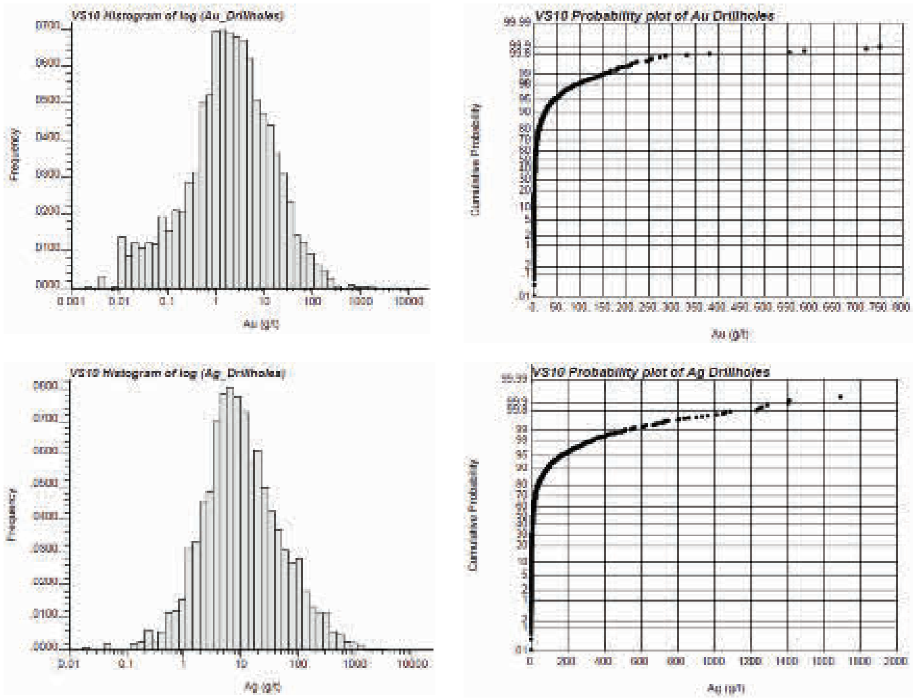
SRK has reviewed the sample outliers used in grade estimation by CGL Colombia, detailed in Figure 7-5 and Figure 7-6 as an example. In SRK's opinion, the grade capping is appropriate.

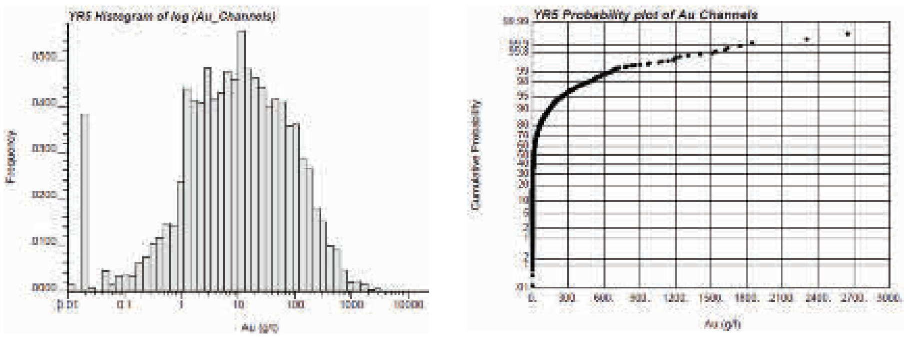
Figure 7-5: Example Log Histogram and Probability Plot for Channels and Drillholes (VS10)

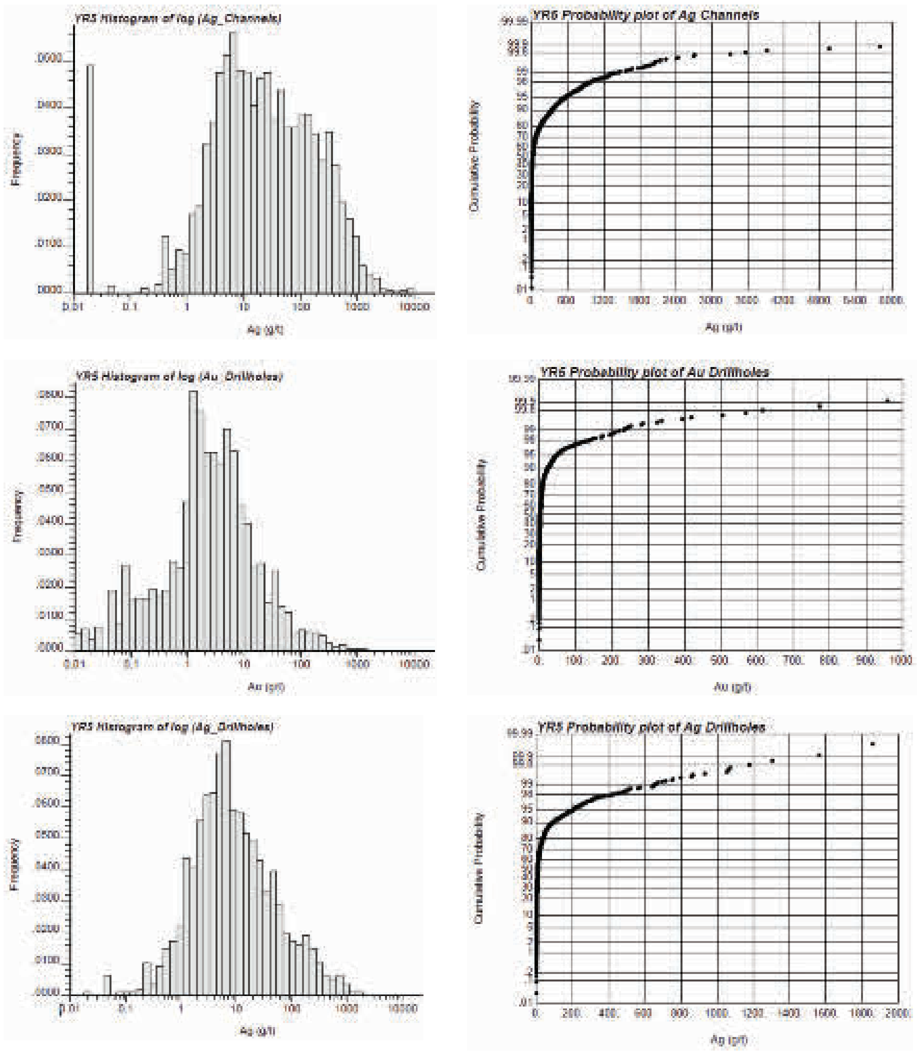




Sources: SRK

Figure 7-6: Example Log Histogram and Probability Plot for Channels and Drillholes (YR5)



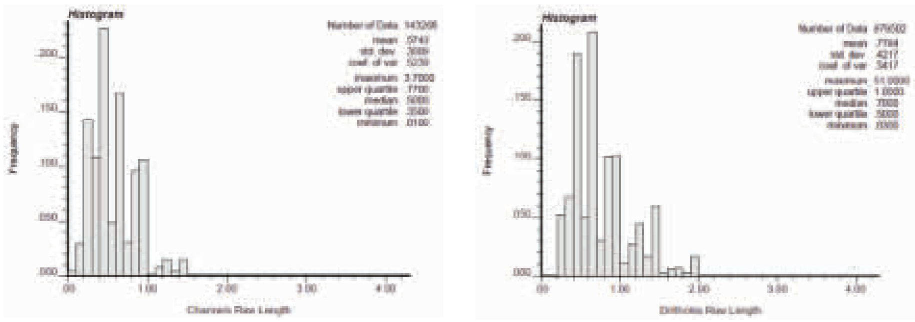


Sources: SRK

7.7 Compositing

Sampling length statistics for veins are plotted in Figure 7-7, indicating that most samples have a length of 0.2 - 1.5 m with significant difference between drillholes and channels. This represents an additional degree of complexity for the compositing process.

Figure 7-7: Histograms of Sampling Length for Raw Samples of Channels and Drillholes



Sources: SRK

All veins were diluted to 1.0 m minimum thickness, as such uncapped gold and silver assays were composited into 1.0 m downhole lengths forcing all samples to be included in one of the composites by adjusting the composite length (the results indicate that using the Datamine software (MODE = 1) parameter enables more of the narrow vein samples to be incorporated into the composites while limiting any potential bias). Minimum composite length was set at 0.1 m.

For BMZs domains, all assays were composited into 4.0 m downhole lengths.

Several holes were randomly selected in mineralised domains, and the composited values were checked for accuracy by SRK. No material errors were found.

7.8 Statistical Analysis and Variography

Variograms were prepared by CGL Colombia in numerous directions in 3D space for both gold and silver composites. To define semi variograms of sufficient clarity to be modelled, univariate semi variograms were calculated on the normal scores for the capped Au and Ag composites. Experimental semi variograms were modelled with a nugget effect and two spherical structures and back transformed to original units for grade estimation. Semi variograms were only calculated and modelled for domains with enough data as other domains had insufficient data to estimate variograms. For BMZ domains omnidirectional semi-variogram was modelled.

Final models for Au are listed in Table 7-7, Table 7-8 and Table 7-9.

Table 7-7: Veta Sur Summary of Au Semi-variogram Parameters

7.9 Block Model and Grade Estimation

The un-rotated block model was created using Datamine™ RM software and was used to estimate tonnage and grade by CGL Colombia. For the defined mineralised solid (undiluted block model), a parent block size of 10 m easting (X) by 10 m northing (Y) by 10 m vertically (Z) was used, with sub-cells of 1 m easting (X) by dynamic option northing (Y) with minimum 0.1 m by 1 m vertically (Z). For the 1 m diluted block model, a parent block size of 2 m easting (X) by 1 m northing (Y) by 2 m vertically (Z) was used. The block model uses the same coordinate projection system as that used in data collection, Magna Sirgas Colombia West Zone. A summary of the block model specifications is presented in Table 7-10. Volume of the block model was validated matching with Veins and BMZ domains.

Table 7-10: Block Model (1m MHW) Specifications

Section	Model Axes	Minimum (m)	Maximum (m)	Parent Block Size (m)	Number of Block	Total Parent Block
Veta Sur	East	1,128,330	1,130,000	2	835	1,035,400,000
	North	1,232,268	1,233,508	1	1,240	
	Elevation	-100	1,900	2	1,000	
Yaragua	East	1,128,295	1,130,095	2	900	1,001,160,000

Table 7-11 summarises geological fields created within the geological model and the codes used.

Table 7-11: Block Model Attributes

Attribute Name	Type	Default	Description
IJK	N	-	Numeric parent cell identifier, unique for all cells falling within the same parent cell

Attribute Name	Type	Default	Description
XC	N	-	X coordinates of the cell center
YC	N	-	Y coordinates of the cell center
ZC	N	-	Z coordinates of the cell center
XINC	N	-	X parent cell X dimensions (m)
YINC	N	-	Y parent cell dimensions (m)
ZINC	N	-	Z parent cell dimensions (m)
VOLUME	N	-	Volume parent cell (m^3)
SYSTEM	N	-	(1) = Veta Sur vein system; (2) = Yaragua vein system
VEIN	N	-	Vein coding for individual mineralised structure
ORE	N	-	VS 1-28, YR 1-24, BMZ 301-304, Halo 98, Halo 99
DOMAIN	N	-	For HVM domains and subdomain coding DOMAIN = 100*VEIN+10*ZONE. For BMZ domains are equal to ORE code.
Au_ppm	N	-	Final Gold estimate in ppm used for reporting (O.K.)
AuEq	N	-	Equivalent Gold = Au_ppm + Ag_ppm × 0.010086
Au_ppmNN	N	-	Gold NN methodology
Au_ppmID	N	-	Gold estimate in ppm using ID^2 (power 2)
Ag_ppm	N	-	Final Silver estimate in ppm used for reporting (O.K.)
Ag_ppmNN	N	-	Silver NN methodology
Ag_ppmID	N	-	Silver estimate in ppm using ID^2 (power 2)
NUMSAM	N	-	Number of samples used to estimate the block
SVOL	N	-	Search volume reference (range from 1 to 3)
MINDIST	N	-	Transformed distance to nearest sample
KV	N	-	Kriging Variance
CLASS	N	-	Final code for Mineral Resource Classification: (1) = Measured; (2) = Indicated; (3) = Inferred; (4) = Blue Sky
DISNEAR	N	-	Transformed distance to Mineral Resource Classification
FILLVOL	N	-	Field that contains the proportion of each full cell in the output model that was filled with cells in the input model. Range from 0 to 1
VOIDVOL	N	-	Field that contains the proportion of the cell in the output model that was not filled by cells in the input model. VOIDVOL + FILLVOL = 1 (100%)
VOLE	N	-	Estimated volume (m^3)
DENSITY	N	-	Diluted Dry Density (Ton/m^3)
TONNES	N	-	Tonnage (Dry-Ton) = VOLE*DENSITY
DEPLEILL	N	-	Depletion by Illegal Mines: (0) = No Mined, (1) = Mined
DEPLELEG	N	-	Depletion by CGL Gold Mines: (0) = No Mined; (1) = Mined
XMORIG	N	1128400	X origin of the model i.e., cell with lowest X value, parent cell
YMORIG	N	1232100	Y origin of the model i.e., cell with lowest Y value, parent cell
ZMORIG	N	-300	Z origin of the model i.e., cell with lowest Z value, parent cell
NX	N	-	Number of model parent cells in X direction
NY	N	-	Number of model parent cells in Y direction
NZ	N	-	Number of model parent cells in Z direction

Sources: SRK

A Kriging Neighbourhood Analysis ("**KNA**") exercise has been completed for gold in two master veins in Yaragua and Veta Sur vein systems (San Antonio Vein and San Marino Vein), to optimise the parameters used in the estimation and kriging calculations. Several scenarios were tested using various estimation and kriging parameters. Different input parameters have been tested and the differences in the slope of regression, kriging efficiencies, and block estimates recorded. To complete the analysis, CGL Colombia ran different estimates for Au, changing the following parameters.

- Block size
- Minimum and maximum number of samples
- Number of discretisation points

Ordinary Kriging ("**O.K.**") interpolation was used for the final grade estimate of the HVM and BMZ domains. For the veins VS21 and VS22, variography is not performed because there is insufficient information. For the estimation of these two veins, Inverse Distance interpolation power two ("**ID^2**") is used. Additional to O.K. estimation, ID^2 and Nearest Neighbour ("**NN**") estimates were run for validation purposes, with similar parameters referenced from Au and Ag. Halo domains were estimated using ID^2, search parameters were applied with veins and halos adopting the same search strategy.

Sub-celling was allowed so that at domain or vein boundaries, a parent cell could be divided into 10 equal parts in an east-west direction with exact centres in the northing direction. For undiluted block model, splitting of cells into sub cells is controlled by the parameter PLANE='XZ' which means that splitting is regular in the XZ plane (1 m in X by 1 m in Z), but dynamic in Y, using minimum 0.1 m thickness. For dilute block model, splitting of cells is regular in the XZ plane (2 m in X by 2 m in Z), and in Y direction minimum 1 m, using FILLVOL parameter to control the proportion of full cell that was filled.

In completing a detailed review of the vein and the veinlet style mineralisation, CGL Colombia concluded that given the presence of two principal strike and dip directions a bias could be introduced if a single search orientation was selected per zone. To ensure the block model reflects the nature of the vein mineralisation as accurately as possible, CGL Colombia therefore utilised the wireframe interpretation to aid in determining the search orientations used during the kriging equations on a block-by-block basis. This has been done using the Dynamic Anisotropy function in Datamine™ RM software. During the grade interpolation process for each vein, the massive sub-domain was estimated using soft boundary approach. Search and estimation parameters are summarised in Table 7-12.

Table 7-12: Search and Estimation Parameters for Buritica Deposit

Sources: SRK

Multiple estimation passes were executed for the grade interpolation to progressively capture the sample points, to avoid over-smoothing and preserve local grade variability. Therefore, the kriging passes with smaller search radii are influenced by the first structure of the semi-variogram model, while the kriging passes that use longer search radii are mostly influenced by the second structure. For the Buritica deposit, a first pass search radii of 20 m and 30 m for master veins were used with a minimum of 7 and 16 composites using 3 composites per drillhole; a second pass search radii of 40 m and 60 m for master veins with a minimum of 6 and a maximum of 16 composites.

SRK noted that 2 additional expanded estimation pass of search radii 150 m with a minimum ranged from 3 to 16 composites, and 1 to 16 composites were sufficient to ensure that all appropriate blocks (in areas with reasonable geological confidence) were assigned grade values. These blocks were generally classified with lower confidence. Maps showing Au and Ag distribution of VS10 and YR5 are detailed in Figure 7-8 and Figure 7-9.

Once gold and silver grades have been estimated in each Mineral Resource block model, individual block models for each vein were merged into each HVM system. The mined-out areas were depleted (as of 31 December 2024 underground developments) from the models. All BMZs block models were combined in a one block model file. HVM and BMZ models were combined and HVM estimates overprint BMZ estimates. HVM domains were subtracted before BMZ Mineral Resource statement.

7.10 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the Mineral Resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the Mineral Resource estimate.

SRK has undertaken a thorough validation of the resultant interpolated model, including visual inspection, comparison of Au and Ag grade between ID^2 and O.K., and swath plot checking as well.

Visual inspection provides a validation of the interpolated block model on a local block scale, using visual assessments of sample grades versus estimated block grades. Table 7-13 provides a comparison of Mineral Resource estimates between O.K. and ID2. The details of swath plot checking, see Figure 7-10 to Figure 7-17.

This data indicates that the block model constructed by CGL Colombia is acceptable.

7.11 Mineral Resource Classification

Block model quantities and grade estimates for the Buritica Project were classified according to the *JORC Code* guidelines.

Mineral Resource classification is typically a subjective concept, industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation. The sampling information was acquired primarily from diamond drillholes and channel sampling with overall holes on a grid density of 20 – 50 m by 20 – 50 m. Data quality, drillhole spacing and the interpreted continuity of grades controlled by the veins have allowed CGL to classify portions of the veins in the Measured, Indicated and Inferred Mineral Resource categories.

SRK is satisfied that the geological modelling honours the current geological information and knowledge.

Generally, for mineralisation exhibiting good geological continuity investigated at an adequate spacing with acceptable sampling information accurately located. Blocks estimated within 15 m of at least 3 drill or channel samples from minimum 7 composites used for grade estimation (first search volume) clustered mainly in tunnelling space can be classified as Measured Mineral Resources. Blocks estimated within 40 or 60 m for master veins of at least 2 drill or channel samples from minimum 4 composites used for grade estimation (second search volume) can be classified as Indicated Mineral Resources. Blocks estimated within 150 m of at least 1 drill or channel samples from minimum 1 composite used for grade estimation (third search volume) can be classified as Inferred Mineral Resources, otherwise classified into Potential Mineralisation or Blue Sky, until 300 m, as shown in Figure 7-18 and Figure 7-19.

For all BMZ domains the following approach was adopted for Mineral Resource categorisation:

- Measured: 30 m drill spacing and be estimated using information from 3 drillholes, and a minimum 8 composites used; generally, with P_{90} for Kriging Variance ("KV') = 0.38.
- Indicated: 60 m drill spacing and be estimated using information from 2 drillholes, and a minimum 6 composites used; generally, with P_{90} for KV = 0.40.
- Inferred: 120 m drill spacing and be estimated using information from 1 drillhole, and a minimum 2 composites used; generally, with P_{90} for KV = 0.45.

7.12 External Dilution

A one meter (1 m) dilution process was carried out on the undiluted Mineral Resource block model using halos estimation separately. Datamine^{TM} RM REBLOCK robust macro process with weighted by mass method was used to obtain diluted grades, density, and tonnages. The final density was weighed by volume using 3.1 g/ cm^3 for pure vein and 2.8 g/ cm^3 for halos. Tonnage was recalculated using the proportion of each parent cell in the output model that was filled with cells in the input model (FILLVOL field in the diluted output block model).

7.13 Mineral Resource Statement

The *JORC Code* 2012 defines a Mineral Resource as:

"a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories."

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Buritica Project are amenable for underground mining.

The conceptual parameters used to estimate the cut-off grade for the Buritica Project are summarised in Table 7-14. Gold equivalent ("**AuEq**") was calculated using AuEq = Au g/t+ Ag g/t × 0.010086, based on metal prices of 2700 USD/oz Au and 35 USD/oz Ag and recovery rates of 87.63% Au and 68.18% Ag.

As of 31 December 2024 and at a cut-off grade of 2.0 g/t AuEq, the Buritica Project is estimated to contain 10.1 million tonnes ("**Mt**") of Measured Mineral Resources with an average grade of 7.7 g/t

Au and 23.4 g/t Ag, 19.2 Mt of Indicated Mineral Resources with an average grade of 7.1 g/t Au and 24.7 g/t Ag, and 21.0 Mt of Inferred Mineral Resources with an average grade of 7.1 g/t Au and 20.6 g/t Ag (Table 7-15).

Notes:

[1] All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

[2] The information in this Report which relates to Mineral Resource is based on information compiled by Dr Anshun Xu and Mr Huaixiang Li, who are both full time employee of SRK Consulting China Ltd. Dr Xu is a fellow of AusIMM and Mr Li is a member of AIG. Both Dr Xu and Mr Li have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the *JORC Code*. Dr Xu and Mr Li consent to the reporting of this information in the form and context in which it appears.

[3] Mineral Resources are reported for 1m minimum thickness at a cut-off grade of 2.0 g/t AuEq (AuEq = Au g/t + Ag g/t × 0.010086, based on metal prices of 2700 USD/oz Au and 35 USD/oz Ag and recovery rates of 87.63% Au and 68.18% Ag) considering an underground extraction. Cut-off grades are based on an Au metal price of USD 2,700/oz and USD 35/oz Ag, and one troy ounce is equal to 31.1035 gram.

[4] Mining depletion includes CGL underground extraction as of 31 December 2024.

[5] Mineral Resources are not Ore Reserves and do not have demonstrated economic viability.

7.14 Grade Sensitivity Analysis

The Mineral Resources of the Buritica Project are sensitive to the selection of the reporting AuEq cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Table 7-16 and Table 7-17 at different cut-off grades. The reader is cautioned that the figures presented in these tables should not be misconstrued with a Mineral Resource statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 7-20 and Figure 7-21 presents this sensitivity as grade tonnage curves.

Table 7-16: Block Model Quantities and Grade Estimates[1], Veta Sur at Various Cut-off Grades

Cutoff	Tonnage	Grade	
AuEq (g/t)	(Mt)	Au (g/t)	Ag (g/t)
1.5	29.19	8.52	23.53
1.6	28.40	8.72	23.98
1.7	27.64	8.91	24.42
1.8	26.90	9.11	24.86
1.9	26.19	9.31	25.31

7.15 Exploration Potential and Recommendations

Current defined Au-Ag mineralisation distributes ranging between -145 m and 1,598 m ASL, with elevation difference of 1,743 m vertically. and exploration potential open along the dip extension, demonstrating enough space to find more Au-Ag Mineral Resources at depth. The San Antonio vein (YR5) is the largest vein with a length of 1,364 m along the strike and a plunge extension of 2,050 m, with an average true width of 0.66 m.

SRK considers the capping methods are reasonable and aligned with industry practices. However, extreme high-grade values should be carefully monitored during grade interpolation to prevent local artificial high-grade blocks.

Besides Au and Ag, other elements such of Zn, Cu, Pb, and S may become associated Mineral Resources. It is recommended to have a systematic assaying on all associated elements, and to update the current Mineral Resource estimate.

8 Ore Reserve Estimation

8.1 Technical Studies

Buritica Mine is a producing underground mine at the Effective Date. The latest feasibility study titled *Feasibility Study on the Evaluation of Buritica Gold Mine* (《武里蒂卡金矿估值可行性研究》, the "*FS 2025*") was prepared for the CGL Colombia by the Zijin Xiamen and dated in April 2025.

After the review of the *FS 2025*, SRK noted that it mainly summarised the operating status of Project but with little sustaining designs to the existing operations. There is no further mine plan in place to modify the mining capacity, mining method, development system, ventilation, dewatering and drainage.

There is a difference in terms of the Mineral Resource base between what is presented in the *FS 2025* and what is reviewed and accepted by SRK in April 2025. To simplify the matter, the assumptions of the *FS 2025* are modified in order to be compatible with the Mineral Resource model prepared by SRK and the current operating status.

8.2 Cut-off Grade

Grades of Au and Ag were interpolated in the Mineral Resource model ("**MRM**"). The AuEq was adopted to separate ore from waste by considering that that the gold will bring most revenues to the Buritica Project.

Assumptions to calculate cut-off grade are shown in Table 8-1. The calculated cut-off grade was rounded up to 2.4 g/t gold at the Effective Date to reflect the relative accuracy of Ore Reserve estimate.

The cut-off grade shown in Table 8-1 was calculated by SRK based on industry standard technical and economic assumptions. These assumptions were true at the time of calculation, but may change over time, so different cut-off grades can be produced. Sensitivity analysis of gold cut-off grade is shown in Figure 8-1, which indicates that the cut-off grade is mostly sensitive to the base price of gold and processing recovery rate.

Table 8-1: Assumptions of Cut-off Grade Estimation

Item	Unit	Value	Remarks
Price [1]			
Gold	USD/g	70.73	2,200 USD/oz

8.3 Ore Reserve Model

The latest MRM was completed by CGL Colombia, then was reviewed and accepted by SRK in April 2025. The MRM is a local estimate of gold and silver minerals for the mineralised zones and surrounding wall rocks. The mined-out areas as of 31 December 2024 has been depleted from the Mineral Resource model. The Mineral Resources are reported inclusive of the Ore Reserves.

Description of key fields in the MRM is shown in Table 8-2.

Table 8-2: Description of Key Fields in the Ore Reserve Model

Field	Unit	Description
Au	g/t	Gold grade.
Ag	g/t	Silver grade
Class	/	Mineral resource category. 1 = Measured. 2 = Indicated. 3 = Inferred. 4 = unknown. 5 = wastes.
Vein	/	The integer code of a mineralised zone.
Vein%	/	Volume percentage of a block in the vein.
SG	t/m^3	Bulk density.
VOID1	/	An integer code for illegal mined out area. 0 = not mined. 1 = mined out.
VOID2	/	An integer code for legal mined out area. 0 = not mined. 1 = mined out.

Sources: SRK

8.4 Mineable Analysis

Steps are shown below, which are common for both the sections Veta Sur and Yaragua:

- The grade of BMZ domains are too low to be economically viable. Therefore, these domains were excluded from the Ore Reserve estimate.
- A total of 28 and 24 domains were respectively interpreted for sections Veta Sur and Yaragua when estimating the Mineral Resources. All these domains are inclusive of Measured and Indicated Mineral Resources. These domains were initially included in the Ore Reserve estimate.
- Each mineralised zone was subdivided into stopes in 40 m long by 20 m high to match the planned level setting of development system and sublevel open stoping ("**SLOS**") with delayed backfill. An example of stope layout is shown in Figure 8-2.
- The mining recovery rate is set to 100% due to the setting of no pillar. A sublevel stope was subdivided into three parts to estimate mining dilution rates. The three parts are the heading for drilling, the slot cut for the blasting, and the remaining parts of a sublevel stope for the mainly extraction process.
  - The minimum size of a heading is 3.3 m wide by 4.0 m high in a three-centred arch shape. In the case of a mineralised zone's thickness is less than the width of a heading, the dilution rate is varied with the thickness of a mineralised zone. In the case of a mineralised zone's thickness is greater than the width of a heading, the dilution rate is zero.
  - The minimum size of a cut slot is 3.0 m long by 2.4 m wide in a rectangular shape. In the case of a mineralised zone's thickness is less than the width of a cut slot, the dilution rate is varied with the thickness of a mineralised zone. In the case of a mineralised zone's thickness is greater than the width of a cut slot, the dilution rate is zero.
  - The minimum mining width for the remaining parts of a sublevel stope is 1.8 m. In the case of a mineralised zone's thickness is less than the 1.8 m, the dilution rate is varied with the thickness of a mineralised zone. In the case of a mineralised zone's thickness is greater than the 1.8 m, the dilution rate is zero.
- Statistics of volume, tonnage and grades of gold and silver for each stope were reported in a spreadsheet for each sublevel stope. Just the Mineral Resources of Measured and Indicated category were treated as economic materials, while the Inferred Mineral Resource and wall rock were treated as waste material (i.e. zero grade)s. The mineable material in a stope were estimated to see whether the average grade is greater than the 2.4 g/t AuEq.
- The material in the economically viable sublevel stopes in Table 8-3 and Table 8-4 were considered to be appropriate to report Ore Reserves. It should be noted that the domains V01, V04, V18, V21, V22, Y01, Y03, Y13, Y15, Y16, Y18, Y19, Y21, Y22 and V24 are not economically viable.

Sources: SRK

Notes: Domains Y06, Y16, Y19, Y20 and Y22 are not economically viable.

It should be noted that the tonnage of Inferred Mineral Resources account for no more than 2.0% of total tonnage of mineable materials in Table 8-3 and Table 8-4. These Inferred Mineral Resources must be mined during the ore extraction process. They cannot be selectively excluded from the Ore Reserves.

8.5 Mining Loss and Dilution

The Ore Reserve was estimated by considering the following mining loss and dilution:

- Loss 1: the mineralised materials depleted in history;
- Loss 2: the mineralised materials lost due to mismatching of stope shape and the block model;
- Loss 3: the mineralised materials that cannot be accessed by the planned development system;
- Loss 4: the mineralised materials outside of the economically viable stopes;
- Dilution 1: the mineralised materials that are of low-grade below the 2.0 g/t gold, depleted and outside of mining licences;
- Dilution 2: the mineralised materials dilution due to mismatching of stope shape and the block model; and
- Dilution 3: the Inferred Mineral Resource material and wall rock inside the economically viable stopes.

A summary of loss and dilution are shown in Table 8-5 and Table 8-6 for sections Veta Sur and Yaragua, respectively.

Table 8-5: Summary of Mining Loss and Dilution for Section Veta Sur

Group	Material	Tonnage (kt)	Au Grade (g/t)	Ag Grade (g/t)	Au Metal (kg)	Ag Metal (kg)

Notes:

[1] The grade was set to zero when estimating Ore Reserves in "8.7 Ore Reserve Statement" to consider the intrinsic geological confidence level of Inferred Mineral Resources, which is lower than those of Measured and Indicated Mineral Resources, and the guidelines of the *JORC Code* and the *Listing Rules*.

8.6 Ore Reserve Classification

The Measured Mineral Resources and part of Inferred Mineral Resources and wall rocks in Table 8-3 and Table 8-4 are classified as the Proved Ore Reserves, while the Indicated Mineral Resources and the remainder of Inferred Mineral Resources and wall rocks in Table 8-3 and Table 8-4 are classified as the Probable Ore Reserves.

8.7 Ore Reserve Statement

The Ore Reserve statement is shown in Table 8-7.

Table 8-7: Ore Reserve Statement for the Buritica Mine as of 31 December 2024 by SRK Consulting China Ltd

	Cut-off Grade	Tonnes	Gold			Silver		
Category	(AuEq g/t)	(Mt)	Au (g/t)	Au (kg)	Au (koz)	Ag (g/t)	Ag (kg)	Ag (koz)
Veta Sur								
Proved	2.4	5.7	8.2	46,000	1,500	21.8	120,000	4,000
Probable	2.4	9.7	7.7	75,000	2,400	21.3	210,000	6,600
Sub-total	2.4	15.4	7.9	121,000	3,900	21.5	330,000	11,000
Yaragua								
Proved	2.4	1.3	5.8	7,500	240	21.6	28,000	890
Probable	2.4	5.8	4.5	26,000	840	16.6	97,000	3,100
Sub-total	2.4	7.1	4.7	33,500	1,080	17.5	125,000	4,000
Total								
Proved	2.4	7.0	7.6	53,500	1,740	21.1	148,000	4,890
Probable	2.4	15.5	6.5	101,000	3,240	19.8	307,000	9,700
Total	2.4	22.5	6.9	154,500	4,980	20.2	455,000	15,000

Notes:

1 The information in this Report which relates to Ore Reserve is based on information compiled by Mr Yonggang Wu, MAusIMM, and Dr Anshun Xu, FAusIMM, who are full time employees of SRK Consulting China Ltd. Both Dr Xu and Mr Wu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the *JORC Code*. Dr Xu and Mr Wu consents to the reporting of this information in the form and context in which it appears. AuEq = Au + 0.0095 * Ag + 0.5649 * Cu + 0.2202 * Zn.

2 Number was rounded to the second significant digit to reflect the uncertainties in estimate.

3 Total may not add due to rounding discrepancies

4 Mining dilution rate, including waste rock and Inferred Mineral Resources, are 42.0% and 42.1% for sections; Veta Sur and Yaragua, respectively. Mining loss rates are both 0.0%.

5 The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

8.8 Previously Ore Reserve Estimate

There is no previous Ore Reserve estimate publicly reported for the Buritica Mine.

8.9 Ore Reserve Potential

Most economically viable Measured Mineral

Resources and Indicated Mineral Resources have been converted to Ore Reserves. At the Effective Date, there is limited additional Ore Reserve potential, using the current applied modifying factors.

9 Mining Methods

9.1 Mine Operating Status

Small scale underground exploitation was started in 1990 by local communities. Large scale underground pre-production was commenced in November 2017 to construct a mine with a production capacity of 3,000 tpd run-of-mine (the "**RoM**"). Commissioning was started in April 2020 in the Buritica Plant. The mining capacity is now about 1,320 ktpa or 4,000 tpd.

The production records in years 2022 to 2024 are shown in Table 9-1. Overall, the ore tonnage is a little less than the nominal mining capacity. The mine is subdivided into two mining sections, namely the sections Yaragua and Veta Sur. Almost all Mineral Resources above 1,400 m ASL and 1,120 m ASL have been depleted to date for Yaragua and Veta Sur, respectively.

Table 9-1: Mining Production Records

Item	Unit	2022	2023	2024
Ore tonnage	kt	1,337	1,343	1,494
Driving	kt	464	485	537
Strip ratio[1]	t/t	0.35	0.36	0.36
Mining loss	%	3.19	3.65	3.02
Mining dilution	%	11.37	11.73	11.70

Sources: CGL Colombia

Notes:

[1] The strip ratio equals to stope development in tonnages divided by the extracted ore tonnages.

The mine has been developed in the hybrid of declines and adit. A schematic view of the existing development system is shown in Figure 9-1, and a description is explained:

- The existing development system has been driven down to 950 m ASL, and will be extended to exploit deeper identified Mineral Resources. The vertically spacing interval is either 15 m or 20 m between two sublevels.
- The ore is loaded to trackless trucks, either 20 t or 30 t loading capacity in a working stope with a load-haul-dump ("**LHD**"), then hauled to the crusher in the Buritica Plant via the Higabra Adit (also named Adit 1150).
- Yaragua and Veta Sur are independently developed, except for those connections at the Higabra Adit, Yaragua Decline and Decline 1150.
- Both the Higabra Adit and Decline 1150 are the main ways for hauling of ore to the surface.
- The Veta Sur Decline is the main ventilation access for the exhausted air.
- The Yaragua Decline is now the main way to access levels above 1,150 m ASL in Veta Sur, and will be also used for the ventilation of exhausted air.
