With the rapid development of the industry and the advent of the era of parity, the photovoltaic field has entered a stage of development that emphasizes safety and stability. At the same time, as land resources are increasingly scarce, the efficient use of land resources has also become the development direction of the industry. The Group is committed to promoting the healthy development of the photovoltaic industry, with the development direction of improving product performance, reducing the cost of electricity, and advancing grid parity.

Technological innovation has become the only way for domestic photovoltaic enterprises. In order to stabilize the Company market share in bracket products and maintain the market competitiveness of the products, Tonking New Energy, as an innovator and leader in the field of photovoltaic brackets, has developed a multi-point linkage bracket system with safety and stability as the breakthrough point through professional calculation software such as PVsyst, Ansys, Sap2000 and finite element analysis, while continuously improving its technology and advancement. Based on the original technology, the system has been technically upgraded in terms of the core transmission system, which has adopted a torque transmission system that can adapt to the complex environment and terrain instead of the original push rod transmission system. And it has carried out a modular design for the entire bracket system, with each module designed with a stable self-locking mechanism, which has further upgraded the safety performance of the bracket products.

In order to improve the utilization rate of land resources, the Group has sorted out and integrated various technical points of the bracket system through technical means such as wind tunnel tests, software simulations and theoretical calculations, and analyzed various forms of brackets in the industry. After in-depth analysis and comparison of original needs, a herringbone bracket system with high land utilization has been developed. The bracket products have broken the inherent design thinking and used structural advantages, which have not only greatly reduced the impact of external loads on the brackets, but also enabled comprehensive design based on the project's geography, climate and other factors to meet the project needs to the greatest extent.

With the continuous reduction of high-quality project resources, it has become a new objective demand to solve the box-type transformer platform of surface power station. Therefore, the Group integrated resources, aggregated superior strength, combined with customers' needs and suggestions, and developed a floating water tank transformer installation platform with double buoyancy protection on the premise of safety and stability. The floating water surface box-type transformer installation platform adopts a sealed floating box with solid filling to provide double buoyancy protection; by simulating the ship's stability, the platform structure is optimized to make it have the ability of resisting wind and wave capsizing.

With the advancement of photovoltaic projects, fresh water surface resources are rapidly consumed, and the sea area with better offshore conditions has become the new focus of surface photovoltaic projects. In quick response to the market demand, the Group has made great efforts to develop floating photovoltaic brackets on the sea surface, and adopted a combination of new stainless steel materials resistant to complex seawater environment and new material painting and anticorrosion technology to create floating photovoltaic brackets suitable for the sea surface environment.

According to the different needs of market customers, the Group has comprehensively upgraded the technology of existing bracket products, and developed a full series of tracking control systems with various installation modes, power intake modes and communication modes. At the same time, aiming at the fixed adjustable bracket system, a tool-based and intelligent detachable adjustment system is designed, which can further save the bracket cost and reduce the labor cost on operation and maintenance.

The proposal of the targets of hitting peak carbon dioxide emissions before 2030 and achieving carbon neutrality before 2060, forecasts the arrival of the new energy era with solar photovoltaic power generation as the main driving force. While constantly innovating, Tonking New Energy strives to bring the most visible benefits and the most decent services to users. The Company has been adhering to the core values of "with Tonking New Energy, we creating and sharing together" and the vision "becoming an enterprise with global influence in the field of light energy", and is committed to building green ecological intelligent photovoltaic power stations in the world, so that human beings can fully enjoy light energy!
