The five highest paid employees during the year ended 31 December 2021, and one month ended 31 January 2021 and 2022 each included one director, details of whose remuneration are set out in note 7 above. Details of the remuneration for the Relevant Periods of the remaining highest paid employees who are neither a director nor chief executive of the Company are as follows:

	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i> <i>(unaudited)</i>	<i>RMB'000</i>
Salaries, allowances and benefits in kind . . . . .	5,300	410	589
Share based compensation . . . . .	1,972	–	352
	<u>7,272</u>	<u>410</u>	<u>941</u>

The number of non-director and non-chief executive highest paid employees whose remuneration fell within the following bands is as follows:

	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
		<i>(unaudited)</i>	
Nil to 200,000 . . . . .	–	4	3
200,001 to 1,000,000 . . . . .	–	–	1
1,000,001 to 2,000,000 . . . . .	3	–	–
2,000,001 to 3,000,000 . . . . .	1	–	–
	<u>4</u>	<u>4</u>	<u>4</u>
	=	=	=

**10. OTHER INCOME AND GAINS**

	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i> <i>(unaudited)</i>	<i>RMB'000</i>
Gains on changes in fair value of derivative financial instruments . . . . .	20,946	9,239	–
Interest income . . . . .	1,090	175	62
Others . . . . .	276	105	33
	<u>22,312</u>	<u>9,519</u>	<u>95</u>

**11. OTHER EXPENSES**

	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i> <i>(unaudited)</i>	<i>RMB'000</i>
Foreign exchange losses, net . . . . .	3,777	819	1,534
Other . . . . .	635	10	13,819
	<u>4,412</u>	<u>829</u>	<u>15,353</u>

## 12. FINANCE COSTS

An analysis of finance costs is as follows:

	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i> <i>(unaudited)</i>	<i>RMB'000</i>
Interest on loans . . . . .	36,784	5,663	3,255
Interest on metal streaming arrangement . . . . .	16,662	1,412	1,313
Accretion of interest of provisions . . . . .	509	27	125
Interest on lease liabilities . . . . .	10,464	852	827
	<u>64,419</u>	<u>7,954</u>	<u>5,520</u>

## 13. PROFIT/(LOSS) BEFORE TAX

The Group's profit/loss before tax is arrived at after charging/(crediting):

	Notes	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
		<i>RMB'000</i>	<i>RMB'000</i> <i>(unaudited)</i>	<i>RMB'000</i>
Cost of raw materials and consumables . . . . .		271,534	25,974	24,018
Depreciation and amortisation . . . . .		200,286	17,857	12,899
Foreign exchange losses, net . . . . .	11	3,777	819	1,534
Gains on changes of derivative financial instruments of fair value . . . . .	10	(20,946)	(9,239)	–
Employee benefit expense . . . . .		228,779	19,467	19,914
Expense relating to short-term leases and leases with low-value assets . . . . .	18	1,519	127	141
Share based compensation . . . . .		22,871	1,920	14,403

## 14. INCOME TAX EXPENSES

The Group is subject to income tax on an entity basis on the profits arising in or derived from the tax jurisdictions in which the Group's subsidiaries are domiciled and operate.

List of main corporate income tax rates applicable to the Group's subsidiaries:

Name	Countries and regions	Rates
Golden Star (Wassa) Limited . . . . .	Ghana	35%
Golden Star Resources (UK) Ltd. . . . .	The United Kingdom	19%
Golden Star Exploration (Ghana) Limited . . . . .	Ghana	35%
Caystar Holdings . . . . .	Cayman	0%
Caystar Finance Co. . . . .	Cayman	0%
Caystar Management Holdings . . . . .	Cayman	0%
Wasford Holdings . . . . .	Cayman	0%

An analysis of the Group's provision for tax is as follows:

	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i> <i>(unaudited)</i>	<i>RMB'000</i>
Current . . . . .	185,597	14,753	6,910
Deferred . . . . . 20	<u>38,660</u>	<u>3,722</u>	<u>(64,064)</u>
Total tax charge . . . . .	<u>224,257</u>	<u>18,475</u>	<u>(57,154)</u>

A reconciliation of the tax expense applicable to profit/(loss) before tax at the statutory rates for jurisdictions in which the Company is domiciled to the tax expense at the effective tax rates, and a reconciliation of the applicable rates (i.e., the statutory tax rates) to the effective tax rates, are as follows:

	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i> <i>(unaudited)</i>	<i>RMB'000</i>
Profit/(loss) before tax . . . . .	<u>118,717</u>	<u>36,266</u>	<u>(410,577)</u>
Tax expense calculated at the statutory tax rate of 35% . . . . .	41,551	12,693	(143,702)
Effect of different tax rates of subsidiaries . . . . .	130,392	3,853	20,930
Non-deductible expenses . . . . .	11,513	346	9,509
Unrecognised deductible temporary differences and tax losses . . . . .	<u>40,801</u>	<u>1,583</u>	<u>56,109</u>
Tax charge at the effective rate . . . . .	<u>224,257</u>	<u>18,475</u>	<u>(57,154)</u>

#### 15. DIVIDENDS

No dividend has been declared or paid by the Company during the Relevant Periods.

#### 16. EARNINGS/(LOSS) PER SHARE ATTRIBUTABLE TO ORDINARY EQUITY HOLDERS OF THE PARENT

Earnings/(loss) per share information is not presented as its inclusion, for the purpose of this report, is not considered meaningful.

#### 17. PROPERTY, PLANT AND EQUIPMENT

	Buildings	Machinery	Mobile equipment	Electronic Equipment and others	Mineral assets	Construction in progress	Total

**18. LEASES**

The Group has lease contracts for various items of buildings and machinery and vehicles.

**(a) Right-of-use assets**

The carrying amounts of the Group's right-of-use assets and the movements are as follows:

	<b>Buildings</b>	<b>Machinery and Vehicles</b>	<b>Total</b>
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
Year ended 31 December 2021			
Cost at 1 January 2021, net of accumulated depreciation . . . . .	1,960	286	2,246
Additions . . . . .	–	215,786	215,786
Depreciation provided during the year . . . . .	(85)	(21,720)	(21,805)
Exchange differences . . . . .	(201)	(2,092)	(2,293)
<b>At 31 December 2021</b> . . . . .	<u>1,674</u>	<u>192,260</u>	<u>193,934</u>
At 31 December 2021			
Cost . . . . .	3,442	213,604	217,046
Accumulated depreciation . . . . .	(1,768)	(21,344)	(23,112)
<b>Net carrying amount</b> . . . . .	<u>1,674</u>	<u>192,260</u>	<u>193,934</u>

	Buildings	Machinery and Vehicles	Total
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
Year ended 31 January 2022			
Cost at 1 January 2022, net of accumulated depreciation . . . . .	1,674	192,260	193,934
Depreciation provided during the period . . . . .	(18)	(1,428)	(1,446)
Exchange differences . . . . .	(435)	(26)	(461)
At 31 January 2022 . . . . .	<u>1,221</u>	<u>190,806</u>	<u>192,027</u>
At 31 January 2022			
Cost . . . . .	3,442	213,604	217,046
Accumulated depreciation . . . . .	<u>(2,221)</u>	<u>(22,798)</u>	<u>(25,019)</u>
Net carrying amount . . . . .	<u>1,221</u>	<u>190,806</u>	<u>192,027</u>

**(b) Lease liabilities**

The carrying amount of lease liabilities and the movements are as follows:

	Year ended 31 December 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Carrying amount at 1 January . . . . .	9,442	209,193
New leases . . . . .	215,786	–
Accretion of interest recognised during the year/period . . . . .	10,464	827
Payments . . . . .	(24,124)	(2,814)
Exchange differences . . . . .	(2,375)	(70)
Carrying amount at end of the year/period . . . . .	<u>209,193</u>	<u>207,136</u>
Analysed into:		
Current portion . . . . .	<u>20,361</u>	<u>20,291</u>
Non-current portion . . . . .	<u>188,832</u>	<u>186,845</u>

The amounts recognised in profit or loss in relation to leases are as follows:

	Year ended 31 December 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Interest on lease liabilities . . . . .	10,464	827
Depreciation charge of right-of-use assets . . . . .	21,805	1,446
Expense relating to short-term leases and leases with low-value assets . . . . .	1,519	141

The maturity analysis of lease liabilities is disclosed in note 39 to the Historical Financial Information.

## 19. OTHER INTANGIBLE ASSETS

	Exploration and mining rights	Others	Total
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
<b>Cost</b>			
At 1 January 2021 . . . . .	706,890	–	706,890
Additions . . . . .	–	816	816
Exchange differences . . . . .	(16,164)	(10)	(16,174)
At 31 December 2021 . . . . .	690,726	806	691,532
Exchange differences . . . . .	(120)	–	(120)
At 31 January 2022 . . . . .	690,606	806	691,412
<b>Accumulated amortisation</b>			
At 1 January 2021 . . . . .	675,850	–	675,850
Charge for the year . . . . .	2,357	26	2,383
Exchange differences . . . . .	(15,482)	–	(15,482)

Charge for the period . . . . .	209	13	222
Exchange differences . . . . .	(114)	–	(114)
At 31 January 2022 . . . . .	662,820	39	662,859
<b>Net book value</b>			
At 1 January 2021 . . . . .	31,040	–	31,040
At 31 December 2021 . . . . .	28,001	780	28,781
At 31 January 2022 . . . . .	27,786	767	28,553

## 20. DEFERRED TAX

For presentation purposes, certain deferred tax assets and liabilities have been offset. The following is the analysis of the deferred tax balances for financial reporting purposes:

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Deferred tax assets . . . . .	–	66,828
Deferred tax liabilities . . . . .	236,487	239,044

Deferred tax assets have not been recognised in respect of the following items:

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Deductible temporary differences . . . . .	147,339	32,494
Deductible tax losses . . . . .	1,988,955	2,198,056
	2,136,294	2,230,550

The unrecognised income tax losses, which have fixed expiry dates, will expire in the following years:

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
31 December 2026 . . . . .	55,830	55,830
31 December 2027 . . . . .	84,665	84,665
31 December 2028 . . . . .	76,414	76,414
31 December 2029 . . . . .	115,868	115,868
31 December 2030 and beyond . . . . .	1,656,178	1,865,279
Total . . . . .	<u>1,988,955</u>	<u>2,198,056</u>

The movement in deferred tax assets and liabilities during the year, without taking into consideration the offsetting of balance within the same tax jurisdiction, is as follows:

Deferred tax assets	Environmental rehabilitation	Deductible tax losses	Total
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
At 1 January 2021 . . . . .	36,592	–	36,592
Charged to profit or loss . . . . .	(5,043)	–	(5,043)
Exchange differences . . . . .	(837)	–	(837)
At 31 December 2021 . . . . .	30,712	–	30,712
Credited to profit or loss . . . . .	7,373	66,663	74,036
Exchange differences . . . . .	(5)	165	160
At 31 January 2022 . . . . .	<u>38,080</u>	<u>66,828</u>	<u>104,908</u>

Deferred tax liabilities	Accelerated depreciation of property, plant and equipment	Total
	<i>RMB'000</i>	<i>RMB'000</i>
At 1 January 2021 . . . . .	239,505	239,505
Credited to profit or loss . . . . .	33,617	33,617
Exchange differences . . . . .	(5,923)	(5,923)
At 31 December 2021 . . . . .	267,199	267,199
Credited to profit or loss . . . . .	9,972	9,972
Exchange differences . . . . .	(47)	(47)
At 31 January 2022 . . . . .	<u>277,124</u>	<u>277,124</u>

## 21. OTHER NON-CURRENT ASSETS

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Funds for land restoration and environmental rehabilitation after mine closure . . . . .	<u>14,762</u>	<u>14,759</u>
	<u>14,762</u>	<u>14,759</u>

## 22. INVENTORIES

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Raw materials . . . . .	156,456	161,057
Work in progress . . . . .	19,832	34,436
Finished goods . . . . .	14,156	38
	<u>190,444</u>	<u>195,531</u>

## 23. TRADE RECEIVABLES

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Trade receivables . . . . .	1,589	6,500
Impairment . . . . .	—	—
	<u>1,589</u>	<u>6,500</u>

An ageing analysis of the trade receivables as at the end of each of the Relevant Periods, based on the invoice date, is as follows:

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Less than 1 year . . . . .	<u>1,589</u>	<u>6,500</u>
	<u>1,589</u>	<u>6,500</u>

The Group applies the simplified approach in calculating ECLs for trade receivables. Trade receivables relating to customers with known financial difficulties or significant doubt on collection are assessed individually for impairment allowance. The remaining trade receivables are grouped and collectively assessed for impairment allowance. Under the collective approach, an impairment analysis is performed at each reporting date using a provision matrix to measure expected credit losses. The provision rates are based on ageing of bills for groupings of various customer segments with similar loss patterns. The calculation reflects the probability-weighted outcome, the time value of money and reasonable and supportable information that is available at the reporting date about past events, current conditions and forecasts of future economic conditions.

## 24. PREPAYMENTS, OTHER RECEIVABLES AND OTHER ASSETS

## The Group

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Prepayments . . . . .	46,852	54,712
Deposits and other receivables . . . . .	40,844	37,678
Less: impairment of other receivables . . . . .	—	—

## 27. DERIVATIVE FINANCIAL LIABILITIES

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Non-hedge derivative contract liability:		
Maturing within one year . . . . .	188	–
Maturing in more than one year . . . . .	11,153	–
	<u>11,341</u>	<u>–</u>
	<u>11,341</u>	<u>–</u>

For the year ended 31 December 2021, in relation to these positions, the Company recognized an unrealized gain of \$0.6 million.

## 28. TRADE PAYABLES

Trade payables do not bear interest and are usually settled within 60 days.

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Trade payables . . . . .	146,316	172,763
	<u>146,316</u>	<u>172,763</u>
	<u>146,316</u>	<u>172,763</u>

An ageing analysis of trade and notes payables as at the end of each of the Relevant Periods is as follows:

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Less than 1 year . . . . .	146,316	172,763
	<u>146,316</u>	<u>172,763</u>
	<u>146,316</u>	<u>172,763</u>

## 29. CONTRACT LIABILITIES

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Short-term advances received from customers		
Metal Streaming Arrangement ( <i>Note</i> ) . . . . .	50,619	50,610
Long-term advances received from customers		
Metal Streaming Arrangement ( <i>Note</i> ) . . . . .	591,866	590,143
	<u>642,485</u>	<u>640,753</u>
	<u>642,485</u>	<u>640,753</u>

*Note:* In May 2015, one subsidiary of GSR, Caystar Finance Co. entered into a gold purchase and sale agreement (the “Metal Streaming Arrangement”) with RGLD Gold AG, in which GSR obtained USD145,000,000 from RGLD Gold AG, in exchange, GSR is required to deliver 10.5% of future gold production of its two subsidiaries at a cash purchase price of 20% of the spot gold price until 240,000 ounces of gold have been delivered (“Tier One”). Thereafter, 5.5% of the gold production will be delivered at a cash purchase price of 30% of the spot gold price (“Tier Two”). As at December 31, 2021 and 31 January 2022, the Company had delivered a total of 136,040 ounces and 137,130 ounces of gold to RGLD Gold AG since the inception of the Streaming Agreement.

The changes of contract liabilities — Metal Streaming Arrangement from 1 January 2021 to 31 January 2022 are as follows:

	<u>Gold delivery obligation</u>
Balance as at 1 January 2021 . . . . .	681,891
Revenue recognized from delivery of goods . . . . .	(44,236)
Financial expenses . . . . .	16,662
Exchange differences . . . . .	<u>(11,832)</u>
Balance as at 31 December 2021 . . . . .	<u>642,485</u>
Including: Contract liabilities due within one year . . . . .	50,619
Contract liabilities more than one year . . . . .	591,866
Balance as at 1 January 2022 . . . . .	642,485

Ending balance . . . . .	<u>109,145</u>	<u>108,800</u>
Current . . . . .	<u>6,797</u>	<u>6,796</u>
Non-current . . . . .	<u>102,348</u>	<u>102,004</u>

### 33. SHARE CAPITAL

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Issued and fully paid: . . . . .	6,906,459	6,906,459
	<u>6,906,459</u>	<u>6,906,459</u>

A summary of movements in the Company's share capital is as follows:

	Number of shares in issue	Share capital
		<i>RMB'000</i>
At 1 January 2021 . . . . .	111,313,595	6,810,170
Issue of shares . . . . .	4,220,213	89,356
Share-base payment . . . . .	289,477	6,933
At 31 December 2021 . . . . .	<u>115,823,285</u>	<u>6,906,459</u>
At 31 January 2022 . . . . .	<u>115,823,285</u>	<u>6,906,459</u>

On 28 October, 2020, the Company entered into a \$50 million “at-the-market” sales agreement. The use of proceeds from the “at-the-market” sales agreement is for discretionary growth capital at Wassa, exploration, general corporate purposes and working capital.

During the year ended 31 December, 2021, 4,220,213 new shares were issued under the “at-the-market” sales agreement. The net proceeds from shares issued under the “at-the-market” sales agreement of RMB92,656,912 for the period ended 31 December, 2021 is net of share issuance costs of RMB3,300,618.

During the year 2021, the number of share options exercised by was 98,238, the number of restricted shares under the deferred share units plan was 20,660, the number of performance and restricted shares under the 2017 Performance and restricted share units plan was nil, and the number of performance shares under the UK performance share units plan was 170,579. After deducting the tax impact, the Company’s common share capital increased by 289,478 shares, and the common share capital increased by RMB6,932,598.

#### 34. SHARE-BASED COMPENSATION

The Company operates Stock options, Deferred share units, Share appreciation rights, 2017 Performance and restricted share units and UK performance share units. Share-based compensation expenses recognized in the consolidated statements of profit or loss are as follows:

	Year ended 31 December 2021	One month ended 31 January 2021	One month ended 31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i> <i>(unaudited)</i>	<i>RMB'000</i>
Share-based compensation expense . . . . .	22,871	1,920	14,403

Following Chifeng Jilong Gold Mining Co. Ltd.’s acquisition of the Company on January 28, 2022, all Deferred share units, 2017 Performance and restricted share units, UK performance share units were deemed unconditionally vested and cancelled by Golden Star in consideration for a cash payment equal to USD3.91 per unit. In addition, each in-the-money stock option and Share appreciation rights was cancelled by Golden Star in consideration for a cash payment equal to the excess of USD3.91 and the exercise price per stock option/unit.

	<u>1,055,473</u>	<u>–</u>	<u>1,055,473</u>

## 39. FAIR VALUE AND FAIR VALUE HIERARCHY OF FINANCIAL INSTRUMENTS

Management has assessed that the fair values of cash and cash equivalents, trade receivables, trade payables, other payables and accruals, other non-current liabilities due within one year and financial assets included in prepayments, other receivables and other assets approximate to their carrying amounts largely due to the short-term maturities of these instruments.

The fair values of other non-current assets, long-term loans, lease liabilities and other non-current liabilities were determined by discounting the expected future cash flows using market rates of return currently available for other financial instruments with similar terms, credit risk and remaining maturities or incremental borrowing rate. The Group's own non-performance risk for long-term loans was assessed to be insignificant. The fair values of listed equity investments are based on quoted market prices.

The Group's finance department headed by the finance manager is responsible for determining the policies and procedures for the fair value measurement of financial instruments. The finance manager reports directly to the chief financial officer and the audit committee. At the end of each of the Relevant Periods, the finance department analyses the movements in the values of financial instruments and determines the major inputs applied in the valuation. The valuation is reviewed and approved by the chief financial officer.

**Fair value hierarchy**

The following tables illustrate the fair value measurement hierarchy of the Group's financial instruments:

Assets measured at fair value:

As at 31 December 2021	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
Financial assets at fair value through profit or loss				
Including: Equity investment . . . .	158	–	–	158
	<u>158</u>	<u>–</u>	<u>–</u>	<u>158</u>
	<u><u>158</u></u>	<u><u>–</u></u>	<u><u>–</u></u>	<u><u>158</u></u>
As at 31 January 2022	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
Financial assets at fair value through profit or loss				
Including: Equity investment . . . .	158	–	–	158
	<u>158</u>	<u>–</u>	<u>–</u>	<u>158</u>
	<u><u>158</u></u>	<u><u>–</u></u>	<u><u>–</u></u>	<u><u>158</u></u>

Liabilities measured at fair value:

As at 31 December 2021	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
Derivative financial liabilities				
Non-hedge derivative contract liability . . . . .	–	11,341	–	11,341
	–	–	–	–
	–	11,341	–	11,341
	=	=	=	=
As at 31 January 2022	Fair value measurement using			
	Quoted prices in active markets (Level 1)	Significant observable inputs (Level 2)	Significant unobservable inputs (Level 3)	Total
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
Derivative financial liabilities				
Non-hedge derivative contract liability . . . . .	–	–	–	–
	–	–	–	–
	–	–	–	–
	=	=	=	=

During the year ended 31 December 2021 and one month ended 31 January 2022, there were no transfers between Level 1 and Level 2, or transfers into or out of Level 3 for both financial assets and financial liabilities. The Group's policy is to recognise transfers between levels of the fair value hierarchy as at the end of each of the Relevant Periods in which they occur.

#### 40. FINANCIAL RISK MANAGEMENT OBJECTIVES AND POLICIES

The Group is exposed to various risks in relation to financial instruments in its daily operations, mainly, credit risk, liquidity risk and market risk (including interest rate risk, exchange rate risk, and commodity price risk). The Group's major financial instruments include cash and cash equivalents, financial assets at fair value through profit or loss, derivative financial assets, trade receivables, other non-current assets, long-term loans, financial liabilities at fair value through profit or loss, trade payables, other payables and accruals, etc. The Group also carries out derivatives transactions, mainly involving commodity futures contracts, aiming at managing the market risks of the Group's operation. The Group manages the market risks of derivatives based on the difference between metal price in the market and the target metal price pre-determined by the management. Risks in connection with such financial instruments, and the risk management strategies adopted by the Group to mitigate such risks are summarized as follows.

##### Interest rate risk

The Group's exposure to the risk of changes in market interest rates relates primarily to the Group's long term debt obligations with a floating interest rate.

Interest rate risk is the risk that the future cash flows of a financial instrument will fluctuate because of changes in market interest rates. As at 31 December 2021, the RCF with Macquarie Bank Limited incurs interest at 4.5% plus the applicable USD LIBOR rate per annum. Based on our current RMB529,656,000 outstanding balance, a 50 basis point change in the USD LIBOR rate would result in a change in interest expense of RMB2,869,000. As at 31 January 2022, there's no floating rate loan balances left. We have not entered into any agreements to hedge against unfavorable changes in interest rates but may do so in the future to actively manage our exposure to interest rate risk.

**Foreign currency risk**

The Group's primary operations are located in Ghana, with its main business transactions settled in US dollars. The foreign currency risks associated with the Group's identified foreign currency assets and liabilities, as well as future foreign currency transactions (where the pricing currencies for foreign currency assets, liabilities, and transactions are primarily Ghanaian cedis), are minimal.

The Group continuously monitors the scale of its foreign currency transactions, assets, and liabilities to minimize the foreign currency risks it faces.

**Credit risk**

Credit risk is the risk that one party to a financial instrument will cause a financial loss for the other party by failing to discharge an obligation. The Group's credit risk is primarily associated with liquid financial assets and derivatives.

The Group limits exposure to credit risk on liquid financial assets by holding our cash, cash equivalents, restricted cash and deposits at highly-rated financial institutions. In addition, the Group continuously monitors the balance of trade receivables to ensure that the Group is not exposed to significant bad debt risks. Risks associated with gold trade receivables is considered minimal as the Group sells gold to a credit-worthy buyers via an agent who settles promptly within two days of receipt of gold bullion.

Other financial assets of the Group include receivables and some derivatives. The credit risk on these financial assets arises from the default of counterparties, with a maximum exposure equal to the carrying amounts of these instruments.

**Liquidity risk**

The Group monitors its risk to a shortage of funds using a recurring liquidity planning tool. This tool considers both the maturity of its financial instruments and financial assets (e.g., trade receivables) and projected cash flows from operations.

The Group's objective is to maintain a balance between continuity of funding and flexibility through the use of loans and bank borrowings.

The maturity profile of the Group's financial liabilities as at the end of each of the Relevant Periods, based on the contractual undiscounted payments, is as follows:

	As at 31 December 2021			
	Within 1 year	1 to 5 years	Over 5 years	Total
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>
Derivative financial liabilities . . . . .	188	11,153	–	11,341

### Capital management

The primary objective of the Group's capital management is to ensure that it maintains strong credit rating and healthy capital ratios in order to support its business and maximise shareholders' value.

The Group regards total equity as its capital and manages its capital structure and makes adjustments to it, in light of changes in economic conditions. To maintain or adjust the capital structure, the Group may adjust the dividend payment to shareholders, return capital to shareholders or issue new shares. No changes were made in the objectives, policies and processes during the Relevant Periods.

During the Relevant Periods, the Group's strategy was to maintain the gearing ratio at a healthy level in order to monitor capital. The principal strategies adopted by the Group include, but are not limited to, reviewing future cash flow requirements and the ability to meet debt repayment schedules when they fall due, maintaining a reasonable level of available banking facilities and adjusting investment plans and financing plans, if necessary, to ensure that the Group has a reasonable level of capital to support its business. Gearing ratio is total liabilities divided by total assets.

The gearing ratios at the end of each of the Relevant Periods were as follows:

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Total assets . . . . .	2,183,463	2,123,050
Total liabilities . . . . .	2,012,997	2,282,581
Gearing ratio . . . . .	92%	108%

### 41. INVESTMENTS IN SUBSIDIARIES

	31 December 2021	31 January 2022
	<i>RMB'000</i>	<i>RMB'000</i>
Investments, at cost . . . . .	1,931,161	3,225,985
Less: impairment . . . . .	(543,226)	(543,133)
Net carrying amount . . . . .	1,387,935	2,682,852

Particulars of the subsidiaries, which are directly owned by the Company, are included in note 1 to the Historical Financial Information.

### 42. SUBSEQUENT FINANCIAL STATEMENTS

No audited financial statements have been prepared by the Group in respect of any period subsequent to 31 January 2022.

The information set out in this appendix does not form part of the Accountants' Report from Ernst & Young, Certified Public Accountants, Hong Kong, the reporting accountants of the Company, as set out in Appendix IA to this listing document, and is included herein for information only. The unaudited pro forma financial information should be read in conjunction with the section headed "Financial Information" and the "Accountants' Report" set out in Appendix IA to this Prospectus.

#### A. UNAUDITED PRO FORMA STATEMENT OF ADJUSTED CONSOLIDATED NET TANGIBLE ASSETS

The following unaudited pro forma statement of adjusted consolidated net tangible assets of our Group prepared in accordance with Rule 4.29 of the Listing Rules and with reference to Accounting Guideline ("AG") 7 *Preparation of Pro Forma Financial Information for Inclusion in Investment Circulars* issued by the HKICPA is set out below to illustrate the effect of the Global Offering on the consolidated net tangible assets of our Group attributable to owners of the Company as at 30 September 2024 as if it had taken place on 30 September 2024.

This unaudited pro forma statement of adjusted consolidated net tangible assets has been prepared for illustrative purposes only and because of its hypothetical nature, it may not give a true picture of the consolidated net tangible assets of our Group as at 30 September 2024 or at any future dates following the Global Offering. It is prepared based on the consolidated net tangible assets of our Group as at 30 September 2024 as set out in the Accountants' Report of our Group, the text of which is set out in Appendix IA to this Prospectus, and adjusted as described below. The unaudited pro forma statement of adjusted consolidated net tangible assets does not form part of the Accountants' Report.

	Consolidated net tangible assets attributable to owners of the Company as at 30 September 2024 <sup>(1)</sup>	Estimated net proceeds from the Global Offering <sup>(2)</sup>	Unaudited pro forma adjusted consolidated net tangible assets attributable to owners of the Company	Unaudited pro forma adjusted consolidated net tangible assets per Share <sup>(3)(4)(5)</sup>	
	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB'000</i>	<i>RMB</i>	<i>HK\$</i>
Based on the Offer Price of					
HK\$13.72 per Offer Share . . . .	1,032,075	2,467,840	3,499,915	1.87	2.03
Based on the Offer Price of					
HK\$15.83 per Offer Share . . . .	1,032,075	2,855,925	3,888,000	2.08	2.26

*Notes:*

- (1) The consolidated net tangible assets attributable to owners of the Company as at 30 September 2024 is extracted from the Accountants' Report set out in Appendix IA to this Prospectus, which is based on the consolidated net assets of our Group attributable to owners of the Company as at 30 September 2024 of approximately RMB7,116 million with an adjustment for the other intangible assets of RMB6,042 million and goodwill of RMB42 million.

- (2) The estimated net proceeds from the Global Offering are based on the Offer Price of HK\$13.72 per Offer Share or HK\$15.83 per Offer Share, being the low-end price or high-end price, after deduction of the estimated underwriting fees and other related expenses payable by the Company and takes no account of any Share which may be issued upon the exercise of the Over-allotment Option. The estimated net proceeds from the Global Offering are converted from Hong Kong dollars into RMB at an exchange rate of HK\$1.00 to RMB0.9221.
- (3) The unaudited pro forma adjusted consolidated net tangible assets per Share has been arrived at by dividing the unaudited pro forma adjusted consolidated net tangible assets attributable to owners of the Company by 1,869,563,378 Shares. The 1,869,563,378 Shares is calculated on the basis of a total of 205,652,000 Shares were in issue assuming that Global Offering has been completed as at 30 September 2024, excluding Shares which may be issued upon the exercise of the Over-allotment Options.

The Shares used in the calculation include the 15,182,600 Treasury Shares, as the Company is in the opinion of that these 15,182,600 shares have been granted to eligible participants of Phase III Employee Stock Ownership Plan in February 2025, and which will be vested and exercised with highly possibility. If excluding the 15,182,600 Treasury Shares, the unaudited pro forma adjusted consolidated net tangible assets attributable to owners of the Company per Share as at 30 September 2024, which is divided by 1,854,380,778 Shares, would then be adjusted to RMB1.89 (HKD2.05) or RMB2.10 (HKD2.28) based on the Offer Price of HKD13.72 per Share or HKD15.83 per Share, respectively.

- (4) The unaudited pro forma adjusted consolidated net tangible assets of the Group attributable to owners of the Company per Share is converted from RMB into Hong Kong dollars at the rate of HK\$1.00 to RMB0.9221. No representation is made that RMB amounts have been, could have been or could be converted to Hong Kong dollars, or vice versa at that rate or at any other rates or at all.
- (5) Except as disclosed above, no adjustment has been made to reflect any trading results or other transactions entered into by our Group subsequent to 30 September 2024.

## **B. INDEPENDENT REPORTING ACCOUNTANTS' ASSURANCE REPORT ON THE COMPILATION OF PRO FORMA FINANCIAL INFORMATION**

### **To the Directors of Chifeng Jilong Gold Mining Co., Ltd.**

We have completed our assurance engagement to report on the compilation of pro forma financial information of Chifeng Jilong Gold Mining Co., Ltd. (the "Company") and its subsidiaries (hereinafter collectively referred to as the "Group") by the directors of the Company (the "Directors") for illustrative purposes only. The pro forma financial information consists of the pro forma consolidated net tangible assets as at 30 September 2024, and related notes as set out on pages IIA-1 to IIA-2 of the Prospectus dated 28 February 2025 issued by the Company (the "Pro Forma Financial Information"). The applicable criteria on the basis of which the Directors have compiled the Pro Forma Financial Information are described in Appendix IIA to the Prospectus.

The Pro Forma Financial Information has been compiled by the Directors to illustrate the impact of the global offering of shares of the Company on the Group's financial position as at 30 September 2024 as if the transaction had taken place at 30 September 2024. As part of this process, information about the Group's financial position, has been extracted by the Directors from the Group's financial statements for the nine months ended 30 September 2024, on which an accountants' report has been published.

### **Directors' responsibility for the Pro Forma Financial Information**

The Directors are responsible for compiling the Pro Forma Financial Information in accordance with paragraph 4.29 of the Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited (the "Listing Rules") and with reference to Accounting Guideline ("AG") 7 *Preparation of Pro Forma Financial Information for Inclusion in Investment Circulars* issued by the Hong Kong Institute of Certified Public Accountants (the "HKICPA").

**Our independence and quality control**

We have complied with the independence and other ethical requirements of the *Code of Ethics for Professional Accountants* issued by the HKICPA, which is founded on fundamental principles of integrity, objectivity, professional competence and due care, confidentiality and professional behavior.

Our firm applies Hong Kong Standard on Quality Management 1 Quality Management for Firms that Perform Audits or Reviews of Financial Statements, or Other Assurance or Related Services Engagements which requires the firm to design, implement and operate a system of quality management including policies or procedures regarding compliance with ethical requirements, professional standards and applicable legal and regulatory requirements.

**Reporting accountants' responsibilities**

Our responsibility is to express an opinion, as required by paragraph 4.29(7) of the Listing Rules, on the Pro Forma Financial Information and to report our opinion to you. We do not accept any responsibility for any reports previously given by us on any financial information used in the compilation of the Pro Forma Financial Information beyond that owed to those to whom those reports were addressed by us at the dates of their issue.

We conducted our engagement in accordance with Hong Kong Standard on Assurance Engagements 3420 *Assurance Engagements to Report on the Compilation of Pro Forma Financial Information Included in a Prospectus* issued by the HKICPA. This standard requires that the reporting accountants plan and perform procedures to obtain reasonable assurance about whether the Directors have compiled the Pro Forma Financial Information in accordance with paragraph 4.29 of the Listing Rules and with reference to AG 7 issued by the HKICPA.

For purposes of this engagement, we are not responsible for updating or reissuing any reports or opinions on any historical financial information used in compiling the Pro Forma Financial Information, nor have we, in the course of this engagement, performed an audit or review of the financial information used in compiling the Pro Forma Financial Information.

The purpose of the Pro Forma Financial Information included in the Prospectus is solely to illustrate the impact of the global offering of shares of the Company on unadjusted financial information of the Group as if the transaction had been undertaken at an earlier date selected for purposes of the illustration. Accordingly, we do not provide any assurance that the actual outcome of the transaction would have been as presented.

A reasonable assurance engagement to report on whether the Pro Forma Financial Information has been properly compiled on the basis of the applicable criteria involves performing procedures to assess whether the applicable criteria used by the Directors in the compilation of the Pro Forma Financial Information provide a reasonable basis for presenting the significant effects directly attributable to the transaction, and to obtain sufficient appropriate evidence about whether:

- the related pro forma adjustments give appropriate effect to those criteria; and
- the Pro Forma Financial Information reflects the proper application of those adjustments to the unadjusted financial information.

The procedures selected depend on the reporting accountants' judgment, having regard to the reporting accountants' understanding of the nature of the Group, the transaction in respect of which the Pro Forma Financial Information has been compiled, and other relevant engagement circumstances.

The engagement also involves evaluating the overall presentation of the Pro Forma Financial Information.

We believe that the evidence we have obtained is sufficient and appropriate to provide a basis for our opinion.

### **Opinion**

In our opinion:

- (a) the Pro Forma Financial Information has been properly compiled on the basis stated;
- (b) such basis is consistent with the accounting policies of the Group; and
- (c) the adjustments are appropriate for the purpose of the Pro Forma Financial Information as disclosed pursuant to paragraph 4.29(1) of the Listing Rules.

**Ernst & Young**

28 February 2025

**(A) PROFIT ESTIMATE FOR THE YEAR ENDED DECEMBER 31, 2024****I. Bases**

Our Directors have prepared the estimate of the consolidated profit attributable to owners of the Company for the year ended December 31, 2024 (the “**Profit Estimate**”) based on the audited consolidated results of our Group for the nine months ended September 30, 2024 and the unaudited consolidated results of our Group for the three months ended December 31, 2024. The Profit Estimate has been prepared on the basis of the accounting policies consistent in all material aspects with those currently adopted by our Group as set out in the Accountant’s Report, the text of which is set out in Appendix IA to this prospectus.

**II. Profit estimate for the year ended December 31, 2024**

On the basis set out in Appendix IIB to this prospectus, and in the absence of unforeseen circumstances, we estimate that our consolidated profit attributable to owners of our Company for the year ended December 31, 2024 are as follows:

Estimated consolidated profit attributable to owners of our Company for the year ended December 31, 2024	Not less than RMB1,730.0 million (equivalent to approximately HK\$1,879.4 million)

28 February 2025

The Board of Directors  
Chifeng Jilong Gold Mining Co., Ltd.

CITIC Securities (Hong Kong) Limited

Dear Sirs,

**Chifeng Jilong Gold Mining Co., Ltd. (“the Company”)**

**Profit estimate for year ended 31 December 2024**

We refer to the estimate of the consolidated profit attributable to equity holders of the Company for the year ended 31 December 2024 (“the Profit Estimate”) set forth in the section headed “Financial Information” in the prospectus of the Company dated 28 February 2025 (“the Prospectus”).

**Directors’ responsibilities**

The Profit Estimate has been prepared by the directors of the Company based on the audited consolidated results of the Company and its subsidiaries (collectively referred to as “the Group”) for the nine months ended 30 September 2024, the unaudited consolidated results based on the management accounts of the Group for the remaining three months ended 31 December 2024.

The Company’s directors are solely responsible for the Profit Estimate.

**Our independence and quality management**

We have complied with the independence and other ethical requirements of the *Code of Ethics for Professional Accountants* issued by the Hong Kong Institute of Certified Public Accountants (“HKICPA”), which is founded on fundamental principles of integrity, objectivity, professional competence and due care, confidentiality and professional behavior.

Our firm applies Hong Kong Standard on Quality Management 1 *Quality Management for Firms that Perform Audits or Reviews of Financial Statements, or Other Assurance or Related Services Engagements*, which requires the firm to design, implement and operate a system of quality control including policies or procedures regarding compliance with ethical requirements, professional standards and applicable legal and regulatory requirements.

**Reporting accountants’ responsibilities**

Our responsibility is to express an opinion on the accounting policies and calculations of the Profit Estimate based on our procedures.

We conducted our engagement in accordance with Hong Kong Standard on Investment Circular Reporting Engagements 500 *Reporting on Profit Forecasts, Statements of Sufficiency of Working Capital and Statements of Indebtedness* and with reference to Hong Kong Standard on Assurance Engagements 3000 (Revised) *Assurance Engagements Other Than Audits or Reviews of Historical Financial Information* issued by the HKICPA. Those standards require that we plan and perform our work to obtain reasonable assurance as to whether, so far as the accounting policies and calculations are concerned, the Company’s directors have properly compiled the Profit Estimate in accordance with the bases adopted by the directors and as to whether the Profit Estimate is presented on a basis consistent in all material respects with the accounting policies normally adopted by the Group. Our work is substantially less in scope than an audit conducted in accordance with Hong Kong Standards on Auditing issued by the HKICPA. Accordingly, we do not express an audit opinion.

**Opinion**

In our opinion, so far as the accounting policies and calculations are concerned, the Profit Estimate has been properly compiled in accordance with the bases adopted by the directors as set out in Appendix IIB of the Prospectus and is presented on a basis consistent in all material respects with the accounting policies normally adopted by the Group as set out in our accountants’ report dated 28 February 2025, the text of which is set out in Appendix IA of the Prospectus.

Yours faithfully,

**Ernst & Young**

*Certified Public Accountants*

Hong Kong

**(C) LETTER FROM THE SPONSOR**

*The following is the text of a letter, prepared for the inclusion in this prospectus, received from CITIC Securities (Hong Kong) Limited, the Sponsor, in relation to our Group's profit estimate for the year ended December 31, 2024.*

CITIC Securities (Hong Kong) Limited  
18/F, One Pacific Place  
88 Queensway  
Hong Kong

February 28, 2025

**The Directors**  
**Chifeng Jilong Gold Mining Co., Ltd.**

Dear Sirs,

We refer to the estimate of consolidated profit attributable to owners of Chifeng Jilong Gold Mining Co., Ltd. (the “**Company**”) and its subsidiaries (collectively referred to as the “**Group**”) for the year ended December 31, 2024 (the “**Profit Estimate**”), for which the directors of the Company (the “**Directors**”) are solely responsible, as set out in the section headed “Financial Information — Profit estimate for the year ended December 31, 2024” in the prospectus of the Company dated February 28, 2025 (the “**Prospectus**”).

The Profit Estimate has been prepared by the Directors based on the audited consolidated results of the Group for the nine months ended September 30, 2024 and the unaudited consolidated results based on the management accounts of the Group for the three months ended December 31, 2024.

We have reviewed and discussed with the Directors the bases made by the Directors as set out in Appendix IIB to the Prospectus, upon which the Profit Estimate has been made. We have also considered and relied upon the letter dated February 28, 2025 addressed to the Directors and ourselves from the Company’s reporting accountant, Ernst & Young, regarding the accounting policies and calculations upon which the Profit Estimate has been made.

On the basis of the information comprising the Profit Estimate and on the basis of the accounting policies and calculations adopted by the Directors and reviewed by Ernst & Young, we are of the opinion that the Profit Estimate, for which the Directors are solely responsible, has been made after due and careful enquiry.

For and on behalf of  
**CITIC Securities (Hong Kong) Limited**

## Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

3D	three dimensional
%	percent
°	degree, either temperature or angle of inclination
°C	degree, Celsius temperature
'	Minute
"	Second
×	Multiply by
AISC	All-in sustaining cost
Au	element symbol for gold
asl	above sea level
AusIMM	Australasian Institute of Mining and Metallurgy
BFA	Bench face angles
CIM	the Canadian Institute of Mining, Metallurgy and Petroleum
cm	centimetre
cm <sup>3</sup>	cubic centimetre
RMB	Chinese Yuan currency
COG	Cut-off grade
CPR	Competent Person's Report
CRMs	Certified reference materials.
Cu	element symbol for copper
Designed Mining Capacity	The production capacity planned based on the mine's design, equipment, and technical parameters
E	East.
Exchange	The Stock Exchange of Hongkong Ltd., a wholly owned subsidiary of Hong Kong Exchanges and Clearing Ltd ("HKEx")
FEL	Front end loader
g	gram(s)
g/cm <sup>3</sup>	gram per cubic centimetre
g/t	gram per tonne
GOCOM	Gocom Engineering Design Company
Hanfeng Mining	Jilin Hanfeng Mining Technology Co, Ltd
HKEx	Hong Kong Exchanges of Clearing Ltd.
Huatai Mining	Chifeng Huatai Mining Co., Ltd.
Indicated Mineral Resource	that part of a resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a reasonable level of confidence. It is based on exploration,

	sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes. The locations are too widely or inappropriately spaced to confirm geological and/or grade continuity but are spaced closely enough for continuity to be assumed
Inferred Mineral Resource	that part of a resource for which tonnage, grade and mineral content can be estimated with a low level of confidence. It is inferred from geological evidence and assumed but not verified geological and/or grade continuity. It is based on information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings, and drill holes which may be limited or of uncertain quality and reliability
Inner Mongolia	Inner Mongolia Autonomous Region
IDW	Inverse Distance Weighting
IDW <sup>2</sup>	Inverse Distance Weighting Square
IPO	Initial Public Offering
Jilong Mining	Chifeng Jilong Mining Co., Ltd.
Jintai/Jintai Mining	Eryuan Jintai Mining Development Co., Ltd.
JORC Code	the 2012 edition of the Australasian code for reporting of exploration results, mineral resources and ore reserves prepared by the Joint Ore Reserves Committee of The Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Mineral Council of Australia
k	Kilo or thousand
kg	Kilogram, equivalent to 1,000 grams
km	Kilometre, equivalent to 1,000 metres
km <sup>2</sup>	square kilometre
kt	thousands tonnes
kV	Kilovolts, equivalent to 1,000 volts
kW	Kilowatt, equivalent to 1,000 watts
LoM	Life of mine
m	metre
m <sup>2</sup>	square metre
m <sup>3</sup>	cubic metre
Measured Mineral Resource	that part of a resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a high level of confidence. It is based on detailed and reliable exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
M	million
mm	millimetre
MLR	Ministry of Land and Resources
m asl	relevant elevation to sea level in meter
m/s	Meters per second.
Mt	million tonnes
Mtpa	million tonnes per year

MW	megawatt, equivalent to 1,000,000 watts
N	north, also the element symbol for nitrogen
NE	northeast
NEE	northeast east
NQ size core	47.6mm diameter
NW	northwest
NI43-101	the Canadian Securities Administrators' National Instrument
Oz.	troy ounce, equivalent to 31.1035 grams
Pb	element symbol for lead
Permitted mining capacity	permitted mining capacity means the amount of ore allowed to be mined annually as stated on the mining license
pH	a measure of the acidity or alkalinity of a solution, numerically equal to 7 for neutral solutions, increasing with increasing alkalinity and decreasing with increasing acidity. The pH scale commonly in use ranges from 0 to 14
ppb	part per billion
PPE	personal protective equipment
ppm	parts per million, equivalent to grams per tonne (g/t)
PQ size core	85mm diameter
P.R. China	the People's Republic of China
Probable Ore Reserve	the economically mineable part of an indicated, and in some circumstances measured, resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments, which may include feasibility studies, have been carried out, and include consideration of and modification by realistically assumed mining, metallurgical, economic, marketing, legal, environmental, social and government factors. These assessments demonstrate at the time of reporting that extraction could reasonably be justified
Proved Ore Reserve	the economically mineable part of a measured resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments, which may include feasibility studies, have been carried out, and include consideration of and modification by realistically assumed mining, metallurgical, economic, marketing, legal, environmental, social and government factors. These assessments demonstrate at the time of reporting that extraction could reasonably be justified. Also referred to as recoverable proved reserve
QA/QC	quality assurance and quality control
QPR	Qualified Person's Report
QTY	quantity
S	south, also the element symbol for sulphur
RPEEE	reasonable prospects for eventual economic extraction
SE	southeast
SG	Specific gravity.
SRK	SRK Consulting (China) Ltd.

t	tonne (metric ton)
Te	Element symbol for tellurium
TMM	Total material movement
Tpa or t/a	tonne per annum
Tpd or t/d	tonne per day
Valmin Code	the Code for Technical Assessment and Valuation of Mineral and Petroleum Assets and Securities for Independent Expert Reports
Yanbian	Yanbian Korean Autonomous Prefecture
Zn	element symbol for zinc

---

## Executive Summary

### Introduction

Chifeng Jilong Gold Mining Co., Ltd. (“**Chifeng Gold**”, the “**Company**” or the “**Client**”) commissioned SRK Consulting China Limited (“**SRK**”) to undertake an independent technical assessment of all relevant aspects of its five subsidiaries’ operating gold and polymetallic mines and associated processing and metallurgical plants (hereafter referred to as the “**Chifeng Gold Project**” or the “**Project**”) in Inner Mongolia Autonomous Region (“Inner Mongolia”), Liaoning, Jilin and Yunnan Provinces of the People’s Republic of China (“**China**”).

SRK understands that the independent technical assessment was required to be included in a Competent Person’s Report (“**CPR**”, the “**Report**” or this “**Report**”) to provide Chifeng Gold and potential equity investors as well as possible future shareholders with SRK’s technical opinions on the Project.

The Report was prepared following the requirements of the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the “**JORC Code**”) and in accordance with the rules governing the listing of securities on the Stock Exchange of Hong Kong Ltd (the “**Exchange**”) including the Chapter 18 requirements (Appendix B), Chapter 2.6 of the Guide for New Listing Applicants (Appendix C) and other relevant regulations of the Exchange and Hong Kong Exchanges and Clearing Ltd (“**HKEx**”).

This Report does not express an opinion as to the value of mineral or other assets involved.

### Summary of Principal Objectives

The principal objective of this Report is to provide the Company and potential equity investors and future shareholders of the Company with an independent technical assessment of the geology and exploration, Mineral Resources and Ore Reserve, Mining methods and processing and metallurgical technologies, technical and economic analysis, and environmental and social aspects of the reviewed Project base on all available technical data. The aim has been to produce a CPR suitable for inclusion in documents that the Company plans to use for the proposed listing on the Main Board of the Exchange.

### Outline of Work Program

The work program of this Project included:

- review of all relevant information and documents provided by Chifeng Gold as of 30 September 2024;
- site inspection to each of mines, processing and metallurgical plants and supporting facilities in December 2022, January and March 2023, and May and June 2024;
- data verification conducted by SRK in December 2022 and May 2024;
- discussion with the Company management and technical personnel;
- analysis of the data provided by the Company and generated by SRK;

- construct the geological solids, prepare data for statistical, established the block model, estimate grades, tabulate Mineral Resources;
- preparation of a draft report in accordance with the JORC Code and the rules governing the listing of securities on the Exchange including the Chapter 18 requirements and other relevant regulations of the Exchange and HKEx (the declaration date of Mineral Resources and Ore Reserves is 30 September 2024); and
- submission of the draft to Chifeng Gold and the related third parties for comments and finalization of the draft based on feedback.

## Results

### Overall

The reviewed Chifeng Gold Project includes four (4) gold projects and one (1) polymetallic project; they are owned and operated by Chifeng Gold's five subsidiaries.

Jilong Project is an operating gold project. It is wholly owned and operated by Chifeng Jilong Mining Co., Ltd. ("**Jilong Mining**"). The project consists of the Zhuanshanzi gold mine ("**Zhuanshanzi Mine**") and Zhuanshanzi #4#5#6#7 gold mine ("**#4#5#6#7 Mine**") and two processing and metallurgical plants (hereafter refer to as **#1 Jilong Plant** and **#2 Jilong Plant**, respectively). These properties are located in Aohanqi (敖汉旗), Inner Mongolia. The Zhuanshanzi mining license covers an area of 8.61 square kilometres ("km<sup>2</sup>") with a permitted mining capacity of 180,000tpa and Zhuanshanzi #4#5#6#7 mining license covers an area of 9.134km<sup>2</sup> with a permitted mining capacity of 60,000tpa.

Huatai Project is an operating gold project. It is wholly owned and operated by the Chifeng Huatai Mining Co., Ltd. ("**Huatai Mining**"). The Huatai project includes three mining licenses for #26, #3&7 gold veins and #5 mining area in Lianhuashan gold mine ("**Lianhuashan Mine**"), two mining licenses for #86 gold vein and #1 mining area in Honghuagou gold mine ("**Honghuagou Mine**") and one is for Pengjiagou gold mine ("**Pengjiagou Mine**"), and one processing and metallurgical plant (i.e., "**Huatai Plant**"). These properties are located in Songshan District (松山区), Chifeng City, Inner Mongolia. The six mining licenses cover a total area of 10.5173km<sup>2</sup>, with a total permitted mining capacity of 270,000tpa.

Wulong Project is an operating gold project. It is wholly owned and operated by Liaoning Wulong Gold Mining Co., Ltd. ("**Wulong Mining**"). The Wulong project consists of the Wulong gold mine ("**Wulong Mine**") and one processing plant (i.e., "**Wulong Plant**"), and two (2) exploration permits of the Ligunzi and Haojingou-Ligunzi gold deposits. These properties are located in Dandong, Liaoning Province. The mining license for Wulong Gold Mine covers an area of 6.2732km<sup>2</sup>, with a permitted mining capacity of 100,000tpa. The exploration permits cover a total area of 4.4912km<sup>2</sup>.

Jintai Project is an operating gold project. It is wholly owned and operated by Eryuan Jintai Mining Development Co., Ltd. ("**Jintai Mining**"). The project consists of the Xidengping gold mine ("**Xidengping Mine**") and associated the heap leaching plant ("**Heap Leaching Plant**"), located in Eryuan County (洱源县), Dali Bai Autonomous Prefecture (大理白族自治州), Yunnan Province. The Xidengping mining license covers an area of 1.0920 km<sup>2</sup>, with a permitted mining capacity of 140,000tpa. The exploration permit for Xidengping gold deposit covers a total area of 10.28km<sup>2</sup>.

Hanfeng Project is an operating polymetallic project. It is wholly owned and operated by Jilin

Jilin Hanfeng Mining Technology Co., Ltd. (“**Hanfeng Mining**”). The project consists of one Lishan lead-zinc polymetallic mine (“**Lishan Mine**”) and associated processing plant (“**Lishan Plant**”) and the Dongfeng molybdenum mine (“**Dongfeng Mine**”) and associated processing plant (“**Dongfeng Plant**”), located in Longjing City, Yanbian Korean Autonomous Prefecture (“**Yanbian**”), Jilin Province.

Details of the reviewed plants are shown in Table ES- 1 and Table ES- 2.

**Table ES- 1: Detailed Information on Chifeng Gold's Mines**

Company	Mines and Plants	Products	Permitted Mining Capacity (tpa)	2024Q1-Q3 Production (t)	Status
<b>Mining</b>					
<b>Chifeng Jilong Mining Co., Ltd</b>					
	Zone 1, Zone 2, Zone 3	Raw Ore	180,000	98,101	Production
	Zone 4, Zone 5, Zone 6, Zone 7	Raw Ore	60,000		No Production
<b>Chifeng Huatai Mining Co., Ltd</b>					
	#26 Vein, Lianhuashan Mine	Raw Ore	30,000		No Production
	#3&#7 Vein, Lianhuashan Mine	Raw Ore	60,000		No Production
	5 <sup>th</sup> Mining Area, Lianhuashan Mine	Raw Ore	60,000		No Production
	#86 Vein, Honghuagou Mine	Raw Ore	30,000		No Production
	1 <sup>st</sup> Mining Area, Honghuagou Mine	Raw Ore	60,000		No Production
	Pengjiagou Mine	Raw Ore	30,000		No Production
<b>Liaoning Wulong Gold Mining Co., Ltd</b>					
	Wulong Mine	Raw Ore	100,000	77,822	Production
<b>Eryuan Jintai Mining Development Co., Ltd</b>					
	Xidengping Mine	Raw Ore	140,000	360,295	Production
<b>Jilin Hanfeng Mining Technology Co, Ltd</b>					
	Lishan Mine	Raw Ore	600,000	358,362	Production <sup>2</sup>
	Dongfeng Mine <sup>1</sup>	Raw Ore	99,000	119,622	Production <sup>2</sup>

Notes:

<sup>1</sup> The Dongfeng Mine's production from Q1 to Q3 of 2024 exceeds the permitted annual production limit due to the inclusion of comprehensive utilization.

<sup>2</sup> Production at Hanfeng Mining (Lishan Mine and Dongfeng Mine) from Q1 to Q3 of 2024 is focused on the Upper Zone.

**Table ES- 2: Detailed Information on Chifeng Gold's Plants**

Company	Mines and Plants	Products	Designed Processing Capacity (tpa)	2024Q1-Q3 Production (kg)	Status
<b>Processing</b>					
<b>Chifeng Jilong Mining Co., Ltd</b>					
	#1 Jilong Plant <sup>1</sup>	Gold Ingot	120,000	791 kg	Production

<b>Eryuan Jintai Mining Development Co., Ltd</b>					
	Heap Leaching Plant	Au-loaded Carbon	140,000	196 kg	Production

Company	Mines and Plants	Products	Designed Processing Capacity (tpa)	2024Q1-Q3 Production (kg)	Status
<b>Jilin Hanfeng Mining Technology Co, Ltd<sup>2</sup></b>					
	Lishan Plant	Cu Concentrate		1,396 t	Production
		Pb Concentrate		2,686 t	Production
		Zn Concentrate		10,291 t	Production
	Dongfeng Plant	Mo Concentrate		442 t	Production

Notes:

<sup>1</sup> Huatai Mining's mines have no production in 2023 and first to third quarters of 2024.

<sup>2</sup> The plants treated materials were only from the upper part of the Lishan Mine and Dongfeng Mine, a small amount of the original residuals and remnants or original abandoned low-grade orebodies and very thin orebodies. The lower part of the Lishan Mine is under construction and the lower part of the Dongfeng Mine is under technical study.

The Jilong Mining, Huatai Mining, Wulong Mining, Jintai Mining and Hanfeng Mining's properties, including mines and plants can be easily accessed by national highways and/or provincial and local concrete-paved roads from their administrative jurisdictions or country towns.

The mines and plants are operated by the subsidiaries of Chifeng Gold, and are relatively well integrated and well managed operations. The operating standards at all sites generally follow the Chinese national mining industrial practices.

Based on a reasonable cut-off grade of gold, zinc or molybdenum, SRK has estimated the Mineral Resources and Ore Reserves for the Jilong, Huatai, Wulong, Jintai, and Hanfeng projects. As of 30 September 2024, the Mineral Resources and Ore Reserves of the Chifeng Gold Project, as per the JORC Code guidelines were list in Table ES- 3.

**Table ES- 3: Summary of Mineral Resources and Ore Reserves, as of 30 September 2024**

Category	Mineral Resources				Category	Ore Reserves

Source: SRK

Except for the Jintai Mining's Xidengping Mine, which is an open pit mine with surface mining via free dig – transportation – heap leaching methodology, all other operating mines are developed as underground mines. Details of mine development and mining methodology adopted by each project are summarised in Table ES- 4.

**Table ES- 4: Details of Mine Development and Mining Method Adopted by Each Project**

Project	Mine Development	Mining Methodology
<b>Jilong</b>	Zhuanshanzi Mine has three stand-alone development systems Access via shafts or adits	Resuing stoping method Mining dilution: 16-17%; Ore loss: 5%
<b>Huatai</b>	Six gold mines, each with an independent development system Access via adit & shaft or incline shaft	Modified resuing stoping method Mining dilution: 20%; Ore loss: 15%
<b>Wulong</b>	Wulong Mine has three stand-alone underground operating systems (Zones 2, 3 and 4), Zone 4 is further separated into the main shaft zone and the service shaft zone Access via shafts and blind shafts	Overhand cut and fill mining for relatively thicker orebodies; Resuing method for steep and thin orebodies Mining dilution: 15%; Ore loss: 8%
<b>Jintai</b>	Xidengping Mine is an open it mine	A conventional open pit mining methodology is used, comprising free dig & loading, and haulage by truck. Mining dilution: 5%; Ore loss: 5%
<b>Hanfeng</b>	Both Lishan and Dongfeng mines are underground mines Access via adits and blind shafts	Shrinkage delay fill; Slice & fill; Resuing; Sub-level open stope delay fill. Mining dilution: 22%; Ore loss: 20%

Source: SRK

Based on the production schedule for each project over its remaining life of mine (“LoM”), the capital expenditures (“Capex”) and the forecasted operating expenses (“Opex”) for each project, and the forecasted gold and zinc prices and other principal assumptions, SRK has estimated each project's net present values (“NPV”) using the discount cashflow method.

At a discount rate of 10%, the NPVs are Renminbi (“RMB”) 1,375 million (“mln”) for the Jilong Project, RMB278 mln for the Huatai Project, RMB602 mln for the Wulong Project, RMB32 mln for the Hanfeng Project and RMB106 mln for the Jintai Project.

The positive NPVs for each project indicate they are technically feasible and economically viable.

### Operational Licenses and Permits

SRK sighted key operational licenses and permits for Chifeng Gold's each subsidiary mining project, including business license; mining license, safety operational permits for mining, processing plant and TSF; water use permit; and site discharge permit, as shown in Table ES- 5.

**Table ES- 5: Key Operational Licenses and Permits for the Project, as of 30 September 2024**

Subsidiary/Project	Business License	Mining License	Safety Production Permit	Water Use Permit	Site Discharge Permit
Jilong Mining	Y	Y	Y <sup>1</sup>	Y	Y
Huatai Mining	Y	Y	Y <sup>2</sup>	Y	Y
Wulong Mining	Y	Y	Y	Y	Y
Jintai Mining	Y	Y	Y	Y	Y
Hanfeng Mining	Y	Y	Y	Y	Y

Note:

<sup>1</sup> The safety production permit for Jilong Mining's #3 Mining Section has expired (expiry date: 5 May 2024), which is to be renewed. Currently, the #3 Mining Section is undergoing technical renovation and is expected to complete by 27 November 2027, and application for a new safety production permit will be followed.

<sup>2</sup> The safety production permit for Huatai Mining's TSF has expired (expiry date: 23 September 2024), which is to be renewed. The application for its safety production permit is in process.

## Geology and Exploration

### Jilong Project

**Geology and Mineralogy:** Jilong project is situated within the Lianhuashan fault block, Inner Mongolia platform uplift of North China platform. The outcropped strata in the project region are the Palaeoarchean Wulashan Group, which is lithologically composed of plagioclase hornblende gneiss, hornblende plagioclase gneiss, biotite plagioclase hornblende gneiss and migmatite. Overlying rock sequences are the Early Cretaceous Jiufotang Formation, consisting of tuffaceous sandstone and shale, and the Quaternary sediments. The Palaeoarchean Wulashan Group is the main strata hosting the gold mineralisation.

Structures of the Zhuanshanzi gold deposit area are well developed, in which the Variscan period is dominated by folds and the Yanshan period is dominated by faults. The faults are divided into four (4) groups, nearly north-south, nearly east west, northwest and northeast trending faults. The northwest trending fault is the main structure hosting and controlling the gold mineralisation.

Intrusive rocks are developed at the project area, they include the Early Cretaceous granite, the Late Cretaceous granite porphyry, the Jurassic diorite and the Permian diorite. Dykes include Felsite porphyry, trachyte and quartz vein, which strike northwest, northeast or nearly east west.

The Zhuanshanzi gold deposit is a typical of medium-low temperature hydrothermal gold deposit. It consists of several gold Mineralisation zones. The wall rock alterations include pyritization,

carbonation, silicification, chloritization, sericitization, and epidote. The mineralisation type is mainly gold-bearing quartz vein type. Two (2) gold mineralised blocks/zones in the Zhuanshanzi gold deposit are included in this report, namely Zhuanshanzi #1#2#3&depth Block and Zhuanshanzi #4#5#6#&7 Block.

The ore minerals include native gold and silver, pyrite, sphalerite, galena, chalcopyrite magnetite, hematite, and chalcocite. Gangue minerals include quartz, sericite, chlorite, calcite, feldspar hornblende. Ore textures include crystalline texture, cataclastic texture, metasomatic residual texture, solid melt decomposition texture, structures include disseminated structure, vein-like structure, brecciated structure, banded structure.

**Exploration and Quality Control:** The regional geological and mineral exploration began in the 1980s and from then, several phases of exploration work were carried out. The resource and reserve verification of Zhuanshanzi Mineralisation block was undertaken from 2010, and the detailed exploration work of Zhuanshanzi #4-5-6-7 Block are conducted during the period from 2010 to 2012.

SRK was provided with the quality control (“QC”) data of Zhuanshanzi #1#2#3&depth Block and Zhuanshanzi #4#5#6#&7 Block. The sampling preparation, security, and analytical procedures of the two gold mineralised blocks are acceptable. The pass rates of both internal and external check samples are acceptable.

SRK has performed data verification by taking duplicate samples during or after site visit. A total of 154 verification samples were chosen randomly to ensure the representation and were sent to SGS Mineral Laboratory (“SGS Lab”), located in Tianjin China by commercial logistic company for analysis. A large bias was observed between original assay and check results, SRK has checked with both main laboratory and SGS staff, found that the sample preparation and sample assay methods are different, the sample preparation protocol which the original main laboratory adopted is relatively conservative, they use sieve to remove potential visible gold and then for assay to minimize the nugget effect, which may lead to a system lower bias compared to SGS Lab using screen fire assay method. SRK advised to send the samples to umpire laboratory, the Intertek laboratory for further verification. Based on the returned assay results, a general trend can be observed although larger biases are found in the higher-grade samples, which may be caused by the nugget effect of visible gold.

### **Huatai Project**

**Geology and Mineralogy:** Tectonically, the Huatai project is also situated within the Lianhuashan fault block, Inner Mongolia platform uplift of in the North China Platform. The outcropped strata are the Paleoproterozoic Wulashan Group, the Early Cretaceous Jiufotang Formation, and the Quaternary sediments. The Paleoproterozoic Wulashan Group is the main strata hosting the gold mineralisation.

Structures in the project region are well developed, and faults are divided into three (3) groups: north-northeast, northeast and northwest (or west-northwest) trending faults. The northwest trending faults are the main structures holding and controlling the gold mineralisation.

The Huatai project area is characterized by the extensive magmatic intrusion with multiple stages and complex types. Magmatic intrusive rocks include Jurassic granite-porphphy, Jurassic monzogranite and Alkali-Feldspar Granite.

The Huatai Project consists of several medium-low temperature hydrothermal gold deposits of Honghuagou-Lianhuashan gold mineralisation belt. The wall rock alteration is mainly silicified pyritization and sericitization, followed by chloritization and carbonation. The mineralisation type is mainly gold-bearing quartz vein type.

A total of 6 mineralised gold zones/blocks are included in this report; they are the #1 Mining Zone and #86 Vein in Honghuagou gold mine, the Pengjiagou Zone in Pengjiagou gold mine, and the #5 Mining Zone, #26 Vein and #3&#7 Vein in Lianhuashan gold mine. After many years of mining, resources of the mineralised bodies above both #1 Mining Zone of the Honghuagou gold mine and #5 Mining Zone of the Lianhuashan gold mine have been depleted.

The ore minerals include native gold, pyrite, chalcopyrite, magnetite, and minor of sphalerite, galena, chalcocite, bornite, limonite. Gangue minerals include quartz, sericite, chlorite, potassium feldspar, plagioclase, hornblende, calcite, kaolin. Ore textures include fragmented structure, metasomatic filling, fine idiomorphic crystal structure and metasomatic residue. Structures include massive structure, strip structure, disseminated structure, and breccia structure.

**Exploration and Quality Control:** The region geological and mineral exploration began in the 1950s and from then, several phases of exploration work were carried out. The resource and reserve verification work of Honghuagou-Lianhuashan Mineralisation zone was undertaken from 2011, the detailed exploration work on #1 Mining Zone and #86 Vein in Honghuagou gold mine, Pengjiagou gold mine, and #26 Vein and #3&#7 Vein in Lianhuashan gold mine are conducted during the period from 2011 to 2018.

SRK was provided with the QC data of the #1 Mining Zone, #86 Vein, #5 Mining Zone, #3&#7 Vein, and Pengjiagou. The sampling preparation, security, and analytical procedures of these mineralised gold zones/blocks are acceptable. The pass rates of both internal and external check samples are acceptable.

SRK's data verification of Huatai project is divided into two parts: one part is Honghuagou gold mine including #1 mining zone, #86 Vein and Pengjiagou Deposit; the other part is Lianhuashan gold mine including #3-7 Vein, #26 Vein and #5 mining zone.

A total of 105 verification samples, including 50 pulps from the Honghuagou Mine and 55 pulps from the Lianhuashan Mine, were chosen randomly to ensure the representation and were sent to SGS Lab for analysis. A large bias was observed between original assay and check results, SRK has checked with both main laboratory and SGS staff, found that the sample preparation and sample assay methods are different, the sample preparation protocol which the original main laboratory adopted is relatively conservative, they use sieve to remove potential visible gold and then for assay to minimize the nugget effect, which may lead to a system lower bias compared to SGS using screen fire assay method. SRK advised to send the samples to umpire laboratory, the Intertek laboratory for further verification. Based on the returned assay results, a general trend can be observed although larger biases are found in the higher-grade samples, which may be caused by the nugget effect of visible gold.

### **Wulong Project**

**Geology and Mineralogy:** The Wulong project is located in the eastern part of Liaoning province. The strata in the project region are mainly the Paleoproterozoic Liaohe Group layered metamorphic rocks, which are sporadically outcropped, mostly in the form of xenoliths remaining in the Mesozoic

granites and migmatites distributed over a large area. The stratigraphy of these metamorphic rocks is composed of Lieryu Formation, Gaojiayu Formation, Dashiqiao Formation, Gaixian Formation and Quaternary, from the oldest to the newest. Lithologically, these rocks consist of various types of marble, schist and granulite.

The structure in this area is mainly fault structure, and then fold structure. The Yalu River Fault is the largest fracture zone in the region, which is located at the edge of the region and extends in the northeast direction of 50°-60° and dips to southeast. It is formed by multiple extrusion and shearing. This fault zone controls the distribution of copper and gold deposits in the region.

The Wulong project area is characterized by intrusions of the Paleoproterozoic biotite granite and granitelle, early Yanshanian diorite, granodiorite, granite, and many dykes accompanying the intrusions. In the west of the Wulong gold mine, it is the Paleoproterozoic Hongshi biotite granite. In the south, it is the Yanshanian (i.e., 126 million years ago ("Ma")) Sanguliu granodiorite. And in the north, it is the Yanshanian (112Ma) Dingqishan biotite granite. They are closely related to gold Mineralisation.

The Project consists of Wulong gold mine, Ligunzi and Haojingou-Ligunzi gold deposits. The Wulong gold mine is a large quartz vein type gold deposit. The wall rock is biotite granitite and monzogranite and the mineralised body is strictly controlled by two groups of faults, the northwest trending and north-northeast trending faults, consisting of rhombic lattice structure. The mineralised body is within the nearly north-south, northwest trending compressive torsional faults and associated with fine-grained diorite. The mineralisation type is mainly gold-bearing quartz vein type, and the useful components are native gold and silver-gold.

A total of 449 gold-bearing geological bodies were found in the field, including 382 gold-bearing quartz veins and 67 silicified alteration zones. Due to years of mining, only 18 main mineralised bodies can be mined at present, which can be spatially divided into three ore-forming belts, namely A, B and C. The mineralised bodies in A and B belts are nearly extending north-south, which are controlled by granite porphyry veins. The shallow part of the mineralised body is far from the granite porphyry, the deep part is closer to the granite porphyry, even directly in the granite porphyry. The main mineralised body in A belt is the Vein #32, and the main mineralised bodies are the Veins #2-3, #2-6, #4-1 and #4-2 in B belt. The mineralised bodies in C belt trend northwest and the main body is Vein #163.

In the Ligunzi deposit, the mineralised body is vein-like, which is controlled by two group faults, the nearly north-south trending fault, and the northwest trending fault. Generally, the down-dip length is longer than the strike length. The single vein is stable and has the characteristic of balk reappear, compound of branch. They are right-sided oblique in the plane and slightly forefront in the section. The maximum extension of mineralised body along strike is up to 600m and the dip length is over 800m, with thickness varying generally from 0.2m to 3.0m.

In the Haojingou-Ligunzi deposit, a total of 20 gold mineralised bodies and 1 gold low-grade mineralised body are outlined in Haojingou-Ligunzi area. The strike of mineralised body is northwest, northeast, or nearly north south and dips to southwest, northwest, southeast, or west with dip angles from 45° to 80°. They are in the central or edge part of the diorite dyke, granite porphyry, and sometimes in migmatite. Generally, the mineralised bodies are 37-317m long and 20-225m downdip, with a width of 0.3-2.46m. The gold grade varies from 1.22 to 40.06g/t.

**Exploration and Quality Control:** The regional geological and mineral exploration began in the 1960s and from then, several phases of exploration work were carried out. The resource and reserve verification work of Wulong mine was undertaken in 2019, the detailed exploration work of Ligunzi deposit was completed in 2011, and the detailed exploration of Haojingou-Ligunzi deposit was conducted during the period from 2012 to 2017. Table ES- 6 summaries the engineering's details in the three explorations. There is no new geology exploration work since then.

**Table ES- 6: Summary of Trenching, Drilling and Tunnelling**

Item	Wulong	Ligunzi	Haojingou-Ligunzi
Trenching/m <sup>3</sup>	/	506	28,974.53
Surface Drilling/m	/	1,097.8	20,026
Underground Drilling/m	/	/	1,021.9
Tunnelling/m	3,650	308	1,619
Sampling	2,229	400	2,334

We have not received the QC data for Ligunzi deposit. However we believe the QC data from Haojingou mining area is somewhat representative of the data quality for Ligunzi. The sampling preparation, security, and analytical procedures of Wulong gold mine and Haojingou-Ligunzi deposit are acceptable, and the pass rates of both internal and external check samples are acceptable.

SRK's data verification of Wulong project is divided into two parts: one part is Wulong Mineralised zone; the other part is Haojingou-Ligunzi Mineralised zone including Haojingou Deposit and Ligunzi Deposit.

For Wulong Mineralised zone, SRK has performed data verification by taking duplicate samples during or after site visit. A total of 129 verification samples were chosen randomly to ensure the representation. The samples were sent to SGS Mineral Laboratory located in Tianjin China by commercial logistic company. The results show that most samples returned relative deviations between the original samples and SRK checks of within 20%, which are acceptable.

### Jintai Project

**Geology and Mineralogy:** The Jintai project is located in the eastern edge of the Changdu-Lanping-Simao block of the Qiangtang-Sanjiang orogenic system and is adjacent to east of the Diancang – Yuanlao Mountain metamorphic basement complex of the upper Yangtse paleo platform. Gold mineralisation in this area is closely related to Himalayan tectonics and alkaline magmatic activities.

The strata outcropped in the project area are Huanglongyan Formation and Shimenguan Formation of Paleoproterozoic, Jingxing Formation of Cretaceous, Yunlong Formation of Paleogene, Sanying Formation of Neogene and Quaternary. Bed 3 of Member 2 of Sanying Formation are the most important gold-bearing strata in the area.

The general structure in the area is a syncline fold. It is a subgrade of the Changyi compound syncline in the region. The core stratigraphy of the syncline is the Member 3 of Sanying Formation, and the orientation of the axis is about 325°. And it turns to about 350° at the West Mountain, and at about 700m northwest of Xidengping village, the direction turns to about 320°. The faults in the mine area are divided into two groups, one is northwest ("NW") trending fault, and the other is northeast ("NE")

trending fault. According to relationship between the two groups of faults, it can be determined that the NE trending fault is newer than the NW trending fault.

The magmatic rocks in the mining area are mainly in the form of dikes, including diabase dikes, diorite dikes and syenite porphyry dikes.

There are regional metamorphism and dynamic metamorphism in the mining area.

Wallrock alteration types mainly include silicification, pyrite, and kaolinization. There is no obvious zonation of the alteration. When a variety of hydrothermal alteration is superimposed, the gold grade is usually higher, and vice versa.

Two mineralised domains within the mining licence area and eight mineralised domains in the exploration permit area are found. The main domains are V1 in the mining licence area and V4, V10 in the exploration permit area.

The gold Mineralised domain V1 is distributed in the northwest of mining licence. It strikes to the northwest of about 325~340°, dips to the southwest of about 235~250° with a dip angle of 6~15°, has a known strike length of 307m and down-dip extension of 539m. The thickness of the domain ranges from 2.00 to 25.43m, with an average of 8.90m. The gold grades range from 0.31g/t to 1.84g/t, with an average of 0.90g/t.

The gold mineralised domain V4 is distributed in the Tangzibian zone, southern part of the exploration permit area. It strikes to the northwest of about 330°, dips to the southwest of 240° with a dip angle of 2~40°, has a known strike length of about 550m and the down-dip extensions range from 40m to 560m. The thickness of the domain V4 ranges from 0.79 m to 86.76 m, with an average of 22.87m. Most gold grades range from 0.2g/t to 10 g/t (the maximum is up to 113g/t), with an average of 1.69 g/t.

The mineralised domain V10 is distributed in the Xidengping zone, northern part of the exploration permit area. It strikes to the northwest of about 330°, dips to the southwest of about 245° with a dip angle of 2~12°, has a known strike length of 268m and the down-dip extensions range from 120~410m. The gold grade in V10 gold domain ranges from 0.11g/t to 25g/t, with an average grade of 2.69g/t.

**Exploration and Quality Control:** In the mining licence area, the geological exploration has gone through three phases, the general exploration was conducted by Shanghai Fuduo from 2007 to 2010, the exploration for the domain V2 was completed by Shanghai Fuduo from 2012 to 2013 and the Mineral Resources verification was carried out by Yunnan Yuanhao from 2020 to 2021.

In the exploration licence area, the geological exploration has included two phases, the exploration was conducted by Shanghai Fuduo from 2011 to 2017, and the advanced exploration was conducted by Yunnan Yuanhao from 2020 to 2022. The summary of the exploration workloads is listed in Table ES- 7

**Table ES- 7: Summary Characteristics of Trenching and Drilling**

Item	Mining area	Exploration area
Trenching/m <sup>3</sup>	8,158	3,781.6
Drilling/m	2,917.9	11,699.5

Item	Mining area	Exploration area
Sampling	1,650	9,629

Shanghai Fuduo and Yunnan Yuanhao conducted the sampling in each exploration phase respectively. Samples were prepared and analysed by the laboratory of Kunming Mineral Resources Supervision and Testing Centre, the 3<sup>rd</sup> Geological Brigade of Yunnan Bureau of Geology and Mineral Resources Exploration and Development according to the Specification of Testing Quality Management for Geological Laboratories (DZ/T0130-2006).

SRK considers that the sampling preparation, security and analytical procedures used by Jintai Mining for Xidengping deposit are acceptable. The pass rates of both internal and external check sample are acceptable, while CRMs, duplicate and blank sample were not used in the project.

### Hanfeng Project

**Geology and Mineralogy:** Tectonically, both the Lishan-Xinxing Mining Zone of Tianbaoshan Lead-Zinc Mine and the Dongfeng Mining Zone of Tianbaoshan Molybdenum-Zinc Mine are located at the junction of the western edge of Yanbian eugeosyncline fold belt and Dunhua uplift of Jilin Eugeosynclinal fold belt. The strata in this project area are mainly the Palaeozoic Ordovician - Permian marine carbonate and volcano-sedimentary rock series, and the Mesozoic Jurassic continental volcanoclastic rocks.

The magmatic activity in the project area is strong, mainly showing the Hercynian and Yanshan granites. The area is dominated by fault structures, showing three groups of faults in northwest, north-northwest and northeast directions.

**Lishan** - Lishan-Xinxing Mining Area contains three polymetallic deposits, namely Lishan, Xinxing and Lishan Plant-Houshan.

The Lishan deposit (below -92m asl) is a zinc-polymetallic deposit dominated by zinc ore, associated with some copper and lead. The orebodies are lenticular and lenticular like shaped forms. The main types of wall rock alteration are skarnization, biotitization, kaolinization, sericitization, silicification, chloritization, epidote, and pyritization. There are 128 zinc-lead-copper mineralised bodies.

The ore minerals are mainly sphalerite and galena, followed by chalcocite, pyrite, pyrrhotite, magnetite, chalcocite, bornite and arsenopyrite. Gangue minerals are diopside, garnet, epidote, quartz, calcite, sericite, actinolite and chlorite.

**Dongfeng** - Dongfeng lead-zinc Mineralisation belt/deposit is mainly located in the skarn Mineralisation zone formed at fault zone. The mineralised bodies have been identified in Dongfeng lead-zinc deposit, all of which belong to polymetallic Mineralisation type. The boundary between the mineralised body and the surrounding wall rock is unclear and shows a gradual transition relationship.

The molybdenum orebodies (below 250m asl) of the Dongfeng Mine are located within the contact zones of Early Jurassic diorite granite, Late Triassic quartz diorite, and fine-grained diorite, as well as along the surrounding fracture zones of the rock masses. These orebodies are controlled by the underlying concealed rock bodies and northwest-trending fault structures, resulting in two sets of northwest-trending molybdenum-bearing quartz vein zones with steep and gentle dips. The orebodies appear vein-like or kidney-shaped, arranged parallel to each other, sometimes exhibiting local contraction and dilation phenomena. The boundaries of the orebodies are defined by samples

collected near the rock walls. Through deep-level tunnels and drilling engineering control, a total of 178 molybdenum mineralised bodies of varying sizes have been discovered.

The ore minerals are mainly molybdenite, followed by a small amount of chalcopyrite, sphalerite, galena, arsenopyrite, and pyrite. Gangue minerals are quartz, diopside, chlorite, epidote, zeolite, calcite, feldspar, biotite.

**Exploration and Quality Control:** There is no new geology exploration work of Lishan lead-zinc mine (above-92m asl) and Dongfeng Mine (above 250m asl) since 2011, only the annual consumption and remaining reports of resources and reserves.

**Lishan** - The deep exploration of Lishan lead-zinc mine (below -92m asl) lasted nine years and one month from August 2011 to August 2020. The working methods include tunnel geological log, tunnel hydrogeology, engineering geology, environmental geology survey, tunnel exploration, and drilling. The basic sampling, infilled sampling, engineering test and experimental research are carried out. By 20 August 2020, a total of 46,351.96 m of drilling and 6,384.80 m of tunnel exploration has been completed.

Drill holes survey starts from 25m and then every 50m. Spot check of survey results are conducted regularly at each hole. The maximum deviation distance of borehole bending degree from the design coordinate is 7.78m. Hole depth is verified every 100m and before drilling completed. The exploration density of major Mineralised bodies is 20 ~ 135m × 8 ~ 126m. For other mineralised bodies, the exploration density is 22 ~ 114m × 14 ~ 136m.

The sampling preparation, security and analytical procedures used by Hanfeng Mining are acceptable. The pass rates of both internal and external check sample are acceptable, while CRMs samples, duplicates and blank samples were not used in the project.

SRK has performed data verification by taking duplicate samples during or after site visit. A total of 152 verification samples were chosen randomly to ensure the representation. The samples were sent to SGS Mineral Laboratory located in Tianjin China by commercial logistic company. The results show that most Cu and a majority of Lead and Zinc samples returned relative deviations between the original samples and SRK checks of within 20%, which are acceptable.

**Dongfeng** - The exploration programme of the Dongfeng Molybdenum Mine (below 250m ASL) was conducted from December 2013 to 28 February 2023, including geological mapping in tunnels, as well as tunnel exploration and drilling. The exploration depth ranged from 250 meters to -600 meters. A total of 3611.9m drilling and 3499.54m of tunnel exploration from 2013 to 2017 and totalling 82,101.16 m drilling and 1207.80m of tunnel exploration from 2019 to 2023 were conducted.

The sampling preparation, security and analytical procedures used by Hanfeng Mining are acceptable. The pass rates of both internal and external check sample are acceptable, while CRMs samples, duplicates and blank samples were not used in the project.

SRK has performed data verification by taking duplicate samples during or after site visit. A total of 189 verification samples were chosen randomly to ensure the representation. The samples were sent to SGS Mineral Laboratory located in Tianjin China by commercial logistic company. The results show that most Mo samples returned relative deviations between the original samples and SRK checks of within 20%, which are acceptable.

### Mineral Resources Estimation

The Mineral Resource Statement presented herein represents the Mineral Resource estimation prepared for the Chifeng Gold Project in accordance with the JORC Code. The effective date of the Mineral Resource statement is 30 September 2024.

The database used to estimate the **Jilong, Huatai and Wulong Projects** Mineral Resources was audited by SRK. Surpac 2020 software was used by SRK to create the grade solids, prepare assay data for analysis, construct the block model, estimate gold grades, and tabulate Mineral Resources. The final model was prepared by SRK using conventional 3D modelling and ID2 estimation techniques.

Table ES- 8 presents a summary of the estimated Mineral Resources in compliance with the JORC Code for the Jilong Project, as of 30 September 2024 and using a gold cut-off grade of 1.5g/t.

**Table ES- 8: Mineral Resource Statement for the Jilong Project, as of 30 September 2024**

Mineralised Zone/Block	Category	Tonnage (kt)	Grade (Au g/t)	Au Metal Contained (t)	Au Metal Contained (koz)

## Notes:

- <sup>1</sup> All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.
- <sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Huaixiang Li, Mr. Shaobo Dai and Dr. Yiefei Jia who are full time employees of SRK Consulting China, Mr. Li is a member of AIG and Dr. Jia is a Fellow of AusIMM (No. 230607) and a Chartered Professional in Geology (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Li and Dr. Jia consent to the reporting of this information in the form and context in which it appears.
- <sup>3</sup> The cut-off grad is 1.5 g/t Au.

The database used to estimate the **Jintai Project** Mineral Resources was audited by SRK. Surpac 2020 software was used by SRK to create the grade solids, prepare assay data for analysis, construct the block model, estimate gold grades, and tabulate Mineral Resources.

Table ES- 11 presents a summary of the estimated Mineral Resources in compliance with the JORC Code for the Jintai Project, as of 30 September 2024 and using a gold cut-off grade of 0.17g/t.

Table ES- 11: Mineral Resource Statement for the Jintai project, as of 30 September 2024

Mineralised Zone/Block	Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
Xidengping	Measured	3,363	1.68	5.64	181
	Indicated	4,604	1.02	4.70	151
	<b>Measured + Indicated</b>	<b>7,967</b>	<b>1.30</b>	<b>10.33</b>	<b>332</b>
	Inferred	2,699	1.29	3.49	112

## Notes:

- <sup>1</sup> All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

<sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Huaixiang Li, Mr. Shaobo Dai and Dr. Yiefei Jia who are full time employees of SRK Consulting China, Mr. Li is a member of AIG and Dr. Jia is a Fellow of AusIMM (No. 230607) and a Chartered Professional in Geology (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. They consent to the reporting of this information in the form and context in which it appears.

<sup>3</sup> The cut-off grade is 0.17g/t Au.

For the **Hanfeng Project**, both Lishan and Dongfeng mines have long mining history, and SRK has only been provided the detailed data of the deep area (below -92m asl) of Lishan Mine and deep area of Dongfeng Molybdenum Deposit (below 250m asl), which means that only the Mineral Resources in deep areas can be reported.

According to a conceptual calculation, SRK considers that the blocks not below a cut-off grade of 0.50% Zn show "reasonable prospects for eventual economic extraction" for the deep area of Lishan underground mine and can be reported as Mineral Resource, and that the blocks not below a cut-off grade of 0.03% Mo show "reasonable prospects for eventual economic extraction" for the deep area of Dongfeng underground mine and can be reported as Mineral Resource.

As of 30 September 2024, of the estimated Mineral Resources of Lisha Mine in compliance with the JORC Code for the Hanfeng Project are shown in Table ES- 12.

**Table ES- 12: Mineral Resource Statement for the Lishan Mine, as of 30 September 2024**

Mineralised Zone/Block	Category	Tonnage (kt)	Zn Grade (%)	Zn Metal Contained (kt)	Cu Grade (%)	Cu Metal Contained (kt)	Pb Grade (%)	Pb Metal Contained (kt)
Lishan	Measured	752	2.36	18	0.01	0	0.12	1
	Indicated	8,583	2.66	229	0.07	6	0.12	10

	Measured + Indicated	28,314	0.12	34
	Inferred	37,053	0.12	45

Notes:

- <sup>1</sup> All figures are rounded to reflect the relative accuracy of the estimate.
- <sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Ms. Yanfang (Bonnie) Zhao and Dr. Yiefei Jia who are both full time employees of SRK Consulting China, Ms. Zhao is a member of AusIMM and Dr. Jia is a Fellow of AusIMM (No. 230607) and a Chartered Professional in Geology (CP Geo). Dr. Jia and Ms. Zhao have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms. Zhao and Dr. Jia consent to the reporting of this information in the form and context in which it appears.
- <sup>3</sup> Within mining license area and below 250m asl.

### Ore Reserves Estimation

SRK estimated the Ore Reserves for the Chifeng Gold's mines in accordance with the JORC Code guidelines and based on each mine's mining recovery rate and dilution rate as well as other modifying factors cited either from the historical mining records, the prefeasibility or feasibility study, and/ or mine designs. The following table summarises the estimated Ore Reserves of the Jilong, Huatai, Wulong, Jintai and Hanfeng projects, with an effective date 30 September 2024.

As of 30 September 2024, the total Ore Reserve for the **Jilong Project** is estimated at 919 kt at an average grade of 8.73g/t Au, containing 8.02 t of gold. This includes the Proved Ore Reserve estimated at 510 kt at an average grade of 9.81g/t Au, containing 5.00 t of gold, and the Probable Ore Reserve estimated at 409 kt at an average grade of 7.38g/t Au, containing 3.02 t of gold (see Table ES- 14).

**Table ES- 14: Ore Reserve Statement for the Jilong Project, as of 30 September 2024**

Reserve Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
Proved	510	9.81	5.00	161
Probable	409	7.38	3.02	97
<b>Total</b>	<b>919</b>	<b>8.73</b>	<b>8.02</b>	<b>258</b>

Sources: SRK

Notes:

- <sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Ms. Tzuhsuan Chuang, MAusIMM and Dr. Yiefei Jia, FAusIMM (CP Geo), who are full time employees of SRK Consulting China Ltd. Both Ms. Chuang and Dr. Jia have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Ms. Chuang and Dr. Jia consent to the reporting of this information in the form and context in which it appears;
- <sup>2</sup> The Ore Reserves Statement is based on the depletion data provided by Jilong Mine for the six-month period, 1 April 2024 to 30 September 2024. The reported Jilong Mine data may differ from that reported by SRK, due the updated Block model now used by Jilong Mine for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the Jilong Mine provided data as the basis for this statement.
- <sup>3</sup> Ore Reserve are estimated at a cut-off grade of 2.76g/t Au; and
- <sup>4</sup> Number was rounded to the second significant digit, and total may not add due to rounding discrepancies.

As of 30 September 2024, the **Huatai Project** contains a total Ore Reserves of 1,694kt at an average grade of 6.20g/t Au, containing 10.50t of gold, which includes the Proved Ore Reserves of 226kt at

an average grade of 5.21g/t Au, containing 1.18t of gold, and the Probable Ore Reserves of 1,468kt at an average grade of 6.35g/t Au, containing 9.32t of gold (see Table ES- 15).

**Table ES- 15: Huatai Project Underground Ore Reserve Statement, as of 30 September 2024**

Reserve Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)

## Mining Assessment

### Jilong Project

Zhuanshanzi Mine currently has three stand-alone underground operating systems: Zone 1, Zone 2 and Zone 3. Zone 1 is located on the southwest side of the mine, including No. 27 area and Yangpo area. Zone 2 is located on the north side of Zone 1. Zone 3 is located on the east side of Zone 1. The Zhuanshanzi Mine intends to increase its production capacity by developing peripheral Zones 4, 5, 6, and 7. This expansion is projected to commence operations in 2027, with an expected production rate of 60 thousand tonnes per annum ("ktpa"). The LoM is expected to be 9 years.

All of these zones are utilizing an underground mining method, accessing the orebodies via shafts or adits.

The resuing mining method is used in the Zhuanshanzi Mine, where the orebodies are very steep and thin with solid surrounding rocks. This mining method enables the separation of the ore and surrounding rocks, with the ore being transported and extracted while the waste is kept in the stope for backfilling. The mining dilution is 16-17% and the ore loss is 5%.

The stope's length is 50m and its height is 40-45m. Wooden hopper is used, and the ore is transported manually. The distance between hoppers is 10m, the sill pillar is 3m, and no other pillar is left. There are raises beside the stope, and the section of the raise is 2.0m x 1.5m. The drift is about 2.4m x 2.5m depending on the ore body.

### Huatai Project

Huatai Project includes six (6) gold mines, each with an independent development system. They are all utilizing or planning conventional underground mining methodologies, access via adit & shaft or incline shaft, resuing stoping method, railway ore car transportation. Huatai Project operation and plan status are described as follows:

- Pengjiagou Mine: this mine has planned to modify the mining system to achieve the capacity of 40ktpa from the previous 30ktpa. The client conducted a preliminary design on this mine, decided to commend its expansion in 2028.
- Honghuagou #86 Vein: this mine has planned to modify the mining system to achieve the capacity of 40ktpa from the previous 30ktpa. The client decided to commend its production in 2028.
- Honghuagou #1 Mining Zone: this mine contained 4 sub-zones with their own mining license, which are #1 vein, #3 sub-zone, #1 sub-zone, and Longtoushan. The mine has planned to modify mining system to achieve the capacity of 60ktpa from the previous 38.9ktpa. The client conducted a preliminary design on these sub-zones, decided to commend its production in 2027.
- Lianhuashan #26 Vein: this mine has planned to modify mining system to achieve the capacity of 40ktpa from the previous 30ktpa. The client conducted a preliminary design on this mine, decided to commend its expansion in 2028.
- Lianhuashan #3&#7 Vein: this mine has planned to modify mining system to achieve the capacity of 60ktpa from the previous 30ktpa. The client conducted a scoping studies and preliminary design on this mine, decided to commend its production in 2027.
- Lianhuashan #5 Mining Zone: this mine has decided to modify mining system to achieve the capacity of 60ktpa from the previous 30ktpa. The client conducted a preliminary design on this mine, decided to commend its production in 2026.

Additionally, Huatai Mine has planned to integrate Lianhuashan #5 Mining Zone and Lianhuashan #26 Vein to a capacity of 100ktpa, as well as the integration of Honghuagou #1 Mining Zone and Pengjiagou Mine to a capacity of 100 ktpa. The expansion is currently in progress, with a defined plan and budget in place.

A modified resuing stoping method is adopted by Huatai Mining. The stoping method is suitable for the veins horizontal thickness being less than 0.8m. The modifying point from traditional resuing is the rock sourced out of stope partly, not all from surrounding rock mined down.

The stope length is about 50 to 100m and the height is the same as level interval. There are no crown pillar or rib pillar planned, and the sill pillar is proposed for draw point installation and separation stopes. The square-set raise for manway is planned at each end of stope. The draw points interval is about 10m from centre to centre.

The average mining dilution rate is 20% and the ore loss is 15%. The LoM is expected to be 28 years.

### **Wulong Project**

Wulong Mine currently has three stand-alone underground operating systems: Zone 2, Zone 3, and Zone 4. Zone 4 is further separated into the main shaft zone and the service shaft zone, and the latter is also known as Zone 5.

The development system is shafts and blind shafts. Shafts are being used for transporting ore and waste and personnel. Development to access these stope blocks is designed years in advance.

For steep and thin orebody with solid surrounding wall rocks, the resuing method is adopted to separate the ore and surrounding rocks, with the ore being transported and extracted while the waste is kept in the stope for backfilling.

For relatively thicker orebody, the overhand cut and fill mining is adopted. The cut and fill mining allows selective mining, separate recovery of high-grade portions, and stope retention of low-grade rock. Excavated voids are backfilled with waste rock once the stope has been mined out. This method provides a relatively inexpensive and convenient way to advance a working platform in order to keep access to the ore for drilling, blasting, and mucking.

The average mining dilution rate is 15% and the ore loss is 8%. The LoM is estimated to be 12 years with an expected production rate of 100ktpa.

### **Jintai Project**

Jintai Mining obtains one mining license and one exploration license for the Xidengping Mine. Based on the geological characteristics, a total of nine (9) mineralised bodies, named V1, V2 (V2-1 and V2-2), V4, V5, V6, V7, V8, V9 and V10, were delineated, but only V1, V2, V4 and V10 contain the Measured and Indicated Mineral Resources.

Several technical studies on the mineralised bodies V1 and V2 within the mining license have been conducted since they obtained the mining license in 2012. Therefore, only V1 and V2 have the Ore Reserves. SRK has received and reviewed the following studies:

- Preliminary Design for Xidengping Mine with a capacity of 140ktpa conducted by JinJian Engineering Design Co., Ltd (“**GOCOM**”) in February 2022 (hereafter referred to as “**FS 2022**”), and
- Mineral Resources Development and Utilisation Scheme for Xidengping Mine with a capacity of 650ktpa conducted by Yunnan Shangli Mining Co., Ltd. (“**Shangli**”) in March 2024 (hereafter referred to as “**FS 2024**”).

They initialled mine and plant construction for the V1 and V2 at the beginning of 2023. The designed mining and processing capacity is 140ktpa. The mine is proposed for surface mining via free dig – transportation – heap leaching methodology. The LoM is about 12 years including one-year mine construction period, as the FS 2022 proposed.

The average mining dilution rate is 5% and the ore loss is 5%.

After review FS 2022 and discussed with mine management, SRK opines that the mine is well studied, and the mining method is technically reasonable and feasible. The risk on mining operation is low, as the method employed is common and practical. However, the pit optimization along with pit design, as well as cut-off grade definition could be updated when considering the JORC Code estimates.

Also, the Client is applying for another one mining licence for the exploitation of V4 and V10 with a capacity of 650ktpa based on the FS 2024 and the application is in process.

### **Hanfeng Project**

Hanfeng Mining operate 2 established mines, the Lishan Mine and Dongfeng Mine. They are both utilizing conventional underground mining methodologies, access via adit & shaft, shrinkage stoping method, railway ore car transportation. There are 2 processing plants which located in Lishan and Dongfeng, respectively. The Lishan Plant deals with zinc, lead, and copper resources and the Dongfeng Plant processes molybdenum feeds. The infrastructure at both mines is established and the risk of shortage of power, water, fuel and other materials is low.

The operating status of the Hanfeng Project is described as followings:

#### **Lishan Mine**

- Lishan Mine is divided into 2 parts in vertical.
- The upper part which is above -92m asl, is operated at a nominated capacity of 165 ktpa run of mine ("ROM") containing zinc, lead, and copper elements, feeding the Lishan plant. The upper part is currently in operation to mine the historically residual inventory. The upper part is not within the scope of the Ore Reserve estimation.
- The lower part, which is from -92m asl to -700m asl, is planned to construct in 2 stages.
- Stage I is targeting the Mineral Resource from -92m asl down to -373m asl. Stage I is proposed at a capacity of 435ktpa, operating with upper part together to achieve 600ktpa capacity. The construction of Stage I is currently on progress (as of September 2024). The main shaft has been developed but not equipped due to ventilation shaft and return air drift is on development.
- Stage II will focus on the Mineral Resource under -373m asl, downwards to -700m asl. The Client aims to achieve 600ktpa capacity. However, the technical studies and/or design on this stage has not initiated yet.

#### **Dongfeng Mine**

- Dongfeng Mine is also divided into two parts in vertical, and the intersection elevation is 250m asl.
- The upper part is on operating at the south section and north section
- South section contains the mineralisation veins of zinc, lead, and copper. The mined ore of this section is trucked to the Lishan Plant for treatment. It is expected that this section resource would maintain a mining plan of 60ktpa for the next three years.
- North section contains veins of moly element. This section was on care and maintenance before 2022. In 2022 this section was re-operated at 6 ktpa ROM. The Dongfeng Plant was also re-

operated to treat this 6 ktpa ROM and 9k ore from surface stockpile, which was stored for nearly 10 years.

- The lower part is for the North section which is moly resources. The lower part Mineral Resources have been estimated but have not converted them into Ore Reserves yet due to a lack of a technical study currently.

Based on the historical mining production records in 2021, the mining dilution rate of 22% and ore loss of 20% on average, which is considered the comparison of resource depletion against run of mine.

Based on the remaining Ore Reserves of the Lishan Mine, the LoM is estimated to be 8 years. The peak mining rate is 450ktpa.

## Metallurgical and Processing Assessment

### Jilong Metallurgical Plant

Jilin Institute of Geological Sciences conducted a laboratory processing testwork on the Zhuanshanzi ore in 2018.

The gold grade of the composite sample is 10.20g/t and the silver grade is 45.32g/t. After grinding to -0.074 mm accounting for 70% ( $P_{70}=74\mu\text{m}$ ), the sample is subjected to flotation tests. The test flowsheet is a closed circuit of "one roughing, two cleanings and two scavengings" to obtain gold concentrate. The final concentrate has a gold grade of 147.78g/t and a gold recovery of 95.05%, and a silver grade of 554.34g/t and a silver recovery of 80.25%. The test shows that the flotation process can be used to obtain desirable indexes for the ore of Zhuanshanzi gold mine. Nevertheless, Jilong Metallurgical Plant has not adopted the flotation method but whole ore cyanidation, as the whole ore cyanidation can produce gold bullion on site.

The Project has two processing plants, #1 Jilong Plant is the original 400tpd plant and #2 Jilong Plant is the new 600tpd plant. The #2 Jilong plant was put into operation in May 2024 and has already reached its designed capacity, thus the two plants can achieve a total production capacity of 1,000tpd (300,000 tpa). Both plants adopt the same process of whole ore cyanidation, with the final product being gold ingot. The gold recovery rate for the Jilong Plant reaches over 96%. Table ES- 19 shows the historical production indexes of Jilong two processing plants.

**Table ES- 19: Historical Production Index of Jilong Plant**

Item	Unit	2021	2022	2023	2024 Q1-Q3 <sup>1</sup>
ROM throughput	kt	143.7	152.7	152.6	168.0
Feed grade	g/t	7.51	5.52	9.33	4.88
Gold recovery	%	97.08	96.17	97.66	96.52
Gold ingot output <sup>2</sup>	kg	1,048	811	1,390	795

Notes:

<sup>1</sup> The data include the historical index of 2024Q1-Q3 of the #1 Jilong Plant and the index from May to September 2024 of the #2 Jilong Plant.

<sup>2</sup> The gold ingot output in the table does not include the gold metal which is recovered from gold-bearing materials, cyanide slag smelting, etc.

**Huatai Metallurgical Plant**

Huatai Mining commissioned the mineral experimental research institute of Inner Mongolia Autonomous Region to conduct a laboratory process test study on ore processing in 2017.

The gold grade of test sample is 6.22g/t, after grinding to -0.074mm accounted for 85% ( $P_{85}=74\mu\text{m}$ ), a closed flotation circuit of "one roughing, two cleanings and two scavengers" was adopted to obtain gold concentrate. The final concentrate has a gold grade of 149.31g/t and gold recovery of 95.06%, indicating the ore is amenable to flotation. However, Huatai Metallurgical Plant did not adopt flotation but carbon-in-pulp ("CIP") method for obtaining gold bullion on site.

The Huatai Metallurgical Plant with a processing capacity of 200tpd (60ktpa) was built in 1987. A traditional CIP process was adopted to produce gold mud as the final product, which is then sent to the metallurgical plant of Jilong Mining to produce gold ingots for sale. Table ES- 20 shows the historical production indexes of the Huatai Metallurgical Plant. The ore supply has been seriously reduced due to mining renovation in 2022 and 2023, resulting in the plant out of running frequently. Until now, the processing plant is out of operation so there is no production record in 2024.

**Table ES- 20: Historical Production Index of Huatai Metallurgical Plant**

Items	Unit	2021	2022	2023
Processing throughput	kt	58.51	19.12	1.62
Feed grade	g/t	2.42	2.69	2.43
Gold recovery	%	93.75	93.41	92.80
Gold output in ingot	kg	132.75	48.02	3.65

**Wulong Processing Plant**

In 2021, Wulong Mining commissioned BGRIMM Technology Group to carry out a mineral processing test on the Wulong gold ore.

The closed-circuit comparative tests were carried out on three flotation processes: "on-site process" (one roughing, three scavengers and three cleanings), "two roughings, two scavengers and three cleanings" and "stage flotation (two products) process". The gold grade of the composite sample is 3.51g/t.

The test results showed that the gold concentrate with gold grade of 61.38g/t and gold recovery rate of 89.73% can be achieved by "on-site process" flotation. The gold concentrate with gold grade of 64.25g/t and gold recovery rate of 90.57% can be achieved by the process of "two roughings, two scavengers and three cleanings". The mixed gold concentrate with a mixed gold grade of 66.80g/t and the total gold recovery rate is 91.73% by "stage flotation process". After comparative analysis of processing flowsheet indexes, it is recommended to adopt "staged flotation process".

A new Wulong processing plant with a capacity of 3,000tpd was built in 2020, and it was put into operation in January 2021. The old processing plant has ceased production. Grinding and separation are divided into two series. The production capacity of the first series is 2,000tpd, and that of the second series is 1,000tpd. The flotation process of "three roughings, two scavengers and three cleanings" is adopted for gold separation. The gold grade of ROM is 2.5-3.5g/t and the final gold concentrate grade is 51-60 g/t. The recovery rate fluctuates between 89% and 93% due to the

variance of ROM grade and ore properties. Table ES- 21 shows the historical production indexes of the Wulong processing plant.

**Table ES- 21: Historical Production Index of Wulong Processing Plant**

Items	Unit	2021	2022	2023	2024Q1-Q3
ROM throughput	kt	382.1	418.6	579.3	512.52
Feed grade	g/t	2.48	3.42	3.53	3.25
Concentrate output	kt	14.62	25.13	33.08	25.19
Concentrate grade	g/t	57.93	51.5	57.01	60.25
Gold recovery	%	89.37	90.39	92.23	91.07

### Jintai Heap Leaching Plant

The main factor affecting the gold leaching rate is the ore particle size according to the results of column leaching test from laboratory, SRK recommends that the particle size of the stacked ore be 100% less than 25mm, which is also a reasonable particle size that can be achieved by conventional crushing system. The permeability of ore heap is a key factor affecting the success or failure of heap leaching. The high content of "slime" (-200 mesh fines) in ore is very likely to cause the permeability problem of ore heap. SRK suggests the use of pelleting heap leaching process to avoid the permeability problem. Following SRK's recommendation, Jintai has implemented ore pelleting in July 2024.

In order to verify the feasibility of gold extraction by heap leaching, Jintai Mining conducted industrial tests of heap leaching at the mine site from January 2014 to February 2015. The industrial test was carried out in three phases, with the test stacked ore grade ranging from 0.3 to 2.0g/t, with an average of 1.06g/t. The total amount of heap leached ore was about 160,000 t. A crushing process with two open circuit sections and pre-screening before fine crushing was used to crush the ore to less than 50mm, which was transported by car to the leach pad for stacking, with the initial test ore stacking height ranging from 1 to 2.5m and the later ore stacking height ranging from 5 to 15m. Leaching by Leaching reagent solution spraying. The leaching period was about 3 months, and the dosage of Leaching reagent was stabilized at about 150g/t and the dosage of lime was stabilized at about 4.2kg/t, which was much lower than the dosage of column leaching in the laboratory. The overall gold leaching rate was about 80%, and the leaching result of the test was good, which confirmed that heap leaching method for gold extraction was feasible in Xidengping mine.

GOCOM Engineering Design Co., Ltd. completed the *Preliminary Design of Eryuan Jintai Mining Development Co. Ltd. For 140,000t/a Open Pit Mining Project at Xidengping Gold Mine in Eryuan County* in October 2022, which was designed maximum size of stacked ore is 35mm and the heap was constructed by truck and then bulldozer. The ore heap is constructed in multiple layers, each layer is 7m high, and when the previous layer of leaching is finished, the next layer is directly constructed without unloading the first one, until 6 layers. The heap was leached by spraying with 0.15%~0.20% Jinchan Gold Leaching Agent. The designed leaching rate is 85%, the final product is gold-loaded carbon, with the heap leaching comprehensive recovery rate of 85%. The GOCOM Preliminary Design is the basis of the current heap leach plant construction at mine, and also the basis for this report.

The heap leaching plant was completed in October 2023. As of 30 September 2024, a total of 527,027 t of ore had been heap leached (D1 to D6 heaps), with an average grade of 0.69g/t, yielding 271.60kg of gold (carbon-loaded gold) and a gold recovery rate of 74.71%. The ore currently being leached amounts to 54.689 t (D7-1 and D7-2 heaps), with 17.34kg of gold recovered. The D8 heap, which is currently being built.

### Hanfeng Processing Plants

Hanfeng Mining commissioned Changchun Gold Design Institute to carry out two laboratory processing test study on deep molybdenum ore and refractory molybdenum ore respectively in December 2023. The deep molybdenum grade of the processing test sample is 0.115%, and the closed-circuit process can obtain the molybdenum concentrate with molybdenum grade of 46.96% and recovery of 88.05%. The refractory molybdenum grade of the processing test sample is 0.126%, and the closed-circuit process can obtain the molybdenum concentrate with molybdenum grade of 46.26% and recovery of 74.72%.

Hanfeng Mining has two processing plants, Lishan plant and Dongfeng plant. The Lishan plant processes Cu-Pb-Zn polymetallic ore, which sources from Lishan and Dongfeng mining areas. It adopts flotation process, and the main products are copper concentrate, lead concentrate and zinc concentrate. The designed production capacity of Lishan plant is 1,500tpd, and the current production capacity has reached 2,000tpd through technical renovation.

The Dongfeng plant processes molybdenum ore and the existing processing capacity is 700tpd. It adopts flotation process, and the processing product is molybdenum concentrate. The plant ceased operation for years and restart production in July 2022. Table ES- 22 shows the historical production indexes of the two plants.

Source: SRK

Notes: <sup>1</sup>. The plants treated materials were only from the upper part of the Lishan Mine and Dongfeng Mine, a small amount of the original residuals and remnants or original abandoned low-grade orebodies and very thin orebodies.

### Capital Expenditures and Operating Expenses.

The Capex and Opex are based on the historical operating data provided by each subsidiary company.

#### Jilong Project

##### Capex

Sustaining Capex: SRK has applied an average sustaining unit cost of approximately RMB 324 per milled ton, based on sustaining data from 2023 through 2024 Q3.

Expansion Capex: Jilong Mining has completed new preliminary design study for expansion zone (zone 5, zone 6 and zone 7). The construction period is three years with the total capital cost of RMB137.8 mln. has completed new preliminary design study for expansion deeper zone (zone 1, zone 2 and zone 3). The construction is estimated to be finished in 2025 with the total capital cost of RMB58.8 mln.

##### Opex

Table ES- 23 presents the historical unit Opex from 2021 to 2024 Q3, excluding depreciation, amortization, and financial costs. It also includes the average unit cost and the unit cost for TEM (technical economic model) input.

**Table ES- 23: Historical Operating Costs from 2020 to 2024 Q3**

Item	Unit	2021	2022	2023	2024 Q3	Unit Cost	TEM Input
Labor	RMB/t	409.93	413.40	400.67	383.86	401.40	620.09
Material	RMB/t	133.56	160.23	158.89	161.11	153.93	230.90
Electricity	RMB/t	76.85	70.33	70.49	79.93	74.50	79.93
Contractors	RMB/t	-	-	-	-	-	-
Engineering	RMB/t	31.02	27.45	23.93	11.30	23.01	31.02
Service	RMB/t	13.14	13.21	4.25	0.52	7.52	13.21
Safety	RMB/t	27.56	26.19	20.02	41.12	29.05	41.12
Repairment	RMB/t	9.90	10.95	11.05	1.46	8.14	11.05
Others	RMB/t	3.59	3.44	1.38	0.55	2.18	3.59
Taxes and surcharges	RMB/t	118.10	104.55	414.78	113.03	186.72	186.72
Selling costs	RMB/t	0.57	0.66	0.76	0.02	0.49	0.76
G&A costs	RMB/t	210.25	199.34	282.57	172.28	215.09	282.57
R&D costs	RMB/t	70.89	54.89	133.24	97.33	89.55	133.24

Note:

<sup>1</sup> The TEM input is higher than the average unit cost because the milled tonnage at Jilong Mine exceeds the mining tonnage due to comprehensive utilization, which results in a lower overall unit cost. As a result, SRK adjusted the unit cost upward to a more reasonable level.

## Huatai Project

### Capex

**Sustaining Capex:** Huatai Gold Mine has no production in 2023 and 2024. SRK used the sustaining unit costs from 2021 and 2022. These costs were adjusted to exclude expansion and exploration activities, resulting in an estimated sustaining unit cost of approximately RMB 162 per milled ton.

**Expansion Capex:** The Huatai Mine consists of six gold mines, with plans to expand production by construction for each mine. Table ES- 24 presents the total budget and timeline allocated to each project. Due to the limitations of the processing plant's capacity, SRK has assumed that each expansion will take three years to complete, with the construction start date based on the LOM.

**Table ES- 24: Huatai Future Expansion**

Project	Budget ('0000 RMB)	Construction Period (Year)
Lianhuashan #5 Mining Zone	3,706	2024-2026
Honghuagou #1 Mining Zone	11,358	2026-2028
Lianhuashan #3&#7 Vein	2,113	2038-2040
Lianhuashan #26 Vein	2,237	2045-2047
Pengjiagou Mine	4,483	2047-2049

Source: Client

### Opex

Table ES- 25 presents the historical unit Opex from 2021 to 2024 Q3, excluding depreciation, amortization, and financial costs. It also includes the average unit cost and the unit cost for TEM (technical economic model) input.

**Table ES- 25: Historical Operating Costs from 2020 to 2024 Q3**

Item	Unit	2021	2022	2023	2024 Q3	Average Unit Cost	TEM Input
Labor	RMB/t	480.18	247.05	-	-	455.53	576.21
Material	RMB/t	46.27	83.04	-	-	54.71	54.71
Electricity	RMB/t	74.26	102.25	-	-	82.79	74.26
Contractors	RMB/t	-	-	-	-	-	-
Engineering	RMB/t	170.75	539.68	-	-	275.04	170.75
Service	RMB/t	15.62	24.53	-	-	17.74	24.53
Safety	RMB/t	22.88	15.74	-	-	21.03	22.88
Repairment	RMB/t	6.60	6.64	-	-	6.49	6.64
Others	RMB/t	0.19	0.21	-	-	0.34	0.34
Taxes and surcharges	RMB/t	75.60	151.60	-	-	171.75	75.60
Selling costs	RMB/t	-	-	-	-	-	-
G&A costs	RMB/t	246.40	1,440.29	-	-	896.43	295.68
R&D costs	RMB/t	-	-	-	-	-	-

Note

<sup>1</sup> TEM inputs were based on rules of thumb from a nearby underground mine and adjusted accordingly.

**Wulong Project****Capex**

**Sustaining Capex:** SRK has applied an average sustaining unit cost of approximately RMB 511 per milled ton, based on sustaining data from 2023 through 2024 Q3.

**Opex**

Table ES- 26 presents the historical unit Opex from 2021 to 2024 Q3, excluding depreciation, amortization, and financial costs. It also includes the average unit cost and the unit cost for TEM (technical economic model) input.

**Table ES- 26: Historical Operating Costs from 2021 to 2024Q3**

Item	Unit	2021	2022	2023	2024 Q3	Average Unit Cost	TEM Input
Labor	RMB/t	209.75	226.65	241.48	210.30	223.34	670.03
Material	RMB/t	49.73	134.41	146.78	95.59	110.58	331.73
Electricity	RMB/t	73.58	100.02	66.27	64.53	74.74	100.02
Contractors	RMB/t	18.86	-	-	-	3.81	18.86
Engineering	RMB/t	21.81	-	-	3.41	5.33	21.81
Service	RMB/t	2.51	19.54	14.09	47.25	21.95	47.25
Safety	RMB/t	-	-	-	-	-	-
Repairment	RMB/t	8.10	5.24	3.79	6.24	5.64	8.10
Others	RMB/t	-	-	-	-	-	-
Taxes and surcharges	RMB/t	33.21	49.13	54.69	58.85	50.26	58.85
Selling costs	RMB/t	-	-	-	-	-	-
G&A costs	RMB/t	56.26	105.66	48.74	27.45	57.07	105.66
R&D costs	RMB/t	29.09	38.73	46.29	51.14	42.46	51.14

Note

<sup>1</sup> The TEM input is higher than the average unit cost because the milled tonnage at Wulong Mine exceeds the mining tonnage due to comprehensive utilization, which results in a lower overall unit cost. As a result, SRK adjusted the unit cost upward to a more reasonable level.

**Jintai Project****Capex**

**Sustaining Capex:** Jintai Mining has started operation since 2023. SRK used the averaged unit cost, approximately 24 RMB/milled ton, as the forecasted sustaining unit cost for the LOM.

**Opex**

Table ES- 27 presents the historical unit Opex from 2023 to 2024 Q3, excluding depreciation, amortization, and financial costs. It also includes the average unit cost and the unit cost for TEM (technical economic model) input.

**Table ES- 27: Historical Operating Costs from 2023 to 2024Q3**

Item	Unit	2023	2024 Q3	Average Unit Cost	TEM Input
Labor	RMB/t	14.43	6.58	8.41	14.43
Material	RMB/t	15.15	13.25	13.70	15.15
Electricity	RMB/t	0.57	1.48	1.27	1.48
Contractors	RMB/t	8.44	2.66	4.01	8.44

Item	Unit	2023	2024 Q3	Average Unit Cost	TEM Input
Engineering	RMB/t	8.73	10.25	9.89	10.25
Service	RMB/t	12.18	15.82	14.97	15.82
Safety	RMB/t	5.00	4.08	4.30	5.00
Repairment	RMB/t	-	-	-	-
Others	RMB/t	-	-	-	-
Taxes and surcharges	RMB/t	9.98	0.08	2.39	9.98
Selling costs	RMB/t	0.36	0.27	0.29	0.36
G&A costs	RMB/t	36.20	15.82	20.57	36.20
R&D costs	RMB/t	-	-	-	-

<sup>1</sup> TEM inputs were based on rules of thumb from a nearby underground mine and adjusted accordingly.

## Hanfeng Project

### Capex

Sustaining Capex: Hanfeng Mining operate two mines: the Lishan Mine and the Dongfeng Mine. Only the Lower Part (Stage 1) of the Lishan Mine was considered in Ore Reserves estimation. Currently, this Lower Part is under construction and has no production.

The capital expenditure data of the Upper Part of the Lishan Mine and the Dongfeng Mine is referenced for the economic analysis of the Lower Part of the Lishan Mine. SRK has applied an average sustaining unit cost of approximately RMB 80 per milled ton, based on sustaining data from 2023 through 2024 Q3.

### Opex

Table ES- 28 presents the historical unit Opex from 2021 to 2024 Q3 for the Upper Part of the Lishan Mine and the Dongfeng Mine, excluding depreciation, amortization, and financial costs. It also includes the average unit cost and the unit cost for TEM (technical economic model) input.

**Table ES- 28: Historical Operating Costs from 2021 to 2024Q3**

Item	Unit	2021	2022	2023	2024 Q3	Average Unit Cost	TEM Input
Labor	RMB/t	51.69	62.90	57.61	144.02	80.02	64.02
Material	RMB/t	34.72	38.94	26.85	32.78	33.78	27.02
Electricity	RMB/t	28.73	32.93	30.97	23.50	29.05	23.24
Contractors	RMB/t	-	-	-	39.78	10.28	8.23
Engineering	RMB/t	28.30	23.66	21.22	0.03	18.17	14.54
Service	RMB/t	1.94	1.37	0.58	1.10	1.28	1.02
Safety	RMB/t	4.35	2.77	3.04	6.15	4.09	3.27
Repairment	RMB/t	1.18	0.68	0.66	0.34	0.71	0.57
Others	RMB/t	2.51	1.57	1.50	1.05	1.65	1.32
Taxes and surcharges	RMB/t	15.49	16.83	8.54	22.01	16.10	12.88
Selling costs	RMB/t	0.23	0.27	0.25	-	0.19	0.15
G&A costs	RMB/t	30.84	21.38	33.96	23.95	27.00	21.60
R&D costs	RMB/t	-	-	-	-	-	-

Note

<sup>1</sup> The unit cost in the TEM input is lower than the average unit cost because the historical costs include both Lishan Mine and Dongfeng Mine. As a result, SRK adjusted the unit cost downward to a more reasonable level.

**Economic Analysis**

The economic analysis presented here is based on the results of the technical review. Some key assumptions are made for technical evaluation and Ore Reserve estimation purposes only. The Project economic analysis was conducted using the discount cash flow ("DCF") method and is based on assumptions of technical and economic parameters from actual historical production data and the feasibility study and/or mine design of each mine with some adjustments by SRK.

The following Table ES- 29 shows the forecasted Capex over the LoM and the forecasted unit Opex for the Chifeng Gold each project.

**Table ES- 29: Forecasted Capex over the LoM and Forecasted Unit Opex for Each Project**

Capex	Unit	Over LoM				
		Jilong <sup>1</sup>	Huatai <sup>2</sup>	Wulong	Jintai	Hanfeng <sup>3</sup>
Expansion	RMB mln	197	239	0	0	109
Sustaining	RMB mln	298	274	503	33	266
Closure	RMB mln	15	37	40	6	15
Opex	Unit	Over LoM (TEM Input)				
		Jilong	Huatai	Wulong	Jintai	Hanfeng

## Environmental approvals and status

### Jilong Project

Three EIA reports have been completed and approved for the Jilong Project, covering the current main production facilities, the expanded processing plant and the new tailings storage facility. No rare plants and wild animals under state have been found around the project. Mine water is sedimented underground and discharged into the upper sump and reused in the processing plant. During the winter, the project may have a small amount of mine water discharging outside. During this site visit, SRK noticed that there are waste rock dumps in each mining area of the project. At present, the tailings of the project are dry discharged into the TSF after being treated in the filter press workshop. The accident and collection ponds were built at the foot of the tailings dam. During the time of SRK's site visit, SRK did not observe any evidence of leaching or ARD impacts. SRK sighted that dust removers were installed in the processing plant. SRK did not note the obvious dust emission in the open area of the project during the time of this site visit.

### Huatai Project

The EIA report for Chifeng Huatai Mining Ltd. Gold Mine Mining and Processing Expansion Project (60 ktpa) was prepared by Chifeng City Environmental Science Institute in May 2007. The EIA report was approved by Chifeng City Environmental Protection Bureau on June 6, 2007. In addition, SRK has sighted other six EIA reports and approvals which cover the whole mining sections.

The EIA report states that there are no sensitive targets such as natural reserves within 10 km of the project area. There are no rare, endangered and protected flora and fauna species within the scope of the project. The mine water is generally collected by water tank and reused for underground production. The processing wastewater is fully recycled, and the tailings filter wastewater is reused for processing as well. At present, waste rock from the project is mainly used for underground

backfilling or sold for road building. During the site visit, SRK noticed that there are past-generated waste dumps at the portal of shafts in each mining area. During the time of SRK's site visit, SRK did not observe any evidence of leaching or ARD impacts.

### **Wulong Project**

The EIA report for Liaoning Wulong Gold Mine Development Project (0.15Mtpa) was prepared by Dandong City Environmental Protection Science Institute in October 2006. The EIA report was approved by Dandong City Environmental Protection Bureau on November 6, 2006.

The EIA report for Liaoning Wulong Zhoujiagou TSF Treatment and Processing Plant (800t/d) Decommissioning Project was produced by China Coal Technology & Engineering Group Shenyang Design & Research Institute Ltd. in December 2013. The EIA report was approved by Dandong City Environmental Protection Bureau on April 8, 2014.

SRK noted that the EIA reports for the Liaoning Wulong Gold Mine Development Project (0.15Mtpa) and Liaoning Wulong Zhoujiagou TSF Treatment and Processing Plant (800 tpd) Decommissioning Project does not include the new processing plant. Wulong Mining stated that the EIA report for the new processing plant had been submitted to the environmental protection bureau and was under review.

The EIA report states that there were no rare or endangered flora and fauna in the project area. The project has a water treatment plant to treat mine water. The treated mine water is reused for production and heating, and the excess water is discharged into the Banshi River. SRK noted that the project's TSF is approximately 7 km from the downstream reservoir. SRK recommends that quality monitoring be undertaken of the groundwater and surface water resources within the project area (including upstream and downstream of the project area), and also any site water discharges. During this site visit, SRK noticed that the waste rocks were temporarily dumped at the portal of shafts in each mining area. Liaoning Wulong stated that the waste rock from the project is mainly used for underground backfilling or sold for construction. At present, the tailings of the project are dry discharged into the TSF after being treated in the filter press workshop. The accident and leakage collection ponds were built at the foot of the tailings dam. During the time of SRK's site visit, SRK did not observe any evidence of leaching or ARD impacts.

### **Jintai Project**

The EIA report for Xidengping Gold Mine Mining, Processing and Tailings Project (0.14Mtpa) was conducted by Kunming Nonferrous Metallurgy Design & Research Institute Led in December 2013. The EIA report was approved by Yunnan Province Environmental Protection Bureau on February 17, 2014.

During the EIA baseline study, some National second-class protected plants and animals were found in the project's survey area. The EIA concluded that with better management, the operation of the project would not have a significant impact on the diversity and distribution pattern of vegetation in this area and would have a lesser impact on wildlife. During this site visit, SRK observed the drainage ditch was well constructed around the leaching heap. Emergency pond and rainwater collection pond were constructed downstream of the leaching heap. The leach heap was paved with HDPE membrane and bentonite to prevent seepage. SRK sighted groundwater monitoring boreholes were utilized around the leaching heap. SRK noted the exceedance of arsenic levels in soil at the mine

site during the environmental baseline study. The EIA report opines that this is related to the co-occurrence of arsenic in the gold ore formation process and that the project is located in an area where the background value of arsenic is high. The waste rock was discharged into the waste rock dump on site and the topsoil was collected for the future reclamation.

### Hanfeng Project

The EIA report for Longjing Hanfeng Mining Ltd. Tianbaoshan Mine Area Residual Resources Recovery and Utilization Project was prepared by Yanbian Environmental Protection Science Institute in March 2005. The EIA report was approved by Yanbian Environmental Protection Bureau on March 14, 2005.

The EIA report for Lishan-xinxing Mine Area Lead-Zinc Mining Expansion Project (0.18Mtpa) was prepared by Jilin Metallurgical Research Institute Jilin Linchang Environmental Technology Service Ltd. in May 2013. The EIA report was approved by Jilin Province Environmental Protection Bureau on June 9, 2013.

The EIA report for Jilin Hanfeng Lishan Processing Plant Technical Transformation Project was produced by Jilin Northeast Coal Industry Environmental Protection Research Ltd. in February 2017. The EIA report was approved by Yanbian Environmental Protection Bureau on February 20, 2020. The EIA report for Jilin Hanfeng Lishan Mining Area Expansion Project (0.6Mtpa) was prepared by Jilin Linchang Environmental Service Ltd. Jilin Province Ecology and Environmental Bureau issued EIA approval on August 31, 2021. No endangered or protected flora and fauna in the project area were reported in the EIAs. Surface water bodies near the project include the Baoshan River and the Burhaton River. SRK suggests that the company establish an emergency water supply plan to address issues such as changes in groundwater levels. If the development affects the water usage of surrounding communities, alternative water sources can be provided. During this site visit, SRK noticed that the waste rocks from the project were temporarily dumped near the portal of shaft in the mining area and processing plant. Jilin Hanfeng stated that the waste rock is mainly used for underground backfilling. SRK has sighted some former waste rock dumps on site and one of them has been rehabilitated. At present, the tailings of the project are discharged into the TSF. SRK has sighted minor dust generation in the TSF during the site visit.

### Risk Assessment

SRK completed a risk assessment of the risks identified for the Chifeng Gold Project in relation to their likelihood of occurrence and consequence in accordance with the Exchange to the Listing Rules.

SRK considers various technical aspects which may affect the feasibility and future cash flow of each operating mine and conducts risk assessments for the Chifeng Gold Project based on similar techno-economic conditions among the three mines, which have been summarized in Table ES- 32.

**Table ES- 32: Risk Assessment for Chifeng Gold Project**

Risk Source/Issue	Likelihood	Consequence	Risk
<b>Jilong Project</b>			
<b>Geology, Mineral Resources and Ore Reserves</b>			
Lack of Significant Miner Resource	Unlikely	Moderate	Low
Lack of Significant Ore Reserve	Unlikely	Major	Medium

<b>Risk Source/Issue</b>	<b>Likelihood</b>	<b>Consequence</b>	<b>Risk</b>
Significant Unexpected Geological Faulting	Possible	Moderate	Medium

## Recommendations

SRK Offers the following recommendations:

### Huatai Project

In general, the mines of Huatai Project were operated at small scale capacity for a long time. The geotechnical and hydrogeological conditions are not complex to deal with. Therefore, the underground access method, stoping method, and related service systems and machinery are suitable for the mine operations.

In order to ensure normal mining production in the future, the existing operation system and the design needs further supplementation and improvement, which include mainly the following aspects:

- The reconciliation study is recommended in the future. The reconciliation study would help the operation to compare the estimates against production, then improve the estimation getting a higher-level confidence of resource estimates and improve mining operation outcomes.

### Wulong Project

Underground Geological sampling at Wulong Mine has continued throughout 2024, the tunnel sampling data needs to be provided to SRK for the resource model update in alignment with the mining depletion data.

The actual dilution rate and recovery rates appear to be inconsistent with the planned targets, as the mining grade is significantly lower than the geological grade. It has been noted by onsite personnel that, in the interest of comprehensive resource utilization, a portion of lower-grade ore has been

intentionally blended in. It is recommended that a reconciliation study be conducted to better understand the underlying discrepancies and to facilitate improvements in future production.

As the ore comes from different mining areas, and the ROM properties are obviously different and fluctuating, SRK suggests that the reagent regime in the process of actual production should be adjusted according to the production situation to obtain the optimal separating indexes.

#### **Jintai Project**

SRK considers the mining and stripping methods adopted to be a mature mining technology commonly used in open pit mining practices, and technically both are reasonable and feasible. The designed bench height and slope angle are considered reasonable, as well as the small-scale excavator is suitable for selective mining. However, the truck payload (7.8t) is not commonly used in practice. Some larger trucks (30t payload) were observed standing by during site visit. The loading round would be increased then the haulage round would be reduced. But the excavator and truck matching each other would not be a material risk for operation, as the total volume of mining is small.

For the heap leaching plant, SRK recommends that the particle size of the stacked ore be 100% less than 25mm, which is also a reasonable particle size that can be achieved by conventional crushing system. The permeability of ore heap is a key factor affecting the success or failure of heap leaching operation. The high content of "slime" (-200 mesh) in Xidengping ore is very likely to cause the permeability problem of ore heap. SRK suggests the use of pelleting heap leaching process to avoid the permeability problem. SRK believes that the designed recovery rate can be achieved under the condition of ensuring the ore size and the heap permeability. Heap leaching has the characteristics of flexible scale, low Capex and Opex, and rapid benefit. The discovery of V4 Mineralised body makes it possible to further expand the scale of heap leaching. SRK suggests that the possibility of future expansion of production scale should be considered when the heap leaching facilities are designed and constructed.

The final product of the mine is designed to be gold-loaded carbon. SRK suggests that, if possible, a smelting workshop be built in the mine to use a processing device of "high-temperature elution and homo-thermal electrowinning " to produce gold bullion, or gold ingot. The gold stripped carbon will be returned to the adsorption system after regeneration.

#### **Hanfeng Project**

SRK recommends Hanfeng Mining to carry out in-fill drilling exploration and/or underground exploration for resource category upgrade to meet life of mine plan for the lower parts of both Lishan and Dongfeng mines.

In order to ensure stable mining production in the future, the existing operation system and the design needs further supplementation and improvement.

## 1 Introduction

Chifeng Jilong Gold Mining Co., Ltd. ("**Chifeng Gold**", the "**Company**" or the "**Client**") commissioned SRK Consulting China Limited ("**SRK**") to undertake an independent technical assessment of all relevant aspects of its five subsidiaries' operating gold and polymetallic mines and associated processing and metallurgical plants (hereafter referred to as the "**Chifeng Gold Project**" or the "**Project**"), located in the People's Republic of China ("**China**").

The Chifeng Gold Project consists of the following mining projects:

- Jilong Project: it includes the Zhuanshanzi gold mine ("**Zhuanshanzi Mine**"), Jilong metallurgical and processing plant and other supporting facilities, located in Inner Mongolia Autonomous Region ('Inner Mongolia'). The Jilong Project is wholly owned and operated by Chifeng Jilong Mining Co., Ltd. ("**Jilong Mining**")
- Huatai Project: it consists of six (6) operating gold mines, #26 Vein, #3&7 Vein, #86 Vein, #1 Mining Zone, #5 Mining Zone and Pengjiagou mines, Huatai processing and metallurgical plant and other supporting facilities, located in Chifeng City, Inner Mongolia. The Huatai Project is wholly owned and operated by Chifeng Jilong Mining Co., Ltd. ("**Jilong Mining**").
- Wulong Project: it includes the Wulong gold mine ("**Wulong Mine**"), Wulong processing plant, and two exploration gold properties, namely the Ligunzi deposit and the Haojingou-Ligunzi deposit, which are all located in Dandong City, Liaoning Province. The Wulong Project is wholly owned and operated by Liaoning Wulong Gold Mining Co., Ltd. ("**Wulong Mining**").
- Jintai Project: it consists of the Xidengping gold mine ("**Xidengping Mine**") and Jintai heap leaching plant, located in Eryuan County, Yunnan Province. The Jintai Project is owned and operated by Eryuan Jintai Mining Development Co., Ltd. ("**Jintai Mining**").
- Hanfeng Project: it includes two lead and zinc polymetallic mines (i.e., Lishan Mine and Dongfeng Mine), two ore processing plants and one Dongfeng exploration molybdenum deposit. They are all located in Yanbian Korean Autonomous Prefecture ("**Yanbian**"), Jilin Province. The Hanfeng Project is wholly owned and operated by Jilin Hanfeng Mining Technology Co, Ltd. . ("**Hanfeng Mining**").

SRK understands that the independent technical assessment was required to be included in a Competent Person's Report ("**CPR**", the "**Report**" or this "**Report**") to provide Chifeng Gold and potential equity investors as well as possible future shareholders with SRK's technical opinions on the Project.

The Report was prepared following the requirements of the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the "**JORC Code**") and in accordance with the rules governing the listing of securities on the Stock Exchange of Hong Kong Ltd (the "**Exchange**") including the Chapter 18 requirements (Appendix B), Chapter 2.6 of the Guide for New Listing Applicants (Appendix C) and other relevant regulations of the Exchange and Hong Kong Exchanges and Clearing Ltd ("**HKEx**").

This Report does not express an opinion as to the value of mineral or other assets involved.

## 2 Program Objectives and Work Program

### 2.1 Purpose of the Report

The purpose of this Report is to provide both existing Chifeng Gold shareholders and potential investors with a CPR of the Chifeng Gold Project located in Inner Mongolia, Liaoning, Jilin and Yunnan provinces of China. The SRK's report is proposed to provide an unbiased technical assessment of the risk and opportunities associated with the Project.

### 2.2 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "Valmin Code"). The Valmin Code incorporates the JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy ("AusIMM") members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the JORC Code.

### 2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that the Client has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Client has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Client and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

### 2.4 Effective Date

The effective date for this CPR is deemed to be 30 September 2024 (the "Effective Date"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as of 30 September 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK.

The life of mine (the "LoM") plans and associated technical and economic parameters included in the LoM plans and technical and economic models all commence on 1 October 2024.

## 2.5 Work Program

The work program of this Project included:

- review of all relevant information and documents provided by Chifeng Gold as of 30 September 2024;
- site inspection to each of mines, processing and metallurgical plants and supporting facilities in December 2022, January and March 2023, and May and June 2024;
- data verification conducted by SRK in December 2022 and May 2024;
- discussion with the Company management and technical personnel;
- analysis of the data provided by the Company and generated by SRK;
- construct the geological solids, prepare data for statistical, established the block model, estimate grades, tabulate Mineral Resources;
- preparation of a draft report in accordance with the JORC Code and the rules governing the listing of securities on the Exchange including the Chapter 18 requirements and other relevant regulations of the Exchange and HKEx (the declaration date of Mineral Resources and Ore Reserves is 30 September 2024); and
- submission of the draft to Chifeng Gold and the related third parties for comments and finalization of the draft based on feedback.

## 2.6 SRK Experience

The SRK Consulting Group ("SRK Consulting") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK China was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices—especially SRK Australasia, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience in providing Independent Expert Reports to mining companies for successfully listing on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-1.

**Table 2-1: SRK's Reports for Listing on the HKEx**

Company	Year	Nature of Transaction
Yanzhou Coal Limited (listed in HKEx)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on HKEx and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on HKEx
Lingbao Gold Limited	2005	IPO Listing on HKEx
Yue Da Holdings Limited (listed in HKEx)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on HKEx
Sino Gold Mining Limited	2007	Dual Listing on HKEx
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on HKEx
Kiu Hung International Holding Limited	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Limited	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Limited	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Limited	2009	Acquisition of a molybdenum mining project in Shaanxi, China
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on HKEx
Citic Dameng Holdings Limited	2010	IPO Listing on HKEx
China Hanking Holdings Limited	2011	IPO Listing on HKEx
China Daye Non-Ferrous Metal Mining Limited	2012	Very Substantial Acquisition on HKEx
China Nonferrous Mining Corporation Limited	2012	IPO Listing on HKEx

Company	Year	Nature of Transaction
Hengshi Mining Investments Limited	2013	IPO Listing on HKEx
Future Bright Mining Holdings Limited	2014	IPO Listing on HKEx
King Stone Energy Group Limited	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte LTD	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Limited	2016	IPO Listing on HKEx
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Limited	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Limited	2022	IPO Listing on HKEx
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on HKEx

## 2.7 Project Team

The SRK project team and responsibilities are shown in Table 2-2.

**Table 2-2: SRK Project Team**

Consultant	Title	Discipline and Task
Dr. Yiefei Jia	Principal Consultant (Geology)	Project Manager, whole report, CP
Yanfang (Bonnie) Zhao	Principal Consultant (Geology)	Geology, Mineral Resource Estimation
Feng (Frank) Li	Principal Consultant (Geology)	Data Verification and QA/QC
Mingyan Wang	Consultant (Geology)	Geology, Mineral Resource Estimation
Huaxiang (Hubert) Li	Senior Consultant (Geology)	Geology, Mineral Resource Estimation
Shaobo Dai	Senior Consultant (Geology)	Geology, Mineral Resource Estimation
Falong Hu	Principal Consultant (Mining)	Mining and Ore Reserve Review
Tzuhsuan Chuang	Senior Consultant (Mining)	Mining, Ore Reserve Estimation
Erwei Lu	Consultant (Mining)	Mining, Ore Reserve Estimation
Alexander Thin	Principal Consultant (Mining)	Mining and Ore Reserve Review
Xiangfeng Yang	Senior Consultant (Processing)	Processing and Metallurgical Review
Chao Ding	Consultant (Processing)	Processing Review
Lanliang Niu	Principal Consultant (Processing)	Processing and Metallurgical Review
Nan Xue	Principal Consultant (Environment)	Environment, Social, and Permitting
Meining (Ivy) Dai	HSQ and Project Coordinator	Project Coordination and Translation
Pengfei Xiao	Principal Consultant (Geology)	Internal Peer Review and Quality Control
Dr Yonglian Sun	Corporate Consultant (Mining)	Internal Peer Review and Quality Control

**Yiefei Jia, PhD, FAusIMM (CP Geo)**, is a Principal Consultant (geology) with a specialty of exploration of mineral deposits. He has more than 25 years' experience in the field of exploration, development, and Mineral Resources estimate of precious metal (gold, silver, and PGE), non-ferrous metal (lithium, lead, zinc, copper, vanadium, titanium, cobalt and nickel), and black metal (iron and manganese) as well as non-metallic metal (potash, fluorite and graphite) and decorative stone (marble) ore deposits in different geological settings in Australia, Africa, China, and North and Central

America. He also has over five years' experience in coal deposits exploration and due diligence in China, Indonesia and Mongolia. He has extensive experience in project management, exploration design and Mineral Resource assessment. In recent years, he, as Competent Person, has led and coordinated dozens of due diligence projects with technical reports either for fund raising or listing on overseas stock exchanges, such as the Stock Exchange of Hong Kong Limited. *Dr. Jia is responsible for the whole report. Dr. Jia is qualified as a Competent Person with regard to the type of deposit and the activity undertaken.*

**Yanfang Zhao (Bonnie), MEng, MAusIMM**; Senior Consultant (Geology). Before joining SRK, she worked in Silvercorp Metals Inc. and was mainly responsible for data processing, resource modeling and reserve estimation for operational mines and exploration projects. Bonnie joined SRK China in 2012 and has been involved in more than 50 mining projects in the aspect of data verification, resource modeling and reserve estimation, due diligence and preparing Qualified Person Report in China, Mongolia, Indonesia, Zambia, DRC, Angola and Australia with minerals including Au, Ag, Cu, Fe, Pb, Zn, and Coal. At SRK, she participated in several successful cases in recent years, and most of them have completed acquisition or public listings in stock exchanges, including China Unienergy IPO Listing on HKEx, Agritrade Resource major acquisition of a coal mine in Indonesia, and CNMC African project. Bonnie is expertized in data processing, resource modeling, reserve estimation and independent technical reporting. She is proficient in using mining software, including Surpac, Minex, Leapfrog, ArcGIS, and AutoCAD. *Ms. Zhao is responsible for the geology and Mineral Resource estimation Review.*

**Huaxiang (Hubert) Li, MEng, MAIG**, is a senior consultant (geology) with SRK China. He graduated from the China University of Geosciences (Beijing) and used to work in a geological exploration company for more than 6 years and gained lots of experiences and expertise in geological and Mineral Resources exploration. As a consulting geologist, he has participated a number of metal mineral projects, including exploration design review, data verification, due diligence reviews and Mineral Resource estimation. He is familiar with the principles and methods for metal ore deposits prospecting and exploration including lithium, gold, silver, PGE, REE, copper, lead, zinc, molybdenum, bauxite, etc. He is proficient in geological modelling, Mineral Resources estimation, data processing and GIS/RS application. *Mr. Li is responsible for the geology and Mineral Resource estimation Review.*

**Mingyan Wang, BMgt**, is a Consultant (Geology) with SRK China, Prior to joining SRK in 2022, he was employed it China Geo-Engineering Corporation., where he focused on ecological restoration design and comprehensive land management. At SRK, his main responsibilities include Mineral Resource modelling and estimation, data processing and map drafting. He has also served as an onsite geologist for exploration projects, overseeing geological logging, sampling, and quality control. Mingyan is proficient in software such as GIS/RS, Surpac, Leapfrog, and AutoCAD. *Mr. Wang is responsible for the geology and exploration review, data processing, Modelling and Mineral Resource estimation.*

**TzuHsuan (Shan) Chuang, M.Eng., MAusIMM**, is a Senior Consultant (Mining) at SRK China. She has experience in consulting and operation management. After graduating from Colorado School of Mines, she conducted scoping studies, pre-feasibility, feasibility studies, and project valuation in Zijin mining design company, with projects in China, Serbia, Tajikistan, Australia, Colombia, and Guyana. She then worked at Buritica underground gold mine of Continental Gold in Colombia, and was responsible for LOM plan, production operation, and grade control optimization. Her expertise includes pit optimization, mine design, and scheduling in metal mine, and is skilled in using Deswik,

Whittle, Surpac, Minesched, and AutoCAD. *Ms. Chuang is responsible for mining review and Ore Reserve estimation.*

**Erwei Lu, M.Eng.;** Consultant (Mining) at SRK China, he obtained his bachelor's degree and master's degree in mining engineering from Central South University. He has over five years of practice of underground operation, and about one year's mineral project evaluation experience. He worked as an on-site mining engineer in Zambia for China Nonferrous Metal Mining (Group) Co., Ltd. after graduation in 2017. He also worked for an autonomous driving application and mineral project investment companies since 2022. He is familiar with large scale underground mobile equipment operation and training, long-hole blasting, mine design and scheduling, and production management, as well as autonomous driving application in open pit mine, and project evaluation. *Ms. Chuang is responsible for mining review and Ore Reserve estimation.*

**Falong Hu, MBA, B.Eng., FAusIMM, Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Chinese Certified Consulting Engineer (Investment),** is a Principal Consultant (Mining). He obtained his bachelor's degree in mining engineering from Central South University and Master of Business Administration (MBA) in China University of Geosciences (Beijing). Before joining SRK he worked as an on-site and head office mining engineer in 2 different international mining companies which were called Sino Gold Mining Limited (later merged with Eldorado Gold Corp.) and Silvercorp Metals Inc. He is familiar with underground and open pit mines' production systems and has been involved in mining engineering and development design, scheduling, long-hole blasting and production operation, rock mechanics, ventilation, back-fill; and cost accounting. After take part in SRK, he accumulated extensive experience in ore reserve estimation, economic analysis, project valuation, mining assessment, scoping/pre-feasibility/feasibility studies and so on. Minerals include gold, silver, lead, zinc, copper, iron, bauxite, laterite-nickel, sylvine, phosphate and graphite, as well as quartzite, marble, bentonite and so on. He is a modeler on both technical and economic and also proficient in digital modeling by using Surpac, Whittle, Minesched, Datamine and AutoCAD. *Mr Hu provided a review on mining and Ore Reserve Estimates.*

**Xiangfeng Yang, MEng; MAusIMM, Chinese Certified Constructor (Mining Engineering and Mechanical and Electrical Engineering), Registered Cost Engineer, Chinese Certified Mineral Right Value,** is a senior consultant (processing) at SRK China. She graduated from Wuhan University of Technology in 2010. During her undergraduate and master's studies, she systematically learned the relevant knowledge of non-ferrous metal ore and non-metal ore separation process and mineral processing plant design. She has been engaged in feasibility research, preliminary design and construction drawing design at Bluestar Lehigh Engineering Institute and NMS. She has published several journal papers and utility models and has led and participated in many medium and large phosphate mines, potassium salt, sulphide ore and other processing projects. She has rich experience in the design of processing programs such as salt and sulphide ore and has rich experience in the selection of mineral processing equipment, bidding and procurement, the design of mineral processing technology plans, as well as the configuration of processing workshops. *Ms Yang is responsible for processing and Metallurgical review.*

**Nan Xue, M.Sc, MAusIMM,** is a Principal Environmental Consultant with SRK Consulting China Ltd. He holds a master's degree in environmental sciences from Nankai University in Tianjin. He has four years' experience in environmental impact assessment, environmental planning, and environmental management. He has been involved in a number of large EIA projects and pollution source surveys

for SINOPEC, as well as the environmental planning project funded by UNDP. He has particular expertise in construction project engineering analysis, pollution source calculations, and impact predictions. In recent years after he joined SRK, Nan Xue has been involved in a number of due diligence projects, such as the Fuguiniao Mining project in China. *Mr. Xue has reviewed the environment, permits and approvals.*

**Pengfei Xiao, MSc, MAusIMM, MAIG**, is the Managing Director of SRK China. He is a Principal Consultant (Geology) with a specialty in mineral exploration applying comprehensive geological and geophysical methods; and his expertise also includes resource modelling and estimation. He is familiar with both theory and practice in sampling, sample preparation and chemical analysis. As a consulting geoscientist, he has been active in mining projects including due diligence reviews, exploration design, data verification and resource estimation in China, Mongolia, Africa, America, Southeast and Central Asia. His experience relates precious metal (Au, Ag, PGE), base metal (Cu, Ni, Pb, Zn) and other metal deposits (Fe, Mn, V, Mo, Co), and also includes a few non-metal projects (phosphorite, potash, gypsum). In the past ten years he has been working in geology and resource assessment with SRK, and co-authored dozens of technical reports aiding clients in successful property transactions; and more than half of them are published in stock exchanges. *Mr Xiao is responsible for the internal peer review to ensure the quality of the Report meeting the required standard.*

**Dr Yonglian Sun, BEng, PhD, FAusIMM, FIEAust, CPEng**, is a Corporate Consultant (Geotech) with over 25 years' experience in geotechnical and mining engineering in five countries across four continents. He has extensive international mining experience with an emphasis on site investigation, analysis, and modelling of geotechnical issues in open pits, underground mines, and civil tunnels. He also possesses considerable experience in evaluating mining projects. In recent years, Yonglian has coordinated and led dozens of due diligence projects, most of which have been successfully listed in the Stock Exchange of Hong Kong Limited. *Dr Sun provided internal peer review to ensure the quality the report meets the required standard.*

## 2.8 Warranties

Chifeng Gold has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

## 2.9 Compliance Statement

The information in this report that relates to Mineral Resources/Ore Reserves is based on information compiled by Dr. Yiefei Jia, a Competent Person who is a Fellow of AusIMM and a Chartered Professional in Geology (CP Geo), and Mr Falong Hu, a Competent Person who is a Fellow of the AusIMM. Both are full-time employees of SRK.

This Report is a Competent Person's Report in line with the Listing Rules of the Exchange and HKEX.

Dr. Yiefei Jia and Mr Falong Hu have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code".

Dr. Yiefei Jia and Mr Falong Hu consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Mr Pengfei Xiao, *MAusIMM*, a Principal Consultant (Geology) and Dr Yonglian Sun, *FAusIMM (CP Eng)*, a Corporate Consultant (Mining).

## 2.10 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Chifeng Gold or Chifeng Gold's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence. SRK is independent of Chifeng Gold applying all of the tests in 18.21 and 18.22 of the Listing Rules of the Exchange and HKEX.

## 2.11 Consent

SRK consents to this Report being included, in full, in documents that Chifeng Gold proposes to submit to the HKEX and/ or disclosure to the public markets, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

## 2.12 Forward Looking Statement

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

### 3 Property Description and Location

#### 3.1 Property Location

The Jilong, Huatai, Wulong and Hanfeng projects are operating gold and/or polymetallic mines with associated ore processing and metallurgical plants and exploration tenements, which are located in Inner Mongolia, Liaoning and Jilin provinces, northeast part of China (see Figure 3-1).

**Figure 3-1: General Location Map of the Project (northeast part)**

The property of Jintai Project is located in Yunnan province, southwestern part of China (Figure 3-2).

**Figure 3-2: General Location Map of the Project (southwestern part)**

### 3.1.1 Jilong Project

The Jilong gold project is located about 21km west of Aohanqi or 58km west of Chifeng City, Inner Mongolia. Chifeng City has extensive networks of railway line and well paved highways and is also about 400km northeast of Beijing. The Zhuanshanzi operating gold mine and exploration permits are administered by Sidaowan Township (四道湾镇) of Aohanqi. The central geographical coordinates of the Jilong Project are longitude 119°36'5.02587"E and latitude 42°18'19.94458"N (2000 National Geographic Coordinate System).

### 3.1.2 Huatai Project

The Huatai gold project is located approximately 33~38km west of Chifeng City, Inner Mongolia. Three operating mines of the Lianhuashan gold mine, Honghuagou gold mine and Pengjiagou gold mine, and exploration permits are administratively under the jurisdiction of Wangfu Township (王府镇), Songshan District of Chifeng City. The project's central geographical coordinates are longitude 118°35'12"E and latitude 42°14'23"N (1980 Xi'an Geographic Coordinate System).

### 3.1.3 Wulong Project

The Wulong gold project is located about 15km west of Dandong City, Liaoning Province. The Wulong operating gold mine and the Haojingou-Ligunzi exploration permit are administered by Zhen'an District of Dandong City. The project's central geographical coordinates are longitude 124°11'53"E and latitude 40°09'44"N (1980 Xi'an Geographic Coordinate System).

### 3.1.4 Hanfeng Project

The Hanfeng polymetallic project is located approximately 42km of northwest of Longjing City, Jilin Province. The Hanfeng polymetallic project consists of two mining areas (i.e., the Lishan-Xinxing and Dongfeng mining areas). Administratively, the Tianbaoshan lead-zinc mine and the Dongfeng exploration permit are under the jurisdiction of Laotougou Township (老头沟镇), Longjing City, Yanbian Korean Autonomous Prefecture. The project's central geographical coordinates are longitude 128°58'30"E and latitude 42°56'25"N (1980 Xi'an Geographic Coordinate System).

### 3.1.5 Jintai Project

The Xidengping gold mine, located southwest of Eryuan County, is administered by Liantie Township (炼铁乡) of Eryuan County (洱源县), Dali Bai Autonomous Prefecture (大理白族自治州). The project's central geographical coordinates are about longitude 99°48'12"E and latitude 25°59'58"N (2000 National Geographic Coordinate System).

## 3.2 Mineral Tenure

SRK relies on the information provided by the Company, and SRK did not conduct a legal due diligence review of the Project since such work is outside the scope of SRK's technical review.

**3.2.1 Jilong Project**

Two mining licenses and one exploration permit are currently held by Jilong Mining. Details of the mining licenses and exploration permits for the Project are presented in Table 3-1 and Table 3-2, respectively.

**Table 3-1: Information of Mining Licenses, Jilong Mining**

<b>Company</b>	<b>Chifeng Jilong Mining Co., Ltd.</b>
Project Name	Zhuanshanzi Gold Mine, Chifeng Jilong Mining Co., Ltd
License No.	C1500002009114120054250
Issued To	Chifeng Jilong Mining Co., Ltd.
Issued By	Department of Natural Resources of Inner Mongolia Autonomous Region
Period of Validity	May. 1, 2024 – Sep. 26, 2026
Area (km <sup>2</sup> )	8.61
Mining Type	Underground
Mining Depth	From 700m to -671m
Production Rate (tpa)	180,000
Project Name	Aohanqi zhuanshanzi Gold Mine, Chifeng Jilong Mining Co., Ltd
License No.	C1500002023124210156146
Issued To	Chifeng Jilong Mining Co., Ltd.
Issued By	Department of Natural Resources of Inner Mongolia Autonomous Region
Period of Validity	Dec. 27, 2023 – Mar. 27, 2032
Area (km <sup>2</sup> )	9.134
Mining Type	Underground
Mining Depth	From 737m to 373m
Production Rate (tpa)	60,000

<b>Area (km<sup>2</sup>)</b>	10.28

### 3.3 Underlying Agreements

SRK is not aware of any underlying agreements other than those disclosed in this Report.

### 3.4 Permits and Authorization

A list of licenses and permits and authorization in Section 3.2 for each of the five subsidiary mining companies, i.e., Jilong Mining, Huatai Mining, Wulong Mining, Hanfeng Mining and Jintai Mining, to undertake legal exploration, exploitation, and production in China has been sighted by SRK.

Apart from the mining license, other operational permits are required for the Project according to the relevant Chinese laws and regulations. These operational permits include:

- Business License,
- Safety Production License,
- Land/forest Use Permit,
- Water Use Permit, and
- Site Discharge Permit

The safety production licenses, water use permits, and site discharge permits for the five projects are presented in Section 13.4.

### 3.5 Environmental Considerations

Environmental liabilities associated with the project operation are mainly from underground mining, waste rock dumps, processing plant, tailings storage facilities and other auxiliary facilities. The significant inherent environmental risks for the project consist of environmental approvals, water management and tailings management. Additional details on environmental approvals, water management and tailings management are provided in Sections 19 of this Technical Report.

## **4 Accessibility, Climate, Local Resources, Infrastructure, and Physiography**

### **4.1 Accessibility**

#### **4.1.1 Jilong and Huatai Projects**

As shown in Figure 3-1, both Jilong and Huatai projects are located in Inner Mongolia, approximately 58km away from Chifeng City in the west and 33-38km away from Chifeng in the east, respectively. Chifeng City has extensive networks of railway line and well paved highways and is also about 400km northeast of Beijing. There are multiple high-speed railways run between Beijing and Chifeng every day.

Access to both projects is excellent. Jilong Project is only 15km away from the Xiaohe (小河) Station of Beijing - Tongliao Railway in the north, and Huatai Project's properties are all within 3 to 10km away from the Honghuagou (红花沟) Station of Beijing - Tongliao Railway. There are gravel roads connecting both projects' properties to the railway station and main paved roads.

#### **4.1.2 Wulong Project**

The Wulong project is located in Liaoning Province, about 15km west of Dandong City. Access to the Wulong gold mine is very convenient. The Dandong-Dalian highway is 11km away from the mine in the southeast. There are gravel roads connecting the mine to the main paved roads.

#### **4.1.3 Hanfeng Project**

The Hanfeng project is located in Jilin Province, approximately 42km of northwest of Longjing City. Access to the project area is excellent. The Changchun-Tumen Railway and National Highway G302 pass through Laotougou Township in the southeast of Tianbaoshan mine area. Laotougou Town is just 15km southeast of the project's properties and there is a cement road connecting Laotougou Town and the project site.

#### **4.1.4 Jintai Project**

As shown in Figure 3-2, access to the project is convenient. The project is in Dali Bai Autonomous Prefecture of Yunnan province, approximately 3 km away from Liantie Township. Liantie Township is about 51 km away from Eryuan County in the southwest by asphalt road. And Eryuan County is about 408 km from Kunming, the capital of Yunnan province.

Liantie Township is about 106 km away from Dali going pass Yangbi County. The nearest railway station is Shangguan Station of Dali - Lijiang Railway. The Xidengping mine is about 78 km to the Shangguan Station going pass Liantie Township and Eryuan County. There are daily buses between Eryuan County and Dali going pass Liantie Township. There are gravel roads connecting the mine to the main paved roads.

## 4.2 Local Resources and Infrastructure

### 4.2.1 Jilong and Huatai Projects

The region is a typical habitation for Han nationality and minorities as Mongolian, Hui and others. The population is not dense but seems enough for mining and other industrial activities. The basic economic activity is dominated by farming, while animal husbandry, handicraft manufacture as well as mining are secondary industrial activities. The power and coal supplies are quite convenient for local mining industry.

Jilong Mining has built a 4,000kVA and 6,300kVA general step-down substation in the #1 mining area of the Zhuanshanzi Gold Mine. The power supply comes from the secondary substation (66kV) of Yuanbaoshan. The power supply with 10kV is sourced from Jilong Mining's general step-down substation and can meet the production needs. Water for production and domestic use is sourced from underground water with a water volume of 70 cubic meters per day ("m<sup>3</sup>/d") per water well. The wired telephone and mobile communication cover the mining area.

The power supply for the Huatai project is sourced from the Northeast Power Grid, and the industrial 10kv high-voltage line has been connected to the Lianhuashan and Honghuagou gold mining areas, which can meet both production needs. Water for production and domestic use is sourced from underground water (electromechanical wells), and the water volume is relatively sufficient. The China Mobile communication network and China Unicom network have covered the mining area.

### 4.2.2 Wulong Project

Wulong operating gold mine is an old mining area with complete power supply facilities. The Northeast Power Grid runs through the whole area, and the power supply is sufficient. The water for mine production and surrounding residents is taken from the special water intake area of the mining area, and water resources are relatively sufficient.

### 4.2.3 Hanfeng Project

Residents in the region are mainly Han and Korean, each accounting approximately for nearly 50%. The local economy is dominated by agriculture and mining industry. Agriculture is mainly based on corn, rice, and soybean planting. Mining development is a pillar industry in the local area. Hanfeng Mining's Tianbaoshan Lead-Zinc Mine is a large profit and tax household in Longjing City and has played a positive role in promoting the development of the local economy. There is a 110KV high-voltage dedicated line for Tianbaoshan operating mine, and the power supply can fully meet the production needs.

### 4.2.4 Jintai Project

The region is a typical habitation for Bai and the others are Yi, Han, Naxi and Hui. The basic economic activity is dominated by agriculture and husbandry. Agriculture is mainly based on rice, wheat, corn, and buckwheat planting. Economic crops include walnuts, roasted tobacco, chestnuts, etc. More than 95% of the population is engaged in agriculture, and the economy and culture are relatively backward.

The Puding hydropower station has been built on the Heihui River in the south of Xidengping mine and has been incorporated into the State Grid. The national high-voltage transmission line passes through the southern part of the project. The power supply can fully meet the production needs.

The surface water system is relatively developed, which can be introduced by diversion pipe, and the water quantity and quality can meet the needs of production and living.

### **4.3 Climate Physiography**

#### **4.3.1 Jilong and Huatai Projects**

Both Jilong and Huatai projects areas are located in Nuluerhu mountainous area. The topography is characterised by low to middle mountains or hills, with an elevation ranging from 660 to 844m above sea level ("asl") in Jilong project area, and 1,024 to 730m asl in Huatai project area. Climate type in the region belongs to arid and semi-arid continental climate zone, which is characterized by cold winter, hot summer and windy in spring and autumn.

Generally, the weather in the project site is cold with a yearly average temperature at approximately 7.0 degree Celsius (°C). The lowest temperature in winter could be minus 30.7°C, and the highest temperature in summer can reach 38.7°C. The extremely cold and hot weather usually appears in December and July, respectively.

The annual precipitation is from 217.6 to 595.1 millimetres (mm), whereas the annual evaporation in the region is about several times more than the amount of precipitation, which is from 1.956.0 to 2,836.6mm, with an average of 2.513.5mm. The frost period in the mine area is from late October to March of the next year, the maximum thickness of frozen earth could reach around 1.5 to 2.0 meter (m). The annual average wind speed is 2.4m per second ("m/s"), and the maximum wind speed is 17/s.

There is a northwest direction river valley in the west of the Zhuanshanzi gold mine area. Except for the temporary running water in summer, the river is usually dry. It contains rich groundwater, which is the main water source of the mine.

There is no surface water body in the Huatai project area. About 3km away from the Lianhuashan gold mine in the south, there is a river (i.e., Seluga River), its water volume is small, and the flow is basically cut off in summer.

According to the Seismic Intensity Parameter Zoning Map of China, the seismic peak acceleration in both project areas is 0.10 to 0.15g, which is VII degree. No geological disasters, such as landslide and debris flow are found.

#### **4.3.2 Wulong Project**

The topography in the Wulong project area is characterized by mountains and hills with an elevation ranging from 120m to 606m asl. The terrain is high in the north and low in the south. The terrain undulates greatly, and the V-shaped valleys cut deeply.

The water system in the Wulong gold mine area is relatively developed, and most of them are seasonal gullies. The mine area is located in the southeast of the Liaodong Peninsula, belonging to

the northern temperate marine climate zone, with four distinct seasons. The annual average temperature is at the range from 8.3 to 10.3°C. The lowest extreme temperature in winter is -25.1°C, and the highest extreme temperature is 34.1°C in summer. The average annual precipitation is 656 mm, mostly concentrated in July and August. There are more north or northwest winds in winter, and more south or southeast winds in summer. The maximum thickness of frozen earth is 1.07m, and the frost-free period is 185 days.

#### 4.3.3 Hanfeng Project

The Hanfeng project area is located in the northern extension of the Yingering Mountains in the Changbai Mountains. The terrain is high in the northwest and low in the southeast. The mountains are generally north-northwest direction, with many peaks, steep mountains, and narrow "V"-shaped valleys. Generally, the altitude of mountain peaks ranges from 500m to 800m asl, with a relief of about 300-500m. The main peak in the area is Tianbao Mountain, with an altitude of 1073m asl, and the lowest erosion datum is about 350m.

The Tianbaoshan lead-zinc mine area has a temperate continental climate, with large seasonal temperature differences. The annual highest temperature is concentrated in July to August, with an average temperature above 20°C, and the lowest temperature in January can reach below -30°C. July to August is the rainy season, with an average annual precipitation of 800-900mm. The freezing period is from late November to mid-April of the next year, and the thickness of the frozen soil layer can reach 1.5m.

The rivers in the project area belong to the Buerhatong River basin of the Tumen River system. The rivers mainly include Tianbaoshan River, Jiuhudong River, and Chencaigou River, which originate in Tianbaoshan, flow southeasterly into the Burhatong River at the Huxiantang area. The drainage area of Tianbaoshan River is 8.7km<sup>2</sup>, with a general flow rate of 301.1 liters per second ("l/s"), and a flow rate of 585-641l/s in wet season, which can meet the mine production and domestic water needs.

#### 4.3.4 Jintai Project

The project area is located in the west of the Luoping-Diancang Mountains (trending north-south) in Hengduan Mountain, western Yunnan, and in the east bank of Heihui River. The terrain is high in the northeast and low in the southwest. Generally, the terrain is a gentle slope, with an elevation of 1,800 ~ 2,300 m ASL. The erosion landform is generally gently sloping to the west (Heihui River), and the average slope is about 10°. The terraces can be roughly divided into 5 levels, the slope of the steps is about 25°, the steps are flat, and most of them are cultivated land. The slope of the left bank of Heihui River is about 35° ~ 45°. The west slope of Luoping Mountain is a steep slope with an elevation of 2,300 ~ 2,900 m asl, among which the area with an elevation of 2,300 ~ 2,500 m asl is the remaining terrace landform, with a lot of tongue strip protruding ridges.

The project area has a north subtropical plateau monsoon climate, the highest temperature is 30°C, the lowest temperature is -5°C, the average annual temperature is 13.9°C. The average annual rainfall is 1,200 mm, the maximum rainfall is 1,440.5mm, and the maximum rainfall in 24 hours is 89 mm. May to October is the rainy season, the precipitation accounts for more than 80% of the year. Annual average evaporation of 1,405.7 mm, frost-free period for about 280 days, occasional heavy snow, as well as local areas of hail, is the main disastrous climate in the area. The wind direction in

the area is mainly northwest with an average speed of 2 ~ 8 m/s, and the maximum wind speed at Luoping Mountain is 35 m/s.

According to Code for Seismic Design of Buildings (GB50011-2001) of China, the seismic peak acceleration in the area is 0.20 g, which is VIII degree. The characteristic period of ground motion response spectrum is 0.45 s, which belongs to unstable region. No geological disasters, such as landslide and debris flow are found.

## 5 Geological Setting and Mineralisation

### 5.1 Regional Geology

#### 5.1.1 Jilong and Huatai Projects

Tectonically, the Honghuagou-Lianhuashan and Zhuanshanzi gold deposits are situated at Lianhuashan fault block in Inner Mongolia platform uplift of North China platform. Regional structures and magmatic activity are frequent, which provide the source and conduit for the gold-bearing hydrothermal fluid, and the secondary structure provides the site for the formation of gold deposits. The development of tectonic processes and magmatic activities are favourable for the formation of gold mineralisation.

The Paleozoic strata of Honghuagou-Lianhuashan and Zhuanshanzi gold deposits belong to Chifeng stratigraphic unit of the Inner Mongolia grassland stratigraphic zone in North China stratigraphic region. The Mesozoic and Cenozoic strata belong to Ulanhot-Chifeng stratigraphic unit of the Greater Khingan-Yanshan stratigraphic zone in the Coastal Pacific stratigraphic region.

The outcropped strata are Paleoproterozoic Wulashan Group, Proterozoic Great Wall System, Xinmin Formation of Middle Jurassic of Mesozoic, Baiyingaolao Formation of Upper Jurassic of Mesozoic, Jiufotang Formation of Lower Cretaceous, Neogene Miocene Hannuoba Formation, Quaternary Pleistocene and Holocene. The Paleoproterozoic Wulashan Group is the main strata hosting the Mineralisation.

Fault structures in the project area are developed, the faults are divided into 4 groups: nearly east-west, nearly north-south, northwest and northeast trending faults. The northwest trending is the main faults controlling the gold mineralisation.

Magmatic intrusion is extensive, with multiple stages and complex types. Magmatic intrusive rocks include Jurassic granite-porphyry, monzo-granite and Alkali-Feldspar Granite.

#### 5.1.2 Wulong Project

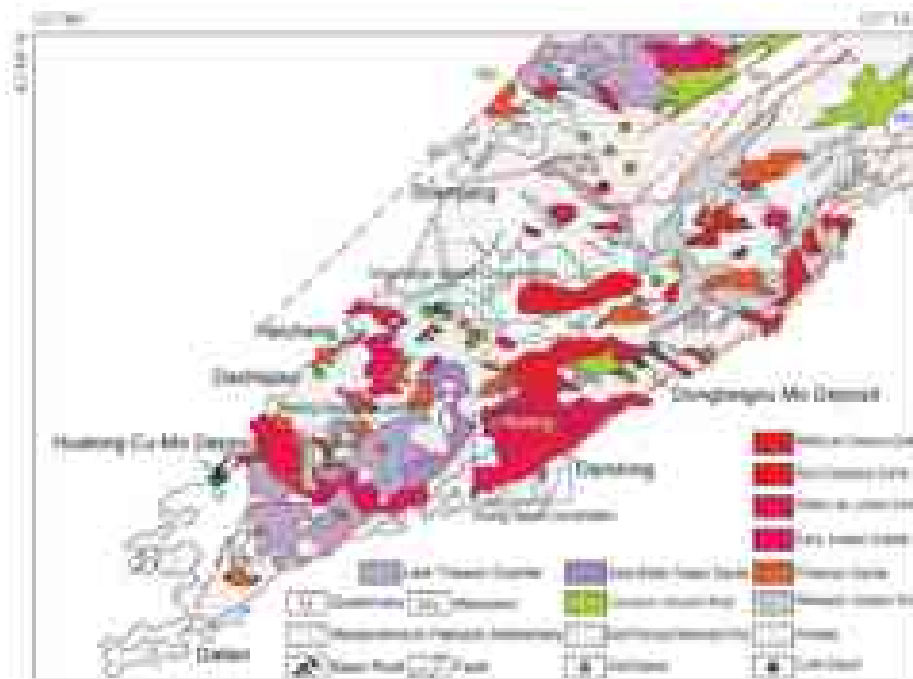

Geotectonically, the Wulong project is located in the eastern margin of North China Block. The eastern part of the North China Block is comprised of Longgang block, Shandong-Liaoning-Jilin orogenic belt and Langlin block (Figure 5-1). There are a number of large and super-large deposits distributed in eastern area of Shandong, eastern area of Liaoning, western area of Henan, northern and eastern area of Hebei, and southern area of Jilin (Zhu et al., 2015).

The strata in the eastern area of Liaoning are mainly composed of Precambrian metamorphic rocks and Mesozoic volcanic and intrusive rocks (Yang et al., 2003). The Precambrian rocks mainly consist of the Paleoproterozoic diorite, quartz diorite, and granodiorite and the Paleoproterozoic Liaohe Group, mainly composed of intermediate and low-grade metamorphic rocks, including various types of schist, gneiss, dacite and amphibolite. The Neoproterozoic and Mesozoic thick sedimentary rocks are sporadically outcropped in the area.

In the Mesozoic, the eastern area of Liaoning became an important part of the circum-Pacific tectonic-magmatic belt, producing a large area (2,000 km<sup>2</sup>) of granite and volcanic rocks, which intruded into the Precambrian metamorphic rocks. The Mesozoic magmatism of the eastern area of

Liaoning was divided into three phases: the Triassic (210~231 Ma) alkaline rocks, diorite and monzonitic granite; the Jurassic (153-180 Ma) quartz diorite, diorite, and gneissic monzogranite; and the Cretaceous (120-131 Ma) diorite, granodiorite, monzonite and lamprophyre, dolerite dykes. The Early Cretaceous magmatism occurred in the context of regional extensional disruption of the North China Block, which led to the formation of large-scale gold Mineralisation in the region (Zhai Mingguo et al., 2003).

**Figure 5-1: Regional Geology Setting of Wulong Project**

Sources: Modified after Zhang et al. (2015).

### 5.1.3 Hanfeng Project

The large-scale Tianbaoshan metallogenic region, with over one hundred years of mining history, is located in eastern Yanbian area, north-eastern China. There are abundant nonferrous metal resources and diverse deposit types, metallogenic theory and ore-prospecting in the Tianbaoshan region. According to the recent research data, the Yanbian area belongs to the Paleo-Asian Ocean tectonic region during the Paleozoic Era and to the Paleo-Pacific Ocean tectonic region since the Jurassic period. Evolution and superimposition of the two tectonic regions resulted in multi-cyclic tectonic-magmatic activities and provided a beneficial ore-forming geological condition to the intensive nonferrous and precious metal Mineralisation in this area. Up to now, at least four types of deposits have been discovered, including skarn lead-zinc deposit (i.e., Lishan deposit and Xuanchanghoushan deposit), crypto-explosive breccia lead-zinc-silver deposit (i.e., Xinxing deposit), sedimentary metamorphic-hydrothermal copper-lead-zinc deposit (i.e., Dongfengnanshan deposit) and lode (-porphyry) molybdenum deposit (i.e., Dongfengbeishan deposit). The regional geology setting is shown as Figure 5-2.

**Figure 5-2: Regional Geology Setting of Hanfeng Project**

1-Quaternary; 2-Lower Jurassic Mingyuegou Formation; 3-Permian Miaoling Formation; 4-Carboniferous Tianbaoshan Group; 5-Silurian Qinglongcun Group; 6-Hercynian intrusive rocks; 7-Indosinian intrusive rocks; 8-Yanshanian intrusive rocks; 9-granite; 10-biotite granite; 11-alkali-feldspar granite; 12-granite diorite; 13-quartz diorite porphyry; 14-diorite; 15-quartz porphyry; 16-sub and site; 17-deposit; 18-compresso-shear fault; 19-transtensional fault; 20-inferred compressor-shear fault; 21-inferred trans tensional fault

#### 5.1.4 Jintai Project

The Jintai Project is located in the eastern edge of the Changdu-Lanping-Simao block of the Qiangtang-Sanjiang orogenic system and is adjacent to east of the Diancang – Yuanlao Mountain metamorphic basement complex of the upper Yangtse paleo platform. The project is in the combination area of two primary tectonic units, Qiangtang-Sanjiang orogenic system and Yangtse platform. The regional metallogenic zone belongs to the coastal Pacific metallogenic domain, the upper Yangtse platform metallogenic province, the middle part of the Lijiang-Dali-Jinping Au-Cu-Ni-Pt-Pd-Mo-Mn-Fe-Pb-Zn mineral belt. With complex geological structure, frequent magmatic activity and strong Mineralisation, the area is a favourable location for searching for gold polymetallic deposits related to the tectono-magmatic activity in the Himalayan period.

The outcropped strata in the east part of the Qiaohou - Yangbi Fault are the Paleoproterozoic Huanglongtan Formation and Shimengguan Formation, the Neoproterozoic Luopingshan Formation, and the Permian Maokou Formation and Wulongba Formation. The outcropped strata in the west part of the Qiaohou - Yangbi Fault are the Cretaceous Jingxing Formation, Nanxing Formation and Hutousi Formation, the Paleogene Yunlong Formation and Baoxiangsi Formation and the Neogene Sanying Formation. The Quaternary is commonly seen in rivers slopes and gullies in the region.

The regional tectonic structure is roughly separated by the Qiaohou-Yangbi Fault, with the Mesozoic depressional basin of Lanping to the west, the Cenozoic slip pulling basin of Qiaohou-Liantie superimposed on the eastern edge of the basin, and the crystalline metamorphic basement (orogenic belt) of the Luoping Mountain Goutoujing Group to the east. The tectonics in the region is

characterized by multi-period inherited activities, and the regional tectonic structure is generally north-northwest trending.

There are two sets of faults in the region, one is trending northwest-southeast, and the other is trending northeast-southwest. The northwest-southeast fault is the main fault in the region, which controls the whole regional tectonic structure and controls the regional geohistorical evolution. The eastern northwest-southeast fault is mainly developed in the ancient metamorphic rocks of the metasedimentary boundary, characterized by multi-stage activity, ductile in the first stage and brittle rupture in the later stage; the western northwest-southeast fault is mainly developed in the Mesozoic strata, characterized by low angle and brittle rupture, mostly positive faults with torsion. From the intersection relationship, the northwest-southeast faults are cut and staggered by the northeast-southwest faults; the northeast-southwest fault is obviously new. The northeast-southwest faults cut through the stratigraphy of the Sanying Formation of Pliocene, indicating that the last activity of the faults was later than the Pliocene.

The regional folding is divided into two parts, east and west. The western part is a fold composed of Mesozoic and Cenozoic strata and the eastern part is an anticline and monoclinial fold composed of schist in ancient metamorphic rocks. The western part of the folds is, the Changyi compound syncline and its subordinate anticline and syncline, the Heihui River compound syncline and its subordinate anticline and syncline. The Heihui River compound syncline is the norther extension of the Changyi compound syncline. The eastern fold is composed of the Lujiacun metamorphic-tectonic schist antiform and the Dayeping monoclinial fold.

The intrusive rock in the region is the Variscan gabbro outcropped in the north part of Dayeping, intruding into Wulongba Formation. The gabbro is trending northwest - southeast and generally consistent with the regional tectonic structure. It is cut off by the north-east fault to the northwest and covered by the Quaternary to the southeast. The rock outcrop is about 2,300m long and 250m wide, and it is a rock wall. The lithology is norite gabbro. The rocks have semi-automorphic granular texture and blocky structure. Near the Qiaohou-Yangbi Fault, there are vein rocks such as granite porphyry, diabase, monzonite porphyry.

There are three types of metamorphic rocks, regional metamorphic rocks, dynamic metamorphic rocks, mixed rocks, and hydrothermal metamorphism (alteration). Metamorphism is more complex.

Soil geochemical surveys at scales of 1:200,000 and 1:50,000 have been carried out in this area. The results show that most of the gold anomaly are in the distribution area of sand, gravel and mudstone of the Sanying Formation.

Gold mineralisation in the metallogenic zone is closely related to Himalayan tectonics and alkaline magmatic activities, and there are mainly two types of deposits, porphyry, and shear zone. Porphyry gold deposit is represented by Heping Beiya, Xiangyun Machangjing and Jinping Chang'an, and shear zone gold deposit is represented by Yuanyang Daping.

## 5.2 Property Geology

### 5.2.1 Jilong Project

The outcropped strata in the Zhuanshanzi Mine, including both Zhuanshanzi Block and Zhuanshanzi #4#5#6#7 Block areas are the Lower Permian Yujiabeigou Formation, the Upper Jurassic Baiyingaolao Formation and the Quaternary sediments. Figure 5-3 shows the local geology setting of the Zhuanshanzi Mine.

Figure 5-3: Local Geology Map of Zhuanshanzi Mine

The Lower Permian Yujiabeigou Formation strikes northeast ( $30^{\circ}$ - $70^{\circ}$ ) and dips to southeast with a dip angle of between  $10^{\circ}$  and  $90^{\circ}$ . The thickness of this formation is 500m. This formation is divided into three members: the lower member is at the central south, and consists of crystalline limestone and layered marble, which is the wall rock of mineralisation. The middle member is composed of crystalline limestone and marble, and the lower member includes slate and siltstone.

The Upper Jurassic Baiyingaolao Formation is a set of continental intermediate-felsic volcanic lava and pyroclastic rocks, including rhyolite, andesite, amygdaloid andesite, rhyolitic tuff, and andesitic tuff. The formation strikes northeast and dips to southeast with a dip angle of  $50^{\circ}$ - $70^{\circ}$ . The thickness of this formation is 700m.

The Quaternary sedimentary series include loess-like loamy soil, loamy soil containing calcareous nodules.

The structure in project area is developed and dominated by fault structure. The faults are developed at the Yanshan period and can be divided into three groups: northwest, nearly east west, northeast trending faults. The northwest trending faults host the gold mineralisation.

The Intrusive rocks are well developed at the deposit area, they include early Cretaceous granite, late Cretaceous granite porphyry, Jurassic and Permian diorites. Dykes include felsite porphyry, trachyte and quartz vein, which strike northwest, northeast or most east-west.

Wall rock alteration includes pyritization, carbonation, silicification, chloritization, sericitization, epidotization.

## 5.2.2 Huatai Project

### Honghuagou #1 Mining Zone

At the Honghuagou #1 Mining Zone area, the outcropped strata include the Archean Wulashan Group, the Lower Cretaceous Jiufotang Formation, and the Quaternary sediments. Figure 5-4 is the local geology setting.

**Figure 5-4: Local Geology Map**

Source: SRK

The Archean Wulashan Group is widely outcropped at the #1 Mining Zone, which is main mineralisation hosting strata. Lithologically, the Wulashan Group is composed of amphibole plagioclase gneiss, amphibolite, migmatite granite, amphibolite gneiss.

The Lower Cretaceous Jiufotang Formation partially occurs at the middle west of the #3 Mining Zone, the lithology is mostly tuffaceous sandstone, discontinuous overlies above the Archean Wulashan Group.

The Quaternary sedimentary rocks are widely outcropped at the mining area, and lithologically they are primarily red clay, variegated gravel layer, yellow sub-sandy soil and loess, the thickness is 20~50m.

Fault structures in the #1 Mining Zone area can be divided into four groups: nearly east-west, nearly north-south, northwest and northeast trending faults. The nearly north-south trending faults are branches of the regional faults, which host gold mineralisation. The north-south trending fault dips to east with a dip angle of 70-80° and controls the #82 Vein. The length and width of this vein is about 330m and 0.5-2.0m, respectively.

Magmatic intrusion doesn't outcrop at the #1 Mining Zone area, only dykes outcrop as granite porphyry and diorite porphyrite veins.

Wall rock alteration includes facial and linear shapes. Facial wall rock alterations include potassium feldspar, albitization, silicification, albite-epidotization, albite-zoisitization, sericitization, pyrite sericitization and carbonation. Linear wall rock alteration develops with hydrothermal replacement, at the breccia around the gold veins, and the linear wall rock alterations include sericitization, chloritization, silicification, pyritization, carbonation.

Gold mineralisation bodies develop at the structural breccia as veins. Mineralisation includes pyrite, pyrrhotite, galena, and sphalerite, which show as disseminated, veined or reticulated widespread. The contact between the wall rock and mineralised bodies is clear.

#### **Honghuagou #86 Vein**

The strata include the Xiaotazigou Formation of Archean Jianping Group, composed of plagioclase hornblende gneiss, hornblende plagioclase gneiss with magnetite quartz lenticle and marble lens; the Baiyingaolao Formation of Late Jurassic, consisting of rhyolite and andesite; and the Quaternary sediments. The fault structures well developed in the property area, they consist of nearly east west, northeast, northwest, and nearly north south trending faults.

The magmatic activity in the area is strong and frequents at different stages and types. The intrusive rocks primarily consist of the Honghuagou granite porphyry dykes.

Wall rock is the Xiaotazigou Formation plagioclase hornblende gneiss. Wall rock alterations include silicification, pyritization, sericitization, chloritization, and carbonation.

#### **Pengjiagou Mine**

The strata include the Xiaotazigou Formation of Archean Jianping Group and the Quaternary sediments. The fault structures include northeast and northwest trending faults.

The magmatic intrusive is not developed, only Yanshanian syenite porphyry and dykes is revealed.

Wall rock alterations include pyritization, sericitization, chloritization, and carbonation.

#### **Lianhuashan #5 Mining Zone**

At the Lianhuashan #5 Mining Zone area, the outcropped strata include the Archean Wulashan Group, and the Pleistocene and Holocene Series of sediments.

The Archean Wulashan Group is widely outcropped at the #5 Mining Zone area, which is main strata hosting the gold Mineralisation. The lithology of the Archean Wulashan Group includes amphibole plagioclase gneiss, amphibolite, migmatite granite, and amphibolite gneiss.

The Quaternary sediments are mainly red clay, variegated gravel layer, yellow sub-sandy soil and loess. The thickness is 60~130m.

Structures in the #5 Mining Zone area can be divided into most east-west, nearly north-south, northwest trending faults. The nearly north-south trend faults are the branch of regional faults F8 and F9, which host mineralisation, and they occur at the central south of the #5 Mining Zone area and control the occurrence of mineralised bodies of #51-1, #51-6, #51-8, #51-9, #51-10.

Magmatic intrusion doesn't expose at the #5 Mining Zone area, only dykes expose as granite porphyry and diorite porphyrite vein. The dykes do not destroy the mineralisation.

Wall rock alteration includes facial and linear shape. Facial wall rock alterations include potassium feldspar, albitization, silicification, albite-epidotization, albite-zoisitization, sericitization, pyrite sericitization and carbonation. Linear wall rock alteration develops with hydrothermal replacement, at the breccia around the gold veins, and linear wall rock alterations include sericitization, chloritization, silicification, pyritization, and carbonation.

Gold mineralised bodies develop at the structural breccia as veins. Mineralisation includes pyrite, pyrrotite, galena, and sphalerite, which show as disseminated, veined or reticulated widespread. The contact between the wall rock and mineralised bodies is clear.

#### **Lianhuashan #26 Vein**

The outcropped strata include the Xiaotazigou Formation of Archean Jianping Group and the Baiyingaolao Formation of Upper Jurassic. Structures mainly include northwest and nearly north-south trending faults, and the nearly north south trending faults host the gold Mineralisation. Magmatic intrusive is not developed, only dykes occur.

Wall rock alterations include pyritization, sericitization, chloritization, and carbonation.

#### **Lianhuashan #38#7 Vein**

The outcropped strata include the Xiaotazigou Formation of Archean Jianping Group, composed of plagioclase hornblende gneiss and the Quaternary sediments. Magmatic intrusive is not developed and only small dykes occur.

Structures mainly include faults at small scale, which host the gold mineralisation.

Wall rock alterations include potassium feldspar, albitization, quartzitization, Albite~epidote, and albite~zoisite.

### **5.2.3 Wulong Project**

As shown in Figure 5-5, the characteristics of the stratigraphy, structures and igneous rocks are detailed as following.

The Paleoproterozoic Liaohe Group rocks, layered metamorphic rocks, are sporadically outcropped, mostly in the form of xenoliths in the Mesozoic granites and mixed granites distributed over a large area. The stratigraphy of the area is composed of Lieryu Formation, Gaojiayu Formation, Dashiqiao Formation, Gaixian Formation and Quaternary, from the oldest to the newest. These rocks consist of various types of marble, schist and leptynite. The metamorphic rocks have a high background of gold abundance. The gold grade in marble is about 5.36~21.0 part per billion ("ppb"), and in schist and leptynite the grade is 3.88~11.0 ppb. These are the initial gold sources, and they contribute the basis for the formation of the gold deposit.

The Lieryu Formation rocks are located mainly around Sanguliu, southeast of the region. They dip to northeast with a dip angle of 35° - 65°. They are composed of biotite leptynite, biotite amphibole leptynite, and tourmaline leptynite.

The Gaojiayu Formation rocks are in the western part of the region around Yemofang and in the southeast part around Sanguliu. They dip to northeast with a dip angle of 35° - 65°. They are composed of graphite leptynite, graphite biotite leptynite, biotite schist, and biotite gneiss with marble.

The Dashiqiao Formation rocks are in the southwestern part of the region around Songjiapu. They dip to northeast with a dip angle of 35° - 65°. They are composed of magnesite marble, calcite marble and dolomitic marble.

The Gaixian Formation rocks are in the southwestern part of the region around Songjiapu. They dip to northeast with a dip angle of 35° - 65°. They are composed of slate, biotite schist and biotite gneiss.

The Quaternary is the eluvium and diluvian sediments. They are composed of silty clay and sandy gravel. The thickness is about 0.3-2.7m.

**Figure 5-5: Property Geology Map**

Sources: Resource & Reserve Verification Report of the Wulong Mine in Zhen'an District, Dandong City, Liaoning Province, 2019.

The structure in this area is mainly fault structure and then fold structure. The Yalu River Fault is the largest fracture zone in the region, which is located at the edge of the region and extends northeast and dips to southeast. It is formed by multiple extrusion and shearing. This fault zone controls the spreading of copper and gold Mineralisation in the region.

The fault structure in the region is mainly the product of the Mesozoic Yanshan tectonic movement, which can be divided into northeast trending faults and northwest trending faults. Extensions of the faults are more than 10 km and the spacing is 2-4 km and 4-6 km respectively. The two groups of faults form a diamond-shaped lattice structure, controlling the distribution of the gold-bearing Mineralised bodies.

The faults can be divided into five groups: the east-west (“**EW**”) trending, north-northeast (“**NNE**”) trending, northwest (“**NW**”) trending, northeast (“**NE**”) trending, and north-south (“**SN**”) trending faults, according to their characteristics. The faults are characterized by multi-phase activities and are mostly filled by various types of vein rocks.

The NW-trending fault is an ore-bearing, tension-torsional fault, which extends about 10 km along the direction of 320°. It dips to SW and the dip angle is from 50° to 70°. It is filled by fine diorite veins and lamprophyre, whose thickness are about 3 to 7 m and up to 25 m sometimes.

The NNE-trending faults are compressive-twisting faults and parallel distributed between each other. They dip west-northwest (“**NWW**”) with dip angles of about 56° - 85°. The extension of the faults is ranging from 4 km to 10 km with a width of 2-30 m. The fault zone is strongly fragmented, and is characterized by strong silicification and pyritization alterations, in which there are extrusion lenses of different scales, and the silicification is very strong, and the lenses are mostly interspersed within cleavage zone, and quartz veins can be seen, and the fracture is characterized by multi-phase development, which is the main ore-bearing structure of the area.

The NE-trending fault is a compressive fault, with an extension of 45° and dip NW at dip angles ranging from 30° to 50°. The NS-trending fault is a tension-torsional fault, with an extension of 350°-0° and nearly vertical. It is filled by granite porphyry veins. The EW-trending fault (F8) is a compressive fault, with an extension of 75°-85° and dip SE at dip angles ranging from 50° to 70°. It is filled by fine diorite and quartz veins.

The fold structure is namely the Wulong anticline, with an extension of 85°. The axial surface of the fold is nearly vertical and the dip angle of the shanks is about 50°-60°. This fold structure controls the distribution of the Hegou-Wulong-Hongshi mineralised zones, which is the earliest fold in the area.

The tectonic activity of the area is mainly of Yanshan period, according to the characteristics of the fold and fault structures on the stratigraphy and their internal fillings.

The area is characterized by the intrusion of Paleoproterozoic biotite granite and granitelle, early Yanshanian diorite, granodiorite, granite, and many dykes accompanying the intrusion. In the west of the Wulong gold mine, it is the Paleoproterozoic Hongshi biotite granite. In the south, it is the Yanshanian (126 Ma) Sanguliu granodiorite. And in the north, it is the Yanshanian (112 Ma) Dingqishan biotite granite. They are closely related to gold Mineralisation.

Intermediate-acid and mafic dykes develop in the area, which are detailed described as follows.

The diorite porphyrite and the fine diorite are almost the same and can't be identified clearly, with a slight difference of crystallization. They are grey and pink, and are composed of fine plagioclase, amphibole, and little quartz. They are nearly north-south trending, and dip to east or west with dip angles mostly 80°. They extend dozens to hundreds of meters, mainly around the tectonic zone, accompanying the gold-bearing quartz veins.

The lamprophyre is located near the upper and lower plates of the quartz orthoclase porphyry. They are nearly NS-trending, dip to east with the dip angles of 55°-70°. They can be divided into two groups, the odinite and the garganite. They extend dozens of meters with a width ranging from 1 to 10m.

The diorite porphyry and the fine-grained diorite are in the wall rock near the Mineralised body. They are characteristic of silicified, chlorite, sericite, carbonatite, and potassium. The quartz orthoclase can also be seen in some parts of the alteration phenomenon. It can be considered that these three vein rocks are of the Mineralisation period, mainly formed before Mineralisation. The lamprophyre, according to its cutting relationship of vein rock and no alteration, should be of post-mining period.

#### **5.2.4 Hanfeng Project**

##### **Lishan Mine**

Tianbaoshan Lishan-Xinxing mines are located at the intersection of Jihei fold system, Yanbian Eugeosynclinal fold belt and Dunhua uplift of Jilin Eugeosynclinal fold belt. The strata in this area are mainly the Paleozoic Ordovician - Permian marine carbonate and volcanic sedimentary rock series, and the Mesozoic Jurassic continental pyroclastic rocks. Intense magmatic activity occurred and Hercynian and the Yanshan granites developed.

Fold structure and fault structure are developed in the area and were intersect with each other to form complex structural system, which provides migration channel and ore storage space for Mineralisation. In short, the metallogenic geological conditions are superior, and it is an important polymetallic Mineralisation concentration area in Jilin Province. The geology map of Tianbaoshan-Lishan mine is shown in Figure 5-6.

Figure 5-6: Geology Map of Lishan Mine

Source: SRK

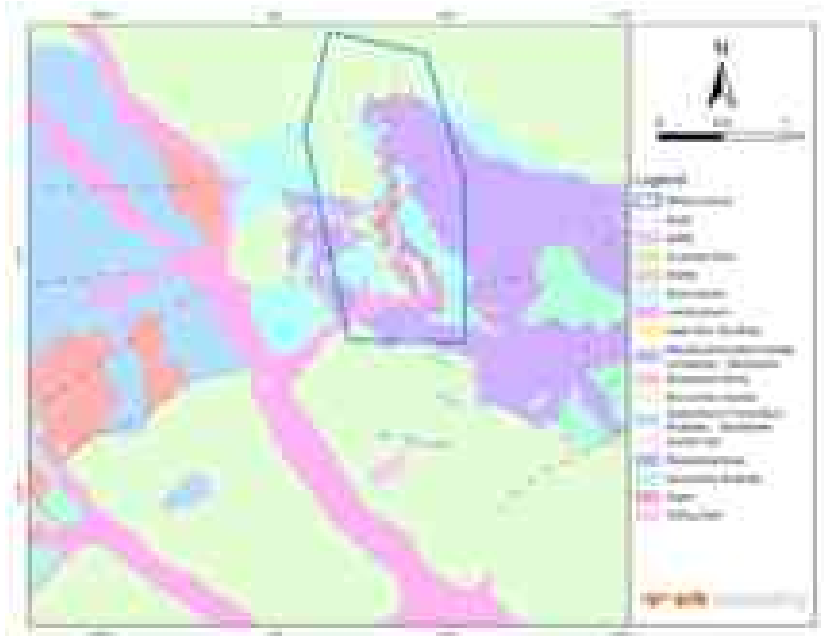

#### 6.2.4.2 Dongfeng Mine

Tianbaoshan Dongfeng Mine is located at the intersection of the west margin of Yanbian Eugeosynclinal fold belt and Dunhua uplift of Jilin Eugeosynclinal fold belt. The strata in this area are mainly the Paleozoic Ordovician - Permian Marine carbonate and volcanic sedimentary rock series, and the Mesozoic Jurassic continental pyroclastic rocks. There are strong magmatic activities, showing the Hercynian and Yanshan granites. Fold structure and fault structure are developed in the area, and they intersect each other to form complex structural system, which provides favourable migration channel and ore storage space for Mineralisation. The geology map of Dongfeng mine is shown in Figure 5-7.

The strata in the area are mainly the Late Paleozoic Permian Miaoling Formation, and locally the Early Paleozoic Ordovician Qinglongcun Group and the Mesozoic Jurassic Tuntianying Formation.

Magmatic activity is intense and widely distributed in the area, accounting for about 70% of the whole area. They are mainly the Hercynian, Indosinian and Yanshanian, among which the Indosinian and Yanshanian magmatic activities are particularly strong and closely related to Mineralisation.

The structure in this area is mainly fault structure, which can be divided into three groups of NW-trending, NNW trending and NE trending according to the characteristics of faults. In the molybdenum mine area, there is also a group of near east-west trending structure and east-west contact zone structure.

**Figure 5-7: Geology Map of Dongfeng Mine**

Source: SRK

### 5.2.5 Jintai Project

The strata outcropped in the project area are the Paleoproterozoic Huanglongyan Formation and Shimenguan Formation, the Cretaceous Jingxing Formation, the Paleogene Yunlong Formation, the Neogene Sanying Formation and the Quaternary sediments (Figure 5-8).

**Figure 5-8: Local Geology Setting**

Sources: Geological (Advanced Exploration) Report of the Xidengping Gold Deposit, Eryuan County, Yunnan Province, 2022

The Paleoproterozoic Huanglongtan Formation can be subdivided into two Members: the first Member of Huanglongtan Formation is composed of gneiss and is distributed in the eastern part of the region. The second Member of Huanglongtan Formation is composed of light-yellow amphibolite gneiss, light grey biotite plagioclasic granulite, and biotite plagioclasic gneiss and is distributed in the northeast part of the region.

The strata of the Paleoproterozoic Shimenguan Formation are distributed in the middle east of the mining area and lithologically, they are composed of light-grey dolomitic marble with phlogopite, light grey sandy microcrystalline marble, and dolomitic marble.

The strata of the Cretaceous Jingxing Formation are mainly distributed in the west of the region on both banks of the Heihui River. It is parallel unconformity contact or fault contact with the overlying and underlying strata.

The strata of the Paleogene Yunlong Formation are composed of mudstone and siltstone; they are mainly located near the Qiaohou-Yangbi Fault on the eastern part of the region.

The Neogene Sanying Formation is subdivided into three members: Member 3, Member 2 and Member 1. The strata of the Member 3 are distributed in the middle of the mining area, which are covered by the Quaternary alluvial-diluvium and slop-deposit.

Member 2 is subdivided into three beds, Bed 3, Bed 2 and Bed 1. The strata of Bed 3 are distributed on the east and west sides of Member 3 and are composed of cataclastic sandstone with silty, coarse sandstone, silty breccia with thin layers of silty mudstone. The Bed 3 is the most important gold-bearing strata in the mining area.

The strata of Bed 2 are distributed on the east and west sides of Bed 3 and are mainly composed of cataclastic argillaceous siltstone with black mudstone, locally composed of fine sandstone, coarse sandstone, and conglomerate interlayer.

The strata of Bed 1 are distributed on the east and west sides of Bed 2 and are composed of gray-white carbonaceous silty mudstone, carbonaceous mudstone, and argillaceous siltstone, with coal line or thin coal seam in some parts.

Member 1 is distributed in the western and eastern part of the mining area. Affected by faults and Quaternary, the width of outcrop varies greatly. The strata exposed in the west of the mining area tend to the northeast, and the strata exposed in the east of the mining area tend to the southwest.

The Quaternary residual slope sediments in the mining area are distributed in the gentle slopes of the regional slopes, ranging from 3 to 20m thick. The lithology is mainly sand and clay, and there are also trans blocks of fine sandstone, siltstone, mudstone, medium-grained sandstone, coarse sandstone, conglomerate, siliceous rock, and siliceous conglomerate.

The general structure in the area is a syncline fold. The faults in the mine area are divided into two sets: the NW-trending fault and the NE-trending fault.

The magmatic rocks in the mining area are mainly in the form of dykes, including diabase dykes, diorite dykes and syenite porphyry dykes.

Quartz-mica-diorite dykes cover an area of about 0.03 km<sup>2</sup> in Shiqiaogou – Niugui at the northeast corner of the mine. The analytical results of sample analysis show that gold grade is 0.01 g/t, which is not closely related to gold mineralisation.

Diabase dykes are distributed in Gaoluoxi area in the eastern part of the mining area. The sandstone surrounding the diabase dykes has obvious keratosis, silicification and pyritization. The highest grade of samples was 0.92g/t Au, generally between 0.2g/t and 0.30g/t Au. The diabase dykes are closely related to gold mineralisation. It provides both heat and mineral sources.

Orthophyre dykes are outcropped in the eastern part of the mine area. The wallrock of the dykes is conglomerate, and pyritization and carbonation are seen in the conglomerate; it shows pyrite and calcite veins filling the conglomerate or sandstone in a network of veins. The sample of the rocks was taken and analysed with a gold grade of 0.051g/t, which is low in gold grade and is not clear that the dykes have a closely relationship to gold mineralisation.

### 5.3 Characteristics of Mineralised Bodies

#### 5.3.1 Jilong Project

A total of 18 mineralised bodies in the Zhuanshanzi Block are discovered: namely #4, #5, #6, #6-1, #27-1, #27-2, #27-3, #27-4, #28 and #72 in the No. 1 Mining Zone, #100, #100-1 and #104 in the No. 2 Mining Zone, and #26, #26-1, #26-2, #26-3 and #26-4 in the No. 3 Mining Zone.

Mineralised body #4 strikes northwest and dips to southwest with a dip angle of 78°. Mineralised body #5 strikes northwest and dips to southwest with a dip angle of 80°. This Mineralised body is about 900 m long and 345 m downdip.

Mineralised body #6 strikes northwest and dips to southwest with a dip angle of 80°. It is approximately 467m long and 369m downdip. Mineralised body #6-1 strikes northwest and dips to southwest with a dip angle of 80°. It is about 207 m long and 416 m downdip.

Mineralised body #27-1 strikes northwest and dips to southwest with a dip angle of 79°. It is 792 m long and 416 m downdip. Mineralisation body #27-2 strikes northwest and dips to southwest with a dip angle of 79°. It is 388 m long and 496 m downdip.

Mineralised body #72 strikes northwest and dips to northeast with a dip angle of 72° . It is 530 m long and 297 m downdip.

Totally 9 mineralised bodies are discovered in the Zhuanshanzi #4#-5#-6#-7 Block, 4 of them are the main Mineralised bodies: namely Nos. #300、#310、#320 and #330. These mineralised bodies are about 80m to 282m long and 84m to 344m downdip. They strike northwest and dips to southwest with a dip angle of 61°-80°.

Ore minerals include native gold and silver, pyrite, sphalerite, galena, chalcopyrite, magnetite, hematite, and chalcocite. Gangue minerals include quartz, sericite, chlorite, calcite, epidote, feldspar, and hornblende.

Textures include crystalline texture, cataclastic texture, metasomatic residual texture, and solid melt decomposition texture. Structures include disseminated structure, vein-like structure, brecciated structure, and banded structure.

### 5.3.2 Huatai Project

#### Honghuagou #1 Mining Zone

Honghuagou #1 Mining Zone is divided into four sub-areas: Sub-area #1, Sub-area #3, Vein #3, and Longtoushan sub-area. The Sub-area #1 includes three mineralised veins, namely Vein #2, Vein #82 and Vein #14, which are controlled by either northwest, nearly north south or northeast trending faults.

Vein #2 is situated at the northwest and host by the contact of mixed granite and hornblende plagioclase gneiss. The Mineralised body is vein-like, strikes northwest and dips northeast with a dip angle of 59-85°. Vein #14 is situated at the east and host by hornblende plagioclase gneiss. The Mineralised body of Vein #14 strikes northeast and dips to southeast with a dip angle of 59-71°. Vein #82 is situated at the southwest and host by hornblende plagioclase gneiss.

Sub-area #3 is situated at the southeast, with slope landform, which is divide into Mineralised body #15 and #15-3.

Vein #3 is at the south of #1 Mining Zone, includes Mineralised bodies #3 and #3-1, which strike northwest, with the dip angle of 62-80°. The mineralised body is host by gneiss of Archean medium-deep metamorphic rock series. The shape of mineralised body is irregular.

Longshantou sub-area contains three mineralised bodies, including #23-2, #23-4 and #23-5. The Mineralised body is host by plagioclase hornblende gneiss, migmatite, plagioclase hornblende, partially hosted by K-feldspar granite. The three mineralised bodies echelon at the cross-section.

The ore minerals include native gold, pyrite, chalcopyrite, magnetite, and minor of sphalerite, galena, chalcocite, bornite, and limonite. Gangue minerals include quartz, sericite, chlorite, potassium feldspar, plagioclase, hornblende, calcite, and kaolin.

Textures include fragmented structure, metasomatic filling, fine idiomorphic crystal structure and metasomatic residue. Structures include massive structure, strip structure, disseminated structure, and breccia structure.

#### Honghuagou #86 Vein

Five mineralised bodies are defined, they are #86, #86-1, #86-2, #86-3, and #86-4. The #86, #86-3, #86-4 are main mineralised bodies.

Mineralised body #86 is situated at the center of the mining area and occurs as gold-bearing quartz vein. It strikes northwest and dips to northeast with a dip angle of 75°.

The structures include fragmented spot structure, fine grain replacement filling structure, self-shaped grain structure. The textures include dense block structure, strip structure, disseminated structure, breccia structure.

Ore minerals include pyrite, and native gold and silver. Gangue minerals include quartz, sericite and chlorite.

**Pengjiagou Mine**

A total of seven mineralised bodies are delineated at the Pengjiagou mining area: they include #1, #1-1, #2, #19-1, #19-2, #65-2 and #65-3.

Ore minerals include native gold, pyrite, chalcopyrite, galena, sphalerite, tetrahedrite, arsenopyrite, goethite, hematite, magnetite, and bornite. Gangue minerals include quartz, sericite, chlorite, calcite, feldspar and hornblende.

Textures include crushed texture, crystalline texture, dissolution texture, enveloping metasomatic texture, including texture. Structures include massive structure, disseminated structure, vein, fine vein and network vein structure.

**Lianhuashan #5 Mining Zone**

At Lianhuashan #5 Mining Zone area, six main mineralised bodies are defined, including #1, #51-1, #51-6, #51-8, #51-9, and #51-10. The structurally controlled mineralised bodies, shown as gold-bearing quartz veins, strike nearly north-south and/or northwest. Wall rock alteration includes silicification, sericitization and chloritization.

Mineralised body 51-1# is situated at the central south, strikes most north-south, dips to west with a dip angle of 79-81°.

Mineralised body 51-10# is situated at the central south, strikes most north-south, dips to west with a dip angle of 78-81°.

Mineralised body 1# is situated at the northwest, strikes northwest, dips to northeast with a dip angle of 65°.

Ore minerals include native gold, pyrite, chalcopyrite, magnetite, and minor of sphalerite, galena, chalcocite, bornite, and limonite. Gangue minerals include quartz, sericite, chlorite, potassium feldspar, plagioclase, hornblende, calcite, and kaolin.

Textures include fragmented structure, metasomatic filling, fine idiomorphic crystal structure and metasomatic residue. Structures include massive structure, strip structure, disseminated structure, and breccia structure.

**Lianhuashan #26 Vein**

Two mineralized bodies are discovered: #1 and #2. The mineralized body #1 is situated at the central, strikes nearly north south and dips to southwest with a dip angle of 65°-68°. The mineralized body #2 also strikes nearly north south and dips to southwest with a dip angle of 65°-70°.

Textures include heteromorphic granular texture, and metasomatic dissolution texture, semi-idiomorphic granular texture, mosaic, crushing, and package metasomatic texture. Structures include dense massive structure, reticulated vein, banded, brecciated, and disseminated.

Ore minerals include native gold, native silver, pyrite, chalcopyrite, galena, magnetite, and hematite. Gangue minerals include quartz, sericite, calcite, and chlorite.

**Lianhuashan #3&#7 Vein**

A total of 7 mineralised bodies are discovered: #3, #3-1, #3-2, #7, #7-1, #8 and #8-1. The #3, #8, and #8-2 are the main mineralised bodies.

Mineralised body #3-2 is situated at the northeast, strikes northwest and dips to northeast, with a dip angle of 55°-63°. Mineralised body #8-2 is situated at the northwest, strikes northwest and dips to northeast with a dip angle of 43°-75°. mineralised body #8 is situated at the northwest, strikes northwest and dips to northeast with a dip angle of 58°-87°.

Ore minerals include native gold, pyrite, magnetite, chalcopyrite, galena, sphalerite, argentite, and chalcocite. Gangue minerals include quartz, sericite chlorite, potassium feldspar, plagioclase, hornblende, calcite, and kaolin.

Textures include heteromorphic granular texture, semi-idiomorphic granular texture, mosaic texture, crushing texture. Structures include massive structure, disseminated structure, followed by strip and network vein.

**5.3.3 Wulong Project****Wulong Mine**

The Wulong Mine is a large quartz vein type gold deposit. The wall rock is biotite granite and monzogranite and the mineralised bodies are strictly controlled by two groups of faults, the northwest trending faults and north-northeast trending faults, consisting of rhombic lattice structure. The mineralised body is in the north-south, northwest trending compressive-twisted faults, and fine-grained diorite associated. The ore type is mainly quartz vein type, and the useful components are native gold and silver-gold.

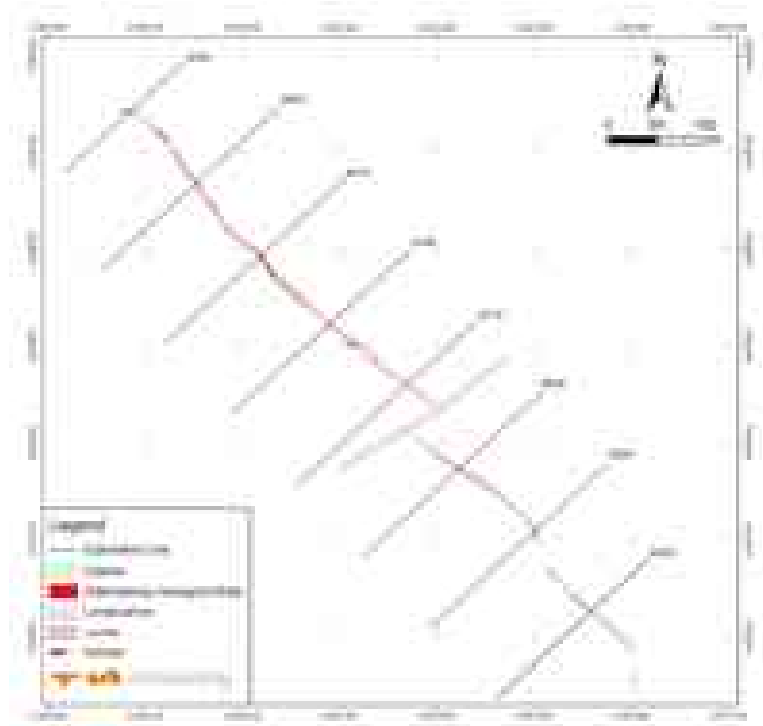

A total of 449 gold-bearing bodies were found in the field, including 382 gold-bearing quartz veins and 67 silicified alteration zones. Due to years of mining, only 18 main mineralised bodies can be mined at present, which can be spatially divided into three ore-forming belts, namely A, B and C.

The mineralised bodies in A and B belts are nearly extending north-south, which are controlled by granite porphyry veins, fine-grained sphalerite distribution in both sides of the granite porphyry. The gold mineralised bodies are in the fine-grained diorite. The lateral trending direction is southeast, with dip angles of about 40°-60°. The shallow part of the mineralised body is far from the granite porphyry, the deep part is closer to the granite porphyry, even directly in the granite porphyry. The main mineralised body in A belt is the Vein #32, and the main mineralised bodies are the Vein #2 (Vein #2-3, Vein #2-6), Vein #4 (Vein #4-1, Vein #4-2, Vein #4-5) in B belt.

The mineralised bodies in C belt trend northwest, and the main mineralised body is Vein #163. The Vein #163 is divided into two parts, the north, and the south. The north zone has a high mineralisation elevation, while the south zone has a low mineralisation elevation.

The gold-bearing quartz veins are enriched in the deep part in a stepwise manner, with the thickness of the fine-grained diorite veins in an inverse elongation relationship, with a right-sided diagonal pattern in the plane. The gold mineralisation is scattered in the upper part of the profile, which is characterized by more veins and smaller scale, while the gold mineralisation is concentrated in the lower part, which is characterized by fewer veins and larger scale (Figure 5-9).

Figure 5-9: Geological Map of Level 20 of Vein #163

Sources: Resource and Reserve Verification Report of Wulong Mine in Zhen'an District, Dandong City, Liaoning Province, 2019.

#### **Ligunzi Gold Deposit**

The Ligunzi gold mineralised body is vein-like, which is controlled by two group faults, the north-south trending fault, and the northwest trending fault. Generally, the dip length is longer than the strike length. The single vein is stable and has the characteristic of balk reappear, compound of branch (Figure 5-10). They are right-sided oblique in the plane and slightly forefront in the section.

The scale of the mineralised body is highly variable, with general extension depth of 200-300m. The max extension along strike length is up to 600m and the dip length is over 800m. The thickness of the veins varies, generally 0.2-3.0m, with maximum thickness of 10m. The north-south trending veins are nearly upright. The northwest trending veins are generally smaller in size, and dip to SW, with a dip angle of 60° to 80°, and the mineralised body is obviously expanded.

The mineralised bodies in Ligunzi are Vein #4-6, Vein #10-3, Vein #82, Vein #83, Vein #84 and Vein #85.

Figure 5-10: The Geological Map of Mining Level #16

Sources: The General Exploration Report of the Ligunzi Deposit in Dandong City, Liaoning Province, 2011.

#### **Haojingou-Ligunzi Gold Deposit**

A total of 20 gold mineralised bodies and 1 gold low-grade mineralised body are outlined in Haojingou-Ligunzi area. The strike of Mineralised body is northwest, northeast, or nearly north south and dips to southwest, northwest, southeast, or west with dip angles from 45° to 80°. They are in the central or edge part of the diorite dyke, granite porphyry, sometimes in mixed granite. Generally, the mineralised bodies are 37-317m long, 20-225m downdip, with a width of 0.3-2.5m. The grade varies from 1.22 to 40.06g/t. Most of the mineralised bodies are thin.

The work area is in the east and south of the Wulong gold mine area, according to the distribution of veins, the detailed exploration area is divided into three parts, respectively, the Haojingou area, the Dahudengzi area, and the Ligunzi area. The Haojingou area is in the north-east of the region, with 8 gold mineralised bodies and 1 low-grade mineralised body (Figure 5-11). The Dahudengzi area is in the central and south-eastern part, with 5 gold mineralised bodies. The Ligunzi area is in the southwest, and with 7 gold mineralised bodies.

Figure 5-11: The Line 805 Section Map in Haojingou Area

Sources: The detailed Exploration Report of the Haojingou-Ligunzi Gold Mine in Dandong City, Liaoning Province, 2017.

### 5.3.4 Hanfeng Project

#### Lishan Mine

Lishan mining area contains three polymetallic deposits, namely Lishan, Xinxing and Lishan Plant-Houshan. Xinxing deposit and Lishan Plant-Houshan deposit has not been exploited due to the difficulty in separating lead and zinc in concentrate. According to previous exploration reports, there are 961 mineralised bodies in Lishan deposit (above -92m asl), one mineralised body in Xinxing deposit, and 12 mineralised bodies in Lishan Plant-Houshan deposit.

Lishan deposit (above -92m asl) consists of three Mineralisation zones, with a total of 961 orebodies, which are divided into Xinglong mineralisation zone, Lishan mineralisation zone and Taisheng mineralisation zone from north to south. Among them, there is one surface exposed mineralised body and 4 underground mineralised bodies in Xinglong mineralisation zone. One surface mineralised body and 636 underground mineralised bodies were interpolated in Lishan mineralisation belt. One surface mineralised body and 318 underground mineralised bodies have been interpolated in Taisheng mineralisation belt.

The Lishan mineralised zone is 700m long, 500m wide and nearly 800m downdip. The Xinglong mineralised zone is about 420 m long and 10-40 m wide, extending from the surface to level 15m. Generally, the strike of mineralised bodies is northwest with a dip angle of about 65°. The mineralised bodies orientation of Taisheng mineralisation zone is relatively complex, the mineralised body strikes generally northwest, most of the mineralised bodies dip to southwest, and some dip to northeast or south, with a dip Angle of 65°. The morphology of Lishan deposit is complex, and the shallow mineralised bodies are mainly lenticular, wedge-shaped and vein shaped. In the central part of the deposit, the mineralised bodies are mainly lenticular and vein-shaped, and there are also small, mineralised bodies in the shape of nests, lentils and wedges. The mineralised bodies in the deep part of the deposit are stratiform or wedge-like, nest-like, with branch compound, pinch-out recurrence, shrinkage and enlargement.

The ore minerals are mainly sphalerite and galena, followed by chalcopyrite, pyrite, pyrrhotite, magnetite, chalcocite, bornite and arsenopyrite. Gangue minerals are diopside, garnet, epidote, quartz, calcite, sericite, actinolite and chlorite.

Lishan Pb-Zn Deposit (Below the -92m asl) is a zinc polymetallic deposit dominated by zinc ore, with some copper and lead. The mineralised bodies are vein, lenticular and lentil shaped. There are 128 zinc-lead-copper mineralised bodies were defined.

Zinc ore is metal sulfide sphalerite, and other metal minerals with relatively less content are zincite, franklinite, pyrite, siderite, galena, boulangerite, cerussite, chalcopyrite, etc. The main metal minerals of copper-zinc ore are sphalerite, chalcopyrite, magnetite, pyrite, and pyrrhotite.

According to the ore structure, the composition, content and symbiotic association of metallic minerals and non-metallic minerals, the natural type of ore is sphalerite-bearing galena skarn type.

#### **Dongfeng Mine**

Dongfeng lead-zinc ore is mainly located in the skarn mineralisation zone formed at fault zone, mostly located between 280m ~ 600m asl. The mineralised belt generally extended in the direction of NW - NW, with a length of about 1,800m, a width of about 150m. It dips to the south-west with a dip Angle of 40°-75°. A total of 123 mineralised bodies have been identified in Dongfeng lead-zinc deposit, all of which belong to polymetallic mineralisation type. The mineralised bodies are stratiform, dendritic, vein-like, lenticular-like and lentil-like, with a general length of 5-90m and a maximum of 380m. The thickness is generally 3-10m, the maximum is 35m, and the maximum depth is 450m. The surrounding rock near the mine is mineralised skarn or mineralised skarn rock, and the boundary between the mineralised body and the surrounding rock is unclear and shows a gradual transition relationship.

Dongfeng molybdenum deposit (above 250m asl) mainly occurs in the porphyritic monzogranite, contact zone of granodiorite and volcanic rock and schistosity zone of quartz diorite porphyry, which are mostly composed of quartz veins and altered breccia. The schistosity zone is generally NW - NW extend, with the length about 1,200m, the bandwidth of each slice about 50m - 100m, the strike 310~350° ~350°, the general trend is southwest, dip to west-south with the dip Angle of 30°-70°. The orebodies are mostly vein-like and locally lentil-like, and the mineralisation is enhanced from surface to depth. Ore minerals are mainly molybdenite, followed by a small amount of chalcopyrite, sphalerite, galena, arsenopyrite, and pyrite. Gangue minerals are quartz, diopside, chlorite, epidote, zeolite, calcite, feldspar and biotite.

At present, the upper part of Dongfeng Mine is mainly engaged in the exploitation of remnant mining and primary mineralised body, and the ore is primary ore without oxidation.

The molybdenum mineralised bodies (below 250m asl) of the Dongfeng Mine are located within the contact zones of Early Jurassic diorite granite, Late Triassic quartz diorite, and fine-grained diorite, as well as along the surrounding fracture zones of the rock masses. These orebodies are controlled by the underlying concealed rock bodies and northwest-trending fault structures, resulting in two sets of northwest-trending molybdenum-bearing quartz vein zones with steep and gentle dips. The orebodies appear vein-like or kidney-shaped, arranged parallel to each other, sometimes exhibiting local contraction and dilation phenomena. The boundaries of the orebodies are defined by samples collected near the rock walls. Through deep-level tunnels and drilling engineering control, a total of 178 molybdenum orebodies of varying sizes have been discovered.

### 5.3.5 Jintai Project

Two mineralised domains in the mining licence and eight mineralised domains in the exploration permit are found. The main domains are V1 in the mining licence area and V4, V10 in the exploration permit area.

Mineralised Domain V1 is distributed in the northwest of mining licence, between line 0 and line 16. It strikes to the northwest of about 325~340°, dips to the southwest of about 235~250° with a dip angle of 6~15°, has a known strike length of 307m and down-dip extension of 539m. The thickness of the domain ranges from 2.00 to 25.43m, with an average of 8.90m. The gold grade is 0.31 ~ 1.84g/t, with an average of 0.90g/t. It is pinched out between lines 7 and 9 in the northwest, and between lines 8 and 16 in the southeast. It appears to be layered surface or near-surface. The domain is controlled by 15 trenches and 30 drillholes. The ore-bearing rocks is ferritization siltstone and silicified siltstone, and the hanging wall is mainly sandstone and siltstone. The foot wall is mainly carbonaceous silty mudstone, and mudstone and argillaceous siltstone, with coal line or thin coal seam (See Figure 5-12).

**Figure 5-12: Section Map of Line 4 for Mineralised Domain V1**

Sources: Geological (Resource Verification) Report of the Xidengping Gold Deposit, Eryuan County, Yunnan Province, 2021

Mineralised Domain V4 is distributed in the Tangzhibian zone, southern part of the exploration permit area, between line 88 and line 122. It is the main and largest domain of the project. It is controlled by 76 drillholes and 10 trenches. It strikes to the northwest of about 330°, dips to the southwest of 240° with a dip angle of 2~40°, has a known strike length of about 550m and the down-dip extensions range from 40m to 560m. The thickness of the domain V4 ranges from 0.79 m to 86.76 m, with an average of 22.87m. The thickness is large in the east side and becomes thinner in the west side (see Figure 5-13 and Figure 5-14). The thickness variation coefficient is 111.58%, indicating that the

thickness variation of the domain is relatively stable. Most of the gold grade range from 0.2g/t to 10 g/t (the maximum is up to 113g/t), with an average of 1.69g/t. By combination analysis, the silver grade of the V4 domain ranges from 0.50g/t to 11.80g/t, and the average is 4.58g/t.

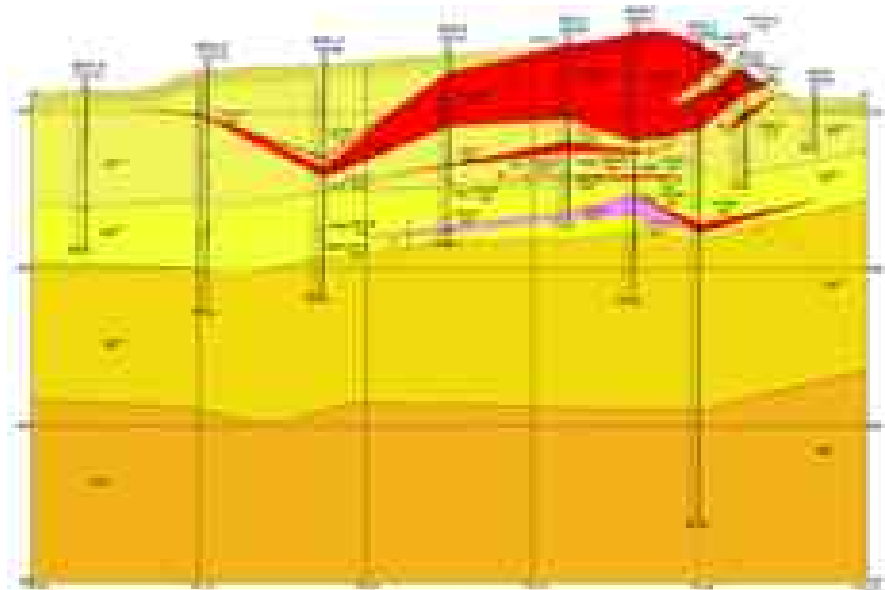

The mineralised domain V4 occurs in siliceous breccia, cataclastic siliceous rock, cataclastic siltstone and siltstone in the interlayer fracture zones of Sanying Formation. The occurrence of the domain is basically consistent with the stratigraphy.

**Figure 5-13: Section Map of Line 98 for Mineralised Domain V4**

**Figure 5-14: Section Map of Line 106 for Mineralised Domain V4**

Sources: Geological (Advanced Exploration) Report of the Xidengping Gold Deposit, Eryuan County, Yunnan Province, 2022

Mineralised Domain V10 is distributed in the Xidengping zone, northern part of the exploration permit area, between line 87 and line 99. It is controlled by 31 drillholes. It strikes to the northwest of about 330°, dips to the southwest of about 245° with a dip angle of 2~12°, has a known strike length of 268m and the down-dip extensions range from 120~410m (Figure 5-15). The gold grade in V10 gold

domain ranges from 0.11g/t to 25g/t, with an average grade of 2.69g/t. By combination analysis, the silver grade of the V10 domain ranges from 0.35 g/t to 2.87g/t, and the average is 1.15g/t.

The mineralised domain V10 occurs in cataclastic siliceous siltstone in the interlayer fracture zones of Sanying Formation. The occurrence of the domain is basically consistent with the stratigraphy.

## 6 Exploration, Sampling, Analytical Procedures and Quality Assurance and Quality Control

### 6.1 Exploration

#### 6.1.1 Jilong Project

Jilong Mining was established in October 2005, formerly known as the state-owned Chifeng Zhuanshanzi Mine.

From 1982 to 1984, No. 108 Geological Brigade of Inner Mongolia Nonferrous Geological Exploration Bureau ("**Brigade 108**") carried out general prospecting work, compiled the "Prospecting Evaluation Report for the Zhuanshanzi Gold Mine in Aohanqi, Chifeng City, Inner Mongolia" .

From April to October 1993, Shenyang Gold Institute revised and surveyed the 1:10000 scale topographic and geological map and compiled the "1:10000 Scale Geological Mapping Report of Zhuanshanzi Mine in Aohanqi, Inner Mongolia".

From 1992 to 1993, Changchun Metallurgical Geology College conducted basic geological research in this area and compiled the "Research on the Metallogenic Structure and Metallogenic Prediction of the Zhuanshanzi deposit in Aohanqi, Inner Mongolia".

In 2005, Inner Mongolia Wuhua Tianbao Mineral Resources Co., Ltd. ("**Tianbao**") was commissioned by Aohanqi Zhuanshanzi Mine to verify the gold resource and reserves within the mining license and compiled the "Resource and Reserve Verification Report on the Zhuanshanzi Mine in Aohanqi, Inner Mongolia" in December 2005.

In 2010, Inner Mongolia Tianxin Geological Exploration and Development Co., Ltd. ("**Tianxin**") was commissioned by Jilong Mining to verify and compile the "Resource and Reserve Verification Report of the Zhuanshanzi Mine in Aohanqi, Inner Mongolia".

In May 2011 Tianxin compiled three reports including "Resource and Reserve Verification Report of #1 Mining Area (Below 150m asl) in the Zhuanshanzi Mine, Aohanqi, Inner Mongolia", "Resource and Reserve Verification Report of #2 Mining Area (Below 520m asl) in the Zhuanshanzi Mine, Aohanqi, Inner Mongolia" and "Resource and Reserve Verification Report of #3 Mining Area (Below 520m asl) in the Zhuanshanzi Mine, Aohanqi, Inner Mongolia".

In February 2012, Jilong Mining entrusted Tianxin to verify and compile the Resource and Reserve Verification Report of the Zhuanshanzi Mine in Aohanqi, Inner Mongolia".

On March 3, 2012, after re-integration and delimitation of the mining area of the Zhuanshanzi Mine, Jilong Mining obtained a new mining license with a certificate number C1500002009114120054250. The mining right covers an area of 6.2614km<sup>2</sup>.

Table 6-1 lists a summary of exploration workloads completed in both #1#2#3&depth mineralised block from 2003 to 2018 and #4#5#6#7 mineralised block between 2013 and 2018 at the Zhuanshanzi Mine.

A 1:2,000 scale geological mapping was conducted to reveal the geology boundary. The profile of channelling sample is 10cm wide by 5cm deep by 0.8-2m long. A topographic survey was conducted and Xi'an 1980 coordinator system (3° for one zone and zone meridian is 117°) and 1985 Elevation reference was adopted. RTK surveying was used for 1:2,000 scale geology and topographic mapping.

### 6.1.2 Huatai Project

From 1957 to 1970, Hebei regional Geological Survey and the No. 2 Geological Brigade of Liaoning Regional Geological Survey ("**Brigade 2**") conduct regional geological mapping at Honghuagou Mine and Lianhuashan Mine.

In 2006 and 2008, Huatai Mining entrusted Tianxin to conduct a detailed geological exploration and a complementary exploration, respectively at both Honghuagou and Lianhuashan mines.

Between October 2006 and December 2007, Huatai Mining commissioned Chifeng Boyuan Mineral Exploration Co. Ltd. ("**Boyuan**") to conduct detailed geological exploration at Honghuagou #86 Vein, Pengjiagou and Lianhuashan #26 Vein and #3&#7 Vein.

From April 2011 to December 2012, Huatai Mining commissioned Chifeng Shengyuan Mineral Exploration Co. Ltd. ("**Shengyuan**") to conduct complementary detailed geological exploration and prepare report at Honghuagou #86 Vein, Pengjiagou and Lianhuashan #26 Vein and #3&#7 Vein.

Table 6-2 lists a summary of exploration workloads completed at Honghuagou #1 Mining Zone and Lianhuashan #5 Mining Zone between 2003 and 2018, and Honghuagou #86 Vein, Pengjiagou Mine, Lianhuashan #26 Vein and Lianhuashan #3&#7 Vein between 2008 and 2020, respectively.

A topographic survey was conducted, and Xi'an 1980 coordinator system (3° for one zone and zone meridian is 117°) and 1985 Elevation reference was adopted.

RTK surveying was used for 1:10,000 scale and 1:2,000 scale geological and topographic mapping. The channelling samples were collected perpendicular to the strike of mineralised bodies along the underground exploration-level adits. The profile of the channelling sample is 10cm wide by 5cm deep by 0.8-1.2m long. The weight of each channelling sample is 9.45-12.38kg.

### 6.1.3 Wulong Project

#### Wulong and Liguizi Gold Deposits

From 1960 to 1987, the Brigade 103 of Liaoning Non-ferrous Geology Bureau ("**Brigade 103**", the former Brigade 107 of the Liaoning Metallurgical Geology Bureau) undertook exploration work in the Wulong mine with a total drillhole length of 185,000m and a total trenching of 230,000m<sup>3</sup>.

From 2001 to 2002, Brigade 103 carried out a national land and resources investigation work in the adjacent area of the Wulong Mine.

From June 2006 to December 2009, Brigade 103 undertook a drilling and tunnelling campaign in the Wulong Mine, with a total drillhole length of 7,128.7m and a total tunnel length of 5,006.8m.

From 2010 to 2011, General Exploration Institute of Liaoning Non-ferrous Geology Bureau undertook the detailed exploration work in Liguizi area, with a total drillhole length of 1,097.8m, a total tunnel length of 308m and a total trenching of 506m<sup>3</sup>.

In 2016 and 2019, the Brigade 7 of Liaoning Geological Bureau ("**Brigade 7**") conducted resource and reserve verification work of the Wulong Mine, respectively.

#### Haojingou-Liguizi Gold Deposit

In 1982, the Brigade 107 of the Liaoning Metallurgical Geology Bureau ("**Brigade 107**") undertook the general and advanced exploration in the Banshi Sandui and Dahudingzi area.

In 1993, Brigade 103 undertook a general exploration in the adjacent area of Wulong Mine and Sidaogou Mine.

In 2000, the exploration license was set up and the Brigade 103 undertook the geological, geophysical, and geochemical survey.

From 2005 to 2011, Brigade 103 undertook the general exploration in the Haojingou-Ligunzi area.

From 2012 to 2017, Brigade 103 undertook the detailed exploration, with a total surface drillhole length of 20,026m, a total underground drillhole length of 1,021.9m, a total tunnel length of 1,619m and a total trenching of 28,974.5m<sup>3</sup>.

#### **Geophysical Survey**

The geophysical survey, including a 1:50,000 scale aerial magnetic survey and a 1:200,000 gravity survey in Dandong region was conducted from 1958 to 1964, and according to the characteristics of the aerial magnetic anomaly, the Wulong Mine and its adjacent are divided into four magnetic anomaly zones, all trending northeast. In the west it is the high anomaly zone and the transitional anomaly zone (+50 to -50nt), negative anomaly zone (<-50nt) and transitional anomaly zone (+50 to -50nt) is in the east. Comparing with the 1:50,000 scale geological map, it shows that all known gold deposits in the area are distributed in the gradient zone of the transition anomaly zone. That is, the transition area of the concentrated distribution of the aerial magnetic anomaly zone in the area is the edge of the major geological bodies or contact zone area in the area, which coincides well with the geological conditions of gold deposits.

#### **Geochemical Survey**

In 1989, Brigade 103 carried out the geochemical stream sediment survey in the Wulong Mine covering an area of 900 km<sup>2</sup>, and indicated 17 elements including Cu, Pb, Zn, Ni, Cr, Co, Mn, Mo, Ag, Au, Hg, V, Ti, As, Cd, Be and Bi as the indicator elements. A total of 4 comprehensive anomalies of class I, 6 comprehensive anomalies of class II and 4 comprehensive anomalies of class III were obtained. These anomalies have obvious concentration centres and good elemental combination. The Wulong gold deposit is located on the I -1 anomaly, and the discovery of these anomalies provides a solid basis for further gold exploration in the area.

#### **Remote Sensing Geological Survey**

From March 1991 to March 1994, the Geology Institute of Liaoning Geological Survey undertook a remote sensing survey. Four sets of lineal images, northeast, north-northeast, northwest, and east-west trending, are clearly developed. The ring images are mainly round and oval, with closed rings and semi-rings, and their sizes vary. The combined image is a composite of four sets of linear images with an incomplete concentric ring image superimposed. The Wulong gold deposit is in this combination image.

### **6.1.4 Hanfeng Project**

#### **Lishan Mine**

In 1950, Northeast Geological and Mineral Survey-YanjiHelong Team conducted a mineral survey.

From 1953 to 1954, Northeast Branch 107 of Ministry of Heavy Industry of China ("**Branch 107**") took a deep exploration below level #6 in Lishan Deposit of Tianbaoshan Mine.

From 1958 to 1965, Jilin Metallurgical Geological Exploration Company carried out survey a detailed investigation and exploration work in Erdaogou-Lishankeng area of Tianbaoshan Mine.

In August 2011, Hanfeng Mining obtained the exploration right (below -92m asl) of Lishan lead-zinc deposit in Tianbaoshan Mine.

The deep exploration of Lishan lead-zinc mine (below -92m asl) lasted nine years and one month from August 2011 to August 2020.

Table 6-3 lists a summary of key completed exploration between 2011 and 2020 at the Lishan Mine below -92m asl.

**Table 6-3: Completed Exploration Workload at Lishan Mine (below -92m asl)**

#### Dongfeng Mine

From 1958 to 1965, Jilin Metallurgical Geological Exploration Company carried out exploration work.

Between 1975 and 1990, the No. 605 Geological Brigade of Jilin Metallurgical Geological Exploration Company ("Brigade 605") and Tianbaoshan Mine carried out a lot of geological exploration work in the mining area and its periphery.

Table 6-4 lists a summary of key completed exploration from December 2013 to February 2023 at the Dongfeng Mine below 250m asl.

**Table 6-4: Completed Exploration Workload at Dongfeng Mine (below 250m asl)**

### 6.1.5 Jintai Project

From 2007 to 2009, the Yunnan Yuxi Maite Industrial Co. Ltd. (“**Yuxi Maite**”) carried out a geological exploration with a total drillhole of 200m, a total exploration pit of 150m and a total excavated trenching of 4,500m<sup>3</sup>.

Between 2009 and 2010, Shanghai Fuduo Mining Exploration Technology Co., Ltd. (“**Fuduo**”) conducted the topographic survey, the geological survey, and the geochemical survey in the mining licence area. A total of 27 drillholes with an aggregate length of 1,410.9m were drilled. A total of 24 trenches with 8,000m<sup>3</sup> were carried out. The general geological exploration report was submitted.

From 2012 to 2016, Fuduo conducted the geological and geochemical survey in the exploration licence area with a total length of 3,361.9m drillholes and a total volume of 1,581.7m<sup>3</sup> trenches.

Between 2017 and 2018, Fuduo conducted the geological exploration in the exploration licence area with a total length of 997.2m drillholes and a total volume of 891.2m<sup>3</sup> trenches.

From October 2020 to October 2021, Yunnan Yuanhao Mining Co., Ltd. (“**Yuanhao**”) carried out the resource verification work in the mining licence area with a total length of 597.2m drillholes. The resource verification report for Xidengping Mine was submitted.

From March 2021 to September 2022, Yuanhao conducted the advanced exploration campaign in the exploration licence area with a total length of 7,386.6m boreholes and a total volume of 1,309.9m<sup>3</sup> trenches. The advanced geological exploration report for the exploration licence area was submitted.

**Table 6-5** lists the main completed exploration work in the Xidengping mining license area. The geological exploration consists of mainly three phases: the general exploration conducted by Fuduo from 2007 to 2010, the exploration for Mineralised Domain V2 conducted by Fuduo from 2012 to 2013 and the Mineral Resource verification conducted by Yuanhao from 2020 to 2021.

## 6.2 Drilling and Trenching

### 6.2.1 Jilong Project

A total of 81 drillholes with an aggregate length of approximately 19,078.3m were conducted at the Zhuanshanzi #1#2#3#depth Block, and a total of 64 drill holes with an aggregate length of 10,925.3m were drilled at the exploration of Zhuanshanzi #4#-5#-6#-#7 Block.

The holes were drilled by XY-4 drill rigs, with a starting diameter of 110mm. After passing through the Quaternary loose sedimentary layer, the diameter of the drill bit was changed to 75 mm until termination of the hole. Figure 6-1 shows the drillhole locations at the Zhuanshanzi Mine.

The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 25m deep after the commencement. The down-hole surveys were conducted with YT-1 little calibre compass clinometer for the boreholes in the #1#2#3#depth Block and with BZM-R-B little calibre compass clinometer for the boreholes in the #4#5#6#7 Block, respectively.

The whole core recovery for all 81 drill cores varied from 86% to 100%, and the average recovery rate for mineralised core intervals was 100%. The whole core recovery for all 64 drill cores varied from 92% to 100%, and the recovery rates for mineralised core intervals were between 93% and 100%.

As design cementation collar seal was conducted, and the #425 cement was used for collar seal.

**Figure 6-1: Distribution of Drillholes in the Zhuanshanzi #1#2#3&depth Block**

A total of 5,989.89m underground tunnels were conducted in the #1#2#3&depth Block, and a total of 45,586.20m underground tunnels were completed in the #4#5#6#7 Block. The profile of tunnel was 2.0m × 2.0m.

## 6.2.2 Huatai Project

### Honghuaqou #1 Mining Zone

A total of 75 drillholes with an aggregate of 27,760.05m were conducted at the 2017 resource verification program, of which 22 were surface holes, total length of 13,435.16m and 53 underground holes, total length of 14,324.89m. A total of 35 historical drillholes with an aggregate length of 6,986.43m are entered into the database. Figure 6-2 shows the distribution of the drillholes.

The surface holes were conducted by XY-4 drill rigs, with a starting diameter of 110mm. After passing through the Quaternary loose sedimentary layers, the diameter of the drill bit was changed to 75mm. The underground holes were conducted by modified XY-2 and XY-4 drill rigs, with a starting diameter of 75mm until terminate.

Figure 6-2: Borehole Location Map

Sources: SRK

The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 25m after commencement. The down-hole survey was conducted with KXP-2 little calibre compass clinometer.

The recovery rates for mineralised intervals of the 75 drill holes were 100%, and all rock core recovery rates varied from 99.28% to 100%. As design cementation collar seal was conducted and the #425 cement was used for collar seal.

A total of 17,143.24m underground tunnels were conducted and used for resource estimate. The profile of the tunnels was 2.0m × 2.0m.

#### **Honghuagou #86 Vein**

A total of 22 drillholes with an aggregate length of 5,739.44m were conducted at the Honghuagou #86 Vein. The holes were drilled by XY-4 drill rigs, with a starting diameter of 91 mm. After passing through the Quaternary loose segmentary layers, the diameter of the drill bit was changed to 75 mm until termination.

The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 25m after commencement. The down-hole survey was conducted with CX-6B little calibre compass clinometer.

The recovery rates for mineralised intervals on 22 drill holes were 100%, and all rock core recovery rates varied from 75% to 100%. As design cementation collar seal was conducted and the #425 cement was used for collar seal.

A total of 1,076m long underground tunnels were conducted and used for resource estimate. The profile the adits was 2.0m × 2.0 m.

#### **Pengjiagou Deposit**

A total of 44 drill holes with an aggregate length of 7227.79m were conducted at the Pengjiagou deposit. The holes were drilled by XY-4 drill rigs, with a starting diameter of 91 mm. After passing through the Quaternary loose sedimentary layers, the drill bit with a diameter 75 mm was used until termination.

The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 25m after commencement. The down-hole survey was conducted with CX-6B little calibre compass clinometer.

The mineralised core recoveries for the 22 drill holes were between 98% and 100%, and all rock core recoveries varied from 93% to 100%. As design cementation collar seal was conducted and the #425 cement was used for collar seal.

A total of 357m underground adits were used for resource estimate. The profile of the adits was 2.0m × 2.0m.

#### **Lianhuashan #5 Mining Zone**

A total of 22 underground drill holes, with an aggregate length of 4,565.42m were conducted at the Lianhuashan #5 Mining Zone. Among these boreholes, three holes are horizontal holes, and the other are inclined holes. The underground holes were conducted by modified XY-5 drill rigs, with a starting diameter of 75 mm until terminate of the holes.

The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 25m after commencement. The down-hole survey was conducted with S42 little calibre compass clinometer.

The recovery rates for all mineralised drill cores were 100%, and for all rock cores were 99%. As design cementation collar seal was conducted and the #425 cement was used for collar seal.

A total of 9,381.5 m underground adits were used for resource estimate. The profile of the adits was 2.0m × 2.0m.

#### **Lianhuashan #26 Vein**

A total of 13 drillholes with a total length of 2,787.39m were conducted at the Lianhuashan #26 Vein. The holes were drilled by XY-4 drill rigs, with a starting diameter of 110 mm. After passing through

the Quaternary loose sediments, the drill bit with a diameter of 75 mm was used until termination of the hole.

The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 25m after commencement. The down-hole survey was conducted with CX-6B little calibre compass clinometer.

The recoveries for all mineralised cores varied from 94% to 100%, and for all rock cored varied from 93% to 100%. As design cementation collar seal was conducted and the #425 cement was used for collar seal.

A total of 1,578.60m underground adits were used for resource estimate. The profile of the adits was 2.0m × 2.0m.

#### **Lianhuashan #3&7 Vein**

Fifty drill holes, with a total length of 5,879.44m were conduct at the Lianhuashan #3&7 Vein. All holes were drilled by XY-4 drill rigs, with a starting diameter of 91 mm. After passing through the Quaternary loose sedimentary layers, the drill bit with a diameter of 75 mm was used until termination of the hole.

The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 22 m after commencement. The down-hole survey was conduct with S42 little calibre compass clinometer.

The recoveries for all mineralised cores varied from 94% to 100%, and for all rock cores varied from 93% to 100%. As design cementation collar seal was conducted and the #425 cement was used for collar seal.

A total of 5,113.66m underground tunnels were used for resource estimate. The profile of the tunnels was 2.0m × 2.0m.

### **6.2.3 Wulong Project**

As described in section 5.1.3, the region geological and mineral exploration began in the 1960s and several phases of exploration work had been carried out since then. SRK was not provided with the former data. Only the resource and reserve verification work at Wulong Mine in 2019, the detailed exploration work at Ligunzi deposit in 2011, and the detailed exploration work at Haojingou-Ligunzi deposit from 2012 to 2017 are discussed in this section. A summary of the exploration workloads is listed in Table 6-7.

**Table 6-7: Summary Characteristics of Trenching, Drilling and Tunnelling**

Item	Wulong	Ligunzi	Haojingou-Ligunzi
Trenching/m <sup>3</sup>	/	506	28,974.53
Surface Drilling/m	/	1,097.8	20,026
Underground Drilling/m	/	/	1,021.9
Tunnelling/m	3,650	308	1,619
Sampling	2,229	400	2,334

**Wulong Mine**

A total of 3,650m underground tunnels were excavated by Wulong Mining. The profile of drift was 1.8-2.0m × 2.0-2.2m, and the slope of drift was 0.3%-0.7%. The sketch map of the tunnels was drawn at a scale of 1:100.

**Liqunzi Gold Deposit**

The purpose of trenching was to reveal gold mineralised body exposed at surface and the trench was perpendicular or roughly perpendicular to the mineralised body strike with a spacing of 100-160 m. The bottom width is 0.6-0.8 m and the top width varied depending on the looseness of the soil and the depth of the trench. At least 0.3 m of the bedrock should be excavated. All the trenches were named regularly and were surveyed by the total station or GPS. The sketch map of the trenches was drawn at a scale of 1:100.

In 2010, two drillholes were drilled by the diamond wire line core drilling technique with the XY-4 drilling rig. The diameter is 75 mm. The boreholes surveys were done with the XJL compass clinometer. The depth was verified. The rock recovery was over 90% while the mineralised core was over 98%. The bores were sealed with clay and cement mortar.

**Haojingou-Liqunzi Gold Deposit**

A total of 559 trenches with a total of approximately 28,712.33m<sup>3</sup> were completed. The width of trench was 1-1.2 m on the top and 0.6-0.8 m at the bottom. The depth was 0-3 m and at least 0.3 m of the bedrock should be excavated. After completion of the trenches, geological logging and sampling were performed in a timely, correct, and objective way and sketched the trenching at 1: 100 scale. The wall was sketched in its natural form and the bottom was mapped at 1.0m wide. The trench logging provided detailed text description of the lithology, structure, Mineralisation, and alteration.

Six trenches with a total of 262.3 m<sup>3</sup> were rehandled. The width at the bottom was 0.8-1.0 m. The depth was 0-3 m and at least 0.3-0.5 m of the bedrock should be excavated.

A total of 73 surface boreholes with an aggregate length of 20,026m were drilled during the detailed exploration period in the exploration license area (Figure 6-3). The types of the drilling rigs were XY-4, XY-44 and XY-B6. The hole's diameter is 75 mm, and the core diameter is 53 mm.

The cores were cleaned, labelled, and placed regularly. The recovery rates for all rock cores varied from 88% to 100% and for all mineralised cores varied from 80% to 100%. The hanging wall and footwall recoveries were between 92% and 100%. The collars of holes were surveyed properly, and down hole survey was undertaken at 50 m intervals. Hole depth was verified at the interval of 50 m and after the bore was finished. The maximum error of hole depth correction is 0.1 m. Initial record on site included shift reports, ore/rock core cards, ore/rock recovery, and depth verification record, were orderly and reliable. The bores were sealed with clay and cement mortar and the collars were marked.

Figure 6-3: Distribution Map of Drillholes

A total of 14 underground boreholes with an aggregate length of 1,021.9m were drilled with the hole diameter of 47 mm and the core diameter of 35 mm. Hole depth was verified at the interval of 50 meters and after the bore was finished. Hole depth was verified after the bore was finished.

A total of 1,619m tunnels were excavated at the Haojingou-Ligunzi gold deposit. The profile of the tunnels was 2.0-2.2m × 1.8-2.5m, and the slope was less than 0.3-0.5%.

SRK was not provided with the whole phase of exploration work data. The exploration or mineral work including the resource and reserve verification work of Wulong mine in 2019, the detailed exploration work of Ligunzi deposit in 2011, and the detailed exploration work of Haojingou-Ligunzi deposit from 2012 to 2017 was checked and accepted by the mine. All the three reports were reviewed by the local geological authorities.

#### 6.2.4 Hanfeng Project

The deep exploration of Lishan Mine (below -92m asl) lasted nine years and one month from August 2011 to August 2020. As of 20 August 2020, a total of 46,351.96 m of drilling and 6,384.80 m of tunnelling exploration were completed at the Lishan Mine below -92m asl (see Table 6-8).

The deep exploration programme of the Dongfeng Molybdenum Mine (below 250m asl) was conducted from December 2013 to February 28, 2023, including geological mapping in tunnels, as well as tunnel exploration and drilling. The exploration depth ranged from 250 m to -600 m. A total of 3,611.9m of drilling and 3,499.54m of tunnel exploration were completed from 2013 to 2017 and totalling 82,101.16 m of drilling and 1,207.80m of tunnel exploration were conducted from 2019 to 2023.

A summary of the exploration work of Hanfeng Project is listed in Table 6-8

**Table 6-8: Drilling and Tunnelling Summary of Hanfeng Project**

Item	Lishan	Dongfeng
Surface Drilling/m	3,573.1	23,828.38
Underground Drilling/m	42,778.86	73,525.42
Tunnelling/m	6,384.8	14,707.34
Drilling Sample	9,127	33,207
Tunnelling Sample	789	702

### 6.2.5 Jintai Project

As described in Section 6.1.2, a summary of the exploration workloads is listed in Table 6-9.

**Table 6-9: A Summary of Characteristics of Trenching and Drilling**

Item	Mining area	Exploration area
Trenching/m <sup>3</sup>	8,158	3,781.57
Drilling/m	2,917.91	11,699.47
Sampling	1,650	9,629

The purpose of trenching was to reveal gold mineralised body exposed at surface and the trench was perpendicular or roughly perpendicular to the mineralised body trend. The bottom width is 0.6-1.0 m and the top width varied from 2.2 m to 2.5 m. At least 0.3 m of the bedrock should be excavated. All the trenches were named regularly.

The geological logging and sampling were carried out in time to avoid rain collapse.

Most of the trenches were not included in the Mineral Resource estimate, just for the purpose of gold domain exploration.

A total of 192 surface drillholes with an aggregate length of 14,617.38 m were drilled in both mining and exploration licence areas from 2007 to 2022 (see Figure 6-4).

The hole's diameter is greater than 75 mm, and the core diameter is 55 mm. The cores were cleaned, labelled, and placed regularly. The recovery rates for all rock cores varied from 82% to 100% and for all mineralised cores varied from 81% to 99%. The collars of holes were surveyed properly, and down hole survey was undertaken at 50 m or 100 m intervals. Hole depth was verified at the interval of 50 m or 100 m and after the bore was finished. The maximum error of hole depth correction is 0.1 m. Initial record on site included shift reports, ore/rock core cards, ore/rock recovery, and depth

verification record, were orderly and reliable. The bores were sealed with clay and cement mortar and the collars were marked.

**Figure 6-4: Map Showing the Distribution of Drilling**

### 6.2.6 SRK Comments

SRK has reviewed the drilling spacing and quality for all the five projects. SRK is confident that the drilling is sufficient for the Mineral Resource estimation.

## 6.3 Sampling, Sample Preparation, Analysis and Quality Control

### 6.3.1 Jilong Project

#### Sampling

Samples were taken from drill cores by splitting along the core axis. The sample length ranges from 0.8m to 1.0m. The weight of samples was between 9.45 kilograms ("kg") and 12.38kg.

All tunnel samples were sampled using channelling method. The samples positions were determined by the geologists and were sampled by the other workers. The sample channel was perpendicular or roughly perpendicular to the strike of mineralised body. The section of channel was 10 cm × 5 cm, and the sample length ranges from 0.1 to 1.2m. The sample intervals were 6 m in ore drift 6 m and 40 m in transverse drift.

#### Sample Preparation and Analysis

The sample preparation was according to the Chechott formula:  $Q=Kd^2$ ,  $K=0.8$ . The core sample preparation was conducted in the following procedures:

- the original samples were crushed passing a mesh of 30 screen.
- sub-sample with 700 grams ("g") was collected from a riffle splitter, and
- the sub-sample was pulverized passing a mesh of 200 screen; and about 20g of pulp sample was bagged and labelled for analysis. The rest was stored as a pulp reject.

Spectrum and chemical analysis were employed for sample analyses. The basic item for chemical analysis is gold, which was assayed using a 20g fire assay with determination by atomic absorption spectroscopy ("AAS") method at Chifeng Geology and Exploration Laboratory ("**Chifeng Laboratory**") according to the *Geology and Mineral Laboratory Testing Quality Management Specification DZ/T0130.3-2006*.

#### **Specific Gravity Data**

A total of 227 samples for specific gravity ("**SG**") measurement were collected from underground channelling samples at the Zhuanshanzi #1#2#3&depth Block and drilling cores for specific gravity analyses. The average specific gravity for is 2.80g/cm<sup>3</sup>.

A total of 110 sample for the SG measurement were collected from underground channelling samples and drilling cores at the Zhuanshanzi #4#5#6#7 Block for specific gravity analyses. The average specific gravity for is 2.81g/cm<sup>3</sup>.

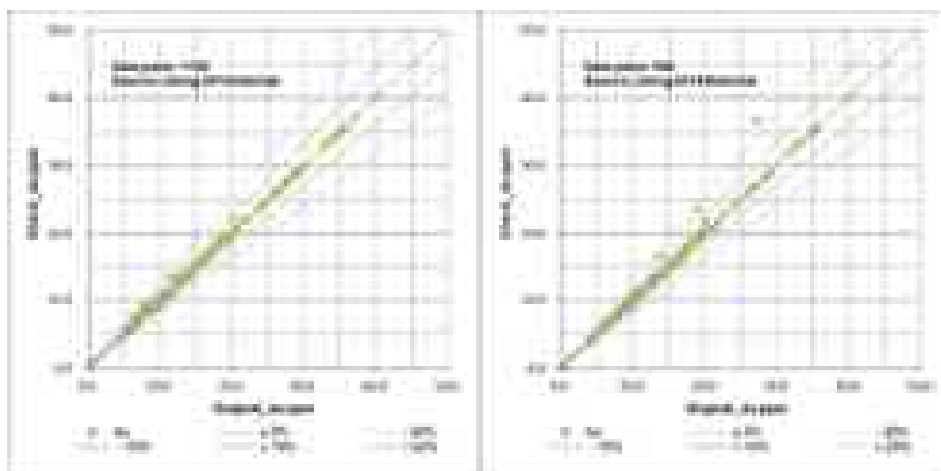

#### **Quality Assurance and Quality Control Programs**

Before 2018, for the Zhuanshanzi #1#2#3&depth Block, a total of 853 samples were randomly selected for internal check, which represented 10.3% of the original analytical samples (i.e., 8,276 samples). The results show that 840 samples are qualified, with a qualification rate of 98.48%. A total of 447 samples were selected for external check and were couriered to the Laboratory of the 10<sup>th</sup> Geology and Mineral Exploration Institute of Inner Mongolia ("**Laboratory 10**") for analyses. The results indicate that 441 samples are qualified, with a qualification rate of 98.66%.

For the Zhuanshanzi #4#5#6#7 Block, a total of 50 samples were selected for internal check, which represented 24.5% of the original analytical samples (i.e., 204 pieces). The results show that 48 pieces are qualified, with a qualification rate of 96%. A total of 30 samples were selected and couriered to the Laboratory 10 for external check. The results show that 29 samples are qualified, with a qualification rate of 96.67%.

In 2018, a total of 1,150 samples were selected as internal duplicates, taking 10% of total, the qualification rate is 98.32%; a total of 596 samples were selected and sent to Chengde No. 514 Geological Assay Co., Ltd. ("**Chengde 514**") for external check, taking 5% of total, the qualification rate is 97.32%. All duplicate gold grades versus original sample gold grades have been plotted into the scatter charts to check the performance as shown in Figure 6-5. Assay results of internal and external check samples display good correlations with the majority of original assay results.

Figure 6-5: Performance of Internal and External Samples from 2018 Production Exploration by Jilong Mining

### 6.3.2 Huatai Project

#### Sampling

Samples were taken from drill cores by splitting along the core axis. The sample length ranges from 0.8m to 1.0m. The weight of samples was between 9.45 and 12.38kg.

The tunnel samples were collected using channelling method. The samples positions were determined by the geologists and were sampled by the other workers. The sample channel was perpendicular or roughly perpendicular to the strike of mineralised body. The section of channel was 10cm × 5cm, and the sample length ranges from 0.1m to 1.5m. The sample intervals were 6 m in ore drift and 40 m in transverse drift.

#### Sample Preparation and Analysis

The sample preparation was based on the Chechott formula:  $Q=Kd^2$ ,  $K=0.8$ . The core sample preparation was conducted in the following procedures:

- the original samples were crushed passing a mesh of 30 screen.
- sub-sample with 700 g was collected from a riffle splitter, and
- the sub-sample was pulverized passing a mesh of 200 screen; and about 20g of pulp sample was bagged and labelled for analysis. The rest was stored as a pulp reject.

Spectrum and chemical analysis were employed for sample analyses. The basic item for chemical analysis is gold, which was assayed using a 20g fire assay with determination by AAS method at Chifeng Laboratory according to the *Geology and Mineral Laboratory Testing Quality Management Specification DZ/T0130.3-2006*.

**Specific Gravity Data**

All samples used for the SG measurement were collected from underground channelling samples and drilling cores at the Lianhuashan #5 Mining Zone, Lianhuashan #26 Vein, Lianhuashan #3&#7 Vein, Honghuagou #1 Mining Zone, Honghuagou #86 Vein and Pengjiajia Mine. for specific gravity analyses. The average results of specific gravity measurement for the Huatai Project are listed in Table 6-10.

**Table 6-10: Results of Specific Gravity Measurement for Huatai Project**

Mine	Sample Count.	Average SG Value (g/cm <sup>3</sup> )
Lianhuashan #5 Mining Zone	96	2.80
Lianhuashan #26 Vein	30	2.86
Lianhuashan #3&#7 Vein	35	2.80
Honghuagou #1 Mining Zone		
Mineralised Body 2#, Sub-area 1#		3.10
Mineralised Body 14#, Sub-area 1#		2.88
Mineralised Body 82#, Sub-area 1#	256	2.81
Sub-area 3#		2.82
Vein 3#		2.80
Longtoushan		2.88
Honghuagou #86 Vein	35	2.80
Pengjiajia Mine	30	2.70

**Quality Assurance and Quality Control Programs**

During the deep exploration of the Lianhuashan #5 Mining Zone in 2018, a total of 54 samples were selected for internal check, which represented 12% of the total number of samples analysed (449 samples). The return results show that the qualification rate is 96.30%. Totalling 30 pieces samples were selected and couriered to the Laboratory of 514<sup>th</sup> Geology Brigade ("Laboratory 514") for external check. The analytical results indicate that the qualification rate is 96.67%.

For the Lianhuashan #26 Vein, a total of 30 samples were selected for internal check, which represented 8.8% of the total number of samples analysed (342 samples), and the results show that 30 pieces are qualified, with a qualification rate of 100%. A total of 31 samples were selected and couriered to the Laboratory 10 for external check, and the results show that 29 pieces are qualified, with a qualification rate of 96.67%.

A total of 82 samples were selected from the Lianhuashan #3&#7 Vein for internal check, which represented 22.5% of the total number of samples analysed (264 samples). The results show that 79 pieces are qualified, with a qualification rate of 86.64%. Totalling 63 samples were selected and couriered to the Laboratory 10 for external check. The results show that 61 pieces are qualified, with a qualification rate of 96.82%.

During the resource and reserve verification program at the Honghuagou #1 Mining Zone in 2010, a total of 312 samples were selected for internal check, which represented approximately 11.3% of the total number of samples analysed (2,786 samples). The results show that 304 pieces are qualified, with a qualification rate of 97.44%. A total of 166 samples were selected and couriered to the Laboratory 10 for external check, and the results show 160 pieces are qualified, with a qualification rate of 96.39%. During the resource and reserve verification program in 2017, a total of 70 samples

were selected for internal check, which represented about 13.4% of the total number of samples analysed (524 samples) and the results show that 69 pieces are qualified, with a qualification rate of 98.57%. Totalling 38 samples were selected and couriered to the Laboratory 514 for external check, and the results show that 37 pieces are qualified, with a qualification rate of 97.37%.

For the Honghuagou #86 Vein, a total of 30 samples were selected for internal check, which represented about 9% of the total number of samples analysed (334 samples). The results show that 30 pieces are qualified, with a qualification rate of 100%. A total of 30 samples were selected and couriered to the Laboratory 10 for external check, and the results show that 29 pieces are qualified, with a qualification rate of 96.67%.

For the Pengjiagou Mine, a total of 51 samples were selected for internal check, which represented about 14.9% of the total number of samples analysed (342 samples). The results show that 30 pieces are qualified, with a qualification rate of 96.58%. Totalling 30 samples were selected and couriered to the Laboratory 10 for external check, and the results show that 29 pieces are qualified, with a qualification rate of 95.26%. Figure 6-8 shows the internal and external checks performance of the Pengjiagou Mine.

**Figure 6-6: Internal and External Samples Performance of the Pengjiagou Mine**

### 6.3.3 Wulong Project

#### Sampling

The drilling core samples were sampled by 1/2 split core method. The sample length was 1.0 m. The maximum length was 1.5 m, and the minimum length was 0.2 m.

All tunnel samples were taken by channelling method. The samples positions were determined by the geologists and were sampled by the other workers. The sample channel was perpendicular or roughly perpendicular to the strike of mineralised body. The profile of channel was 10cm × 5cm, and the length was 1m. The maximum length was less than 1.5m. The sample intervals were 6m in ore drift and 40m in transverse drift.

The trench samples were taken by channeling method. The section of channel was 10cm × 3cm, and the length was less than 1.5 m.

A total of 229 samples, 400 samples and 2,334 samples were respectively collected from the Wulong Mine during the resource and reserve verification program in 2019 the Ligunzi gold deposit during the detailed exploration in 2011 and the Haojingou-Ligunzi gold deposit during the detailed exploration from 2012 to 2017.

#### **Sample Preparation and Analysis**

The sample preparation was according to the Chechott formula:  $Q=Kd^2$ ,  $K=0.8$ . The sample preparation was conducted in the following procedures:

- the original samples were firstly coarse crushed by the jaw crusher and were crushed to 10mm.
- the samples were then medium crushed to 0.25 mm (60 mesh) by rod mill.
- the sub-sample with 350-450g was collected as duplicate from a riffle.
- the sub-sample with 150-500g was collected from a riffle, was then pulverized passing a mesh of 200 screen, and then was packed and labelled for analysis.

Samples from the Wulong Mine were analysed by the laboratory of Liaoning 7<sup>th</sup> Geological Brigade Co., Ltd. ("**Laboratory 7**"). Samples from the Ligunzi and Haojingou-Ligunzi gold deposits were assayed by the laboratory of the Brigade 103 of Liaoning Non-ferrous Geology Bureau ("**Laboratory 103**"). The basic item for chemical analysis is gold using AAS method at these laboratories according to the *Specification of Testing Quality Management for Geological Laboratories (DZ/T0130)*.

#### **Specific Gravity Data**

A total of 90 SG ore samples were collected from the tunnels at the Wulong Mine and a total of 48 SG samples were collected from drilling cores at Haojingou-Ligunzi gold deposit according to the different grade resulted from the basic analyses. The samples size was 5cm × 5cm × 5cm. They were sealed and sent to the Laboratory for both gold and SG analysis.

Figure 6-7 is scatter plots of the specific gravity against gold content. The results show that the SG has no significant correlation against the gold grade for Wulong Mine and Haojingou-Ligunzi gold deposit. The average results of SG samples are 2.67g/cm<sup>3</sup> for Wulong Mine and 2.69g/cm<sup>3</sup> for Ligunzi and Haojingou-Ligunzi deposits, which can be applied in the resource estimation.

Figure 6-7: Scatter Plots of SG against gold Grade

Source: SRK  
Note: Wulong Mine (left) and Haojingou-Ligunzi Gold Deposit (right)

**Quality Assurance and Quality Control Programs**

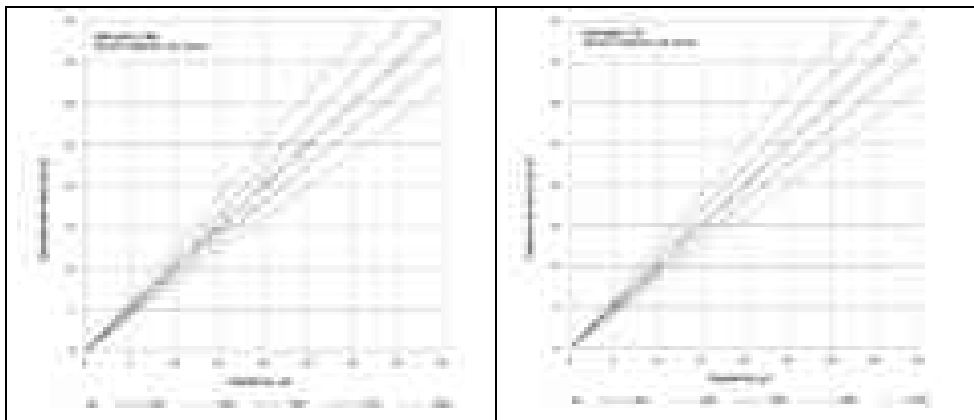

In the Wulong Mine, a total 198 samples, accounting for 8.9% of the total number of samples assayed (2,230 sample) were selected and reanalysed in the Laboratory 103 for internal checking, while 132 samples, accounting for 5.9% of the total number of analysed samples, were sent to the laboratory of Liaoning Nuclear Geological Survey (“Liaoning Lab”) for external lab checking.

The quality control samples summary is shown in Table 6-11, and the performances of the internal and external lab checks are shown in Figure 6-8.

Table 6-11: Summary of Wulong QA/QC data

Category	Data Pairs	Coverage	Relative Difference					
			<10%	10%-20%	>20%			
Internal	198	8.88%	172	86.87%	22	11.11%	4	2.02%
External	132	5.92%	117	88.64%	12	9.09%	3	2.27%

Figure 6-8: Internal and External Performance of Wulong Mine

Source: SRK

In the Ligunzi gold deposit, a total of 30 samples were re-analysed in the Laboratory 103 for internal checking and a total of 15 samples were sent to Liaoning Lab for external lab checking. The pass rates were 97% for internal checks and 100% for external checks.

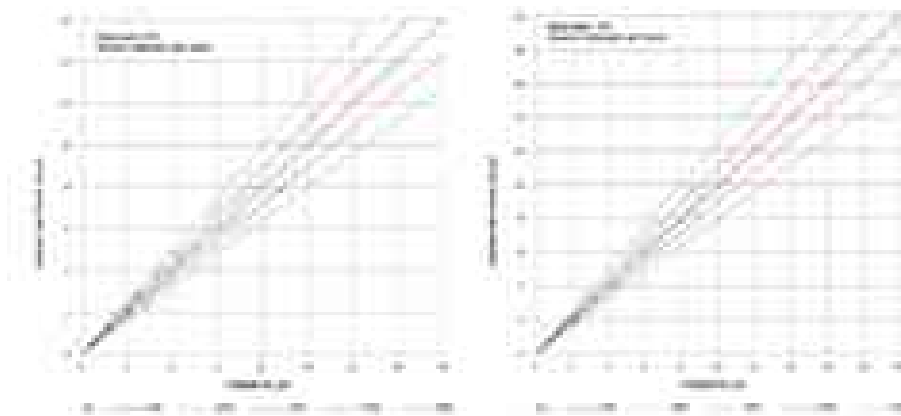

In the Haojingou-Ligunzi gold deposit, a total of 233 samples were re-assayed in the Laboratory 103 for internal checking, with a proportion of 10% and a total of 115 samples were sent to Liaoning Lab for external checking, with a proportion of 4.9%.

The QC samples summary is shown in Table 6-12 and the performance of the internal and external lab check are shown in Figure 6-9.

**Table 6-12: Summary of Haojingou-Ligunzi QC data**

Category	Data Pairs	Coverage	Relative Difference					
			<10%	10%-20%		>20%		
Internal	231	9.90%	118	51.08%	83	35.93%	30	12.99%
External	115	4.93%	98	85.22%	13	11.30%	4	3.48%

### 6.3.4 Hanfeng Project

#### Lishan Mine

A resource and reserve verification program for both Lishan and Dongfeng mines was carried out from 2010 to 2011. A deep exploration of Lishan Mine (-92m asl) was executed during 2011 to 2020.

#### Tunnel Sampling

The tunnel samples were carried out using a channeling method. The section of channel was 10cm×3cm, and most of the sample length was less than 2m. The sampling work was conducted using chisel and hammer. The samples representation met the needs of mineralised body evaluation.

A total of 2,853 channel samples of Lishan Mine were taken separately based on different mineralisation types.

During the deep exploration at Lishan Mine (-92m asl) from 2011 to 2020, the tunnel samples were sampled at the waistline of tunnel continuously based on different rock type and grade rank using channelling method. The samples were marked with red paint after sample division. The section size of the channel sample was 10cm × 3cm, and the sample length is generally 1.0-1.5m. The sample weight was generally 9.5-10.5kg. A total of 789 samples were collected.

#### **Drilling Core Sampling**

A total of 194 boreholes were drilled. The hole diameter of the drilling is 75mm with wire-line coring method. The cores were kept the original structural characteristics and integrity without ore core crushing, dilution and leakage during drilling.

The drilling samples were sampled by ½ split core method. The sample length was determined by core recovery, thickness of mineralised body and Mineralisation. The core was split along the core axis into two halves by the YPK-1 type core splitter. One half was retained as the core, and the other half was bagged and weighed before being sent to the laboratory for analysis. The sample length generally ranged from 1.00m to 1.50m, with a few samples ranging from 0.30m to 0.80m and the longest being 1.90m. A total of 9,127 borehole samples were collected during this stage. The average recovery rate was 99%. The sample weight was between 0.80kg and 4.40kg.

#### **Sample Preparation and Analysis**

The sample preparation included coarse crushing (jaw crusher), medium crushing (disc mill) and fine crushing (disc mill). Each stage was divided into crushing, screening, mixing and shrinkage. The samples analyses were undertaken by the 6th laboratory of Jilin geology and survey Institute. According to DZG93-09 analysis procedures, the analysis instrument for Pb, Zn, Cu is GGX-600 atomic absorption spectrophotometer, the analysis method is AAS method.

During the deep exploration of Lishan Mine (-92m asl) from 2011 to 2020, the sample preparation followed drying, crushing, screening, mixing and splitting procedures. After crushing, the samples were pulverised to 200 mesh and then about 400g was taken for assay and the remains of the pulverised material were stored in the laboratory as pulp rejects.

#### **Specific Gravity Data**

From 2011 to 2020, the samples were collected from cores and tunnels from the Mineralised bodies with various grades and positions. The wax method was used for the SG test.

A total of 466 SG samples were collected, including 326 core samples and 140 channel samples, among which the samples of copper-zinc ores accounts for 36%, lead- zinc ores account for 12%, zinc ores account for 46%, and copper ores account for 6%.

#### **Quality Assurance and Quality Control Programs**

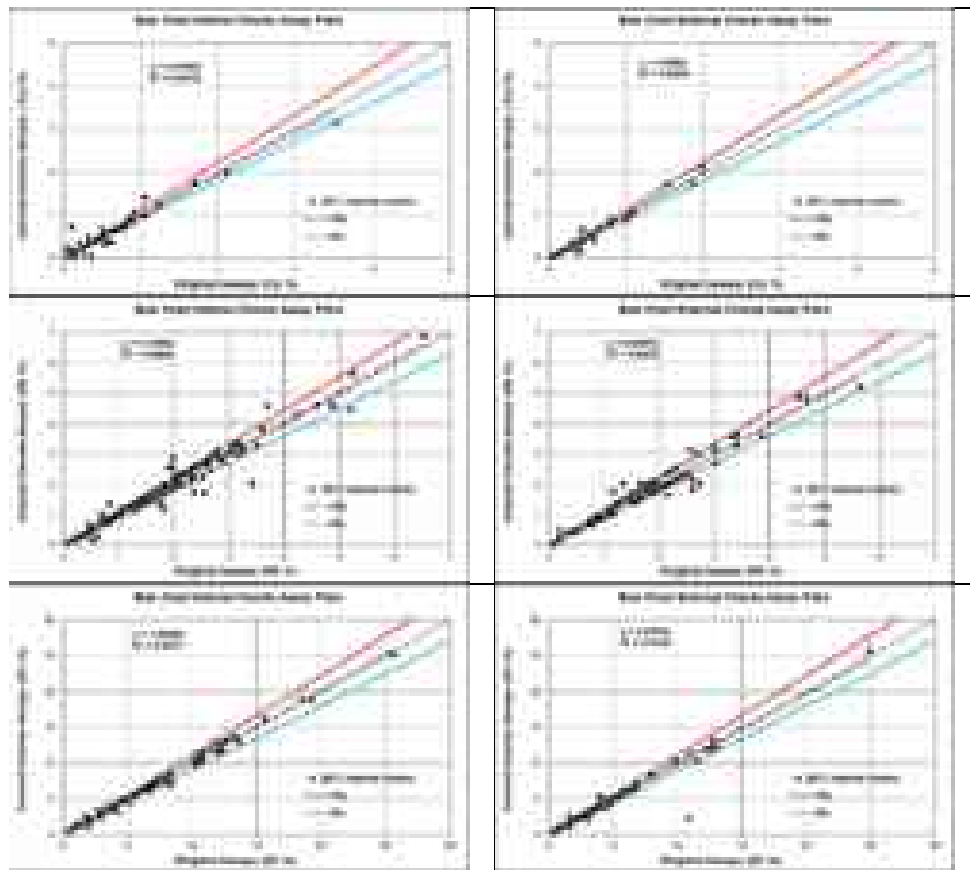

From 2010 to 2011, a total of 2,853 channel samples were taken, and 288 samples were taken for internal check, with a proportion of 10.09%, and 144 samples for external check, accounting for 5.05% of the total samples, were sent to the 4<sup>th</sup> Laboratory of Chemical Geology and Mining

(“Laboratory 4”) for analyses. The sample summary is shown in Table 6-13, and the performance of the internal and external checks are shown in Figure 6-10.

Table 6-13: QA/QC Data Summary of Lishan Mine from 2010 to 2011

Sample	Sample Number		Assay result					
	Count	Percent (%)	Cu		Pb		Zn	
			Samples Above 10x Det. Lim.	Pairs ≤ 10% HARD (%)	Samples Above 10x Det. Lim.	Pairs ≤ 10% HARD (%)	Samples Above 10x Det. Lim.	Pairs ≤ 10% HARD (%)
Internal Checks	288	10.09	31	89.24	35	87.85	25	91.32
External Checks	144	5.05	11	92.36	13	90.97	12	91.67

Figure 6-10: Internal and External Checks of Lishan Mine from 2020-2011

Note: Internal checks on the left and External checks on the right

From 2011 to 2020, a total of 9,916 basic analysis samples, 116 combination analysis samples and 26 phase analysis samples of the Lishan deposit (below -92m asl) were collected. there are 1,208 internal check samples and 710 external check samples for zinc, 80 internal check samples and 40

external samples for copper, 80 internal check samples and 12 external samples for lead. The pass rates of internal and external samples are list in Table 6-14 and the performance of the internal and external checks are shown in Figure 6-11.

**Table 6-14: QA/QC Data Summary of Lishan Mine (below -92m asi) from 2011 to 2020**

Item	Year	Samples number	Qualified	Pass rate (%)	
Basic analysis (Zn)	Internal check	2018	308	298	97
		2019	510	489	96
		2020	390	374	96

Note: Internal checks on the left and External checks on the right

## **Dongfeng Mine**

### **Tunnel Sampling**

Tunnel sampling was carried out using channelling method for newly discovered mineralised bodies, residual mineralised bodies and mineralised bodies missing previous laboratory data. The samples are arranged as vertically as possible to the direction of mineralised bodies. The section of channel size is 10cm × 3cm, and the most sample length is less than 2 m. A total of 1,216 channel samples were taken from different mineralisation types in 2010 to 2011.

During the deep exploration of Dongfeng deposit (-250m asl) from 2013 to 2023, the tunnel samples were sampled at the waistline of tunnel continuously based on different rock type and grade rank using channelling method. The section size of the channel sample was 10cm × 3cm, and the sample length is generally 1.0-1.5m. The sample weight was generally 7.5-8.5kg. A total of 702 samples were collected.

### **Core Drilling Sampling**

A total of 252 boreholes were drilled from 2013 to 2023. The hole diameter of the drilling is 75mm with wire-line coring method. The cores were kept the original structural characteristics and integrity without ore core crushing, dilution and leakage during drilling.

The drilling samples were sampled by ½ split core method. The sample length was determined by core recovery, thickness of mineralised body and Mineralisation. The core was split along the core axis into two halves by the YPK-1 type core splitter. One half was retained as the core, and the other half was bagged and weighed before being sent to the laboratory for analysis. The sample length generally ranged from 1.00m to 1.50m, with a few samples ranging from 0.3m to 0.8m and the longest being 2.0 m. A total of 33,207 borehole samples were collected during this stage. The average recovery rate was 99.87%. The sample weight was between 0.63kg and 3.86kg.

### **Sample Preparation and Analysis**

The sample preparation included coarse crushing (jaw crusher), medium crushing (disc mill) and fine crushing (disc mill). Each stage was divided into crushing, screening, mixing and shrinkage. The sample testing work was undertaken by the 6th laboratory of Jilin geology and survey Institute. According to DZG93-09 analysis procedures, the analysis instrument for Pb, Zn, Cu is GGX-600 atomic absorption spectrophotometer, the analysis method is AAS method.

**Specific Gravity Data**

In 1987, the Brigade 650 of Jilin Nonferrous Metal Geological Exploration Company collected 175 SG samples from different levels of Dongfeng Pb-Zn Mine. The average SG is 3.26g/cm<sup>3</sup>, and there was no significant difference between the different mining levels.

A total of 310 SG samples were taken from orebodies in the deep area of Dongfeng Mine (-250m asl), of which 227 from drillings and 83 samples form tunnels.

**Quality Assurance and Quality Control Programs**

From 2010 to 2011, resource and reserves verification of Dongfeng Deposit was carried out. A total of 1,216 channel samples were taken from Dongfeng lead-zinc deposit, including 705 Pb, Zn, Cu samples, of which 71 samples was taken for internal check and 35 samples was taken for external check. A total of 511 channel samples were taken from Mo sample, of which 52 samples was taken for internal check and 26 samples was taken for external check.

The Chemical Geology and Mining Laboratory #4 carried out external analysis. The pass rates of internal and external samples are list in Table 6-15 and the performance of the internal and external checks are shown in Figure 6-12 and Figure 6-13.

**Table 6-15: QC Data Summary of Dongfeng Deposit in 2011**

Item	Sample		Pass rate			
	Count	Percent (%)	Cu (%)	Pb (%)	Zn (%)	Mo (%)
Internal check	Cu Pb Zn: 71	10.07	92.96	85.92	88.73	92.31
	Mo: 52	10.17				
External check	Cu Pb Zn: 35	4.96	91.43	94.29	91.43	93.21
	Mo: 26	5.09				

**Figure 6-12: Internal check of Dongfeng Deposit in 2011**

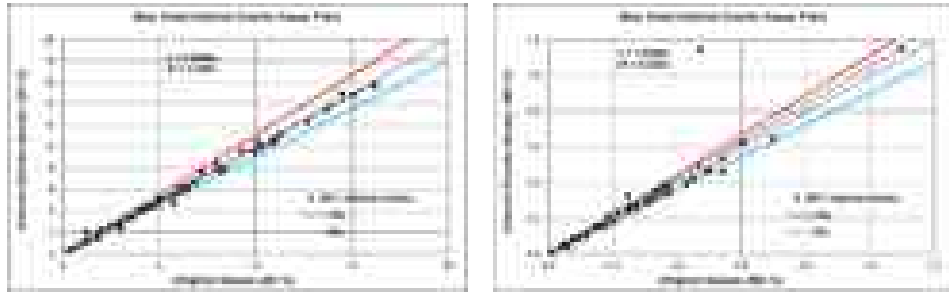

Figure 6-13: External check of Dongfeng Deposit in 2011

From 2013 to 2023, a total of 33,909 basic analysis samples, 141 combination analysis samples and 114 phase analysis samples of the Dongfeng deposit (below 250m asl) were collected. and there are 3,832 internal check samples and 2,431 external check samples for Mo. The pass rates of internal and external samples are list in Table 6-16 and the performance of the internal and external checks are shown in Figure 6-14.

Table 6-16: QA/QC Data Summary of Dongfeng Deposit from 2013 to 2023

Item	Sample Count	Percent (%)	Pass rate
Internal check	3,832	113	96.41
External check	2,431	7.17	97

Figure 6-14: Mo Internal check of Dongfeng Deposit from 2013 to 2023

### 6.3.5 Jintai Project

#### Trench Sampling

In the mining licence area, a total of 618 channel samples were taken separately based on different mineralisation types. The section of channel was 10 cm × 5 cm, and most of the sample length was 1.2 m.

In the exploration licence area, a total of 540 channel samples were collected separately based on different mineralisation types. The section of channel was 10 cm × 3 cm, and the length ranged from 1.0 m to 1.5 m.

The samples representation met the needs of mineralised body evaluation.

#### Core Drilling Sampling

In the mining licence area, samples were collected separately based on different mineralisation types. The drilling samples were sampled by ½ split core method. The sample length was determined by core recovery, thickness of mineralised body and mineralisation, ranging from 0.5 m to 1.5 m.

In the exploration licence area, a total of 9,089 samples were collected separately based on different Mineralisation types. The drilling samples were sampled by ½ split core method. The sample length was determined by core recovery, thickness of mineralised body and mineralisation, ranging from 1 m to 1.5 m. The samples were collected by manual in the loose rock area, while hard rock with core splitter.

The samples representation met the needs of mineralised body evaluation.

#### Sample Preparation and Analyses

From 2007 to 2010, a general exploration for Xidengping deposit was carried out. The sample preparation included coarse crushing, medium crushing and fine crushing. Each stage was divided into crushing, screening, mixing and shrinkage. The samples analyses were undertaken by the lab of Kunming Mineral Resources Supervision and Testing Centre and Yunnan 3<sup>rd</sup> Geological Brigade ("Kunming Laboratory"). The basic analysis item was gold. Both internal and external lab check

samples were according to the Specification of Testing Quality Management for Geological Laboratories.

From 2020 to 2021, Mineral Resource verification was conducted. The sample preparation included coarse crushing, medium crushing and fine crushing. Each stage was divided into crushing, screening, mixing and shrinkage. The total loss rate was less than 5%. The K value was set to 0.5 in the formulation  $Q = Kd^2$  and the sample was crushed to 0.074 mm (200 mesh). Samples were analysed by the central laboratory of Yunnan Bureau of Geology and Mineral Resources Exploration and Development ("**Central Laboratory**"). External check samples were sent to Henan Rock and Mineral Testing Center ("**Henan Laboratory**"). The basic analysis item was gold. Both internal and external lab check samples were according to the Specification of Testing Quality Management for Geological Laboratories (DZ/T0130-2006).

From 2020 to 2022, advanced exploration was conducted. The sample preparation included coarse crushing, medium crushing and fine crushing. Each stage was divided into crushing, screening, mixing and shrinkage. The samples were firstly coarse crushed by the jaw crusher and were crushed to 4 mm. Then the samples were medium crushed by the disc mill and were crushed to 1 mm. After that, there were the mixing and splitting procedures. The K value was set to 0.8 in the formulation  $Q = Kd^2$  and the sample was crushed to 0.074 mm (200 mesh). Samples were analysed by the Central Laboratory. External check samples were sent to Henan Laboratory. The basic analysis item was gold. Both internal and external lab check samples were according to the Specification of Testing Quality Management for Geological Laboratories (DZ/T0130-2006).

#### **Specific Gravity Data**

From 2007 to 2010, a total of 30 SG piece samples were collected from the mineralised bodies with various grades and positions. The wax method was used for the SG test. The average SG was 2.14 g/cm<sup>3</sup>. And 2 bulk samples were collected, and the result was 1.76g/cm<sup>3</sup>. The SG samples were more representative, so the SG value of 2.14g/cm<sup>3</sup> was applied in the Mineral Resource estimate.

From 2020 to 2022, a total of 103 SG piece samples were collected from the mineralised bodies with various grades and positions. The wax method was used for the SG test. 40 samples were collected for domain V4, 31 samples were collected in the Xidengping area, and 32 samples were collected for domain V8. The samples representation met the needs of mineralised body evaluation. 4 bulk samples were collected, and the result was consistent with piece samples. The SG values were 2.15g/cm<sup>3</sup> for domain V9 and V10, 2.29g/cm<sup>3</sup> for domain V8, and 2.24g/cm<sup>3</sup> for domain V4, V5, V6 and V7.

#### **Quality Assurance and Quality Control Programs**

From 2007 to 2010, general exploration for Xidengping deposit was carried out. A total of 1,506 samples were sent to labs for gold grade. A total of 30 samples were taken for internal lab check with a proportion of 1.99%. 30 samples were taken for external lab check with a proportion of 1.99%. The qualification rate was 70% for internal check and 56.67% for external check.

The QA/QC samples summary is shown in **Table 6-17**, and the performance of the internal and external lab check are shown in Figure 6-15.

**Table 6-17: Summary of General Exploration QA/QC data**

Category	Data Pairs	Coverage	Relative Difference					
			<10%	10%-20%	>20%	<10%	10%-20%	>20%
Internal	30	1.99%	12	40.00%	9	30.00%	9	30.00%
External	30	1.99%	9	30.00%	8	26.67%	13	43.33%

**Figure 6-15: Performance of Internal and External Checks for General Exploration**

From 2020 to 2021, Mineral Resource verification for Xidengping deposit was carried out. A total of 563 samples were sent to labs for gold grade. A total of 50 samples were taken for internal lab check with a proportion of 8.91%. 31 samples were taken for external lab check with a proportion of 5.51%. The qualification rate was 70% for internal check and 100% for external check.

The QA/QC samples summary is shown in **Table 6-18** and the performance of the internal and external lab check are shown in Figure 6-16.

**Table 6-18: Summary of Resource Verification QA/QC data**

Category	Data Pairs	Coverage	Relative Difference					
			<10%	10%-20%	>20%	<10%	10%-20%	>20%
Internal	50	8.91%	21	42.00%	14	28.00%	15	30.00%
External	31	5.51%	29	93.55%	2	6.45%	-	-

**Figure 6-16: Performance of Internal and External Checks for Resource Verification**

From 2012 to 2022, in the exploration licence area, a total of 9,629 samples were sent to labs for gold grade. A total of 819 samples were taken for internal lab check with a proportion of 8.51%. 350 samples were taken for external lab check with a proportion of 3.63%. The qualification rate was 68.62% for internal check and 89.71% for external check.

The QA/QC samples summary is shown in **Table 6-19**, and the performance of the internal and external lab check are shown in Figure 6-17.

**Table 6-19: Summary of Advanced Exploration QA/QC data**

Category	Data Pairs	Coverage	Relative Difference					
			<10%		10%-20%		>20%	
Internal	819	8.51%	369	45.05%	193	23.57%	257	31.38%
External	350	3.63%	278	79.43%	36	10.29%	36	10.29%

Figure 6-17: Performance of Internal and External Checks for Advanced Exploration

### 6.3.6 SRK Comments

In the opinion of SRK, the sampling, sample preparation and analytical procedures used for Jilong, Huatai, Wulong, Hanfeng and Jintai projects are acceptable. The pass rates of both internal and external check samples for these projects are acceptable, while blank sample were not used in these projects.

## 7 SRK Data Verification

### 7.1 Introduction

In accordance with the JORC Code guidelines, SRK team conducted multiple site visits of the Chifeng Gold's five subsidiaries' mining projects, including the Jilong, Huatai and Wulong projects from 22 to 26 December 2022, the Hanfeng project between 9 and 10 January 2023, and the Jintai project on 8 March 2023 in the first round; the Jilong, Huatai, Wulong and Hanfeng project from 14 to 19 May 2024 and the Jintai project from 21 to 23 May 2024 in the second round, and the Jilong and Wulong projects from 28 May 2024 to 1 June 2024 in the third round. During the site visit, SRK conducted the following verification procedures:

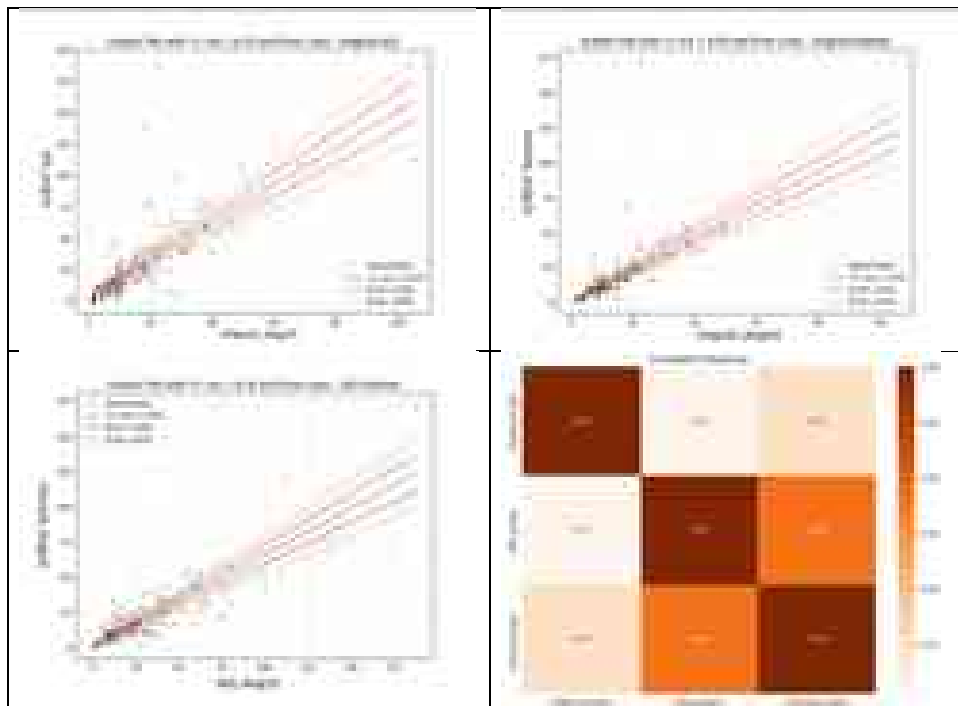

- Site inspection of each project area by SRK's competent persons and senior geologists.
- Met with Company representatives.
- Discussed with the technical personnels.
- Checked the historical exploration work.
- Borehole coordinates verification by handheld GPS.
- Inspection of the core warehouse.
- Witnessed underground channel sampling.
- Witnessed the underground and/ or open pit mining development, and
- Re-sampled historical pulp samples from the five projects.

### 7.2 Jilong Project

SRK used the cut-off grade of 1.0g/t Au to select verification samples, based on the exploration report on the Zhuanshanzi Mine in 2018, a total of 154 samples have been taken. The samples were re-numbered and sent to SGS Mineral Laboratory located in Tianjin, China ("SGS Lab") for verification assay.

The assay results are listed in Appendix D and the scatter plots are shown in Figure 7-1. A large bias was observed between original assay and check results, SRK has checked with both main laboratory and SGS Lab staff, found that the sample preparation and sample assay methods are different, the sample preparation protocol which the original main laboratory adopted is relatively conservative, they use sieve to remove potential visible gold and then for assay to minimize the nugget effect, which may lead to a system lower bias compared to SGS Lab using screen fire assay method. SRK advised to send the samples to the Intertek laboratory in Beijing ("Intertek Lab"), for further verification, the assay results are listed in Appendix D and plotted in Figure 7-1, a general trend can be observed although larger biases are found in the higher grade samples, which may be led by the nugget effect of visible gold .

Figure 7-1: Performance of SRK Verification Samples from Zhuanshanzi Mine

Source: SRK

### 7.3 Huatai Project

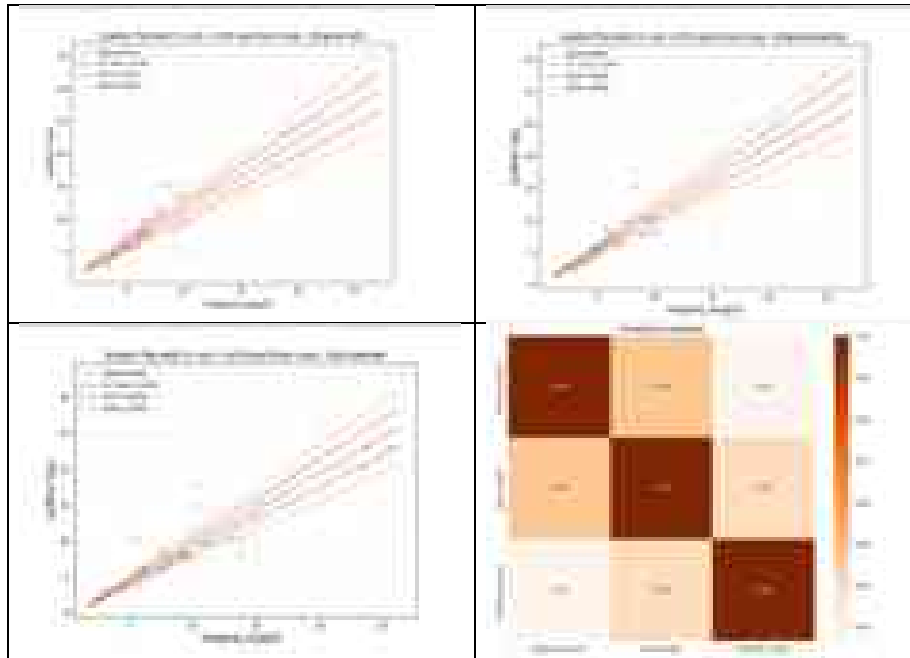

The data verification of Huatai project is divided into two parts: one part is from the Honghuagou Mine including #1 mining zone, #86 Vein and Pengjiagou Deposit; the other part is from the Lianhuashan Mine including #3&#7 Vein, #26 Vein and #5 mining zone.

SRK used the cut-off grade of 1.0g/t Au to select verification samples, a total of 50 pulp duplicate samples are from the Honghuagou Mine and a total of 55 pulp samples are from the Lianhuashan Mine. All samples were re-numbered and sent to SGS Lab for re-analysis.

The assay results from Honghuagou Mine are listed in Appendix B and plotted in Figure 7-2. A large bias was observed between original assay and check results, SRK has checked with both main laboratory and SGS Lab staff, found that the sample preparation and sample assay methods are different, the sample preparation protocol which the original main laboratory adopted is relatively conservative, they use sieve to remove potential visible gold and then for assay to minimize the nugget effect, which may lead to a system lower bias compared to SGS Lab using screen fire assay method. The samples have been sent to Intertek Lab for further verification, the assay results are listed in Appendix B and plotted in Figure 7-2, and a general trend can be observed although larger biases are found in the higher grade samples, which may be caused by the nugget effect of visible gold

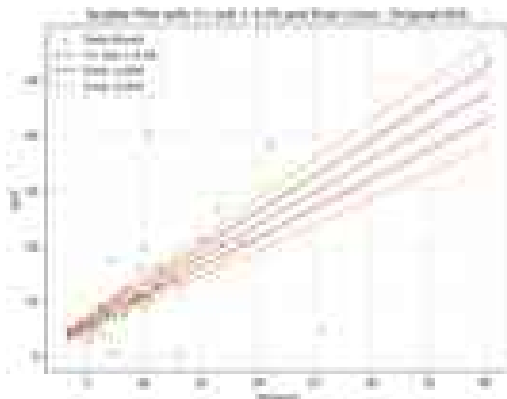

For the verification samples from the Lianhuashan Mine, a large bias was also observed between original assay and check results. About 60% plotting pairs are within  $\pm 20\%$ . About 40% pairs are out of  $\pm 20\%$ , which may be caused by the nugget effect. The assay results are listed in Appendix B and plotted in Figure 7-3.

**Figure 7-2: Performance of SRK Verification Samples from Honghuagou Mine**

Source: SRK

**Figure 7-3: Performance of SRK Verification Samples from Lianhuashan Mine**

Source: SRK

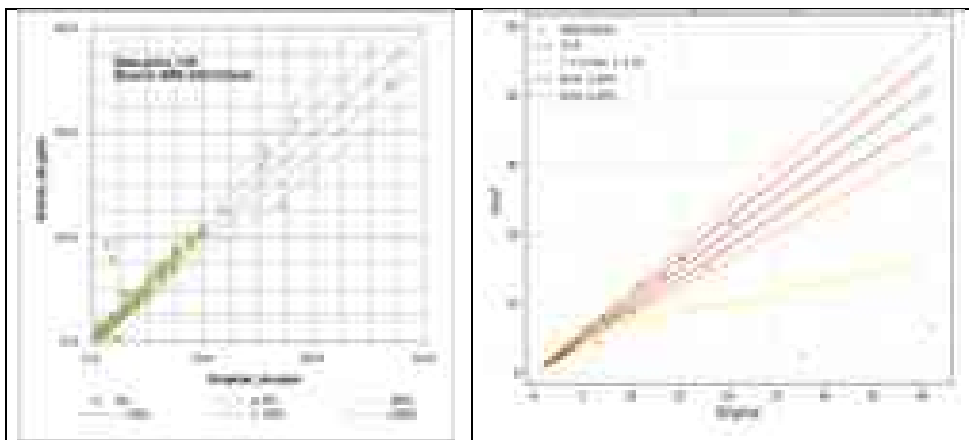

## 7.4 Wulong Project

The data verification of Wulong Project is divided into two parts: one part is from the Wulong Mine and the other part is from the Haojingou gold deposit and Haojingou-Ligunzi gold deposit.

SRK used the cut-off grade of 1.0g/t Au to select verification samples based on the Wulong Resource and Reserve Verification report 2019, a total of 129 pulp samples are from the Wulong Mine and a total of 36 pulps from the Haojingou and Haojingou-Ligunzi gold deposits. All samples were re-numbered and sent to SGS Lab for analysis.

The scatter plots are shown in Figure 7-4. The comparison of assay results between the original samples and SRK check samples show that the relative differences between them are mostly within  $\pm 20\%$ , with only a few pairs exceeded  $\pm 20\%$ , but is still acceptable considering this type of gold mineralisation.

**Figure 7-4: Performance of SRK Verification for Wulong Project**

Source: SRK

Note: Wulong Mine on the left and Haojingou and Haojingou-Ligunzi deposits on the right

## 7.5 Hanfeng Project

### Lishan Project

SRK used the cut-off grade of 0.5% Zn to select verification samples. A total of 152 pulp samples are taken from the Lishan Mine (based on the Lishan Exploration Report 2020). The verification samples were re-numbered and sent to SGS Lab for re-analysis. The assay results are listed in Appendix B and plotted in Figure 7-6. The scatter diagrams show that most of the returned analysis results for Cu and Zn are within  $\pm 20\%$ , the Pb have returned poorer performance, however, most of which are in the very low grade, and therefore the results are considered acceptable.

Figure 7-5: Performance of SRK 2023 Verification Samples from Lishan Mine

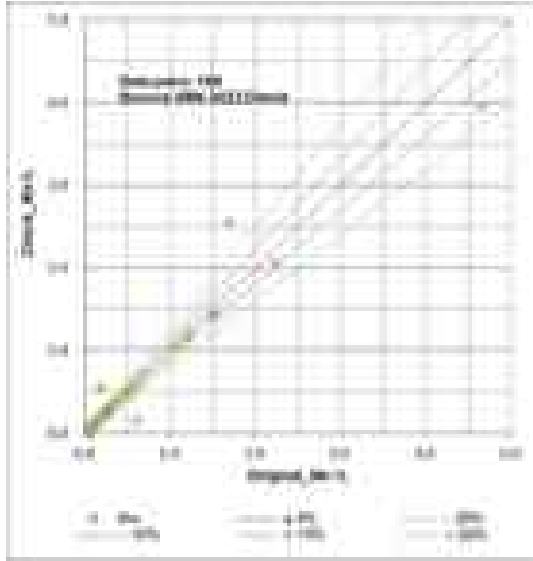

Source: SRK

#### Dongfeng Project

SRK used the cut-off grade of 0.03% Mo to select verification samples. A total of 189 samples have been taken from the Dongfeng Mine and were sent to SGS Lab for analysis. The assay results are listed in Appendix B and plotted in Figure 7-6. The scatter diagrams show that all of the returned analysis results for Mo are within  $\pm 20\%$ , which are considered acceptable.

Figure 7-6: Performance of SRK 2023 Verification Samples from Dongfeng Mine

Source: SRK

## 7.6 Jintai Project

SRK used the cut-off grade of 0.17g/t Au to select verification samples. A total of 77 pulp samples from different exploration phases are collected and are sent to SGS Lab for analysis. Details of the verification samples are presented in Appendix B, are summarised in Table 7-1 and are plotted in Figure 7-7. The scatter diagrams show that about 52% results for gold are within  $\pm 20\%$ . About 48% results are outside  $\pm 20\%$ , which may be caused by the nugget effect.

Table 7-1: Summary of SRK Verification Samples

Phase	Samples	Samples Au $\geq$ 0.17	Verification Samples	Percentage Au $\geq$ 0.17
General Exploration	684	256	13	5.08%
Mineral Resource Verification	880	50	2	4.00%
Advanced Exploration	9,629	1,505	62	4.12%
<b>Total</b>	<b>11,193</b>	<b>1,811</b>	<b>77</b>	<b>4.25%</b>

Figure 7-7: SRK 2023 Verification on Xidengping Gold Mine

Source: SRK

## 7.7 SRK Comments

Overall, SRK is satisfied with the quality and result of the sample preparation and assay conducted by related analytical laboratories. The analytical procedures are consistent with generally accepted industry practices and the primary sample results are therefore suitably reliable for use in Mineral Resource estimation.

## 8 Mineral Resource Estimates

### 8.1 Introduction

The Mineral Resource Statement presented herein represents Mineral Resource estimation prepared for the Chifeng Gold Project in accordance with the JORC Code.

The effective date of the Mineral Resource Statement is 30 September 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key assumptions considered by SRK. In the opinion of SRK, the Mineral Resource estimation reported herein is a reasonable representation of the global Mineral Resources found in Jilong, Huatai, Wulong, Hanfeng and Jintai projects at the current level of sampling. The Mineral Resources are reported in accordance with the JORC Code. The Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve.

The database used to estimate the Chifeng Gold Project Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling, tunnelling and trenching information is sufficiently reliable to interpret with confidence the boundaries for gold, lead-zinc and molybdenum mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

The Surpac 2020.1 ("**Surpac**") software was used to construct the grade solids, prepare assay data for analysis, construct the block model, estimate gold grades, and tabulate Mineral Resources.

### 8.2 Mineral Resource Estimation Procedures

The Mineral Resource estimation methodology involved the following procedures:

- Database compilation and verification;
- Construction of wireframe models for the boundaries of the gold Mineralisation;
- Definition of resource domains;
- Data conditioning (compositing and capping) for analysis;
- Block modelling and grade interpolation;
- Resource classification and validation;
- Assessment of "reasonable prospects for eventual economic extraction ("**RPEEE**")" and selection of appropriate cut-off grades; and
- Preparation of the Mineral Resource Statement.

### 8.3 Mineral Resource Database

#### 8.3.1 Jilong Project

Jilong Project is composed of the Zhuanshanzi Mine including two mineralised blocks of the #1#2#3&depth Blocks and the #4#5#6#7 Block.

SRK was provided with geological exploration reports and maps, topography, database, QAQC data, and SG data. The coordinate system of Jilong Project is CGCS 2000. SRK undertook a thorough review for the database, followed by various verification procedures, and verified that the database was acceptable for a Mineral Resource estimation.

Based on the data, SRK constructed a Mineral Resource database, composed of borehole collar, survey, lithology, assay, and SG data. Table 8-1 summaries the database covering the entire project area. The boundary of the estimation is the Zhuanshanzi mining licence.

**Table 8-1: Mineral Resource Database Statistics of Jilong Project**

Mine/Deposit	Type	Counts	Length (m)	Assay Samples
Zhuanshanzi Mine (#1#2#3&depth Block)	Drillholes	81	1,9078.32	602
	Tunnels	6,240	5,989.89	14,328
	<b>Total</b>	<b>6,321</b>	<b>25064.21</b>	<b>14,930</b>
Zhuanshanzi Mine (#4#5#6#7 Block)	Drillholes	64	10,810.47	339
	Trenches	55	90.69	106
	Tunnels	12	45.94	87
	<b>Total</b>	<b>131</b>	<b>10,947.1</b>	<b>532</b>

### 8.3.2 Huatai Project

Huatai Project consists of the Honghuagou Mine including #1 Mining Zone and #86 Vein, the Pengjiagou Mine and the Lianhuashan Mine including #5 Mining Zone, #26 Vein and #3-7 Vein.

The resource database included all the samples both from drillholes and mining levels. SRK was provided with geological exploration reports and maps, topography, database, QA/QC data, and SG data. The coordinate system of Huatai Project is CGCS 2000. SRK undertook a thorough review for the database, followed by various verification procedures, and verified that the database was acceptable for a Mineral Resource estimation.

Based on the data, SRK constructed a Mineral Resource database, composed of borehole collar, survey, lithology, assay, and SG data. Table 8-2 summaries the database covering the entire project area. The boundary of the estimation is the Honghuagou, Pengjiagou and Lianhuashan mining licenses.

**Table 8-2: Mineral Resource Database Statistics of Huatai Project**

Mine/Deposit	Type	Counts	Length (m)	Assay Samples
Honghuagou mine	Drillholes	96	33,424.71	478
	Tunnels	764	2,031.80	2,652
	<b>Total</b>	<b>860</b>	<b>35,456.51</b>	<b>3,130</b>
Pengjiagou deposit	Drillholes	44	9,438.6	92
	Tunnels	112	282.85	292
	<b>Total</b>	<b>156</b>	<b>9,721.45</b>	<b>384</b>
Lianhuashan deposit	Drillholes	96	14,179.76	188
	Tunnels	1,153	2,159.86	3,271
	<b>Total</b>	<b>1,249</b>	<b>16,339.62</b>	<b>3,459</b>

### 8.3.3 Wulong Project

Wulong Project is composed of the Wulong Mine, and the Ligunzi gold deposit and the Haojingou-Ligunzi deposit.

SRK was provided with geological exploration reports and maps, topography, database, QA/QC data and SG data. The coordinate system of Wulong Mine and Ligunzi deposit is Beijing 54 while Haojingou-Ligunzi deposit is Xi'an 80. SRK undertook a thorough review for the database, followed by various verification procedures, and verified that the database was acceptable for a Mineral Resource estimation.

Based on the data, SRK constructed a Mineral Resource database, composed of borehole collar, survey, lithology, assay, and SG data. Table 8-3 summaries the database covering the entire project area. The boundary of the estimation is the Wulong mining licence, and the Ligunzi and Haojingou-Ligunzi exploration permits.

**Table 8-3: Mineral Resource Database Statistics of Wulong Project**

Mine/Deposit	Type	Counts	Length (m)	Assay Samples
Wulong Mine	Drillholes	38	15,135.9	1,164
	Tunnels	5,167	8,809.7	13,123
	<b>Total</b>	<b>5,205</b>	<b>23,945.6</b>	<b>14,287</b>
Ligunzi Deposit	Drillholes	2	1,077.8	104
	Tunnels	303	537.4	303
	Trenches	3	2.0	3
	<b>Total</b>	<b>308</b>	<b>1,617.2</b>	<b>410</b>
Haojingou-Ligunzi Deposit	Surface Drillholes	88	21,158.4	1,935
	UG Drillholes	11	787.7	74
	Tunnels	131	195.0	231
	Trenches	279	169.2	452
	<b>Total</b>	<b>509</b>	<b>22,310.2</b>	<b>2,692</b>

### 8.3.4 Hanfeng Project

Hanfeng Project consists of two mining rights, the Lishan Mine and the Dongfeng Mine. The Mineral Resources are reported in the deep area of below -92m asl of for the Lishan Mine and in the deep area of below 250m asl for Dongfeng Molybdenum Deposit.

The solid models were prepared using vein tool by Leapfrog 2021.1 and IDW estimation techniques by GEOVIA Surpac 2020.1. The entire estimate procedure, consisting of database compilation, mineralised domains construction, the grade interpolation as well as the resources classification, were completed by SRK.

The data SRK received from the client include collar, assay, survey, density and lithologies in excel format, internal and external checks data, and geology maps. Detail information is as shown in Table 8-4, and the drillhole location is shown in Figure 8-1.

**Table 8-4: Resource Database Statistics of Hanfeng Project**

Mine	Type	Counts	Profiles(m)	Assay records
Lishan	Drillholes	194	46,352	9,556
	Tunnels	102	477	487
Dongfeng	Drillholes	252	88,402	31,949
	Tunnels	63	431	417

**Figure 8-1: Hole location of Lishan and Dongfeng Mines**

Note: Lishan Mine on the left and Dongfeng Mine on the right

### 8.3.5 Jintai Project

SRK was provided with geological exploration reports and maps, topography, database, QAQC data, and SG data. The coordinate system is CGCS2000. SRK undertook a thorough review for the database, followed by various verification procedures, and verified that the database was acceptable for a Mineral Resource estimation.

Based on the data, SRK constructed a Mineral Resource database, composed of borehole collar, survey, lithology, assay, and SG data. Table 8-5 summaries the database covering the entire project area.

**Table 8-5: Mineral Resource Database Statistics for Jintai Project**

Mine/Deposit	Type	Counts	Length (m)	Assay Samples
Xidengping Mine	Drillholes	196	14,615.38	10,653
	Trenches	12	105.30	102
	<b>Total</b>	<b>208</b>	<b>14,720.68</b>	<b>10,755</b>

## 8.4 Solid Body Modelling

SRK was provided with section maps and mining level maps of all mineralised domains. SRK has constructed and reviewed the solid models according to the maps provided by the client and they are acceptable for the estimation.

For the Jilong, Huatai and Wulong and Jintai projects, the mineralisation is dominated by gold. The mineralised domains for the Jilong, Huatai and Wulong projects were interpreted by samples collected based on a cut-off grade of 1.0g/t Au, and the mineralised domains for the Jintai Project were interpreted by samples collected based on a cut-off grade of 0.17g/t Au.

For the Hanfeng Project, the zinc mineralised domains were interpreted by samples collected based on a cut-off grade of 0.5% Zn, and the molybdenum mineralised domains were interpreted by samples collected based on a cut-off grade of 0.03% Mo.

### 8.4.1 Jilong Project

A total of 44 mineralised domains for the #1#2#3&depth Block and 4 mineralised domains for the #4#5#6#7 Block were constructed in the Zhuanshanzi Mine (see Figure 8-2).

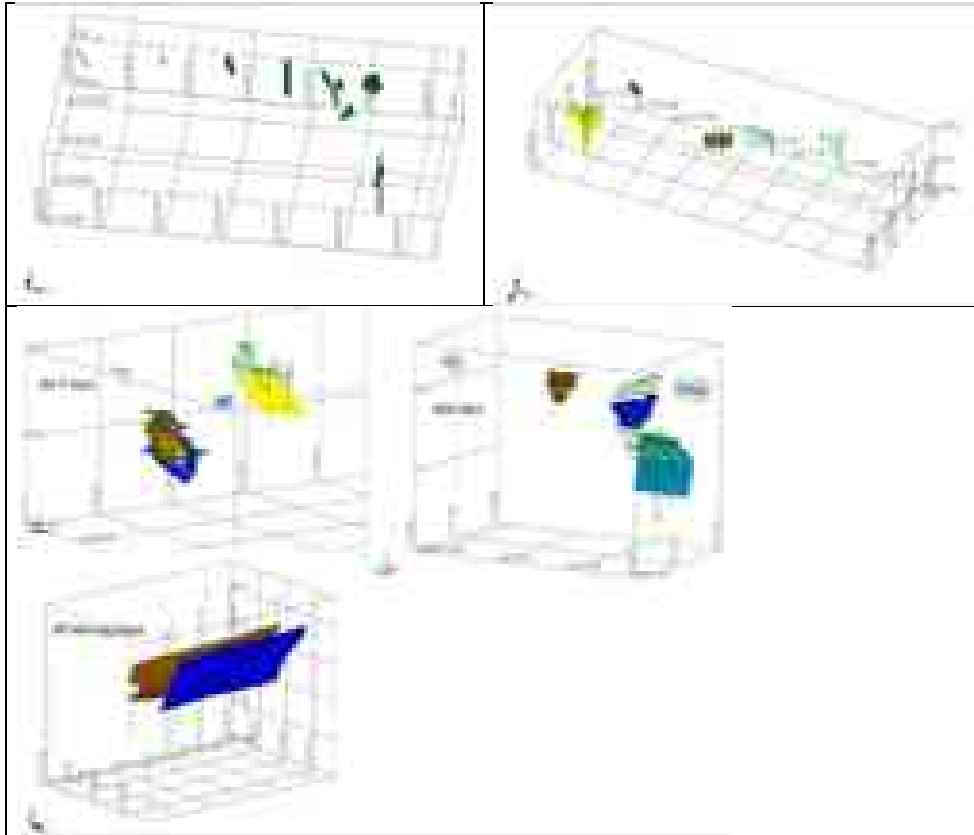

Figure 8-2: Mineralised Domains in the Zhuanshanzi Mine

Note: Solid bodies of #1#2#3&depth block on the left and #4#5#6#7 block on the right

### 8.4.2 Huatai Project

As shown in Figure 8-3, a total of 16 mineralised domains for the Honghuagou Mine, 6 mineralised domains for the Pengjiagou Mine and a total of 12 mineralised domains for the Lianhuashan Mine were constructed.

**Figure 8-3: Mineralised Domains of Honghuagou, Pengjiagou and Lianhuashan Mines**

Note: Solid bodies of Honghuagou Mine on the upper left, Pengjiagou Mine on the upper right and Lianhuashan Mine on the bottom.

#### 8.4.3 Wulong Project

A total of 33 mineralised domains for the Wulong Mine, 6 mineralised domains for the Ligunzi deposit and a total of 17 mineralised domains for the Haojingou-Ligunzi deposit were constructed (Figure 8-4).

**Figure 8-4: Mineralised Domains of Wulong Mine and Ligunzi and Haojingou-Ligunzi Deposits**

Note: Solid bodies of Wulong Mine on the upper left, Ligunzi deposit on the upper right and Haojingou-Ligunzi deposit on the bottom.

#### 8.4.4 Hanfeng Project

A total of 128 lead-zinc mineralised domains for the Lishan Mine (below-92m asl) and a total of 178 molybdenum mineralised domains the Dongfeng Mine were constructed (see Figure 8-5).

**Figure 8-5: Mineralisation Domains of Lishan and Dongfeng Mines**

Note: Solid bodies of Lishan Mine (below -92m asl) on the left and Dongfeng Mine (below 250m asl) on the right.

#### 8.4.5 Jintai Project

A total of 11 mineralised domains were constructed in Xidengping Mine (see Figure 8-6).

**Figure 8-6: Mineralised Domains of Xidengping Mine**

Source: SRK

### 8.5 Compositing

#### 8.5.1 Jilong Project

The database of the #1#2#3 depth block in the Zhuanshanzi Mine indicates that most of the sample intervals are 0.4 m, and a 0.4 m interval composite length was selected for compositing. All raw samples were composited to 0.4 m downhole lengths, with a minimum of 0.75 m for each composite

sample. A 0.4 m interval composite length was applied by SRK for subsequent statistic and grade interpolation. The distribution of sample lengths is shown in Figure 8-7.

The database of the #4#5#6#7 block in the Zhuanshanzi Mine indicates that most of the sample intervals are 1.0 m, and a 1.0 m interval composite length was selected for compositing. A 1.0 m interval composite length was applied by SRK for subsequent statistic and grade interpolation. The distribution of sample lengths is shown in Figure 8-7.

**Figure 8-7: Histograms of Sample Length of Zhuanshanzi Mine**

Note: Histograms of sample length for the #1#2#3&depth block on the left and for #4#5#6#7 block on the right.

The calculated univariate statistics for gold within the #1#2#3&depth block and #4#5#6#7 block of Zhuanshanzi Mine are presented in Table 8-6.

**Table 8-6: Composites Statistics of Zhuanshanzi Mine**

Mine/Deposit	Samples	Min	Max	Mean	Median	SD
#1#2#3&depth block, Zhuanshanzi Mine	2502	0.30	0.40	0.39	0.40	0.03
#4#5#6#7 block, Zhuanshanzi Mine	194	0.4	1	0.95	1	0.13

### 8.5.2 Huatai Project

The database of the #1 Mining Zone in the Honghuagou Mine indicates that most of the sample intervals are 0.8 m, and a 0.8 m interval composite length was selected for compositing. All raw samples were composited to 0.8 m downhole lengths, with a minimum of 0.75 m for each composite sample. A 0.8 m interval composite length was applied by SRK for subsequent statistic and grade interpolation. The distribution of sample lengths of the #1 Mining Zone is shown in Figure 8-8.

For the #86 Vein of Honghuagou Mine, #26 Vein, #3&7# Vein and #5 Mining Zone of the Lianhuashan Mine, and Pengjiagou Mine, a 0.5 m interval composite length was selected for compositing. All raw samples were composited to 0.5 m downhole lengths, with a minimum of 0.75 m for each composite sample. A 0.5 m interval composite length was applied by SRK for subsequent statistic and grade interpolation.

Figure 8-8: Histogram of Sample Length of #1 Mining Zone of Honghuagou mine

The statistical results of the composited gold data from Huatai Project are presented in Table 8-7.

Table 8-7: Composites Statistics of Huatai project

Mine/Deposit	Ore block	Samples	Min	Max	Mean	Median	SD	CoV.
Honghuagou	#86 Vein	355	0.02	0.5	0.45	0.5	0.01	0.23
	#1 Mining Zone	764	0.60	0.80	0.79	0.80	0.04	0.05
	#3-7 Vein	821	0.01	0.5	0.40	0.47	0.03	0.47
Lianhuashan	#26 Vein	91	0.2	0.5	0.41	0.5	0.01	0.29
	#5 Mining Zone	698	0.01	0.50	0.40	0.50	0.03	0.41
Pengjiagou	Pengjiagou	323	0.01	0.50	0.45	0.50	0.01	0.27

### 8.5.3 Wulong Project

Prior to the statistical analysis, the samples were generally combined to the length of each sample was basically equivalent. The basic statistics of geological sampling length of original samples are carried out by SRK, as shown in Table 8-8.

Table 8-8: Statistics of Sample Length of Each Deposit

Mine/Deposit	Samples	Min	Max	Mean	Median	SD	Kurtosis	Skewness
Wulong	6,705	0.10	18.38	0.98	1.00	0.65	92.83	4.80
Ligunzi	268	0.30	3.10	1.83	2.00	0.70	-1.03	-0.17
Haojingou-Ligunzi	308	0.03	1.50	0.72	0.70	0.34	-0.43	0.26

The database of the Wulong Mine indicates that most of the sample intervals are 1 m, and a 1 m interval composite length was selected for compositing. All raw samples were composited to 1 m downhole lengths, with a minimum of 0.75 m for each composite sample. A 1 m interval composite length was applied by SRK for subsequent statistic and grade interpolation.

The database of the Ligunzi deposit indicates that most of the sample intervals are 2 m, and a 2 m interval composite length was selected for compositing. All raw samples were composited to 2 m downhole lengths, with a minimum of 1.5 m for each composite sample. A 2 m interval composite length was applied by SRK for subsequent statistic and grade interpolation.

The database of the Haojingou-Ligunzi deposit indicates that most of the sample intervals are 1 m, and a 1 m interval composite length was selected for compositing. All raw samples were composited to 1 m downhole lengths, with a minimum of 0.75 m for each composite sample. A 1 m interval composite length was applied by SRK for subsequent statistic and grade interpolation.

The distributions of sample lengths of the Wulong Mine, and the Ligunzi and Haojingou-Ligunzi deposits are shown in Figure 8-9.

**Figure 8-9: Histograms of Sample Length for Wulong Mine, Ligunzi and Haojingou-Ligunzi Deposits**

Note: Histograms of sample length for Wulong Mine on the upper left, Ligunzi deposit on the upper right and Haojingou-Ligunzi deposit on the bottom.

Table 8-9 lists the summarised statistics of composites against raw samples for each mine and deposit. No material errors were found.

**Table 8-9: Summary Statistic of Composites against Raws of Each Deposit**

Deposit	Type	Counts	Min	Max	Mean	Variance	SD	Cov
Wulong	Raw	6705	0.00	172.00	8.36	92.25	9.60	1.15
	Composite	6674	0.00	172.00	9.01	86.45	9.30	1.03
	Difference (%)	-0.46	0.00	0.00	7.67	-6.29	-3.20	-10.09
Ligunzi	Raw	268	0.30	41.00	5.34	18.56	4.31	0.81
	Composite	233	0.30	41.00	5.46	18.22	4.27	0.78
	Difference (%)	-13.06	0.00	0.00	2.22	-1.85	-0.90	-3.05
Haojingou-Ligunzi	Raw	308	0.05	107.00	6.25	96.93	9.85	1.57

Deposit	Type	Counts	Min	Max	Mean	Variance	SD	Cov
	Composite	254	0.05	46.75	6.52	54.93	7.41	1.14
	Difference (%)	-17.53	0.00	-56.30	4.29	-43.33	-24.74	-27.83

#### 8.5.4 Hanfeng Project

The compositing interval was selected by reviewing sample length histograms. A mineralised sample length histogram from the Lishan Mine (below -92m asl) and Dongfeng Mine (below 250m asl) are displayed in Figure 8-10.

A composite length of 1 m was chosen for both Lishan and Dongfeng Mine as it does not distort the grade distribution for the mine when compared to the length-weighted raw grade statistics.

**Figure 8-10: Histogram of Sample Length for Lishan and Dongfeng Mines**

Note: Histograms of sample length for Lishan Mine (below -92m asl) on the left and Dongfeng Mine (below 250m asl) on the right.

The statistical results of the composited Zn, Pb and Cu data from the Lishan Mine is presented in Table 8-10, and the statistical results of the composited Mo data from the Dongfeng Mine is presented in Table 8-11.

**Table 8-10: Composites Statistics of Lishan Mine (below-92m asl)**

Item	Cu Composites	Pb Composites	Zn Composites
Number of samples	1,818	1,818	1,818
Minimum value	0	0	0.001
Maximum value	6.41	9.04	43.73
Mean	0.056	0.13	2.47
Variance	0.12	0.33	8.78
Standard Deviation	0.34	0.58	2.96
Coefficient of variation	6.18	4.30	1.20

**Table 8-11: Composites Statistics of Dongfeng Mine (below 250m asl)**

Item	Mo Composites
Number of samples	8,988
Minimum value	0.001

Item	Mo Composites
Maximum value	5.265
Mean	0.11
Variance	0.04
Standard Deviation	0.19
Coefficient of variation	1.69

### 8.5.5 Jintai Project

Prior to the statistical analysis, the samples were generally combined to the length of each sample was basically equivalent. The basic statistics of geological sampling length of original samples are carried out by SRK, as shown in Table 8-12.

**Table 8-12: Statistics of Sample Length of Xidengping Mine**

Mineralised Domain	Samples	Min	Max	Mean	Median	SD	Kurtosis	Skewness
V1	215	0.57	1.65	1.01	1.00	0.12	9.90	1.55
V2	79	0.67	1.42	1.02	1.00	0.14	2.15	1.14
V2_1	6	1.00	1.50	1.19	1.15	0.22	-1.83	0.45
V2_2	18	0.80	1.50	1.14	1.00	0.24	-1.18	0.66
V4	1,145	0.20	1.50	0.99	1.00	0.19	1.46	-0.80
V5	47	0.60	1.38	0.99	1.00	0.16	0.57	-0.41
V6	3	1.00	1.00	1.00	1.00	0.00	/	/
V7	79	0.51	1.38	1.00	1.00	0.16	1.66	-0.70
V8	122	0.40	2.70	1.01	1.00	0.29	8.73	1.47
V9	30	0.38	1.49	1.03	1.01	0.21	2.21	-0.61
V10	42	0.64	1.55	1.03	1.01	0.18	0.99	0.00
Total	1,786	0.20	2.70	1.00	1.00	0.19	5.10	-0.11

As shown in Figure 8-11, the result indicates that most of the sample intervals at the Xidengping Mine are 1 m, and a 1 m interval composite length was selected for compositing. All raw samples were composited to 1 m downhole lengths, with a minimum of 0.75 m for each composite sample. A 1 m interval composite length was applied by SRK for subsequent statistic and grade interpolation.

The statistical results of the composited gold data from Jintai Project are presented in Table 8-13.

Figure 8-11: Histogram of the Sample Length of Xidengping Mine

## 8.6 Evaluation of Outliers

Top cut analysis is undertaken to assess the influence extreme grade outliers have on the sample population of each data type. Although the extreme grades are real, these outliers are not representative of the domain assay population and so may overstate the block grades in some parts of the deposit if left uncut.

### 8.6.1 Jilong Project

In order to avoid any disproportionate influence of random, anomalously high-grade assays on the resource average grade, assay capping for gold was applied for the #1#2#3&depth block of Zhuanshanzi Mine. The histogram and cumulative probability plot are presented in Figure 8-12 and the capping values of the #1#2#3&depth block are listed in Table 8-14.

Figure 8-12: Cumulative Probability Plot and Histogram for the #1#2#3&depth Blocks

Table 8-14: Capping Values Statistics of #1#2#3&depth Block of Zhuanshanzi Mine

Mine\Deposit	Assay Cap	Number of Replaced Samples	Capped Ratio (%)	Mean	
				Before Capping	After Capping
Zhuanshanzi Mine (#1#2#3&depth block)	52	74	1.71%	9.31	9.07

SRK have conducted corresponding statistical analysis for the gold composited data of the 4#5#6#7# Block of Zhuanshanzi Mine. The grade variation coefficient of the gold mineralised body in the mining area is between 39.35-65.90%, which is less than 100%. Capping grade should be 82.62g/t, which is six times of the average grade (13.77g/t) and larger than the highest grade (45.03g/t). Since all the sample grades are lower than the capping grade, no capping was applied.

### 8.6.2 Huatai Project

In order to avoid any disproportionate influence of random, anomalously high-grade assays on the resource average grade, assay capping for gold was applied for the Huatai Project. The cumulative-probability plots and the capping values for the #1 Mining Zone and #26 Vein are presented in Figure 8-13 and Table 8-15.

Figure 8-13: Cumulative Probability Plots for #1 Mining Zone and #26 Vein

Note: 5 plots of KT2100, KT1420, KT3000, KT3100 and KT2300 from #1 Mining Zone and the last plot on bottom right from #26 Vein.

Table 8-15: Capping Values Statistics of Huatai Project

Mine\Deposit	Assay Cap	Number of Replaced Samples	Capped Ratio (%)	Mean	
				Before Capping	After Capping
Honghuagou #1 Mining Zone kt2100	15.26	4	0.11	10.41	6.86
Honghuagou #1 Mining Zone kt1420	15.96	7	0.06	7.92	6.94
Honghuagou #1 Mining Zone kt3000	25.00	4	0.08	10.61	9.89
Honghuagou #1 Mining Zone kt3100	8.30	6	0.04	6.04	5.41
Honghuagou #1 Mining Zone kt2340	17.13	5	0.10	8.93	8.35
Lianhuashan #26 Vein	19.54	2	0.04	8.29	8.16

**8.6.3 Wulong Project**

The composite grade distributions of each deposit were examined via histograms and cumulative probability plots to determine if capping was required and if so at what level. Figure 8-14, Figure 8-15 and Figure 8-16 show the histogram and cumulative probability curve of the composite gold for each mine and deposit.

**Figure 8-14: Au Histogram and Cumulative Probability Curve of Wulong Mine**

**Figure 8-15: Au Histogram and Cumulative Probability Curve of Ligunzi Deposit**

**Figure 8-16: Au Histogram and Cumulative Probability Curve of Haojingou-Ligunzi Deposit**

The composite samples statistics are listed in Table 8-9 and are shown in figures from Figure 8-14 to Figure 8-16, indicating that grades are defined as outlier value samples. Table 8-16 contains the outlier value details.

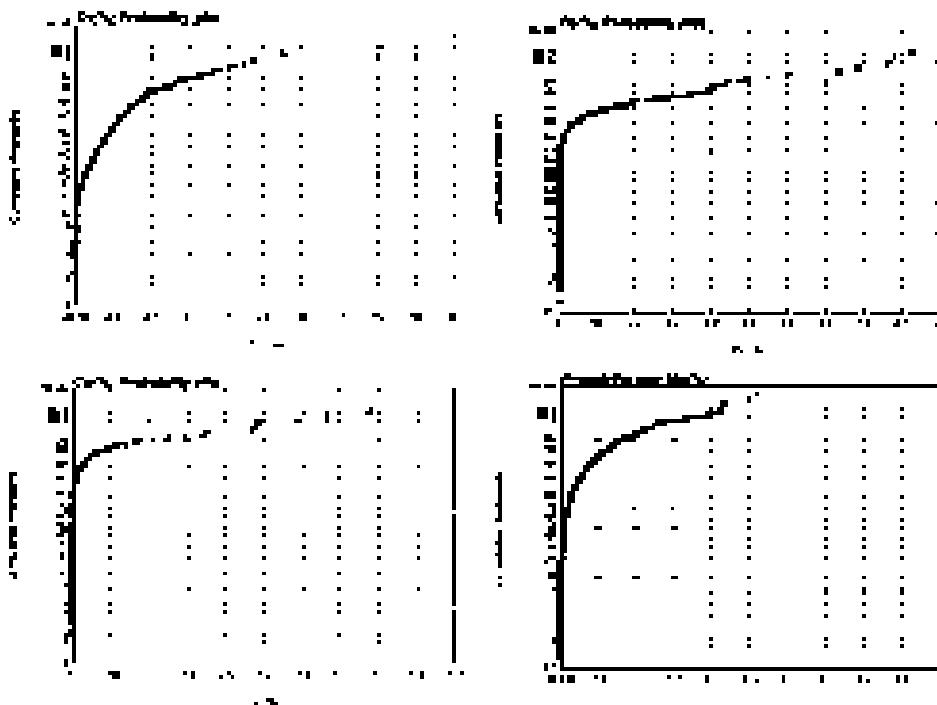

Table 8-16: Capping Values Statistics of Wulong Project

Mine/Deposit	Assay Cap	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t)		Difference (%)
	Au (g/t)			Before Capping	After Capping	
Wulong	54	29	0.43	9.01	8.88	-1.44
Ligunzi	15	8	5.15	5.46	5.26	-3.66
Haojingou-Ligunzi	28	5	1.97	6.52	6.32	-3.07

8.6.4 Hanfeng Project

In order to avoid any disproportionate influence of random, anomalously high-grade assays on the resource average grade, Assay capping for Pb, Zn and Cu was applied for the mineralised domains of Lishan Mine and Assay capping for Mo for Dongfeng Mine. The cumulative-probability plots and Capping Values of Lishan and Dongfeng are presented in Figure 8-17 and Table 8-17.

Figure 8-17: Cumulative-probability plots for Lishan and Dongfeng Mines

Note: Lishan Mine (below -92m asl) on the top and bottom left and Dongfeng Mine (below 250m asl) on the bottom right.

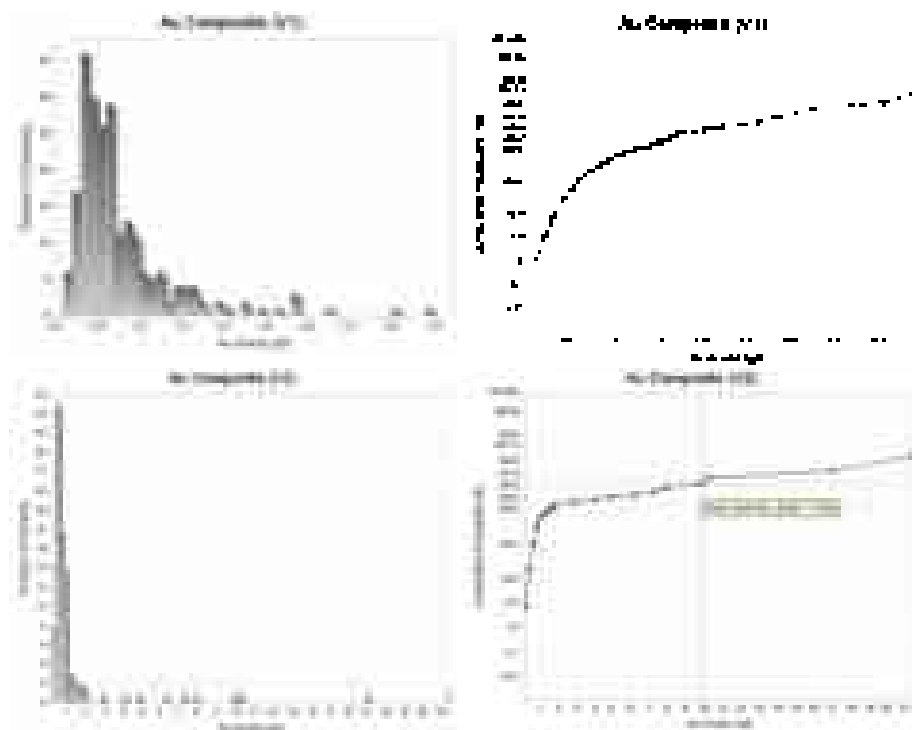

Table 8-17: Outliers Treatment of Hanfeng Project

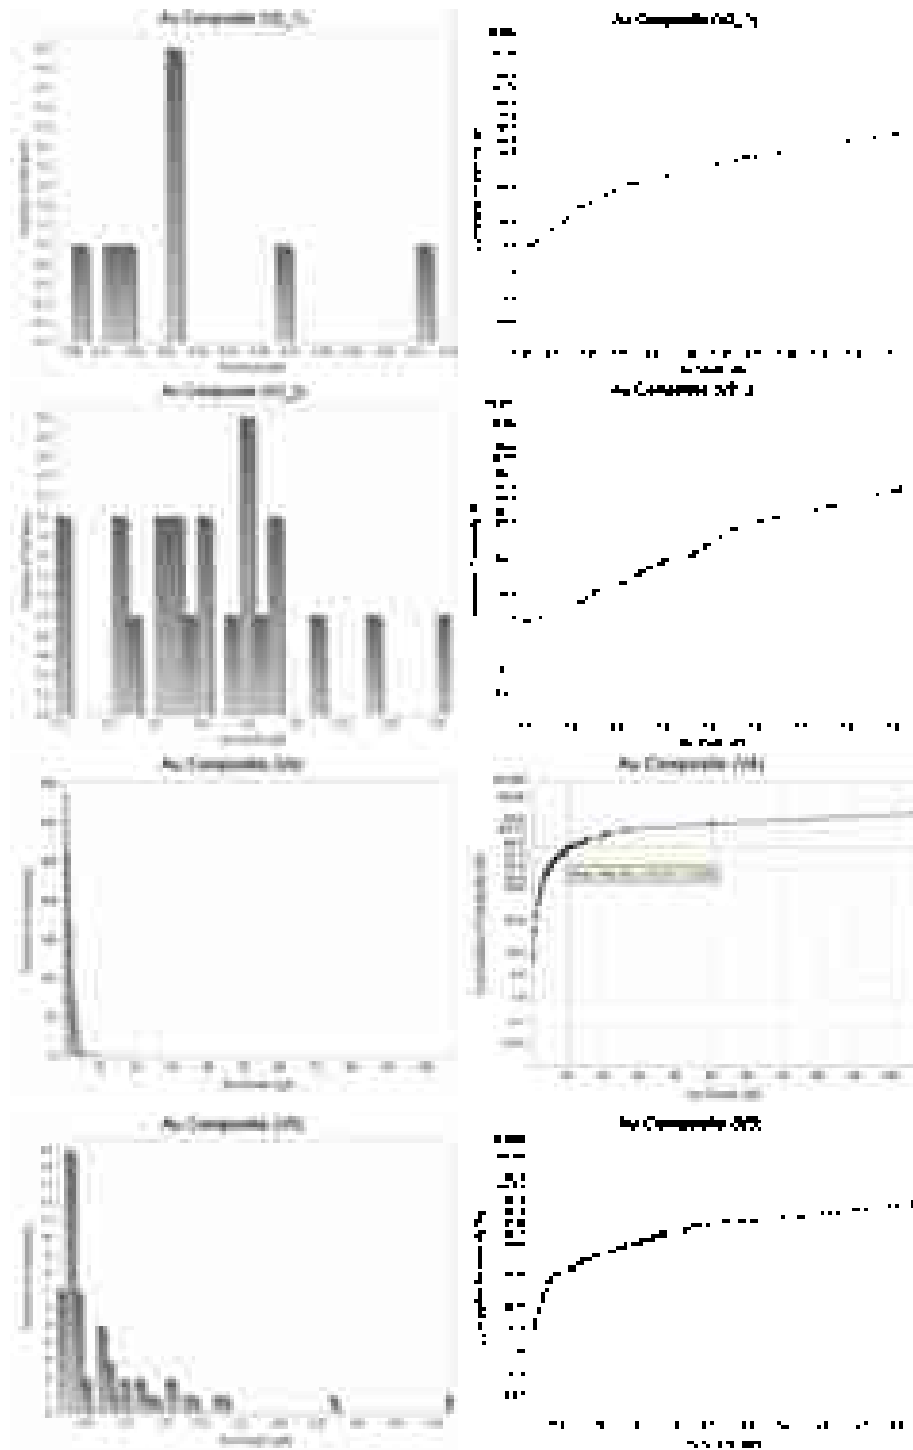

Mine	Element	Assay Cap	Number of Replaced Samples	Capped Ratio (%)	Mean	
					Before Capping	After Capping
Lishan	Zn (%)	20.69	4	0.22	2.47	2.45
	Pb (%)	4.60	7	0.39	0.13	0.12
	Cu (%)	1.35	19	1.05	0.05	0.04
Dongfeng	Mo (%)	2.28	4	0.04	0.11	0.11

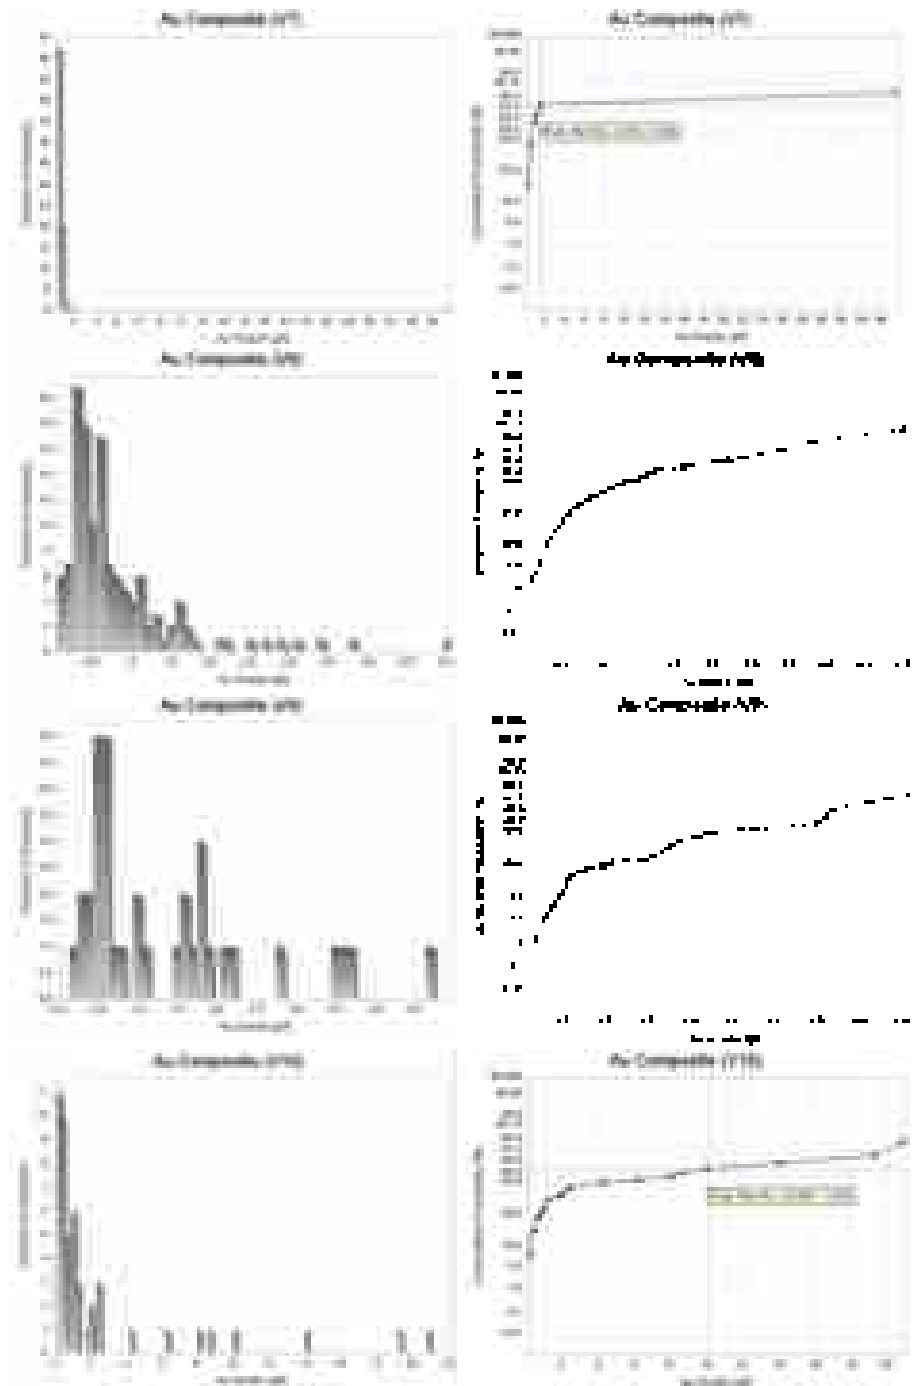

8.6.5 Jintai Project

The composite grade distributions of each domain were examined via histograms and cumulative probability plots to determine if capping was required and if so at what level. Figure 8-18 below show the histograms and cumulative probability curves of the composites Au for the domains V1, V2, V2\_1, V2\_2, V4, V5, V7, V8, V9 and V10, respectively.

Figure 8-18: Histograms and Cumulative Probability Curves of Gold Mineralised Domains

The composite samples statistics are listed in Table 8-13 and are shown in Figure 8-18 indicating that grades are defined as outlier value samples. Table 8-18 contains the outlier value details.

**Table 8-18: Capping Values Statistics of Xidengping Mine**

Doma in	Assay Cap	Number of Replaced Samples	Capped Ratio (%)	Au Mean (g/t)		Difference (%)
	Au (g/t)			Before Capping	After Capping	
V2	10	3	4.00	1.65	1.40	-15.15
V4	11	10	0.89	1.72	1.55	-9.82
V7	2	1	1.35	0.93	0.45	-51.56
V10	11	3	7.32	2.90	2.37	-18.16

## 8.7 Block Model and Grade Estimation

### 8.7.1 Jilong Project

For the #1#2#3&depth Block of Zhuanshanzi Mine, a block size of 4 m easting by 4 m northing by 4 m elevation was used. The block model used the same coordinate system as that was used in data collection. A summary of the block model specifications is listed in Table 8-19.

**Table 8-19: Block Model Specifications of #1#2#3&depth Block of Zhuanshanzi Mine**

Deposit	Coords	Min	Max	Block Size	Sub Block Size	Rotation
Zhuanshanzi Mine (#1#2#3&depth block)	N	4684100	4687252	4	1	0
	E	466100	468500	4	1	0
	Z	-400	652	4	1	0

The Inverse Distance Weighting ("IDW") method was used for grade estimation via Surpac in the block model. The parameters of the searching ellipsoid were thus manually optimized, and the parameters are summarized in Table 8-20 and Table 8-21. According to the general dipping trend, different dip angles were adopted. The domain, category, SG and depletion attributes were assigned directly using the solid models.

**Table 8-20: Search Parameters Used in #1#2#3&depth Block of Zhuanshanzi Mine**

Domain	major/semi- major	major/ minor	Azimuth	Plunge	Dip
KT540, KT2714, KT2851, KT10800	1.2	4	130	0	80
KT2821, KT2820, KT2830, KT7220	1.2	4	120	0	70
KT5730, KT5720, KT5710, KT2702, KT2701, KT512, KT521, KT530, KT2710, KT2720	1.2	4	130	0	-80
KT2810, KT2812, KT2814	1.2	4	130	0	-50
KT2501, KT2502	1.2	4	150	0	-90
KT930	1.2	4	100	0	90
KT1100	1.2	4	133	0	80
KT1110	1.2	4	96	0	90
KT1212	1.2	4	140	0	40
KT2510	1.2	4	160	0	-90

Domain	major/semi-major	major/minor	Azimuth	Plunge	Dip
KT2840	1.2	4	140	0	50
KT2860	1.2	4	160	0	50
KT5220	1.2	4	150	0	70
KT7230, KT7250	1.2	4	140	0	-80
KT7251	1.2	4	140	0	-90
KT10490, KT10481, KT10482	1.2	4	174	0	70
KT10410	1.2	4	160	0	-60
KT10400	1.2	4	170	0	-50
KT1044	1.2	4	110	0	-90
KT2604, KT2703, KT2704, KT10010	1.2	4	140	0	10

Table 8-21: Search distance and Samples Used in #1#2#3&amp;depth Block of Zhuanshanzi Mine

Pass	Max Radius(m)	Min samples	Max samples
1	40	5	45
2	80	3	45
3	160	1	45

For the #4#5#6#7 Block of Zhuanshanzi Mine, 4 block models were created, with size of 4 m easting by 4 m northing by 4 m elevation. The block models used the same coordinate system as that was used in data collection. A summary of the block model specifications is listed in Table 8-22.

Table 8-22: Block Model Specifications of #4#5#6#7 Block of Zhuanshanzi Mine

Block	Coords	Min	Max	Block Size	Sub Block Size	Rotation
#4	N	4689340	4689900	4	0.5	60
	E	466400	466892	4	0.5	0
	Z	500	900	4	0.5	0
#5	N	4684400	4685100	4	0.5	30
	E	468300	469200	4	0.5	0
	Z	300	900	4	0.5	0
#6	N	4681770	4682202	4	0.5	30
	E	467300	467920	4	0.5	0
	Z	200	900	4	0.5	0
#7	N	4680640	4681232	4	0.5	30
	E	469800	470600	4	0.5	0
	Z	200	900	4	0.5	0

The IDW method was used for grade estimation via Surpac in the block models. The parameters of the searching ellipsoid were thus manually optimized, and the parameters are summarized in Table 8-23. According to the general dipping trend, different parameters were adopted for each model. The domain, category and SG attribute were assigned directly using the solid models.

Table 8-23: Distance and Samples Used in #4#5#6#7 Block of Zhuanshanzi Mine

Block	Pass	Search Distance	Min num of Samples	Max num of Samples	Bearing	Plunge	Dip	Major/Semi-major	Major/Minor

	2	80	7	45	120	0	-75	1.2	4
	3	160	3	45	120	0	-75	1.2	4

### 8.7.2 Huatai Project

For the #1 Mining Zone, a block size of 4 m easting by 4 m northing by 4 m elevation was used. For the #86 Vein, #26 Vein, #3&#7 Vein, #5 Mining Zone, and Pengjiagou Mine, a block size of 2 m easting by 2 m northing by 2 m elevation was used. The block model used the same coordinate system as that was used in data collection. A summary of the block model specifications is listed in Table 8-24.

**Table 8-24: Block Model Specifications of Huatai Project**

Deposit	Coords	Min	Max	Block Size	Sub Block Size	Rotation
Honghuagou #1 Mining Zone	N	4674000	4676980	4	1	0
	E	386050	389102	4	1	0

### 8.7.3 Wulong Project

For the Wulong Mine, a block size of 4 m easting by 4 m northing by 4 m elevation was used. The block model used the same coordinate system as that was used in data collection. A summary of the block model specifications is listed in Table 8-27. The attributes and descriptions are presented in Table 8-28.

**Table 8-27: Block Model Specifications of Wulong Mine**

Deposit	Coords	Min	Max	Block Size	Sub Block Size	Rotation
Wulong	N	4445900	4448400	4	1	0
	E	47200	475600	4	1	0

#### 8.7.4 Hanfeng Project

SRK generated the non-rotational model for Lishan Mine (below-92m asl) and Dongfeng Molybdenum Mine (below 250m asl) by Surpac software for grade and tonnage estimation. Suitable block interval and unit size was adopted to build a block model which was able to contain the mineralised zones. The block model used the same coordinate system as data collection. The block model summary of Lishan and Dongfeng mines are presented in Table 8-39.

**Table 8-39: Block Model Parameters for Lishan and Dongfeng Mines**

Mine	Coords	Min	Max	Block Size	Sub Block Size	Rotation
Lishan	N	4756770	4757350	20	10	0
	E	43495640	43496460	20	10	0
	Z	-620	0	2	1	0
Dongfeng	N	4757100	4758800	20	5	0
	E	500000	501100	20	5	0
	Z	-500	760	20	5	0

The IDW method was applied for grade estimation in the mineralised domains for Lishan and Dongfeng Mine. The three progressively more relaxed search criteria used are presented in Table 8-40. For a small local un-estimated area, interpolation was performed with a larger search radius. Three different search ellipsoids (see Table 8-41 and Table 8-42) were aligned with the different mineralisation orientations for both Lishan and Dongfeng mines.

**Table 8-40: Specific Search Parameters for Hanfeng Project**

Mine	Pass	Search Distance	Minimum of Samples	Maximum of Samples
Lishan	1	40	3	15
	2	80	3	15
	3	160	3	15
Dongfeng	1	50	3	15
	2	100	3	15
	3	200	3	15

**Table 8-41: Ellipsoid Parameters for Lishan Mine (below-92m asl)**

Domain	Bearing	Plunge	Dip	major/semi-major	major/minor

D series	17	40	73	2	5
H series	163	-13	-19	2	5

### 8.7.5 Jintai Project

The block model of Xidengping Mine was created using Surpac, and it was used to estimate tonnage and grade. Appropriate block cell size was selected for the deposits.

A block size of 10 m easting by 10 m northing by 5 m elevation was used. The block model used the same coordinate system as that was used in data collection. A summary of the block model specifications is listed in Table 8-43. The attributes and descriptions are presented in Table 8-44.

Table 8-43: Block Model Specifications of Xidengping Mine

Deposit	Coords	Min	Max	Block Size	Sub Block Size	Rotation
Xidengping	N	2875400	2879000	10	2.5	0
	E	578500	581600	10	2.5	0
	Z	1900	2200	5	1.25	0

Table 8-44: Attributes and Descriptions of Xidengping Mine

Attribute	Description
domain	V1, V2, V2_1, V2_2, V4, V5, V6, V7, V8, V9, V10
au_gpt_capped	Gold grade, capped
classification	1=Mea, 2=Ind, 3=Inf
sg	Specific gravity, 0=air
partial percent	Partial percent
depletion	1=after depletion, 0=air

The IDW<sup>2</sup> method was used for grade estimation via Surpac in the block model. The parameters of the searching ellipsoid were thus manually optimized, and the parameters are summarized in Table 8-45 and Table 8-46. According to the general dipping trend, different dip angles were adopted. The domain, classification, SG and depletion attribute were assigned directly using the solid models.

Table 8-45: Search Parameters Used in Xidengping Mine

Domain	Bearing	Plunge	Dip	major/semi-major	major/minor
V1	335	0	8	1	10
V2	335	0	8	1.6	10
V2_1	335	0	4	1.6	10

V10	1	80	3	15	2
	2	160	3	15	2
	3	160	1	15	2

**8.8 Model Validation and Sensitivity**

Model validation is a common approach for determining whether grade estimation has performed as expected. SRK has undertaken a through validation of the resultant interpolated model, including visual inspection, and swath plot validation as well.

Visual inspection provides a validation of the interpolated block model on a local block scale, using visual assessments of sample grades versus estimated block grades.

**8.8.1 Jilong Project**

The details of swath plot validation for each domain can be seen in Figure 8-19 to Figure 8-22. There is no swath plot for #4 block because there are too few samples for a valid swath plot. These data indicate that the block models constructed by SRK are reliable.

**Figure 8-19: Au Swath Plot of #1#2#3&depth Block of Zhuanshanzi Mine**

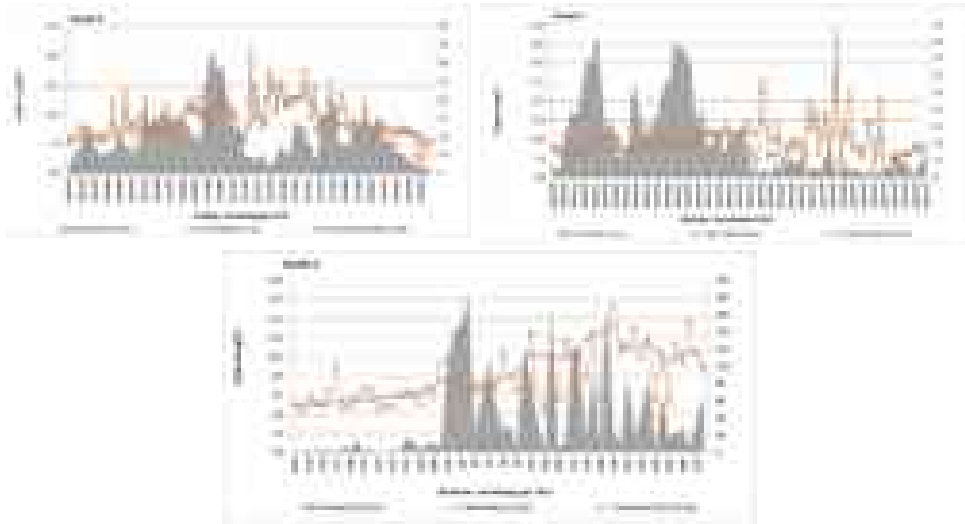

Figure 8-20: Au Swath Plot of #5 block of Zhuanshanzi Mine

Figure 8-21: Au Swath Plot of #6 block of Zhuanshanzi Mine

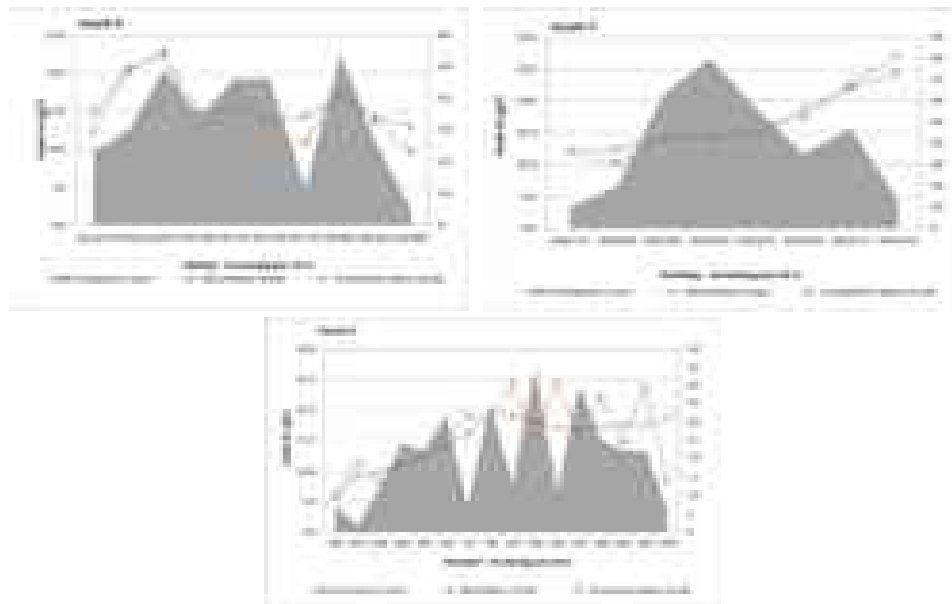

Figure 8-22: Au Swath Plot of #7 block of Zhuanshanzi Mine

**8.8.2 Huatai Project**

For the #1 Mining Zone and #86 Vein, the details of swath plots validation can be seen in Figure 8-23, for the #26 Vein and #3&#7 Vein, the details of swath plots validation can be seen in Figure 8-24 and for the #5 Mining Zone and Pengjiagou Mine, the details of swath plots validation can be seen in Figure 8-25. These data indicate that the block models constructed by SRK are reliable.

Figure 8-23: Au Swath Plots of #1 Mining Zone and #86 Vein

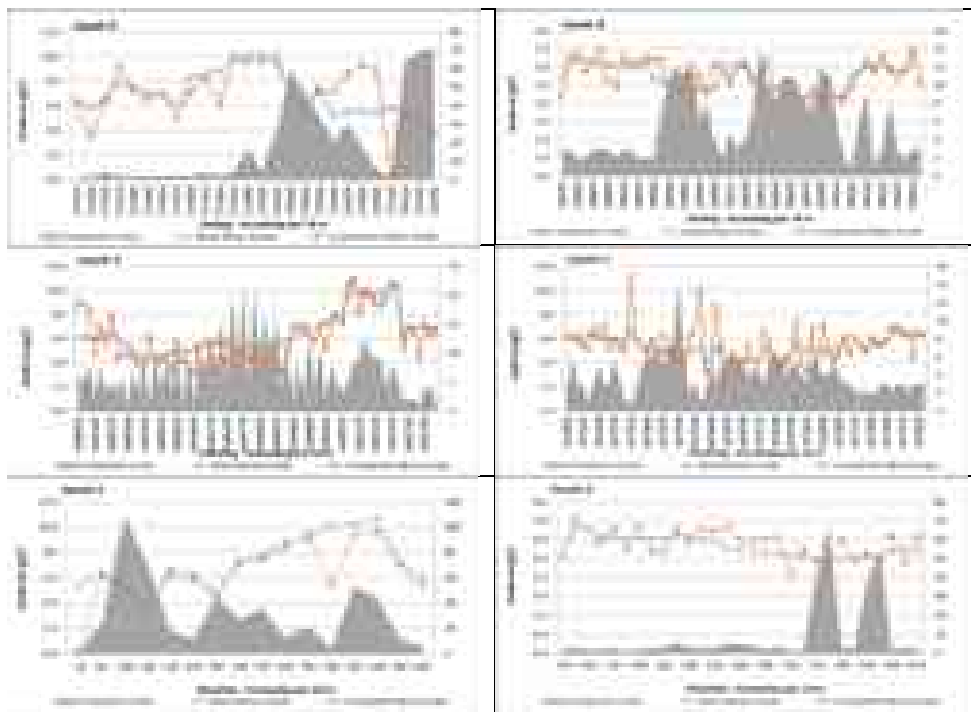

Note: #1 Mining Zone on the left and #86 Vein on the right.

Figure 8-24: Au Swath Plots of #26 Vein and #3&#7 Vein

Note: #26 Vein on the left and #3&#7 Vein on the right.

Figure 8-25: Au Swath Plots of #5 Mining Zone and Pengjiagou Mine

Note: #5 Mining Zone on the left and Pengjiagou Mine on the right.

### 8.8.3 Wulong Project

For the Wulong Mine, the details of swath plot validation for each domain can be seen in figures from Figure 8-26 and for the Ligunzi and Haojingou-Ligunzi deposits, the details of swath plots validation can be seen in Figure 8-27. These data indicate that the block models constructed by SRK are reliable.

Figure 8-26: Au Swath Plot of Wulong Mine

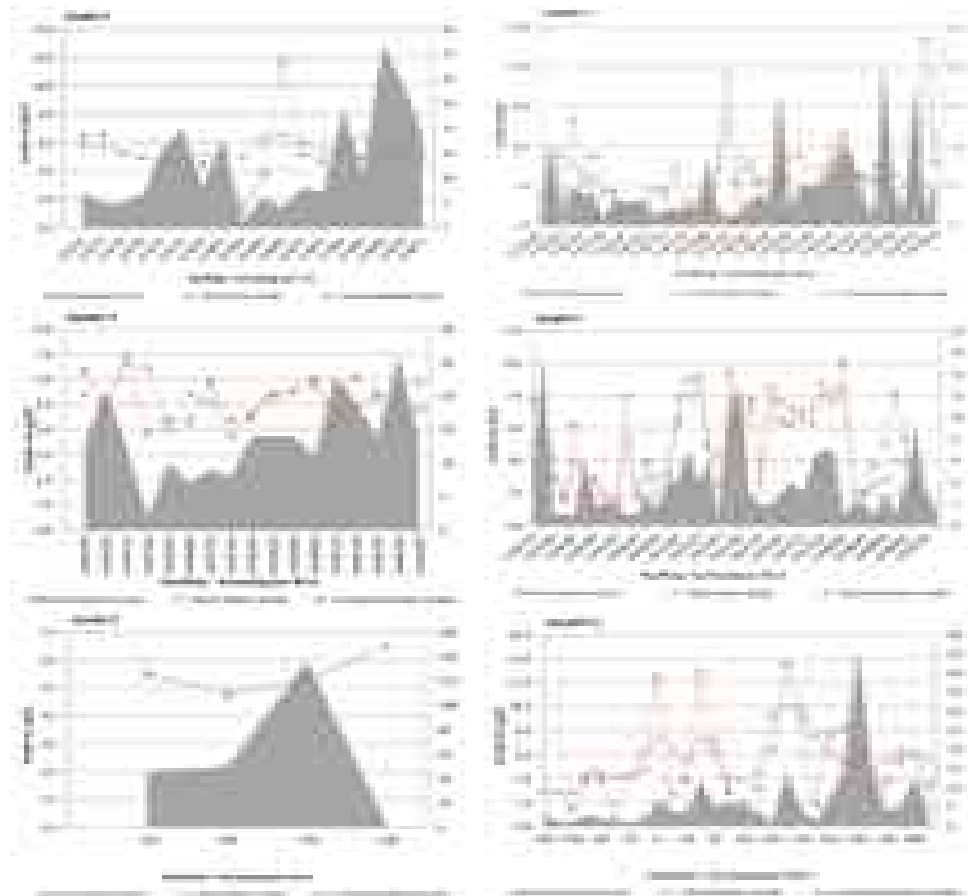

Figure 8-27: Au Swath Plots of Ligunzi and Haojingou-Ligunzi Deposits

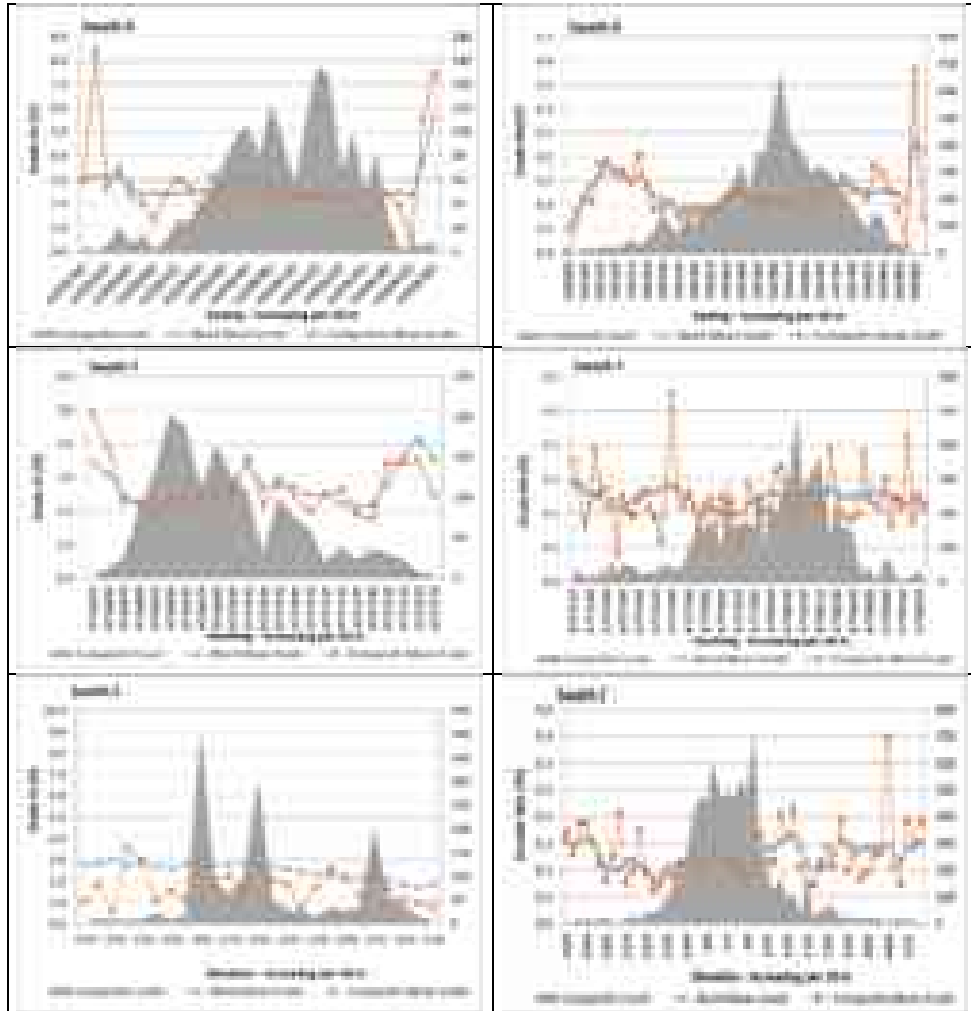

Note: Ligunzi deposit on the left and Haojingou-Ligunzi deposit on the right.

**8.8.4 Hanfeng Project**

Swath plots of Zn grade were created in three orthogonal directions for Lishan and Mo grade for Dongfeng Mine (easting, northing, and vertical, as X, Y, and Z) in particular slice thicknesses in each direction to validate the resultant block models. As shown in Figure 8-28, the block models and composites match reasonably well in all orthogonal directions. This comparison shows close agreement between the block model and composites in terms of overall distribution as a function of X, Y, and Z location.

**Figure 8-28: Zn Swath Plot of Lishan Mine and Mo Swath Plot for Dongfeng Mine**

Note: Lishan Mine on the left and Dongfeng Mine on the right.

### 8.8.5 Jintai Project

The details of swath plot validation of the Xidengping Mine can be seen in Figure 8-29. The data indicate that the block models constructed by SRK are reliable.

Figure 8-29: Au Swath Plot of Xidengping Mine

## 8.9 Mineral Resource Classification

Block model quantities and grade estimates for the Jilong, Huatai, Wulong, Hanfeng and Jintai projects were classified according to the JORC Code by Mr. Mingyan Wang, Mr. Huaixiang (Hubert) Li, Ms. Yanfang (Bonnie) Zhao and Mr. Shaobo Dai, under the supervision of Yiefei Jia, PhD, a Principal Consultant and a Fellow of the AusIMM (No. 230607) and a chartered professional in geology (CP Geo). They are appropriate Competent Persons for the purpose of JORC Code.

Mineral Resource classification is typically a subjective concept. Industry best practices suggest that Mineral Resource classification should consider both the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates, and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support Mineral Resource evaluation.

Generally, for mineralization exhibiting good geological continuity investigated at an adequate spacing with reliable sampling information accurately located, SRK considers that blocks estimated during the first estimation run (pass) can be classified in the Measured Mineral Resource category, the second estimation run can be classified in the Indicated Mineral Resource category within the meaning of the JORC Code.

### 8.9.1 Jilong Project

For all the blocks of the Zhuanshanzi Mine, the Mineral Resource with a mean sample distance of 40m are classified as Measured Mineral Resource; the Mineral Resource with a mean sample distance of 80m are classified as Indicated Mineral Resource; and the Mineral Resource with a mean sample distance of 160m are classified as Inferred Mineral Resource. Figure 8-30 shows the Mineral Resource classification of the Zhuanshanzi Mine.

**Figure 8-30: Mineral Resource Category Distribution of Zhuanshanzi Mine**

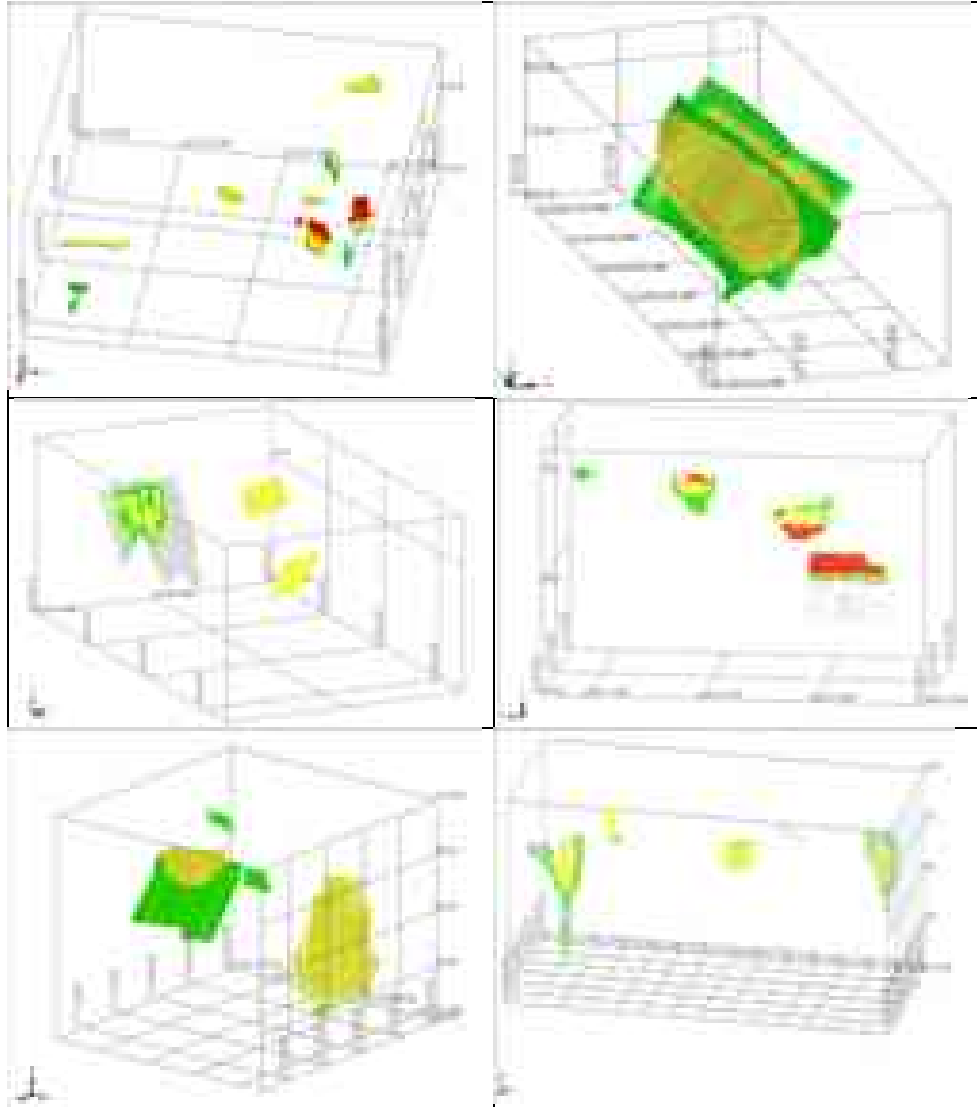

Note: #1#2#3&depth Block (dark red: Measured, blown: Indicated and green: Inferred) on the left and #4#5#6#7 Block on the right.

### 8.9.2 Huatai Project

For the Huatai project, the Mineral Resource with a mean sample distance of 40m are classified as Measured Mineral Resource; the Mineral Resource with a mean sample distance of 80m are classified as Indicated Mineral Resource, and the blocks excluded by Measured and Indicated categories and within the mineralised domains should be appropriately classified in the Inferred category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters or to enable an evaluation of economic viability. Figure 8-31 shows the Mineral Resource classification of the Huatai Project.

Figure 8-31: Mineral Resource Category Distribution of Huatai Project

Note: #1 Mining Zone of Honghuagou Mine on the top left; #86 Vein of Honghuagou Mine on the middle left; #38#7 Vein of Lianhuashan Mine on the bottom left; #26 Vein of Lianhuashan Mine on the top right; #5 Mining Zone of Lianhuashan Mine on the middle right; and Pengjiagou Mine on the bottom right (dark red: Measured, brown: Indicated and green: Inferred) on the left and #4#5#6#7 Block on the right.

### 8.9.3 Wulong Project

SRK considers that blocks estimated with an average drillhole spacing of less than 40 m can be classified in the Indicated Mineral Resource, and the blocks excluded by Indicated category and within the mineralised domains should be appropriately classified in the Inferred category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and

economic parameters or to enable an evaluation of economic viability. Figure 8-32 shows the Mineral Resource classification of the Wulong Project.

**Figure 8-32: Mineral Resource Category Distribution of Wulong Project**

Note: Wulong Mine on the top left, Ligunzi Deposit on the top right and Haojingou-Ligunzi Deposit on the bottom.

#### 8.9.4 Hanfeng Project

For the Lishan Mine, the resources with a mean sample distance of 40m are classified as Measured Mineral Resource; Resource with a mean sample distance of 80m are classified as Indicated resources; the resources with a mean sample distance of 160m are classified as Inferred Mineral Resource.

For the Dongfeng Mine, the resource with a mean sample distance of 50m are classified as Measured Mineral Resource; the resource with a mean sample distance of 100m are classified as Indicated Mineral Resource; and the resources with a mean sample distance of 200m are classified as Inferred Mineral Resource.

For the spotted dog phenomenon caused by some samples with the sampling interval out of set range, SRK adjusted it by considering the geological continuity, data quality and geologist's confidence in the models of both mines (Figure 8-33).

**Figure 8-33: Mineral Resource Category Distributions of Lishan and Dongfeng Mines**

Note:

Lishan Mine (below -92m asl) on the left and Dongfeng Mine (below 250m asl) on the right.

Mineral Resource category: Measured in red, Indicated in blue and Inferred in green.

### 8.9.5 Jintai Project

SRK considers that the blocks estimated with an average drillhole spacing of less than 40 m for both strike and dip directions can be classified in the Measured Mineral Resource category, the blocks estimated with an average drillhole spacing of less than 80 m for both strike and dip directions can be classified in the Indicated Mineral Resource category, and the blocks excluded by Measured and Indicated categories and within the mineralised domains should be appropriately classified in the Inferred Mineral Resource category because the confidence in the estimate is insufficient to allow for the meaningful application of technical and economic parameters or to enable an evaluation of economic viability. Figure 8-34 shows the Mineral Resource classification of the Jintai Project

**Figure 8-34: Mineral Resource Category Distribution of Xidengping Mine**

## 8.10 Mineral Resource Statement

The JORC Code defines a Mineral Resource as:

“a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.”

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade taking into account extraction scenarios and processing recoveries. In order to meet this requirement, SRK considers that major portions of the Jilong Project, Huatai Project, Wulong Project and Hanfeng Project are amenable for underground mining and that major portions of the Jintai Project are amenable for open pit extraction.

The conceptual parameters used in the Chifeng Gold Project are summarised in Table 8-47. The reader is cautioned that the results of the estimate are used solely for the purpose of testing the RPEEE by underground mining and do not represent an attempt to estimate Ore reserves. The results are to be used as a guide for assisting in the preparation of a Mineral Resource Statement and for selecting an appropriate Mineral Resource-reporting cut-off grade.

**Table 8-47: Conceptual Assumptions Considered for Chifeng Gold Project**

Parameter	Unit	Jilong	Huatai	Wulong	Hanfeng	Jintai
Gold Metal Price	US\$ per ounce	2,150	2,150	2,150		2,150
Zinc Metal Price	US\$ per ton				2,550	
Molybdenum	US\$ per ton				29,500	
Mining Cost	US\$ per ton ore	104.51	125.78	96.41	9.07	1.52
Processing Cost	US\$ per ton ore	19.31	25.80	76.33	9.31	6.70
G&A Cost	US\$ per ton ore	30.62	30.62	30.62	3.49	4.32
Mining Dilution	percent	20	20	20	32	5
Processing Recovery	percent	97% Au	93% Au	91% Au	88% Zn; 70% Mo	78% Au
Gold cut-off Grade	Grams per tonne	1.5g/t Au	1.5g/t Au	1.5g/t Au	0.5% Zn; 0.03% Mo	0.17g/t Au

SRK considers that the blocks not below a cut-off grade of 1.5g/t Au show “reasonable prospects for eventual economic extraction” from an underground mine for the Jilong, Huatai and Wulong projects can be reported as a Mineral Resource, that the blocks not below a cut-off grade of 0.5% Zn for the Lishan Mine and 0.03% Mo for the Dongfeng Mine show “reasonable prospects for eventual economic extraction” from an underground mine for the Hanfeng Project can be reported as a Mineral Resource, and that the blocks not below a cut-off grade of 0.17g/t Au show “reasonable prospects for eventual economic extraction” from an open pit mine for the Jintai Project can be reported as a Mineral Resource.

### 8.10.1 Jilong Project

As of 30 September 2024, the Jilong Project is estimated to contain 484 kt of Measured Mineral Resources with an average grade of 12.19g/t Au, 424 kt of Indicated Mineral Resources with an

average grade of 9.25g/t Au, and 508 kt of Inferred Mineral Resources with an average grade of 9.24g/t Au (see Table 8-48).

**Table 8-48: Mineral Resource Statement of Jilong Project, as of 30 September 2024**

Mineralised Zone/Block	Category	Tonnage	Grade	Contained Au	Contained Au
		kt	(g/t Au)	(t)	(koz)

Notes:

<sup>1</sup> All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

<sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Mingyan wang and Dr. Yiefei Jia who are both full time employees of SRK Consulting China. Dr. Jia is a Fellow of AusIMM and a Chartered Professional in Geology (CP Geo). Both have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Dr. Jia consents to the reporting of this information in the form and context in which it appears.

<sup>3</sup> The cut-off grad is 1.5g/t.

### 8.10.2 Huatai Project

As of 30 September 2024, the Huatai Project is estimated to contain 385 kt of Measured Mineral Resources with an average grade of 5.88g/t Au, 2,146 kt of Indicated Mineral Resources with an average grade of 7.27g/t Au, and 1,281 kt of Inferred Mineral Resources with an average grade of 6.90g/t Au (see Table 8-49).

<sup>1</sup> All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

<sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Huaixiang (Hubert) Li, Mr. Mingyan wang and Dr. Yiefei Jia who are full time employees of SRK Consulting China. Mr. Li is a Member of AIG and Dr. Jia is a Fellow of AusIMM and a Chartered Professional in Geology (CP Geo). They have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr Li, Mr. Wang and Dr. Jia consents to the reporting of this information in the form and context in which it appears.

<sup>3</sup> The cut-off grad is 1.5g/t Au.

### 8.10.3 Wulong Project

As of 30 September 2024, the Wulong Project is estimated to contain 1,261 kt of Indicated Mineral Resources with an average grade of 8.17g/t Au, and 1,738 kt of Inferred Mineral Resources with an average grade of 7.21g/t Au (see Table 8-50).

**Table 8-50: Mineral Resource Statement, Wulong Project, as of 30 September 2024**

**Notes:**

- <sup>1</sup> All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.
- <sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Huaixiang (Hubert) Li and Dr. Yiefei Jia who are full time employees of SRK Consulting China. Mr. Li is a Member of AIG and Dr. Jia is a Fellow of AusIMM and a Chartered Professional in Geology (CP Geo). Both have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Li and Dr. Jia consents to the reporting of this information in the form and context in which it appears.
- <sup>3</sup> The cut-off grad is 1.5g/t Au.

### 8.10.4 Hanfeng Project

Within the current mining License area and permitted elevation range, as of 30 September 2024, the Lishan Mine (below-92m asl) contains 752 kt of Measured Mineral Resources at an average grade of 2.36% Zn, 0.01% Cu and 0.12% Pb; 8,583 kt of Indicated Mineral Resources at an average grade of 2.66% Zn, 0.07% Cu and 0.12% Pb, and 10,616 kt of Inferred Mineral Resources at an average grade of 2.90% Zn, 0.09% Cu, 0.13%Pb. Details of estimated Mineral Resources are shown in Table 8-51.

**Table 8-51: Mineral Resource Statement of Lishan Mine, as of 30 September 2024**

Mineralised Zone/Block	Category	Tonnage (kt)	Zn Grade (%)	Zn Metal Contained (kt)	Cu Grade (%)	Cu Metal Contained (kt)	Pb Grade (%)	Pb Metal Contained (kt)

<sup>1</sup> Differences may occur in totals due to rounding.<sup>2</sup> All figures are rounded to reflect the relative accuracy of the estimate.<sup>3</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Shaobo Dai, Mr. Huaixiang (Hubert) Li and Dr. Yiefei Jia who are full time employees of SRK Consulting China, Mr. Li is a Member of AIG, and Dr. Jia is a Fellow of AusIMM and a Chartered Professional in Geology (CP Geo). Dr. Yiefei Jia have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves", the JORC Code. Mr. Li and Dr. Jia consent to the reporting of this information in the form and context in which it appears.<sup>4</sup> The cut-off grade is 0.17g/t Au.

## 8.11 Grade Sensitivity Analysis

### 8.11.1 Jilong Project

The Mineral Resources of the Jilong Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates of the

#1#2#3&depth Block of the Zhuanshanzi Mine are presented in Table 8-54 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 8-35 present this sensitivity as grade tonnage curves of the #1#2#3&depth Block of the Zhuanshanzi Mine.

**Table 8-54: Global Block Model Quantities and Grade Estimates<sup>1</sup>, #1#2#3&depth Block of Zhuanshanzi Mine**

Cut-off Grade Au (g/t)	Quantity (Mt)	Au Grade (g/t)
1.40	1.30	8.87
1.60	1.30	8.88
1.80	1.30	8.88
2.00	1.30	8.89
2.20	1.30	8.89
2.40	1.30	8.89
2.60	1.30	8.89
2.80	1.30	8.90
3.00	1.30	8.90
3.20	1.30	8.91
3.40	1.29	8.92
3.60	1.29	8.93
3.80	1.29	8.95
4.00	1.28	8.97
4.20	1.27	9.00
4.40	1.26	9.05
4.60	1.24	9.14
4.80	1.20	9.27
5.00	1.16	9.44
5.20	1.12	9.58
5.40	1.07	9.76
5.60	1.02	9.97

Notes:

<sup>1</sup> The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of a cut-off grade.

Figure 8-35: Grade Tonnage Curves of #1#2#3&amp;depth Block of Zhuanshanzi Mine

### 8.11.2 Huatai Project

The Mineral Resources of the Huatai Project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates of the #1 Mining Zone, #86 Vein, #3&#7 Vein, #26 Vein, #5 Mining Zone and Pengjiagou Mine are presented in Table 8-54 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 8-36 present this sensitivity as grade tonnage curves of the #1 Mining Zone, #86 Vein, #3&#7 Vein, #26 Vein, #5 Mining Zone and Pengjiagou Mine.

### 8.11.3 Wulong Project

The Mineral Resources of the Wulong project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Table 8-56 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 8-37 presents the sensitivity as grade tonnage curves of the Wulong Project.

**Table 8-56: Global Block Model Quantities and Grade Estimates<sup>1</sup>, Wulong Project**

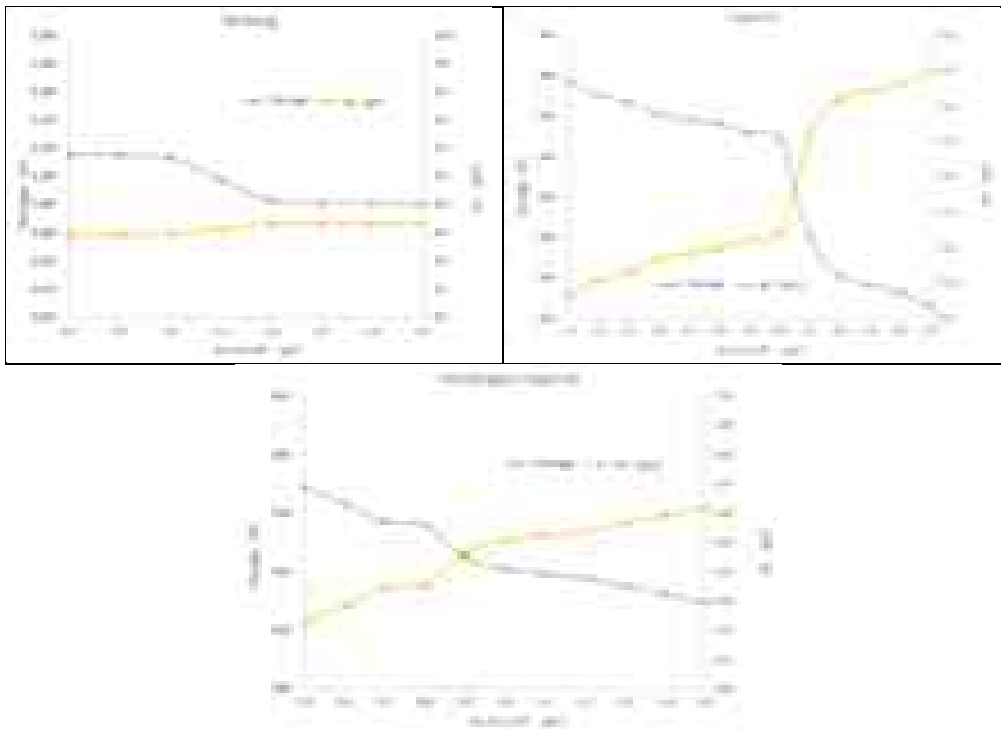

Mine/Deposit	Cut-off Grade Au (g/t)	Quantity (Mt)	Au Grade (g/t)

Notes:

<sup>1</sup> The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of a cut-off grade.

Figure 8-37: Grade Tonnage Curves of Wulong Project

8.11.4 Hanfeng Project

Mineral Resource is sensitive to the selection of cut-off grade. To illustrate this sensitivity, ore quantities and grade estimates at different cut-off grades of the Lishan and Dongfeng mines are presented in Table 8-57. The reader is cautioned that the figures presented in this table should not be mistaken for a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 8-38 represents this sensitivity as tonnage-grade curves of the Lishan and Dongfeng mines.

Table 8-57: Block Model Quantities and Grade Estimates<sup>1</sup>, Hanfeng Project

Mine	Cut-off Grade (Zn %)	Quantity (Mt)	Zn Grade (%)
Lishan Mine	0.5	19.95	2.78
	0.6	19.71	2.80
	0.7	19.55	2.82
	0.8	19.30	2.85
	0.9	19.06	2.87
	1.0	18.78	2.90

<sup>1</sup> The reader is cautioned that the figures in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

Figure 8-38: Tonnage-Grade Curves of Lishan and Dongfeng Mines

### 8.11.5 Jintai Project

The Mineral Resources of the Xidengping mine are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Table 8-58 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade. Figure 8-39 presents this sensitivity as grade tonnage curves.

Table 8-58: Global Block Model Quantities and Grade Estimates<sup>1</sup>, Xidengping Mine at Various Cut-off Grades

Deposit	Cut-off Grade Gold(g/t)	Quantity (Mt)	Grade Gold(g/t)
Xidengping	0.0	11.48	1.25
	0.1	11.48	1.25
	0.2	11.47	1.25
	0.3	11.18	1.27
	0.4	10.24	1.36

## 9 Ore Reserve Estimates

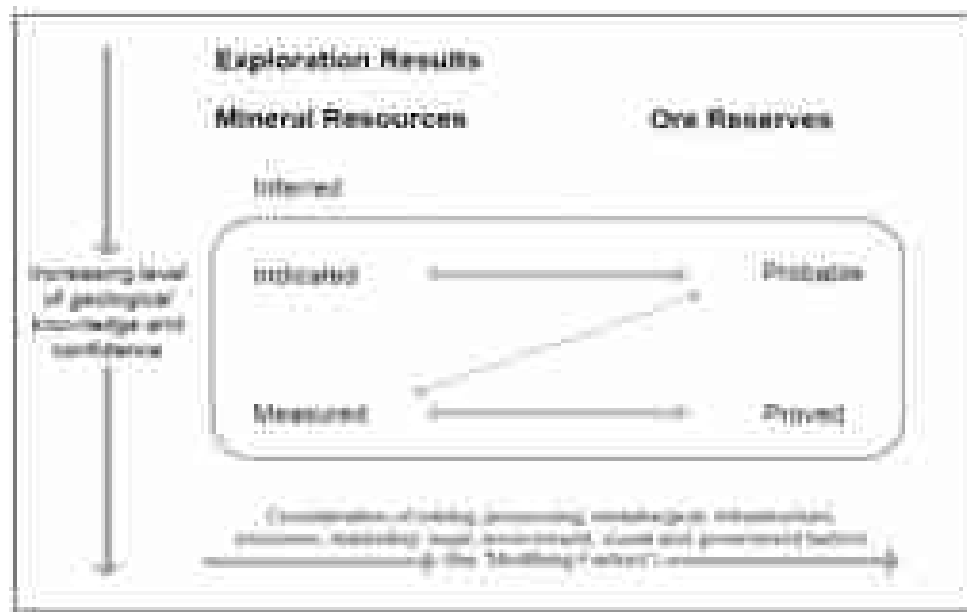

According to the JORC Code,

*an ‘Ore Reserve’ is the economically mineable part of a Measured and/ or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.*

*The Modifying Factors are considerations used to convert Mineral Resources to Ore Reserves. These include, but are not restricted to mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental. Social and governmental factors.*

Figure 9-1 provide for a direct relationship between Indicated Mineral Resources and Probable Ore Reserve and between Measured Mineral Resources and Proved Ore Reserve.

**Figure 9-1: Relationship Between Mineral Resources and Ore Reserve**

Sources: JORC Code (2012)

According to the JORC Code, a Probable Ore Reserve is the economically mineable part of an Indicated, and in some cases, a Measured Mineral Resource. The confidence in the modifying factors applying to a Probable Ore Reserve is lower than that applying to a Proved Ore Reserve. A Proved Ore Reserve, on the other hand, is the economically mineable part of a Measured Mineral Resource and implies a high degree of confidence in the modifying factors.

The Ore Reserve estimates for the Jilong, Huatai, Wulong, Hanfeng, and Jintai Projects have been prepared in accordance with the JORC Code. These estimates were derived by applying modifying factors to the Mineral Resource Estimate, with only Measured and Indicated resources being

converted to Ore Reserve. Inferred resources were treated as waste with zero grade. These projects are operational mines, and their designs and operating practices were reviewed to at least a prefeasibility study level.

The Jilong, Huatai, Wulong, and Hanfeng Projects are underground mines. Skin dilution was applied into the stope shape as an equivalent linear overbreak slough. Subsequently, these annealed mineable shapes were cut using Stope Slicer within GEOVIA Surpac™. Stopes falling outside the design scope or with irregular shapes were filtered out. The cut-off grade with gold price of US\$2,050/oz and a zinc price of US\$2,550/t were used to estimate the in-stope Ore Reserves. The factors such as ore loss were factored in Microsoft Excel.

The Jintai Project is an open pit mine. The optimal economic shape for the open pit was determined using GEOVIA Whittle™ optimization. SRK compared this optimal shape with the open pit design from the prefeasibility study and found minimal discrepancies. Consequently, SRK decided to use the prefeasibility study's open pit design. The mining dilution and ore loss were also considered and factored into Ore Reserves.

## 9.1 Jilong Project

### 9.1.1 Introduction

Jilong Mining is actively operating and includes several deposits within its various mining zones, specifically Zone 1 through Zone 7. Each of these zones is either currently being exploited or is planned for future exploitation. The locations of these mines, along with their respective veins, are detailed in Figure 9-2, which has been reviewed for the Ore Reserve estimation.

**Figure 9-2: Plan View of Mining Zones**

Sources: SRK

### 9.1.2 Mineral Resources Model

The Jilong Project resource block model was completed by SRK geologist in a \*.mdl file format, and it has been converted into \*.dm file format for design and scheduling purposes.

### 9.1.3 Feasibility Study

SRK has reviewed the following preliminary design studies:

- Zhuanshanzi #1 Mining Zone Preliminary Design by Chifeng Zhenghang Design Company in February 2024;
- Zhuanshanzi #2 Mining Zone Preliminary Design by Chifeng Jilong Mining Company in February 2024;
- Zhuanshanzi #3 Mining Zone Preliminary Design by Inner Mongolia Mining Development Company in February 2024;
- Zhuanshanzi periphery Mining Zone (#4, #5, #6, #7 Mining Zone) Preliminary Design by Chifeng Zhenghang Design Company in February 2024.

### 9.1.4 Cut-off Grade

The unit cost of mining, processing, general and administrative, and processing recovery from 2021 to 2024 Q3 were provided by Jilong Mining, as detailed in Table 9-1. The cut-off grade is calculated to be 2.76g/t, based on the average historical three-year unit costs, while also considering processing recovery and royalty factors, as shown in Table 9-2.

**Table 9-1: Unit Cost of Jilong Project from 2021 to 2024Q3**

Item	Unit	2021	2022	2023	2024 Q1-Q3
Mining Cost	RMB/t Ore	1,379	1,632	1,050	983
Processing Cost	RMB/t Ore	110	113	108	106
G&A Cost	RMB/t Ore	211	200	283	172
Processing Recovery for Au	%	97	97	98	97

Sources: Client

<sup>1</sup> The mining production and unit cost only include stope production.

**Table 9-2: Cut-off Grade Calculation**

Item	Unit	Assumption
Gold Price	USD/oz	2,050
Gold Price <sup>1</sup>	RMB/g	476
Mining	RMB/t ore	903
Processing	RMB/t ore	109
G&A	RMB/t ore	216
Processing Recovery	%	97
Royalty	%	4
Cut-off Grade	g/t	2.76

Sources: SRK

<sup>1</sup> The exchange rate of 7.22 USD to RMB was applied.

<sup>2</sup> The mining production and unit cost only include stope production. Since the mining contractor also mining remnants extraction and hauling low-grade ore, the mining cost has been factored and adjusted downward.

### 9.1.5 Mining Dilution and Ore Loss

Mining dilution includes unplanned dilution from stope wall failures and overbreak from stope walls and floors. Waste rock dilution primarily originates from material sloughing off the hanging wall, with minor contributions from the ends and floors of the stoping area. Waste dilution typically ranges between 0.04m and 0.2m, depending on the size and shape of the orebodies.

To estimate mining dilution, SRK has expanded the orebody wireframe by 0.04 to 0.2m in all directions (Green line in Figure 9-3), creating skins as an equivalent linear overbreak slough. Overall, it is estimated that mining dilution will be approximately 16-17%.

Additionally, a mining loss of 5% was estimated and applied to the Ore Reserve estimation.

**Figure 9-3: Skin Analysis for Mining Dilution**

Sources: SRK

### 9.1.6 Ore Reserve Estimates

The estimated process details are provided in Table 9-3, with the corresponding waterfall charts illustrated in Figure 9-4 and Figure 9-5.

Approximately 65% of tonnes and 55% of metal have been converted from Mineral Resources to Ore Reserve. Key negative factors affecting this conversion include the exclusion of Inferred Mineral Resources.

**Table 9-3: Estimated Process Summary**

Conversion Process	Tonnage (kt)	Au Contained (kg)
M+I+I Resources	1,415	14,514
Inferred Resources Exclusion	(508)	(4,697)
M+I Resources	907	9,817
Design Boundary	(39)	(584)

Conversion Process	Tonnage (kt)	Au Contained (kg)
Irregular Shape	(46)	(636)
COG Filter	(20)	(154)
Mining Dilution	166	1
Ore Loss	(48)	(422)
Ore Reserve	920	8,022

Sources: SRK

Figure 9-4: Estimated Process - Change in Tonnes

Sources: SRK

Figure 9-5: Estimated Process - Change in Metal Contained

Sources: SRK

**9.1.7 Ore Reserve statement**

SRK has estimated the Ore Reserve for the Jilong Project in compliance with the JORC Code. The Ore Reserve, with an effective date of 30 September 2024, is summarised in Table 9-4.

As of 30 September 2024, the total Ore Reserve for the Jilong Project is estimated at 919 kt at an average grade of 8.73g/t Au, containing 8.02 t of gold. This includes the Proved Ore Reserve

estimated at 510 kt at an average grade of 9.81g/t Au, containing 5.00 t of gold, and the Probable Ore Reserve estimated at 409 kt at an average grade of 7.38g/t Au, containing 3.02 t of gold.

**Table 9-4: Jilong Project Underground Ore Reserve Statement, as of 30 September 2024**

Reserve Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
Proved	510	9.81	5.00	161
Probable	409	7.38	3.02	97
<b>Total</b>	<b>919</b>	<b>8.73</b>	<b>8.02</b>	<b>258</b>

Sources: SRK

Notes:

- <sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Ms. Tzuhsuan Chuang, MAusIMM and Dr. Yiefei Jia, FAusIMM and a Chartered Professional in Geology (CP Geo), employees of SRK Consulting China Ltd. Both Dr. Jia and Ms. Chuang have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the JORC Code. Dr. Jia supervised the work of Ms. Chuang. Dr. Jia and Ms. Chuang consent to the reporting of this information in the form and context in which it appears;
- <sup>2</sup> The Ore Reserves Statement is based on the depletion data provided by Jilong Mine for the six-month period, 1 April 2024 to 30 September 2024. The reported Jilong Mine data may differ from that reported by SRK, due the updated Block model now used by Jilong Mine for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the Jilong Mine provided data as the basis for this statement.
- <sup>3</sup> Ore Reserve are estimated at a cut-off grade of 2.76g/t Au;
- <sup>4</sup> Number was rounded to the second significant digit;
- <sup>5</sup> Total may not add due to rounding discrepancies; and
- <sup>6</sup> Mining dilution is 16-17% and ore loss is 5%.

## 9.2 Huatai Project

### 9.2.1 Introduction

Huatai Project is actively operating and includes several deposits within the following mining zones:

- Pengjiagou Mine;
- Honghuagou #1 Mining Zone (referred to as Zone 1);
- Honghuagou #86 Vein (referred to as Vein 86);
- Lianhuashan #5 Mining Zone (referred to as Area 5);
- Lianhuashan #26 Vein (referred to as Vein 26);
- Lianhuashan #3&#7 Vein (referred to as Vein 3&7).

The locations of the mining zones are shown in Figure 9-6. It should be noted that Vein 86 is not included in the Ore Reserve estimation due to its remote spatial location relative to other mines, making its exploitation potentially unprofitable.

**Figure 9-6: Plan View of Mining Zones**

Sources: SRK

### 9.2.2 Ore Resources Models

The Huatai Project resource block model was completed by SRK geologist in a \*.mdl file format, and it has been converted into \*.dm file format for design and scheduling purposes.

### 9.2.3 Feasibility Study

SRK has reviewed the following preliminary design studies:

- Pengjiagou Preliminary Design by Chifeng Gaoda Engineering Design Company in May 2018. There are 2 veins named 65-2 and 2. The design has covered levels between 456m to 769m with capacity of 30ktpa run-of mine (ROM).
- Honghuagou #1 Mining Zone Expansion Preliminary Design by Inner Mongolia Mining Industry Development Co., Ltd. in May 2013. There are 4 sections named LTS, YCFQ, SHMFQ and SCFQ with 16 veins. The design has covered levels for each section with a total capacity of 30.3ktpa ROM.
- Lianhuashan #5 Mining Zone Expansion Preliminary Design by Chifeng Zhenghang Design Co., Ltd. in November 2022. There are 4 veins named 51-1, 51-6, 51-8 and 51-10. The design has covered 18 levels between 105m to 752m with a total capacity of 60ktpa ROM.
- Lianhuashan #26 Vein Preliminary Design by Chifeng Gaoda Engineering Design Company in May 2018. There are 2 veins named 1 and 2. The design has covered levels between 480m to 760m with capacity of 30ktpa ROM.
- Lianhuashan #3&#7 Vein Preliminary Design (Only 3-2 vein considered) by Chifeng Zhenghang Design Co., Ltd. in July 2015. The design has covered levels between 700m to 820m with capacity of 30ktpa ROM.
- Lianhuashan #3&#7 Vein Mineral Resources Development and Utilization Scheme by Inner Mongolia Geology and Mineral Technology Co., Ltd in December 2019. There are 3 veins named

3-2, 8 and 8-2 considered in this scheme. The scheme has limited its boundary for 8 and 8-2 within 470m level above, 3-2 within 745m level above because of low geology confidence. According to the scheme, the capacity of 3&7 is 60ktpa ROM.

#### 9.2.4 Cut-off Grade

The unit cost of mining, processing, general and administrative, and processing recovery from 2020 to 2022 were provided by Huatai Mining, as detailed in Table 9-5. The fiscal data for 2023 was not collected due to ongoing technological upgrades during the year.

The cut-off grade is calculated to be 2.93g/t, based on the adjustment from average historical three-year unit costs, while also considering processing recovery and royalty factors, as shown in Table 9-6.

**Table 9-5: Unit Cost of Huatai Project from 2021 to 2024 Q3**

Item	Unit	2021	2022	2023	2024 Q3
Mining Cost	RMB/t Ore	732	939	-	-
Processing Cost	RMB/t Ore	151	188	586	-
G&A Cost	RMB/t Ore	246	1,440	-	-
Processing Recovery for Au	%	94	93	93	-

Sources: Client

**Table 9-6: Cut-off Grade Calculation**

Item	Unit	Assumption
Au Price	USD/oz	2,050
Au Price <sup>1</sup>	RMB/g	476
Mining	RMB/t ore	840
Processing	RMB/t ore	160
G&A <sup>2</sup>	RMB/t ore	246
Processing Recovery	%	93
Royalty	%	4
Break-even Cut-off Grade	%	2.93

Sources: SRK

<sup>1</sup> The exchange rate of 7.22 USD to RMB was applied.

<sup>2</sup> The G&A costs are unusually high, so SRK opted to use the G&A costs in 2021, which is more reasonable in the context of the Huatai overall operating expenses.

#### 9.2.5 Mining Dilution and Ore Loss

Mining dilution includes unplanned dilution from stope wall failures and overbreak from stope walls and floors. Waste rock dilution primarily originates from material sloughing off the hanging wall, with minor contributions from the ends and floors of the stoping area. Waste dilution typically ranges between 0.02m and 1m, depending on the size and shape of the orebodies.

To estimate mining dilution, SRK has expanded the orebody wireframe by 0.03 to 0.4m in all directions (Pink line in Figure 9-7), creating skins as an equivalent linear overbreak slough. Overall, it is estimated that mining dilution will be approximately 20%.

Additionally, a mining loss of 15% was estimated and applied to Ore Reserves.

**Figure 9-7: Skin Analysis for Mining Dilution**

Sources: SRK

### 9.2.6 Ore Reserve Estimates

The estimated process details are provided in Table 9-7, with the corresponding waterfall charts illustrated in Figure 9-8 and Figure 9-9.

Approximately 50% of tonnes and 43% of metal have been converted from Mineral Resources to Ore Reserve. Key negative factors affecting this conversion include the exclusion of Inferred Mineral Resources and design boundaries.

**Table 9-7: Estimated Process Summary**

Conversion Process	Tonnage (kt)	Au Contained (t)
M+I Resources	3,378	24.45
Inferred Resource Exclusion	(1,160)	(8.34)
M+I Resources	2,218	16.11
Design Boundary	(479)	(3.00)
Irregular Shape	(38)	(0.27)
COG Filter	(57)	(0.32)
Mining Dilution	358	(0.02)
Ore Loss	(313)	(1.99)
Ore Reserves	1,694	10.50

Sources: SRK

Figure 9-8: Estimated Process - Change in Tonnes

Sources: SRK

Figure 9-9: Estimated Process - Change in Metal Contained

Sources: SRK

### 9.2.7 Ore Reserves Statement

SRK has estimated the Ore Reserve for the Huatai Project in compliance with the JORC Code. Ore Reserves, with an effective date of 30 September 2024, is summarized in Table 9-8.

As of 30 September 2024, the total Ore Reserve for the Huatai Project is estimated at 1,694 kt at an average grade of 6.20g/t Au, containing 10.50 t of gold. This includes the Proved Ore Reserve estimated at 226 kt at an average grade of 5.21g/t Au, containing 1.18 t of gold, and the Probable Ore Reserve estimated at 1,468 kt at an average grade of 6.35g/t Au, containing 9.32 t of gold.

**Table 9-8: Huatai Project Underground Ore Reserve Statement, as of 30 September 2024**

Reserve Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
Proved	226	5.21	1.18	38
Probable	1,468	6.35	9.32	300
<b>Total<sup>3</sup></b>	<b>1,694</b>	<b>6.20</b>	<b>10.50</b>	<b>338</b>

Sources: SRK

Notes:

<sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Mr. Erwei Lu and Dr. Yiefei Jia, FAusIMM and a Chartered Professional in Geology (CP Geo), employees of SRK Consulting China Ltd. Both Dr. Jia and Mr. Lu have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the JORC Code. Dr. Jia supervised the work of Mr. Lu. Dr. Jia and Mr. Lu consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Ore Reserve are estimated at a cut-off grade of 2.93g/t Au;

<sup>3</sup> Number was rounded to the second significant digit;

<sup>4</sup> Total may not add due to rounding discrepancies; and

<sup>5</sup> Mining dilution is 20% and ore loss is 15%.

## 9.3 Wulong Project

### 9.3.1 Introduction

Wulong Mining is actively operating and includes several deposits within its various mining zones, specifically Zone 1 through Zone 5. Each of these zones is currently being exploited. The locations of these mines, along with their respective veins, are detailed in Figure 9-10, which has been reviewed for the Ore Reserve estimation.

**Figure 9-10: Plan View of Mining Zones of Wulong**

Sources: SRK

### 9.3.2 Mineral Resources Models

The Wulong Project resource block model was completed by SRK geologist in a \*.mdl file format, and it has been converted into \*.dm file format for design and scheduling purposes.

### 9.3.3 Feasibility Study

SRK has reviewed the following preliminary design studies:

- Wulong #2 Mining Zone Preliminary Design by Shenyang Nonferrous Metallurgy Design and Research Institute in Feb 2022.
- Wulong #3 Mining Zone Preliminary Design by Shenyang Nonferrous Metallurgy Design and Research Institute in Feb 2022.
- Wulong #4 and #5 Mining Zone Preliminary Design by Shenyang Nonferrous Metallurgy Design and Research Institute in Feb 2022.

### 9.3.4 Cut-off Grade

The unit cost of mining, processing, general and administrative, and processing recovery from 2021 to 2024Q3 were provided by Wulong Mining, as detailed in Table 9-9. The cut-off grade is calculated to be 2.50g/t, based on the adjustment from average historical three-year unit costs, while also considering processing recovery and royalty factors, as shown in Table 9-10.

**Table 9-9: Unit Cost of Wulong Project from 2021 to 2024Q3**

Item	Unit	2021	2022	2023	2024 Q1-Q3
Mining Cost	RMB/t Ore	1,129	1,569	2,061	2,259
Processing Cost	RMB/t Ore	76	97	94	85
G&A Cost	RMB/t Ore	56	106	49	27
Processing Recovery for Au	%	89	90	92	91

Sources: Client

<sup>1</sup> The mining production and unit cost only include stope production.

**Table 9-10: Cut-off Grade Calculation**

Item	Unit	Assumption
Gold Price	USD/oz	2,050
Gold Price <sup>1</sup>	RMB/g	476
Mining <sup>2</sup>	RMB/t ore	873
Processing	RMB/t ore	89
G&A	RMB/t ore	57
Processing Recovery	%	97
Payable Rate	%	92
Royalty	%	4
Break-even Cut-off Grade	%	2.50

Sources: SRK

<sup>1</sup> The exchange rate of 7.22 USD to RMB was applied.

<sup>2</sup> The mining production and unit cost only include stope production. Since the mining contractor also mining remnants extraction and hauling low-grade ore, the mining cost has been factored and adjusted downward.

### 9.3.5 Mining Dilution and Ore Loss

Mining dilution includes unplanned dilution from stope wall failures and overbreak from stope walls and floors. Waste rock dilution primarily originates from material sloughing off the hanging wall, with minor contributions from the ends and floors of the stoping area. Waste dilution typically ranges between 0.04m and 0.2m, depending on the size and shape of the orebodies.

To estimate mining dilution, SRK has expanded the orebody wireframe by 0.04m and 0.2m in all directions (Grey line in Figure 9-11), creating skins as an equivalent linear overbreak slough. Overall, it is estimated that mining dilution will be approximately 15%.

Additionally, a mining loss of 8% was estimated and applied to the Ore Reserve estimation.

**Figure 9-11: Skin Analysis for Mining Dilution**

Sources: SRK

### 9.3.6 Ore Reserve Estimates

The estimated process details are provided in Table 9-11, with the corresponding waterfall charts illustrated in Figure 9-12 and Figure 9-13.

Approximately 42% of tonnes and 38% of metal have been converted from Mineral Resources to Ore Reserve. Key negative factors affecting this conversion include the exclusion of Inferred Mineral Resources and design boundaries.

**Table 9-11: Estimates Process Summary**

Conversion Process	Tonnage (kt)	Au Contained (kg)
M+I Resources	2,368	18,997

Conversion Process	Tonnage (kt)	Au Contained (kg)
Inferred Resource Deduction	(1,371)	(10,146)
Remained M+I Resources	997	8,851
Design Boundary	15	44
Irregular Shape	(117)	(993)

### 9.3.7 Ore Reserve Statement

SRK has estimated the Ore Reserve for the Wulong Project in compliance with the JORC Code. The Ore Reserve, with an effective date of 30 September 2024, is summarized in Table 9-12.

As of 30 September 2024, the total Ore Reserve for the Wulong Project is estimated at 984 kt at an average grade of 7.30g/t Au, containing 7.19 t of gold.

**Table 9-12: Wulong Project Underground Ore Reserve Statement, as of 30 September 2024**

Reserve Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
Proved	-	-	-	
Probable	984	7.30	7.19	231
<b>Total<sup>3</sup></b>	<b>984</b>	<b>7.30</b>	<b>7.19</b>	<b>231</b>

Sources: SRK

Notes:

<sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Ms. TzuHsuan Chuang, MAusIMM and Dr. Yiefei Jia, FAusIMM and a Chartered Professional in Geology (CP Geo), employees of SRK Consulting China Ltd. Both Dr. Jia and Ms. Chuang have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the JORC Code. Dr. Jia supervised the work of Ms. Chuang. Dr. Jia and Ms. Chuang consent to the reporting of this information in the form and context in which it appears;

<sup>2</sup> The Ore Reserves Statement is based on the depletion data provided by Wulong Mine for the six-month period, 1 April 2024 to 30 September 2024. The reported Wulong Mine data may differ from that reported by SRK, due the updated Block model now used by Wulong Mine for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the Wulong Mine provided data as the basis for this statement.

<sup>3</sup> Ore Reserve are estimated at a cut-off grade of 2.50g/t Au;

<sup>4</sup> Number was rounded to the second significant digit;

<sup>5</sup> Total may not add due to rounding discrepancies; and

<sup>6</sup> Mining dilution is 20% and ore loss is 8%.

## 9.4 Hanfeng Project

### 9.4.1 Introduction

Hanfeng Project is actively operating and includes several deposits within the following mining zones:

- Lishan Lower Part (Stage1- levels between -92m to -373m);
- Lishan Lower Part (Stage2- levels between -373m to -700m);
- Dongfeng Lower part.

It should be noted that only Lishan Lower Part (Stage1) is included in Ore Reserves since there are no sufficient technical studies regarding the Lishan Lower Part (Stage 2) and Dongfeng Lower part.

In order to classify as Proved or Probable Ore Reserve category, technical studies need to be completed to at least a PFS level with an appraisal of how access would be achieved, mining methodology (including extraction and dilution factors), the geotechnical understanding as well as ventilation. Along with the technical understanding and extraction achievability, the economics of each area needs to be proved, i.e. with the application of Capex and Opex, is it economic to mine, cash flow positive.

In addition, the Dongfeng Molybdenum Mine is expected to begin construction in 2025. Currently, the mine is preparing the feasibility study report. The projected annual mining capacity is 1.65 million tons per year, using underground mining methods, with an annual production of 3,990 tons of molybdenum concentrate at 47% Mo content. The estimated life of mine is 33 years.

#### 9.4.2 Mineral Resources Models

The Hanfeng Project resource block model was completed by SRK geologist in a \*.mdl file format, and it has been converted into \*.dm file format for design and scheduling purposes.

#### 9.4.3 Feasibility Study

SRK has reviewed the following preliminary design studies:

- Lishan Lower Part (Stage1) Preliminary Design (“Lishan LS1”) by Changchun Gold Design Institute in Dec. 2021 with capacity of 435ktpa ROM

#### 9.4.4 Cut-off Grade

The unit cost of mining, processing, general and administrative, and processing recovery from 2021 to 2024 Q3 were provided by Hanfeng Mining, as detailed in Table 9-13. The cost data is extracted from operational zinc mine, which is Lishan Mine Upper and the Dongfeng Mine Upper South.

The cut-off grade for Lishan Lower Part is calculated to be 1.42% Zn, based on the adjustment from average historical three-year unit costs, while also considering processing recovery factors, as shown in Table 9-14.

**Table 9-13: Unit Cost of Lishan Upper Part and the Dongfeng Upper South from 2021 to 2024 Q3**

Item	Unit	2021	2022	2023	2024 Q3
Mining Cost	RMB/t Ore	94	115	129	112
Processing Cost	RMB/t Ore	58	61	67	67
G&A Cost	RMB/t Ore	31	22	42	32
Processing Recovery for Zinc	%	87	88	89	88

Sources: Client

<sup>1</sup> The mining production and unit cost is extracted from Lishan Upper Part and the Dongfeng Upper South.

**Table 9-14: Zinc Cut-off Grade Calculation of Lishan Lower Part**

Item	Unit	Assumption
Zinc Price <sup>1</sup>	USD/t	2,500
Zinc Price <sup>2</sup>	RMB/t	18,050
Underground Mining	RMB/t ore	77
Processing	RMB/t ore	63
Processing Recovery	%	88
G&A	RMB/t ore	25

Item	Unit	Assumption
Payable Rate	%	76
Royalty	%	4
Cut-off Grade	%	1.42

Sources: SRK

<sup>1</sup> CMF price in Q1, 2024 was used for cut-off estimation.

<sup>2</sup> The exchange rate of USD to RMB at 7.22 was applied.

<sup>3</sup> The cut-off grade is applied to Lishan Lower Part, therefore the cost is adjusted.

#### 9.4.5 Mining Dilution and Ore Loss

Lishan Lower Part (Stage1) contains various stopes based on horizontal width of the stopes. Mining dilution includes unplanned dilution from stope wall failures and overbreak from stope walls and floors. Waste rock dilution primarily originates from material sloughing off the hanging wall, with minor contributions from the ends and floors of the stoping area. Waste dilution typically ranges between 0.2 m and 1.0 m, depending on the size and shape of the orebodies.

To estimate mining dilution, SRK has expanded the orebody wireframe by 0.2 m and 1.0 m in all directions (Orange line in Figure 9-14), creating skins as an equivalent linear overbreak slough. Overall, it is estimated that mining dilution will be approximately 22%.

Additionally, a mining loss of 20% was estimated and applied to the Ore Reserve estimation.

**Figure 9-14: Skin Analysis for Mining Dilution**

Sources: SRK

#### 9.4.6 Ore Reserve Estimates

The estimated process details are provided in Table 9-15, with the corresponding waterfall charts illustrated in Figure 9-15 and Figure 9-16.

Approximately 17% of tonnes and 15% of metal have been converted from Mineral Resources to Ore Reserve. Key negative factors affecting this conversion include the exclusion of Inferred Mineral Resources and design boundaries.

**Table 9-15: Estimated Process Summary**

Conversion Process	Tonnage (kt)	Zn Contained (t)
M+I+I Resources	19,951	553,966
Inferred Resource Deduction	(10,623)	(307,867)
M+I Resources	9,328	246,099

#### 9.4.7 Ore Reserve statement

SRK has estimated the Ore Reserve for the Hanfeng Project in compliance with the JORC Code. The Ore Reserve, with an effective date of 30 September 2024, is summarised in Table 9-16.

As of 30 September 2024, the total Ore Reserve for the Hanfeng Project (Lishan Lower Part - Stage1) is estimated at 3,310 kt at an average grade of 2.45% Zn, containing 81 kt of Zn. This includes the Proved Ore Reserve estimated at 390 kt at an average grade of 2.26% Zn, containing 9 kt of Zn, and the Probable Ore Reserve at 2,920 kt at an average grade of 2.47% Zn, containing 72 kt of Zn.

Table 9-16: Hanfeng Project Underground Ore Reserve Statement, as of 30 September 2024

Reserve Category	Tonnage (kt)	Zn Grade (%)	Zn Metal Contained (kt)
Proved	390	2.26	9
Probable	2,920	2.47	72
<b>Total</b>	<b>3,310</b>	<b>2.45</b>	<b>81</b>

Sources: SRK

Notes:

<sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Mr. Erwei Lu and Dr. Yiefei Jia, FAusIMM and a Chartered Professional in Geology (CP Geo), employees of SRK Consulting China Ltd. Both Dr. Jia and Mr. Lu have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the JORC Code. Dr. Jia supervised the work of Mr. Lu. Dr. Jia and Mr. Lu consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Ore Reserve are estimated at a cut-off grade of 1.42% Zn;

<sup>3</sup> Number was rounded to the second significant digit;

<sup>4</sup> Total may not add due to rounding discrepancies; and

<sup>5</sup> Mining dilution is 22% and ore loss is 20%.

## 9.5 Jintai Project

### 9.5.1 Introduction

Jintai Project is actively operating and includes several deposits within its various mining zones:

V1, V2 (V2\_1, V2\_2), V4, V5, V6, V7, V8, V9, and V10

It should be noted that only V1, V2, V4 and V10 have measured resource and indicated resource, but only V1 and V2 are included in Ore Reserves since there are no sufficient technical studies for the rest of mining zones.

### 9.5.2 Mineral Resources Models

The Jintai Project resource block model was completed by SRK geologist in a \*.mdl file format, and it has been converted into \*.dm file format for pit optimization, design, and scheduling purposes.

### 9.5.3 Feasibility Study

SRK has reviewed the following preliminary design studies:

- Preliminary Design for Xidengping Mine with a capacity of 140ktpa ROM conducted by Jinjian Engineering Design Co., Ltd. (“**GOCOM**”) in February 2022 (“**FS 2022**”).
- Xidengping Mine Mineral Resources Development and Utilization Scheme with a capacity of 650ktpa conducted by Yunnan Shangli Mining Co., Ltd. (“**Shangli**”) in March 2024 (“**FS 2024**”).

### 9.5.4 Cut-off Grade

Economically mineable ore was defined based on the results of open pit optimization. Open pit optimization was used to identify the optimum economic pit shape based on the highest project cash flow. The cut-off grade (“**COG**”) of gold is defined the destination for material within designed pit. If the material that has a grade more than COG, these materials would truck to the draw-point of mill plant, otherwise would be dump into WRD.

The inputs were applied by SRK to estimate MCOG of gold ore, which are presented in Table 9-17.

**Table 9-17: Estimates of MCOG for Gold Ore**

Inputs	Unit	Parameter
Mining cost	RMB/t TMM	11
Heap leaching	RMB/t ore feed	45
G&A cost	RMB/t ore feed	31
Recovery Rate	Percentage	78
Payable Rate	Percentage	97
Gold Price	USD/ oz	2,050
Exchange Rate	RMB/USD	7.22
Royalty	%	4

Inputs	Unit	Parameter
Gold Price	RMB/g	476
Cut-off Grade	g/t	0.25

Sources: SRK

The COG is estimated to be 0.25g/t Au. SRK is of the view that material within pit has more than 0.25g/t Au can be processed economically, and reserves at COG will have positive revenues.

The COG was calculated based on technical and economic assumptions described in the Table above. These assumptions may change in the future, which will affect the COG calculation, which will impact the mine inventory estimation.

### 9.5.5 Modifying Factors

The following modifying factors are used to determine the mine inventory.

- Optimal pit shell: Includes the economic pit limits to the vein domains and excludes resources outstanding mining license or road limit as mining 'no-go' area.
- Pit design: The conversion factor for the mining inventory between the optimized pit shell and the practical mine design has been accounted for in this parameter.
- Dilution: Mining dilution is estimated as 5% by FS 2022. The modifying factor would be updated when more experience parameters were gained during pilot and operation reconciliation data.
- Mining recovery: A 95% mining recovery rate was applied by FS 2022 and similar as dilution rate, updates would be applied when more data obtained.

### 9.5.6 Ore Reserve Estimates

The estimated process details are provided in Table 9-18, with the corresponding waterfall charts illustrated in Figure 9-17 and Figure 9-18.

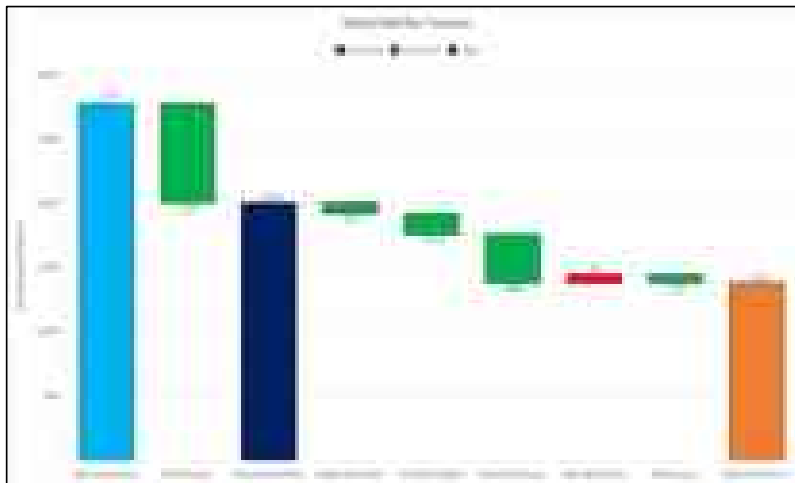

Approximately 49% of tonnes and 33% of metal have been converted from Mineral Resources to Ore Reserve. Key negative factors affecting this conversion include the exclusion of Inferred Mineral Resources.

**Table 9-18 Estimated Process Summary**

Conversion Process	Tonnage (kt)	Au Metal Contained (t)
M+I+I Resources	2,772	3.10
Inferred Resource	(769)	(1.55)
M+I Resources	2,004	1.55
Design Boundary	(81)	(0.04)
Pit Optimization	(161)	(0.03)
Detailed Design	(388)	(0.40)
Mining Dilution	69	-
Mining Loss	(72)	(0.05)
Ore Reserves	1,370	1.03

Sources: SRK

Figure 9-17: Estimated Process - Change in Tonnes

Sources: SRK

Figure 9-18: Estimated Process - Change in Metal Contained

Sources: SRK

**9.5.7 Ore Reserve Statement**

SRK has estimated the Ore Reserve for the Jintai Project in compliance with the JORC Code. The Ore Reserve, with an effective date of 30 September 2024, is summarized in Table 9-19.

As of 30 September 2024, the total Ore Reserve for the Jintai Project (V1&V2) is estimated at 1,370 kt at an average grade of 0.75 g/t Au, containing 1.03 t of gold.

**Table 9-19 Open Pit Mineral Ore Reserve Statement of Jintai Project, as of 30 September 2024<sup>1,2,3,5</sup>**

Reserve Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
Proved	-	-	-	-
Probable	1,370	0.75	1.03	33
<b>Total<sup>4</sup></b>	<b>1,370</b>	<b>0.75</b>	<b>1.03</b>	<b>33</b>

Sources: SRK

Notes:

<sup>1</sup> The information relates to Ore Reserves conversion is based on information compiled by Mr Erwei Lu, Mr. Falong Hu, MAusIMM, and Dr. Yiefei Jia, FAusIMM and a Chartered Professional in Geology (CP Geo), employees of SRK Consulting China Ltd. Both Dr. Jia and Mr. Hu have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the JORC Code. Mr Lu, Mr Hu and Dr. Jia consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Ore Reserve are estimated at a cut-off grade of 0.25g/t Au;

<sup>3</sup> Number was rounded to the second significant digit;

<sup>4</sup> Total may not add due to rounding discrepancies;

<sup>5</sup> Mining dilution is 5% and ore loss is 5%; and

The Ore Reserves Statement is based on the depletion data provided by Jintai for the six-month period, 1 April 2024 to 30 September 2024. The reported Jintai data may differ from that reported by SRK, due the updated block model now used by Jintai for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the Jintai provided data as the basis for this statement.

## 10 Mining Assessment

### 10.1 Jilong Project

#### 10.1.1 Introduction

Jilong Gold Mine now has three stand-alone underground operating systems: Zone 1, Zone 2, and Zone 3. Zone 1 is located on the southwest side of the mine, including No. 27 area and Yangpo area. Zone 2 (also known as Huangjindong) is located on the north side of Zone 1. Zone 3 (also known as Luofengmao) is located on the east side of Zone 1. All of these zones are utilizing underground mining method, accessing the orebody via shafts or adits.

Jilong Gold Mine intends to increase its production capacity by developing peripheral Zones 4, 5, 6, and 7. This expansion is projected to commence operations in 2027, with an expected production rate of 60 ktpa.

In addition, the mine is expected to build a processing plant in June 2024 with a capacity of 180 ktpa, combining with the existing processing capacity of 120 ktpa to total 300 ktpa. The mining capacity will increase to 300 ktpa by the end of 2025 due to deeper mining and the expansion of the mining zone, which will match the capacity of the processing plant.

#### 10.1.2 Geotechnical and Hydrogeological Conditions

Visually, the geotechnical and hydrogeological conditions of Jilong Project, where SRK visited, are fair to good. The rock underground appears competent, and the drifts are mostly unsupported. Local support by wood or steel arcs is necessary where small faults cross the drift.

The tunnels back and walls are dry, and the water on floor is minimum, collecting at the ditch then staged pumps to water tanks close to the adit exits.

SRK opines that both geotechnical and hydrogeological risks are medium to low as the available data and the site views

#### 10.1.3 Mining Method

The Jilong Mine mainly adopted the resuing method since the orebody is very steep and thin with solid surrounding wall rocks. Since the vein's thickness is so thin and the void area so small, miners cannot work within the vein during mining. However, if the waste is removed all at once, the depletion is too high, raising transportation and processing expenses, which is not economically feasible. As a result, this mining method enables the separation of the ore and surrounding rocks, with the ore being transported and extracted while the waste is kept in the stope for backfilling. (See Figure 10-1)

The vein's width is so small that a section of the surrounding rock must be blasted to create a minimum working width, hence the stope's width is crucial. Every effort should be made to limit the mining of waste rock because it is an unprofitable operation.

**Figure 10-1: Resuing Method**

Source: Design from a PFS level of study (2018)

The mining process is to lay the rubber pad, blast the ore, ventilate, skid the roof support, carry the ore to the chute by hand with rubber pad, withdraw the rubber pad, reuse, level the working platform, and set up the ore chute to the next operation cycle.

#### **Materials Movement and Handling**

Electric locomotives are used for transportation to haul ore and waste rocks, and wooden sleeper light rails are laid in the mine (Figure 10-2). The ore is lifted to the surface by shafts with double-deck cages, unloaded to the stockpile and transported by trucks to the processing plant.

**Figure 10-2: Mine cart in the underground**

Source: Site visit on 31<sup>st</sup> May 2024

### 10.1.4 Production

#### History Production

In Zone 1, Zone 2, and Zone 3, the current mining stope operation produces approximately 76 ktpa of ore per with an average gold grade of 10.99g/t . Table 10-1 shows the historical stope production in the last three years.

**Table 10-1: Jilong Mine Yearly Stope Production from 2021 to 2024 Q3**

Item	Unit	2021	2022	2023	2024Q1 – Q3
Ore Tonnes	kt	62	57	85	98
Au Grade	g/t	13.11	14.90	11.41	7.02
Au Metal	kg	813	853	967	688

The Jilong Mine contains mineralized waste rock, development materials, residues in stopes, and low-grade stockpiles both underground and on the surface. Residues are the stopes that the prior old mine regarded low-grade with no value. The stockpile is low-grade ores from the prior old mine with an Au grade of less than 3g/t, which was heaped in the drift rather than being transferred to the processing plant.

With the recent increase in gold prices, these materials have gained economic value and are now considered as ROM material for comprehensive utilization in mining operations. The mine has begun to haul the low-grade stope and transport the stockpile of previously low-grade ore to the processing plant. **Table 10-2** shows the historical production for comprehensive utilization in the last three years.

**Table 10-2: Jilong Mine Yearly Production for comprehensive utilization from 2021 to 2024 Q3**

Item	Unit	2021	2022	2023	2024Q1 – Q3
Ore Tonnes	kt	76	96	70	63
Au Grade	g/t	3.44	2.02	4.70	5.77
Au Metal	kg	263	194	328	361

#### Mine Design and Access

The stope's length is 50 m, and its height is 40-45 m. Wooden hopper is used, and the ore is transported manually. The distance between hopper is 10m, the sill pillar is 3 m, and no pillar is left. There are raises beside the stope, and the section of the raise is 2.0m × 1.5m. The drift section is about 2.4m × 2.5m depending on the orebody. SRK notes that most of the drifts are solid enough to not to be supported. A few of the drifts with weak surrounding rocks need to support with shotcrete.

Figure 10-3 shows the design of the shaft, which is used in every zone in Zhuanshanzi Mine. There are different types of orebody access which is shown in **Table 10-3**. **Table 10-4** shows the purpose of each development in each zone.

**Table 10-3: Type of Access in Each Zone**

### 10.1.5 Underground Service

#### Ventilation

The air flows down the mine to the working places and levels from shafts and downcasts, and then is discharged through upcasts. The studies had designed the air flow in 2D diagram (Figure 10-4) and had estimated the air volume required for each zone individually.

During the site visit, SRK observed that the ventilation was satisfactory and did not present any potential hazards.

**Figure 10-4: Example of Ventilation Design in Jilong Mine (Zone 1 to Zone 3)**

Source: Design from a PFS level of study (2018)

#### Dewatering

In its current configuration, the mine utilizes a two-stage drainage system. First, water from the drifts drains into a sump, and then water is pumped by pumping stations to a surface pond.

During the site visit, SRK observed that the drainage was satisfactory and did not present any potential hazards.

### Air Compressor

There is an air compressor station near the wellhead, and the air leg is the drilling equipment. The analysis demonstrates that the compressed air delivery system satisfies the majority of production requirements. A comprehensive calculation of air consumption and the selection and amount of air compressors is included in a PFS-level research study (2018).

## 10.1.6 Mining Equipment

The mining equipment in each zone is shown in **Table 10-5** to **Table 10-7**.

**Table 10-5: Mine Equipment in Zone 1**

Zone 1			
Equipment	Model	Quantity	Power (kw)
Jackleg	YT28	48

### 10.1.7 Production Schedule

The mine schedule was developed using Deswik software, based on productivity estimates for each task. For instance, stope excavation requires several days for preparation. The assumptions for mining sequence and dependencies are as follows:

- Mining and Processing Operation: The ROM capacity remains at 180 ktpa, with Zones 4, 5, 6, and 7 scheduled to operate in 2027.
- Vertical Overlap: Mining progresses downward, level by level, with typically 3-4 levels grouped into one section for better operational flexibility.
- Horizontally Overlap: Mining advances from the hanging wall to the footwall.
- Priority: Stopes accessible via existing development will be mined first.
- Life of Mine: 9 years.

The development schedule is not considered, as the mine has been previously operational and further development is not seen as high-risk. Mining activities are expected to last approximately nine years. Zones 4, 5, 6, and 7 are new to Jilong Mining, and with the existing infrastructure in Zones 1, 2, and 3.

Figure 10-5 illustrates the production schedule, detailing both the ROM production and the ROM grade. **Table 10-8** provides the details of mine production.

Figure 10-5: Production Schedule

## 10.2 Huatai Project

### 10.2.1 Introduction

Huatai Project includes six (6) gold mines, each with an independent development system. They are all utilizing or planning conventional underground mining methodologies, access via adit & shaft or incline shaft, resuing stoping method, railway ore car transportation. Huatai Project operation and plan status are described as follows:

- Pengjiagou Mine: the mining license (30ktpa) was obtained in 2015. The client conducted a preliminary design on this mine, decided to commend its production in 2028.
- Honghuagou #86 Vein: the mining license limits capacity of 30ktpa as the same as Pengjiagou, the client decided to delay construction on this mine.
- Honghuagou #1 Mining Zone: this mine contained 4 sub-zones with their own mining license, which are #1 vein, #3 sub-zone, #1 sub-zone, and Longtoushan. The client conducted a preliminary design on these sub-zones, decided to commend its production in 2027.
- Lianhuashan #26 Vein: the mining license limits capacity of 30ktpa as similar as the Pengjiagou and #86. The client conducted a preliminary design on this mine, decided to commend its production in 2028.
- Lianhuashan #3&#7 Vein: the mining license is also 60ktpa capacity. The client conducted a scoping studies and preliminary design on this mine, decided to commend its production in 2027.
- Lianhuashan #5 Mining Zone: this mine has also decided to modify mining system to achieve the capacity of 60ktpa from the previous 30ktpa. The client conducted a preliminary design on this mine, decided to commend its production in 2026.

### 10.2.2 Geotechnical and Hydrogeological Conditions

Visually, the geotechnical & hydrogeological conditions of Lianhuashan #5 Zone, where SRK visited are fair to good. The rock underground appears competent, and the drifts are mostly unsupported. Local support by wood or steel arcs is necessary where small faults cross the drift.

The tunnels back and walls are dry, and the water on floor is minimum, collecting at the ditch then staged pumps to water tanks close to the adit exits.

SRK opines that both geotechnical and hydrogeological risks are medium to low as the available data and the site views.

### 10.2.3 Mining Method

Huatai Project using a modified resuing stoping method, named slice and fill with rock, for all stopes of mining zones, and planned to use this method for the rest Mineral Resources in future.

The stoping method is suitable for the veins horizontal thickness is less than 0.8m. the mining cycle is from the footwall waste mining, to give a space for miner operation to drill ore blasting holes. Then mine the ore down to the pad at the bottom of slice. The broken ore will be cleaned into artificial ore pass within the stope down to the draw point for ore car collection. Then fill the slice with rock from development heading on upper levels via raises, or mine footwall rock down to perform the work platform for miners to drill the next lift. The modifying point from traditional resuing is the rock sourced out of stope partly, not all from surrounding rock mined down.

The stope length is about 50 to 100m and the height is the same as level interval. There are no crown pillar or rib pillar planned, the sill pillar is proposed for draw point installation and separation stopes. The square-set raise for manway is planned at each end of stope. The draw points interval is about 10m middle to middle.

### 10.2.4 Production

#### Historical Production

The current mining operation has been suspended due to technical upgrade and expansion. Table 10-9 below displays the historical production records.

**Table 10-9: Huatai Project Yearly Ore Production from 2020 to 2023**

	Unit	2021	2022	2023	2024Q1 – Q3

Au Grade	g/t	2.28	1.80	-	-
Au Metal	kg	121	31	-	-

Sources: Client

#### Mine Design and Access

As for Lianhuashan #5 Zone, the underground mine is accessed via 3 staged shafts from surface down to Level 18, as followings:

- Stage I: adit and incline shaft, serving the first 5 levels, the Mineral Resources on these 5 levels are nearly depleted.
- Stage II: a blind caged shaft from Level 5 down to Level 12 as the main access to these levels. The resources on these levels have been mined in recent years.
- Stage III: a third shaft have been established to serve the Level 12 down to Level 18. The resources on these levels are the key mining target supporting the production expansion plan.

The broken ore from the stopes is loaded into ore cars from the draw point at the sill of stope. The ore cars are hauled by locomotive via the level drift to shaft station at the level access. The ore is then relayed hoisted to surface by the hoisting system in the shafts.

The waste rock from development headings is backfilled into mined stope.

All personnel and materials are transported in and out of the mine via the staged shafts and level drifts. The level interval is about 40m height, totally 18 levels have been established. The main adit portal and shaft station of level 5 are shown in Figure 10-6, the typical level drift and crosscut drift are shown in Figure 10-7.

**Figure 10-6: Photos of Main Adit Portal and Shaft Station on Level 5**

Sources: shot during site visit on 25<sup>th</sup> Dec 2022

Note: Typical Level Drift on Level 5 (left) and Typical Cross-cut Drift on Level 8 (right)

### Other Mining Zones

As previously described, similar to the Lianhuashan #5 Zone, all other sub-zones are either currently utilizing or planning to utilize conventional underground mining methodologies. Concurrently, preliminary designs for all sub-zones have been conducted in accordance with Chinese Standards. Along with historical operation records, SRK considers these designs to be pre-feasible for guiding Ore Reserves estimation.

### 10.2.5 Underground Service

Ventilation system, water supply compressed air supply, drainage, and power supply system for #5 Zone is established, and the expansion construction is ongoing. For the Lianhuashan #1 Zone and Lianhuashan #3&#7 Vein, the expansion construction and technical updates are planned to be completed by the end of 2026. For the Pengjiagou and Lianhuashan #26 Vein, the construction is scheduled to be completed in 2029. The expansion plan consists of development system update, machinery purchase and installation, drift renew and re-rail or enlarge the cross-section size, as well as update the service system to fit the enlarged capacity from 30ktpa to 60ktpa.

The level 5 staged sump of #5 Zone and the main power substation underground is shown in Figure 10-8 below.

**Figure 10-8: Photos of Level 5 Sump and Main Power Substation of Lianhuashan #5 Zone**

Sources: shot during site visit on 25<sup>th</sup> Dec 2022

### 10.2.7 Production Schedule

The mine schedule was developed using Deswik software, based on productivity estimates for each task. For instance, stope excavation requires several days for preparation. The assumptions for mining sequence and dependencies are as follows:

- Mining and Processing Operation: Operations is estimated to start in 2026 with the ROM capacity of 60ktpa.
- Vertical Overlap: Mining progresses downward, level by level, with typically 3-4 levels grouped into one section for better operational flexibility.
- Horizontally Overlap: Mining advances from the hanging wall to the footwall.
- Priority: Based on the current development system and the anticipated yield of mined metals, as well as considering the client's operational strategy, the initial mining operations will focus on #1

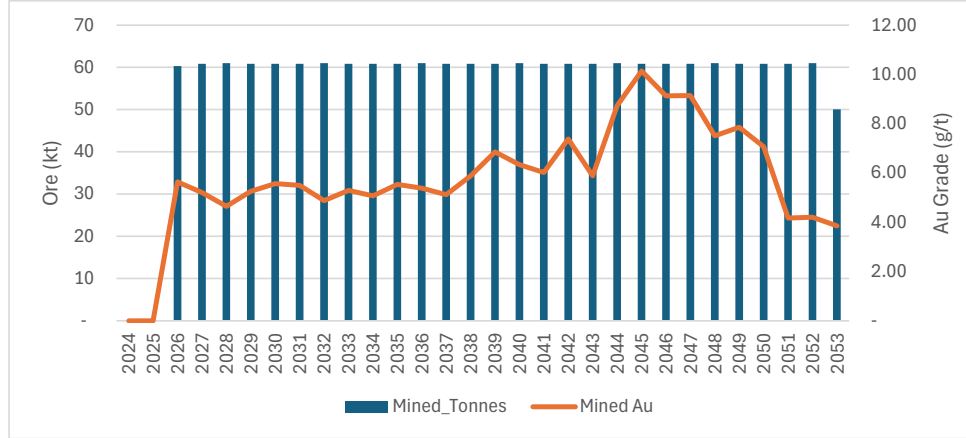

Zone and #3&#7 Vein. These will be followed by the extraction of resources from #26 Vein, #5 Zone, and Pengjiagou.

- Life of Mine: 28 years.

The development schedule is not considered, as the mine has been previously operational and further development is not seen as high-risk.

Figure 10-9 illustrates the production schedule, detailing both the ROM production and the ROM grade. Table 10-11 provides the details of mine production.

**Figure 10-9: Production Schedule**

Sources: SRK

Notes:

- <sup>1</sup> The line represents the average gold grade, corresponding to the right axis.
- <sup>2</sup> The column represents the ore amount, corresponding to the left axis.

## 10.3 Wulong Project

### 10.3.1 Introduction

The administrative division of the Wulong Gold Mine is governed by Zhen'an District of Dandong City, which is located 15km to the northwest of Dandong City. The mine is located on mining lease C2100002011084140116558. The mining level is from 100m asl to -750m asl, with a total area of 6.2732 km<sup>2</sup>. The mine started small-scale mining in 1938, became a state-run mine in 1948, and changed from a state-run mine to a private mine in 2009, and the mine has closed the abandoned drift and backfilled the excavated voids with waste rock.

Wulong Gold Mine now has three stand-alone underground operating systems: Zone 2, Zone 3, and Zone 4. Zone 4 is further separated into the main shaft zone and the service shaft zone, which is also known as Zone 5. Figure 10-10 shows the location of each zone.

**Figure 10-10: Zone Layout**

### 10.3.2 Geotechnical and Hydrogeological Conditions

Visually, the geotechnical and hydrogeological conditions at the Wulong Project, as observed by SRK during the site visit, range from fair to good. The underground rock appears intact, with most drifts being unsupported. However, localized support using wood or steel arches is necessary where minor faults intersect the drifts. The tunnel backs and walls are dry, with minimal water on the floor, which is collected in ditches and pumped to water tanks near the adit exits. Based on the available data and site observations, SRK considers the geotechnical and hydrogeological risks to be medium to low.

### 10.3.3 Mining Method

For steep and thin orebody with solid surrounding wall rocks, resuing method is adopted to separate the ore and surrounding rocks, with the ore being transported and extracted while the waste is kept in the stope for backfilling.

For relatively thicker orebody, overhand cut and fill mining is adopted (See Figure 10-11). Cut and fill mining allows selective mining, separate recovery of high-grade portions, and stope retention of low-grade rock. Excavated voids are backfilled with waste rock once the stope has been mined out. This method provides a relatively inexpensive and convenient way to advance a working platform in order to keep access to the ore for drilling, blasting, and mucking.

**Figure 10-11: Overhand Cut and Fill**

Source: Design from a PFS level of study (2020)

The stope is around 40 to 60 m wide, and it is not more than 40 m height. The section of the raise is 1.5m x 2.5m. There is a hopper set up every 15 m or so. Each stope has one to two raises that are connected to the upper middle level so that the waste rock can be used to backfill the stope. Once the bottom drift has mined out, the void is backfilled with waste rock generated by development to other level. The waste rock is stored underground in unused drifts.

### Materials Movement and Handling

Electric locomotives are used for transportation to haul ore and waste rocks, and wooden sleeper light rails are laid in the mine. The ore is lifted to the surface by shafts with double-deck cages, unloaded to the stockpile and transported by trucks to the processing plant.

### 10.3.4 Production

#### History Production

The current stope operation has produced approximately 100 ktpa of ore with an average gold grade of 6.86g/t over the past three years. Table 10-12 shows the historical stope production from 2021 to the third quarter of 2024.

**Table 10-12: Wulong Mine Yearly Stope Production from 2021 to 2024 Q3**

Item	Unit	2021	2022	2023	2024Q1 – Q3
Ore Tonnes	kt	104	104	106	78
Au Grade	g/t	3.39	5.92	9.08	9.74
Au Metal	kg	353	615	966	758

The Wulong Mine contains mineralized waste rock, development materials, residues in stopes, and low-grade stockpiles both underground and on the surface. Residues are the stopes that the prior old mine regarded low-grade with no value. The stockpile is low-grade ores from the prior old mine with an Au grade of less than 3g/t, which was heaped in the drift rather than being transferred to the processing plant.

With the recent increase in gold prices, these materials have gained economic value and are now considered as ROM material for comprehensive utilization in mining operations. The mine has begun to haul the low-grade stope and transport the stockpile of previously low-grade ore to the processing plant. Table 10-13 shows the historical production for comprehensive utilization in the last three years.

**Table 10-13: Wulong Mine Yearly Production for comprehensive utilization from 2021 to 2024 Q3**

Item	Unit	2021	2022	2023	2024Q1 – Q3
Ore Tonnes	kt	279	285	470	451
Au Grade	g/t	1.86	2.62	1.86	1.60
Au Metal	kg	519	746	876	721

#### Mine Design and Access

The section of the drift is about 2.4m x 2.5m. SRK notes that most of the drifts are solid enough to not to be supported (Figure 10-12). A few of the drifts with weak surrounding rocks are supported with wood or steel arcs.

Wulong Mine is accessed from shafts with double-deck cages in each zone. Each cage carries 9 people at one time. The current mine as-builts for each area are shown in Figure 10-13.

**Figure 10-12: Level 7 in Zone 2 (-136m asl)**

Source: Site visit on 23<sup>rd</sup> Dec 2022

**Figure 10-13: Pan Views of Zone 2 (left), Zone 3 (centre) and Zones 4 and 5 (right) As-builts**

Source: Management

SRK notes that the individual stopes are designed using 2D polygonal long sections once they reach the level through development. Figure 10-14 shows the long section in Zone 4. This method is to divide the orebody into different small blocks according to the geological characteristics and conditions of the deposit (such as ore grade, natural type, reserve category, technical conditions of mining and hydrogeological conditions of the deposit, etc.) or exploration engineering, and for each block, the reserves can be estimated by the arithmetic average method.

SRK notes that this is a medium-risk mine design method, although it is frequently used in highly variable vein systems in China.

**Figure 10-14: Aver Example of 2D polygonal long sections in Zone 4**

Source: Management

The development system is shafts and blind shafts. Shafts are being used for transporting ore and waste and personnel. Development to access these stope blocks is designed years in advance. An example of the development design is shown in Figure 10-15. The schedule is based on designs, crosscut assess, faces, raises, and ventilation.

**Figure 10-15: Example of development design in Zone 4 and Zone 5**

Source: Management

### 10.3.5 Underground Service

#### Ventilation

The air flows down the mine to the working places and levels from shafts and downcasts, and then is discharged through upcasts. Figure 10-16 shows the internal design of ventilation. SRK notes that there is no software simulate the rates of flow but only 2D design.

During the site visit, SRK observed that the ventilation was satisfactory and did not present any potential hazards.

**Figure 10-16: Ventilation system design in Zone 3**

Source: Ventilation design from a PFS level of study (2020)

#### Dewatering

The current dewatering capacity for the mine is supported by a system of electric pumps set in various levels and locations. Water from the drifts drains into a sump, and then water is pumped by pumping stations to a surface pond.

SRK notes that the problem of water accumulation is not serious during site visit.

#### Air Compressor

According to a PFS-level research study, the amount of air compressors was calculated by the air consumption of jackleg. The analysis demonstrates that the compressed air delivery system satisfies the majority of production requirements.

### 10.3.6 Mining Equipment

The quantity of major mining equipment used underground is summarized in **Table 10-14**. The amount and size of the equipment seem to be enough for the operation. SRK notes that only a few equipment is in poor condition. It is less likely that there would be a scarcity of equipment because the mining equipment is less expensive and requires a smaller investment.

**Table 10-14: Mining Equipment in Each Zone**

Equipment	Zone 2	Zone 3	Zone 4	Zone 5	Total
Trolley electric locomotives	46	25	47	16	134
Electric loader	17	15	20	14	66
Electric scraper	12	13	23	5	53
Mine cart	203	213	281	165	862

Source: Management

### 10.3.7 Production Schedule

The mine schedule was developed using Deswik software, based on productivity estimates for each task. For instance, stope excavation requires several days for preparation. The assumptions for mining sequence and dependencies are as follows:

- Mining and Processing Operation: Operations remain with the ROM capacity of 100ktpa.
- Vertical Overlap: Mining progresses downward, level by level, with typically 3-4 levels grouped into one section for better operational flexibility.
- Horizontally Overlap: Mining advances from the hanging wall to the footwall.
- Priority: Stopes accessible via existing development will be mined first.
- Life of Mine: 12 years.

Due to the existing infrastructure, there is no ramp-up period.

Figure 10-17 illustrates the production schedule, detailing both the ROM production and the ROM grade. Table 10-15 provides the details of mine production.

Figure 10-17: Production Schedule

Sources: SRK

Notes:

## 10.4 Hanfeng Project

### 10.4.1 Introduction

Hanfeng Mining operate 2 established mines, the Lishan Mine and the Dongfeng Mine. They are both utilising conventional underground mining methodologies, access via adit & shaft, shrinkage stoping method, railway ore car transportation. There are 2 processing plants which located in Lishan and Dongfeng respectively. Lishan plant is focused on zinc, lead, and copper resources. Dongfeng Plant processes molybdenum feeds. The infrastructure of both mines is established, and the risk of shortage of power, water, fuel, and materials is low.

The two mines of Hanfeng Project operation and plan status are described as followings:

- Lishan Mine is divided into 2 parts in vertical.
  - The upper part which is above -92m asl, is operated at a nominated capacity of 165ktpa ROM contains zinc, lead, and copper elements, feeding the Lishan plant. The upper part is currently in operation to mine the historically residual inventory. It has been confirmed with the client that the upper part is not within the scope of the Ore Reserves estimation
  - The lower part which is from -92m asl to -700m asl is planned to construct in 2 stages.
    - Stage I is targeting the Mineral Resource from -92m asl down to -373m asl. Stage I is proposed at a capacity of 435ktpa, operating with upper part together to achieve 600ktpa capacity. The construction of Stage I is on progress currently (as of September 2024). Main shaft has been development but not equipped due to ventilation shaft and return air drift is on developing.
    - Stage II will focus on the Mineral Resource under -373m asl, downwards -700m asl. The management of the Company aims achieving 600ktpa capacity of this stage II relay the Stage I and the upper part operation. However, the technical studies and/or design on this stage is not initiated yet.

- Dongfeng Mine is also divided into 2 parts in vertical, and the intersection elevation is 250m asl.
  - The upper part is on operating as South section and North section
    - South section contains the Mineralisation veins of Zinc, Lead, and copper. This section mined 36kt feed in 2022, and the management the Mineral Resource is nearly depleted. However, they are hoping that the exploration during operation by along veins developing would reveal more resource to maintain a mining plan of 60ktpa for next 3 years. The ore of this section is trucked to Lishan plant for treatment.
    - North section contains veins of Molybdenum element. This section was on care and maintenance before 2022. In 2022 this section was re-operated 6k ROM. Dongfeng Plant was also re-operated to treat this 6k ROM and 9k ore from surface stockpile, which was stored for nearly 10 years.
  - The lower part is for North section which is Moly resources. As of 30 September 2024, the lower part Mineral Resources were estimated, but the technical study is not initialled yet for lower part as well as the mining license is not applied.

Only the Lower Part (Stage 1) of the Lishan Mine was considered during the Ore Reserves estimation, based on the status as of 30 September 2024.

#### 10.4.2 Geotechnical & Hydrogeological Conditions

Visually, the geotechnical & hydrogeological conditions of Dongfeng mine, where SRK visited, are fair to good. The rock underground appears competent, and the drifts are mostly unsupported. Local support by wood or steel arcs is necessary where small faults are crossing the drift. The surrounding rock of zinc veins are fair, but those around moly veins are weaker than zinc veins. The exposure time is controlled by the operation to mitigate the risk of hanging wall failure, as stated by the management.

The tunnels back and walls are dry, and the water on floor is minimum, collected at the ditch then pumped in stages to water tanks close to the adit shaft exits.

The geotechnical & hydrogeological parameters for upper parts of Lishan and Dongfeng mines are unavailable to review. The lower part (Stage I) of Lishan Mine has studied and reported geotechnical & hydrogeological conditions. The mechanical properties of rock and ore are summarized in **Table 10-16**. Considering the size of openings, the preliminary design proposed unsupported tunnelling for most drifts and stopes, wood or steel arc would be applied where weak zones occurred, or faults are encountered.

**Table 10-16: Summary of Rock Mechanical Properties of Lishan Lower Part (Stage I)**

Property	Unit	Ore	Surrounding
Testing Blocks	QTY	11	37
Uniaxial Compressive Strength	MPa	77.68-80.31	84.92-42.71
Extension Strength	MPa	6.69-7.09	2.77-7.52
Cohesion	MPa	8.82-9.02	4.92-9.76
Internal Friction Angle	degree	50.96-51.07	42.16-53.71
Average RQD	%	90.8	90.9
Class	N/A	Fair	Fair

Sources: Lishan LS1

The water inflow estimated for the Lishan Lower part, are 434m<sup>3</sup> per day normally, and 3,430m<sup>3</sup> per day maximum. Considering the records of drainage at the range of 200m<sup>3</sup> to 500m<sup>3</sup> per day, the hydrogeological condition is classified as simple.

SRK opines that both geotechnical and hydrogeological risks are medium to low based on the available data and the site inspections.

### 10.4.3 Mining Method

#### Lishan Upper Part

Lishan Upper Part using shallow hole shrinkage stoping method for all the stopes. When the horizontal width of vein is wider than 2m, no sill pillar stope structure is applied. Otherwise, the stope will leave a 5m high sill pillar for draw points. The crown pillar of stope is 3-4m height. The stope length is about 50m and the height is the same as level interval. The rib pillar is 5-6m and the raise for manway is located in the rib pillar. the draw points interval is about 6-7m middle to middle.

#### Lishan Lower Part Stage I

The preliminary design for Lishan lower Part proposed 4 stoping methods that suit different vein widths, which are as presented in **Table 10-17**.

**Table 10-17: Summary of Stoping Methods for Lishan Lower Part (Stage I)**

Parameters	Unit	Shrinkage delay fill	Slice & fill	Resuing	sub-level open stope delay fill
Vein horizontal thickness	m	0.8-5	0.8-5	<0.8	>5
Dipping	degree		>50		
Percentage	%	35	15	10	40
Stope productivity	tpd	150-200	60-80	20-30	200-250
Loss	%	10	12	15	10
Dilution	%	11	10	17	10

Sources: Lishan LS1

The backfill material is waste rock during drift developing.

#### Dongfeng Upper Part

Dongfeng Upper Part is using the same method as Lishan upper part, which is shrinkage stoping method for all the stopes.

### 10.4.4 Production

#### History Production

Table 8-18 shows the historical production record of Lishan Mine Upper Part and the Dongfeng Mine Upper South, which primarily contains zinc and lead, and is processed at the Lishan Plant.

Table 8-19 shows the historical production record of Dongfeng Mine Upper North, which primarily contains molybdenum and is processed at the Dongfeng Plant.

**Table 10-18: Hanfeng Project (Lishan Mine Upper Part and the Dongfeng Mine Upper South) Yearly Ore Production from 2021 to 2024 Q3**

Item	Unit	2021	2022	2023	2024Q1 – Q3

**Underground Mine Design**

**Lishan Upper Part**

The underground mine is accessed via a #2 cage shaft which is from the surface down to 42m asl, the under levels are accessed via relay cage shaft. The run of mine is hoisted up to surface via the #1 skip shaft. The projected view of the mine design is presented in Figure 10-18.

**Figure 10-18: Longitudinal Projected View of Lishan Upper Part**

Sources: Client

The broken ore from the stopes is loaded into ore cars by the railway ore loader. The ore cars are hauled by locomotive via the level drift to shaft station at the level access. The ore is then hoisted to surface by the hoisting system in the skip shaft. All personnel and materials as well as the waste rock are transported in and out of the mine via the #2 cage shaft and level drifts. The level interval is about 30m height, totally 20 levels have been established.

**Lishan Lower Part Stage I**

Lishan lower part Stage I designed as adit & blind shaft development. The adit is at 554m asl and the shaft from this adit down to -373m asl with a diameter of 5m, equipping cage. All materials, personal and run of mine are transported via this main shaft. the waste rock will be backfilled into mined voids as planned. When waste rock could not be balanced to fill, the rest waste will be hoisted via the main shaft out.

The level transported as similar as the upper part using ore car hoisted by locomotive from stope to shaft station on each level access.

**Dongfeng Upper Part**

Dongfeng Mine upper part is accessed via a main cage shaft which is from the surface down to 288m RL. The run of mine from both North and South Sections are hoisted up to surface via the main shaft. The projected view of the mine design is presented in Figure 10-19.

**Figure 10-19: Longitudinal Projected View of Dongfeng Upper Part**

Sources: Client

All materials, personal and run of mine are transported via this main shaft. the distance from North Section to main shaft is somehow long which is around 800 to 1000m. the main adit and drift of level 3 are shown in Figure 10-20.

Figure 10-20: Photos of Access of Adit and Drift on Level 3 at Dongfeng Mine

Sources: shot during site visit on 9<sup>th</sup> Jan 2023

Note: Access of Adit (left) and Drift (right) on Level 3 of Dongfeng Mine

#### 10.4.5 Underground Service

##### Lishan Upper Part

Ventilation system for upper part is established. The water supply, compressed air supply, drainage system as well as power supply system have been established already.

##### Lishan Lower Part Stage I

Lishan lower part has designed underground service system, the ventilation shaft is sinking when the site visit, and the main shaft is sunk but not equipped.

##### Dongfeng Upper Part

Dongfeng upper part is the same situation as Lishan upper part. The main sump and power substation underground of Dongfeng upper part is shown in Figure 10-21.

Figure 10-21: Photos of Main Sump and Power Substation on Adit Level of Dongfeng Mine

Sources: shot during site visit on 9<sup>th</sup> Jan 2023

Note: Main Sump on Adit level (left) and Main Power Substation underground (right) at Dongfeng Mine

#### 10.4.6 Mining Equipment

There is no heavy mobile equipment on site. The mine machinery is mostly shaft hoisting equipment and trailway locomotive and ore cars, as well as fans for ventilation.

The machinery of hoisting system is maintenance well during site visit, as shown in Figure 10-22.

Figure 10-22: Shaft Access on Adit Level of Dongfeng Upper Part

Sources: shot during site visit on 9<sup>th</sup> Jan 2023

The mining equipment in each zone is shown in Table 10-20.

**Table 10-20 Mine Equipment Requirements for Hanfeng Project**

#### 10.4.7 Production Schedule

The mine schedule was developed using Deswik software, based on productivity estimates for each task. For instance, stope excavation requires several days for preparation. The assumptions for mining sequence and dependencies are as follows:

- Mining and Processing Operation: Operation is estimated to be started in 2025 with the ROM capacity of 430ktpa.
- Vertical Overlap: Mining progresses downward, level by level, with typically 3-4 levels grouped into one section for better operational flexibility.
- Horizontally Overlap: Mining advances from the hanging wall to the footwall.
- Priority: Stopes accessible via existing development will be mined first.
- Life of Mine: 8 years.

Figure 10-23 illustrates the production schedule, detailing both the ROM production and the ROM grade. **Table 10-21** provides the details of mine production.

**Table 10-21: Production Schedule**

Hanfeng	LoM	2024E	2025E	2026E	2027E	2028E	2029E	2030E	2031E	2032E
Total Tonnes Mined	Mt	3.31	0.43	0.44	0.43	0.36	0.45	0.43	0.40	0.37
Zn grade	%	2.45	2.32	2.25	2.32	2.13	2.80	3.03	2.40	2.23

<sup>1</sup> The line represents the average gold grade, corresponding to the right axis.<sup>2</sup> The column represents the ore amount, corresponding to the left axis.

## 10.5 Jintai Project

### 10.5.1 Introduction

Jintai Project obtains one mining license and one exploration license for Xidengping Mine. Based on the geological definition, there are several mineralization zones named V1, V2 (V2\_1, V2\_2), V4, V5, V6, V7, V8, V9, and V10. It should be noted that only V1, V2, V4, and V10 have measured and indicated resources.

Several technical studies on the mineralized bodies V1 and V2 within the mining license were conducted since they obtained the mining license in 2012. Only V1 and V2 are included in the Ore Reserves, as there are no sufficient technical studies for the remaining mining zones.

They initialled mine construction for V1 and V2 at the beginning 2023 for both mine and plant. The designed capacity for V1 and V2 is 140 ktpa.

Currently, Jintai Mining is in the process of applying for another mining license for the exploitation of V4 and V10, with a capacity of 650 ktpa based on FS 2024.

### 10.5.2 Geotechnical & Hydrogeological Conditions

GOCOM admitted that due to the lack of geotechnical parameters, the surrounding rock characteristics in the open pit mine were analysed using empirical and analogous data. Without detailed geological cross-sections and zoning data, the verification cross-sections were based on a generalized model of the designed open-pit boundary.

Slope stability was analysed using the Janbu, Bishop, Morgenstern-Price, and Spencer methods. The results show that the slope is stable when the final angle is less than 40°. Figure 10-25 shows

the location of the slope stability verification cross-sections, and **Table 10-22** shows the stability results under different conditions.

**Figure 10-24: Production Pit in V1 Pit Area**

Sources: Jintai FS 2022

**Table 10-22: Jintai Project Slope Stability Analysis Results**

Scenario	Janbu		Bishop		Morgenstern-Price		Spencer	
	I-I	II-II	I-I	II-II	I-I	II-II	I-I	II-II
<b>Dead Weight</b>	1.584	1.610	1.569	1.603	1.581	1.606	1.581	1.611
<b>Dead Weight + Earthquake</b>	1.398	1.411	1.367	1.396	1.396	1.412	1.396	1.412
<b>Dead Weight + Precipitation</b>	1.362	1.361	1.348	1.355	1.358	1.357	1.358	1.357

Sources: Jintai FS 2022

The overall slope angles in the design are 10° to 32° for the V1 and 11° to 22° for the V2. In some areas, the angles are controlled within 40°, and GOCOM considered the slope stability to be safe. Additionally, slope stability monitoring and precaution measures should be considered during actual operations.

This area is characterized by a high plateau with low to medium mountain terrain. The currently controlled orebodies are distributed above the erosion base level. Observations indicate that the terrain is conducive to the natural discharge of groundwater, with atmospheric precipitation quickly draining from the surface and dissolution fractures. Additionally, the rivers within the area have no impact on the water inflow into the ore deposits. Only a few sections of the pit experience minor water infiltration. The hydrogeological conditions at the locations of the orebodies are classified as simple.

The orebodies are located on small ridges or gentle slopes, with natural slope angles ranging from 0° to 15°, indicating relatively good stability. During the rainy season, heavy rainfall may cause minor collapses of sandy and muddy materials on the surface. The main orebodies are either directly exposed at the surface or covered by a thin overburden, resulting in minimal stripping material. The orebodies consist of massive hard rock, with a soft rock layer as the footwall. The primary gold orebodies are hosted within fracture zones or fissures, and the orebodies themselves exhibit good stability. The engineering geological exploration type of the mining area is classified as medium, predominantly consisting of weak to semi-hard clastic rocks.

### 10.5.3 Mine Method

Considering the mineralisation occurrence and mining license permits, a capacity of 140ktpa feed ore is designed.

The conventional mining sequence proceeds downwards, and two benches work simultaneously in each section.

A conventional open pit mining methodology is used, comprising free dig & loading, and haulage by truck. The mine is run as contractor operation, and the owner response for technical service and management. No magazine is proposed due to no blasting works needed.

#### Mining

The main mining equipment is excavator. 2 sets of 1m<sup>3</sup> bucket excavators are proposed for about 490ktpa total material movement, which consist of 140ktpa ore and 350ktpa waste in average. 1 set of the same excavator is proposed stand-by for miscellaneous work. Excavator capacity estimates is presented in Table 10-23.

**Table 10-23: Excavator (1m<sup>3</sup> bucket) Capacity Estimates**

Item	Unit	Parameter for Ore	Parameter for Waste
Days per annual	day	300.0	300.0
Shift per day	shift	2.0	2.0
Hours per shift	hr	8.0	8.0
Bucket Capacity	m <sup>3</sup>	1.0	1.0
Circle time per load round	second	45.0	45.0
Bucket fill factor	%	90.0	90.0
Rock swell factor	%	150.0	150.0
Availability	%	80.0	80.0
Utilization	%	80.0	80.0
Bulk density (ore)	t/m <sup>3</sup>	2.1	1.9
Annual capacity per excavator	ktpa	317.0	280.0
Capacity per shift	m <sup>3</sup> /shift	245.8	245.8

Source: FS 2022

As the estimates result above, 2 set of excavators are suitable for the nominated mine capacity. As the bulk density of waste (~1.9t/m<sup>3</sup>) is lower than that of ore (2.1t/m<sup>3</sup>), it is resulting an annual capacity per an excavator is 280ktpa, A set of excavators stand-by is reasonable, when considering the work unbalance for waste and ore.

### Transport

The transport of material, which are ore and waste, by trucks via in-pit and out-pit roads. The roads are designed based on truck size requirement.

The existing road connected the trail production pit (V1 pit) portal at 1,943m asl and crusher station at 1968mRL is single lane as about 3m wide, the average gradient is 5.9%.

The designed main road is dual lane with 8m total wide, consist of 6m net road surface, 2m berm (1.5m) and ditch (0.5m). The road surface is clay bound macadam pavement. The branch road is 4.5m wide as the same pavement as main road. The segment of road system is as followings:

- V1 pit road above 1,939m asl: out-pit dual lane, the radius of turning is 15m; average gradient is 5% and the total length is about 1,076m;
- V1 pit road below 1,939m asl: in-pit dual lane with the same configuration as out-pit road, and the total length is about 400m
- V2 pit road above 1,980m asl: out-pit dual lane connects to V1 pit 1,988m asl bench at 2,006m asl of V2 pit. The lower part from 2,006m asl down to 1,980m asl is inclined ramp in pit. The total length is 1064m.
- V2 pit road below 1,980m asl: out-pit dual lane from V1 1,950m asl bench to V2 pit 1,980m asl. The total length is 1,025m. The material below 1,980m asl is transported via in-pit ramp as the total length is about 343m.
- Waste routes: the waste stripped from V1 pit is dumped in the temporary stockpile for land reclamation, which is about 50m away from pit edge. This branch road is designed as single lane with a width of 4.5m. The waste from V2 pit will be dumped into V1 mine-out voids via the roads described above.

Considering the total material movement annually, the truck requirement is estimated by FS2022 as shown in Table 10-24. Totally 6 set of 7.8t payload trucks are proposed when considering 70% availability.

**Table 10-24: Truck Capacity Estimates**

Item	Unit	Feed	Waste
Hours per shift	hr	8.0	8.0
Time utilization	%	85.0	85.0
Loading buckets per truck	bucket	6.0	6.0
Average haulage distance	km	0.9	1.2
Average speed	km/h	20.0	20.0
Travel time per round	min	5.4	7.2
Loading time	min	4.0	4.0
Dumping time	min	1.0	1.0
Waiting time	min	2.0	2.0
Circle time per truck round	min	12.4	14.2
Payload utilization	%	93.0	96.0
Truck payload	t	7.8	7.8
Capacity per shift	t per shift	238.7	214.2
Mining Target	ktpa	140.0	350.0

Item	Unit	Feed	Waste
Days per annual	day	300.0	300.0
Shift per day	shift	2.0	2.0
Workload per shift	t/shift	233.3	583.3
Unbalance factor	N/A	1.2	1.2
Trucks per shift	QTY	1.1	3.1
Availability	%	70.0	70.0
Total trucks	QTY	6.0	

#### 10.5.4 Mine Design

Mine design scope is the 100m South away from country road (X084 road) and the boundary of V1 & V2 veins. The mine design follows typical open pit design procedure, which is from pit optimization, detailed design and modification.

##### Pit Optimization

To develop an optimal open pit design for the Mine, an optimised open pit shell was prepared using the Lerchs-Grossman 3D algorithm in GEMCOM software (LG 3D). The LG 3D open pit optimiser determines a set of resource blocks with the maximum value per tonne, creating an optimised open pit shell from a resource block model. The inputs of pit optimization as proposed in FS 2022 are presented in Table 10-25.

**Table 10-25: Input Parameter for Pit Optimization in FS 2022**

Item	Unit	Parameter
Mining cost	RMB/t total material moved	8
Post-mining cost	RMB/t feed ore	98
Mining dilution	%	5
Mining loss	%	5
Processing recovery rate	%	85.5
Gold price	RMB/gram	313
Payable of gold product	%	97
OSA	degree	40

Source: FS 2022

Note:

<sup>1</sup> Post-mining cost includes processing, G&A, and other Miscellaneous

<sup>2</sup> OSA is standing for overall slope angles.

##### Pit Design

The pit design was under the guide of optimization and the design inputs, then manual modified by engineer. The design inputs are presented in Table 10-26.

**Table 10-26: Summary of Design Inputs**

Item	Unit	Parameter
Bench height	m	10
Sub-bench height	m	5
BFA	degree	40
Catch berm	m	4
Safety berm	m	7
Road berm	m	8
Ramp width	m	8
Road gradient	%	5
OSA	degree	40

Note: BFA is standing for bench face angles.

The designs are presented in Figure 10-25 and the results are shown in Table 10-27.

**Figure 10-25: Pit Design for V1 and V2 by GOCOM**

Source: FS 2022

**Table 10-27: Pit Design Result in FS 2022**

Item	Unit	V1 Pit	V2 Pit
Pit size	m x m	472 x 336	409 x 138
Crest elevation	mRL	2,007.0	2,011.0
Bottom elevation	mRL	1,972.0	1,946.0
Pit dept	m	80.0	65.0
Closed circle elevation	mRL	1,939.0	1,954.0
resource in pit	kt	1,409.9	212.4
incl. Measured (CN Standard)	kt	-	-
incl. Indicated (CN Standard)	kt	1,253.1	75.4
incl. Inferred (CN Standard, 70%)	kt	156.8	137.0
Waste (Including 30% Inferred)	kt	699.1	1,096.9
Mineable resource	kt	1,362.9	171.3
Stripping ratio	t/t	0.5	6.4
Average grade	g/t	0.81	0.90

Source: FS 2022

The table above shows V2 pit contains more Inferred Resource (79%) than that in V1 pit (11.5%).

### 10.5.5 Production

The Project has started operation since 2023 (See **Table 10-28** with average grade of 0.69g/t.)

The mining operation employs free digging methods due to the relatively shallow nature of the deposit, eliminating the need for drilling and blasting. The mining and hauling are conducted by contractors.

**Table 10-28: Jintai Mine Yearly Ore Production from 2023 to 2024Q3**

Item	Unit	2023	2024 Q1-Q3	Total
Ore Mined	t	200,358	360,295	560,653
Ore Milled	t	122,924	404,103	527,027
Au grade	g/t	0.83	0.65	0.69

Source: Jintai Mining

### 10.5.6 Mine Service

The mine site area is covered by lush vegetation and the weather is classed as hot climate, which belongs to the plateau mountain area. November to May of the next year is the dry season. The rainfall is concentrated from June to October, with the annual average rainfall of 1,000~1,400mm. the average temperature is 12~14 °C annually, with the highest temperature could reach around 35 °C from May to August.

A flood prevention channel is to be constructed around 2 pits of the project preventing outsource water flowing into pits. As well as the closed circle of each pit, connected channel to outer channel are also designed on 1,947m asl of V1 pit and 1,956m asl of V2 pit, respectively. The channel is designed as 0.8m × 0.8m rectangle, with cemented masonry wall at 0.3m thickness.

The dewater facilities in pit are also designed considering the inflow volume as Table 10-29.

**Table 10-29: Water Inflow Estimates and Dewatering**

Item	Unit	V1 Pit	V2 Pit
Normal Water Inflow Volume	m <sup>3</sup> /d	598	144
Maximum Inflow (once in 20 years)	m <sup>3</sup> /d	5978	1439
Maximum days of flooding	day	7	7
Capacity of dewatering	m <sup>3</sup> /d	854	206
Dewatering height	m	15	10
Pump	model	SQ35-22	SQ35-22
Head of pump	m	22	22
Rate of pump flow	m <sup>3</sup> /h	35	35
Power	kW	5.5	5.5
Set	QTY	2	2

Source: FS 2022

The pumps are planned transfer to V2 pit as soon as V1 is finished mining. The pipeline is designed using DN100 seamless steel tube along benches.

Water consumption is mainly attributable to dust suppression purposes, sourced from plant head tank.

The electric power requirement of the mine site is minimal, and its main uses are the dewatering pump, and lighting. A 10kV/0.4kV substation is located on the mine site and is connected to the national electricity grid.

Maintenance of mobile mining equipment is proposed to be outsourced from downtown.

The diesel supply is planned outsourced from downtown supplier via tank truck to refill the mobile equipment. There are no planned fuel storage facilities on site.

### 10.5.7 Mining Equipment

Apart from the main mining equipment fleet of excavator and truck, there are several types of equipment suitable for relevant activities. There are water trucks for dedusting, rock breaker, front-end loader (FEL) and so on. The mine fleet as proposed by FS2022 is presented in Table 10-30.

**Table 10-30: Main Mining Equipment Fleet as Proposed**

Fleet	QTY	Specification
Excavator	3	1m <sup>3</sup> bucket
Truck	6	7.8t payload
FEL	1	1m <sup>3</sup> bucket
Water truck	1	5t tank
Rock breaker	1	

Sources: Jintai FS 2022

### 10.5.8 Production Schedule

The strategic scheduling is based on the Whittle shell (RF=1) and serves as a guide for the high-level scheduling of the final design. The processing capacity is designed and constructed to handle 140ktpa. There is no cut-back for V1 and V2; both pits will be operated as a single operation.

The mining sequence and/or dependency is simplified as follows:

- Mining and Processing Operation: Operation remains with the ROM capacity of 140ktpa.
- Operational Design: Based on the Feasibility Study (FS) 2022, the mine is designed to operate 300 days per year, with two shifts per day, each lasting 8 hours. The proposed mining capacity is 140ktpa of feed ore, and the total material mining capacity is approximately 490ktpa.
- Mine Plan Strategy: The strategy involves mining the V1 pit first, with the mined-out pit of V1 serving as the dumping area for waste rock from the V2 pit.
- Vertical Overlap: The mining sequence progresses downwards, bench by bench.
- Horizontal Sequence: The material on each bench is divided into blocks with a maximum area of 2,500 m<sup>2</sup>.

- Stripping Line: The proposed stripping line is 200 m for the V1 pit and 120 m for the V2 pit, with a minimum width of 20 m.

Based on the strategy and assumptions above, the LoM is scheduled using Deswik software. The mining plan, ROM and ROM feed are presented in Figure 10-26 and Figure 10-27 at an annually basis.

The mining schedule by SRK is shown in Table 10-31 below.

**Table 10-31 Mining Schedule of SRK**

- <sup>2</sup> The column represents the ore amount, corresponding to the left axis.

The proposed plan aligns with the client’s strategy to sustain plant feed as previously outlined, resulting in a 11-year mine life, a total of 1,370 kt of feed will be processed. The final year of the LoM will involve a ramp-down phase.

The peak mining amount is projected in 2033, with a capacity of 1,031ktpa, which exceeds the designed mining capacity. To accommodate this peak, additional equipment mobilization should be planned well in advance, even considering the decade-long lead time. The summary of LoM is in Table 10-32.

Table 10-32 The Summary of LoM

## 11 Processing and Metallurgical Assessment

### 11.1 Jilong Project

#### 11.1.1 Processing and Metallurgical Testwork

The components of the gold-bearing ore at the Zhuanshanzi Mine are relatively simple. The ore minerals are native gold, native silver, electrum, pyrite, sphalerite, galena, chalcocopyrite and a small amount of chalcocite, and argentite. The gangue minerals are mainly quartz, followed by feldspar, calcite, sericite, and chlorite. The main mineral available for recovery in the ore is gold.

In 2018, Jilong Mining commissioned Jilin Institute of Geological Sciences to conduct a laboratory flotation process test on ore of the Zhuanshanzi Mine.

The gold grade of the composite sample was 10.20g/t, and the silver grade was 45.32g/t. After grinding to -0.074 mm accounting for 70% ( $P_{70}=74\mu\text{m}$ ), the sample was subjected to one roughing, two cleanings and two scavengings to obtain gold concentrate with a gold grade of 147.78g/t and a gold recovery of 95.05%, and a silver grade of 554.34g/t and a silver recovery of 80.25%, the test results are shown in Table 11-1. The test shows that the flotation process can be used to obtain desirable indexes for the ore of Zhuanshanzi mine. Nevertheless, Jilong Metallurgical Plant has not adopted the flotation method but whole ore cyanidation, as the whole ore cyanidation can produce gold bullion on site.

**Table 11-1: Test Results of Ore Sample from Jilong Mine**

Product	Yield (%)	Grade (g/t)		Recovery (%)	
		Au	Ag	Au	Ag
Concentrate	6.56	147.78	554.34	95.05	80.25
Tailings	93.44	0.54	9.58	4.95	19.75
ROM	100.00	10.20	45.32	100.00	100.00

Source: Laboratory Process Test Study Report on Rock Gold Ore Processing of Zhuanshanzi Mine, Aohan Banner, Inner Mongolia Autonomous Region, February 2018.

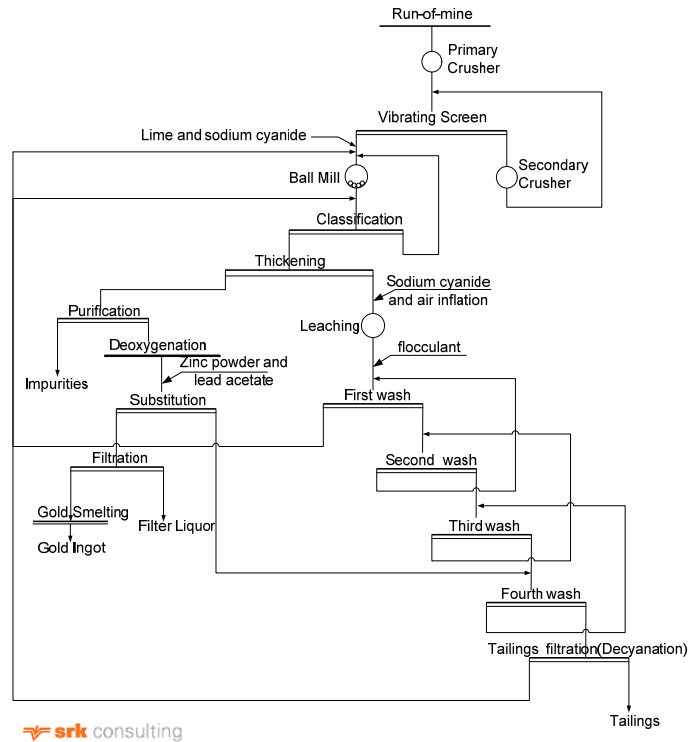

#### 11.1.2 Production Status of Processing Plant

The original production capacity of #1 Jilong Plant is 400tpd (120,000 tpa). In May 2022, a new 600tpd processing plant (i.e., #2 Jilong Plant) began to be constructed, and was put into operation in June 2024. The new plant has already reached its designed capacity, thus two plants can achieve a total production capacity of 1,000tpd (300,000 tpa). The two plants adopt the same process of whole ore cyanidation, with the final product being gold ingot. The gold recovery rates reaches over 96% for the #1 Jilong Plant, and varies from 92.11% to 97.24% for the #2 Jilong Plant.

#### Production Flowsheet

The two processing plants adopt a mature process flowsheet of whole ore cyanidation - counter-current decantation washing ("CCD") - zinc dust precipitation (Merrill-Crowe process) - tailings decyanation and dry stockpiling, which is shown in Figure 11-1.

Figure 11-1: Production Flowsheet of Jilong Processing Plant

The specific production flowsheet is described as follows:

### **Crushing and Grinding**

The crushing operation adopts a two-stage closed-circuit process. The ROM feed size is less than 200mm and the final crushed product size is less than 16mm, after which it is sent to the fine ore bin for grinding.

The grinding operation adopts a one-stage closed-circuit grinding and classification process, with final grinding fineness of  $-74\ \mu\text{m}$  accounting for more than 70% ( $P_{70}=74\ \mu\text{m}$ ). At the same time, sodium cyanide and lime are added to the grinding system for gold leaching in advance.

### **Cyanide Leaching - Zinc Dust Precipitation (Merrill-Crowe Process)**

#### ■ Pre-leach Thickening and Cyanide Leaching

The overflow from the classifier firstly enters the thickener for thickening, and the thickened underflow slurry is leached in a train of agitation tanks by adding sodium cyanide and filled with oxygen for 35 hours. The overflow from the thickener is used as the pregnant solution and flows into the pregnant solution tank to enter the zinc dust precipitation circuit (Merrill-Crowe process).

#### ■ CCD and Merrill-Crowe Process

The cyanide leached slurry enters a triple-deck thickener and a single thickener for counter current decantation ("CCD"). The final overflow is returned to the grinding system as feed water before and after the ball mill. The final underflow is pumped to tailings detoxing operation.

After being purified by the filter cloth of the purification tank, the pregnant solution is vacuum self-primed to the deoxygenation tower for deoxygenation, after which zinc powder is added for zinc dust precipitation, and then fed into a frame filter press by pump. The filtrate enters the lean solution tank as washing water, and the filter cake (gold mud) is blown dry by high pressure air and sent to the smelting room to obtain the final product "gold ingot".

#### **Tailings Decyanation and Stockpiling**

The washed pulp (cyanide residue) from CCD operation is transported to the tailings detoxing workshop, where the tailings is press filtered and the cake is simultaneously backwashed with clean water and backblown with high pressure air, while decyanation reagents are added to break the cyanide in the tailings to reduce the cyanide content of the tailings. The water content of the filter cake is around 15% and the filtrate is returned to the cyanidation workshop for reuse, while the filter cake is transported by loader and dump truck to the TSF.

#### **Mineral Processing Facilities and Main Equipment**

The processing plant facilities mainly include crushing and screening workshop, grinding, leaching, substitution, CCD workshop and tailings press filter workshop, and has a complete laboratory assay, TSF, water and electricity supply facilities. The main processing equipment includes crushing and screening machines, grinding and classifying machines, thickeners, purification and deoxygenation equipment, filters, etc., which are listed in Table 11-2.

SRK conducted a site visit to the key workshops and production equipment of the processing plant. SRK noted that the equipment of 400tpd processing plant was in good condition and although there were some minor flaws in the equipment configuration, which did not affect production. The new 600tpd plant has installed more advanced equipment, which is a modern plant integrating production, intelligence, sightseeing and green. The site photos of the original plant and the new plant are shown in Figure 11-2 and Figure 11-3, respectively.

**Table 11-2: Main Equipment of Jilong Processing Plants**

No.	Equipment	Specification	Power (kw)	QTY.

### Historical Production Index

SRK has analysed and summarised the historical production indexes of # 1 and #2 Jilong Plant from 2021 to September 2024 through the site visit and collected production statements and other information, and the results are shown in Table 11-3. Additionally, the #2 Jilong plant has been put into operation since May 2024.

According to the data in the below table, SRK noted that actual annual ROM throughput has reached the designed capacity, and the gold recovery rate reaches over 96%.

Table 11-3: Historical Production Index of Jilong Plant

Item	Unit	2021	2022	2023	2024 Q1-Q3 <sup>1</sup>
ROM throughput	kt	143.7	152.7	152.6	168.0
Feed grade	g/t	7.51	5.52	9.33	4.88
Gold recovery	%	97.08	96.17	97.66	96.52
Gold ingot output <sup>2</sup>	kg	1,048	811	1,390	795

Notes:

<sup>1</sup> The data include the historical index of 2024Q1-Q3 of the #1 Jilong Plant and the index from May to September 2024 of #2 Jilong Plant.

<sup>2</sup> The gold ingot output in the table does not include the gold metal which is recovered from gold-bearing materials, cyanide slag smelting, etc.

### 11.1.3 Tailing Storage Facility

The existing tailings storage facility ("TSF") of Zhuanshanzi Mine was put into operation in 1996, with a maximum dam height of 21.7m and a total volume of about  $40 \times 10^4 \text{ m}^3$ . To make the TSF meet the requirements of the current national laws and regulations on safety production, standards and norms, and to meet the requirements for the storage capacity of the stockpile after the expansion of the processing plant, Inner Mongolia Mining Development Company Limited was commissioned to carry out design for the TSF for renovation and expansion in 2012, a disposal method of "tailing filter press - dry discharge" was adopted with all filtration wastewater returned to the processing plant for recycle.

The TSF is located in the main valley on the north side of the processing plant. The valley appears from east to west, with a "U" shaped in the cross section, and the status of the TSF is shown in Figure 11-4. The dam height is 40m, with a total storage capacity of 1,440kt, which belongs to Grade 4 TSF, with a total service life of 12 years. The TSF has accumulated about 1,398kt of tailings, with a remaining capacity of about 42 kt. The remaining service life is about 3 to 5 months and the preparatory work before the closure of the TSF is being carried out according to the design.

The new TSF is 1.2km northeast of the processing plant. It is currently in trial operation, which will last for 3~6 months, and has not yet been officially put into use. The total height of the dam is 90m, and the total capacity is  $360.5 \times 10^4 \text{ m}^3$  equals  $228.4 \times 10^4 \text{ m}^3$  of effective capacity. The service life of new TSF is about 14.42 years. The site photos of the TSF are shown in Figure 11-5.

**Figure 11-4: TSF of Jilong Project**

Source: SRK site visit

### 11.1.4 Conclusions and Recommendations

The ore is of sulphide-bearing quartz vein type with characteristics of simple mineral composition, less variety and coarse grain-size. A process of whole ore cyanidation - zinc dust precipitation (Merrill-Crowe) was adopted. SRK believes that the processing flowsheet is suitable for the requirements of the ore properties, and the equipment are reasonable, and a satisfied gold recovery rate was obtained with no major flaws.

The Project has two processing plants, which is the original 400tpd plant (i.e., #1 Jilong Plant) and the new 600tpd plant (i.e., #2 Jilong Plant). The #2 Jilong plant was put into operation in June 2024 and has already reached its designed capacity until now.

The capacity of the existing TSF is close to the designed capacity while a new TSF with an effective capacity of  $228.4 \times 10^4 \text{m}^3$  is currently in trial operation, which will serve the processing plants for about 14.42 years.

## 11.2 Huatai Project

### 11.2.1 Processing and Metallurgical Testwork

The ore in this mining area is mainly auriferous pyrite-quartz vein type, and the main ore minerals are native gold, pyrite, chalcopyrite, magnetite and hematite and the gangue minerals are mainly quartz, sericite, feldspar, followed by chlorite, and graphite.

The gold minerals are predominately electrum and native gold, mainly occurrence in the form of gold inclusions, fissured gold, and intergranular gold. The particle size composition of gold in the ore is fine with a particle size less than 0.01mm accounting for more than 90%, which makes it difficult to dissociate.

In 2017, Huatai Mining commissioned Mineral Experimental Research Institute of Inner Mongolia to conduct a laboratory processing testwork on this type of ore.

The gold grade of test sample is 6.22g/t, after grinding to -0.074mm accounted for 85% ( $P_{85}=74\mu\text{m}$ ), a closed-circuit process of "one roughing + two cleanings + two scavengings" was adopted to obtain the gold concentrate with a grade of 149.31g/t and gold recovery of 95.06%, the test result is shown in Table 11-4.

SRK believes that the ore of Honghuagou gold mine is easily beneficiated, and an ideal indicator can be obtained by using a single flotation processing flowsheet, the flowsheet structure is simple. However, the particle size composition of gold is considered to be small, indicating that the grinding fineness of -0.074mm accounting for 85% ( $P_{85}=74\mu\text{m}$ ) in the one-stage grinding operation can not be reached. It is recommended to consider using a two-stage closed-circuit process in the construction design in the future. However, Huatai Metallurgical Plant did not adopt flotation but carbon-in-pulp ("CIP") method for obtaining gold bullion on site.

**Table 11-4: Test Results of Ore Sample from Huatai Mine**

Product	Yield (%)	Au Grade (g/t)	Au Recovery (%)
Concentrate	3.96	149.31	95.06

Product	Yield (%)	Au Grade (g/t)	Au Recovery (%)
Tailings	96.04	0.32	4.94
Raw Ore	100.00	6.22	100.00

Source: Laboratory Process Test Study Report on Rock Gold Ore Processing of Honghuagou Mine, Inner Mongolia Autonomous Region, Aug 2017

### 11.2.2 Production Status of Huatai Processing Plant

The Huatai processing plant, formerly known as the state-owned Chifeng Honghuagou Gold Mine Processing Plant, was built in 1987, and the ore type is primary sulphide ore of auriferous quartz vein type. The designed capacity of the processing plant is 200tpd, and a process of carbon-in-pulp ("CIP") was adopted to produce gold mud as the final product, which is then sent to the metallurgical plant of Jilong Mining to produce gold ingots for sale. The average grade of the ROM is about 2.63 g/t, and the average gold recovery rate reaches over 92%.

#### Production Flowsheet

A traditional process of CIP was adopted by the processing plant of Huatai mining, which is considered to be relatively reasonable. The production process flowsheet is shown in Figure 11-5, and specified as follows:

#### Crushing and Grinding

The crushing operation adopts a two-stage closed-circuit process. The feed size of ROM is less than 300mm and the size of the final crushed product is less than 14mm. The grinding operation adopts two-stage closed-circuit classification process, and the slurry from the primary grinding process enters the debris sieve for waste residue filtration, and then enters the hydro-cyclone group for classification. The underflow of the hydrocyclones enters the secondary grinding mill, while the overflow enters to the debris sieve for waste residue filtration, and then enters the procedure of pre-leach thickening. The final grinding fineness is -74 $\mu$ m accounting for more than 80% ( $P_{80}=74\mu$ m). At the same time, lime is added to the grinding system to adjust the pH value for the pulp.

#### CIP Process

##### ■ Agitation Leaching and Carbon Adsorption

The slurry is dewatered by the pre-leach thickener and then enters to surge tank, and the sodium cyanide is pumped from the storage tank into the agitating tank for cyanide leaching by rubber pump. The leaching concentration is about 42-45% with a leaching time of 27 hours, the sodium cyanide concentration of 0.03% and pH value of 10.5~11.5. The active carbon with a concentration of 15~40g/L is added for absorption for about 22 hours. After absorption, the slurry contained gold-loaded carbon is fed to the carbon lifting screen through the airlifter to separate the gold-loaded carbon from the slurry, and then sent to the desorption electrowinning operation after screening and washing.

##### ■ Gold Loaded Carbon Desorption

The gold-loaded carbon enters the acid washing tank and is washed with hydrochloric acid for inorganic impurities (mainly calcium salts) removal, then transferred to the desorption column, where the gold is desorbed from the gold-loaded carbon by using the normal pressure and temperature

desorption method, and then enters the desorption pregnant solution. The unloaded carbon will be returned to the CIP circuit for recycling after desorption.

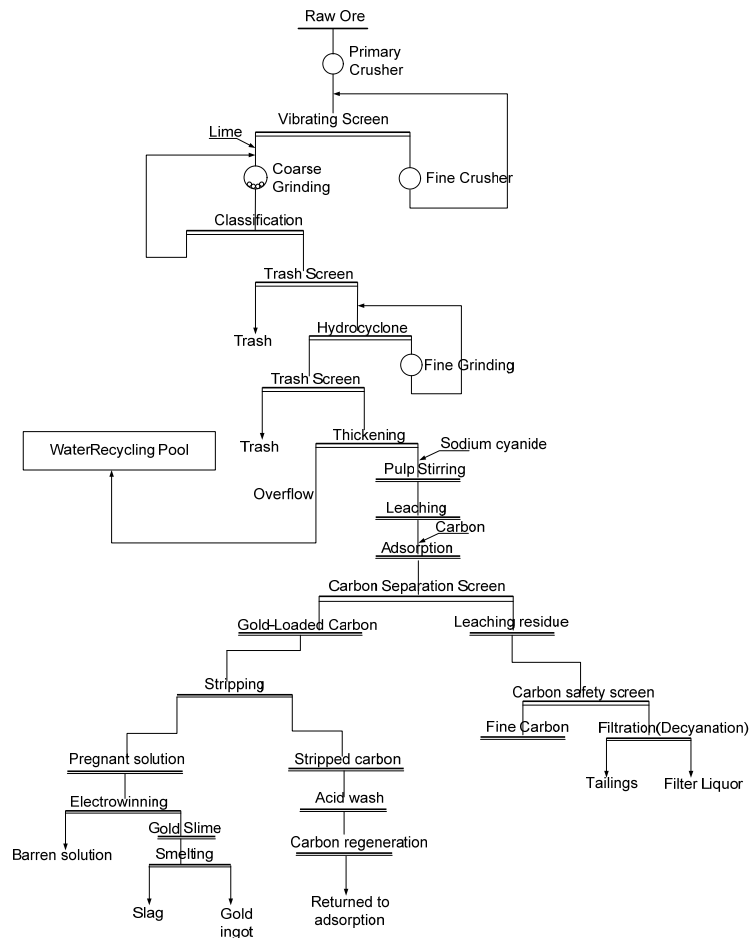

■ **Electrowinning**

The gold in pregnant solution is reduced to elementary substance in electrowinning cells and precipitate on cathode steel wool. The cathode is periodically taken out and gold is eluted to obtain gold mud. After filter pressing and drying, the gold mud is sent to the smelting workshop of Jilong processing plant. Fluxing agent is added. The gold mud is smelted in the smelting furnace and cast into gold ingots.

■ **Tailings Decyanation**

The tailings first enter the security screen to recover the broken carbon, and the broken carbon is sent directly to the smelter on site. The undersized slurry is transported to the filter press workshop for filter pressing and cyanide breaking. In 2018, three filter presses were newly installed, and cyanide residue was treated by circulating water purification system. The tailings slurry is filter pressed into cakes and then the cyanide residue filter cakes are washed with reagent to break the cyanide to meet the discharge standard. The filter cake after reagent treatment enters the TSF for storage, and the filtrate returns to the processing plant for recycling.

Figure 11-5: Processing Flowsheet of Huatai Processing Plant

### Mineral Processing Facilities and Main Equipment

The processing equipment of Huatai processing plant mainly includes crusher, vibrating screen, ball mill and classifier, etc. in the process of crushing, grinding and classification; leaching tank, adsorption tank, carbon screen and security screen, etc. in leaching process; desorption column, electric heater, electrowinning cell, etc. in desorption electrowinning process. The main processing equipment are shown in Table 11-5.

SRK team conducted site visit on key workshops and production equipment of the processing plant. The photos of the processing plant are shown in Figure 11-6. Due to the long history of the plant, most of the main equipment has been in use for nearly 30 years, with some problems of equipment aging, resulting in high energy consumption. The overflow ball mill is used for two-stage grinding, and the fine grinding capacity is not fully utilized. High weir spiral classifier has poor classification effect, so SRK recommend adopting hydrocyclone group to replace the classifier for classification.

**Table 11-5: Main Equipment of Huatai Processing Plant**

No.	Equipment Name	Specifications	Power (kw)	Quantity
1	Jaw Crusher	PEF400×600	37	1
2	Cone Crusher	PYD900	55	1

8	Thickener	TNB-15		1
9	Desorption Electrolysis			1

**Figure 11-6: Site Photos of Huatai Processing Plant**

Source: SRK site visit

**Historical Production Index**

The historical production indicators of Huatai processing plant from 2021 to 2023 are shown in Table 11-6. As shown in the table, the gold recovery rate is over 92%. Through site visit and on-site communication, SRK learned that in 2022 and 2023, due to the technical upgrade of the mining system, the annual operating days of the processing plant were few, and the gold output seriously declined. Until now, the processing plant is out of operation, so there are no production records in 2024.

**Table 11-6: Historical Production Index of Huatai Processing Plant**

Items	Unit	2021	2022	2023
Processing throughput	ktpa	58.51	19.12	1.62
Feed grade	g/t	2.42	2.69	2.43
Gold recovery	%	93.75	93.41	92.80
Gold output in ingot	kg	132.75	48.02	3.65

**11.2.3 Tailings Storage Facility**

Huatai TSF was designed by Changchun Gold Design Institute Co., Ltd. of Ministry of Metallurgical Industry in 1980. It is located in an open valley about 0.54 km east of the processing plant, which is a valley-type TSF. The current status of the TSF is shown in Figure 11-7. In order to reduce the pollution to the environment, the tailings press filtering process was added in 2010 for dry storage and seepage control was conducted to the TSF. China Metallurgical Mining Anshan Metallurgical Design and Research Institute Co., Ltd. was commissioned to supplement the design of TSF, which was double checked and accepted by relevant government departments.

The TSF is designed with a total dam height of 35m and a total storage capacity of  $200 \times 10^4 \text{m}^3$ , which is a Grade 4 TSF. At present, about  $149.5 \times 10^4 \text{m}^3$  tailings have been stored in the TSF, and the remaining storage capacity is  $50.5 \times 10^4 \text{m}^3$ , which has remaining service life of 11.7 years.

**Figure 11-7: TSF of Huatai Mining**

#### 11.2.4 Conclusions and Recommendations

The ore is mainly of gold-bearing pyrite-quartz type, and the particle size of gold is fine, which makes it difficult to dissociate.

Traditional CIP technology is adopted for gold recovering. In SRK's opinion, it is reasonable and stable. The satisfactory technical indexes have been achieved, with no major defects.

At the time of SRK site visit, the processing plant was in a state of shutdown. Huatai Mining informed that the reason was that the ongoing technical innovation and the production capacity expansion were underway.

The TSF is in good operation condition, with no subsidence, displacement, landslide and vertical and horizontal cracks.

### 11.3 Wulong Project

#### 11.3.1 Processing and Metallurgical Testwork

The ore type is mainly disseminated bismuthinite mineralisation quartz veins, with useful components of native gold and electrum. The ore minerals are dominated by pyrrhotite, with a small amount of pyrite, occasionally with magnetite, chalcopyrite, galena, telluric bismuth, and native bismuth. The gangue minerals are quartz, followed by potash feldspar and albite, and a small amount of biotite, chlorite, anorthite and calcite.

The particle size of gold in the ore is fine, and it mainly occurs as fracture gold and exposed gold. The relationship between gold minerals and sulphides is relatively close, and the dissociation effect of sulphide is good. Therefore, it is easy to enrich gold into gold concentrate by flotation under suitable grinding fineness.

In 2021, Wulong Mining commissioned Beijing General Research Institute of Mining and Metallurgy ("BGRIMM") to carry out test study on the processing technology of Wulong Mine, with the aim of recommending a technically feasible and economically reasonable processing flowsheet and technical parameters, obtaining better mineral processing indexes, and providing a basis for design and production.

A detailed flotation testwork was carried out. Based on the condition test, closed-circuit comparative tests were carried out on three technological processes: "on-site process" (one roughing, three scavengings and three cleanings), "two roughings, two scavengings and three cleanings" and "stage flotation (two products) process". The gold content of test sample is 3.51g/t. The test results are shown in Table 11-7.

**Table 11-7: Test Results of ore sample from Wulong Mine**

Flowsheet	Product	Yield (%)	Au Grade (g/t)	Au Recovery (%)
One Roughing, Three Scavengings and Three Cleanings	Gold Concentrate	5.13	61.38	89.73
Two Roughings, Two Scavengings and Three Cleanings	Gold Concentrate	4.99	64.25	90.57
Stage Flotation Process	Gold Concentrate 1	2.29	125.96	80.86
	Gold Concentrate 2	2.61	14.86	10.87
	Gold Concentrate (Total)	4.90	66.80	91.73

Source: Processing Test Study Report of Wulong Gold Mine in Liaoning Province, January 2021.

The testwork results show that the gold concentrate with gold grade of 61.38g/t and gold recovery rate of 89.73% can be obtained by "on-site process" flotation. The gold concentrate with gold grade of 64.25g/t and gold recovery rate of 90.57% can be obtained by the process of "two roughings, two scavengings and three cleanings". Gold concentrate 1 with gold grade of 125.96g/t and gold recovery rate of 80.86% and gold concentrate 2 with gold grade of 14.86g/t and gold recovery rate of 10.87% can be obtained by "stage flotation process". The total gold concentrate grade is 66.80g/t and the total gold recovery rate is 91.73%. After comparative analysis of processing flowsheet indexes, it is recommended to adopt "stage flotation process".

### 11.3.2 Production Status of Wulong Processing Plant

Wulong Mining built a new 3,000tpd gold flotation plant in 2020, and it was put into operation in January 2021. The old processing plant has ceased production. Grinding and separation are divided into two series. The production capacity of the first series is 2,000tpd, and that of the second series is 1,000tpd. The flotation process of "three-stage roughings, two-stage scavengings and two-stage cleanings" is adopted for gold separation and the final product is gold concentrate for sale.

#### Production Flowsheet

The processing plant of Wulong Mining adopts the single flotation process for gold ore processing. The production process flowsheet is shown in Figure 11-8, and specified as follows:

**Crushing and Screening**

The ore in the mining area is transported by car to the ROM bin of the processing plant. A heavy-duty plate feeder is set up under the ROM bin to feed the ore to primary crushing. The primarily crushed product is transported to the screening workshop by the belt conveyor for screening. The oversize product of the upper screen is returned to the secondary crushing buffer bin by the belt conveyor, and is fed to the cone crusher by the heavy-duty mobile belt feeder under the bin for secondary crushing; The oversize product of the lower screen is returned to the fine crushing buffer bin by the belt conveyor, and is fed to the cone crusher by the heavy-duty mobile belt feeder under the bin for fine crushing. The secondarily and finely crushed products and the primarily crushed product are combined and fed into the screening operation by belt conveyor, forming a closed circuit. The undersize product is transferred to the fine ore bin by belt conveyor and enters the grinding and flotation systems. The particle size of the fed ore is no more than 400mm, and the particle size of the crushed product is -8mm after several renovation tests of the vibrating screen sieve pit.

**Grinding and Flotation**

The grinding operation adopts the two-stage closed-circuit process. The fineness of the primary grinding is 60% of -200 meshes ( $P_{60}=74\mu\text{m}$ ), and that of the secondary grinding is 90% of -200 meshes ( $P_{90}=74\mu\text{m}$ ). The flotation operation adopts the stage flotation process (3 roughings + 2 scavengings + 3 cleanings). After Roughing I of the grinding product, the roughing foam goes to Cleaning I to produce concentrate product 1. The roughing tailings go to Roughings II and III, of which the roughing foams go to Cleaning II and Cleaning III to produce concentrate product 2. The two concentrate products are combined as the final concentrate. The Roughing III tailings go to Scavengings I and II to produce the final tailings.

**Concentrate Dewatering**

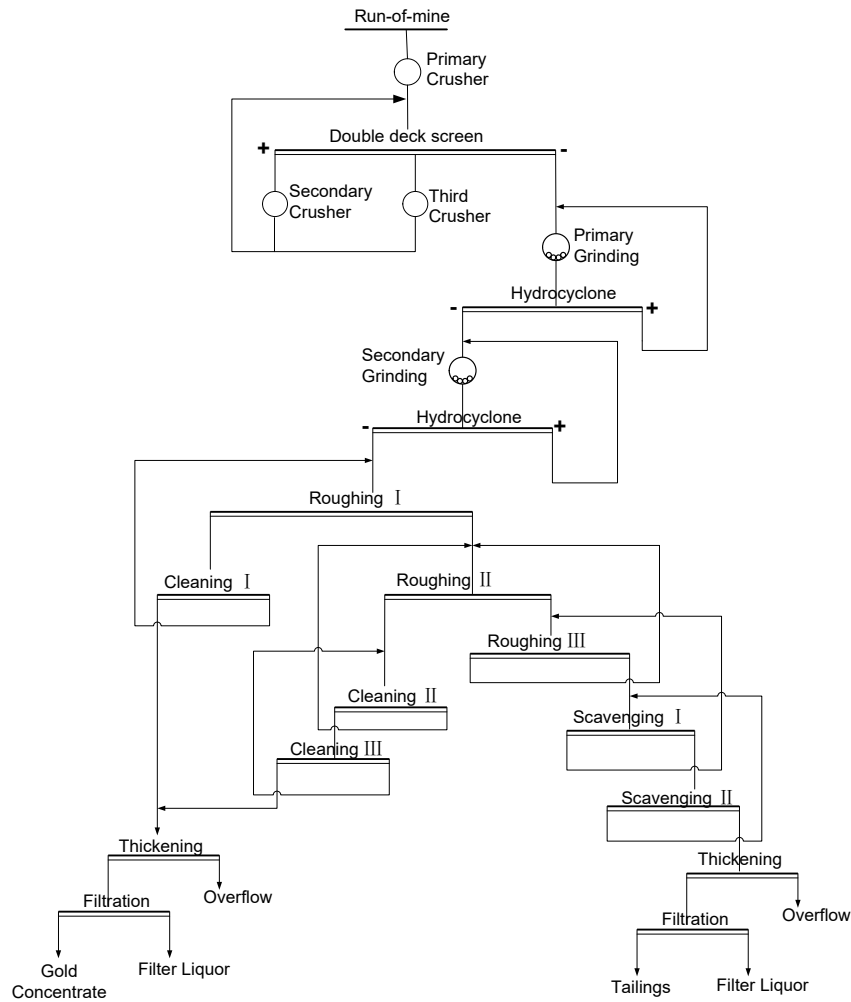

The concentrate is dewatered by two stages of "thickening + filtration" mechanical dewatering process. The moisture of the final gold concentrate is no more than 17%. After dewatering, the concentrate enters the concentrate warehouse for packing and storage.

In order to ensure the quality of the backwater, the overflow of the thickener and pressure filter water are pumped to the existing  $\Phi 14\text{m}$  thickener of the processing plant for precipitation, and the overflow enters the backwater system.

**Tailings Transport and Press Filtration**

The flotation tailings are thickened and then pumped to the tailings filter-press workshop near the TSF. After the press filtration, the filter cake contains about 18% moisture, and then transported to the TSF for storage by belt conveyor.

Figure 11-8: Production Process Flowsheet of Wulong Processing Plant

### Mineral Processing Facilities and Main Equipment

The Wulong processing plant consists of crushing and screening workshop section, grinding and flotation section, concentrate dewatering section, tailings dewatering section and auxiliary production section, and the main processing equipment is shown in Table 11-8.

SRK conducted site visit on key workshops and production equipment of the processing plant, and the site photos are shown in Figure 11-9. The workshops are arranged by steps to make full use of the site topography, and the layout is compact and reasonable. The equipment adopts centralized layout, to facilitate production operation, maintenance and management. The main factory plant is equipped with elevators and visiting channels. The floor of the workshops is clean and tidy. The

whole process and equipment of the processing plant have reached advanced, reasonable, safe, efficient and environmental protection goals, The plant is built well and in very good condition.

**Table 11-8: Main Equipment List of Wulong Processing Plant**

No.	Equipment Name	Specification	Power (kw)	QTY.	Remark
1	Jaw crusher	CT3042	110	1	Primary crushing

### Historical Production Index

The historical production indexes of Wulong processing plant from 2021 to September 2024 are shown in Table 11-10. According to the data in the table, the actual annual processing throughput is increasing year by year but have not reached the designed capacity which is 900ktpa because the lack of ore supply. The average gold concentrate grade is 56.67g/t and recovery rate of about 91%.

Table 11-9: Historical Production Index of Wulong Processing Plant

Items	Unit	2021	2022	2023	2024 Q1-Q3
ROM throughput	kt	382.1	418.6	579.3	512.52
Feed grade	g/t	2.48	3.42	3.53	3.25
Concentrate output	kt	14.62	25.13	33.08	25.19
Concentrate gold grade	g/t	57.93	51.5	57.01	60.25
Gold recovery	%	89.37	90.39	92.23	91.07

### 11.3.3 Tailings Storage Facilities

The Zhoujiagou TSF is located in the southwest of Wulong processing plant with the straight-line distance of about 3.4km. It is a valley-type TSF, and the current situation is shown in Figure 11-10. The total dam height of the tailings dam is 45m, and the total storage capacity is  $158.01 \times 10^4 \text{m}^3$  equal to effective capacity of  $142 \times 10^4 \text{m}^3$ , which is a Class 4 TSF. At present, about  $107.26 \times 10^4 \text{m}^3$  of tailings

have been piled up, and the remaining storage capacity is about  $34.74 \times 10^4 \text{m}^3$ . The site selection of the new TSF has been completed and is under the stage of designing now .

**Figure 11-10: TSF of Wulong Mining**

#### **11.3.4 Conclusions and Recommendations**

As the ore comes from different mining areas, and the ROM properties are obviously different and fluctuating, SRK suggests that the reagent regime in the process of actual production should be adjusted according to the production situation to obtain the optimal separating indexes.

SRK believes that the process flowsheet of Wulong processing plant is reasonable, and the overall layout is reasonable and advanced with large-scale equipment, high automation level, energy saving and high efficiency. The production and management personnel are of high quality, with standardized management.

The Zhoujiagou TSF is close to closure. The site selection of the new TSF has been completed and is under the stage of designing now.

## 11.4 Hanfeng Project

### 11.4.1 Processing and Metallurgical Testwork

#### Lishan Mine Testwork

The target mineral of the deep ore in Lishan Mine is mainly sphalerite, while the content of other minerals such as pyrite, smithsonite, galena, cerussite and chalcopyrite is relatively small. The gangue minerals are mainly quartz, carbonate, and feldspar. Sphalerite is linked or wrapped with gangue and other sulphides, and 58.50% of sphalerite is linked or wrapped with gangue.

In 2018, Hanfeng Mining commissioned Jilin Haorong Group Co., Ltd. to carry out a laboratory processing testwork on the ore of Lishan Mine.

The zinc grade of the processing test sample is 3.11%, after grinding to -0.075mm accounted for 70% ( $P_{70}=75\mu\text{m}$ ), a closed-circuit process of "1 roughing + 4 cleanings + 2 scavengins" was adopted to obtain the zinc concentrate with zinc grade of 47.46% and recovery of 95.77%. The test result is shown in Table 11-10. The experiment result shows that the flotation process can obtain the ideal index on the deep zinc ore in Lishan deposit, which can provide reference for the subsequent deep ore separation.

**Table 11-10: Test Results of Ore Sample from Lishan Mine**

Product	Yield (%)	Zn Grade (g/t)	Zn Recovery (%)
Concentrate	6.26	47.46	95.77
Tailings	93.74	0.14	4.23
Raw Ore	100.00	3.10	100.00

#### Dongfeng Mine Testwork

The molybdenum ore of Dongfeng Mine is low sulfide quartz vein type, with disseminated grain size distribution being uneven. Molybdenum minerals are mainly molybdenum sulfide minerals (accounting for 97.39%), followed by molybdenum oxide mineral of powellite (accounting for 2.61%), which mainly occurs in the cracks between ore grains, and a small part is wrapped in gangue or other sulphides. Gangue minerals are mainly of feldspar, quartz and mica, accounting for over 98%. Other gangue mineral content is little.

Hanfeng Mining commissioned Changchun Gold Design Institute to carry out two laboratory processing test study on deep molybdenum ore and refractory molybdenum ore respectively in December 2023.

The deep molybdenum grade of the processing test sample is 0.115%, after coarse grinding to -0.074mm accounted for 75% ( $P_{75}=74\mu\text{m}$ ), a closed-circuit process of "1 roughing + 6 cleanings + 3 scavengins + cleaning 1 concentrate regrinding ( $P_{95}=45\mu\text{m}$ )" was adopted to obtain the molybdenum concentrate with molybdenum grade of 46.96% and recovery of 88.05%. The test result is shown in Table 11-11. The experiment result shows that the flotation process can obtain the ideal index on

the deep molybdenum ore, which can provide reference for the subsequent large-scale resource development and optimization of the existing mineral process.

**Table 11-11: Test Results of Deep Ore Sample from Dongfeng Mine**

Product	Yield (%)	Mo Grade (g/t)	Mo Recovery (%)
Concentrate	0.22	46.96	88.05
Tailings	99.78	0.01	11.95
Raw Ore	100.00	0.115	100.00

Source: Processing Test Study Report of deep molybdenum ore, Changchun Gold Design Institute, December 2023.

The refractory molybdenum grade of the processing test sample is 0.126%. The ore adopts the stage grinding and floating process, and the process structure is as follows: one stage grinding and flotation ( $P_{60}=74\mu\text{m}$ ) with one roughing + one scavenging; two stage grinding and flotation ( $P_{90}=74\mu\text{m}$ ) with one roughing + three scavengings + six cleanings; two roughing coarse concentrate combined for cleaning and cleaning I concentrate regrinding ( $P_{95}=45\mu\text{m}$ ). The molybdenum concentrate is obtained with molybdenum grade of 46.26% and recovery of 74.72%. The test result is shown in Table 11-12.

**Table 11-12: Test Results of Refractory Ore Sample from Dongfeng Mine**

Product	Yield (%)	Mo Grade (g/t)	Mo Recovery (%)
Concentrate	0.20	46.26	74.72
Tailings	99.80	0.02	25.28
Raw Ore	100.00	0.126	100.00

## 11.4.2 Production Flowsheet

### Lishan Processing Plant

The Lishan processing plant processes Cu-Pb-Zn polymetallic ore, which sources from Lishan and Dongfeng mining areas. It adopts flotation process, and the products are copper concentrate, lead concentrate and zinc concentrate. The designed processing capacity of Lishan processing plant is 1,500tpd, and the current production capacity has reaches 2,000tpd through technical renovation. The production process is described as follows:

#### Crushing

Lishan processing plant adopts two-stage closed-circuit process, with the raw ore feed size of no more than 300mm and the product size of -12mm.

#### Grinding and Classification

The grinding process adopts a two-stage closed circuit grinding system, divided into two series, equipped with spiral classifier and hydrocyclone for classification, with a final overflow fineness of -200 mesh accounting for 62% to 76% and a concentration of 35% to 38%.

#### Flotation

The flotation process is based on the principle of "mixed copper and lead flotation with priority", where the mixed copper and lead concentrates are selected from the raw ore before the copper and lead concentrates are separated. The copper-lead mixed flotation process structure is "one roughing, three scavengings and five cleanings", while the copper-lead separation flotation process structure is "one roughing, two scavenging and five cleanings". The copper-lead mixed flotation tailings are then for flotation of zinc to produce concentrate, with a process structure of "one roughing, three scavengings and five cleanings". The flotation process effectively avoids the use of copper sulphate and other activators and inhibitors, prevents interaction, saves the dosage of chemicals, and achieves better separation index.

#### Dewatering

Copper concentrate, lead concentrate and zinc concentrate all use a two-stage dewatering process, with one stage of dewatering using a thickener and a discharge concentration of 40% to 50%; the second stage of dewatering uses a cylindrical external filter, with a final concentrate moisture content of 10% to 12%.

SRK believes that for copper-lead-zinc polymetallic ores, the flowsheet of Lishan processing plant is mature and feasible.

### **Dongfeng Processing Plant**

The Dongfeng processing plant mainly processes molybdenum ore and the history processing capacity is 500tpd. After optimizing the process, the production capacity reaches to about 700tpd. It adopts flotation process, and the final product is molybdenum concentrate with grade of 40%~45%. The plant ceased operation for years and restart production in July 2022. The production process is described as follows:

#### Crushing and Grinding

Dongfeng processing plant adopts two-stage closed-circuit process, and the product size is -12mm. The grinding process adopts a two-stage closed circuit grinding system, divided into two series, equipped with double spiral classifier for classification, with a final grinding fineness of -200 mesh accounting for 95% and a concentration of 38% to 41%.

#### Flotation and Dewatering

The molybdenum flotation process structure is "one roughing, three scavenging and eight cleanings, phase bubble regrinding, fine tail desulfurization ". The molybdenum concentrate adopted a three-stage dewatering process which is "thickening+filtration+drying". The final concentrate moisture content is less than 4%.

### **11.4.3 Mineral Processing Facilities and Equipment**

Lishan processing plant mainly consists of crushing and screening plant, grinding plant, flotation plant, concentrate dewatering plant and other plants, with lime milk preparation, technical inspection stations and laboratories. The whole plant is built on a hill, making full use of whose natural topography, with compact and reasonable equipment configuration inside the plant, reducing conveying pressure and shortening the length of the tape conveyor and slurry pipeline. The main

equipment of Lishan and Dongfeng processing plant is shown in Table 11-13 and Table 11-14 respectively, and the site photos are shown in Figure 11-11 and Figure 11-12.

#### 11.4.4 Historical Production Index

The processing production records of Lishan and Dongfeng processing plant from 2021 to September 2024 are shown in Table 11-15. As can be seen, Lishan processing plant has decreased its production throughput by almost 39% in 2023 compared to that in 2022, which is mainly attributed to the implementation of technical modifications. The average Cu, Pb and Zn recovery rate is of 53.32%, 64.49% and 88.20%, respectively.

The Dongfeng processing plant ceased operation for years and restart production in July 2022. The actual production capacity has reached about 700tpd since May 2024. Through the optimization of the process flow, the molybdenum recovery rate was increased to 77%-85%, with an average of about 79%.

Table 11-15: Historical Production Index of Lishan and Dongfeng Processing Plants

Items	Unit	2021	2022	2023	2024 Q1-Q3

#### 11.4.5 Tailings Storage Facility

Lishan TSF was completed and put into operation in 1965, and in 2007 the Changchun Gold Design Institute was commissioned to carry out the restoration design and renovation. The site is located to the southeast of the Lishan processing plant, at a distance of about 3.2km, and it is a valley type TSF. The total dam height of the TSF is 59.5m, with a total storage capacity of  $1,164 \times 10^4 \text{m}^3$ , which is a class 3 storage facility. At present, a volume of  $1,006 \times 10^4 \text{m}^3$  tailings has been stockpiled in the TSF, with a remaining storage capacity of  $158 \times 10^4 \text{m}^3$  and an expected remaining service life of 3 years. The Lishan TSF plan to expand the storage volume of total  $2,146 \times 10^4 \text{m}^3$  with dam height of 80m to serve for both Lishan and Dongfeng plant.

The Dongfeng TSF is located to the south of Lishan processing plant, at a distance of about 1.5km. The total dam height of the TSF is 74m, with a total storage capacity of  $640 \times 10^4 \text{m}^3$  and is a class 3 storage facility. At present, a volume of  $130 \times 10^4 \text{m}^3$  storage capacity remained, an expected remaining service life of 4.6 years.

The current situation of the Lishan TSF and Dongfeng TSF is shown in Figure 11-13.

Figure 11-13: TSF of Hanfeng Mining

#### 11.4.6 Conclusion and Recommendations

The Lishan processing plant mainly processes Cu-Pb-Zn polymetallic ore, which sources from Lishan and Dongfeng mining areas. It adopts flotation process, and the products are copper concentrate, lead concentrate and zinc concentrate, with average recovery rates of 53.32%, 64.49% and 88.20% , respectively.

The Lishan plant is built on a hill, making a full use of the natural topography, and the equipment inside the plant is compact and reasonable.

The Dongfeng processing plant mainly processes molybdenum ore, and the history processing capacity is 500tpd. After optimizing the process, the production capacity reaches to about 700tpd and the molybdenum recovery rate was increased to 77%-85%. It adopts flotation process, and the final product is molybdenum concentrate with grade of 40%~45%.

## 11.5 Jintai Project

### 11.5.1 Metallurgical Testwork

Kunming Metallurgical Research Institute (“**KMRI**”) and the Centre Laboratory of Yunnan Geological and Mineral Exploration and Development Bureau (“**Yunnan Central Lab**”) and Jintai Mining conducted metallurgical testwork on the Xidengping gold ore. The tests include the following aspects:

- Mineralogy
- Agitation Leaching
- Column leaching
- Selection of gold leaching agent and
- Industrial test of heap leach

The testing results of the sieve analysis of -33mm of Xidengping ore by the KMRI showed 39.5% of "slime", and the column leaching showed a serious permeability problem. The results of the physical properties of -25mm ore by the Yunnan Central Lab are shown in Table 11-16, and the "slime" content was 25.62%, which is relatively high, and the test report describe it as "average permeability", which SRK understands as "not serious permeability problems". Jintai Mining also found slime and serious permeability problems in the ore by soaking the ore in tanks. During the site visit, SRK found that the ores were highly oxidized. Combined with the test results of the high slime content of the ore and the high lime dosage, SRK recommends pelleting heap leaching with alkaline cement or lime as the binder.

**Table 11-16: Ore Physical Property Test Results**

Item	Unit	Results
Density	g/cm <sup>3</sup>	2.60
Heap Density	g/cm <sup>3</sup>	1.42
Angle of Repose	degree	40
Hardness		6.3
Moisture Content <sup>1</sup>	%	0.55
Slime Content	%	25.62
Permeability coefficient <sup>2</sup>	m/d	1.30
Moisture Absorption Rate	%	17.96

Note:

<sup>1</sup> The Moisture Content was tested at the original ore-2mm particle size, and the rest of the parameters were measured at the original ore-25mm particle size.

<sup>2</sup> The permeability coefficient was tested at a spray intensity of 10 L/m<sup>2</sup>.h.

In order to verify the feasibility of gold extraction by heap leaching, Jintai Mining conducted industrial tests of heap leaching at the mine site from January 2014 to February 2015. The industrial test was carried out in three phases, with the test stacked ore grade ranging from 0.3 to 2.0g/t, with an average of 1.06g/t. The test heap area was about 24,000m<sup>2</sup> and the total amount of ore heap during the test period was about 160,000t. A crushing process with two-stage open circuit and pre-screening before fine crushing was used to crush the ore to less than 50mm, which was transported by car to the leach

pad for stacking, with the initial test ore stacking height ranging from 1 to 2.5m and the later ore stacking height ranging from 5 to 15m. Leaching by leaching reagent solution spraying, the test spraying intensity was 13-20 L/m<sup>2</sup>·h. The leaching period was about 3 months, and the dosage of leaching reagent was stabilized at about 150g/t and the dosage of lime was stabilized at about 4.2kg/t, which was much lower than the dosage of column leaching in the laboratory. The average gold leaching rate during the industrial test was about 80%, it is a satisfactory result, confirming that heap leaching method was feasible for Xidengping Gold Mine.

### 11.5.2 Jintai Heap Leaching Plant

GOCOM Engineering Design Co., Ltd. completed the *Preliminary Design of Eryuan Jintai Mining Development Co. Ltd. For 140,000t/a Open Pit Mining Project at Xidengping Gold Mine in Eryuan County* in October 2022, which was designed maximum size of stacked ore is 35mm and the heap was constructed by truck and bulldozer. The ore heap is constructed in multiple layers, each layer is 7m high, and when the previous layer of leaching is finished, the next layer is directly constructed without moving away the first one, until 6 layers. The heap was leached by spraying with 0.15%~0.20% Jinchan Gold Leaching Agent. The designed gold leaching rate is 86%, the final product is gold-loaded carbon, with the heap leaching comprehensive recovery rate of 85.05%. The GOCOM Preliminary Design is the basis of the current heap leach plant construction at mine, and also the basis for this report.

The construction of Jintai Heap Leaching Plant was completed and put into operation in October 2023. The project included the restoration of the original crushing production line and solution ponds, as well as the construction of new solution ponds and water and electricity supply facilities. As of 30 September 2024, leaching has been completed on the D1 to D6 ore heaps, leaching on the D7-1 and D7-2 ore heaps is underway, and D8 ore heap is under stacking. The total amount of ore in the D1 to D6 heaps that has completed leaching is 527 kt, averaging grade of 0.69g/t Au, yielding 271.6 kg of gold (carbon-loaded gold), with an average gold recovery rate of 74.71%. Leaching on D7-1 and D7-2 heaps are currently ongoing, with a total ore amount of 54,689 t, averaging grade of 0.81g/t.

The main technical risks are the coarse particle size of the ore feeding the heap and the poor permeability of the heap. SRK recommends changing the crushing process from open circuit to closed circuit, reducing the crushed particle size to less than 25 mm, and using cement or lime for pelleting. Then, use a belt conveyor to transport the pelleted ore and build the heap, thereby improving the heap's permeability. SRK believes that controlling the ore particle size and enhancing heap permeability are key measures to ensure gold recovery rates.

### 11.5.3 Heap Leaching Process

The designed process mainly includes three systems of ore crushing, heap leaching and adsorption, and the final product is gold-loaded carbon with a gold grade between 2000g/t to 4000 g/t. Jintai Mining entrusts other party to processing the gold-loaded carbon (elution - electrowinning - smelting), to produce a final product of Gold Dorè. The gold stripped carbon will be returned to the adsorption system. The heap leaching process is shown in Figure 11-14 and illustrated as follows

### **Ore Crushing**

A two-stage open-circuit crushing process is used to crush the ore to -35mm. The maximum particle size of the open-pit ore is 500mm, which is transported by car to the ROM bin or ore stacking area in the crushing workshop of the processing plant. Then the material less than 100mm is screened out by a grizzly feeder, and the oversize material is fed to a primary jaw crusher. The undersize material of the grizzly feeder and the coarsely crushed product are fed to a vibrating screen to screen out materials less than 35mm, and the oversize material of the screen is fed into a secondary jaw crusher. The finely crushed product is combined with the undersize material and transported by truck to the leach pad for stacking.

### **Heap Leaching Site**

The heap leaching site covers an area of 7.24hm<sup>2</sup> (72,400m<sup>2</sup>) and is located about 150m to the south of the open pit of Orebody V1. It is a gentle slope of medium and low mountains, which requires slope cutting to reduce the gradient. The longitudinal slope gradient of the heap leaching site is finally determined to be 5%-10% and the lateral slope to be 4%-5%, to reduce the earthwork volume of the slope cutting engineering. In order to prevent uneven settlement, the filling section adopts the bedded earth rolling method, with a compaction coefficient of no less than 0.97. In order to prevent the impact of groundwater on site stability, a groundwater collection and drainage system is installed under the leach pad. The groundwater collection and drainage system is located below the anti-seepage system, and the burial depth is not less than 1.5m, that is, the sand and gravel blind drain is arranged in the base, and after the collection infiltration of the sand reverse filter layer, the groundwater is discharged to the downstream sedimentation pond by the DN200 ultra-high molecular weight polyethylene drainage pipe in the gravel layer, which is used as production water, or discharged after the detection reaches the environmental emission standard.

### **Leach Pad Laying**

The durable bottom pad is a compound pad composed of 4,800g/m<sup>2</sup> sodium-based bentonite impermeable blanket (GCL) + one layer of 2mm-thick HDPE geomembrane. A gradient of not less than 3% is set when the bottom pad is laid, to facilitate the leach solution flowing into the collection ditch along the bottom slope, and the DN100 ultra-high molecular weight polyethylene drainage pipe is laid in the direction of downstream water to dredge the liquid flow. A sand gravel layer of 2-10mm and 16-32mm with a thickness of 300-500mm is laid on the geomembrane as an ore heap percolation drainage layer and a protective bottom pad to ensure that the leach solution can smoothly penetrate into the bottom of the ore heap and flow into the collection pond through the collection facility. After completion of the bottom facilities of the leach pad, the ore stacking work begins.

### **Ore Stacking**

The crushed ore (-35mm) is transported directly to the leach pad by car. The truck is equipped with a bulldozer to stack the ore stacking, and the excavator is used to turn the ore stacking and shape it. It adopts a zonal and layered stacking method, with a layer height of 7m. After the completion of ore stacking, the surface layer of the ore stacking compacted by vehicles is loosened for 3-4m by an excavator to facilitate the penetration of the leach solution. According to the terrain around the ore stacking ground, grooves are laid with a slope of 2-5% to facilitate the collection of leach solution,

and the collected leach solution flows into the sedimentation pond and the pregnant leach solution pond. It adopts a permanent heap leach yard without moving away the leached heap.

#### **Laying of Solution Distribution Pipes**

After the completion of ore stacking in each zone, a solution distribution pipe network is laid on the top of the heap, and the solution distribution is carried out by rotating-swing spray nozzles (the Senninger spray nozzles). The grid of the nozzle is generally 4×4m. A regulating valve is set at the connection between the main pipe and the branch pipe to control the flow and troubleshooting of a certain part of the ore stacking.

#### **Alkaline Washing**

At the time of ore stacking, a certain amount of lime is added in advance. When the ore stacking is washed with water, the pH value of the effluent may reach 9-10. If it cannot reach the specified pH value, a certain amount of caustic soda should be added until the pH value of the effluent reaches 11-11.5, after which stop washing, and then spray it with a gold leaching agent solution.

#### **Spray Leaching**

The solution with a concentration of 0.15%-0.20% and a pH= 1-11.5 is prepared in the barren solution pond with the Jinchan gold leaching agent as gold leaching reagent. The prepared leach solution is pumped from the barren solution pond to the spray pipe network, through which the ore stacking is sprayed and leached. The spray intensity is 6L to 30L/m<sup>2</sup>·h, and the continuous time of each spray is 1h with the interval time of 0.5h, which can be adjusted according to the process stage or the actual site situation.

The sprayed leaching solution permeates the heap from surface to bottom while the gold is dissolved into the leaching solution, and flowing out of the ore heap flows into the pregnant leach solution collection pond and is pumped to the pregnant leach solution pond after precipitation. The pregnant leach solution is then discharged to the barren solution pond after being adsorbed by carbon. The returned barren solution should be added with leaching agent according to the analysis results to ensure the concentration of gold leaching agent and pH value of the leaching solution. The ore stacking is continued to be sprayed to form a spray-leach-adsorption cycle until the end of leaching.

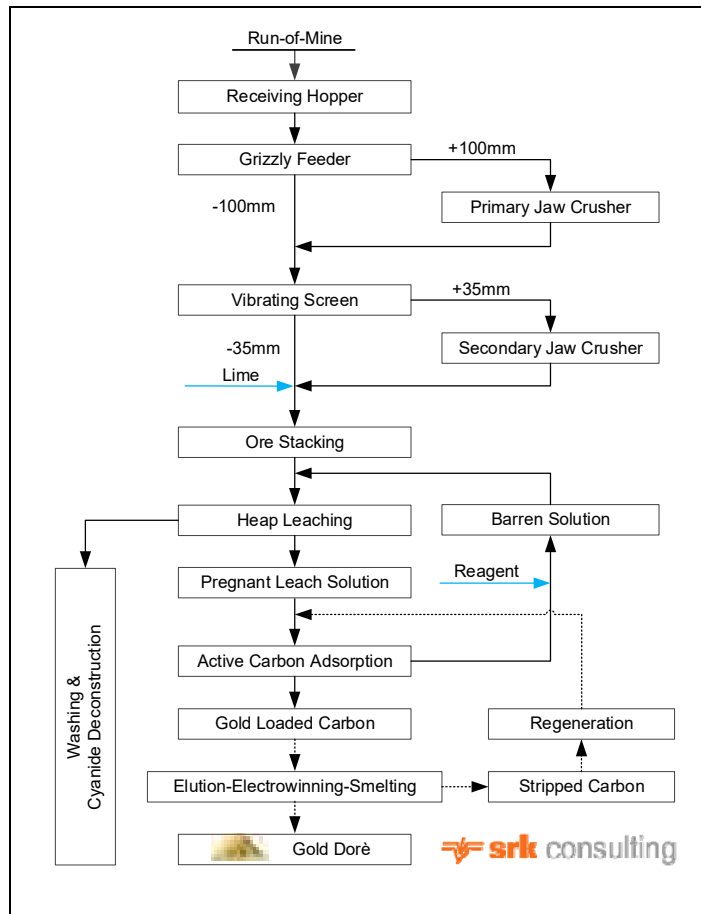

#### **Active Carbon Adsorption**

Active carbon is used as gold and silver adsorbent and loaded into the adsorption column. The gold and silver in the pregnant leach solution are adsorbed and leached by five adsorption columns in series. After the gold load of the active carbon reaches the designed adsorption capacity (4,000g/t), it is discharged through the bottom carbon discharge valve, and then sampled, weighed and stored after the surface moisture is dried. The gold-loaded carbon is the final product on site. While Jintai Mining entrusts other party to processing the gold-loaded carbon (elution - electrowinning - smelting), to produce a final product of Gold Dorè. The gold stripped carbon will be returned to the adsorption system. Jintai tells SRK the stripped carbon will be recycled three times and then will be sold.

**Washing and Detoxification**

The designed leaching cycle is 50-60 days. After the completion of leaching, the ore heap is sprayed and washed with a weak alkaline limewater to wash out the residual leaching solution containing gold and gold leaching agent, and finally it is sprayed and washed with the alkaline bleaching powder solution to detoxify the ore heap. The washing-purification time is about 15-20 days. After the washing and detoxification of the ore heap is completed, the pipe network is dismantled, the impermeable bottom pad is re-laid on the top of the ore stacking, and then the second layer of the ore heap is stacked and leached until the stacking and leaching of the 6<sup>th</sup> layer ore heap is completed. After the final leaching, the disinfected leaching residue is stored in situ and reclaimed by covering soil.

**Figure 11-14: Heap Leaching Process Flowsheet of Xidengping Gold Mine**

Source: SRK

**11.5.4 The Facilities and equipment of Heap Leaching Plant**

A complete crushing system, solution pond system and adsorption system are left over from the original heap leaching test plant. Although the facilities and equipment of these systems are small, they can still be used after maintenance. *GOCOM Preliminary design* to make use of them, and added some solution pond, water supply and drainage facilities and laboratories, spare parts warehouse, reagent storage and products warehouse. The main production facilities and equipment designed are shown in Table 11-17. Figure 11-15 shows the key facilities of the heap leaching plant.

**Table 11-17: Heap Leaching Facilities and Equipment**

Equipment	Equipment name and specification	Installed power (kW)	Quantity	Remarks
Jaw crusher	PE600×900	55	1	Used equipment

### 11.5.5 Designed technical index and production performance

The technical index of heap leaching designed by *GOCOM Preliminary design* is shown in Table 11-18, and the scale of heap leaching is 140,000 t/a, with 0.83g/t of feed grade, the overall gold recovery rate is 85.05%, the final product is gold-loaded carbon with the gold grade of 4,000g/t, the annual output of gold (contained in gold-loaded carbon) is 98.83kg.

Table 11-18: Designed Technical Index of Heap Leaching

Item	Unit	Quantity
The tonnage of ROM	t/a	140,000
Ore size of ROM	mm	500~0
Particle size of stacked ore	mm	35~0
Grade of ROM	g/t	0.83
Gold content of ROM	kg/a	116.2
Leaching rate	%	86
Washing rate	%	99
Adsorption rate	%	99.9
Comprehensive Recovery Rate <sup>1</sup>	%	85.05
Leaching period	day	90
The quantity of leaching residue	t/a	140,000
The grade of leaching residue	g/t	0.124
Gold content of leaching residue	kg/a	17.37
The quantity of gold loaded carbon	t/a	24.71
The grade of gold loaded carbon	g/t	4,000
Gold content in loaded carbon	kg/a	98.83
The consumption of lime	kg/t	4.5
The consumption of Jinchuan gold leaching agent	kg/t	0.35
The consumption of bleaching powder	kg/t	0.55

Note:

<sup>1</sup> Overall recovery rate = Leaching rate × washing rate × Adsorption rate

The heap leaching plant was completed in October 2023. It includes the maintenance of the existing crushing equipment and the construction of the plant building, reinforcement and anti-seepage treatment of the existing solution pond, construction of new solution ponds, construction of the heap leaching site, and construction of basic infrastructure.

As of 30 September 2024, eight heaps (D1, D2, D3, D4, D5, D6, D7-1 and D7-2) were constructed and six of the heaps were leached, and D8 ore heap is under construction. The ore quantities and gold leaching amounts for each heap are shown in Table 11-19 and the gold recovery curves are illustrated in Figure 11-16.

For the six heaps where leaching has been completed, the overall gold recovery is 74.71%. The actual gold recovery is much lower than the designed 85.05%

SRK observed on site that the pregnant leach solution (PLS) was turbid and had low grade, speculating two possible reasons:

- High clay content in the ore, leading to poor permeability;
- Excessive spray intensity of the leach solution, causing the leach solution to erode the heap.

SRK also noted on site that to improve the permeability of the heap, the actual particle size of the ore in the heap was around -100mm, much larger than the designed -35mm. Although the coarser particle size can improve permeability, it will significantly impact the recovery rate. SRK recommends maintaining the designed ore crushing particle size and adopting pelleting operations to ensure the permeability of the heap. Jintai told SRK, the pelleting operation has implemented from July 2024 and applied in D7-2 Heap.

**Table 11-19: Heap Leaching Production Performance, as of 30 September 2024**

Item	Unit	D1	D2	D3	D4	D5	D6	Total
Ore quantity	t	51,110	71,814	112,964	109,249	107,505	74,386	527,027
Average grade	g/t	0.77	0.87	0.69	0.59	0.59	0.76	0.69
Gold content in heap	g	39,354	62,485	78,290	64,412	62,771	56,206	363,519
Leaching period	day	41	50	126	126	110	73	
Cumulative gold load in carbon	g	34,557	48,503	55,226	52,568	25,448	55,293	271,595
Cumulative recovery rate <sup>1</sup>	%	87.81	77.62	70.54	81.61	40.54	98.38	74.71

Source: SRK calculated based on data provided by Jintai Mining

Note:

<sup>1</sup> The recovery rate is calculated according to the accumulated gold load in carbon and the amount of metal in heap. Since the later period PLS of an ore heap is used as the leaching solution of the next ore heap, and the gold content in the PLS also enters in the next ore heap, so the recovery rate of a single ore heap does not accurately reflect the real leaching situation, while the total recovery of all the ore heaps can reflect the overall leaching situation.

**Figure 11-16: Heap leaching Recovery Curve for Xidengping Mine**

Source: drawn by SRK according to Jintai's "Gold-loaded Carbon Production Report"

**11.5.6 Conclusion and Recommendation**

- The designed maximum size of stacked ore is 35mm, and the heap is continuously stacked without moving away the leached ore, with a total of 6 layers superimposed, and the average height of each layer is 7m. Due to the particle size is an important factor affecting gold leaching rate, SRK recommends using closed circuit for fine-crushing operation to reduce the particle size of stacked ore to 100% less than 25mm. The permeability of ore stack is the key factor affecting the success or failure of heap leaching. SRK suggests that cement and leaching reagent solution should be used for pelleting to avoid argillization, and belt conveyors and stacking conveyor should be used to build ore stack to avoid compaction and ensure the permeability of ore heap.

Pelleting with cement and leaching reagent solution can provide sufficient protective alkali in advance, and save the pre-alkaline washing operation, shorten the leaching period and improve the gold leaching rate.

- It is reasonable to construct groundwater seepage control and drainage system by cutting treatment of heap leaching site as stepped type. It is reasonable to lay the liquid collection drainage pipe network system on the bottom pad of the ore heap, which can timely export the leaching solution to the ore stack and reduce the scouring of the ore at the bottom of the stack. During the site construction, it is recommended to rationally arrange the location and network of the system according to the terrain conditions.
- The design scale of heap leaching is 140,000 t/a, the average grade of ore is 0.83g/t, the overall recovery rate of gold is 85.05%, the final product is gold-loaded carbon, the gold grade of loaded carbon is 4,000g/t. The Xidengping gold ore is amenable to heap leach process and the leaching rate is 85%~91% in column leaching test, SRK believes that the overall recovery of 85% gold can be reached or even exceeded under the condition of ensuring the permeability of ore heap. SRK observed on-site that the maximum ore size feeding the heap was approximately 100mm, which is much larger than the designed ore size for heap leaching. Additionally, there are permeability issues with the ore heap, which will result in the gold recovery rate not meeting the designed specifications. SRK suggests modifying the existing open-circuit crushing process to a two-stage closed-circuit process, reducing the ore to below 25mm, and adding a drum granulator to granulate the crushed ore, and using a belt conveyor to build the heap.
- Heap leaching has the characteristics of flexible scale, low investment, low cost and short-term benefit, and Xidengping ore is suitable for heap leaching. The discovery of V4 orebody makes it possible to expand the scale of heap leaching to 1 million t/a. The current scale of 140,000 t/a is feasible by mainly using the facilities and equipment of the original pilot plant. Jintai Mining plans to build a second crushing workshop to expand production capacity. SRK recommends using a closed-circuit crushing process to reduce the ore to less than 25mm and pelleting the crushed ore to improve the heap's permeability. SRK believes that this can achieve the designed recovery rate of 85%.
- The final product of the mine is gold-loaded carbon, Jintai Mining entrusts other party to processing the gold-loaded carbon, to produce gold doré, SRK suggests that a smelting workshop should be built in the mine to use a processing device of "high-temperature elution and homothermal electrowinning " to produce Gold Doré.

## 12 Project Infrastructure

### 12.1 Location and Access

#### 12.1.1 Jilong Project

The Jilong gold project is located about 21km west of Aohanqi or 58km west of Chifeng City, Inner Mongolia. The Zhuanshanzi gold mine is approximately 45km away from the Pingzhuang Station of Yebaishou - Chifeng Railway in the southwest and only 15km away from the Xiaohe Station of Beijing - Tongliao Railway in the north. There are gravel roads connecting the mine to the railway stations and main paved roads.

#### 12.1.2 Huatai Project

The Huatai gold project, including the Lianhuashan gold mine, Honghuagou gold mine and Pengjiagou gold mine, is located approximately 33~38km west of Chifeng City, Inner Mongolia. Three operating mines are all within 3 to 10km away from the Honghuagou Station of Beijing - Tongliao Railway. Chifeng City has extensive networks of railway line and well paved highways. There are gravel roads connecting these mines to the railway station and main paved roads. Access to these properties is convenient.

#### 12.1.3 Wulong Project

The Wulong gold project is located about 15km west of Dandong City or 38km south of Donggang City, Liaoning Province. Access to the Wulong gold mine is very convenient. The Dandong-Dalian highway is 11km away from the mine in the southeast. There are gravel roads connecting the mine to the main paved roads.

#### 12.1.4 Hanfeng Project

The Jilong lead-zinc project is located approximately 42km of northwest of Longjing City, Jilin Province. Access to the project area is excellent. The Changchun-Tumen Railway and National Highway G302 pass through Laotougou Township in the southeast of Tianbaoshan mine area. Laotougou Town is just 15km southeast of the project's properties and there is a cement road connecting Laotougou Town and the project site.

#### 12.1.5 Jintai Project

Jintai project is located about 54km road away Southwest to Eryuan county, Dali Bai Autonomous Prefecture, Yunnan Province. Access to Jintai project is very convenient. The local downtown Liantixiang is about 3km from mine site and the connected with national road to Eryuan county about 51km. the downtown to Dali is about 106km.

## **12.2 Power Supply**

### **12.2.1 Jilong Project**

Jilong Mining has built a 4,000kVA+6,300kVA general step-down substation in the first mining area of the Zhanshanzi Gold Mine and the power supply is Yuanbaoshan 66kV, a second substation. The power supply in the mining area is sourced from the general step-down substation. A 10kV transmission line is connected to the power distribution room in the mining area through LGJ-95mm<sup>2</sup> steel-cored aluminum stranded wires. The power supply meets production needs.

### **12.2.2 Huatai Project**

The power supply for the Huatai project is sourced from the Northeast Power Grid, and the industrial 10kv high-voltage line has been connected to the Lianhuashan and Honghuagou gold mining areas, which can meet both production needs.

### **12.2.3 Wulong Project**

Wulong operating gold mine is an old mining area with complete power supply facilities. The Northeast Power Grid runs through the whole area, and the power supply is sufficient.

### **12.2.4 Hanfeng Project**

There is a 110kV high-voltage dedicated line for Tianbaoshan operating mine, and the power supply can fully meet the production needs.

### **12.2.5 Jintai Project**

Jintai project is located about 54km by road Southwest to Eryuan county, Dali Bai Autonomous Prefecture, Yunnan Province. Access to Jintai project is very convenient. The local downtown Liantiexiang is about 3km from mine site and the connected with national road to Eryuan county about 51km. the downtown to Dali is about 106km.

The power supply for the Jintai project is sourced from the 35kV power station of Liantiexiang town which is a station to the China Southern Power Grid. The industrial 10kv high-voltage line has been connected to the project about 1.8km away, which can meet both production needs. Residential electricity is supplied as the mine is not constructed, during site visit. Figure 12-1 shows the power station and the connection of power line.

**Figure 12-1: Power Station of Liantiexiang**

### **12.3 Water Supply**

#### **12.3.1 Jilong Project**

Water for production and domestic use is sourced from underground water with a water volume of 70 cubic meters per day ("m<sup>3</sup>/d") per water well

#### **12.3.2 Huatai Project**

Water for production and domestic use is sourced from underground water (electromechanical wells), and the water volume is relatively sufficient.

#### **12.3.3 Wulong Project**

The water for mine production and surrounding residents is taken from the special water intake area of the mining area, and water resources are relatively sufficient.

#### **12.3.4 Hanfeng Project**

The production water supply is from the water source of Huxiantang water source on the southeast side of the ore processing plant and the underground water of Lishan Pit.

Huxiantang Water Source: there is a 6m × 12m water intake pumping station built at the water intake point, using three sets (one for backup and two for use) of water intake pumps D155-30 × 9 (Q=72 ~ 126m<sup>3</sup>/h, H=270m, N=200kW), through a D300mm iron pipe through an air-raid shelter and the

water source pipeline at the mouth of Dongfenggou, and then directly pump water to the high-level water tank of the ore processing plant. The straight-line distance of water supply is about 5,000m.

In addition, the backwater from the Lishan tailings pond is also transported to the high-level water tank of the concentrator through the pump station.

Lishan Pit Gushing Water: the gushing water from the Lishan pit, through four-level drainage pumping stations, are pumped to the surface. The water supply capacity is 500m<sup>3</sup>/d.

### 12.3.5 Jintai Project

The production water is planned sourced from the nearby river of Heihui. A pump station and powerhouse are planned to construct. Pipeline connecting water source and head tank of processing plant is also planned. the water source location is shown in Figure 12-2.

**Figure 12-2: Planned Water Source Point along Heihui River**

The domestic water is source from the spring pond and the water plant of Xidengping village, which is the source for local community. The pipeline has been constructed along the road to the mine site.

## 13 Environmental Studies, Permitting, and Social or Community Impact

### 13.1 Environmental, Permitting, and Social or Community Review Objective

The objective of this due diligence review is to identify and or verify the existing and potential Environmental, Permitting, and Social or Community liabilities and risks, and assess any associated proposed remediation measures for the Project.

### 13.2 Environmental, Permitting, and Social or Community Review Process, Scope, and Standards

The process for the verification of the environmental compliance and conformance for the Project comprised a review and inspection of the Project's environmental management performance against:

- Chinese national environmental regulatory requirements; and
- World Bank/International Finance Corporation ("IFC") environmental standards and guidelines, and internationally recognised environmental management practices.

The methodology applied for this environmental review of the Project consisted of a combination of documentation review, site visit, and interviews with Company technical representatives. The last site visit for the environmental review was undertaken in May 2024.

### 13.3 Status of Environmental Impact Assessment

The basis of environmental policy in China is contained in the 2018 Constitution of the People's Republic of China. Pursuant to Article 26 of the Constitution, the state protects and improves the environment in which people live and the ecological environment. It prevents and controls pollution and other public hazards. The state organizes and encourages afforestation and the protection of forests.

The following are other Chinese laws that provide environmental legislative support to the Minerals Resources Law of the People's Republic of China (2019) and the Environmental Protection Law of the People's Republic of China (2014):

- Environmental Impact Assessment ("EIA") Law (2018).
- Law on Prevention & Control of Atmospheric Pollution (2018).
- Law on Prevention & Control of Noise Pollution (2021).
- Law on Prevention & Control of Water Pollution (2017).
- Law on Prevention & Control Environmental Pollution by Solid Waste (2020).
- Forestry Law (2021).
- Water Law (2016).
- Land Administration Law (2019).

- Protection of Wildlife Law (2023).
- Regulations on the Administration of Construction Project Environmental Protection (2017).

In accordance with Chinese legislation the Project will be subjected to a comprehensive EIA to assess the environmental impacts of the proposed development on the human and natural environment prior to the commencement of mining operations.

The details of the EIA reports and approvals for each project are presented in the tables below.

### 13.3.1 Jilong Project

**Table 13-1: Details of the EIA Reports and Approvals for the Jilong Project**

Project	Produced By	Production date	Approved By	Approval date

Xidengping Gold Mine Mining, Processing and Tailings Project (0.14Mtpa)	Kunming Nonferrous Metallurgy Design & Research Institute Ltd..	December 2013	Yunnan Province Environmental Protection Bureau	February 17, 2014

SRK noted that the EIA reports for the Liaoning Wulong Gold Mine Development Project (0.15Mtpa) and Liaoning Wulong Zhoujiagou TSF Treatment and Processing Plant (800 tpd) Decommissioning Project did not include the new processing plant. However, Wulong Mining stated that the EIA report had been submitted to the environmental protection bureau and was under review. Yunnan Rongtan Environmental Protection Technology Co., Ltd. prepared a report on the optimization and demonstration of environmental protection measures for the project in May 2022. The report concluded that the changes resulting from the continuation of the project do not constitute significant changes and do not alter the environmental impact assessment conclusions already approved for the project.

### 13.4 Status of Environmental Licenses and Permits

According to the requirements of relevant laws and regulations of China, a series of environmental protection related licenses and permits should be obtained during the operation of mines, such as safety production permit, water use permit and site discharge permit.

#### 13.4.1 Safety Production Permit

The safety production permits for each project are presented in the following tables.

**Table 13-6: Details of Safety Production Permits of Jilong Project**

<b>Expiry Date</b>	15 May, 2029
<b>Water Supply Source</b>	Surface water
<b>Water Use Allocation</b>	92,400m <sup>3</sup> /year

#### 13.4.3 Site Discharge Permit

The status of site discharge permit/registration for the Project are summarized as follows:

- Jilong Project has registered the discharge of fixed pollution sources on July 10, 2020. The registration number is 91150430779492220K002X. Registration is valid until July 9, 2025.
- Huatai Project has registered the discharge of fixed pollution sources on January 6, 2021. The registration number is 9115040476767883814P002Z. Registration is valid until January 5, 2026.
- Wulong Project has registered the discharge of fixed pollution sources on March 10, 2020. The registration number is 91210600673786837T001W. Registration is valid until March 9, 2025.
- Hanfeng Project has registered the discharge of fixed pollution sources on August 22, 2023. The registration number is 91222405764593512F001X. Registration is valid until September 24, 2028.
- Jintai Project has registered the discharge of fixed pollution sources on October 20, 2023. The registration number is 915329306708718763001Z. Registration is valid until October 19, 2028.

### 13.5 Environmental Study and Management

This chapter summarizes the conclusions of EIA studies, the status of environmental management observed during site visits and the recommendations made by SRK.

#### 13.5.1 Jilong Project

According to the EIA report, the vegetation in the project area belongs to the arid grassland vegetation area. Due to years of reclamation, a large area of natural vegetation has been destroyed. Much of the surrounding land has been reclaimed for farming. No rare plants under state or local protection have been found around the project. The project area is heavily affected by human activities and large wild animals have disappeared. Small wildlife is limited to small rodents and reptiles. No wild animals and birds under state protection were found in the project area.

The domestic water source for the project comes from two wells located 2.1 kilometers away. The well also replenishes the processing plant with fresh water. Mine water is sedimented underground and discharged into the upper sump and reused in the processing plant. The EIA believes that the project's water abstraction will not have a great impact on the production and domestic water consumption of local villagers and other water users. Chifeng Jilong reported to SRK that the groundwater quality is regularly monitored. SRK has sighted an environmental monitoring report which was produced in April, 2024. Water samples from water monitoring well and mine dewatering outlet were collected in March 2024. The water monitoring results are all within the limits of the relevant environmental standards. SRK recommends the company improve an effective drainage system to divert run-off from undisturbed areas around disturbed areas.

During the site visit, SRK noticed that there are waste rock dumps in each mining area of the project. No geochemical characterization of waste rocks or acid rock drainage ("ARD") assessment has been sighted as part of this review. At present, the tailings of the project are dry discharged into the TSF after being treated in the filter press workshop. The accident and collection ponds were built at the foot of the tailings dam. Two tailings samples from the project, which were wet and dry tailings separately, were collected and tested in December, 2022. The test results show that cyanide in the tailings meet the requirements of technical specification for pollution control of cyanide leaching residue in gold industry (less than 5 mg/L). During the time of SRK's site visit, SRK did not observed any evidence of leaching or ARD impacts. A new TSF and a new filter press workshop are under

construction which is located to the northeast of the processing plant. The EIA approval for the Zhuanshanzi Gold Mine Processing Expansion Project states all production wastewater should be reused.

The dust emissions sources for the project are mainly from drilling, explosion, ore crushing and screening, tailings storage facility, waste rock dump, open areas and movement of vehicles and mobile equipment. SRK sighted that dust removers were installed in the processing plant. SRK did not note the obvious dust emission in the open area of the project during the time of this site visit.

The hazardous materials generated by the project mainly consists of hydrocarbons (i.e. waste oils), processing reagents, chemical and oil containers, explosives, etc. SRK noted during the site visit that storage of sodium cyanide was generally safe. Chifeng Jilong stated that vehicle fuel and machinery maintenance are all outsourced. The project has a main explosives magazine and four sub-magazines. During the site visit SRK inspected the main explosive magazine, and it is SRK's opinion that it is a secure facility that is designed and managed in accordance with relevant Chinese National requirements. SRK recommends that the collected waste oil and dangerous chemical be stored with secondary containment which is in line with the recognised international industry management practices.

### 13.5.2 Huatai Project

The EIA report states that there are no sensitive targets such as nature reserves within 10 km of the project area. There are no rare, endangered and protected plant species within the scope of the project. Animal resources within the scope of the project are scarce, mainly small rodents, reptiles and common birds, and there are no rare and endangered animals. After the implementation of management measures, there is little impact on the vegetation and animals in the project area.

The domestic water and fresh water for the processing plant will be supplied from underground wells. The mine water is generally collected by water tank and reused for underground production. The processing wastewater is fully recycled and the tailings filter wastewater is reused for processing as well. The residents in the town near the project use centralized water supply. The EIA of the project concluded that the groundwater extraction would not have a significant impact on local groundwater resources. In addition, the EIA opines the project has a slight impact on surface water and groundwater after taking measures such as wastewater reuse and TSF seepage prevention. The company provided a groundwater quality monitoring report for the mining area in May 2022. Manganese, iron, arsenic, mercury, cadmium and lead in the samples did not exceed the requirements of the third class of groundwater quality standards. SRK recommends the company improve an effective drainage system to divert run-off from undisturbed areas around disturbed areas.

At present, waste rock from the project is mainly used for underground backfilling or sold for road building. During this site visit, SRK noticed that there are past-generated waste dumps at the portal of shafts in each mining area. No geochemical characterization of waste rocks or acid rock drainage ("ARD") assessment has been sighted as part of this review. However, the EIA considers the waste rock generated by the project to be General Industrial Solid Waste Class I. At present, the tailings of the project are dry discharged into the TSF after being treated in the filter press workshop. During the time of SRK's site visit, SRK did not observed any evidence of leaching or ARD impacts.

The dust emissions sources for the project are mainly from drilling, explosion, ore crushing and screening, tailings storage facility, waste rock dump, open areas and movement of vehicles and mobile equipment. The EIA concluded that the dust generated by the project had little impact on the surrounding environment after appropriate management measures were taken. SRK sighted that dust removers were installed in the processing plant. SRK did not see significant dust generation during this site visit.

The hazardous materials generated by the project mainly consists of hydrocarbons (i.e. waste oils), processing reagents, chemical and oil containers, explosives, etc. SRK noted during the site visit that storage of sodium cyanide was generally safe. There is no gas and diesel storage on site. Chifeng Huatai reported that the waste oil produced by the project is stored in a separate warehouse. During the site visit SRK inspected this explosive magazine, and it is SRK's opinion that it is a secure facility that is designed and managed in accordance with relevant Chinese National requirements. SRK recommends that the collected waste oil and dangerous chemical be stored with secondary containment which is in line with the recognised international industry management practices.

### 13.5.3 Wulong Project

The project area is well covered with vegetation. Wild animals in this area mainly include hares, squirrels, pheasants and so on. The EIA report states that there were no rare or endangered plants and animals in the project area. The impact of the project on the level of plant population, community and ecosystem was not significant. After greening, the vegetation in the project area will be gradually restored, which will make up for the loss of plant species diversity.

The main river in the project area is the Banshi River, which is a seasonal river. The river eventually drains into Tiejia Reservoir. The project has a water treatment plant to treat fluoride in the mine dewatering water. The treated mine dewatering water is reused for production and heating, and the excess water is discharged into the Banshi River. The processing wastewater is fully recycled. SRK noted that the project's TSF is approximately 7 km from the downstream reservoir. Therefore, it should be ensured that the operation of the project will not affect the Banshi River and Tiejia Reservoir. Liaoning Wulong stated that the Environmental Protection Bureau conducted surface water and groundwater monitoring for the project. However, no water monitoring report has been sighted as part of this review. SRK recommends that quality monitoring be undertaken of the groundwater and surface water resources within the project area (including upstream and downstream of the project area), and also any site water discharges.

During this site visit, SRK noticed that the waste rocks were temporarily dumped at the portal of shafts in each mining area. Liaoning Wulong stated that the waste rock from the project is mainly used for underground backfilling or sold for construction. No geochemical characterization of waste rocks or acid rock drainage ("ARD") assessment has been sighted as part of this review. At present, the tailings of the project are dry discharged into the TSF after being treated in the filter press workshop. The accident and leakage collection ponds were built at the foot of the tailings dam. During the time of SRK's site visit, SRK did not observed any evidence of leaching or ARD impacts.

The dust emissions sources for the project are mainly from drilling, explosion, ore crushing and screening, tailings storage facility, waste rock dump, open areas and movement of vehicles and mobile equipment. The project's EIA report concluded that the operation of the project would have no significant impact on the ambient air. SRK did not see significant dust generation during this site visit.

The hazardous materials generated by the project mainly consists of hydrocarbons (i.e. waste oils), processing reagents, chemical and oil containers, explosives, etc. There is no gas and diesel storage on site. During the site visit SRK inspected this explosive magazine, and it is SRK's opinion that it is a secure facility that is designed and managed in accordance with relevant Chinese National requirements. SRK recommends that the collected waste oil and dangerous chemical be stored with secondary containment which is in line with the recognised international industry management practices.

#### 13.5.4 Hanfeng Project

The forest vegetation in the project area belongs to the typical flora of Changbai Mountain and has been replaced by natural secondary forest and artificial forest after long-term human activities. Due to the influence of human activities, the wildlife resources in the surveyed area have been sharply reduced. No endangered or protected plants and animals in the project area were reported in the EIAs. The EIA report opines in general the construction of the project will not change the ecological structure and the characteristics of biodiversity.

Surface water bodies near the project include the Baoshan River and the Burhaton River. According to the EIA, there is no hydraulic connection between the local water source well and the groundwater of the mining area, and the project production has no influence on the drinking water of its residents. SRK suggests that the company establish an emergency water supply plan to address issues such as changes in groundwater levels. If the development affects the water usage of surrounding communities, alternative water sources can be provided. The mine dewatering water of the project are collected and reused for mining and processing. Jilin Hanfeng stated that all processing wastewater and mine dewatering water of the project are reused and shall not be discharged. SRK recommends the company construct an effective drainage system to divert run-off from undisturbed areas around disturbed areas. In addition, some prevention measures, such as surface hardening, ground seepage control and second containment facility, are recommended to mitigate the water pollution risks.

During this site visit, SRK noticed that the waste rocks from the project were temporarily dumped near the portal of shaft in the mining area and processing plant. Jilin Hanfeng stated that the waste rock is mainly used for underground backfilling. SRK has sighted some former waste rock dumps on site and one of them has been rehabilitated. No geochemical characterization of waste rocks or acid rock drainage ("ARD") assessment has been sighted as part of this review. However, the EIA concluded that the waste rock from the project was not classified as hazardous waste. At present, the tailings of the project are discharged into the TSF. During the time of SRK's site visit, SRK did not observed any evidence of leaching or ARD impacts.

The dust emissions sources for the project are mainly from drilling, explosion, ore crushing and screening, tailings storage facility, waste rock dump, open areas and movement of vehicles and mobile equipment. SRK sighted that dust removers were only installed in the Lishan processing plant. SRK has sighted minor dust generation in the TSF during this site visit.

The hazardous materials generated by the project mainly consists of hydrocarbons (i.e. waste oils), processing reagents, chemical and oil containers, explosives, etc. There is a semi-underground diesel tank on site, and the ground has been hardened. A hazardous waste storage workshop is also set up on site to store waste oil. During the site visit SRK inspected this explosive magazine, and it is SRK's opinion that it is a secure facility that is designed and managed in accordance with relevant

Chinese National requirements. SRK recommends that the collected waste oil and dangerous chemical be stored with secondary containment which is in line with the recognised international industry management practices.

### 13.5.5 Jintai Project

Due to the restriction of geological and soil conditions, as well as the frequent human activities around the area, the native vegetation no longer exists in the project area. The main vegetation types in the area are shrub grass and secondary vegetation. The forest coverage rate of the district is about 30%, and the trees are mainly Yunnan pine and blue eucalyptus. In addition, a small amount of sloping farmland is distributed around the project area, and the main crops are corn, beans and flue-cured tobacco. During the EIA survey, gold buckwheat (*Fagopyrum dibotrys*), which is National second-class protected plants, was found near the mining area (outside the mine site boundary). No old and famous trees were found within the EIA survey area. Four species of national second-class protected wild animals were found to in the project's survey area, which consist of pine sparrowhawk (*Accipiter virgatus*), common buzzard (*Buteo buteo*), kestrel (*Falco tinnunculus*) and leopard cat (*Prionailurus bengalensis*). The EIA concluded that with better management, the operation of the project would not have a significant impact on the diversity and distribution pattern of vegetation in this area and would have a lesser impact on wildlife.

Surface water bodies near the project include the Heihui River and the Liantie River. The Heihui River flows by the west of the mine site. The Liantie River is a tributary of the Heihui River, which flows from east to west into the Heihui River and is located to the south outside the mine area. The project's domestic water sources are drawn from the same springs as the local population. The project's supplementary water source for production comes from the Heihui River, which is also used for irrigation of the local villagers' farmland. The EIA predicted that the mining would not affect the drinking water sources of the surrounding villages. SRK recommends that it would be good for the company to develop an emergency response plan for water supply to cope with problems which may be caused by changes in groundwater table and pollution accident. The settling ponds are recommended to collect and dispose the leaching water from waste rock dump and mine water from open pit. All production wastewater from the heap leaching process will be reused and not discharged, and the heap leaching production facilities are designed and to be constructed with anti-seepage measures. SRK noted the exceedance of arsenic levels in soil at the mine site during the environmental baseline study. The EIA report opines that this is related to the co-occurrence of arsenic in the gold ore formation process and that the project is located in an area where the background value of arsenic is high. In August 2022, the 209th Geological Team of Yunnan Nuclear Industry conducted a report on the current status of major heavy metals in the soil and the background survey of the surrounding areas of the Xidengping Gold Mine in Eryuan County. The report concluded that the current background values of arsenic in the soil both within and around the mining area exceed the Category II screening value (60 mg/kg) specified in the "Soil Environmental Quality Standards for Soil Pollution Risk Management and Control of Construction Land (Trial)" (GB36600-2018). The other major heavy metals did not exceed the limit values. During this site visit, SRK observed the drainage ditch was well constructed around the leaching heap. Emergency pond and rainwater collection pond were constructed downstream of the leaching heap. The leach heap was paved with HDPE membrane and bentonite to prevent seepage. SRK sighted groundwater monitoring boreholes were utilized around the leaching heap. The company stated that qualified third party tested groundwater samples on a quarterly basis.

The waste rock was discharged into the waste rock dumps next to the open pit of the V1 ore body. The EIA report states that the heap leaching residue are hazardous waste. The project's heap leaching residue is to be disposed of in situ and impermeable measures will be adopted to prevent leakage. During the site visit, SRK noted the stripped topsoil were collected and rehabilitated. No geochemical characterization of waste rocks or acid rock drainage ("ARD") assessment has been sighted as part of this review. However, the EIA concluded that the waste rock from the project was not classified as hazardous waste. During the time of SRK's site visit, SRK did not observed any evidence of leaching or ARD impacts.

The dust emissions sources for the project are mainly from ore crushing, ore stockpile, waste rock dump, open areas and movement of vehicles and mobile equipment. The project's EIA report concluded that the operation of the project would have a minor impact on the ambient air. During this site visit, SRK observed that a certain amount of dust was generated when vehicles passed over the haul road. Water sprinkling was adopted to mitigate the dust emission on site.

No explosives will be used in the operation of the project and therefore there will be no explosives store on site. For this project, hazardous substances include mainly leaching reagents and hydrocarbons (i.e. waste oils). The handling, storage and transportation of hazardous materials shall prevent leakage, overflow or other accidental discharge into soil, surface water and groundwater. SRK suggests taking measures to mitigate the risk of pollution caused by leakage, such as surface hardening and second containment facility to reduce spillage and avoid flowing into key areas, and collected waste oil shall be handed over to a local specialized company for disposal. During the site visit, SRK noted that the leaching reagents were stored in a well protected room. SRK recommends that the leaching reagents purchase, transportation, handling/storage, use, equipment decommissioning, operation safety, emergency response, training, etc. should comply with the Chinese legal requirements and the standards of the International Cyanide Management Code.

### 13.6 Occupational Health and Safety

A well developed and comprehensive safety management system comprises site inductions, site policies, safe work procedures, training, risk/hazard management (including signage), use of personal protective equipment ("PPE"), emergency response process, incident/accident reporting, an onsite first aid/medical centre, designated safety responsibilities for site personnel, regular safety meetings and a work permit/tagging system.

SRK has reviewed the safety management systems and emergency response plans as provided by the Company and is of the opinion that the reports cover items that are generally in line with recognised Chinese industry practices and Chinese safety regulations. During this site visit, SRK observed that safety signs were in place, safety provisions and rules were also displayed within the work areas, guard railings were installed on all gantries, and proper personal protection equipment was provided and was being used by the workers, such as hardhats. SRK thinks more PPE could be given to workers, such as earplugs and dust masks.

SRK has sighted the statistics of work-related injury records in the last three years for the Project. The statistics show that there was one fatal accident which occurred for Chifeng Huatai in 2022 and Jilin Hanfeng in 2023 respectively. On May 18, 2022, the Songshan District People's Government of Chifeng City issued a reply regarding the closure of Huatai Mining "3.16" collapse accident, agreeing with the findings of the accident investigation team. The direct cause of the accident was the workers' violation of underground work regulations. The accident was classified as a general safety liability

incident. Huatai Mining has developed the "Lianhuashan Mining Area #5 Mining Zone Safety Rectification Plan" in response to the accident and has implemented specific rectification measures in accordance with the plan. According to the accident investigation report issued by the Longjing Municipal Government's Accident Investigation Team on June 30, 2023, Jilin Hanfeng "6.4" falling accident was classified as a general safety liability accident, in which the worker's violation of operational procedures led to his own death. The report concluded that the on-site rescue and response measures were appropriate, and post-accident follow-up was orderly. No secondary disasters or additional incidents occurred during the emergency response. SRK recommends the company conduct safety record and develop incident analysis reports for the possible injuries in future. The proposed reports analysed the cause of injuries and identified measures to prevent a recurrence, which are in line with international recognized OHS accident monitoring practice.

### 13.7 Site Closure Planning and Rehabilitation

The Chinese national requirements for mine closure are covered under Article 21 of the Mineral Resources Law of People's Republic of China (2023), the Rules for Implementation of the Mineral Resources Law of the People's Republic of China, the Mine Site Geological Environment Protection Regulations (2019), and the Land Rehabilitation Regulation (2011) issued by the State Council. In summary, these legislative requirements cover the need to conduct geological environment protection and land rehabilitation.

There is currently no overall operational closure planning process in place for the Project that is in line with the recognised international industry management practices. However, SRK was provided with a number of Project's Geological Environment Protection and Land Reclamation Plans which describes the proposed rehabilitation of the mine sites.

#### 13.7.1 Chifeng Jilong

- The Geological Environment Protection and Land Reclamation Plan for the Zhuanshanzi Gold Mine was produced by Inner Mongolia Huadi Environmental Consulting Ltd. in March 2024. The plan states that the total cost of static investment is RMB15,024,500, of which the static investment of mine geological environment is RMB 1,233,400, and the land reclamation is RMB 13,791,100.

#### 13.7.2 Chifeng Huatai

- The Geological Environment Protection and Land Reclamation Plan for the Honghuagou #1 Mining Section was produced by China Building Materials Industry Geological Survey Center Liaoning Team in April 2022. The plan states that the investment on the geological environmental protection is RMB21,365,400.
- The Geological Environment Protection Plan for the Lianhuashan #5 Mining Section was produced by China Building Materials Industry Geological Survey Center Liaoning Team in June 2020. The plan states that the investment on the geological environmental protection is RMB1,947,900.
- The Geological Environment Protection Plan for the Lianhuashan #3 and #7 Orebody was produced by China Building Materials Industry Geological Survey Center Liaoning Team in April

2020. The plan states that the investment on the geological environmental protection is RMB2,002,200.

- The Geological Environment Protection and Land Reclamation Plan for the Pengjiagou Mining Section was produced by China Building Materials Industry Geological Survey Center Liaoning Team in March 2021. The plan states that the investment on the geological environmental protection is RMB6,433,500.
- The Geological Environment Protection and Land Reclamation Plan for the Lianhuashan #26 Orebody was produced by Inner Mongolia No.10 Geological Mineral Exploration and Development Ltd. and Chifeng Guoyuan Real Estate Evaluation Ltd. in July 2014. The plan states that the investment on the geological environmental protection is RMB1,222,100.
- The Geological Environment Protection and Land Reclamation Plan for the Honghuagou #86 Orebody was produced by China Building Materials Industry Geological Survey Center Liaoning Team in December 2021. The plan states that the investment on the geological environmental protection is RMB3,549,000.

### 13.7.3 Liaoning Wulong

- The Geological Environment Protection and Land Reclamation Plan for Liaoning Wulong Gold Mine was produced by Liaoning Nonferrous Geological Team 103 Ltd in July 2020. The plan states that the dynamic investment on the geological environmental protection and land reclamation are RMB 35,895,100 and RMB3,917,400, respectively.

### 13.7.4 Jilin Hanfeng

- The Geological Environment Protection and Land Reclamation Plan for the Dongfeng Mine was produced by Changchun Xiaohua Mineral Science and Technology Ltd. in November 2016. The plan states that the investment on the geological environmental protection and land reclamation are RMB6,622,727.
- The Geological Environment Protection and Land Reclamation Plan for the Lishan Mine was produced by Changchun Xiaohua Mineral Science and Technology Ltd. in July 2021. The plan states that the investment on the geological environmental protection and land reclamation are RMB15,313,300.

### 13.7.5 Yunnan Jintai

- The Geological Environment Protection and Land Reclamation Plan for the Xidengping Gold Mine was produced by Southwest Nengkuang Construction Engineering Ltd. and Yunnan Jinrang Technology Ltd. in January 2022. The plan states that the investment on the geological environmental protection and land reclamation are RMB1,182,200 and RMB4,942,000, respectively.

SRK notes that the above-mentioned geological environmental protection and land reclamation plans for the Project are generally in line with the relevant regulations and recognised Chinese industry practices. According to the Chinese legal requirements, a mine geological environment treatment and restoration fund account should be established by the mine. The company provided information about the accounts, and SRK opines that the Project generally complied with the requirements of the

relevant regulations. In addition, during this site visit SRK observed that Chifeng Huatai and Chifeng Jilong's TSF have both been partially conducted reclamation.

## **13.8 Social Aspects**

### **13.8.1 Jilong Project**

The project is located 98km to the east of Chifeng City, Inner Mongolia Autonomous Region and is surrounded mainly by farmland and forest. The nearest settlement is Fumin Village, with about a hundred households, mostly Han Chinese, with a few Mongolians.

During this site visit, Chifeng Jilong reported that there are no environmental non-compliance notices or fines for the project. Chifeng Jilong also stated that there are no natural reserves or significant cultural heritage sites within or surrounding the project area; and the EIA report also does not report any natural reserves or significant cultural heritage sites within or surrounding the project.

The EIA report for the Chifeng Jilong Mining Ltd. Gold Mine Mining and Processing Project (400 tpd) provided the public participation surveys for the project construction. The survey results showed 83.33% personal support for the project and there are no people who are opposed to the project in the survey. In terms of the impact on local environmental quality, most of the public's concerns focused on ecological damage, accounting for 36.67% of the total number of respondents. Other EIA reports for the Jilong Project also show that there were no objections during the public participation process.

Chifeng Jilong reported that the company had done a lot of work to maintain community relations, including building a primary school in Aohanqi, providing free waste rock to nearby residents to build roads, and providing free vehicles for residents to use.

### **13.8.2 Huatai Project**

The project is located in Wangfu Town, Chifeng City, Inner Mongolia Autonomous Region and is surrounded mainly by farmland and forest. The surrounding communities are predominantly Han Chinese.

During this site visit, Chifeng Huatai reported that there are no environmental non-compliance notices or fines for the project. Chifeng Huatai also stated that there are no natural reserves or significant cultural heritage sites within or surrounding the project area; and the EIA report also does not report any natural reserves or significant cultural heritage sites within or surrounding the project.

SRK reviewed the environmental impact assessment reports provided by the company. The reports, which include detailed results of public participation, show that the majority of the public supports the project's operation, with no objections raised. Chifeng Huatai stated that the company has good relations with the local community and has donated to it for COVID-19. SRK has sighted the receipt for the above donation.

### **13.8.3 Wulong Project**

The project is located in Zhen'an District, Dandong City, Liaoning Province and is surrounded mainly by farmland and forest. During this site visit, SRK noted that settlements dotted the area around the

mine site. The surrounding communities are predominantly Han Chinese. Liaoning Wulong stated that the company has good relations with the local community.

Liaoning Wulong also stated that there are no natural reserves or significant cultural heritage sites within or surrounding the project area; and the EIA report also does not report any natural reserves or significant cultural heritage sites within or surrounding the project.

The EIA report for the Liaoning Wulong Gold Mine Development Project provided the public participation surveys for the project construction. The survey results showed 100% personal support for the project. The respondents believed that the project had a positive effect on the local area, both economic and social. They also suggested that it would be good if the company has regular environmental protection measures in place to ensure that surface and groundwater are not polluted. And air pollutants and factory boundary noise are discharged in a stable manner. In addition, due to historical reasons, there are still some residents waiting to be relocated in the mining area.

In January 2020, the company signed a waste rock donation agreement with Banshi Village, giving 60,000 m<sup>3</sup> of waste rock. In addition, the company also donated RMB 5,000 to the village primary school on Teachers' Day 2022.

#### 13.8.4 Hanfeng Project

The project is located in Tianbaoshan Town, Longjing City, Jilin Province and is surrounded mainly by farmland and forest. The surrounding communities are predominantly Han Chinese and Korean. Jilin Hanfeng stated that the company has good relations with the local community.

During this site visit, Jilin Hanfeng reported that there are no environmental non-compliance notices or fines for the project. Jilin Hanfeng also stated that there are no natural reserves or significant cultural heritage sites within or surrounding the project area; and the EIA reports also do not report any natural reserves or significant cultural heritage sites within or surrounding the project.

The EIA reports for the project provided the public participation surveys for the project construction. The survey results of EIA for the Tianbaoshan Mine Area Residual Resources Recovery and Utilization Project showed 89% personal support for the project. The local residents did raise the impact on surface water quality and local employment as the key concerns for the project's development. The survey results of EIA for the Lishan-xinxing Mine Area Lead-Zinc Mining Expansion Project showed that the respondents have no objection to the construction of this project. The survey results of EIA for the Lishan Processing Plant Project showed most of the affected residents in the project area are in favor of the construction of the project. No objections were raised during the public participation for the EIA of Jilin Hanfeng Lishan Mining Area Expansion Project (0.6Mtpa).

#### 13.8.5 Jintai Project

The project is located 20 km to the southwest of Eryuan County, Yunnan Province and is surrounded mainly by farmland and forest. The project is administrated by Liantie Township and the surrounding villages are predominantly Bai and Han Chinese.

Yunnan Jintai stated that there are no natural reserves or significant cultural heritage sites within or surrounding the project area; and the EIA reports also do not report any natural reserves or significant cultural heritage sites within or surrounding the project. During the site visit, SRK was informed that

more than 30 cemeteries within the mine rights have been relocated through compensation agreements with villagers. Yunnan Jintai stated that the forest and land use procedures had been completed. SRK has sighted part of land and forest use approvals/permits. However, SRK observed some cattle from nearby villagers grazing within the mining right during the site visit. Yunnan Jintai responded that in the future fences will be installed along the boundary of the mine site to keep cattle out.

The original EIA report for the project provided the public participation surveys for the project construction. The survey results showed 98.5% personal support for the project and 100% group support. During the latest EIA publicity period, no opinions and suggestions from personals and groups were received.

## 14 Capital and Operating Costs

The mines owned by the five mining companies all have a long production history. Capital expenditures (“Capex”) for construction of the mines, ore processing plants and onsite facilities had been invested in history. The Jilong, Huatai, Wulong, and Hanfeng Projects are underground mines, and the Jintai Project is an open pit mine.

### 14.1 Jilong Project

#### 14.1.1 Capital Expenditures

##### Sustaining

Sustaining capital includes capital development and all costs related to the acquisition, replacement, or major overhaul of assets during the mine life required to sustain operations. According to the data provided by Jilong Mining, the capital expenditures for the last three years from 2021 to 2023 are shown in Table 14-1.

Capital expenditures encompass initial and expansion construction, sustaining capital, exploration, and sunk capital, of which sunk capital represents the total of initial and expansion construction, exploration, and sustaining capital because SRK does not obtain the breakdown of these three components. To forecast sustaining capital over the LOM, SRK has applied an average sustaining unit cost of approximately 324 RMB per milled ton, based on sustaining data from 2023 through 2024 Q3.

**Table 14-1: Jilong Capital Expenditures from 2021 to 2024 Q3**

Year	Unit	2021	2022	2023	2024 Q3
<b>Initial/Expansion</b>	Million RMB	-	-	88.57	36.7
<b>Sustaining</b>	Million RMB	-	-	69.95	33.94
<b>Exploration</b>	Million RMB	-	-	-	0.71
<b>Sunk Capital</b>	Million RMB	44.43	74.18	-	-

Source: Client

##### Expansion

Jilong Mining has completed new preliminary design study for expansion zone (zone 5, zone 6 and zone 7), the detailed items are in Table 14-2. The construction period is three years and is estimated to be finished in 2026.

**Table 14-2: Initial Capital Expenditures for Jilong Expansion**

Item	Investment ('0000 RMB)
<b>Mining</b>	8,970
<b>Water supply and drainage</b>	300
<b>Power supply and communication</b>	570

Item	Investment ('0000 RMB)
Heating and ventilation	300
General plan transportation	450
Machine repairment	300
Environment	500
Other expenses	1,000
Contingency	860
Working capital	525
<b>Total project investment</b>	<b>13,775</b>

Source: Client

Jilong Mining has a deeper expansion for zone 1, zone 2, and zone 3, the detailed items are in Table 14-2. The construction period is estimated to be finished in 2025 with the investment of RMB 59 mln.

**Table 14-3: Initial Capital Expenditures for Jilong Deeper Expansion**

Item	Investment ('0000 RMB)	Already Finished
Part One: Engineering Costs	5,296	
Drifts and crosscuts	3,500	
Construction	500	
Equipment purchase	1,200	
Equipment installation	96	
Part 2: Other expenses	305	
land acquisition	30	YES
Engineering construction supervision fees	80	
Construction management fee	30	
Early entry and training fees for employees	15	
Trial Production cost	20	
Production tool purchase	13	YES
Office and lifestyle	12	YES
Geological exploration	30	YES
Design	25	YES
Other start-up expenses	50	
Total of Parts 1 and 2	5,601	
Part Three: Project Contingency	392	
Total of Parts 1, 2 and 3	5,993	
Construction period interest	-	
Working capital	460	
<b>total project investment</b>	<b>6,453</b>

### 14.1.2 Historical Operating Cost

The total operating cash costs from 2021 to 2024 Q3, which exclude depreciation, amortization, and financial costs, are presented in Table 14-4. Table 14-5 presents the unit costs for the same period, along with the average unit cost and the unit cost for TEM (technical economic model) input.

**Table 14-4: Operating Costs from 2021 to 2024 Q3 in Jilong Project**

Item	Unit	2021	2022	2023	2024 Q3
Labor	RMB M	58.90	63.14	61.14	64.52
Material	RMB M	19.19	24.47	24.24	27.08
Electricity	RMB M	11.04	10.74	10.76	13.44
Contractors	RMB M	-	-	-	-

Service	RMB/t	13.14	13.21	4.25	0.52	7.52	13.21
Safety	RMB/t	27.56	26.19	20.02	41.12	29.05	41.12
Repairment	RMB/t	9.90	10.95	11.05	1.46	8.14	11.05
Others	RMB/t	3.59	3.44	1.38	0.55	2.18	3.59
Taxes and surcharges	RMB/t	118.10	104.55	414.78	113.03	186.72	186.72
Selling costs	RMB/t	0.57	0.66	0.76	0.02	0.49	0.76
G&A costs	RMB/t	210.25	199.34	282.57	172.28	215.09	282.57
R&D costs	RMB/t	70.89	54.89	133.24	97.33	89.55	133.24

Source: Client

<sup>1</sup> The TEM input is higher than the average unit cost because the milled tonnage at Jilong Mine exceeds the mining tonnage due to comprehensive utilization, which results in a lower overall unit cost. As a result, SRK adjusted the unit cost upward to a more reasonable level.

### 14.1.3 Forecasted Operating Cost

The operating cost over the LOM is shown in Table 14-6.

**Table 14-6: Operating Cost Forecast in Jilong Project (Million RMB)**

Item	2024 Q4	2025	2026	2027	2028	2029	2030	2031	2032

## 14.2 Huatai Project

### 14.2.1 Capital Expenditures

Table 14-7 shows the capital expenditures from 2021 to 2024 Q3. The Huatai Gold Mine plans to expand its production in the near future.

Capital expenditures encompass initial and expansion construction, sustaining capital, exploration, and sunk capital, of which sunk capital represents the total of initial and expansion construction, exploration, and sustaining capital because SRK does not obtain the breakdown of these three components.

Huatai Gold Mine has no production in 2023 and 2024. In forecasting sustaining capital over the LOM, SRK used the sustaining unit costs from 2021 and 2022. These costs were adjusted to exclude expansion and exploration activities, resulting in an estimated sustaining unit cost of approximately 162 RMB per milled ton.

**Table 14-7: Huatai Capital Expenditures from 2021 to 2024 Q3**

Year	Unit	2021	2022	2023	2024 Q3
Initial/Expansion	Million RMB	-	-	-	-
Sustaining	Million RMB	-	-	8.55	8.69
Exploration	Million RMB	-	-	-	-
Sunk Capital	Million RMB	48.87	14.31	-	-

Source: Client

### Expansion

The Huatai Mine consists of six gold mines, with plans to expand production by construction for each mine. Table 14-8 presents the total budget and timeline allocated to each project, as determined by the respective feasibility studies. Due to the limitations of the processing plant's capacity, SRK has assumed that each expansion will take three years to complete, with the construction start date based on the LOM.

**Table 14-8: Huatai Future Expansion**

Project	Budget ('0000 RMB)	Construction Period (Year)
Lianhuashan #5 Mining Zone	3,706	2024-2026
Honghuagou #1 Mining Zone	11,358	2026-2028
Lianhuashan #3&#7 Vein	2,113	2038-2040
Lianhuashan #26 Vein	2,237	2045-2047

Project	Budget ('0000 RMB)	Construction Period (Year)
Pengjiagou Mine	4,483	2047-2049

Source: Client

### 14.2.2 Historical Operating Cost

The total operating cash costs from 2021 to 2024 Q3, which exclude depreciation, amortization, and financial costs, are presented in Table 14-9. Table 14-10 presents the unit costs for the same period, along with the average unit cost and the unit cost for TEM input.

**Table 14-9: Operating Costs from 2021 to 2024 Q3 in Huatai Project**

Item	Unit	2021	2022	2023	2024 Q3
Labor	RMB M	28.10	4.72	3.28	-

## 14.3 Wulong Project

### 14.3.1 Capital Expenditures

Table 14-12 shows the capital expenditures from 2021 to 2024 Q3. Capital expenditures encompass initial and expansion construction, sustaining capital, exploration, and sunk capital, of which sunk capital represents the total of initial and expansion construction, exploration, and sustaining capital because SRK does not obtain the breakdown of these three components. To forecast sustaining capital over the LOM, SRK has applied an average sustaining unit cost of approximately 511 RMB per milled ton, based on sustaining data from 2023 through 2024 Q3.

**Table 14-12: Wulong Capital Expenditures from 2021 to 2024 Q3**

Year	Unit	2021	2022	2023	2024 Q3

Source: Client

Notes:

<sup>1</sup> The TEM input is higher than the average unit cost because the milled tonnage at Wulong Mine exceeds the mining tonnage due to comprehensive utilization, which results in a lower overall unit cost. As a result, SRK adjusted the unit cost upward to a more reasonable level.

### 14.3.3 Forecasted Operating Cost

The operating cost over the LOM is shown in Table 14-15.

Table 14-15: Operating Cost Forecast in Wulong Project (Million RMB)

Item	2024 Q4	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035

## 14.4 Hanfeng Project

### 14.4.1 Capital Expenditures

Hanfeng Mining operate two mines: the Lishan Mine and the Dongfeng Mine. Only the Lower Part (Stage 1) of the Lishan Mine was considered in Ore Reserves estimation. Currently, this Lower Part is under construction and has no production.

The capital expenditure data of the Upper Part of the Lishan Mine and the Dongfeng Mine is referenced for the economic analysis of the Lower Part of the Lishan Mine.

The Upper Part of the Lishan Mine, along with the Dongfeng Mine, remains in production. Table 14-16 shows the capital expenditures from 2021 to 2024 Q3. Capital expenditures encompass initial and expansion construction, sustaining capital, exploration, and sunk capital, of which sunk capital represents the total of initial and expansion construction, exploration, and sustaining capital because SRK does not obtain the breakdown of these three components. To forecast sustaining capital over the LOM, SRK has applied an average sustaining unit cost of approximately 80 RMB per milled ton, based on sustaining data from 2023 through 2024 Q3.

**Table 14-16: Hanfeng (Upper Part of the Lishan Mine and the Dongfeng Mine) Capital Expenditures from 2021 to 2024 Q3**

Year	Unit	2021	2022	2023	2024 Q3
Initial/Expansion	Million RMB	-	-	31.77	65.44
Sustaining	Million RMB	-	-	30.52	27.56
Exploration	Million RMB	-	-	-	1.00
Sunk Capital	Million RMB	65.51	76.76	-	-

Source: Client

#### 14.4.2 Historical Operating Cost

SRK summarised the historical operating cost data from 2020 to 2022 for the Upper Part of the Lishan Mine and the Dongfeng Mine. The total operating cash costs from 2021 to 2024 Q3, which exclude depreciation, amortization, and financial costs, are presented in Table 14-17. Table 14-18 presents the unit costs for the same period, along with the average unit cost and the unit cost for TEM input.

**Table 14-17: Operating Costs from 2021 to 2024 Q3 in Hanfeng Project**

Item	Unit	2021	2022	2023	2024 Q3
Labor	RMB M	26	37	25	77
Material	RMB M	18	23	12	18

Repairment	RMB/t	1.18	0.68	0.66	0.34	0.71	0.57
Others	RMB/t	2.51	1.57	1.50	1.05	1.65	1.32
Taxes and surcharges	RMB/t	15.49	16.83	8.54	22.01	16.10	12.88
Selling costs	RMB/t	0.23	0.27	0.25	-	0.19	0.15
G&A costs	RMB/t	30.84	21.38	33.96	23.95	27.00	21.60
R&D costs	RMB/t	-	-	-	-	-	-

Source: Client

<sup>1</sup> The unit cost in the TEM input is lower than the average unit cost because the historical costs include both Lishan Mine and Dongfeng Mine. As a result, SRK adjusted the unit cost downward to a more reasonable level.

#### 14.4.3 Forecasted Operating Cost

The operating cost over the LOM is shown in Table 14-19.

**Table 14-19: Operating Cost Forecast in Hanfeng Project (Million RMB)**

Item	2024 Q4	2025	2026	2027	2028	2029	2030	2031	2032

### 14.5 Jintai Project

#### 14.5.1 Capital Expenditures

Jintai has started operation since 2023. Table 14-20 is the historical capital expenditure. SRK used the averaged unit cost, approximately 24 RMB/milled ton, as the forecasted sustaining unit cost for the LOM.

**Table 14-20: Jintai capital expenditure from 2021 to 2024 Q3**

Year	Unit	2023	2024 Q3
Initial/Expansion	Million RMB	54.95	3.85
Sustaining	Million RMB	-	9.88

Source: Client

### 14.5.2 Historical Operating Cost

The total operating cash costs from 2023 to 2024 Q3, which exclude depreciation, amortization, and financial costs, are presented in Table 14-21. Table 14-22 presents the unit costs for the same period, along with the average unit cost and the unit cost for TEM input.

**Table 14-21: Operating Costs from 2023 to 2024 Q3 in Jintai Project**

## 15 Economic Analysis

An economic model was created to project annual cash flows and evaluate sensitivities. This economic analysis, which evaluated on a discounted cash flow basis, is solely for the purpose of Ore Reserve estimation.

### 15.1 Historical Price

Metal markets are mature, global markets with reputable smelters and refineries located throughout the world. Figure 15-1 shows the metal price trends for gold, copper, lead and zinc over the past five (5) years from 2019 to 2024, in US\$, which were sourced from the world largest precious metals and base metals website: [www.kitco.com](http://www.kitco.com).

**Figure 15-1: 5-Year Price Trends of Gold, Copper, Lead and Zinc**

Source: World Largest Precious Metals (gold on upper left) and Base Metals (copper on upper right, lead on lower left and zinc on lower right) Website: [www.kitco.com](http://www.kitco.com).

### 15.2 Price Forecast

A gold price of US\$2,050 was used for the calculation of the cut-off grade in the Ore Reserve estimates for the Jilong, Huatai, Wulong and Jintai projects. A zinc price of US\$2,500/t was used for the cut-off grade in Ore Reserve estimate for the Hanfeng project.

The Gold price forecasts and Zinc price forecasts of CMF is shown in Table 15-1, which are used in the technical and economic analysis for the Chifeng Project.

**Table 15-1: Gold and Zinc Price Forecasts**

Commodity	Unit	2024	2025	2026	2027	2028	2029 and after
Gold	US\$/oz	2,480	2,480	2,360	2,220	2,130	2,000
Zinc	US\$/t	2,750	2,650	2,550	2,500	2,500	2,650

Source: Forecasted Prices for Gold and Zinc by CMF in the 3<sup>rd</sup> Quarter of 2024.

## 15.3 Jilong Project

### 15.3.1 Principal Assumptions

The Jilong Project contains 0.92 Mt of Ore Reserves with an average grade of 8.73 g/t Au. SRK conducted an economic analysis based on the following basic assumptions:

- The final product is gold ingot;
- LoM is 9 years within 6 mining zones;
- SRK does not consider future inflation or currency and cost fluctuations; the price and cost remain constant over the LoM.
- Unit sustaining costs, operating costs, mining dilution, mining recovery, and processing recovery rate are considered constants over the LoM;

### Production Schedule

Table 15-2 shows the technical parameters over life of mine, and Figure 15-2 is the mining schedule.

**Table 15-2: Technical Parameters for Jilong Project**

Parameter	Unit	Value over the LoM
Ore Reserves	t	919,059
Au Grade	g/t	8.73
Contained Au	koz	258
Processing Recovery	%	97%
Gold Produced	g	7,781,969
Gold Produced	oz	250,196

Source: SRK

Figure 15-2: Jilong Project Schedule

Source: SRK

Notes:

- <sup>1</sup> The line represents the average gold grade, corresponding to the right axis.
- <sup>2</sup> The column represents the mined amount, corresponding to the left axis.

**Capex**

Jilong Mining has completed new preliminary design study for expansion zone (zone 5, zone 6 and zone 7) and the construction period is three years and is estimated to be finished in 2026. Jilong Mining also has a deeper expansion for zone 1, zone 2, and zone 3, and the construction period is estimated to be finished in 2025.

To forecast sustaining capital over the LOM, SRK has applied an average sustaining unit cost of approximately 324 RMB per milled ton, based on sustaining data from 2023 through 2024 Q3.

Please see Chapter 14.1.1 for more details.

Figure 15-3: Annual Capex over the LoM

Source: SRK

**Opex**

SRK has summarized the TEM input cost, please see Chapter 14.1.2 for more details.

**Figure 15-4: Annual Opex over the LoM**

Source: SRK

**Tax and Surcharges**

Non-income tax, royalties and other surcharges have been considered in Opex. The income tax is 15%.

**Depreciation**

SRK uses the straight-line depreciation method as the economic analysis assumption, and the depreciation period is 9 years.

**Closure Cost**

The closure cost is estimated to be RMB15,024,500 (See Chapter 13.7.1) and is assumed to be distributed across the LoM.

**15.3.2 Financial Net Present Value**

The NPV is about RMB 1,308 mln at a 10% discount rate.

Table 15-3 shows the Total Cash Flow over the LoM. Figure 15-5 shows the net cash flow and Table 15-4 shows the NPV with different discount rate.

Table 15-3: Total Cash Flow over the LoM for Jilong Project (unit: RMB mln)

Item	Total Cash Flow over the LoM

### 15.3.3 Sensitivity Analysis

SRK conducted single factor sensitivity analysis for the Project. The gold price, Capex and Opex are chose to run the sensitivity analysis with  $\pm 30\%$  range. The result is shown in Table 15-5 and Figure 15-6. Price is relatively the most sensitive factor in NPV, however, when price is below 30%, the Project can still be economical.

**Table 15-5: Sensitivity Analysis for Jilong Project at 10% Discount Rate (unit: RMB mln)**

NPV	Opex	Capex	Price
-30%	1,632	1,425	470
-25%	1,578	1,406	610
-20%	1,524	1,386	749

**Figure 15-6: Sensitivity Analysis for Jilong Project at 10% Discount Rate (unit: RMB mln)**

Source: SRK

## 15.4 Huatai Project

### 15.4.1 Principal Assumptions

The Huatai Project contains 1.69 Mt of Ore Reserves with an average grade of 6.2g/t Au. SRK conducted an economic analysis based on the following basic assumptions:

- The final product is gold ingot;
- LoM is 28 years within 5 mining zones;
- SRK does not consider future inflation or currency and cost fluctuations; the price and cost remain constant over the LoM.
- Unit sustaining costs, operating costs, mining dilution, mining recovery, and processing recovery rate are considered constants over the LoM;
- Working capital will be fully recovered when the mine is closed.

### Production Schedule

Table 15-6 shows the technical parameters over life of mine, and Figure 15-7 is the mining schedule.

**Table 15-6: Technical Parameters for Huatai Project**

Parameter	Unit	Value over the LoM
Ore Reserves	t	1,693,160
Au Grade	g/t	6.2
Contained Au	koz	337
Processing Recovery	%	93%
Gold Produced	g	9,796,028
Gold Produced	oz	314,949

Source: SRK

**Figure 15-7: Huatai Project Schedule**

Source: SRK

Notes:

- <sup>1</sup> The line represents the average gold grade, corresponding to the right axis.
- <sup>2</sup> The column represents the mined amount, corresponding to the left axis.

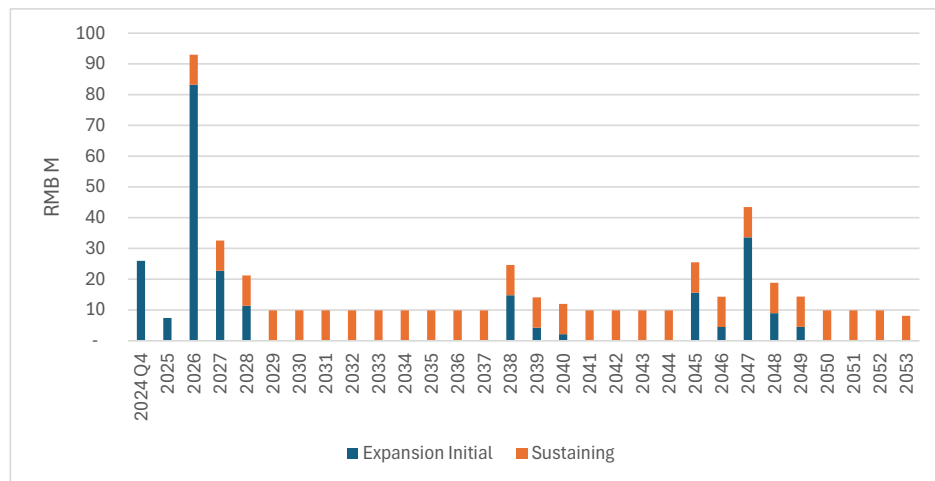

**Capex**

For expansion, SRK has assumed that each expansion will take three years to complete, with the construction start date based on the LOM.

Huatai Gold Mine has no production in 2023 and 2024. In forecasting sustaining capital over the LOM, SRK used the sustaining unit costs from 2021 and 2022. These costs were adjusted to exclude expansion and exploration activities, resulting in an estimated sustaining unit cost of approximately 162 RMB per milled ton.

Please see Chapter 14.2.1 for more details.

**Figure 15-8: Annual Capex over the LoM**

Source: SRK

**Opex**

SRK has summarized the TEM input cost, please see Chapter 14.2.2 for more details.

Figure 15-9: Annual Opex over the LoM

Source: SRK

**Tax and Surcharges**

Non-income tax, royalties and other surcharges have been considered in Opex. The income tax is 25%.

**Depreciation**

SRK uses the straight-line depreciation method as the economic analysis assumption, and the depreciation period is 10 years.

**Closure Cost**

The closure cost is estimated to be RMB36,520,100 (See Chapter 13.7.2) and is assumed to be distributed across the LoM.

**15.4.2 Financial Net Present Value**

The NPV is about RMB 291 mln at a 10% discount rate. Table 15-7 shows the total cash flow over LoM. Table 15-8 shows the net cash flow and Figure 15-10 shows the NPV with different discount rate.

Table 15-7: Total Cash Flow over the LoM for Huatai Project (Unit: RMB mln)

Item	Total Cash Flow over the LoM

### 15.4.3 Sensitivity Analysis

SRK conducted single factor sensitivity analysis for the Project. The gold price, Capex and Opex are chose to run the sensitivity analysis with  $\pm 30\%$  range.

The results, detailed in Table 15-9 and Figure 15-11, indicate that gold price is the most significant factor affecting NPV. The Project becomes uneconomical if the price decreases by 30%.

Table 15-9: Sensitivity Analysis for Huatai Project at 10% Discount Rate (Unit: RMB mln)

NPV	Opex	Capex	Price
-30%	459	350	-32

Source: SRK

Figure 15-11: Sensitivity Analysis for Huatai Project at 10% Discount Rate (Unit: RMB mln)

Source: SRK

## 15.5 Wulong Project

### 15.5.1 Principal Assumptions

The Wulong Project contains 0.98 Mt of Ore Reserves with an average grade of 7.30g/t Au. SRK conducted an economic analysis based on the following basic assumptions:

- The final product is gold ingot;

- LoM is 12 years within 4 mining zones;
- SRK does not consider future inflation or currency and cost fluctuations; the price and cost remain constant over the LoM.
- Unit sustaining costs, operating costs, mining dilution, mining recovery, and processing recovery rate are considered constants over the LoM;
- Working capital will be fully recovered when the mine is closed.

**Production Schedule**

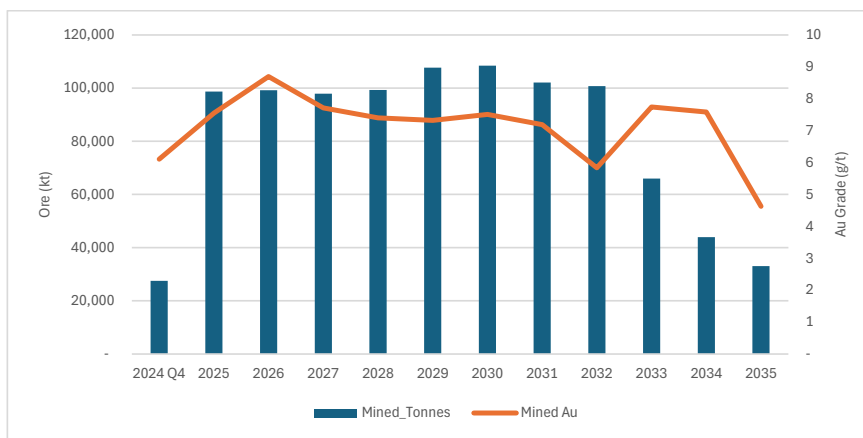

Table 15-10 shows the technical parameters over life of mine, and Figure 15-12 is the mining schedule.

**Table 15-10: Technical Parameters for Wulong Project**

Parameter	Unit	Value over the LoM
Ore Reserves	t	984,409
Au Grade	g/t	7.30
Contained Au	koz	231
Processing Recovery	%	91%
Gold Produced	g	6,537,702
Gold Produced	oz	210,192

Source: SRK

**Figure 15-12: Wulong Project Schedule**

Source: SRK

**Capex**

To forecast sustaining capital over the LOM, SRK has applied an average sustaining unit cost of approximately 511 RMB per milled ton, based on sustaining data from 2023 through 2024 Q3.

Figure 15-13: Annual Capex over the LoM

Source: SRK

Notes:

<sup>3</sup> The line represents the average gold grade, corresponding to the right axis.

<sup>4</sup> The column represents the mined amount, corresponding to the left axis.

**Opex**

SRK has summarized the TEM input cost, please see Chapter 14.3.2 for more details.

Figure 15-14: Annual Opex over the LoM

Source: SRK

**Tax and Surcharges**

Non-income tax, royalties and other surcharges have been considered in Opex. The income tax is 15%.

**Depreciation**

SRK uses the straight-line depreciation method as the economic analysis assumption, and the depreciation period is 10 years.

**Closure Cost**

The closure cost is estimated to be RMB38,812,500 (See Chapter 13.7.3) and is assumed to be distributed across the LoM.

**15.5.2 Financial Net Present Value**

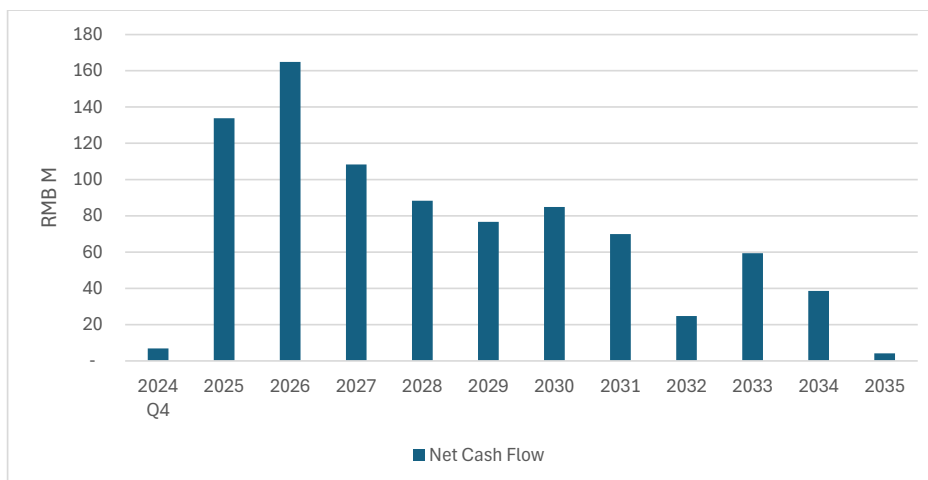

The NPV is about RMB 634 mln at a 10% discount rate. Table 15-11 shows the total cash flow over LoM. Figure 15-15 shows the net cash flow and Table 15-12 shows the NPV with different discount rate.

**Table 15-11: Total Cash Flow over the LoM for Wulong Project (Unit: RMB mln)**

### 15.5.3 Sensitivity Analysis

SRK conducted single factor sensitivity analysis for the Project. The gold price, Capex and Opex are chose to run the sensitivity analysis with  $\pm 30\%$  range. The result is shown in Table 15-13 and Figure 15-16. Price is relatively the most sensitive factor in NPV, however, when price is below 30%, the Project can still be economical.

Table 15-13: Sensitivity Analysis for Wulong Project at 10% Discount Rate (Unit: RMB mln)

NPV	Opex	Capex	Price
-30%	878	729	94

NPV	Opex	Capex	Price

## 15.6 Hanfeng Project

### 15.6.1 Principal Assumptions

The Hanfeng Project contains 3.31 Mt of Ore Reserves with an average grade of 2.45% Zn. SRK conducted an economic analysis based on the following basic assumptions:

- The final product is Zn concentrate;
- LoM is 8 years within 1 mining zones;
- SRK does not consider future inflation or currency and cost fluctuations; the price and cost remain constant over the LoM.

- Unit sustaining costs, operating costs, mining dilution, mining recovery, and processing recovery rate are considered constants over the LoM;
- Working capital will be fully recovered when the mine is closed.

**Production Schedule**

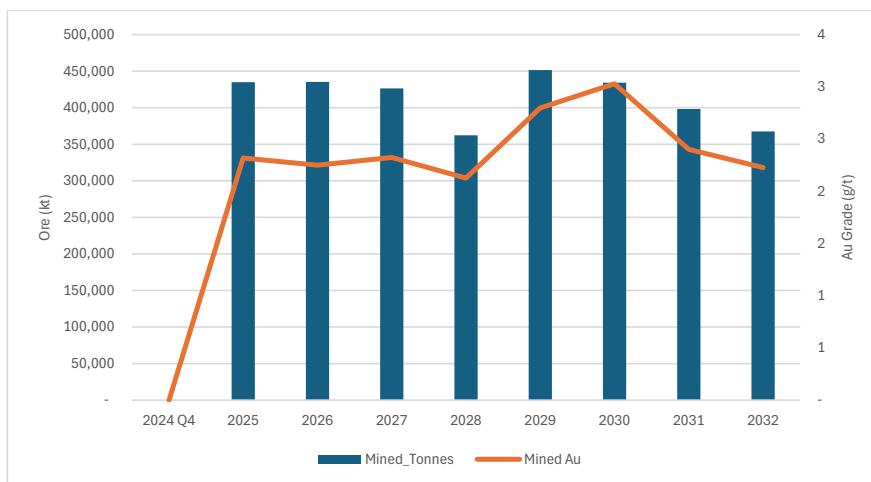

Table 15-14 shows the technical parameters over the LoM, and Figure 15-17 is the mining schedule.

**Table 15-14: Technical Parameters for Hanfeng Project**

Parameter	Unit	Value over the LoM
Ore Reserves	t	3,310,358
Zn Grade	%	2.45
Contained Zn	kt	81
Processing Recovery	%	88%
Zn Concentrate	t	152,385

**Figure 15-17: Hanfeng Project Schedule**

Source: SRK

Notes:

- The line represents the average gold grade, corresponding to the right axis.
- The column represents the mined amount, corresponding to the left axis.

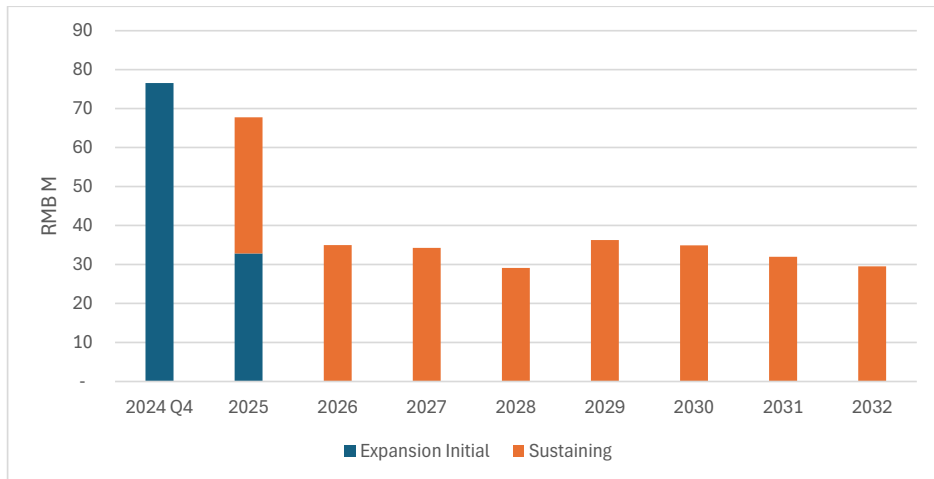

**Capex**

Hanfeng Mining operate two mines: the Lishan Mine and the Dongfeng Mine. Only the Lower Part (Stage 1) of the Lishan Mine was considered in Ore Reserves estimation. The capital expenditure data of the Upper Part of the Lishan Mine and the Dongfeng Mine is referenced for the economic analysis of the Lower Part of the Lishan Mine since they are operational mines.

To forecast sustaining capital over the LOM, SRK has applied an average sustaining unit cost of approximately 80 RMB per milled ton, based on sustaining data from 2023 through 2024 Q3.

Please see Chapter 14.4.1 for more details.

Figure 21-17: Annual Capex over the LoM

Source: SRK

**Opex**

SRK has summarized the TEM input cost, please see Chapter 14.4.2 for more details.

Figure 15-18: Annual Opex over the LoM

Source: SRK

**Tax and Surcharges**

Non-income tax, royalties and other surcharges have been considered in Opex. The income tax is 25%.

**Depreciation**

SRK uses the straight-line depreciation method as the economic analysis assumption, and the depreciation period is 8 years.

**Closure Cost**

The closure cost is estimated to be RMB15,313,300 (See Chapter 13.7.4) and is assumed to be distributed across the LoM.

**15.6.2 Financial Net Present Value**

The NPV is about RMB 39 mln at a 10% discount rate. Table 15-15 shows the total cash flow over LoM. Figure 15-19 shows the net cash flow and Table 15-16 shows the NPV with different discount rate.

**Table 15-15: Total Cash Flow over the LoM for Hanfeng Project (Unit: RMB mln)**

### 15.6.3 Sensitivity Analysis

SRK conducted single factor sensitivity analysis for the Project. The Zn price, Capex and Opex are chose to run the sensitivity analysis with  $\pm 30\%$  range. The result is shown in Table 15-17 and Figure 15-20. The Project becomes uneconomical if the Price decreases by 10%, OPEX increased by 15%, or CAPEX increased by 20%.

## 15.7 Jintai Project

### 15.7.1 Principal Assumptions

The Jintai Project contains 1.37 Mt of Ore Reserves with an average grade of 0.74g/t Au. SRK conducted an economic analysis based on the following basic assumptions:

- The final product is gold ingot;
- LoM is 11 years within 2 open pits;
- SRK does not consider future inflation or currency and cost fluctuations; the price and cost remain constant over the LoM.
- Unit sustaining costs, operating costs, mining dilution, mining recovery, and processing recovery rate are considered constants over the LoM;

- Unit sustaining costs, operating costs, mining dilution, mining recovery, and processing recovery rate are considered constants over the LoM;
- Working capital will be fully recovered when the mine is closed.

**Production Schedule**

Table 15-18 shows the technical parameters over the LoM, and Figure 15-21 is the mining schedule.

**Table 15-18: Technical Parameters for Jintai Project**

Parameter	Unit	Value over the LoM
Ore Reserves	t	1,369,639
Wast	t	2,568,020

**Tax and Surcharges**

Non-income tax, royalties and other surcharges have been considered in Opex. The income tax is 15%.

**Depreciation**

SRK uses the straight-line depreciation method as the economic analysis assumption, and the depreciation period is 11 years.

**Closure Cost**

The closure cost is estimated to be RMB6,124,200 (See Chapter 13.7.5) and is assumed to be distributed across the LoM.

**15.7.2 Financial Net Present Value**

The NPV is about RMB 83 mln at a 10% discount rate. Table 15-19 shows the total cash flow over LoM. Figure 15-24 shows the net cash flow and Table 15-20 shows the NPV with different discount rate.

## 16 Risk Assessment

SRK completed a risk assessment of the specific risks identified for the Chifeng Gold Project in relation to their likelihood of occurrence within the LoM and consequence in accordance with the Exchange to the Listing Rules.

In general, the risk of a project decreases from exploration, through development, to the production stage. The Chifeng Gold's five projects are all advanced projects.

SRK considered various technical aspects which may affect the feasibility and future cash flow of the China Project. SRK's final Risk Assessment is presented in Table 16-1.

**Table 16-1: Risk Assessment for Chifeng Gold Project**

Risk Source/Issue	Likelihood	Consequence	Risk
<b>Jilong Project</b>			
<b>Geology, Mineral Resources and Ore Reserves</b>			
Lack of Significant Mineral Resource	Unlikely	Moderate	Low
Lack of Significant Ore Reserve	Unlikely	Major	Medium
Significant Unexpected Geological Faulting	Possible	Moderate	Medium
Unexpected Groundwater Ingress	Unlikely	Moderate	Low
<b>Mining</b>			
Significant Production Shortfalls	Possible	Moderate	Medium
Significant Geological Structure	Unlikely	Moderate	Low
Excessive Surface Subsidence	Unlikely	Moderate	Low

<b>Capital Costs- Ongoing</b>	Possible	Moderate	Medium
<b>Operating Cost Underestimated</b>	Possible	Moderate	Medium

In the risk assessment, various risk issues have been assessed for Likelihood, Consequence, and Overall Rating. SRK has used a matrix as described below.

The Likelihood of a risk is considered within a certain time frame, e.g., five years, as:

- **Likely:** will probably occur;
- **Possible:** may occur; or
- **Unlikely:** unlikely to occur.

The Consequence of a risk is classified as:

- **Major:** the factor poses an immediate danger to the China Project that, if uncorrected, will have a material effect on the China Project cash flow and performance and could lead a project failure;

- **Moderate:** the factor, if uncorrected, will have a significant effect on the China Project cash flow and performance; or
- **Minor:** the factor, if uncorrected, will have little or no effect on the China Project cash flow and performance.

The overall risk assessment combines the Likelihood and Consequence of a risk and be classified as Low (unlikely and possible minor risks, and unlikely moderate risk), Medium (likely minor, possible moderate, and unlikely major risks) and High (likely moderate and major risks, and possible major risks).

## 17 Conclusions and Recommendations

SRK conducted a full technical review on the Chifeng Gold Project and the conclusions and recommendations of this review have been discussed in each main section or technical discipline of this Report.

The Projects consists of five operating projects; the Jilong, Huatai and Wulong Projects are underground gold mines, the Jintai Project is an open pit gold mine, and the Hanfeng Project, including the Lishan and Dongfeng mines, is an underground lead-zinc polymetallic project. The Jintai Project just started mining operation in the first quarter of 2024, while the other four projects including the Jilong Huatai, Wulong and Hanfeng projects have been in production for many years.

### 17.1 Jilong Project

There are ongoing production exploration programs at the Zhuanshanzi Mine for further Mineral Resources. SRK recommends that Jilong mining conduct a structured QA/QC process for this exploration work, including the level exploration tunnelling, in-fill drilling, sampling, sample preparation, analysis, internal and external checks, and insertion of control samples (i.e. blank, standard and duplicate samples). SRK recommends that Jilong mining retains coarse duplicates and pulp duplicate samples for future examination.

SRK has conducted Mineral Resource and Ore Reserve Estimates under the JORC Code. It is recommended to improve the quality of the grade control model and incorporate it into resource/reserve model.

The processing flowsheet of whole ore cyanidation and Merrill-Crowe process is suitable for the requirements of the ore properties. The production process and equipment are reasonable, and a satisfied gold recovery rate was obtained with no major flaws.

The capacity of the existing TSF is close to the designed capacity while a new TSF with an effective capacity of  $228.4 \times 10^4 \text{m}^3$  is currently in trial operation, which will serve the processing plants for about 14.42 years.

The access and mine design are appropriate. Also, the geotechnical structure and drainage are acceptable during the site visit. There are PFS level studies for each zone with detailed design of underground service.

- The areas visited were clean, reasonably well-ventilated and dry.
- There is minimal geological support underground, verifying that mining is progressing as per plan, and/ or one ore. There is no regular face sampling, hence unable to reconcile the MRE with the actual mining face grade, with ore mined/ moved grades, processed grades and gold produced.
- Reported that the mine does not have sufficient geologists. Reported limited budget for technical support services, and it appears that they generally have limited skilled technical services support.
- On surface they utilise ore/ waste sorting based on size. Material is hoisted to surface and put through a large screen with small material assumed to be ore.

## 17.2 Huatai Project

There are ongoing production exploration programs for further Mineral Resources. SRK recommends that Huatai mining conduct a structured QA/QC process for this exploration work, including the level exploration tunnelling, in-fill drilling, sampling, sample preparation, analysis, internal and external checks, and insertion of control samples (i.e. blank, standard and duplicate samples). SRK recommends that Huatai mining retains coarse duplicates and pulp duplicate samples for future examination.

Traditional CIP technology is adopted for gold recovering. In SRK's opinion, it is reasonable and stable. The satisfactory technical indexes have been achieved, with no major defects.

At the time of SRK site visit, the processing plant was in a state of shutdown. Huatai Mining informed that the reason was that the ongoing technical innovation and the production capacity expansion were underway.

SRK has conducted Mineral Resource and Ore Reserve Estimates under the JORC Code. It is recommended to improve the quality of grade control model and incorporate it into resource/reserve model.

In general, mine of Huatai Project were operated at small scale capacity for a long time. The geotechnical and hydrogeological conditions are not complex to deal with. Therefore, the underground access method, stoping method, and related service systems & machinery are suitable for the mine operations.

In order to ensure normal mining production in the future, the existing operation system and the design needs further supplementation and improvement, which include mainly the following aspects:

- The reconciliation study is recommended in the future. The reconciliation study would help the operation to compare the estimates against production, then improve the estimation getting a higher-level confidence of resource estimates and improve mining operation outcomes.

## 17.3 Wulong Project

There are ongoing production exploration programs for further Mineral Resources. SRK recommends that Wulong mining conduct a structured QA/QC process for this exploration work, including the level exploration tunnelling, in-fill drilling, sampling, sample preparation, analysis, internal and external checks, and insertion of control samples (i.e. blank, standard and duplicate samples). SRK recommends that Wulong mining retains coarse duplicates and pulp duplicate samples for future examination.

SRK has conducted Mineral Resource and Ore Reserve Estimates under the JORC Code. It is recommended to improve the quality of grade control model and incorporate it into resource/reserve model.

Wulong Project has been operating for a long period of time, and there is ongoing production exploration for resource potential. There is no major issue for development and the mine design. During the site visit, SRK notes that the geotechnical structure and drainage are acceptable. Also, there are PFS level of studies for each zone with detailed design of underground service.

Recommendations

- Underground Geological sampling at Wulong Mine has continued throughout 2024, the tunnel sampling data was required to be provided to SRK for the resource model update in alignment with the mining depletion data.
- No mining software derived plan.
- Planning 100ktpa, achieving 60ktpa from underground stopes, supplemented by underground and surface stockpiles, but no ore grade verification of stockpile material.
- There is minimal geological support underground, verifying that mining is progressing as per plan, and/ or one ore. There is no regular face sampling, hence unable to reconcile the MRE with the actual mining face grade, with ore mined/ moved grades, processed grades and gold produced.

The actual dilution rate and recovery rates appear to be inconsistent with the planned targets, as the mining grade is significantly lower than the geological grade. It has been noted by onsite personnel that, in the interest of comprehensive resource utilization, a portion of lower-grade ore has been intentionally blended in. It is recommended that a reconciliation study be conducted to better understand the underlying discrepancies and to facilitate improvements in future production.

#### **17.4 Hanfeng Project**

It is recommended to carry out in-fill drilling exploration and/or underground exploration for the Deeper parts of Lishan and Dongfeng mines.

In order to ensure normal mining production in the future, the existing operation system and the design needs further supplementation and improvement.

#### **17.5 Jintai Project**

SRK has conducted Mineral Resource and Ore Reserve Estimates under the JORC Code. It is recommended to improve the quality of grade control model and incorporate it into resource/reserve model.

SRK considers the mining and stripping methods adopted to be a mature mining technology commonly used in open pit mining practices, and technically both reasonable and feasible. The designed bench height and slope angle are considered reasonable, as well as the small-scale excavator is suitable for selective mining. However, the truck payload (7.8t) is not commonly used in practice. Some larger trucks (30t payload) were observed standing by during site visit. The loading round would be increased then the haulage round would be reduced. But the excavator and truck matching each other would not be a material risk for operation, as the total volume of mining is small.

## Appendix A JORC Code Table 1

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<p><b>Jilong and Huatai Projects</b></p> <ul style="list-style-type: none"> <li>Both projects use the same sampling techniques.</li> <li>Samples were taken from drill cores by splitting along the core axis. The sample length ranges from 0.8m to 1.0m. The weight of samples was between 9.45 kilograms ("kg") and 12.38kg.</li> <li>Samples were collected from tunnels using a channeling method. The sample channel was perpendicular or roughly perpendicular to the strike of mineralised body. The section of channel was 10cm × 5cm, and the sample length ranges from 0.1m to 1.2m. The distance between samples were 6m along drift, and 40 m along transverse drift.</li> <li>Geological logging was completed, and the mineralised intervals were determined by experienced geologists.</li> <li>All samples were submitted to commercial laboratories for assay. Industry standard practice has been applied on site to ensure sample presentivity. The laboratories have applied appropriate QA/QC to sample preparation and appropriate calibration of QA/QC to analytical instruments.</li> </ul> <p><b>Wulong Project</b></p> <ul style="list-style-type: none"> <li>The trench, tunnel and diamond drill core samples were collected.</li> <li>For the Wulong Mine, the tunnel samples were taken by channeling method. The sample channel was perpendicular or roughly perpendicular to the strike of mineralised body. The section of channel was 10cm × 5cm, the length was generally 1.0m, and the maximum length was less than 1.5 m. The distance between samples were 6m along drift, and 40 m along transverse drift.</li> <li>For the Ligunzi Gold Deposit, the trench samples were taken by channeling method. The section of channel was</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>10 cm × 3 cm, and the length was less than 1.5 m. The drill core samples were sampled by 1/2 split core method. The sample length was 1.0 m. The maximum length was 1.5 m, and the minimum length was 0.2 m.</p> <ul style="list-style-type: none"> <li>• For the Haojingou-Ligunzi Deposit, the trench samples were sampled using channeling method. The section of channel was 10 cm × 5 cm, and the length of 0.9m-1.0 m. The surface drilling core samples were sampled by 1/2 split core method. The sample length generally ranges from 0.2 m to 1.5 m.</li> <li>• The tunnel samples positions were determined by the geologists and were sampled by the other workers.</li> <li>• Geological logging was completed, and the mineralised intervals were determined by experienced geologists.</li> <li>• All samples were submitted to commercial laboratories for assay. Industry standard practice has been applied on site to ensure sample presentively. The laboratories have applied appropriate QA/QC to sample preparation and appropriate calibration of QA/QC to analytical instruments.</li> </ul> <p><b>Jintai Project</b></p> <ul style="list-style-type: none"> <li>• Diamond drill core samples were collected.</li> <li>• Drilling &amp; sampling has been conducted by Kunming branch of Yunnan Geological Engineering Survey and Design Institute, Dali Hengchuang Foundation Engineering Co. LTD., the Shandong 6th Geology and Mineral Exploration Institute and Yunnan Southern Geological Exploration Engineering Corporation.</li> <li>• Most of the trenches were not included in the Mineral Resource estimate, just for the purpose of gold domain exploration.</li> <li>• Geological logging was completed, and the mineralised intervals were determined by experienced geologists.</li> <li>• All samples were submitted to commercial laboratories for assay. Industry standard practice has been applied on site to ensure sample presentively. The laboratories have applied appropriate QA/QC to sample preparation and appropriate calibration of QA/QC to analytical instruments.</li> </ul> <p><b>Hanfeng Project</b></p> <ul style="list-style-type: none"> <li>• Diamond drill core samples and underground tunnel samples were collected.</li> <li>• Drilling &amp; sampling of the deep areas for both Lishan and Dongfeng Mines has been conducted by Team 603 of Jilin Province Non-ferrous Geological Exploration Bureau.</li> <li>• Most of the drilling and tunnel samples were included in the Mineral Resource estimate of the deep area.</li> <li>• Geological logging was completed, and the mineralised intervals were determined by experienced geologists.</li> <li>• All samples were submitted to commercial laboratories for assay. Industry standard practice has been applied on site to ensure sample presentively. The laboratories have applied appropriate QA/QC to sample preparation and appropriate calibration of QA/QC to analytical instruments.</li> </ul>

Criteria	JORC Code explanation	Commentary
<p><b>Drilling techniques</b></p>	<ul style="list-style-type: none"> <li>• <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<p><b>Jilong Project</b></p> <ul style="list-style-type: none"> <li>• All drill holes were conducted by XY-4 drill rigs, with a starting diameter of 110mm. After passing through the Quaternary loose sedimentary layers, the diameter of the drill bit was changed to 75 mm until termination of the hole.</li> <li>• The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 25m deep after commencement.</li> <li>• For the Zhuanshanzi #1#2#3&amp;depth Block, the down-hole survey was conducted with YT-1 little caliber compass clinometer.</li> <li>• For the Zhuanshanzi #4#5#6#7 Block, the down-hole survey was conducted with BZM-R-B little caliber compass clinometer.</li> </ul> <p><b>Huatai Project</b></p> <ul style="list-style-type: none"> <li>• The surface drill holes were conducted by XY-4 drill rigs, with a starting diameter of 110 mm. After passing through the Quaternary loose sedimentary layers, the diameter of the drill bit was changed to 75 mm.</li> <li>• The underground holes were conducted by modified XY-2 and XY-4 drill rigs, with a starting diameter of 75 mm until termination.</li> <li>• The collars of the holes were properly surveyed, and down-hole surveying was undertaken at 50m intervals starting at 25m after commencement.</li> <li>• For the Honghuagou #1 Mining Zone, the down-hole survey was conducted with KXP-2 little caliber compass clinometer.</li> <li>• For the Honghuagou #86 Vein, Pengjiagou Deposit and Lianhuashan #26 Vein, the down-hole survey was conducted with CX-6B little caliber compass clinometer.</li> <li>• For the Lianhuashan #5 Mining Zone and #3&amp;7 Vein, the down-hole survey was conducted with S42 little calibre compass clinometer.</li> </ul> <p><b>Wulong Project</b></p> <ul style="list-style-type: none"> <li>• For the Wulong Mine, tunnels were excavated by Wulong Mining. The profile of the tunnel was 1.8-2.0 m × 2.0-2.2 m, and the slope was 0.3%-0.7%.</li> <li>• For the Ligunzi Deposit, the bottom width of trenches is 0.6-0.8 m, the top width varied depending on the looseness of the soil, and the depth of the trenches is at least 0.3 m of the bedrock excavated.</li> <li>• In 2010, two holes were drilled by the diamond wire line core drilling technique with the XY-4 drilling rig. The diameter is 75 mm. Drill holes survey were done with the X.JL compass clinometer. The depth was verified.</li> <li>• The cross -section size of drift was 1.8-2.2 m × 2.0-2.3 m, and the slope was 0.3%-0.7%.</li> <li>• For Haojingou-Ligunzi Deposit, the width of trenches was 1-1.2 m on the top and 0.6-08 m at the bottom. The depth was 0-3 m and at least 0.3 m of the bedrock should be excavated.</li> <li>• A total of 73 surface boreholes were drilled during the detailed exploration period in the exploration license area. The types of drilling rigs were XY-4, XY-44 and XY-B6. The hole's diameter is 75 mm, and the core</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>diameter is 53 mm. A total of 14 underground boreholes were drilled with a hole diameter of 47 mm and the core diameter of 35 mm.</p> <ul style="list-style-type: none"> <li>The borehole depth was verified at the interval of 50 m and after the borehole was finished.</li> <li>The profile of the tunnels along drift was 2.2 m × 2.5 m, and the slope was less than 0.5%. The profile of the raises was 2.0 m × 1.0-1.3 m, and the slope was 50°-60°.</li> </ul> <p><b>Jintai Project</b></p> <ul style="list-style-type: none"> <li>The borehole's diameter is greater than 75 mm, and the core diameter is 55 mm. The cores were cleaned, labelled, and placed regularly. The recovery rates for the whole cores varied from 82% to 100% and for the mineralised cores varied from 81% to 99%.</li> <li>The bottom width of trenches is 0.6m-1.0 m and the top width varied from 2.2 m to 2.5 m. At least 0.3 m of bedrock should be excavated. All the trenches were named regularly.</li> </ul> <p><b>Hanfeng Project</b></p> <ul style="list-style-type: none"> <li><b>Lishan Mine:</b> The section size of the channel sample was 10cm × 3cm, and the sample length is generally 1.0m ~ 1.5m. The sample weight was generally 9.5kg ~ 10.5kg. The relative error between the actual weight and the theoretical weight of the sample is 0.04% ~ 9.76%. A total of 789 samples were collected. The drilling samples were sampled by ½ split core method. The sample length was determined by core recovery, thickness of mineralized body and mineralization. The core was split along the core axis into two halves by the YPK-1 type core splitter. The half was retained as the core, and the other half was bagged and weighed before being sent to the laboratory for analysis. The sample length generally ranged from 1.00m to 1.50m, with a few samples ranging from 0.30m to 0.80m and the longest being 1.90m.</li> <li><b>Dongfeng Mine:</b> The section size of the channel sample was 10cm × 3cm, and the sample length is generally 1.0m ~ 1.5m. The sample weight was generally 7.5kg ~ 8.5kg. The relative error between the actual weight and the theoretical weight of the sample is 0.00% ~ 4.80%. A total of 702 samples were collected. The drilling samples were sampled by ½ split core method. The sample length was determined by core recovery, thickness of mineralized body and mineralization. The core was split along the core axis into two halves by the YPK-1 type core splitter. One half was retained as the core, and the other half was bagged and weighed before being sent to the laboratory for analysis. The sample length generally ranged from 1.00m to 1.50m, with a few samples ranging from 0.30m to 0.80m and the longest being 2.00 m.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample</li> </ul>	<p><b>Jilong Project:</b></p> <ul style="list-style-type: none"> <li>For the Zhuanshanzi #1#2#3&amp;depth Block, the recovery rates for the whole cores varied from 86% to 100%, for</li> </ul>

<b>Geology</b>	<ul style="list-style-type: none"> <li>• <i>Deposit type, geological setting and style of mineralisation.</i></li> </ul>	<p><b>Jilong and Huatai Projects:</b></p> <ul style="list-style-type: none"> <li>• The genetic type is medium-low temperature hydrothermal gold deposit. The gold-bearing quartz veins filled mainly along suitable faults and/or fractures.</li> </ul> <p><b>Wulong Project:</b></p> <ul style="list-style-type: none"> <li>• The Wulong Gold Mine is a large quartz vein type gold mine, the mineralized body is controlled by two groups of fault structures, the north-west trending faults, and the north-east trending faults. The wall rocks are mixed granite, mixed granite gneiss, fine-grained diorite, and granite porphyry et al. The ore type is mainly quartz vein type, and the industrial type of the deposit is gold-bearing quartz single vein type.</li> </ul> <p><b>Jintai Project:</b></p> <ul style="list-style-type: none"> <li>• The metallogenic mechanism of the deposits was that gold was activated and dissolved under the action of high temperature and high pressure by the underground hot brine and entered underground hot water in the form of complex ions to form gold-bearing hydrothermal liquid. The hydrothermal liquid rose along the structure and fracture in the thermal cycle. Near the surface, due to the decrease of temperature and pressure, a large amount of silicon in the hydrothermal liquid (hot spring) precipitated, with a small amount of gold. Due to the large amount of silicon precipitation, the channel was gradually blocked, and the temperature and pressure of the hydrothermal liquid increased. The rapid decrease of temperature and pressure led to the rapid decrease of gold solubility in hot water, with a large amount of gold precipitation near the surface at a certain depth. This process was repeated many times, and gold domains were eventually formed and further enriched in the weathering process.</li> </ul> <p><b>Hanfeng Project:</b></p> <ul style="list-style-type: none"> <li>• Lishan Pb-Zn Deposit (Below the -92m asl) is a zinc polymetallic deposit dominated by zinc ore, with some copper and lead. The mineralised bodies are lenticular and lentil shaped. There are 128 zinc-lead-copper mineralized bodies were defined.</li> <li>• Dongfeng Mo Deposit (above 250m asl) mainly occurs in the porphyritic monzogranite, contact zone of granodiorite and volcanic rock and schistosity zone of quartz diorite porphyry, which are mostly composed of quartz veins and altered breccia.</li> <li>• According to the geological characteristics of the deposit, including the wall rock alteration, ore texture and structure, the Lishan deposit belongs to post-magmatic mesothermal filling metasomatic polymetallic deposit. The Dongfeng deposit belongs to the skarn-type polymetallic deposit.</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:               <ul style="list-style-type: none"> <li>○ easting and northing of the drill hole collar</li> <li>○ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>○ dip and azimuth of the hole</li> <li>○ down hole length and interception depth</li> <li>○ hole length.</li> </ul> </li> <li>• If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<p><b>Jilong Project</b></p> <ul style="list-style-type: none"> <li>• For the Zhuanshanzi #1#2#3&amp;depth Block, it is informed by data from 81 drillholes, for a combined length of 19,078.32m, and 6,240 tunnels, for a combined length of 5,989.89 m, with a total of 14,930 assay samples.</li> <li>• For the Zhuanshanzi #4#5#6#7 Block, it is informed by data from 64 drillholes, for a combined length of 10,810.47m, with a total of 339 assay samples, 55 trenches, for a combined length of 90.69 m, with a total of 106 assay samples, and 12 tunnel, for a combined length of 45.94 m, with a total of 87 assay samples.</li> </ul> <p><b>Huatai Project</b></p> <ul style="list-style-type: none"> <li>• A total of 236 drillholes, for a combined length of 57,043.07m, and 2,029 tunnels, for a combined length of 4,474.51 m, with a total of 6,973 assay samples.</li> <li>• All information of drillholes carried out so far in Jilong and Huatai project area are collected, including collar, elevation, depth, survey etc. and details see database along with this report.</li> </ul> <p><b>Wulong Project</b></p> <ul style="list-style-type: none"> <li>• SRK's estimation of the Mineral Resources documented in this report is informed by data from 139 drillholes, for a combined length of 38,160 m, and 5,601 tunnels, for a combined length of 9,542 m, and 282 trenches, for a combined length of 171 m, with a total of 17,389 assay samples. The boundary of the estimation is the Wulong mining licence, Ligunzi and Haojingou-Ligunzi exploration permits.</li> </ul> <p><b>Jintai Project</b></p> <ul style="list-style-type: none"> <li>• Database used for Mineral Resource estimate contains 208 holes / 14,720.68 m.</li> </ul> <p><b>Hanfeng Project</b></p> <ul style="list-style-type: none"> <li>• As of March, 2024. There were 194 drillholes ( 46,351.96 m) and 102 tunnel samples (477.3m) in the resource database for Lishan Mine and 252 drillholes ( 88,402 m) and 63 tunnel samples (431m) in the database for Dongfeng Mine.</li> </ul>
<b>Data aggregation methods</b>	<ul style="list-style-type: none"> <li>• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>• Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>• The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<p><b>Jilong Project</b></p> <ul style="list-style-type: none"> <li>• Exploration data is reported as the average sample grade over the mineralised intersection. The mineralised domain is defined at cut-off grade of 1.5g/t Au.</li> <li>• Jilong project: For the Zhuanshanzi #1#2#3&amp;depth Block, Capping grade is 52g/t. For the Zhuanshanzi #4#5#6#7 Block, no capping was applied.</li> <li>• Not applicable to this project</li> </ul> <p><b>Huatai Project</b></p> <ul style="list-style-type: none"> <li>• Exploration data is reported as the average sample grade over the mineralised intersection. The mineralised domain is defined at cut-off grade of 1.5 g/t Au.</li> <li>• Huatai project: Capping grade had been applied in six mineralised zones, and details see evaluation of outliers along with this report.</li> </ul>

**Appendix B    Compliance with Chapter 18**

Chapter 18		
18.01	DEFINITIONS AND INTERPRETATION	
18.02-18.04	CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES	1
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.	
18.03	A Mineral Company must:—	
(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—	CPR Executive Summary and Section 3.2 <sup>(1)</sup>
(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or	
	<i>Note: 'control over a majority' means an interest greater than 50%.</i>	
(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which give it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—	CPR Executive Summary and Section 8.10
(a)	Indicated Resources; or	
(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—	CPR Executive Summary and Section 14
(a)	workforce employment;	
(b)	consumables;	
(c)	fuel, electricity, water and other services;	
(d)	on and off-site administration;	
(e)	environmental protection and monitoring;	
(f)	transportation of workforce;	
(g)	product marketing and transport;	
(h)	non-income taxes, royalties and other governmental charges; and	
(i)	contingency allowances;	
	<i>Not e: A Mineral Company must:</i>	
	• <i>set out the components of cash operating costs separately by category;</i>	
	• <i>explain the reason for any departure from the list of items to be included under cash operating costs; and</i>	
	• <i>discuss any material cost items that should be highlighted to investors.</i>	
(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—	CPR Section 15 only for reference
(a)	general, administrative and operating costs;	
(b)	property holding costs; and	
(c)	the cost of any proposed exploration and/or development; and	
	<i>Not e: Capital expenditures do not need to be included in working capital</i>	

Chapter 18		
		<i>requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.</i>
	(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has available sufficient working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.
		CPR Section 15 only for reference
18.04		If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.
		<i>Note</i> : A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.
<b>18.05-18.08</b>	<b>CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS</b>	
18.05		In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—
	(1)	a Competent Person's Report;
		CPR Executive Summary, Section 1 and Section 2.2
	(2)	a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;
		CPR Section 2.4
	(3)	the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;
		CPR Section 3.2 and Section 13.4
	(4)	a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;
		CPR Section 2.3
	(5)	disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and
		CPR Executive Summary and Section 16
	(6)	if relevant and material to the Mineral Company's business operations, information on the following:—
	(a)	project risks arising from environmental, social, and health and safety issues;
		CPR Executive Summary and Section 16
	(b)	any non-governmental organisation impact on sustainability of mineral and/or exploration projects;
		CPR Section 2.3
	(c)	compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;
		CPR Sections 13.2, 13.3
	(d)	sufficient funding plans for remediation, rehabilitation and, closure and removal of facilities in a sustainable manner;
		CPR Section 13.7
	(e)	environmental liabilities of its projects or properties;
		CPR Section 13.5

<b>Chapter 18</b>			
	(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	CPR Section 13.8
	(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	Not applicable. Section 2.3
	(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	CPR Section 13.4
<b>18.06-18.08</b>	<b>Additional disclosure requirements that apply to certain new applicant Mineral Companies</b>		
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.		CPR Section 14
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.		Not applicable <sup>[2]</sup>
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.		CPR Section 10.8 and Section 9
<b>18.09-18.13</b>	<b>RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS</b>		
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—		
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;	
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;	
		<i>Not e: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.</i>	
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and	
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.	
		<i>Note: Material liabilities that remain with the issuer on a disposal must also be discussed.</i>	
<b>18.10-18.11</b>	<b>Requirements that apply to listed issuers</b>		
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.		
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.		

<b>Chapter 18</b>		
<b>18.12-18.13</b>	<b>Requirements that apply to Mineral Companies and listed issuers</b>	
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.	
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.	
<b>18.14-18.17</b>	<b>CONTINUING OBLIGATIONS</b>	
<b>18.14</b>	<b>Disclosure in reports</b>	
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.	
<b>18.15-18.17</b>	<b>Publication of Resources and Reserves</b>	
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.	
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.	
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18. <i>Note</i> : Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.	
<b>18.18-18.27</b>	<b>STATEMENTS ON RESOURCES AND/OR RESERVES</b>	
<b>18.18</b>	<b>Presentation of data</b>	
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.	CPR Executive Summary, Section 8.10 and Section 9
<b>18.19</b>	<b>Basis of evidence</b>	
18.19	All statements referring to Resources and/or Reserves:—	
(1)	in any new applicant listing document or circular relating to a Relevant Notifiable Transaction, must be substantiated in a Competent Person's Report which must form part of the document; and	
(2)	in all other cases, must at least be substantiated by the issuer's internal experts.	
<b>18.20</b>	<b>Petroleum Competent Persons' Reports</b>	Not applicable.

<b>Chapter 18</b>		
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.	
<b>18.21-18.22</b>	<b>Competent Person</b>	
18.21	A Competent Person must:—	
	(1) have a minimum of five years experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	CPR Section 2.7
	(2) be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	CPR Section 2.7
	(3) take overall responsibility for the Competent Person's Report.	CPR Sections 2.7 and 2.9
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—	CPR Section 2.7 and 2.10
	(1) have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2) not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3) in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4) in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
<b>18.23</b>	<b>Additional requirements of Competent Evaluators</b>	
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—	
	(1) have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2) have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3) hold all necessary licences.	
	<i>Note</i> : A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.	
<b>18.24</b>	<b>Scope of Competent Persons' Reports and Valuation Reports</b>	
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—	
	(1) be addressed to the Mineral Company or listed issuer;	CPR Executive Summary, Section 1 and Section 2.2
	(2) have an effective date (being the date when the contents of the Competent	CPR Section 2.4

<b>Chapter 18</b>		
	Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	
(3)	set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	Executive Summary, Section 1 and Section 2.2
<b>18.25-18.26</b>	<b>Disclaimers and Indemnities</b>	
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.	CPR Section 2.11 and 2.12
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.	CPR Section 2.11 and 2.12
<b>18.27</b>	<b>Obligations of sponsor</b>	CPR Section 2.6, 2.7, 2.9 and 2.10
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.	
<b>18.28-18.34</b>	<b>REPORTING STANDARD</b>	
<b>18.28-18.30</b>	<b>Mineral reporting standard</b>	
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.	
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—	CPR Executive Summary, Section 1, Section 8.10 and Section 9
(1)	under:	
(a)	the JORC Code;	
(b)	NI 43-101; or	
(c)	the SAMREC Code,	
	as modified by this Chapter; or	
(2)	under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
Note	: <i>The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.</i>	
18.30	A Mineral Company must ensure that:—	
(1)	any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;	CPR Section 9

<b>Chapter 18</b>			
	(2)	estimates of mineral Reserves and mineral Resources are disclosed separately;	CPR Section 8.10 and Section 9
	(3)	Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;	CPR Section 15
	(4)	for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—	CPR Section 8.10, Section 9 and Section 15
	(a)	the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	
	(b)	if a contract for future prices of mineral Reserves exists, the contract price is used; and	
	(5)	for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.	
<b>18.31-18.33</b>	<b><i>Petroleum reporting standard</i></b>		Not applicable.
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.		
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—		
	(1)	under PRMS as modified by this Chapter; or	
	(2)	under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	<i>Note</i> : <i>A Reporting Standard applied to specific assets must be used consistently.</i>		
18.33	A Mineral Company must ensure that:—		
	(1)	where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;	
	(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
	(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	
	(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month	

<b>Chapter 18</b>		
	within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	
	<i>Not e: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.</i>	
(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
	<i>Not e: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.</i>	
(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	
<b>18.34</b>	<b>Mineral or Petroleum Asset Valuation Reports</b>	Not applicable.
18.34	A Mineral Company must ensure that:—	
(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

## Notes:

1. CPR is the Competent Person's Report prepared by SRK.
2. China Project is a producing project.

---

**Appendix C      Chapter 2.6 of the Guide for New Listing Applicants**

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	Section 8.10 and Section 9
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	Section 9
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	Section 9
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	Section 3
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	Section 9 and Section 10
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	Section 15
(vi)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	Section 7
(vi)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	Section 16

## Competent Person's Report for the Sepon Gold and Copper Project, Lao People's Democratic Republic

Savannakhet Province , Lao People's Democratic Republic  
Chifeng Jilong Gold Mining Co., Ltd.

SRK Consulting China Ltd. ■ SCN849B ■ 28 February 2025

**Final**

Competent Person's Report for the Sepon Gold and Copper Project, Lao  
People's Democratic Republic

Savannakhet Province , Lao People's Democratic Republic

**Prepared for:**

Chifeng Jilong Gold Mining Co., Ltd.  
No.7 Xiaojingjia, Wanfeng Road  
Fengtai District, Beijing, China  
10000

**Prepared by:**

SRK Consulting China Ltd.  
B1301 COFCO Plaza, No. 8 Jianguomen Inner Street  
Dongcheng District, Beijing, China

## **Acknowledgments**

SRK would like to acknowledge the support and collaboration provided by LXML personnel for this assignment. Their collaboration was greatly appreciated and instrumental to the success of this project.

SRK Consulting China Ltd. has prepared this document for Chifeng Jilong Gold Mining Co., Ltd. ("**Chifeng Gold**", or "**the Client**"). Any use or decisions by which a third party makes of this document are the responsibility of such third parties. In no circumstance does SRK accept any consequential liability arising from commercial decisions or actions resulting from the use of this report by a third party.

The opinions expressed in this document have been based on the information available to SRK at the time of preparation. SRK has exercised all due care in reviewing information supplied by others for use on this project. While SRK has compared key supplied data with expected values, the accuracy of the results and conclusions from the review are entirely reliant on the accuracy and completeness of the supplied data. SRK does not accept responsibility for any errors or omissions in the supplied information, except to the extent that SRK was hired to verify the data.

## Contents

Useful Definitions .....	xiii
1 Introduction and Terms of Reference .....	1
2 Program Objectives and Work Program.....	2
2.1 Purpose of the Report .....	2
2.2 Scope of Work and Reporting Standard.....	2
2.2.1 Scope of Work.....	2
2.2.2 Basis of Technical Report .....	2
2.2.3 Site Visit .....	3
2.2.4 Reporting Standard .....	3
2.3 Limitations Statement .....	3
2.4 Effective Date .....	4
2.5 Work Program .....	4
2.6 SRK Experience .....	4
2.7 SRK Project Team.....	6
2.8 Warranties .....	8
2.9 Compliance Statement .....	9
2.10 Independence Statement .....	9
2.11 Consent .....	9
2.12 Forward Looking Statement .....	10
3 Operational Licenses and Permits .....	11
3.1 Mining License.....	11
3.2 Exploration Permit .....	11
3.3 Other Key Operational Licenses and Permits .....	12
4 Accessibility, Climate, Local Resources, Infrastructure, and Physiography .....	13
4.1 Accessibility .....	13
4.2 Physiography and Climate.....	13
4.3 Local Resources and Infrastructure .....	14
5 History.....	15
6 Geological Setting and Mineralization .....	16
6.1 Regional Geology.....	16
6.1.1 Regional Stratigraphy.....	16
6.1.2 Regional Structures.....	17
6.1.3 Magmatic Rocks.....	17
6.1.4 Regional Mineralization.....	17
6.2 Property Geology.....	17
6.2.1 Gold and Copper Deposit Geology .....	18
6.3 Deposit Types.....	22
6.3.1 Copper and Gold Mineralization types.....	23
6.3.2 Main Factors of Metallogeny.....	24
7 Exploration and its Quality Assurance and Quality Control and Sampling .....	26
7.1 Exploration Programs .....	26
7.1.1 Exploration Programs of Gold and Copper Deposits Prior to Chifeng Gold .....	26
7.1.2 Exploration Programs of Gold and Copper Deposits by Chifeng Gold .....	28

7.1.3	Trenching .....	30
7.1.4	Drilling .....	30
7.1.5	Mapping.....	32
7.2	Quality Assurance and Quality Control of the Exploration Programs .....	32
7.2.1	Standard Sample .....	32
7.2.2	Duplicates .....	34
7.2.3	Blanks.....	34
7.2.4	QA/QC Performance .....	34
7.2.5	SRK Comments .....	42
7.3	Sample Preparation, Analyses, and Security .....	42
7.3.1	Sample Preparation and Analyses of Gold and Copper Deposit.....	42
7.3.2	Bulk Density .....	43
7.3.3	Database Management.....	43
7.3.4	SRK Comments .....	44
8	Data Verification .....	45
8.1	Verifications by SRK.....	45
8.2	Site Visits.....	48
9	Mineral Processing and Metallurgical Testing.....	51
9.1	Gold Ores .....	51
9.1.1	Mineralogy.....	51
9.1.2	Metallurgical Tests .....	51
9.1.3	GRG Test.....	52
9.1.4	Conclusion and Recommendation .....	55
9.2	Copper ores .....	55
9.2.1	Introduction .....	55
9.2.2	Mineralogy.....	56
9.2.3	Flotation Test .....	56
9.2.4	Conclusion and Recommendation .....	58
10	Mineral Resource Estimates.....	59
10.1	Introduction.....	59
10.2	Year (Quarter)-end Map and Mined-out Areas.....	60
10.3	Mineral Resource Models.....	60
10.4	Open Pit Mining .....	61
10.4.1	Discovery East (DSE OP) .....	61
10.4.2	Discovery West (DSW OP) .....	61
10.4.3	Namkok West (NKW OP).....	62
10.4.4	Nalou (NLU OP) .....	63
10.4.5	Ban Mai (MAI OP).....	65
10.4.6	Ban Non (NON).....	66
10.4.7	Nakachan (NAK OP).....	67
10.4.8	Thenkham (TKM OP).....	68
10.5	Underground Mining.....	68
10.5.1	Discovery Deep East (DSE UG) .....	68
10.5.2	Discovery Deep West (DSW UG) .....	69
10.5.3	Khanong (KHN UG) .....	70
10.6	Stockpile .....	71
10.6.1	Gold Stockpile .....	71
10.6.2	Copper Stockpile.....	71
10.7	Conclusions and Recommendations.....	72

11	Ore Reserve Estimates .....	74
11.1	Introduction .....	74
11.2	Feasibility Study .....	76
11.3	Mineral Resource Models .....	76
11.4	Open Pit Mining .....	77
11.4.1	Month-end Map .....	77
11.4.2	Open Pit Design .....	77
11.4.3	Cut-off Grade .....	77
11.4.4	Dilution and Loss .....	78
11.4.5	DSE OP .....	78
11.4.6	DSW OP .....	80
11.4.7	NMK OP .....	82
11.4.8	NLU OP .....	84
11.4.9	SKM OP .....	86
11.5	Underground Mining .....	86
11.5.1	Mined-out Area .....	86
11.5.2	Underground Design .....	86
11.5.3	Cut-off Grade .....	87
11.5.4	Ore Reserve model .....	88
11.5.5	Dilution and Loss .....	89
11.5.6	Ore Reserve Estimates .....	90
11.5.7	Ore Reserve Statement .....	92
11.6	Stockpiles .....	93
11.6.1	Cut-off Grade .....	93
11.6.2	Gold Stockpile .....	94
11.6.3	Copper Stockpile .....	95
11.7	Production Schedule .....	95
11.8	Conclusions and Recommendations .....	96
12	Mining .....	99
12.1	Production History and Current Status .....	99
12.2	Hydrology and Hydrogeology .....	100
12.3	Open Pit Geotechnics .....	101
12.3.1	Studies and Data .....	101
12.3.2	Seismicity .....	102
12.3.3	Modes of Failure .....	102
12.3.4	Geotechnical Domains .....	103
12.4	Open Pit Mining .....	103
12.4.1	Grade Control .....	103
12.4.2	Open-pit Design .....	103
12.4.3	Waste Dumps Design .....	104
12.4.4	Ore Stockpiles Design .....	104
12.4.5	Mining Equipment .....	105
12.4.6	Conclusions and Recommendations .....	105
12.5	Underground Geotechnics .....	105
12.6	Underground Mining .....	107
12.6.1	Development System .....	107
12.6.2	Mining Methods .....	108
12.6.3	Backfill .....	109
12.6.4	Mining Equipment .....	109
12.6.5	Ventilation .....	110

12.6.6	Conclusions and Recommendations .....	112
13	Recovery Methods.....	113
13.1	Gold Processing Plant.....	113

## Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

Abbreviation	Terminology
'	minute of arc
%	percent/percentage
/	per
°	degree(s) of arc
°C	degree(s) Centigrade
3D	three-dimensional
AER	Annual Environmental Report
Ag	The chemical symbol for silver
AN/FO	ammonium nitrate/fuel oil
ARD	acid rock drainage
As	The chemical symbol for arsenic
ASL	above sea level
Au	The chemical symbol for gold
AusIMM	Australasian Institute of Mining and Metallurgy
B.Eng.	Bachelor of Engineering
B×H	breadth × height
BD	bulk density
Capex	capital cost
CCD	counter current decantation
Chifeng Gold	Chifeng Jilong Gold Mining Co., Ltd.
Client	Chifeng Gold
cm	centimetre(s)
Conc.	Concentrate
CP	Competent Person
CPI	consumer price index
CPR	Competent Person's Report
CIL	carbon in leach
CRF	cemented rock fill
CSV	comma-separated values
Cu	The chemical symbol for copper
Cut-off grade	The grade threshold above which a mineral material is considered potentially economic and is selectively mined and processed as ore
CuSO <sub>4</sub>	copper sulphate
CV	Coefficient of Variation
DA	depreciation and amortization
m/s	meter(s) per second
DCF	discounted cash flow
Dr.	Doctor of Philosophy
ECAP	Environmental Corrective Action Plan
EIA	The Environmental Impact Assessment
EPMP	Environmental Protection and Management Plan

Abbreviation	Terminology
ESHS	Environmental, Social, Health and Safety
etc.	et cetera (= and so on)
FAusIMM	Fellow of the AusIMM
Fe	The chemical symbol for iron
FS	feasibility study report
g	gram(s)
g/t	gram(s) per tonne
GPS	global positioning system
GRG	gravity recoverable gold
ha	hectare(s)
HKEx or the Stock Exchange	The Stock Exchange of Hong Kong Limited
HQ core	core diameter of 63.5mm
POX	concentrate pressure oxidation
i.e.	id Est (= that is)
ID5	inverse distance power of 5
IFC	International Finance Corporation
Indicated Mineral Resource	An Indicated Mineral Resource is that part of a mineral resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a reasonable level of confidence. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes. The locations are too widely or inappropriately spaced to confirm geological and/or grade continuity but are spaced closely enough for continuity to be assumed
Inferred Mineral Resource	An Inferred Mineral Resource is that part of a mineral resource for which tonnage, grade and mineral content can be estimated with a low level of confidence. It is inferred from geological evidence and assumed but not verified geological and/or grade continuity. It is based on information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings, and drill holes which may be limited or of uncertain quality and reliability
Intertek	Intertek Laboratory in Beijing
IP	Induced Polarisation, which is an exploration technique whereby an electrical current is pulsed through the ground and the response from the sub surface measured in order to identify minerals of interest. Strong IP responses may be a result of sulphide which may be associated with gold mineralisation
IPO	Initial Public Offering
IRR	internal rate of return
JORC Code	Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves, 2012 edition, as published by the Joint Ore Reserves Committee.
JORC Committee	Joint Ore Reserves Committee of The Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
kg	kilogram(s), equivalent to 1,000 grams
kg/t	kilogram(s) per tonne
km	kilometre(s), equivalent to 1,000 metres
km <sup>2</sup>	square kilometre(s)
kt	Thousand tonne(s)
ktpa	Thousand tonne(s) per annum
kV	kilovolt(s)
kW	kilowatt(s)
kWh/t	kilowatt(s) hour per tonne
Laos	Lao People's Democratic Republic

Abbreviation	Terminology
L×B×H	length × breadth × height
LHD	load-haul-dump machine
LoM	life of mine
LXML	Lane Xang Minerals Limited Company, a subsidiary of Chifeng Gold
m	meter(s)
M	Million(s)
m ASL	meter(s) above sea level
M.Eng.	Master of Engineering
M.Sc.	Master of Science
m/kt	meter(s) per kilo tonne
m <sup>2</sup>	square metre(s)
m <sup>3</sup>	cubic metre(s)
m <sup>3</sup> /d	cubic meter(s) per day
m <sup>3</sup> /s	cubic meter(s) per second
m <sup>3</sup> /t	cubic meter(s) per tonne
m <sup>3</sup> /year	cubic meter(s) per year
MAusIMM	Member of the AusIMM
Measured Mineral Resource	A Measured Resource is that part of a mineral resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a high level of confidence. It is based on detailed and reliable exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
Mineral Resources	A concentration or occurrence of material of intrinsic economic interest in or on the earth's crust in such form, quality and quantity that there are reasonable prospects for eventual economic extraction, as defined in JORC Code. The location, quantity, grade, geological characteristics and continuity of a mineral resource are known, estimated or interpreted from specific geological evidence and knowledge
mg/l	milligram(s) per litre
mg/m <sup>3</sup>	milligram(s) per cubic metre
mm	millimetre(s)
Mn	The chemical symbol for manganese
Mo	The chemical symbol for molybdenum
Moz	Million ounce(s)
Projects	Sepon Gold and Copper Projects
Mr.	Mister
Mt	Million tonne(s)
Mtpa	Million tonne(s) per annum
MW	Megawatt(s), equivalent to 1,000,000 watts
NCF	net cash flow
Ni	The chemical symbol for nickel
NPV	net present value
NQ core	core diameter of 47.6mm
O.K.	Ordinary Kriging
OHS	occupational health and safety
Opex	operating cost
Ore Reserves	The economically mineable part of a Measured and/or Indicated mineral resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments and studies have been carried out including consideration of and modification by realistically assumed mining, processing, metallurgical, infrastructure, economic, marketing, legal,

Abbreviation	Terminology
	environmental, social and government factors, as defined in the JORC definition standards. These assessments demonstrate at the time of reporting that extraction could reasonably be justified. Ore Reserves are sub-divided in order of increasing confidence into Probable Ore Reserves and Proved Ore Reserves
oz	Ounce
Pb	The chemical symbol for lead
pH	hydrogen ion concentration
Ph.D.	Doctor of Philosophy
ppb	part(s) per billion
PRC	People's Republic of China
Probable Ore Reserve	A Probable Ore Reserve is the economically mineable part of an Indicated, and in some circumstances Measured Resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments, which may include feasibility studies, have been carried out including consideration of and modification by realistically assumed mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental, social and governmental factors. These assessments demonstrate at the time of reporting that extraction could reasonably be justified
Proved Ore Reserve (or Proved Ore Reserve)	A Proved Ore Reserve is the economically mineable part of a Measured Resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments, which may include feasibility studies, have been carried out, and include consideration of and modification by realistically assumed mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental, social and governmental factors. These assessments demonstrate at the time of reporting that extraction could reasonably be justified.
QA/QC	Quality Assurance / Quality Control
QMS	Quality Management System
Report	Competent Person's Report
RMB	Renminbi, which is the official currency of the People's Republic of China.
RMB/a	RMB per annum
RMB/g	RMB per gram
ROM	run-of-mine
RTK	real-time kinematic
S	The chemical symbol for sulphur
SBX	Sodium butyl xanthate
SD	standard deviations
SG	specific gravity
SRK	SRK Consulting China Ltd trading as SRK Consulting
t	tonne(s), equivalent to 1,000kg
t/h	tonne(s) per hour
t/m <sup>3</sup>	tonne(s) per cubic meter
TFe	Total iron, including magnetic and non-magnetic iron
tpa	tonne(s) per annum
tpd	tonne(s) per day
tph	tonne(s) per hour
TSF	tailings storage facility
TSX	Toronto Stock Exchange
USD	United States Dollar
V	The chemical symbol for vanadium

<b>Abbreviation</b>	<b>Terminology</b>
Valmin Code	Australian Code for Public Reporting of Technical Assessment and Valuation of Mineral and Petroleum Assets and Securities used in Independent Expert Reports
VAT	value-added tax
WRD	waste rock dump
WSCP	Water and Soil Conservation Plan
Zn	The chemical symbol for zinc
µm	micron(s), 1/1,000 of a millimetre

---

## Executive Summary

SRK Consulting China Ltd. (“**SRK**”) was requested by Chifeng Jilong Gold Mining Co., Ltd. (“**Chifeng Gold**” or the “**Client**”) to prepare a Competent Person’s Report (“**CPR**” or the “**Report**”) for its Sepon Gold and Copper Projects (the “the **Projects**”) located in Savannakhet Province, Lao People’s Democratic Republic (“**Laos**”) in accordance with guidelines of the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves, 2012 edition (“**JORC Code (2012)**”) and the Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited (“**HKEx**”), including the Chapter 18 requirements (Appendix C), Chapter 2.6 of the Guide for New Listing Applicants (Appendix D) and other relevant regulations of the Exchange and Hong Kong Exchanges and Clearing Ltd (“**HKEx**”). The projects include exploration licenses, mining licenses, currently operating open-pit mines, and associated ore processing and metallurgic plants, as well as an underground mine, and various defined deposits with gold, copper and rare earth elements (“**REE**”) mineral resources (the REE project will be reported in a separate report). The projects are currently operated by Lane Xang Minerals Limited Company (“**LXML**”), which is a subsidiary of Chifeng Gold.

This Report consists of an independent review of the geology, exploration, mineral resources, Ore Reserves, mining, mineral processing and smelter-refinery, capital investment, operating cost, and environmental and social aspects of the Projects.

## Outline of Work Program

The geological models for the Projects were constructed and provided to SRK by Chifeng Gold. In SRK’s opinion, the geological models are a reasonable representation of the distribution of the targeted mineralisation at the current level of sampling. The models were reviewed and updated by SRK from December 2022 to January 2023, as well as in January and June 2024.

Based on the Mineral Resource statements and models and the studies and mine designs provided by LXML and third parties, SRK rescheduled the production profile and converted parts of the Mineral Resources into Ore Reserves.

During the period from 9 December 2022 to 14 December 2022, SRK’s personnel conducted site visits to the Sepon Project, inspected and observed the status of the operation at that time, held meetings with the managements and technical personnel of LXML, sighted geology, exploration, mineralization, mining operation, ore processing and metallurgic operation, as well as their own data verification programs. SRK team also conducted additional site visits in December 2023 and May 2024, respectively, inspecting mining, ore processing and smelter, and environmental and social aspects.

SRK team reviewed the information provided by LXML and compiled a technical report according to JORC (2012) technical report form, and submitted it to the client for comments in January 2023, and late submitted a memo of updating Mineral Resources and Ore Reserves as of 31 December 2023.

From May to June 2024, SRK further conducted site visits, and updated the report as of 30 September 2024.

SRK will update the Competent Person's Report (CPR) as and when the company requires updates, ensuring that the content remains accurate and up-to-date in light of relevant circumstances and feedback.

## Results

### Overall

The Sepon project area located in Savannakhet province, south-central Laos is an operating mine with open-pit and underground mining and facilities to process gold and copper ores to produce gold bars and cathode copper plates since 2003. After acquired the project in 2018, Chifeng Gold has conducted a lot of exploration programs to look for and define mineral resources to maintain the production and extend the mine life. As of 30 September 2024, by reviewing Sepon's exploration data and resource models, SRK reports the remaining mineral resources as classified as open-pit gold, underground gold, and low grade copper as shown in Table ES- 1.

**Table ES- 1: Summary of Remaining Mineral Resources of Sepon Project as of 30 September 2024**

Type	Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)	Cu Grade (%)	Cu Metal Contained (kt)
Gold	Measured	276	7.98	2.21	71	-	-
	Indicated	7,220	4.13	29.80	958	-	-
	Mea+Ind	7,496	4.27	32.00	1,029	-	-
	Inferred	6,002	3.67	22.00	707	-	-
Low Grade Copper	Measured	-	-	-	-	-	-
	Indicated	4,416	-	-	-	1.45	64.20
	Inferred	2,078	-	-	-	0.98	20.46

Sepon mine's technical personnel conducted various studies and designed the mining production for the next few years to mine part of above resources. By reviewing Sepon mine's data and models, SRK reports the Ore Reserves as of 30 September 2024, classified as surface mining Gold and underground mining Gold, and surface mining Copper as shown in Table ES- 2.

**Table ES- 2: Summary of Remaining Ore Reserves of Sepon Project as of 30 September 2024**

Type	Sub-Type	Category	Tonnage (kt)	Au Grade (g/t)	Cu Grade (%)	Note
Surface mining	Open-pit Gold	Proved	31	1.03	-	Included in Resources
		Probable	2,175	1.87	-	
		<b>Total</b>	2,206	1.86	-	
	Stockpile Gold	Proved	-	-	-	Included in Resources
		Probable	2,185	2.61	-	
		<b>Total</b>	2,185	2.61	-	
Copper	Proved	-	-	-	0.93	
	Probable	1,185	-	-		
	<b>Total</b>	1,185	-	-		
Underground Mining Gold		Proved	237	5.18	-	Included in Resources
		Probable	3,268	4.14	-	
		<b>Total</b>	3,505	4.21	-	

SRK reviewed the production schedule planned by Sepon mine, including three years of surface mining and seven years of underground mining, as well as processing, and the economic parameters proposed by the Sepon mine, such as capital expenditures ("Capex") and operating expenses ("Opex") in next few years. By using the parameters and the products' prices forecasted by SRK, SRK conducted an economic analysis by using discount cashflow method ("DCF"), and the analytical

results show that the operations of surface mining and underground mining as well as processing are economically viable without considering recovering the sunken capital invested.

### **Operational Licenses and Permits**

SRK has sighted the business license and mining license. The land use is mainly governed by a Mineral Exploration and Production Agreement ("MEPA") concession from the Lao Government, combined with land compensation with the communities impacted by the Project. The Company has compensated the impacted residents entitled for the land use accordingly.

### **Property Description and Ownership**

LXML possesses a mining permit with a total area of 116.96 km<sup>2</sup>, that is valid till 29 September 2033. According to the Company, additional mining licensed area of 17.65 km<sup>2</sup> has been extended, and therefore the total mining license area has been increased from 99.31 km<sup>2</sup> to 116.96 km<sup>2</sup>. LXML possesses an exploration permit with a total area of 996.12 km<sup>2</sup>, that is valid till June 2026. The exploration permit consists of 66 inflection points.

### **Geology and Mineralization**

Mineralization styles of the Sepon district can be classified as an intrusion-centred hydrothermal system with the majority of known Cu and Au mineralization spatially associated with the Padan and Thengkhamb porphyry centres. Mineralisation typically displays a zoned pattern in both mineralization type and metal content. Porphyry Mo-Cu systems occur at the core zoning outward through skarn and carbonate replacement Cu deposits to the Au dominated sediment-hosted systems which show Carlin type of deposit characteristics. Pb-Zn mineralization occurs distal to the porphyry's contact metamorphic aureole in a sediment-hosted setting, though a genetic link is yet to be confirmed.

Three major controls on the distribution of gold and copper mineralization in the Sepon Basin have been identified. The primary control is understood to be the porphyry centres around which there is a metal zonation. Secondary control is the structural architecture (faults and folds). In the case of Au mineralisation there seems to be a strong (third order) lithological control where gold dominantly occurs along or close to the Nalou-Discovery formation contact which acts as a favourable receptive region.

### **Exploration Status**

The first campaign was greenfields exploration drilling. This drilling was completed by RTZ during the 1990s. Oxiana continued to use the drilling and sampling protocols developed by RTZ after acquiring the project.

In May 2006 the Sepon site adopted a policy of requiring no wet RC drilling of mineralised zones. If wet RC sample was encountered the hole was stopped. A total of 1,321,787m of diamond drilling ("DD") and reverse circulation ("RC") drilling data are contained in the resource database. Of this, 85% is geologically logged, and 98% of sampled intervals contain gold and copper assays (15% of the RC data were assayed but not logged).

Only samples within the mineralisation or geological domains are used in the estimations. A total of 1,503 diamond holes (100,582.5m), 2,840RC drill holes (170,825.6m) and 13,661 grade control RC holes (202,618.3m) were used to create the Nalou block model.

A total of 1,022 DD (117,495m), 2,3732 RC (no Grade Control) (175,499.2m) RC drill holes and 45,635 RC Grade Control holes (764,831.8m) for a total of 1,057,826m were used to create the Discovery region block model.

After Chifeng Gold took over the Sepon project, the exploration programs focused on discovering new gold deposits in brownfields to supply the processing plant and keep on the production, as well as discovering new types of mineralization in greenfields.

## Mineral Resource and Estimates

SRK has used the datasets made available by LXML, as well as the findings from the previous Mineral Resource Technical Report from LXML. The basic model was prepared by LXML in Vulcan and leapfrog using conventional 3D block modelling and OK estimation techniques. SRK reviewed the process of grade interpolation in historical reports. Based on the current stope topography in September 2024, SRK reported the Mineral Resource within the open pit and underground.

The Sepon gold and copper deposits possess the Mineral Resources as shown in Table ES- 3 gold, in Table ES- 4 for the copper mineral resources.

**Table ES- 3: Sepon Gold Mineral Resources as of 30 September 2024<sup>1</sup>**

Type	Category	Tonnage (kt) <sup>2</sup>	Au Grade g/t	Au Metal Contained t	Au Metal Contained koz

Sources: SRK

Notes:

<sup>1</sup> The information relates to Mineral Resource conversion is based on information compiled by Mr. Liang Li, MAusIMM, and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Both Dr. Xu and Mr. Li have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in JORC (2012). Dr. Xu supervised the work of Mr. Li. Both Dr. Xu and Mr. Li consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

<sup>3</sup> MES+IND: combined measured and Indicated Mineral Resource.

<sup>4</sup> The cut-off grade depends on ore type (Otyp) and mining method. For open pit mining and gold stockpiles, the cut-off grade of oxide ores is 0.6 g/t, the cut-off grade of primary ores is 1.5 g/t. For Underground mining, the cut-off grade of primary ores is 2.3 g/t.

Table ES- 4: Mineral Resource Estimate of Total Copper, as of 30 September 2024 <sup>1</sup>

Notes:

<sup>1</sup> The information relates to Mineral Resource conversion is based on information compiled by Mr. Liang Li, MAusIMM, and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Both Dr. Xu and Mr. Li have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in JORC (2012). Dr. Xu supervised the work of Mr. Li. Both Dr. Xu and Mr. Li consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

<sup>3</sup> MES+IND: combined measured and Indicated, Mineral Resource.

<sup>4</sup> The cut-off grade depends on ore type (Otyp) and mining method. For open pit mining and copper stockpiles, the cut-off grade of oxide ores is 0.7% Cu, the cut-off grade of primary ores is 0.3% Cu. For Underground mining, the cut-off grade of primary oxide ores is 0.8% Cu.

## Ore Reserve Estimates

The gold deposits that are being or to be exploited include DSE OP, DSW OP, NLU OP, NMK OP, Far West Area (Including MAI OP, NON OP, NKN OP), DSE UG, DSW UG. The copper deposits that are being or to be exploited include KHN UG, TKM OPs.

Among these gold and copper deposits, only DSE OP, DSW OP, NLU OP, NMK OP, DSE UG, and KHN UG possess Measured and Indicated Mineral Resources. Additionally, KHN UG is currently in the feasibility study stage. Consequently, open-pit gold mines including DSE OP, DSW OP, NLU OP and NMK OP could be converted to Ore Reserves from their Mineral Resources. For underground gold mines, only DSE UG would be considered for estimating Ore Reserves. None of the copper deposits would be considered for estimating Ore Reserves.

SRK was provided with the SGPS revised on 18 March 2020. Mineral resource models, final open pit designs and underground mining study have been updated by LXML since completion of SGPS. The changes make it necessary relying on both SGPS and updates to estimate Ore Reserves.

The updated block models were applied by SRK to estimate mineable materials. The updated open pit designs have been applied by the LXML to guide mining boundaries for open pit mining. It is technically feasible to report Ore Reserves in Table ES- 5 for open pit mining (gold).

Table ES- 5: Ore Reserve Statement for Open Pit Mining, as of 30 September 2024 <sup>1, 3, 4</sup>

## Surface Mining

Historically, LXML (LXML Sepon) used to be an operational open-pit gold and copper mine. In 1992, Rio Tinto discovered Sepon. In 1999, Rio Tinto sold an 80% option over Sepon to Oxiana. In 2004, Oxiana bought Rio's remaining 20% stake in Sepon. In 2008, Oxiana merged with Zinifex to form OZ Minerals. In 2010, MMG acquired Sepon from OZ Minerals. In 2018, Chifeng acquired LXML (LXML Sepon) from MMG.

As for gold and copper operations:

- Gold production commenced in 2003 but ceased in 2013 due to price fluctuations and other factors. In 2020, gold operations resumed. Construction of the underground mine commenced in April 2022 at DSE UG, and the first gold ore was transported to the surface in 2023. Since then, the gold operation has transitioned to a combination of open-pit and underground mining.
- Copper production began in 2005, and in 2021, LXML ceased open-pit copper mining operations. Since then, the copper processing plant has only processed oxide copper stockpiles.

As of 30 September 2024, the gold deposits that are being or to be exploited include DSE OP, DSW OP, NLU OP, NMK OP, Far West Area (Including MAI OP, NON OP, NKN OP), DSE UG, DSW UG. The copper deposits that are to be exploited include KHN UG, TKM OPs.

In addition to these deposits, there are dozens of stockpiles on site to supply (tonnes & grade) gold and oxide copper ore feed to the processing plant.

The overall processing capacity of the gold plant is 3.8 Mtpa. Historical production data of the copper plant shows that 0.5 to 1.3 Mtpa oxide copper ore were processed. SRK noted that the actual gold mining capacity of ore was 4.2 Mtpa, 3.8 Mtpa and 2.5Mtpa for 2021 to 2023, of which the year in 2021 was greater than 3.8 Mtpa . Excess ore were stored in the gold ore stockpile.

The conventional mining cycle, comprising drilling, blasting, loading, and hauling, are employed for the extraction of ore and waste rocks. The mining operations were conducted on flitches with a height of 2.5 meters. Based on SRK's review, the open-pit mining is expected to be completed in the near future, approximately within three years.

The final open-pit designs have been applied by LXML to guide mining boundaries. The mining cycle and management have been practiced for a long time. SRK considers that no significant risks will be encountered for the open-pit mining in the future.

## Underground Mining

DSE UG is designed as an underground mine to extend mine life. A mining study at scoping level contained in Sepon Gold Project Study ("SGPS") is available to date. The mining capacity proposed by LXML is about 650 – 710 ktpa.

In SGPS, the proposed mining methods in the DSE UG include long-hole stoping with cemented backfill (LHSB), long-hole stoping with pillars (LHSP), and post pillar cut and fill (PPCA).

Construction of the underground mine commenced in April 2022 at DSE UG as mentioned before. As of 30 September 2024, SRK was provided with revised ventilation designs and underground designs by LXML.

SRK re-ran the stope optimization based on LHSB, as selected by LXML, then applied modifying factors and prepared the production schedule based on a review of LXML's data. SRK notes that LHSB has been widely practiced globally and is technically feasible.

## Production Schedule

Production schedule prepared by SRK based on gold and copper minerals are shown in Table ES-9.

**Table ES-9: Production Schedule of LXML**

Type	Unit	Total	2024	2025	2026	2027	2028	2029	2030

Sources: SRK

## Mineral Processing Testing and Recovery Method

Flotation and concentrate pressure oxidation ("POX") and carbon in leach ("CIL") process are applied to primary gold ore, while CIL is applied to oxide gold ore to recovery gold. The final product is Gold Doré. The overall processing capacity of the Sepon Gold Plant is 3.8 Mtpa, including a primary/transition ores capacity of 2.2 Mtpa and an oxide ore capacity of 1.6 Mtpa. In the past three years, the oxide ore throughput varied between 1.0 and 1.5 Mtpa, with gold recovery ranging from 51.8% to 68.9%. The primary ore throughput is from 1.9 to 2.1 Mtpa, with gold recovery ranging from 55% to 67%. Yearly gold production exceeds 6 tonnes. Although most of the facilities and equipment of the gold plant were reformed from the ex-service copper plant, historical production proves it to be practicable.

The copper ore processing facility includes a traditional agitation leaching plant and a heap leaching operation. The mixed ore is crushed and washed, the undersized is agitation leached after milling

and then goes to counter current decantation ("CCD") for the separation of pregnant leach solution ("PLS") and residue. The oversized ore is stacked on pad for heap leaching. The pregnant solutions from agitation leach and heap leach are merged for solvent extraction and electrowinning ("SX/EW"), producing cathode copper plates. The integrated copper recovery is greatly influenced by the ore grade. Historical production data of the copper plant shows that 0.5 to 1.3 Mtpa oxide copper ore are processed; with cathode copper production around 6,000 tpa, and copper recovery varying from 50% to 78%. An overall recovery rate of 65% is recommended by SRK as a parameter for subsequent deposit evaluation and economic analysis, considering the long heap leach cycle.

Low grade primary copper ore is amenable to the flotation process. Flotation tests indicated that copper recovery of 83% to 89%, with concentrate grades of 18% to 24%, can be achieved using the conventional flotation process. A Proof-of-Concept study has been completed for the purpose of primary copper resource development. By using the existing facilities of the current gold plant and a throughput of 7.5 Mtpa, the NPV is negative. The break-even price is USD9,119 per tonne of copper. The primary copper resource development requires a higher copper price and reliable resource volume. A detailed feasibility study is recommended in due course.

## Environmental and Social Aspects

The sources of environmental risk are project activities that may result in potential environmental impacts. These project activities have been previously described within this report. In summary, the most significant potential environmental and social risks for the development of the Project, currently identified as part of the project assessment and this SRK review, are:

- TSF seepage pollution
- Fugitive dust pollution; and
- Deficit mine closure fund.

## Capital Expenditures and Operating Expenses

LXML has about 21 years of production history since 2003. Capital expenditures ("Capex") for construction of the mines, ore processing plants, on-site facilities etc. had been invested in the past.

LXML has made a plan for further Capex in next three years. SRK has developed a unit sustaining capital forecast based on the average expenditures for the years 2022 and 2023. Table ES- 10 summarises the three Capex needed for the Sepon Project as proposed by LXML with SRK's assumption for further sustaining capital.

**Table ES- 10: Further Capex needed for LXML**

Item	Unit	2024	2025	2026	2027	2028	2029	2030
Growth	USD million	11.4	23.6	17.2				
Exploration	USD million	3.3	8.3	8.0				
Sustain	USD million	7.0	18.1	11.4	2.7	1.9	1.4	0.1
<b>Total</b>	USD million	21.7	50.1	36.6	2.7	1.9	1.4	0.1

Sources: LXML and SRK's Forecast

During the economic analysis, non-current assets will be considered for amortization and depreciation. Together with further Capex, they will adhere to the amortization and depreciation rates as proposed in Table 18-2. It is reasonable to expect that the operation of the Sepon project will be extended with further exploration and feasibility studies, the mine closure fee and the residual value of the project will not be considered in the economic projection.

SRK was provided with production and financial records for three year of 2021, 2022, and 2023, 1Q-3Q2024 and summaries of historical production costs in various cost centres. ES-12 summarizes the unit operating costs.

**Table ES-11: Unit Operating Costs in 2021, 2022, 2023 and 1Q-3Q2024**

Item	2021	2022	2023	1Q-3Q2024	Average	Used for TEM

Sources: SRK

## Economic Analysis

Based on the information provided by LXML, SRK's preliminary review and analysis indicate that LXML still has about three years of surface gold mining (including open-pit and stockpile rehandling) and surface copper mining (stockpile rehandling only), and seven years of underground gold operation.

Figure ES- 1 shows the annual net cash flow for LXML.

Figure ES- 1: Annual Net Cash Flow for LXML

Sources: SRK

Based on the parameters reviewed and summarized in the report, an economic analysis indicates that the overall operation will have a NPV ranging from USD247.1 million (at a discount rate of 8%) to USD 232.6 million (at a discount rate of 12%), and USD 239.6 million at the base case (at a discount rate of 10%).

### Project Risk Analysis

Mining is a relatively high-risk industry. In general, the risk may be expected to decrease from exploration, development, through to production stage. The Sepon Project is a production project. Risks exist in different areas. SRK considered various technical aspects which may affect the feasibility and future cash flow of the Project and conducted a qualitative risk analysis which has been summarised in Table ES-13.

Table ES-13: Project Risk Assessment of the Sepon Project

Risk Source/Issue	Likelihood	Consequence	Overall
<b>Geology and Resource</b>			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Possible	Major	High
Unexpected Groundwater Ingress	Unlikely	Minor	Low
<b>Mining</b>			
Significant Production Shortfalls	Unlikely	Major	Medium
Significant Geological Structure	Possible	Minor	Low
Excessive Surface Subsidence	Unlikely	Minor	Low
Poor Ground Conditions	Possible	Moderate	Medium
<b>Ore Processing</b>			
Lower Recovery	Unlikely	Moderate	Low
High Production Cost	Possible	Minor	Low
Poor Plant Reliability	Unlikely	Minor	Low
<b>Capital and Operating Costs</b>			
Project Timing Delays	Possible	Minor	Low
Capital Cost Increases	Unlikely	Minor	Low
Operating Cost Underestimated	Likely	Minor	Medium
High mine closure cost	Likely	Moderate	High
<b>Environmental, Social and Permitting</b>			
Impact to the ecological system	Possible	Moderate	Medium
Poor waste rock management	Possible	Moderate	Medium
Poor hazardous substances management	Possible	Minor	Low
Dust Pollution	Possible	Minor	Low
Renewal of mining licence	Unlikely	Major	Medium

Two high risks of the project are "Lack of significant Ore Reserves" and "High mine closure cost". To manage the risks, SRK recommends the Company should further conduct feasibility studies to develop currently available mineral resources in order to extend the mine life of the project, as well as proactively manage the environmental and mine closure issues during the production, in order to reduce the high mine closure cost at the end of the mine.

## 1 Introduction and Terms of Reference

SRK Consulting China Ltd. (“**SRK**”) was requested by Chifeng Jilong Gold Mining Co., Ltd. (“**Chifeng Gold**” or the “**Client**”) to prepare a Competent Person’s Report (“**CPR**” or the “**Report**”) for its Sepon Gold and Copper Projects (the “**the Projects**”) located in Savannakhet Province, Lao People’s Republic (“**Laos**”) in accordance with the guidelines of the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves, 2012 edition (“**JORC Code (2012)**”) and the Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited (“**HKEx**”), including the Chapter 18 requirements (Appendix C), Chapter 2.6 of the Guide for New Listing Applicants (Appendix D) and other relevant regulations of the Exchange and Hong Kong Exchanges and Clearing Ltd (“**HKEx**”).

The projects include exploration licenses, mining licenses, currently operating open-pit mines, and associated ore processing metallurgic plants, as well as an underground mine in development, and various defined deposits with gold, copper and rare earth elements (“**REE**”) mineral resources. The projects are currently operated by Lane Xang Minerals Limited Company (“**LXML**”), which is 90% owned by Chifeng Gold, and 10% owned by Laos government.

## 2 Program Objectives and Work Program

### 2.1 Purpose of the Report

The purpose of this Report is to provide both existing Chifeng Gold shareholders and potential investors with a CPR of its Sepon Gold and Copper Projects in Laos. The SRK's report is proposed to provide an unbiased technical assessment of the risk associated with the Project.

### 2.2 Scope of Work and Reporting Standard

#### 2.2.1 Scope of Work

The scope of work, as defined in letters of engagement executed in November 2022 and May 2024 between Chifeng Gold and SRK, includes the review/updating of mineral resource models for the gold and copper mineralisation, and review the REE mineralization, delineated on the Projects and preparation of a CPR in compliance with JORC (2012) and the listing requirements of the HKEx. This work involved the assessment of the following aspects of the Projects.

- Regional, local and mine geology
- Exploration history, quality and independent data verification
- Geological modelling, mineral resource estimation and validation
- Mining assessment
- Processing and mineral recovery, smelter and refinery
- Environmental and social
- Operating and capital costs; and economic analysis
- Preparation of a Mineral Resource Statement and a Ore Reserve Statement
- Recommendations for additional work

#### 2.2.2 Basis of Technical Report

This report is based on information collected by SRK during site visits carried out between 8 and 14 December 2022, December 2024, and May 2023, and additional information provided by LXML throughout the course of SRK's investigations. SRK has no reason to doubt the reliability of the information provided by LXML. Other information was obtained from the public domain. This technical report is based on the following sources of information:

- Discussions with LXML and Sepon Mine personnel
- Inspection of the Sepon Gold and Copper Projects area, including outcrops and drill cores
- Review of exploration data collected by LXML
- Additional information obtained from public domain sources

This report has been prepared to accommodate the requirements of HKEx, and the Mineral Resources and Ore Reserves are reported according to the JORC Code (2012) which is binding

upon all Australasian Institute of Mining and Metallurgy (“AusIMM”) members.

### 2.2.3 Site Visit

Dr. Anshun Xu and Dr. Yingting (Tony) Guo visited the Sepon Project during the period from 8 to 14 December 2022 accompanied by Mr. Paul Harris, Chairman of LXML, and other management and technical personnel of LXML. In December 2023, Mr. Yonggang Wu, Mr. Liang Li, and Mr. Erwei Lu visited the project site; and In May 2024, Dr. Andy Li, Mr. Lanliang Niu and Mr. Erwei Lu also conducted a site visit to the project site for updating the technical report of the project.

The purpose of the site visits was to review the digitalization of the exploration database and validation procedures, review exploration procedures, define geological modelling procedures, examine drill core, interview project personnel, and collect all relevant information for the preparation of a revised mineral resource model and inspect the geology and mineralization of the projects, and observe the mining and processing operations. During the visit, a particular attention was given to the treatment and validation of historical drilling data.

SRK was given a full access to relevant data and conducted interviews with Sepon/LXML personnel to obtain information on the past exploration work, to understand procedures used to collect, record, store and analyse historical and current exploration data, as well as operating issues and related data.

### 2.2.4 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the “Valmin Code”). The Valmin Code incorporates The JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy (“AusIMM”) members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a “Competent Person” in accordance with the JORC Code.

## 2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that the Client has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Client has legal right to

all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Client and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

## 2.4 Effective Date

SRK's opinion contained herein and effective as of **30 September 2024**, is based on information collected by SRK throughout the course of SRK's examination and verification. The information in turn reflects various technical and economic conditions at the time of writing this report. Given the nature of the mining business, these conditions can change significantly over relatively short periods of time. Consequently, actual results may be significantly more or less favourable.

This report may include technical information that requires subsequent calculations to derive subtotals, totals, and weighted averages. Such calculations inherently involve a degree of rounding and consequently introduce a margin of error. Where these occur, SRK does not consider them to be material.

## 2.5 Work Program

The mineral resource statement reported herein is a collaborative effort between Chifeng Gold/LXML and SRK personnel. The exploration database was compiled and maintained by Chifeng Gold/LXML, and was audited by SRK. In the opinion of SRK, the geological model is a reasonable representation of the distribution of the targeted mineralization at the current level of sampling. The geostatistical analysis, variography and grade models were completed by SRK during the months from December 2022 to January 2023.

The Mineral Resource Statement reported herein was prepared in conformity with the generally accepted CIM Exploration Best Practices Guidelines and CIM Estimation of Mineral Resource and Ore Reserves Best Practices Guidelines. This technical report was prepared according to JORC (2012) and the Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited ("HKEx").

The technical report was compiled in SRK China offices during the months from December 2022 and January 2023, and was updated from May to November 2024.

## 2.6 SRK Experience

The SRK Consulting Group ("SRK Consulting") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK China was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices—especially SRK Australasia, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience at providing Independent Expert Reports for mining companies who have successfully listed on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-1.

**Table 2-1: SRK's Reports for Listing on the HKEx**

Company	Year	Nature of Transaction
Yanzhou Coal Limited (listed in HKEx)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on HKEx and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on HKEx
Lingbao Gold Limited	2005	IPO Listing on HKEx
Yue Da Holdings Limited (listed in HKEx)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on HKEx
Sino Gold Mining Limited	2007	Dual Listing on HKEx
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on HKEx
Kiu Hung International Holding Limited	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Limited	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Limited	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Limited	2009	Acquisition of a molybdenum mining project in Shaanxi, China

Company	Year	Nature of Transaction
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on HKEx
Citic Dameng Holdings Limited	2010	IPO Listing on HKEx
China Hanking Holdings Limited	2011	IPO Listing on HKEx
China Daye Non-Ferrous Metal Mining Limited	2012	Very Substantial Acquisition on HKEx
China Nonferrous Mining Corporation Limited	2012	IPO Listing on HKEx
Hengshi Mining Investments Limited	2013	IPO Listing on HKEx
Future Bright Mining Holdings Limited	2014	IPO Listing on HKEx
King Stone Energy Group Limited	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte LTD	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Limited	2016	IPO Listing on HKEx
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Limited	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Limited	2022	IPO Listing on HKEx
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on HKEx

## 2.7 SRK Project Team

The SRK project team and responsibilities are shown in Table 2-2.

**Table 2-2: SRK Project Team**

Consultant	Title	Discipline and Task
Dr. Anshun Xu	Corporate Consultant (Geology)	Project Manager, whole report, CP
Liang Li	Senior Consultant (Geology)	Geology, Mineral Resource Estimation
Yingting Guo	Associate Consultant (Geology)	Geology Review
Erwei Lu	Consultant (Mining)	Mining Review
Yonggang Wu	Principal Consultant (Mining)	Mining Review, CP
Lanliang Niu	Principal Consultant (Processing)	Processing Review

Consultant	Title	Discipline and Task
Xiangfeng Yang	Senior Consultant (Processing)	Processing Review
Yuanhai Li	Principal Consultant (Environment)	Environment, Social, and Permitting Review
Dr Yonglian Sun	Corporate Consultant (Mining)	Internal Peer Review and Quality Control

The short bios of key SRK personnel are shown below:

**Anshun Xu (Anson Xu), Ph.D., FAusIMM**, is a Corporate Consultant (Geology) who specializes in the exploration of mineral deposits. He has more than 30 years' experience in exploration and development of various types of mineral deposits including Cu-Ni sulphide deposits related to ultra-basic rocks, tungsten and tin deposits, diamond deposits, and especially deep expertise in various types of gold deposits, including vein-type, fracture-breccia zone type, alteration type, and carlin type. He was responsible for the resource estimations of several diamond deposits, and for reviews of resource estimations of several gold deposits. He recently completed several due diligence jobs for clients from both China and overseas including technical review projects such as Canadian NI43-101 reports and HKEX IPO technical reports. Dr. Xu was the Projects manager of this project and the Competent Person ("CP") who takes overall responsibility for this report.

**Yingting (Tony) Guo, Ph.D., P. Geo. MMSA**, is a Professional Geoscientist and a member of the Association of Professional Engineers and Geoscientists of the Province of British Columbia, Canada (P. Geo), holding License Number 31257. He is also a Qualified Professional (QP) Member with special expertise in Geology and Ore Reserves from the Mining and Metallurgical Society of America (MMSA), holding Member Number 01472QP. Dr. Guo has extensive experience in precious metals exploration, mineral resource estimate, mining project PEA study as well JORC / 43-101 report preparation. He has worked and/or prepared NI43-101/JORC reports on more than 10 gold/copper projects including the Toromocho copper mine project from Chinalco in Peru; Jiama Copper-Gold mine project for China Gold International in Tibet, China. Vatukoula Gold project for Zhongrun Resources in Fiji. He has sufficient experience relevant to the style of Sepon gold/copper mineralization and deposit types under consideration to qualify as Competent Person, as defined in JORC code. He will be responsible for data verification, as well as reviewing on geology, exploration, resource estimate, and he visited the project site.

**Liang Li, MEng. (Geology and Resources)**, is a Senior Geological Consultant at SRK China. Prior to joining SRK, he worked as a geologist for three different companies. He has gained lots of experiences and expertise in mine geology, grade control and optimization, resources/reserves management. He is also very familiar with the processes and principles to geological prospecting of metallic ore deposits in China. He gained lots of rules of thumb in mining, especially in resources/reserves estimation. In addition, he is proficient in digital modelling by using Surpac.

**Yonggang Wu, (Mining and Reserves), MEng., is a Principle Consultant (Mining)**. He joined SRK after graduation from Jiangxi University of Science and Technology in 2007. He has acquired specialized knowledge of mining engineering, MineSight software and has been involved in various projects to date. He has worked on a wide range of commodities including Au, Ag, Pb, Zn, Mn, Cu, Fe, W, Sn, fluorite, potassium salts, alum, phosphorus, serpentine, and many more. He has accumulated extensive experience in mineral resource/ Ore Reserve estimation, pit limit optimization and design, underground mining design, long-term production planning, mining assessment, public facilities and infrastructures assessment and due diligence studies. Yonggang has expertise in

geological and mining modelling and is proficient in using MineSight, Surpac, AutoCAD, and other specialized software packages. He has been involved in dozens of independent technical reports, due diligence reports and annual reports to provide investors, decision makers and shareholders with unbiased technical opinions.

**Erwei Lu, M.Eng.;** Consultant (Mining) at SRK China, he obtained his bachelor's degree and master's degree in mining engineering from Central South University. He has over five years of practice of underground operation, and about one year's mineral project evaluation experience. He worked as an on-site mining engineer in Zambia for China Nonferrous Metal Mining (Group) Co., Ltd. after graduation in 2017. He also worked for an autonomous driving application and mineral project investment companies since 2022. He is familiar with large scale underground mobile equipment operation and training, long-hole blasting, mine design and scheduling, and production management, as well as autonomous driving application in open pit mine, and project evaluation.

**Lanliang Niu, B.Eng., MAusIMM, is a Principal Consultant (Mineral Processing),** who graduated in 1987 from Beijing University of Science and Technology majoring in ore processing. He has worked on the industrial testing of gold leaching with low grade ores, managed or participated in processing and metallurgical testing for more than 10 precious and non-ferrous metals projects. With SRK, he has been responsible for the ore processing and metallurgical scope of work and involved in many key projects. Mr. Niu was responsible for the metallurgical and processing review.

**Andy Li, PhD, MAusIMM, is a Principal Environmental Consultant** with SRK Consulting China Ltd. Having graduated with a doctoral degree in Environmental Engineering from the Florida State University, he has over 12 years' experience in the environmental engineering field and has worked in various environmental projects in the USA, China, Mongolia, and a number of South Asian countries. He has particular expertise in environmental due diligence reviews, environmental compliance, and impact assessments for mining, mineral processing, refining, and smelting; in contaminated-site assessments and remedial design; in wetland and landfill rehabilitation; and in environmental-risk assessment. He also has extensive experience in water/wastewater treatment design, water distribution systems, and storm water management system design. Dr. Li was responsible for the environmental, permit, social and community review.

**Yonglian Sun, B.Eng. PhD, FAusIMM, FIEAust, CPEng.,** is a Corporate Consultant and a Practice Leader of SRK China. Dr Sun has over 30 years' experience in geotechnical engineering and mining engineering in five countries across four continents. He also has extensive international experience in mining project evaluation for project financing and overseas stock market listings. Over the last decade, Dr Sun has led and coordinated dozens of due diligence projects for many mining companies and most of them have been successfully financed or listed on the HKEx. Dr Sun provided internal peer review to ensure the quality of the report meets the required standard.

## 2.8 Warranties

Chifeng Gold has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

Based on the information provided by Chifeng Gold, there are no events that have occurred since the Effective Date that are likely to have a material impact on the Mineral Resource and Mineral Reserve statements for the Sepon Au Cu Project at the date of publication of this CPR.

## 2.9 Compliance Statement

The information in this report that relates to Mineral Resources/Ore Reserves is based on information compiled by Dr. Anshun Xu, a Competent Person who is a Fellow of the AusIMM, and Mr. Yonggang Wu, a Competent Person Who is a Member of the AusIMM. Both are full time employee of SRK Consulting China Ltd.

This Report is a Competent Person's Report in line with the Listing Rules of the Exchange and HKEX.

Dr. Anshun Xu has no prior association with Chifeng Gold in regard to the mineral assets that are the subject of this Report. Dr. Anshun Xu has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

Dr. Anshun Xu and Mr. Yonggang Wu have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code".

Dr. Anshun Xu and Mr. Yonggang Wu consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Dr. Yonglian Sun, *FAusIMM (CP Eng)*, a Principal Consultant (Mining).

## 2.10 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Chifeng Gold or Chifeng Gold's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence. SRK is independent of Chifeng Gold applying all of the tests in 18.21 and 18.22 of the Listing Rules of the Exchange and HKEX.

SRK is not an insider, associate or an affiliate of Chifeng Gold, and neither SRK nor any affiliate has acted as advisor to Chifeng Gold, its subsidiaries or its affiliates in connection with the projects. The results of the technical review by SRK are not dependent on any prior agreements concerning the conclusions to be reached, nor are there any undisclosed understandings concerning any future business dealings.

## 2.11 Consent

SRK consents to this Report being included, in full, in documents that Chifeng Gold proposes to submit to the HKEX and/ or disclosure to the public markets, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

## **2.12 Forward Looking Statement**

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

### 3 Operational Licenses and Permits

This section summarises related operational licences and permits. SRK relies on the information provided by the Company, and SRK understands that a legal due diligence review of this Project has been undertaken by the Company's legal advisors.

#### 3.1 Mining License

Table 3-1 summarizes key information of the mining license, and a scanned copy of the original mining license associated with an English translation is attached in Appendix A.

**Table 3-1: Mining License**

<b>Name of Mine</b>	Sepon Copper Gold Mine
Mining License No.	ML0002
Issued to	Lane Xang Minerals Limited
Issued by	Ministry of Mine and Energy
Area (km <sup>2</sup> )	116.96
Issuing Date	30 September 2023
Expiry Date	29 September 2033

#### 3.2 Exploration Permit

Currently, LXML possesses an exploration permit with a total area of 996.12 km<sup>2</sup>, which is valid till June 2026. The exploration permit consists of 66 inflection points which have been provided in Table 3-2 below.

**Table 3-2: Inflection Points of Sepon Exploration Permit**

Coordinates (Indian60/UTM zone 48N)								
No.	Easting	Northing	No.	Easting	Northing	No.	Easting	Northing
1	576400	1882200	23	627800	1878000	45	592000	1871800
2	585600	1882200	24	639800	1878000	46	590800	1871800

### 3.3 Other Key Operational Licenses and Permits

Table 3-3 presents the major information of the business license. LXML operates the Sepon project, in which Chifeng Gold owns 90% interest and the Lao Government owns the rest 10%.

**Table 3-3: Business License**

<b>Name of Enterprise</b>	Lane Xang Minerals Limited
Registration No.	01-00010734
Operation Activities	Sepon Gold-Copper Exploitation
Issued by	Ministry of Industry and Commerce
Issuing Date	19 October 2018
Expiry Date	Long Term

The Company provided SRK with revised Mineral Exploration and Production Agreement (“MEPA”) dated 15 September 2023 between the Lao government and the Company. According to this agreement, up to 1,127.00 km<sup>2</sup> contract area is defined for the purpose of mining and exploration activities for the project. Annual rent fee is paid to the Lao Government as follows: USD 200/ km<sup>2</sup> for exploration and USD 8,000/ km<sup>2</sup> for mining. This contract area is served as the land use agreement with the Lao Government. In addition, communities living within LXML’s concession area retain land use rights and are legally entitled to compensation for impacts to their land, property and livelihoods due to exploration activities and mining operations. According to the Company, the average compensation paid is ranged from USD 9,000 – 15,000/ha, based on quality of assets on the compensated land. The Company has compensated the impacted residents accordingly.

## 4 Accessibility, Climate, Local Resources, Infrastructure, and Physiography

### 4.1 Accessibility

The Sepon project area located in Savannakhet province, south-central Laos (Figure 4-1). Access to the project area from Vientiane, the capital of Laos may take about 1.5 hours flight or about 8 hour driving with a distance about 560 km. There are daily charter flights between Vientiane and Sepon mine in weekdays. There are also daily flights between Vientiane and Chinese, Vietnam and Thailand cities. Alternate access to the project is about 1 hour flight between Vientiane and Savannakhet and then 4 hour bus-ride between Savannakhet to Sepon.

Figure 4-1: Location of Sepon Project

Source: LXML, 2022

### 4.2 Physiography and Climate

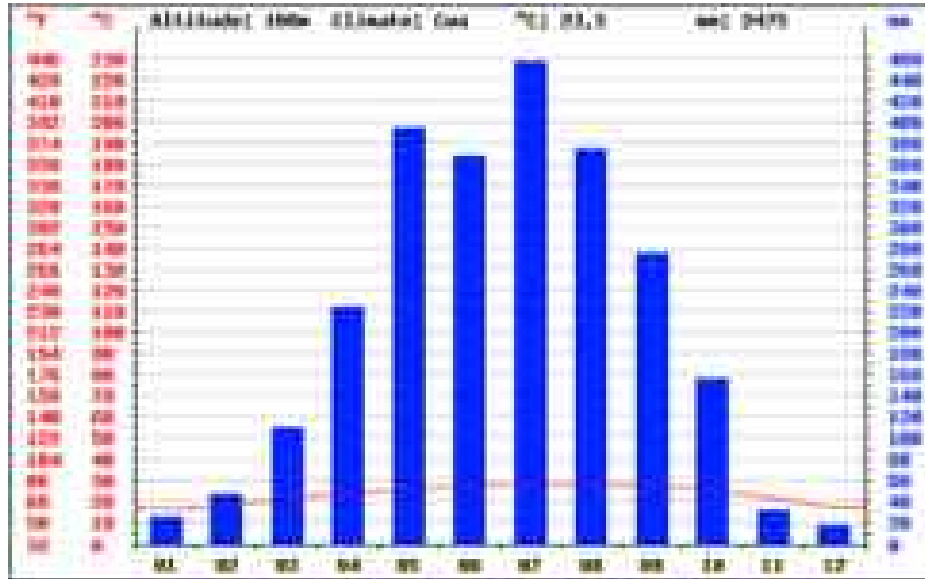

The Sepon project area has a geomorphology of low-mid mountains. The elevations generally range from 240 to 420m above sea level ("ASL"). The highest point in the mountainous area in north is 755.0m ASL. In the mine area, the relative elevation differences are about 50 to about 100m.

The mountain ranges generally strike near east to westerly. Water runs from the slope of each side to small streams. During dry the season, most of the small streams are dry out, while the small rivers into which the small streams flow have running water all year round. The small rivers flow into Sebanghiang River at the foot of the south slope, and the Sebanghiang River flows into Mekong River.

The climate in the project area belongs to tropic climate with northeast monsoon and southwest monsoon. The raining season relates to the southwest monsoon with the characteristics of heavy rains, high temperatures and high moistures, and lasts from mid-April to mid-October. The dry

season lasts from mid-October to mid-April of the following year with the characteristics of less rains and relatively lower temperatures and moistures, with the driest season from mid-November to mid-February of the following year. The monthly temperatures and precipitations in the project area have been illustrated in Figure 4-2 below.

Figure 4-2: Monthly Temperatures and Precipitations in the Project Area

### 4.3 Local Resources and Infrastructure

In the Sepon Project region, the vegetations are abundant with eucalyptus forest and bushes.

Villages are widely distributed in the area, and villagers generally work in agriculture and forestry productions. Rice is the main crop and Manihot is also important crop. Industry is not well developed. Labours are abundant, while technical personnel are absent.

Power line of 220 KV goes through the area and supplies the electricity. Telephones and mobile communication are also available.

## 5 History

Artisanal gold panning in numerous river valleys of the Sepon district was practiced in history, but no assessment of the hard rock potential had ever been undertaken prior to the involvement of CRA Exploration in 1990.

Potential of the Sepon district was first recognised by CRA geologists. While the style of mineralization was not immediately well understood, the association of porphyry intrusives, district scale alteration and extensive gold occurrences (alluvial and hardrock) was considered highly significant. The prospectivity was further confirmed by the assay results for 18 rock samples reported between 3.6 and 55.9g/t Au.

An application covering 5,000 square kilometers ("km<sup>2</sup>") in Savannakhet and Khammouane Provinces was submitted to the Lao Government in early 1991, and a MEPA was signed in September 1993. This Agreement provides for the exclusive right to explore, mine, process, transport and market all minerals from the MEPA.

Intensive exploration by CRA/Rio Tinto between 1993 and 1999 resulted in the discovery of gold and copper mineral resources in six separate deposits. In 1999 Rio Tinto decided to divest of the Sepon Project because it did not satisfy the companies resource size criteria. The project was put to competitive tender and following extensive due diligence Oxiana successfully bid for an 80% stake in the project in early 2000. Rio Tinto retained a 20% shareholding and has continued to provide strong support for Oxiana's subsequent gold and copper mine developments.

Oxiana decided to develop the project in two phases, i.e. oxidized gold development and oxidized copper development. In October 2001 a definitive feasibility study on development of gold mineral resources was done. The gold production from the Sepon project started in 2003, and stopped in December 2013 due to high operating cost and low grade. The feasibility study for developing the copper mineral resources was conducted in 2002. In March 2005, the Sepon mine completed the construction of copper processing plant and started copper production. In 2017, the peak production of cathode copper was more than 90,000 tonnes per year.

In 2018, Chifeng Gold acquired LXML which owns the Sepon project. In 2020, the Sepon project started production of gold from mining primary gold mineral resources. Currently the production is mainly from the primary gold resources, focusing on processing of oxidized gold and copper resources, with an annual production of about 10,000 tonnes cathode copper, and about 7 tonnes gold.

## 6 Geological Setting and Mineralization

### 6.1 Regional Geology

Tectonically, Sepon project area lies within the Truongson Fold Belt (or Annamite Cordillera) and the Kontum Massif. The Truongson Fold Belt is a NW elongated belt between South China Terrane and Indochina Terrane (Figure 6-1).

The Truongson Fold Belt is consisted of Early to Mid Palaeozoic sediments and lesser volcanic rocks, interspersed with lesser tectonic slices of metamorphic terranes, bound to the north by the Song Ma-Song Da suture zone and to the south by the NW trending Truongson Fault. The Kontum Massif comprises an Upper Proterozoic basement of ortho- and para-gneiss, crystalline schist and migmatite which abuts the Truongson Fold Belt to the south.

**Figure 6-1: Regional Geology Setting**

#### 6.1.1 Regional Stratigraphy

The main strata in the region include the Proterozoic low to mid-high grade metamorphic rocks, such as schist, marble and gneiss; Palaeozoic marine volcanic and sedimentary rocks with some continental volcanic and sedimentary rocks, such as limestone, sandstone, siltstone, shale, mudstone and marlstone; Mesozoic continental sedimentary rocks, such as red sandstone and clay; and Cenozoic loose sand and gravel.

### 6.1.2 Regional Structures

In the Sepon district, the Truongson Fold Belt is represented by a series of E-W trending basins which are truncated by the NW-striking Truongson Fault (Figure 6-1). Affected by the Fault, NW and nearly S-N striking faults were developed, with some secondary faults striking NE and nearly E-W.

### 6.1.3 Magmatic Rocks

Granitic intrusions have been mapped in the district as well as rhyodacite and andesite dykes and stocks, interpreted to be part of the Late Palaeozoic Variscan Orogeny. At least three phases of around 300 Ma rhyodacite porphyry intrusion are recognised, including a late, quartz-stockwork veined phase, which is interpreted to be genetically associated with all known Cu and Au mineralisation in the field. Minor remnants of Jurassic to Cretaceous Khorat Basin continental sedimentary rocks unconformably overlie the Palaeozoic marine sedimentary sequences to the east and north, while west of the Kontum Massif and south of the Truongson Fault, Khorat sedimentary rocks are dominant. Cenozoic volcanic rocks unconformably overlie the Palaeozoic rocks to the north-east.

### 6.1.4 Regional Mineralization

There are abundant mineral resources in the region, including gold, copper, lead-zinc and limestone resources, as well as coal, iron, REE and bauxite resources.

## 6.2 Property Geology

Figure 6-2 shows a geological map of the Sepon Project area.

Figure 6-2: Local Geology Setting

Source: Sepon Mine, LXML

### 6.2.1 Gold and Copper Deposit Geology

#### Stratigraphy

The Sepon basin comprises Devonian to Carboniferous age continental fluvial and shallow to deep marine sediments, deposited during the formation of an E-W oriented pull-apart basin. Alternating sequences of carbonate (calcareous shale, dolostone, limestone) and siliciclastic (sandstone, siltstone) rocks form the stratigraphy of the SMD.

The Sepon stratigraphic sequence succession has been informally divided into 8 formations based on lithology and depositional setting (Figure 6-3).

#### 1. Highway Formation

The Highway Formation represents the lower siliclastic, marine sedimentary sequence of stratigraphy that dominates the southern and eastern areas around the Sepon Mining District and also directly north of the North Bounding Fault. The lower member of the Highway Formation comprises a sequence dominated by thick bedded arenitic to arkosic sandstones with lesser, irregular interbeds of siltstone, mudstone and shale. Intervals of thin bedded to laminated calcilutite, calcarenite and limestone occur towards the top of the member. The Upper Highway Member is compositionally similar to the Lower Member but is distinct due to generally thinner bedding thicknesses and more regular (even thickness) beds. It is characterised as medium to thickly bedded (ranging from 0.1 m to 1 m, averaging 0.4 m thick beds) massive quartz-feldspar-mica sandstone with regular interbeds of thinly bedded to laminated siltstone, banded siltstone and mudstone-shale. The Upper Highway Member represents a transitional sequence and has gradational relationships between the underlying Lower Highway Member and the overlying Vang Ngang Formation. It displays variable thickness laterally across the Sepon district. In some areas (particularly from Houay Yeng to Nampa) it is very difficult to map as a distinct unit and may not be present at all and the Lower Highway Member appears to be in direct contact with the Vang Ngang Formation siltstones and/or cherts.

#### 2. Vang Ngang Formation

The Vang Ngang Formation is characterised by very well bedded, thin (2 cm-15 cm) and rhythmically bedded red and green siltstone with lesser sandstone that is typically silicified to chert. Unlike the underlying Highway Formation, the Vang Ngang sediments are non-micaceous. The cherts are underlain by a limestone unit that locally occurs at the boundary between the underlying Highway Formation and overlying Vang Ngang cherts, which serves as a marker unit. The limestone is typically a light grey colour, non-fossiliferous and massive with little internal structure apart from stylolites. In the Ban Salo area it contains sub-vertical veins of barite. The top of the Vang Ngang Formation is marked by the Graptolite Member shales which is a thin unit of laminated, thinly bedded black carbonaceous to graphitic shales containing common graptolite fossils. The Graptolite member is commonly silicified or "cherty" at its base.

#### 3. Kengkeuk Formation

The Kengkeuk Formation consists of black laminated calcareous, carbonaceous shales with rare nodular texture. In the upper parts of the Kengkeuk Formation, the shales become more calcareous, with discrete beds/lamina of carbonate and sand to gravel sized crinoid clasts. Limestone / dolomite talus breccias are common in the upper parts of the formation. Overall, the unit was deposited in a shallowing upwards succession, ranging from deep-water basinal shales in the lower sections, up to

proximal fore-reef slope breccias (or even reef margin) in the upper portions of the unit. The upper carbonate-rich portion of the unit represents a carbonate slope succession that was probably deposited in front of a prograding reef system.

#### 4. Namphuc Formation

The Namphuc Formation, comprising andesite-pebble to cobble conglomerates and volcanic rocks grading to siliceous conglomerates, occur at, or close to the base of the Kengkeuk formation. The Namphuc volcanics sporadically outcrop adjacent to several units and therefore the base of the volcanic unit likely represents an unconformity.

#### 5. Nalou Formation

The Nalou Formation is a platformal carbonate succession that has been almost completely dolomitized throughout the Sepon basin. The Nalou Formation is divided into five units:

- Lower laminated unit
- Lower dolomite-mudstone unit
- Laminated dolomite unit
- Upper bioclastic unit.
- Upper pale bioclastic unit (laterally restricted)

#### 6. Discovery Formation

The Discovery formation is characterized by 200 m-300 m of grey - black to tan weathered nodular calcareous mudstone, with minor bioclastic material near the base of the formation.

The nodular calcareous mudstones grade upwards to planar laminated calcareous mudstone, siltstone and sandstone of the Nam Kian formation. In some areas a narrow bioclastic dolarenite to algal dolarenite - dololutite layer occurs at the contact between the Discovery and Nam Kian formations mudstone.

#### 7. Nam Kian Formation

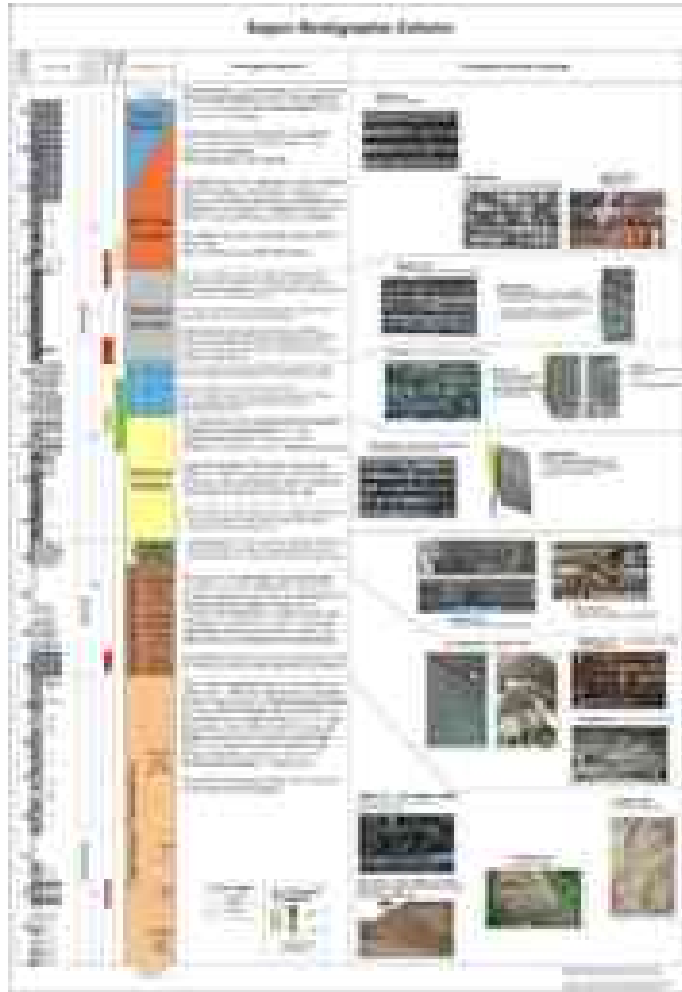

The Nam Kian formation contains variably carbonaceous and calcareous, well laminated and well bedded shale mudstone, siltstone, sandstone and minor chert.

#### 8. Phabing Formation

Overlying and potentially locally interbedded with the Nam Kian Formation is the Phabing limestone, characterized by pale grey to dark grey limestone with abundant stylolites, sometimes nodular, locally resulting in a light to dark grey striped appearance. The minimum thickness of this formation together with Nam Kian formation is 400 m. This formation forms the distinctive karst hills at Phabing and south of Phavat.

Figure 6-3: Sepon Stratigraphy Log

### Structures

The dominant structural grain of the Sepon basin strikes E to ENE and is controlled by the preferential alignment of basin-related fault structures and generally shallowly to moderately N dipping bedding planes. Dip value variations can be attributed to (locally tight) folding and faulting. Two main fold axis trends have been recognized in the Sepon Basin. The dominant fold generation strikes E to ENE, has wavelengths varying up to kilometre-scale, and are open folds. The E to ENE trending folds are deformed by N-trending folds as can be seen at Houay Bang and Houay Payee. The N-trending folds are typically broad open structures with wavelengths of 100's of meters. Tight, m-scale folds of varying orientation have also been documented across the district. These folds are typically associated with faults and their presence can be used as a tool to map brittle structures.

Dominant fault directions are NW (parallel to the Truongson Fault zone) and E to ENE. The NW and E to ENE faults typically dip steeply to the north and south and accommodate variable, but in some instances considerable (e.g. NW-trending Muang Luang Fault), strike-slip and dip-slip offset. The NW faults typically cut the E to ENE trending faults but are thought to have developed broadly contemporaneously in response to movement along the Truongson Fault.

### **Magmatic Rocks**

Rhyodacite Porphyry (RDP), minor andesite, and rare lamprophyre are the only intrusive rocks to have been recognized within the Sepon district. The RDP has a remarkably consistent composition and morphology throughout the area with quartz and feldspar phenocrysts (2 mm-5 mm across) set in an aphanitic groundmass. No equigranular, crowded or megacrystic textures have been observed. A quartz-poor RDP variant has been identified that appears to be spatially associated with Cu mineralization at Thengkham East and South.

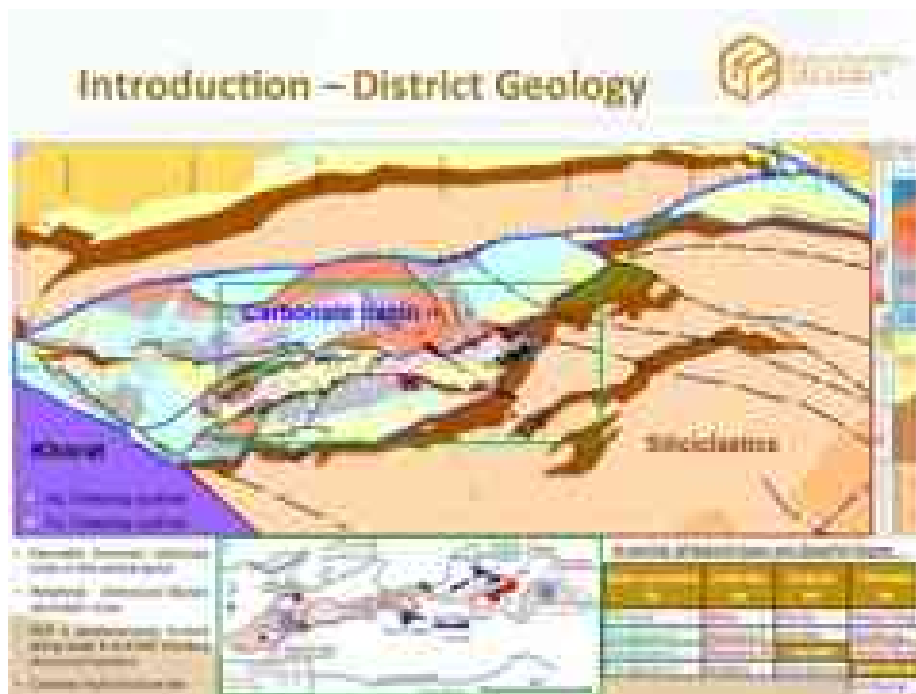

Three major intrusive centres occur across the Sepon district; the Thengkham, Padan and Kaban intrusive centres. The majority of primary gold mineralisation at potentially economic grade is located between the Thengkham Intrusive center in the W and the Padan Intrusive center in the East. These bodies are associated with intense quartz-dominated stock-work veins, and hornfels/skarn alteration of the wall rocks which result in them forming resistive hills. At Thengkham the RDPs are composed of abundant sills, dykes and intrusions with irregular geometries. RDP stocks, sills and dykes have also been mapped at Nakachan, Ban Mai, Katia, and Phu Xo. These porphyry occurrences form a broadly E trending linear across the Sepon district. Numerous RDP dykes also cut the sedimentary sequence, mainly within steep W- or NW- trending fault zones, but also along relatively flat-lying structures such as bedding planes or formational contacts.

### **Gold and Copper Mineralization**

Gold and copper mineralization in the Sepon deposits has many similarities to the sediment-hosted replacement style deposits of the Great Basin, Nevada: host rocks comprise mid-Palaeozoic aged calcareous and carbonaceous sediments; high-angle faults serve as fluid conduits and are major ore controls; ore-bodies are generally tabular to rod-shaped; alteration is characterized by the dissolution of carbonate minerals and the precipitation of silica (jasperoid); gold is generally ultra-fine and intimately associated with pyrite; base metal levels are typically low. Significant differences between Sepon and the Great Basin Carlin-type deposits include the age of gold mineralization – Permian versus Late Eocene respectively, and the tectonic setting – compressive versus extensional respectively. Although the Sepon mineralization shares many characteristics with the Carlin-type of mineralization, it may more accurately be described as “distal-disseminated Au-Ag”, due to its position within a possible zoned, porphyry intrusive centred system.

In the Sepon Project area, gold and copper mineralization has been discovered in a carbonate basin as illustrated in Figure 6-4. Different mineralization types of deposits have been identified, such as skarn associated copper, carlin gold, orogenic gold, and supergene gold deposits. Some of the deposits have been mined out and some are to be developed.

Figure 6-4: Sepon Carbonate Basin and Mineralization Types

### Alterations

There are 14 alteration subtypes that have been recognized in the three broad alteration zones. The earliest documented intrusion-related alteration/mineralization events are K-silicate alteration and associated A-type quartz stock working, hornfels and prograde skarn. Distal to, and transitional with, K-silicate alteration is propylitic alteration, which is commonly observed in the internal cores of rhyodacite porphyry sills adjacent to prograde skarn or K-silicate front. Observed to overprint the K-silicate and prograde skarn alteration types is phyllic alteration, retrograde skarn and carbonate replacement. A texture-destructive equivalent of the phyllic zone is silica-pyrite alteration where there is pervasive and intense replacement of fine to coarse grained quartz and >10 % vol pyrite. Overprinting the above alteration types is intermediate argillic alteration, which is commonly texturally destructive because of the increase in clay minerals. Silicification is a long-lived and pervasive event in these magmatic hydrothermal systems spanning across the porphyry Mo, skarn and jasperoid front. Alteration associated with the sediment-hosted Au systems is typically silicification, decalcification and dolomitization.

### 6.3 Deposit Types

This chapter describes the mineral deposit type(s) being investigated or being explored for and the geological model or concepts being applied in the investigation and on the basis of which the exploration program is planned

### 6.3.1 Copper and Gold Mineralization types

Mineralization styles of the Sepon district can be classified as an intrusion-centred hydrothermal system with the majority of known Cu and Au mineralization spatially associated with the Padan and Thengkhamb porphyry centres. Mineralisation typically displays a zoned pattern in both mineralization type and metal content. Porphyry Mo-Cu systems occur at the core zoning outward through skarn and carbonate replacement Cu deposits to the Au dominated sediment-hosted systems which show Carlin type deposit characteristics (Figure 6-5). Pb-Zn mineralization occurs distal to the porphyry's contact metamorphic aureole in a sediment-hosted setting, though a genetic link is yet to be confirmed.

**Figure 6-5: Relationship between magmatic rock bodies and mineralization types**

Main intrusive centers that control the location of copper mineralisation (proximal) and gold mineralisation (distal) are discussed below.

The dominant style of mineralization in the Sepon mining district is micro disseminated sediment-hosted gold localized in combined structural, rheological and chemical traps. Gold mineralization occurs closely associated with decalcification of calcareous shale and irregularly distributed silica replacement (jasperoid) bodies. The geometry of the deposits is controlled by the interplay of shallow-dipping lithological contacts (dominantly Nalou-Discovery Formation contact) and high-angle faults, forming tabular to rod-like ore bodies. Faults as well as formation contacts often coincide with porphyry margins suggesting that intrusion as well as auriferous fluids exploited similar crustal pathways.

Gold mineralization is associated with elevated concentrations of arsenic, antimony and locally thallium which is also evident in the extensive soil sampling dataset that covers the Sepon mining district.

Figure 6-6: Schematic Cross-Section showing Relationship between magmatic rock bodies and mineralization types of Sepon Project

### 6.3.2 Main Factors of Metallogeny

Three major controls on the distribution of gold and copper mineralization in the Sepon Basin have been identified. The primary control is understood to be the porphyry centres around which there is a metal zonation. Secondary control is the structural architecture (faults and folds). In the case of Au mineralisation there seems to be a strong (third order) lithological control where gold dominantly occurs along or close to the Nalou-Discovery formation contact which acts as a favourable receptive region.

#### ■ Primary Control

The bulk of the mineralisation across the Sepon district is spatially associated with RDP intrusive centres. All known copper deposits are immediately adjacent to intrusive centres and the main sediment-hosted gold zone is located between two of the largest intrusive centres and located in a peripheral position with respect to the molybdenum and copper zones.

#### ■ Secondary Control

The structural architecture around the margins of the intrusions is a key control on the distribution of mineralization. NW to WNW and E to ENE faults localise mineralization from district to outcrop scale and likely acted as the main conduits for mineralizing fluid. These faults provided traps and focused fluids into other depositional sites such as lithological contacts and fold axes. Much of the mineralization occurs to the east and west of the intrusive centres, rather than the north or south.

This also likely relates to the overall architecture of the basin and more specifically the orientation of favourable feeder structures like NW- and E- striking faults.

- Ternary Control

Lithological receptivity favourable factors include: (1) the receptivity of calcareous black shale, with gold deposition accompanying decalcification and jasperoid development; (2) the rheological and permeability contrasts between footwall rhyodacite porphyry sills or bioclastic dolomite and the overlying calcareous shale; (3) the carbonate and clay content of formations Vang Ngang and Kengkeuk and their amenability to forming skarn assemblages.

Petrologic, fluid inclusion and organic studies of drill core samples suggest temperatures >600°C for alteration assemblages developed proximal to intrusions and 150°C-250°C for alteration associated with sediment-hosted gold deposits. It has been estimated that ~4.5 km of stratigraphic section has been eroded from above the currently exposed rocks.

## 7 Exploration and its Quality Assurance and Quality Control and Sampling

### 7.1 Exploration Programs

#### 7.1.1 Exploration Programs of Gold and Copper Deposits Prior to Chifeng Gold

The first campaign was greenfields exploration drilling. This drilling was completed by RTZ during the 1990s. Oxiana continued to use the drilling and sampling protocols developed by RTZ after acquiring the project. This drilling included the oxide gold drilling in the neighbouring Discovery deposit to the north of Khanong.

Oxiana encountered significant amounts of wet sample during RC drilling in Khanong.

In 2006 it was recognised that wet RC samples were subject to considerable downhole grade smearing. This was demonstrated at Thengkhram by drill holes TKN035, a wet RC hole, which returned 2m @ 5% Cu from 74.0 m plus 65.0 m at 6.4% Cu from 94.0 m. This hole was twinned by DD hole TKN077 which intercepted a 0.9m void from 72.2m, then 1.8 m of copper carbonate mineralisation at 41.0 % Cu from 73.1 m. The remainder of the hole was unmineralised dolomite. This was interpreted as indicating that the copper carbonate mineralisation self-stopped as TKN035 was drilled causing the second very long, high grade intersection.

In May 2006 the Sepon site adopted a policy of requiring no wet RC drilling of mineralised zones. If wet RC sample was encountered the hole was stopped. Therefore, any RC drilling post 1/5/2006 is restricted to pre-collars only or was part of a sterilisation campaign. Geologists and/or geotechnicians supervised RC drill rigs at all times while diamond drill rigs were checked twice daily by geology staff to ensure drilling practices were being followed. Drillers maintained drilling logs which recorded the depth and number of drill runs as well as important information such as core loss and ground conditions. In situations where errors were detected in the core during processing, drillers' logs and field geologists' notebooks could be consulted to rectify the error.

Drill holes collars have been surveyed by a range of methods including total station survey instrument, differential GPS, theodolite, handheld GPS and tape and compass over the past years. Planned collar coordinates, which are generally surveyed using handheld GPS, were also recorded for further check to the actual coordinates. The planned coordinates are resurveyed by total station in Sepon SPG06 grid system or differential GPS in the UTM IT60 grid system once drilling was completed. The coordinates in UTM IT60 grid system are converted to local Sepon SPG60 grid system. As set in the database system, the actual coordinates will not be entered into database if the difference to the planned coordinates is greater than 20m. Further check was then conducted to confirm the correct actual coordinates. All drill holes collars survey are stored in the database and ranked according to method and date of survey. Only the most recent survey and the highest rank survey are used for data extraction.

Collar validation was also performed by displaying the drill holes on screen against surface to check visually if there is any collar that is off the surface. Drill holes collars which appear far away from surface or outside of the project boundary are then investigated.

Prior to June 2007, most downhole surveys were conducted by drilling contractor using Eastman Single-shot Cameras with the result recorded in a survey disc. Since June 2007, all downhole surveys were conducted using Reflex camera which provides reading results digitally. The results were then written manually by the driller on a piece of paper. Protocol dictates that surveys should be taken at depths of 12m, 30m, 60m (then every 30m to the bottom of hole). Historically vertical holes with depths of around 50m were not surveyed. These drill holes were drilled at high angles to sub-horizontal mineralisation and hence any deviation is regarded as insignificant and immaterial to resource estimation.

Core orientations were carried out at 18m intervals using chinagraph-tipped spear in the selected holes. Post 2006, all core has been oriented using the electronic ACE Reflex Core Orientation tool. Segments of core were classified as having good, medium or poor quality bottom-of-hole lines (BOH) or no BOH. The BOH line is used as the reference line for recording, presenting and interpreting structural data.

Drilling contractors provide the downhole surveys to LXML. LXML geologists then check the survey disc/form and initial the survey after having been checked. Data is then entered into the database. All surveys are entered into the database; however, if a survey is deemed to be erroneous a field in the database is set to "reject". Only data with accepted surveys are exported for use in resource estimation. The grid to magnetic deviation at Sepon is 1° and so azimuth conversion problems are inconsequential.

Downhole surveys were checked both mathematically in LaosDB (maximum deviation of 0.27° per metre downhole where dip > -80°) and visually for excessive deviation or unlikely hole traces. Any obvious problems were identified and rectified in the database prior to export for use in the Mineral Resource modelling. Neither the planned nor actual rig set up azimuth is recorded in the LaosDB.

A total of 1,321,787m of DD and RC drilling data is contained in the resource database, of this 85% is geologically logged, and 98% of sampled intervals contain gold and copper assays (15% of the RC data was assayed but not logged).

Only samples within the mineralisation or geological domains are used in the estimations. There are also some drillings within block model extents not used in estimations as they fall outside of the areas of interest, or have suspicious assay results.

A total of 1,503 diamond holes (100,582.5m), 2,840 RC drill holes (170,825.6m) and 13,661 grade control RC holes (202,618.3m) were used to inform the Nalou block model.

A total of 1,022 DD (117,495m), 23,732 RC (not Grade Control) (175,499.2m) RC drill holes and 45,635 RC Grade Control holes (764,831.8m) for a total of 1,057,826m were used to inform the Discovery region block model.

Figure 7-1 summarized the drillings that have been completed by December 2022 in the Sepon Project area.

Figure 7-1: Drilling Programs completed in Sepon Project by December 2022

### 7.1.2 Exploration Programs of Gold and Copper Deposits by Chifeng Gold

After Chifeng Gold took over the Sepon project, the exploration programs focused on discovering new gold deposits in brownfield to supply the processing plant and keep on the production, as well as discovering new types of mineralization in green field. Figure 7-2 and Figure 7-3 summarized the exploration programs in 2021 and 2022.

Figure 7-2: Exploration Programs completed in Sepon Project in 2021

Figure 7-3: Exploration Programs completed in Sepon Project in 2022

### 7.1.3 Trenching

LXML conducted exploration work basically by its in-house personnel of the exploration department, including trenching, drilling, and general geological survey and mapping. Figure 7-4 shows trenches used in the exploration programs.

Figure 7-4: Trenches used in the exploration in Sepon Project

### 7.1.4 Drilling

LXML conducted exploration work basically by its in-house personnel of the exploration department, with different drilling rigs. Figure 7-5 shows rigs LXML owns and uses in exploration programs.

Figure 7-5: Drill rigs used in the exploration in Sepon Project

**Diamond Drilling**

Diamond drilling is carried out by a variety of track or skid mounted rigs with 3 m masts. Core barrel lengths are usually 3 m, but sometimes 1.5 m. All diamond drilling is wireline drilling. Drilling productivity is hampered by the very clay rich ground resulting in short run lengths. The diamond drilling has predominantly used triple tube drilling methods to enhance recovery and mostly using a HQ3 size core barrel. Core samples are usually collected over 1 m intervals but may range from 0.5-1.5 metres in length to enable samples to be broken on lithological and mineralisation contacts. Where possible RC pre-collars are used to reduce drilling costs, which is also recorded in the drill hole database.

Run by run recovery has been recorded for all diamond drilling carried out at Sepon and for all drill runs. DD recovery averages 95% (based on length) and RC recovery averages 80% (based on mass).

The recovery data is somewhat muddled by the recording of 'cavities' in the database. There are some true cavities in the Khanong area (small caves that occur in dolomite or limestone). Originally drillers recorded "cavity" when they encountered unconsolidated material inferred to have formed in a cavity.

Since March 2014 this practice changed and that material is now recorded as core loss, the term cavity is only used on voids now.

Diamond drilling recovery improves with depth, reflecting the better drilling conditions and absence of clay and unconsolidated fill.

**Reverse Circulation Drilling**

RC drilling is carried out by a variety of track mounted rigs with 6 m masts and rods. All hammers are face sample with 5 ¼ inch bits and 3 ½ inch rods. No attempt is made to control the direction of the hole. Boosters are not normally used. Exploration, Resource and grade control RC samples are collected at 1.0 m downhole intervals. Representative rock chips are collected during the drilling and logged on site by a geologist to establish the stratigraphic context of the sampling and to provide a geological description of each sample.

No RC drilling has been carried out routinely by the Resource Geology department since 2006. RC drilling at Khanong represents a large amount of the data used to estimate copper grades.

Each metre sample is weighed to assess drilling recovery prior to splitting. The average RC sample weight for dry samples was 22.7kg. This compares to expected sample weights from a 5 ¼ inch hole of 25 kg, assuming average supergene material density (1.8t/m<sup>3</sup>). Sample moisture is recorded and has been summarised below.

About 26% of the RC samples were wet or moist out at Discovery, and 32% from Nalou was wet or moist. This constitutes 31% of the total RC data for Discovery and Nalou metres.

Grade control drilling was used in both Nalou and Discovery resource models for the first time in 2019. This decision was made to better inform the model in terms of data density and produced higher quality geostatistics. It also allowed a small amount of material to be classified as measured due to the greatly increased kriging efficiency.

### 7.1.5 Mapping

Exploration surface interpretation and grade control bench mapping have been used in areas as guidance to generate lithological and structural models. This geological information was further used for interpreting the ore delineation when generating ore domains. The Resource department at Sepon does not do bench or pit wall mapping or surface mapping but relies on other departments for this information.

## 7.2 Quality Assurance and Quality Control of the Exploration Programs

The samples from multiple drilling of the Sepon project development. There are at least five batches of drilling data that relate to these prospects:

- Pre-Oxiana (CRA/Rio Tinto) 1993-1999
- Oxiana Pre-Mining 2000-2002
- Oxiana Active Mining 2002-2006
- SPGRDP (Sepon Resource Development Program) 2006-2007
- LXML Resource and Exploration Drilling Programs 2007-2019
- LXML Grade Control Programs 2020-2022

The quality of the datasets from periods of 2020-2022 has been reviewed by SRK.

LXML developed a standard procedure in which quality control samples were inserted within the sample stream in order to validate analysis and drill-core samples. All of these protocols are also located on the LXML intranet. Full QC reports can be found in monthly reports located on the Sepon server.

LXML has prepared Core Sample Preparation for Lab Testing Standard Operating Procedure which demonstrated the QA/QC procedures in the exploration. Quality control samples including standard samples, blank samples and duplicated samples.

### 7.2.1 Standard Sample

Certified reference materials (standards) are inserted in the sample stream. Currently, most standards have been produced by Ore Research & Exploration and Grade Control. There were 71 standards used within the reporting period, and details are shown in Table 7-1.

**Table 7-1: ALS and Sepon Lab Standards**

Standard Name	METHOD	ELEMENT	UNITS	NOMINAL VALUE	STD DEVIATION	DATA SOURCE

### 7.2.2 Duplicates

Two types of duplicates are used for monitoring laboratory's preparation and analytics: field duplicates and lab duplicates.

Reverse circulation field duplicates have been prepared using a single tier riffle splitter. The larger sample size submitted for analysis has shown better repeatability than diamond drill field duplicates. Analytical duplicates are prepared by taking duplicate splits after pulverization of the sample material.

Lab duplicates are prepared by taking duplicate rotary splits after finer (-2mm) crushing of the sample material.

### 7.2.3 Blanks

Pulp and coarse blanks are inserted into the sample stream at the Sepon core shed operational area.

Presently, on average, coarse blanks and pulp blanks standards are inserted at start of each drill holes and thereafter at a rate of one in every 20 samples.

The Coarse Blank consists of crushed limestone sourced from the limestone pit within Sepon mine site. Analysis of the samples was done by ALS-Lab and Sepon Lab. The Coarse Blank used in Sepon has some detectable presence of Au based on the results of the analysis done by ALS.

Pulp Blank is mainly a hydrated lime originally placed in 25 kg rice bags. They are then re-packed by onsite samplers who scoop it into foil pouches for insertion. The source of the sample is from Vietnam

The blanks occasionally show some low-level contamination (<0.04 g/t maximum). It is uncertain if this should be attributed to the blank source material - establishment of a background baseline value should eliminate most of the noise associated with background mineralisation.

### 7.2.4 QA/QC Performance

The procedure of inserting control samples was routinely carried out over the entire exploration programmes. The control samples include pulp duplicates, coarse rejects and reference standards. Internal check and external check data from JM exploration between 2020 and 2022 were provided to SRK, and the main elements were Au, Cu and Ag.

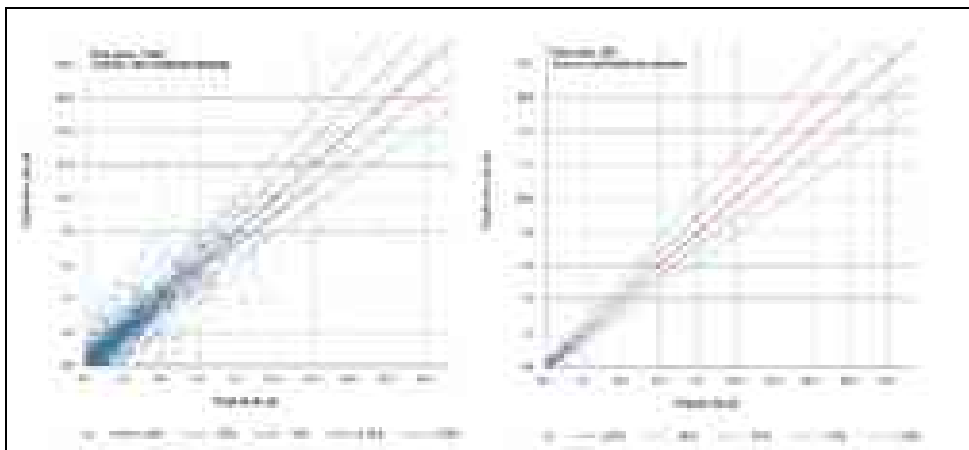

#### a. Duplicate

Two types of duplicates are used for monitoring laboratory's preparation and analytics: field duplicates and lab duplicates.

The Au field duplicate samples are general acceptable, among all 11443 field duplicate samples, 42% of which are below 10% relative difference and 63% of which are below 20% relative difference; the Ag field duplicate samples are general acceptable, among all 1699 field duplicate samples, 47% of which are below 10% relative difference and 71% of which are below 20% relative difference; the Cu field duplicate samples are general acceptable, among all 1959 field duplicate samples, 58% of which are below 10% relative difference and 79% of which are below 20% relative difference.

The Au field duplicate sample performance is not as good as Cu and Ag due to more nugget effect of Au, about 37% field duplicate samples are greater than 20% relative difference. The Au Lab duplicate samples are general acceptable, among all 177 Lab duplicate samples, 39% of which are below 10% relative difference and 61% of which are below 20% relative difference; the Ag Lab duplicate samples are general acceptable, among all 79 Lab duplicate samples, 52% of which are below 10% relative difference and 68% of which are below 20% relative difference; the Cu Lab duplicate samples are general acceptable, among all 94 Lab duplicate samples, 62% of which are below 10% relative difference and 86% of which are below 20% relative difference. The Au Lab duplicate sample performance is not as good as Cu and Ag due to more nugget effect of Au, about 39% Lab duplicate samples are greater than 20% relative difference. The field and lab duplicate samples performance are shown below.

Figure 7-6: Field and Lab Duplicate Au Ag and Cu Plot of Control Sample Programme

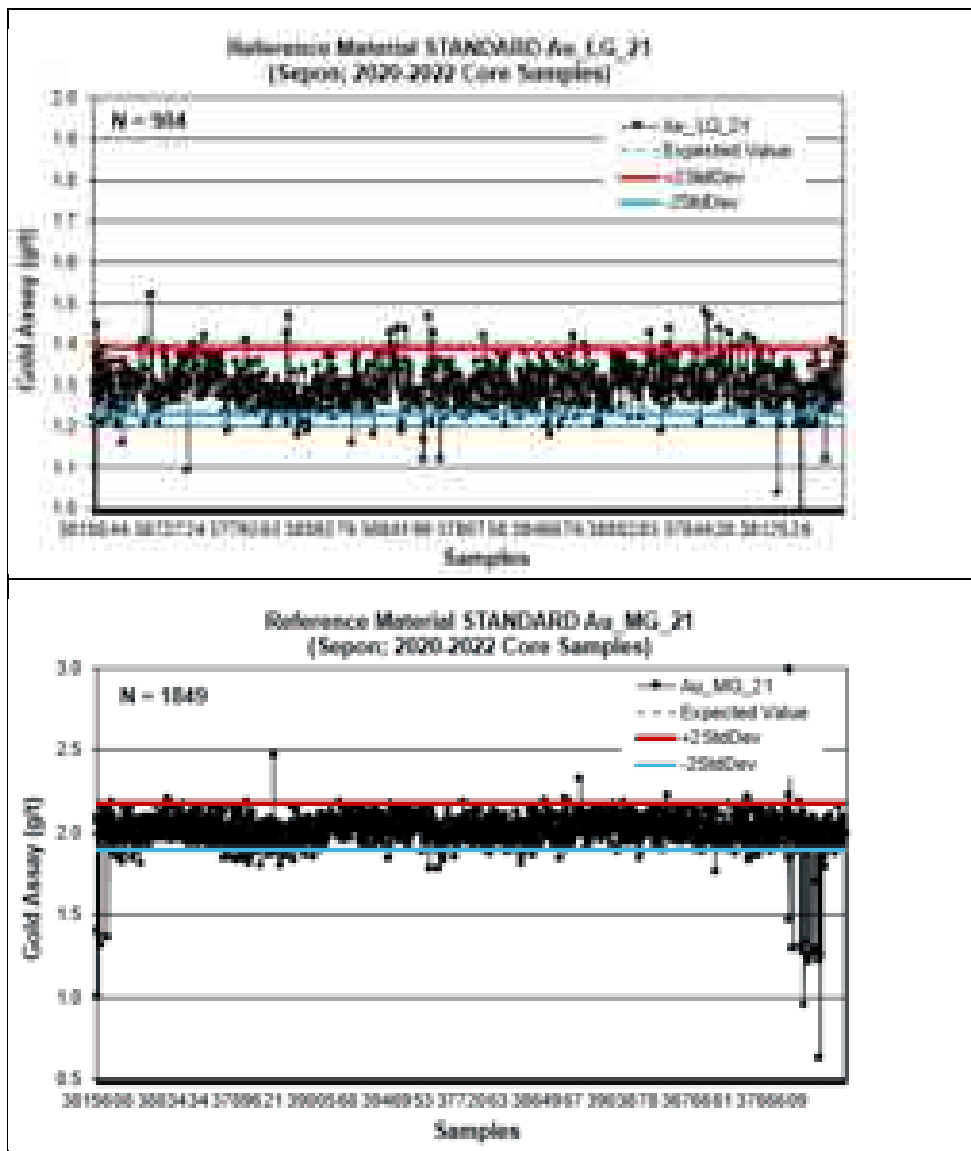

b. Reference Standards

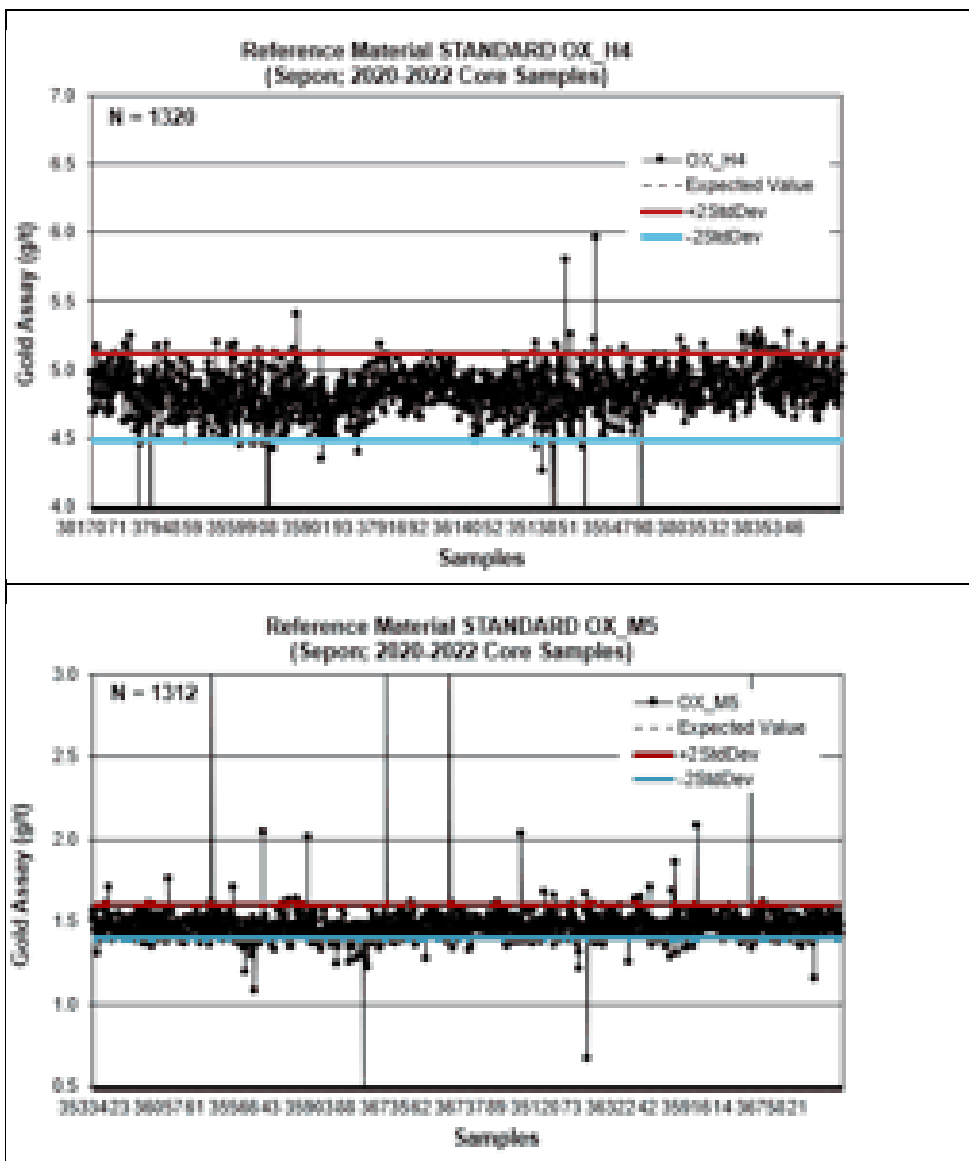

There were 71 standards used for monitoring laboratory's preparation and analytics.

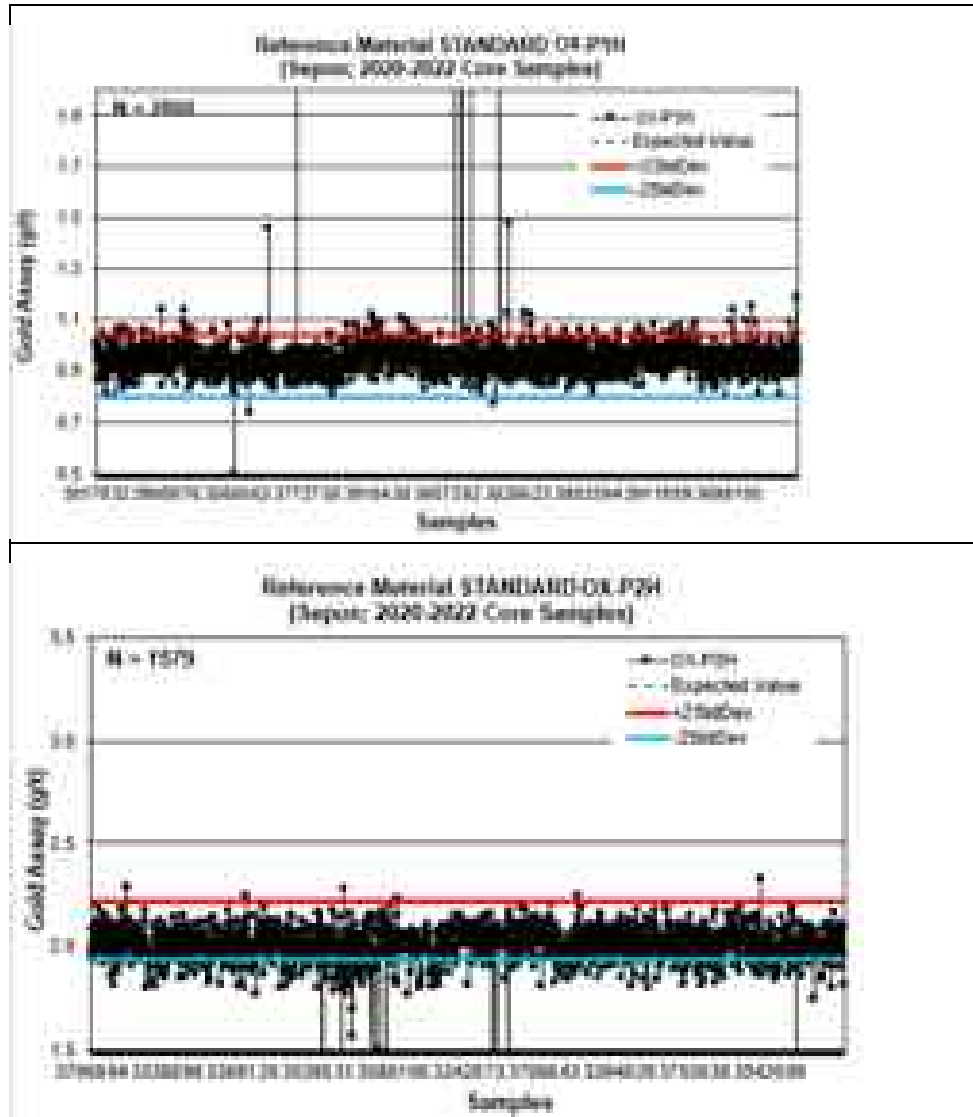

SRK selected standards with large quantities for statistical analysis: Au\_LG\_21 Au\_MG\_21 OX\_H4 OX\_M5 Ox-P1H Ox-P2H and Ox-P2L.

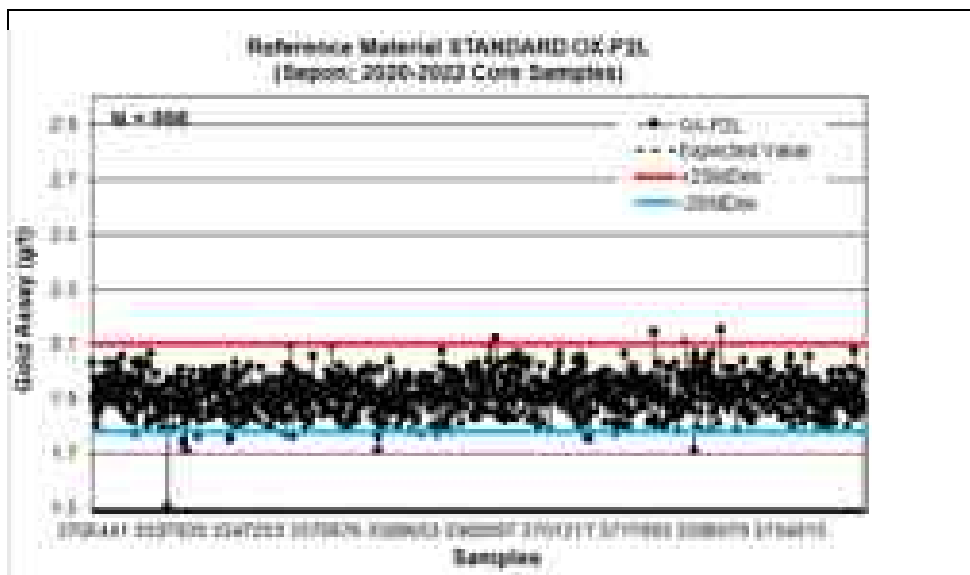

According to the comparison curves between the standard sample reanalysis results and the standard grade values in Figure 7-7, the Au analysis results of each standard sample are fluctuating within 20% around the standard value.

Figure 7-7: Performance of standards of Sepon

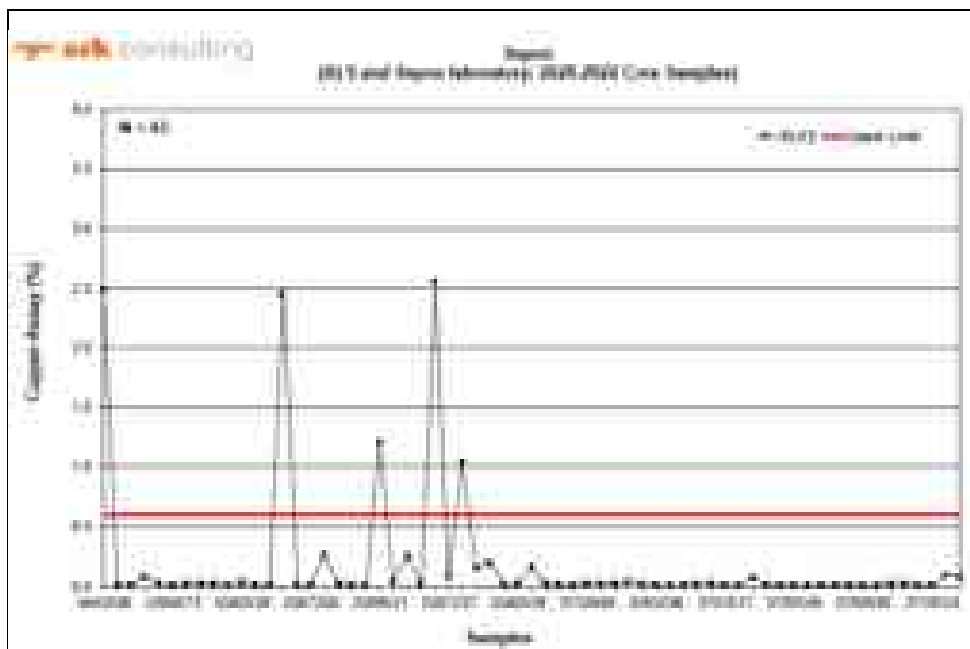

c. Blanks

The blank samples are the original blank sample, and the comparison of blank samples is shown in the figure below. The value of 5 samples exceeds the detection limit of 10 times, and the qualified rate is 92.1%. The blank samples performance is shown below.

Figure 7-8: Performance of blanks of Sepon

**7.2.5 SRK Comments**

SRK considers that, QA/QC performed during 2020-2022 for Sepon mine are consistent with generally accepted industry practices and are therefore adequate for resource estimation.

**7.3 Sample Preparation, Analyses, and Security**

**7.3.1 Sample Preparation and Analyses of Gold and Copper Deposit**

Sample preparation is the most critical step in the entire Laboratory operations and it must provide a homogeneous analytical sub-sample that is representative of the sample submitted to the laboratory.

Samples on arrival at the Laboratory are logged into the ALS tracking system with a bar code label attached. Samples are then dried in an oven at temperature of about 110 degrees followed by crushing of rock chips and drill samples to 70% of the sample passing 2mm. The samples are then split using the riffle splitter 250g and are pulverised to 85% less than 75 microns

The analytical methods employed at Sepon site have varied little over the years. The current assay protocol used by the Sepon Resource department is shown below in Table 7-2.

**Table 7-2: Current Sepon Resource Assay Protocol**

PROTOCOL	METHOD	TRIGGER	LAB	ELEMENTS ANALYZED
321	ALS- Au-AA25			Au
SepCu+IR07	ME-ICP61		ALS	Ag,Al,As,Ba,Be,Bi,Ca,Cd,Co,Cr,Cu,Fe,Ga,K,La, Mg,Mn,Mo,Na,Ni,P,Pb,S,Sb,Sc,Sr,Th,Ti,Tl,U,V,W,Zn

+Cu- PKGPH06	S-IR07 Cu-OG62 CuCN-PH06 CuR-PH06 CuS-PH06 CuT-PH06	>0.5%Cu for OG62 >0.2% for Sequential Cu- PKGPH06	S_S (Sulphide Sulphur) Cu Cu (Cyanide Leach Soluble) Cu (4 Acid Soluble) Cu (Sulphuric Acid Soluble) Cu (Calculated Total)
-----------------	--	--	---

## Notes

<sup>1</sup> ME-ICP61 Four Acid Near Total- ICP Multi-element Method

<sup>2</sup> ME-OG62 Four Acid Near Total Assay Grade Multi-element Method

<sup>3</sup> Au-AA25\_26 Fire Assay Gold AAS finish

<sup>4</sup> IR07 Total S by Lecco Furnace IR – provides sulphur speciation (sulphide sulphur and sulphate sulphur)

<sup>5</sup> PKGPH06 - Sequential Copper CuCn-PH06 (Cu Cyanide leach soluble), CuS-PH06 (Cu Sulphuric Acid leach soluble), CuR-PH06 (Cu 4 acid digest soluble) and CuT-PH06 (Cu calculated total based on all 3 methods of leach).

### 7.3.2 Bulk Density

Historically, various estimations of the wax density have been undertaken; in February 2014. R. Berthelsen and A. Lewin (MMG) confirmed that the density used in the calculation of specific gravity ("SG") in the database is correct. The review formed part of a larger Mineral Resource site review (Sepon resource report 2014).

Samples for bulk density determination are taken from diamond drill core every 10m using wax coated core immersion method; however, in 2015 sample interval was changed to 5m interval. This is to reduce the wide range of sample selection interval hence to allow for more oxide material selection.

Density data was collected for all rock types during each drilling program from 1993 to 2016. During the period 1993-1999 (Rio Tinto International, "RTI"), the field procedure for determining density values changed several times, as summarised by Loader and Curtis (1999). Various techniques for SG measurement have been used in the past. Only SG determination using the Archimedes method (with or without wax coating) has been used in the Mineral Resource models, all other methods are flagged for exclusion in the database.

The bulk density determinations were estimated into both Nalou and Discovery models as there is sufficient data density per rock type to enable ordinary kriging efficiencies over 50%. All SG's were validated both visually and statistically, with errant SG values being flagged in the Leapfrog database for exclusion. The flagged field has been sent to the Sepon database administrator to address in the main database.

### 7.3.3 Database Management

The Sepon Exploration and Resource database system consists of three components, one manual and two digital. These are a manual on Field Logging System, a Data Entry Database (DEDB), and a Master Database (LaosDB). Each digital component is configured to run in SQL Server with user access and permissions controlled by domain logins.

The databases are backed up incrementally 8 hourly (kept for 5 days on the server) and fully daily (kept for 2 weeks on the server). IT incrementally back up the servers to tape daily, with the tapes

kept in the server container for a week. Full back ups of the servers are conducted weekly and the tapes stored both in the admin building and offsite at the LXML Vientiane office.

#### **7.3.4 SRK Comments**

In the opinion of SRK, the sampling preparation, security and analytical procedures used by LXML are consistent with generally accepted industry best practices and are, therefore, adequate.

## 8 Data Verification

### 8.1 Verifications by SRK

SRK has arranged to re-sample a total of 83 pulps from drilling holes DIS745, DIS747, DIS750, DIS761 and KHN1154 to check the repeatability and accuracy of the assay results for the Sepon project. The pulp samples details are listed in Table 10.1 below. SRK has also visited and collected 12 rock chip samples at Discovery West Pit (DSW), Nalou Pit (NIU), Thengkham East Pit (TKE) and Thengkham North Pit (TKN) to verify the mineralization types and grades, and has these samples assayed at the ALS Global Australia (Table 8-1 and Table 8-2).

These pulp samples show gold and copper re-assay values with a 8.18% and 14.65% difference from the respective original assay values from the primary assay lab. It clearly verifies the general tenor of pertinent exploration data, and SRK believes that these data have been verified to a reasonable extent.

Two types of duplicates are used for monitoring laboratory's preparation and analytics: field duplicates and lab duplicates.

The rock samples from three different pits show the various mineral mineralizations such as carlin type gold mineralization, skarn and hornfelsed copper mineralization, hydrothermal gold- copper-molybdenum mineralization.

**Table 8-1: Comparison with Re-assay by SRK and Original Assay from Sepon for Drilling Cores**

## 8.2 Site Visits

Dr. Anson Xu and Dr. Tony Guo from SRK team visited the Sepon property from 8 December 2022 to 14 December of 2022 (Figure 8-2 to Figure 8-4). Table 8-3 lists the details for all the sites visited.

**Table 8-3: Sites Visited at Sepon Property by SRK Team**

Date	Site	Activities
Dec. 9	Mine camp	Visited mine office and met mine senior officers and technical team
Dec.10	Discovery West A2-A3 pits, Nalou pit and Theng-kham east pit, Core shack	Visited DISW A2, A3 operation pits, Nalou and TKE pit; verified the Calin-type sulfide Au mineralization and skarn type Cu mineralization, collected samples R328792, R328793 and R328794 respectively; visited drilling sites of holes PVN1233D1 and MBE036; Checked out cores from holes PVN 1199, HYB163, DSW928, KHN1154, TKE454, PVN1231D1, BME036, DSW039D1
	Discovery and Nalou pits and underground tunnel	Visited open pit operation, sighted mining equipment, checked out mining designing and plan; visited underground tunnel and stopes development
Dec. 12	TKN pits, Processing plants and Laboratory	Visited TKN A pits and slope to check out the lower grade skarn and hornfelzed Cu mineralization, collected rock chip samples from R328796 to R328800, S174600, S174601; Visited processing plant, floatation, high-pressure leaching tanks and laboratory
Dec. 13	Corporate office	Visited corporate office and met mine senior officers and technical team

Figure 8-2: Black Colour Carbonate Hosted Carlin Type Au Mineralization at Discovery West A2 Pit

Figure 8-3: Skarn Type Cu Mineralization at Slope Wall of TKN A Pit

Figure 8-4: Hydrothermal Cu-Au Mineralization in the Intrusive

In December 2023 and May 2024, SRK team conducted an additional site visit to inspect other technical aspects of open-pit and underground mining, ore processing and smelter, as well as environmental issues.

## 9 Mineral Processing and Metallurgical Testing

### 9.1 Gold Ores

#### 9.1.1 Mineralogy

A comprehensive mineralogical study on 60 drill core samples from Sepon Gold Mine was conducted. Sepon ores exhibit typical characteristics of refractory gold ores. In addition to occurring mainly as submicroscopic gold and micron-size inclusions in arsenian pyrite, the presence of slow-dissolving gold telluride, carbonaceous matter and arsenic-bearing Cu-Pb minerals makes gold extraction more challenging.

Bulk mineralogy and gold deportment studies were conducted on 30 of the 60 core samples, including 3 oxide ore samples and 27 primary samples. The mineralogical studies have concluded that:

1. Sepon Primary ores exhibit typical characteristics of refractory gold ores. In addition to occurring mainly as submicroscopic gold and micron-size inclusions in arsenian pyrite, the presence of slow-dissolving gold telluride, carbonaceous matter and arsenic-bearing Cu-Pb minerals makes gold extraction more challenging.
2. Grain size, liberation, association and chemistry of gold minerals (particularly gold tellurides) are the major mineralogical factors affecting gold recovery by gravity, flotation and also cyanidation.
3. Since gold is intimately associated with arsenian pyrite, overall gold recovery will be dictated by the efficiency and effectiveness of pyrite flotation, pressure oxidation and cyanidation.
4. Sepon Primary gold ores are composed mainly of silicate and carbonate minerals (including quartz, dolomite, muscovite and calcite), with trace to minor amounts of sulphide and other minerals. Dolomite is a calcium-magnesium bearing carbonate, which will drive acid demand to over 250 kg/t for the associated quantities within Sepon Primary gold, making any processing route uneconomical which includes acidification.
5. Sepon Primary gold can be classified as Carlin-type due to the presence of organic carbon. It is well known that carbonaceous material in the Carlin-type ores is detrimental to gold ore processing due to its preg-robbing capability. The presence of organic carbon dictates that some fraction of the Sepon Primary gold mineral inventory to be classified as double refractory.
6. Pyrite is the predominant sulphide mineral within Sepon Primary gold ores. Pyrite occurs as arsenian pyrite, mainly fine-grained (down to 1µm) and disseminated in silicate and carbonates. Coarse pyrite (up to several hundred microns) is not common.
7. The grade of refractoriness varies among the primary gold pits; with Nalou and Namkok being classified as highly refractory, while Discovery ore as mildly refractory.

#### 9.1.2 Metallurgical Tests

The metallurgical response of Sepon Primary Ores has been evaluated since 2005. The most relevant testing data have been considered for the 2020 reformation design purposes. This includes three different testing campaigns:

- Burnie Laboratory campaign 2004 – 2005
- Hazen Testwork campaign 2006 – 2007
- G&T Testwork campaign 2006-2008
- Ammtec Testwork campaign - 2010
- ALS Testwork campaign 2012 -2013
- BGRIMM Testwork campaign 2018 - 2019

The metallurgical samples used for these testing campaigns are considered representative of the deposit.

### 9.1.3 GRG Test

A Gravity Recoverable Gold (“GRG”) test was conducted in the year of 2019 BGRIMM testing program. Under a grind fineness of 60% to 90% minus 74 microns, the gravity concentrate grade of the Knelson concentrator is around 20 g/t with a gold recovery of only about 10%. The grinding fineness had little effect.

During the 2013 ALS testing program, a GRG test using a master composite sample ( $P_{80} = 53$  microns) resulted in a gold recovery of 14.5%, with a mass pull of 4.36%. The GRG test results indicate that the gravity process is not feasible with the ultrafine dissemination of gold.

### Flotation Test

The flotation response from Sepon Primary ores has received significant attention in order to maximise gold recovery. The tests were involved in the above testing campaigns. The flotation responses are illustrated in Figure 9-1 and summarized below:

- Gold flotation recovery is in line with the sulphur, arsenic, organic carbon and the mass pull of the concentrate. The flotation time should be no less than 50 minutes.
- The optimal primary grind size is  $P_{80}=53 \mu m$ . The regrind and re-flotation of the flotation tails cannot improve the gold recovery.
- Flash flotation prior to conventional flotation can significantly improve the gold recovery.

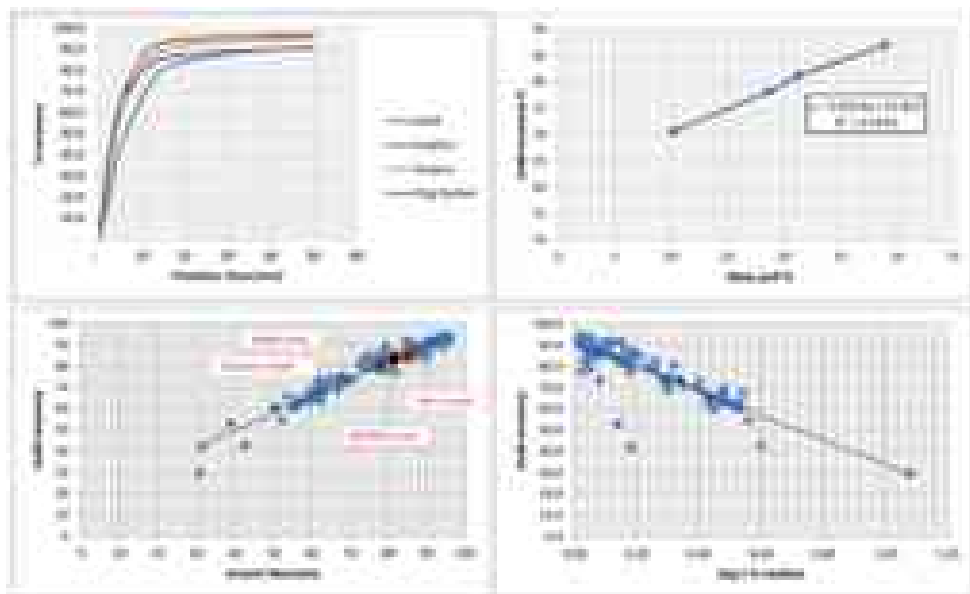

Table 9-1 summarizes the results of four locked cycle flotation tests by BGRIMM.

**Table 9-1: BGRIMM Flotation Test Results**

Flotation Sheet	Head Grade (g)	Concentrate Grade (g/t)	Mass Pull (%)	Gold Recovery (%)
Carbon pre-float	4.38	29.10	10.19	70.52
Conventional	4.38	18.31	18.64	78.04
Flash pre-float	4.38	16.94	21.32	81.24
Intensified flash pre-float	4.38	12.95	29.04	86.89

Source: Sepon Gold Project Study – Chapter 7 Metallurgy and Mineral Processing

Figure 9-1: Sepon Primary Ore Flotation Response

Source: Sepon Gold Project Study – Chapter 7 Metallurgy and Mineral Processing

### Pressure Oxidation

All pressure oxidation feeds were pre-acidulated with flotation concentrate. The post POX residue underwent the CIL process.

Hazen performed POX tests in both batch and pilot plant tests. Three batch tests gave consistent CIL results of 93.7% - 94.2% gold recovery when the sulphide sulphur oxidation was around 95%. The pilot plant produced CIL recoveries of 91.3% - 94.4% for partially acidulated feeds. When the feed was fully pre-acidulated the recoveries were 81% - 85%.

ALS POX tests confirmed the gold recovery ranges from 92% to 94%.

BGRIMM tests showed recoveries within 92.0% - 95.3%, and no regrind either lime boil was required.

### Flotation Tails CIL

Historically cyanide leaching of flotation tails has been performed under aggressive leaching conditions including 2,000 ppm sodium cyanide concentration. Under these conditions, the cyanide consumption was over 4 kg/t, yielding a non-economical business proposition as additional gold recovery was within 3% - 6%.

A pre-conditioning step and a lower cyanide concentration in the CIL were tested. Cyanide consumption was reduced to under 0.4 kg/t.

An additional test was performed by regrinding the flotation tails down to 10 microns; however recovery was not improved highlighting the severe liberation issue related to the non-recoverable gold.

### LXML Metallurgical Laboratory and Testing

The Sepon Gold Plant has been reformed to process oxide ore and primary ore in a parallel mode. The oxide ore is processed by the carbon-in-leaching ("CIL") process, and the primary ore is processed by the "flotation - concentrate POX - CIL process". The final product is Gold Doré. As both the oxide and primary ores are refractory, the gold recoveries are low, with the oxide ore ranging from 51.8% to 68.9% and primary ore ranging from 54.7% to 67.0%.

A metallurgical laboratory adjacent to the plants complex conducted metallurgical tests frequently on the samples from different ore bodies and plant flow to optimise the operation parameters for gold recovery improvement. Figure 9-2 shows part of the metallurgical test equipment.

**Figure 9-2: Part of Test Devices in Sepon Metallurgical Laboratory**

Source: SRK site visit

Tests of Reducing Mass Pull by Regrinding-Recleaning of primary flotation concentrate have been completed in the laboratory. A new plant for regrinding-recleaning of primary concentrate is being built to reduce the carbonates for acid saving of concentrate acidulation. The target regrind fineness is P80=20  $\mu$  m, and the test results are shown in Table 9-2. Mass pull is capable of being reduced down to ~15% via regrinding at a small cost to recovery (e.g., 1-2%). Correspondingly, the flotation recovery of calcium which is the indicator for sulfuric acid consumption in acidification ahead of POX, was reduced by 50% or more.

**Table 9-2: Primary Concentrate Regrinding-recleaning Test Result**

Reflotation Circuit	Mass Pull (%)	Ca Recovery (%)	Au Recovery (%)		
			Flot	POX-CIL	Overall
Current Plant Circuit	29.10	17.1	86.8	78.0	67.7
Coarse Split Flotation - Regrinding	15.66	5.5	86.2	80.1	69.1

Reflotation Circuit	Mass Pull (%)	Ca Recovery (%)	Au Recovery (%)		
			Flot	POX-CIL	Overall
Regrinding	19.31	7.3	86.5		69.3
Coarse Split Flotation - Regrinding	16.90	6.0	86.3		69.1

Source: LXML- Reducing Mass Pull by Regrinding-Recleaning

The current laboratory test is resin-in-Leach ("RIL"), using resin to replace activated carbon as the gold adsorbent. It is expected to improve the gold recovery as that the strong adsorption capacity of the resin can compete with organic carbon.

#### 9.1.4 Conclusion and Recommendation

Sepon gold ores, both oxide and primary, are refractory due to the ultrafine department, the presence of arsenic and antimony minerals and organic carbon.

CIL process is suitable for the gold extraction of oxide ore, but the gold recovery is low. The historical production performance shows gold recovery ranging from 51.8% to 68.9%.

Flotation-POX-CIL process is suitable for the gold extraction of primary ore. The flotation tests indicate the gold recovery of flotation concentrate ranges from 85% to 90%, and the concentrate POX-CIL recovery ranges from 92% to 94%.

Gravity concentration is not suitable for the processing of Sepon gold ores. The gold extraction rate is as low as 3% to 6% for the flotation tails cyanidation.

The onsite metallurgical laboratory is well equipped. The frequent tests can guide the processing plant operation to remain steady and achieve satisfactory result.

## 9.2 Copper ores

### 9.2.1 Introduction

Sepon oxide copper ores are processed using hydrometallurgical process including agitation leaching and heap leaching, solvent extraction and electrowinning ("SX/EW") of the pregnant leach solution ("PLS"). The current copper plant adopts this process.

Supergene copper ores are processed using a unique hydrometallurgical process designed as an alternative to flotation and heap leaching.

Primary copper mineralisation at Thengkhamb and at Khanong has been identified; however, this ore contains chalcocopyrite which the Sepon process was not designed to treat because chalcocopyrite is refractory under the designed leaching conditions.

The test study on primary copper ores is focused on flotation process to produce a saleable copper concentrate.

### 9.2.2 Mineralogy

Seven primary ore samples from Thengkhamb East were examined for mineralogy by ALS in 2008. The mineral composition is listed in Table 9-3 for the seven samples. Nearly all of the copper was present as chalcopyrite. Minor tennantite and bornite, accounting for less than 3% of the total copper, were found in some of the samples. Pyrite was the other main sulphide mineral, varying from 0.2% to 10% in the samples. Gangue minerals varied between the samples. The major gangue minerals were dolomite, other carbonates such as calcite and ankerite, garnet, mica, quartz, and other silicates such as diopside, orthoclase, serpentine and amphibole.

**Table 9-3: Mineral composition of Thengkhamb East Primary Samples**

### 9.2.3 Flotation Test

Flotation tests were conducted on 29 composite samples, which covered different rock types and lithologies, and a broad range of copper, sulphur, calcium and magnesium grade.

The tests adopted conventional flowsheet comprising rougher flotation at grind size of  $P_{80}=106 \mu m$ , regrinding the rougher concentrate to target fineness of  $P_{80}=25 \mu m$  then cleaner flotation. The test results are summarised in Table 9-4.

Low grade samples with average grade of 0.61% Cu yielded a copper recovery of 84.5%, with a concentrate grade of 18.5% Cu.

Middle grade samples with average grade of 1.12% Cu yielded a copper recovery of 83.2%, with a concentrate grade of 19.4% Cu.

High grade samples with average grade of 1.42% Cu, yielding a copper recovery of 57.0%, with a concentrate grade of 7.5%. All the high grade samples showed a high sulphur content and high Acid Soluble Copper (ASCu) fraction, which resulted in the low concentrate grade and low copper recovery.

**Table 9-4: Primary Copper Flotation Results**

A master composite was produced from other composites previously used for bench flotation testing. The flotation test results are shown in Table 9-5. The test achieved a copper recovery of 89.1%, with a concentrate grade of 22.3%.

**Table 9-5: Master Composite Flotation Test Results**

#### 9.2.4 Conclusion and Recommendation

Conventional flotation process can be applied to the primary copper ores to produce a saleable copper concentrate. The concentrate grade and copper recovery are affected by the sulphur grade and ASCu/TCu ratio. A general copper recovery of 80% can be achieved.

The gold and silver are likely recovered into copper concentrate but there are no relevant data. The precious metals credit to the concentrate cannot be evaluated. More flotation tests are recommended to assess the gold and silver recovery and concentrate quality.

## 10 Mineral Resource Estimates

The JORC Code 2012 defines a mineral resource as:

“a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.”

“All reports of Mineral Resources must satisfy the requirements that there are reasonable prospects for eventual economic extraction (ie more likely than not), regardless of the classification of the resource.

Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource...”

### 10.1 Introduction

LXML is an operating mine at the Effective Date. It hosts several deposits along a 14 km long belt of carbonaceous rocks. Figure 10-1 is showing the plan view of current LXML deposits.

The open pits are or will be constructed at the area of deposits of DSE OP, DSW OP, NLU OP, SKM OP, NKW OP, TKM OP, KHN OP and Far West Areas (Nakachan (NAK OP), Ban Non (NON OP), and Ban Mai (MAI OP)). The underground mines are located at deposits Discovery Deep East (DSE UG) and Discovery Deep West (DSW UG).

In addition to these deposits, there are dozens of stockpiles of gold and copper ore on site.

The latest block models and data were constructed or updated by LXML personnel as at 30 September 2024.

At the Effective Date, SRK estimated Mineral Resource from these deposits and stockpiles.

**Figure 10-1: Plan view of LXML Mineral Resource Deposits**

Sources: LXML

## 10.2 Year (Quarter)-end Map and Mined-out Areas

SRK was provided with a year (Quarter)-end map dated on 30 September 2024. The map covers those deposits that are working or in plan. After reviewing of the year-end map, SRK considered it was of sufficient details to support Mineral Resource estimate.

Figure 10-2: Year(Quarter)-end Map, Dated on 30 September 2024

Sources: SRK

## 10.3 Mineral Resource Models

SRK were provided with the latest block models, thirteen in total, which were constructed or updated by LXML personnel between in February to March 2024 and September 2023 (nlu\_gc.bmf) and notes ("MR 2024Q1 Classification Notes.xlsx"), where Mineral Resource categories are classified in twelve block models. Among them, six block models have been updated based on sustaining exploration campaigns. They are: DSE OP ("dse\_gc\_29032024.bmf"), DSW OP ("dsw\_gc\_03022024.bmf"), NMK OP ("nkk\_gc300324.bmf"), NLU OP ("nlu\_gc160324.bmf together with nlu\_gc.bmf"), SKM OP ("Songkham\_v3.bmf"), and DSC UG ("DSC\_UG\_FEB24.bmf").

For the Phavat deposit ("PVT"), the Mineral Resources cannot be reported by SRK since the block model "bm\_pvt\_oct 2023.bmf" has not been classified as Mineral Resource.

## 10.4 Open Pit Mining

### 10.4.1 Discovery East (DSE OP)

The key parameters for DSE Mineral Resource estimation are summarized in Table 10-1.

**Table 10-1: Key Parameters of Mineral Resources Estimate (DSE OP)**

Item	Description
<b>Software</b>	Vulcan
<b>Drill hole database</b>	-
<b>Cut-off grade</b>	The Au cut-off grade depends on the gold ore types. For oxidized gold ore, the cut-off grade is 0.6 g/t, and for primary gold ore is 1.5 g/t
<b>Block size</b>	The Parent block model is 150 x 96 x 75m, and the sub cell is 1 x1 x 2.5 m
<b>Grade capping</b>	-
<b>Grade interpolation</b>	-
<b>Search parameter</b>	-
<b>Mineral Resource classification</b>	Indicated: Approximate drill-hole spacing 20 to 40m through the area. Some parts with closer spacing. Inferred: Approximate drill-hole spacing up to 40m. All of DSE02A pit assigned Indicated. All of Oxide in DSE04B is classified as Indicated, all of Primary in DSE04B is classified as Inferred. The DSE04B pit is targeting the northern edge of mineralisation and several sections do not have drilling closing out the mineralisation. Therefore, this mineralisation has been classified as Inferred in this pit shell. All other mineralisation has been classified as Indicated.

Sources: LXML

The DSE Statement of Mineral Resource is shown in Table 10-2.

**Table 10-2: Mineral Resource Statement of DSE OP Deposit, as of 30 September 2024**

### 10.5 Underground Mining

#### 10.5.1 Discovery Deep East (DSE UG)

The key parameters for DSE UG Mineral Resource estimation are summarized in Table 10-16.

**Table 10-16: Key Parameters of Mineral Resources Estimate (DSE UG)**

Item	Description
<b>Software</b>	Vulcan
<b>Drillhole database</b>	The database contains information for 22,096 boreholes and 69,474 samples with Cu, Au and silver (Ag) assays
<b>Cut-off grade</b>	The Au cut-off grade depends on the gold ore types. For oxidized gold ore, the cut-off grade is 3 g/t, and for primary gold ore is Domain.
<b>Density</b>	21,642 SG samples
<b>Block size</b>	The Parent block model is 5 x 3 x 2.5m, and the sub cell is 1 x 1 x 1.25m
<b>Grade capping</b>	Au Lower:0.005 g/t    Au Upper :10 g/t
<b>Grade interpolation</b>	Ordinary Kriging
<b>Search parameter</b>	Domain AuHGPr_Vn1 Dynamic anisotropy; Min No Samples:12 Max No Samples:20

Item	Description
	Domain AuHGPr_Vn2 Dynamic anisotropy; Min No Samples:8 Max No Samples:20 Domain AuHGPr_Vn3 Dynamic anisotropy; Min No Samples:4 Max No Samples:20
<b>Mineral Resource classification</b>	Measured (approximately 15m spaced drilling), Indicated (mostly 25m, up to 50m spaced), Inferred (50 to 100m spaced)

Sources: LXML

The DSE UG Statement of Mineral Resource is shown in Table 10-17 .

**Table 10-17: Mineral Resource Statement of DSE UG Deposit, as of 30 September 2024**

## 10.6 Stockpile

### 10.6.1 Gold Stockpile

SRK was provided with summary details of the LXML gold stockpiles ("WK13\_All Stockpile Status survey 27 Mar 2024 EODS\_Au\_Ca\_Mg\_update.xls") as of 30 September 2024. There are 41 stockpiles on site, of which 15 are oxide gold stockpiles, and 26 are primary gold stockpiles that are available for extraction of gold. The materials in these available stockpiles were converted to Indicated Mineral Resource.

The gold stockpile Statement of Mineral Resource is shown in Table 10-21.

**Table 10-21: Mineral Resource Statement of Gold Stockpile, as of 30 September 2024**

Type	Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)

### 10.6.2 Copper Stockpile

SRK was provided with summary details of the LXML copper stockpiles ("wk13\_All Stockpile Status survey 27-Mar 2024 EODS\_Cu\_Update.xls") as of 27 March 2024. There are 20 stockpiles on site, of which 15 are oxide copper stockpiles, and 5 are primary copper stockpiles that are available for

extraction of copper. The materials in these available stockpiles were converted to Indicated Mineral Resource. The copper stockpile Statement of Mineral Resource is shown in Table 10-24.

**Table 10-22: Mineral Resource Statement of Copper Stockpile, as of 30 September 2024**

Type	Category	Tonnage (kt)	Cu Grade (%)	Cu Metal Contained (kt)
Oxide	Measured	-	-	0
	Indicated	1,367	0.93	12.74
	MES+IND	1,367	0.93	12.74

## 10.7 Conclusions and Recommendations

The data provided from LXML is sufficient to estimate the Mineral Resource.

The total LXML gold Mineral Resource is shown in Table 10-23.

**Table 10-23: Mineral Resource Estimate of Total Gold, as of 30 September 2024<sup>1</sup>**

Type	Category	Tonnage (kt) <sup>2</sup>	Au Grade g/t	Au Metal Contained t	Au Metal Contained koz
Oxide	Measured	29	1.05	0.03	1
	Indicated	1,981	1.47	2.91	94
	MES+IND <sup>3</sup>	2,010	1.46	2.94	95
	Inferred	2,836	1.50	4.25	137
Primary	Measured	247	8.80	2.17	70
	Indicated	5,239	5.13	26.89	864
	MES+IND <sup>3</sup>	5,486	5.30	29.06	934
	Inferred	3,166	5.61	17.76	571

	Indicated	7,220	4.13	29.80	958
	MES+IND <sup>3</sup>	7,496	4.27	32.00	1,029
	Inferred	6,002	3.67	22.00	707

Sources: SRK

Notes:

<sup>1</sup> The information relates to Mineral Resource estimation is based on information compiled by Mr. Liang Li, MAusIMM, and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Both Dr. Xu and Mr. Li have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking

to qualify as Competent Persons as defined in JORC (2012). Dr. Xu supervised the work of Mr. Li. Both Dr. Xu and Mr. Li consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

<sup>3</sup> MES+IND: combined measured and Indicated, Mineral Resource.

<sup>4</sup> The cut-off grade depends on ore type (Otyp) and mining method. For open pit mining and gold stockpiles, the cut-off grade of oxide ores is 0.6 g/t, the cut-off grade of primary ores is 1.5 g/t. For Underground mining, the cut-off grade of oxide ores is 3g/t, the cut-off grade of primary ores is domain.

The total LXML copper Mineral Resource is shown in Table 10-24.

**Table 10-24: Mineral Resource Estimate of Total Copper, as of 30 September 2024 <sup>1</sup>**

Type	Category	Tonnage (kt) <sup>2</sup>	Cu Grade (%)	Cu Metal Contained (kt) <sup>2</sup>
Oxide	Measured	-	-	-
	Indicated	1,367	0.93	12.74
	MES+IND <sup>3</sup>	1,367	0.93	12.74
	Inferred	855	1.89	16.16
Primary	Measured	-	-	-
	Indicated	3,049	1.69	51.47
	MES+IND <sup>3</sup>	3,049	1.69	51.47
	Inferred	1,222	1.59	19.37
Total	Measured	-	-	-
	Indicated	4,416	1.45	64.20
	MES+IND <sup>3</sup>	4,416	1.45	64.20
	Inferred	2,078	0.98	20.46

Sources: SRK

Notes:

<sup>1</sup> The information relates to Mineral Resource conversion is based on information compiled by Mr. Liang Li, MAusIMM, and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Both Dr. Xu and Mr. Li have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in JORC (2012). Dr. Xu supervised the work of Mr. Li. Dr. Xu and Mr. Li consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

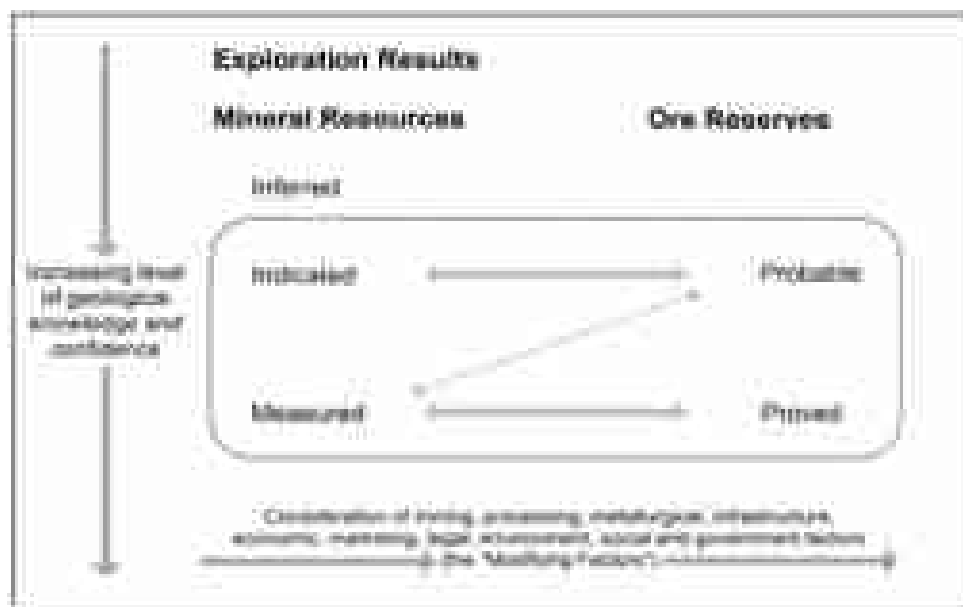

<sup>3</sup> MES+IND: combined measured and Indicated, Mineral Resource.

<sup>4</sup> The cut-off grade depends on ore type (Otyp) and mining method. For open pit mining and copper stockpiles, the cut-off grade of oxide ores is 0.7% Cu, the cut-off grade of primary ores is 0.3% Cu. For Underground mining, the cut-off grade of primary oxide ores is 0.8% Cu.

## 11 Ore Reserve Estimates

The JORC (2012) provide for a direct relationship between Indicated Mineral Resources and Probable Ore Reserve and between Measured Mineral Resources and Proved Ore Reserve. As shown in Figure 11-1 below.

Figure 11-1: Relationship Between Mineral Resources and Ore Reserves

Sources: JORC (2012)

The following statement has been extracted from the JORC (2012) for reference:

“An ‘Ore Reserve’ is the economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.”

“The reference point at which Reserves are defined, usually the point where the ore is delivered to the processing plant, must be stated. It is important that, in all situations where the reference point is different, such as for a saleable product, a clarifying statement is included to ensure that the reader is fully informed as to what is being reported.”

### 11.1 Introduction

The gold deposits that are being or to be exploited include DSE OP, DSW OP, NLU OP, NMK OP, Far West Area (Including MAI OP, NON OP, NKN OP), DSE UG, DSW UG. The copper deposits that are being or to be exploited include KHN UG, TKM OPs.

DSE UG, DSW UG and KHN UG will be developed as underground mines, while all the other deposits will be continued as open pits.

Among these gold and copper deposits, only DSE OP, DSW OP, NLU OP, NMK OP, DSE UG, and KHN UG possess Measured and Indicated Mineral Resources. Additionally, KHN UG is currently in the re-feasibility study stage. Consequently, open-pit gold mines including DSE OP, DSW OP, NLU OP and NMK OP could be converted to Ore Reserves from their Mineral Resources. For underground gold mines, only DSE UG would be considered for estimating Ore Reserves. None of the copper deposits would be considered for estimating Ore Reserves..

The location of the deposits considered in the Ore Reserve estimation review, are shown in Figure 11-2.

**Figure 11-2: Plan View of Ore Deposits to Estimate Ore Reserves**

Sources: SRK

In addition to these deposits, there are dozens of stockpiles on site to supply (tonnes & grade) gold and oxide copper ore feed to the processing plant.

As of 30 September 2024, SRK estimated Ore Reserves from these deposits and stockpiles.

## 11.2 Feasibility Study

SRK was provided with the Sepon Gold Project Study ("SGPS") revised on 18 March 2020. AMC Consultants Pty Ltd ("AMC") completed the Mining, Geotechnical and Ore Reserves components of the SGPS.

As of 30 September 2024, SRK noted that the mineral resource models, final open pit designs, and underground mining study have changed since completion of SGPS.

For gold operations, LXML has gradually transitioned from open pit mining with stockpiles to a combination of open pit and underground mining with stockpiles. Developing the DSE UG for underground mining and the Far West Area for open pit mining would extend the mine life of LXML. The oxide and primary gold processing capacity is 3.8 million Mtpa run-of-mine ("RoM").

For copper operations, LXML currently only processes oxide copper ore from stockpiles, utilizing hydrometallurgy processing. LXML aims to develop the TKM OPs to exploit more oxide copper ore to maintain its oxide copper production. In the meantime, developing the KHN UG to exploit primary copper ore is under technical studies. Historical production data of the copper plant shows that 0.5 to 1.3 Mtpa oxide copper ore were processed.

SRK was also provided with Geotechnical Review - Open Pit & Underground revised on 4 December 2023. MEC Mining Pty Ltd ("MEC") provided a critical review of the geotechnical design and operational function relating to the underground and open pit mines. It was believed that geotechnical risk to be managed well in LXML. MEC has also provided a comprehensive list of improvements opportunities and believed that there were only minor recommendations that MEC considers a high priority.

As of 30 September 2024, SRK was provided with the updated mineral resource models, final open pit designs, underground mine designs, financial results, and capital report by LXML. SRK will estimate Ore Reserves based on the data provided by LXML with minimal modification.

## 11.3 Mineral Resource Models

Ore Reserves estimation was conducted based on mineral resource models constructed by LXML between in February to March 2024 and September 2023 (nlu\_gc.bmf).

Block models have been updated based on sustaining exploration updates. SRK was provided with six latest block models. After review of these block models, SRK noted that:

- The block model covering DSE OP ("dse\_gc\_29032024.bmf") has fields to support preliminary reporting of Ore Reserves.
- The block model covering DSW OP ("dsw\_gc\_03022024.bmf") has fields to support preliminary reporting of Ore Reserves.
- The block model covering NMK OP ("nkk\_gc300324.bmf") has fields to support preliminary reporting of Ore Reserves.
- The block model covering NLU OP ("nlu\_gc160324.bmf together with nlu\_gc.bmf") has fields to support preliminary reporting of Ore Reserves.
- The classification notes ("MR 2023 Classification Notes.xlsx") which explains how LXML geologists define the geological confidence in open pit mines have fair and adequate information to support preliminary reporting of Ore Reserves.

- The block model covering DSC\_UG ("DSC\_UG\_FEB24.bmf") has fields to support preliminary reporting of Ore Reserves.

These block models were applied by SRK to estimate Ore Reserves.

## 11.4 Open Pit Mining

### 11.4.1 Month-end Map

SRK was provided with the Month-end map in March 2024 together with topography in December 2023 which has the pre-backfill data with a scale of 1:1000. The map covers those deposits that are working or in plan. After review of the Month-end map, SRK considered it is detailed enough to support Ore Reserves estimate.

### 11.4.2 Open Pit Design

Ever since the completion of SGPS, open-pit designs have been updated by LXML mining engineers. SRK understands that the typical life of mine ("LoM") for an open pit is several months due to small size of open pit. Open pit designs have been updated by LXML based on exploitation status, update of mineral resource models and other modifying factors.

SRK was provided with latest final open pit designs applied by LXML. Comparison between open-pit designs and survey of Month-end maps shows that the difference is little. SRK considered that it is technically feasible to guide mining boundaries based on the updated final open pit designs, and that the open pit designs can be used directly to support Ore Reserves estimate.

### 11.4.3 Cut-off Grade

The data in Table 11-1 provided, in SRK's opinion, was sufficient to verify cut-off grades to estimate Ore Reserves as of 30 September 2024, as it is shown in Table 11-2.

**Table 11-1 Unit Operating Cost of Open Pit Gold Mining**

Item	Unit	Actual			Budget	
		2021	2022	2023	1Q-3Q2024	2024
<b>OP Mining</b>	USD/Ore&Waste	3.1	3.0	2.7	3.2	3.4
<b>Processing Oxide Gold</b>	USD/milled ton	17.1	18.5	16.9	14.0	15.7
<b>Processing Primary Gold</b>	USD/milled ton	62.1	69.7	56.6	51.6	48.0
<b>G&amp;A</b>	USD/milled ton	20.4	9.0	9.8	9.6	8.7
<b>Overall Recovery Gold</b>	%	54.6	63.8	64.1	61.0	68.4

Sources: LXML

**Table 11-2: Gold Cut-off Grade Calculation**

Item	Unit	Oxide Gold	Primary Gold
<b>Gold Price</b>	USD/oz	2,050.0	2,050.0

Item	Unit	Oxide Gold	Primary Gold
Gold Price	USD/g	66.9	66.9
Processing	USD/milled ton	17.0	55.0
Processing Recovery	%	65.0	65.0
G&A	USD/milled ton	9.0	9.0
Cut-off Grade	g/t	0.6	1.5

Sources: SRK

<sup>1</sup> Due to short life of open pit mining, a short-term price is considered more applicable than a long-term price to calculate cut-off grade.

#### 11.4.4 Dilution and Loss

Same with LXML, mining dilution at 7.5% and mining loss at 5.0% were applied when estimating Ore Reserves.

#### 11.4.5 DSE OP

Comparison of DSE OP, end-of-month map and final open pit design is shown in Figure 11-3.

**Figure 11-3: Comparison between Month-end Status and Final Open Pit Design for DSE OP**

Month-end Map, as of 30 September 2024

Final Open Pit Design

Sources: SRK

Table 11-3 is showing key parameters when estimating Ore Reserves for DSE OP.

**Table 11-3: Key Parameters of Ore Reserves Estimate (DSE OP)**

Item	Description
<b>Mining method</b>	Open Pit Mining
<b>Cut-off Au grade</b>	Oxide Ore: 0.6g/t; Primary Ore: 1.5g/t
<b>Mining loss rate</b>	5%
<b>Mining dilution rate</b>	7.5%

Sources: LXML and SRK

The DSE OP statement of Ore Reserves is shown in Table 11-4.

**Table 11-4: Ore Reserves Estimate of DSE OP Deposit, as of 30 September 2024** <sup>1, 3, 4</sup>

Type	Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
<b>Oxide</b>	Proved	-	-	-	-

-	Total	482	1.50	0.72	23

Sources: SRK

<sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Mr. Erwei Lu and Mr. Yonggang Wu and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Mr. Lu, Mr. Wu and Dr. Xu have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which Mr. Wu is undertaking to qualify as Competent Person as defined in JORC (2012). Mr. Wu and Dr. Xu supervised the work of Mr. Lu, Mr. Wu, Mr. Lu and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

<sup>3</sup> The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

<sup>4</sup> The Ore Reserves Statement is based on the depletion data provided by LXML for the six-month period, 1 April 2024 to 30 September 2024. The reported LXML data may differ from that reported by SRK, due the updated block model now used by LXML for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the LXML provided data as the basis for this statement

#### 11.4.6 DSW OP

Comparison of DSW OP, Month-end map and final open pit designs is shown in Figure 11-4.

**Figure 11-4: Comparison between Month-end Status and Final Open Pit Designs for DSW OP**

Month-end Map, as of 30 September 2024

<sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Mr. Erwei Lu and Mr. Yonggang Wu and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Mr. Lu, Mr. Wu and Dr. Xu have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which Mr. Wu is undertaking to qualify as Competent Person as defined in JORC (2012). Mr. Wu and Dr. Xu supervised the work of Mr. Lu, Mr. Wu, Mr. Lu and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

<sup>3</sup> The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

<sup>4</sup> The Ore Reserves Statement is based on the depletion data provided by LXML for the six-month period, 1 April 2024 to 30 September 2024. The reported LXML data may differ from that reported by SRK, due the updated block model now used by LXML for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the LXML provided data as the basis for this statement

#### 11.4.9 SKM OP

LXML completed SKM OP exploitation in July 2024.

### 11.5 Underground Mining

Underground mining is new to LXML. It is located beside of DSE OP, and its decline access is built at the DSE OP.

#### 11.5.1 Mined-out Area

A decline and other development system are being driven to provide an access to deep mineral resources. SRK was provided with three-dimensional ("3D") survey of the actual development and stopes. Figure 11-7 is showing the decline development end face and one of the stopes which was mined out during site visit.

Figure 11-7: DSE UG Underground Site Visiting Photos

Sources: SRK

After review of the survey data, SRK considered it will not affect Ore Reserves estimation and mined-out area would be deducted.

#### 11.5.2 Underground Design

The design has been updated by LXML based on updated block model, costs and other assumptions. The latest designs of tunnels and stopes are shown in Figure 11-8.

Figure 11-8: Underground Design for DSE UG

Sources: LXML

### 11.5.3 Cut-off Grade

The data in Table 11-11 provided, in SRK's opinion, was sufficient to verify cut-off grades to estimate Ore Reserves as of 30 September 2024, as it is shown in Table 11-12.

Table 11-11 Summary of Gold Production and Operating Cost

Item	Unit	Actual				Budget
		2021	2022	2023	1Q-3Q2024	2024
<b>UG Mining</b>	USD/mined ton	-	28.8	49.2	35.2	-
<b>Processing Primary Gold</b>	USD/milled ton	62.1	69.7	56.6	51.6	48.0
<b>G&amp;A</b>	USD/milled ton	20.4	9.0	9.8	9.6	9.3
<b>Overall Recovery Gold</b>	%	54.6	63.8	64.1	61.0	68.4

Sources: LXML

Table 11-12: Gold Cut-off Grade Calculation

Item	Unit	Underground Primary
<b>Gold Price</b>	USD/oz	2,050.0
<b>Mining</b>	USD/mined ton	30.0
<b>Processing Cost for Primary Gold</b>	USD/milled ton	55.0

Item	Unit	Underground Primary
Processing Recovery	%	65.0
G&A	USD/milled ton	9.0
Backfilling <sup>1</sup>	USD/mined ton	5.0
Cut-off Grade	g/t	2.6

Sources: SRK

<sup>1</sup> The backfilling cost is widely used for a simple study.

#### 11.5.4 Ore Reserve model

During SRK's review of the data, it was found that the stope design is not appropriate for estimating of Ore Reserves. After discussing with LXML Technical Personnel, it was agreed that SRK re-ran the stope optimization to generate new stope wireframe to guide the Ore Reserves estimation. The key parameters for re-running the DSE UG stope optimization are summarised in Table 11-13.

**Table 11-13: Key Parameters of Stope Optimization**

Item	Description
Mining method	Underground Sub-Level Open Stope with Backfilling
Cut-off Au grade to optimize stope boundary	2.0 to 2.5g/t
Footwall angle	>=42° and following ore/waste boundary
Stope height	20m
Stope length	20m
Stope width	>=5m
Cut-off Au grade of feed ore	2.6g/t

Sources: LXML

A stope optimisation exercise was then carried out using the Deswik Stope Optimizer ("SO") with stope design parameters showing in Table 11-13.

In addition, economic attributes and physical constrains of the sliced stopes with modifying factors include spatial location, unplanned mining dilution and loss, cut-off grade, were also considered to ensure stopes generated were technical feasible as well as economic.

Figure 11-9 graphically shows how the stopes (together with LXML's development design) look like.

Figure 11-9: Stope Optimization Results

Sources: SRK

### 11.5.5 Dilution and Loss

Table 11-14 summarizes the modifying factors used for Ore Reserves estimation.

**Table 11-14: Modifying Factors Used for Ore Reserves Estimation**

Factors	Rate	Description
<b>General Stope Recovery</b>	95%	Planned loss: Backfilled stopes, with sharp corner and crown/sill pillar loss
<b>Mining Dilution</b>	15%	Unplanned dilution: overbreak, considering diluted material as waste with no grade.
<b>Mining Recovery</b>	95%	Unplanned loss: underbreak, based on reconciliation analysis.

Sources: SRK

When making the underground designs, modifying factors including mining dilution (at 15%) and mining loss (at 10%) have been applied by LXML. After completing each stope, LXML conducted reconciliation to summarize the results of their underground mining performance. Figure 11-10 is showing the comparison of designed stope with as-built stope for DDE 1800 W1. The overbreak and underbreak were then calculated to be used for unplanned mining dilution and loss analysis. Figure 11-11 summarizes the stope performance after comparing designed stopes with as-built stopes.

Figure 11-10: Overbreak and Underbreak Analysis

Sources: LXML

Figure 11-11: Stope Performance Summary

Sources: SRK

The average of mining dilution is 14% and mining loss is 6%. When conducting estimation, unplanned mining dilution at 15% (same with LXML) and mining loss at 5% (compared with LXML at 10%) were applied.

### 11.5.6 Ore Reserve Estimates

According to JORC (2012), Measured Resources are typically converted into the Proved Reserve category, and Indicated Resources are converted into Probable Reserve.

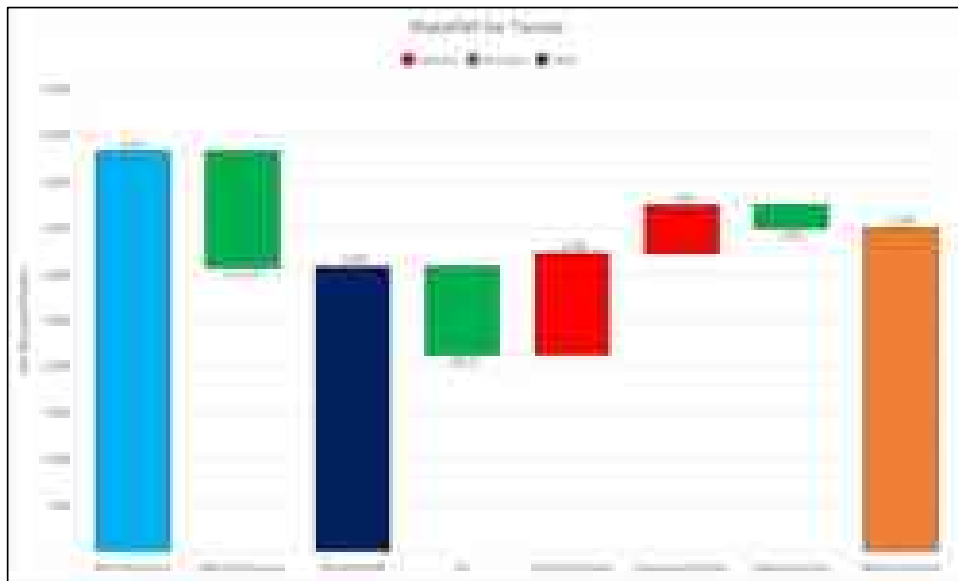

The estimated Mining Inventory based on Mineral Resources and modifying factors is summarized in Table 11-15 and the estimation process is illustrated in waterfall charts shown in Figure 11-12 and Figure 11-13.

Table 11-15: Estimates Process Summary

Process	Tonnes	Au Contained (kg)
M+I+I Resources	4,320,842	30,561
Inferred Resources	(1,236,722)	(8,678)
Remained MI	3,084,120	21,884
SO	(957,014)	(6,156)
Planned Dilution	1,105,594	(158)
Unplanned Dilution	517,905	0
Unplanned Loss	(245,380)	(820)
Ore Reserves	3,505,224	14,749

Sources: SRK

Figure 11-12: Estimates Process - Change in Tonne

Sources: SRK

Figure 11-13: Estimates Process - Change in Metal Contained

Sources: SRK

The Ore Reserves for the DSE UG are presented in Table 11-16 by reserve category. The primary reason why the Ore Reserves tonnes exceed the MI resources tonnes is due to both planned dilution during the Stope Optimizer (SO) process and unplanned overbreak dilution, as illustrated in Figure 11-12. As it is shown in Figure 11-13, Inferred Mineral Resources and SO (27% of total M+I+I Resources contained metal), is the key factors which affects to Ore Reserves conversion.

### 11.5.7 Ore Reserve Statement

The DSE UG statement of Ore Reserves is shown in Table 11-16. Total Ore Reserves contained metal (Proved plus Probable) is approximately 69% of Mineral Resources (Measured plus Indicated).

Table 11-16: Ore Reserves Estimate of DSE UG Deposit, as of 30 September 2024<sup>1, 3</sup>

Type	Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
<b>Oxide</b>	Proved	-	-	-	-

Sources: SRK

<sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Mr. Erwei Lu and Mr. Yonggang Wu and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Mr. Lu, Mr. Wu and Dr. Xu have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which Mr. Wu is undertaking to qualify as Competent Person as defined in JORC (2012). Mr. Wu and Dr. Xu supervised the work of Mr. Lu, Mr. Wu, Mr. Lu and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

<sup>3</sup> The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

<sup>4</sup> The Ore Reserves Statement is based on the depletion data provided by LXML for the six-month period, 1 April 2024 to 30 September 2024. The reported LXML data may differ from that reported by SRK, due the updated block model now used by LXML for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the LXML provided data as the basis for this statement.

## 11.6 Stockpiles

### 11.6.1 Cut-off Grade

For gold stockpiles, the same cut-off grade with open-pit mining was applied for oxide and primary gold stockpiles when estimating Ore Reserves.

For copper stockpiles, back to the time when TKM area was in operation, mineralization was classified into many stockpiles based on several attributes including copper grade and gangue acid consumption ("GAC"). And to define cut-off grade, LXML was using the lowest grade blocks included in the ore stockpiles which is 1.1%. TKM area is currently being re-modelled and will be subsequently re-assessed along with cut-off criteria but no update to this is available now.

By considering the current copper operation, only oxide copper stockpiles are being processed by using hydrometallurgy technique and there have not been enough studies to support how the primary copper stockpiles would be processed. Therefore, when estimating copper Ore Reserves, only oxide copper stockpiles would be considered.

Table 11-17 and Table 11-18 are showing the summary of copper production cost and how the oxide copper cut-off grade was calculated.

**Table 11-17 Summary of Copper Production Cost**

Item	Unit	Actual			Budget	
		2021	2022	2023	1Q-3Q2024	2024
<b>OP Mining</b>	USD/Ore&Waste	3.1	-	-	-	-
<b>Processing Copper</b>	USD/milled ton	47.6	36.0	23.0	19.6	31.7
<b>Overall Recovery Copper</b>	%	68.4	59.2	52.5	44.1	41.5

<sup>1</sup> 2024Q1 CMF price was applied.

### 11.6.2 Gold Stockpile

SRK was provided with summary details of the LXML gold stockpiles ("Au\_WK39 Inventory\_260924\_Sep\_EOM.xls") as of 30 September 2024. There are 41 stockpiles on site, of which 15 are oxide gold stockpiles, and 26 are primary gold stockpiles that are available to process, and among these 41 stockpiles, 35 stockpiles were economically feasible to be converted to Probable Ore Reserves categories.

The gold stockpile statement of Ore Reserves is shown in Table 11-19.

Table 11-19: Ore Reserves Estimate of Gold Stockpile, as of 30 September 2024 <sup>1, 3, 4, 5</sup>

Type	Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
<b>Oxide</b>	Proved	-	-	-	-

Sources: SRK

<sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Mr. Erwei Lu and Mr. Yonggang Wu and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Mr. Lu, Mr. Wu and Dr. Xu have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which Mr. Wu is undertaking to qualify as Competent Person as defined in JORC (2012). Mr. Wu and Dr. Xu supervised the work of Mr. Lu, Mr. Wu, Mr. Lu and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

<sup>3</sup> By reviewing the data summary details and production records, especially the feed grade, which is showing reasonably reconcilable, therefore, SRK trusts the stockpiles data summary details provided by LXML have fair and adequate information to guide the estimation of Ore Reserves.

<sup>4</sup> The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

<sup>5</sup> The Ore Reserves Statement is based on the depletion data provided by LXML for the six-month period, 1 April 2024 to 30 September 2024. The reported LXML data may differ from that reported by SRK, due the updated block model now used

by LXML for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the LXML provided data as the basis for this statement

### 11.6.3 Copper Stockpile

SRK was provided with summary details of the LXML copper stockpiles ("Cu\_wk39\_Inventory\_260924\_Sep\_EOM.xls") as of 30 September 2024. There are 20 stockpiles on site, of which 15 are oxide copper stockpiles, and 5 are primary copper stockpiles that are available to process, and among these 20 stockpiles, 9 oxide stockpiles were economically feasible to be converted to Probable Ore Reserves categories.

The copper stockpile statement of Ore Reserve is shown in Table 11-20.

**Table 11-20: Ore Reserve Estimate of Copper Stockpile, as of 30 September 2024** <sup>1, 3, 4, 5</sup>

Cu metal	kt	11	4	7	-	-	-	-	-

Sources: SRK

## 11.8 Conclusions and Recommendations

The data provided by LXML to SRK was suitable in most cases to estimate the Ore Reserves. The summary outcomes are:

- The Ore Reserves estimation is primarily based on SGPS and LXML technical personnel's studies.
- Gold and copper cut-off grades are applied when estimating Ore Reserves.
- The modifying factors like mining loss, mining dilution are applied by using the design data collected from LXML with minimal adjustment.
- SRK noted that the production plan prepared by LXML assumed that Inferred Mineral Resources will be exploited together with those Measured and Indicated Mineral Resources in years between 2024 and 2026. Exclusive of most of Inferred Mineral Resources usually leads to a shorter operating period with estimation of Ore Reserves.

The LXML gold statement of Ore Reserves is shown in Table 11-22.

**Table 11-22: Ore Reserves Estimate of Gold Minerals in Total, as of 30 September 2024** <sup>1, 3, 4, 5</sup>

Type	Category	Tonnage (kt)	Au Grade (g/t)	Au Metal Contained (t)	Au Metal Contained (koz)
<b>Oxide</b>	Proved	30	0.97	0.03	1

Notes:

<sup>1</sup> The information relates to Ore Reserve conversion is based on information compiled by Mr. Erwei Lu and Mr. Yonggang Wu and Dr. Anshun Xu, FAusIMM, employees of SRK Consulting China Ltd. Mr. Lu, Mr. Wu and Dr. Xu have sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which Mr. Wu is undertaking to qualify as Competent Person as defined in JORC (2012). Mr. Wu and Dr. Xu supervised the work of Mr. Lu, Mr. Wu, Mr. Lu and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>2</sup> Total may not add due to rounding discrepancies.

<sup>3</sup> Only oxide copper stockpiles were considered during Ore Reserves estimation. By reviewing the data summary details and production records, especially the feed grade, which is showing reasonably reconcilable, therefore, SRK trusts the stockpiles data summary details provided by LXML have fair and adequate information to guide the estimation of Ore Reserves.

<sup>4</sup> The Ore Reserves are included in the Mineral Resources. They should not be added to the Mineral Resources.

<sup>5</sup> The Ore Reserves Statement is based on the depletion data provided by LXML for the six-month period, 1 April 2024 to 30 September 2024. The reported LXML data may differ from that reported by SRK, due the updated block model now used by LXML for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the LXML provided data as the basis for this statement.

## 12 Mining

### 12.1 Production History and Current Status

Historically, LXML (LXML Sepon) used to be an operational open-pit gold and copper mine. In 1992, Rio Tinto discovered Sepon. In 1999, Rio Tinto sold an 80% option over Sepon to Oxiana. In 2004, Oxiana bought Rio Tinto's remaining 20% stake in Sepon. In 2008, Oxiana merged with Zinifex to form OZ Minerals. In 2010, MMG acquired Sepon from OZ Minerals. In 2018, Chifeng acquired LXML (LXML Sepon) from MMG.

As for gold and copper operations:

- Gold production commenced in 2003 but ceased in 2013 due to price fluctuations and other factors. In 2020, gold operations resumed. Construction of the underground mine commenced in April 2022 at DSE UG, and the first gold ore was transported to the surface in 2023. Since then, the gold operation has transitioned to a combination of open-pit and underground mining.
- Copper production began in 2005, and in 2021, LXML ceased open-pit copper mining operations. Since then, the copper processing plant has only processed oxide copper stockpiles.

Production records since year 2018 are shown in Table 12-1 for copper ore and gold ore, respectively.

**Table 12-1: Production Records of LXML**

Item	Unit	2018	2019	2020	2021	2022	2023	1Q- 3Q 2024
<b>Copper Operation (Surface Mining)</b>								
<b>Mined Ore</b>	t	2,155,808	2,178,736	1,420,165	148,924	-	-	80,562.62
<b>Waste</b>	t	22,432,995	20,799,689	16,310,493	273,195	-	-	-
<b>Gold Operation (Surface Mining)</b>								
<b>Mined Ore</b>	t	-	322,309	1,888,956	4,237,161	3,794,464	2,274,715	1,626,404
<b>Waste</b>	t	-	3,653,397	11,473,595	37,118,432	32,790,592	28,678,086	13,832,608
<b>Gold Operation (Underground Mining)</b>								
<b>Mined Ore</b>	t	-	-	-	-	-	181,057	311,347

Sources: LXML

The life of a mining location (or an open pit) is typically several months due to small quantity of open pit.

As of 30 September 2024, the gold deposits that are being or to be exploited include DSE OP, DSW OP, NLU OP, NMK OP, Far West Area (Including MAI OP, NON OP, NKN OP), DSE UG, DSW UG.

The copper deposits that are to be exploited include KHN UG, TKM OPs.

In addition to these deposits, there are dozens of gold and copper stockpiles on site to feed to the processing plant.

LXML has successfully transitioned to a copper mining operation with the capability to process both gold and copper in 2019. This transition includes the expansion and redevelopment of existing approved gold pits to access gold reserves located at deeper levels.

For copper operations, LXML exclusively processes oxide copper inventory sourced from historical stockpiles. Major changes occurred in year 2023 and first quarter of 2024 include:

- DSE UG underground development has resulted in the excavation of approximately 512,467 tonnes of rock and the completion of 4,972 meters of total development during 2023. For the first quarter of 2024, DSE UG has excavated about 154,810 tonnes of rock and completed 1,706 meters of total development. As of 30 September 2024, mining has progressed to approximately 11 meters above sea level (mASL).
- In Far West Area, during a site visit in May 2024, it was observed that the road to the Far West Area had been constructed and the topography in the area had been cleared, as shown in the Figure 12-1 below. According to LXML, on-site geologists were preparing geological models based on the latest exploration results. LXML plans to commence production in the Far West Area in the last quarter of 2024.
- For DSW UG, LXML is conducting additional exploration work to increase geological confidence. Figure 12-1 below shows the exploration field during SRK's visit in November 2023.
- In the TKM OPs area, LXML has conducted pit optimization for these deposits, and the results indicate the possibility of open-pit mining exploitation.
- Regarding the KHN UG deposit, LXML has completed a scoping-level study which indicates that KHN UG will be exploited as an underground mine. During the site visit in May 2024, LXML was conducting geotechnical field investigations and studies.

**Figure 12-1: Far West Area and DSW UG Exploration Field**

## 12.2 Hydrology and Hydrogeology

LXML is located in a monsoonal climate, with a maximum rainfall of up to 170 mm per day.

The following study was reviewed by AMC in the SGPS:

- “Feasibility Study Report for Surface Water Drainage and Hydrogeology”, which was prepared by the Golder Associates Pty Ltd (“Golder”) and dated on 13 January 2020.

The studies included:

- A data gap assessment based on the pre-feasibility study and revised mine plan;
- Hydrogeologic field investigations to advance the knowledge of the local groundwater regime and geology features;
- Development of a hydrogeological conceptual model to support both the ESIA and the site water management requirements;
- Numerical groundwater modelling to quantify mine dewatering predictions based on phases of the mine plan development;
- The development of a calibrated surface water runoff model and two-dimensional flood model based on measured and observed data;
- Development of feasibility level of river realignment designs allowing the development of pits within flood plain and water course areas; and
- Development of the mine water management plan addressing potential water quality and quantity impacts, surface water management and pit dewatering requirements.

The realignment of two rivers is planned. The Namkok river will be diverted around the DSW OP in two stages and the Houay Khiang creek will be diverted around the NLU OP.

## 12.3 Open Pit Geotechnics

### 12.3.1 Studies and Data

The following studies were reviewed by AMC in the SGPS:

- “Rock Mechanics Evaluation of The Primary Gold Project Deposits, Sepon Gold Copper Operation, LAOS, P.D.R. (06641487-R01)” , which was prepared by Golder Associates Pty Ltd (“Golder”) and dated in December 2007.
- “MMG Sepon Primary Au Geotechnical Study - Open-Pit Review (1743\_G\3156)”, which was prepared by Mining One Consultants Pty Ltd (“Mining One”) and dated on 20 July 2012.
- “Sepon Gold Project Geotechnical Study”, which was prepared by Mining One and dated on 6 June 2019.
- “Geotechnical Review - Open Pit & Underground”, which was prepared by MEC Mining Pty Ltd and dated on 4 December 2023.

Two geotechnical logging and testing campaigns have been completed to support pit design for mining the primary gold deposits. A summary of drill holes is shown in Table 12-2.

**Table 12-2: Summary of Drill Holes for 2007 and 2018 Drilling Campaigns**

Area	Number of holes in 2007	Number of holes in 2018	Total
Discovery Main	11	5	16

Area	Number of holes in 2007	Number of holes in 2018	Total
Discovery West	9	5	14
Nalou	15	4	19
<b>Total</b>	<b>35</b>	<b>14</b>	<b>49</b>

Sources: SGPS

Structural mapping was done during both campaigns, with the mapping done for the three main rock types encountered, i.e., calcareous shale ("CSH"), dolomite ("DOL"), and rhyodacite porphyry ("RDP").

Laboratory testing was also performed during both campaigns. The 2007 testing was done by AL Technologies (S) PTE LTD and the 2018 testing was carried out by Trilab.

The test data was validated by Mining One and the rock mass parameters shown in Table 12-3 were used in the stability analysis in the SGPS focused on Discovery Main ("DSM"), Discovery West ("DSW") and Nalou ("NLU") areas.

**Table 12-3: Rock Mass Parameters Used for Geotechnical Analysis by Mining One**

Material	UCS (median) (MPa)	Cohesion (kPa)	Internal friction angle (degrees)	Density (mean) (kN/m <sup>3</sup> )	mi (Roclab)	GSI (35 <sup>th</sup> percentile) DSM/DSW/NLU
Clay	-	11.1 (35 <sup>th</sup> percentile)	25.5 (35 <sup>th</sup> percentile)	17.3	-	-

Sources: SGPS

### 12.3.2 Seismicity

LXML is situated in an area of low seismic risk, with peak ground acceleration less than 0.04g.

### 12.3.3 Modes of Failure

Batter-scale stability was assessed using a combination of limit equilibrium and kinematic analysis. Overall and inter-ramp slope stability was assessed using limit equilibrium methods. The potential failure modes identified by Mining One are shown below:

- Circular failure was considered the most likely mechanism in the upper clay slopes, whereas a combination of circular and structurally controlled failure was considered in the upper weathered slopes.

- In the fresh rock, failure was expected to be structurally controlled and would be plane, wedge, or toppling failures.

#### 12.3.4 Geotechnical Domains

Selection of the geotechnical domains is based on the results of the limit equilibrium analyses, kinematic analyses, and anisotropic behaviour.

### 12.4 Open Pit Mining

The conventional mining cycle, comprising drilling, blasting, loading, and hauling, were employed for the extraction of ore and waste rocks. The mining operations were conducted on flitches with a height of 2.5 meters.

#### 12.4.1 Grade Control

The proposed method of grade control is RC drilling on a 5m x 10m pattern to a depth of 20m.

#### 12.4.2 Open-pit Design

Open pit design parameters are summarized in Table 12-4 and Table 12-5.

**Table 12-4: Mine Design Parameters**

Item	Unit	Value	Notes
Bench height	m	20	the height between two berms
Minimum mining width (bench floor)	m	25	
Dual-lane ramp width	m	16.5	
Single-lane ramp width	m	10.5	
Ramp gradient	%	12.5

<b>Dual-lane ramp width</b>	m	16.5	
<b>Ramp grade</b>	%	10.0	

Sources: SGPS

### 12.4.4 Ore Stockpiles Design

Stockpiles design parameters are summarized in Table 12-6.

The Gold ROM Pad development will be built on the current Eastern Copper ROM. The Gold ROM is estimated to have a total capacity of 1.6 Mt of ore.

#### 12.4.5 Mining Equipment

Open pit mining was outsourced to seven contractors, which are HCD, KJL, KXN, VCC, VDC, Orica, and EIC. Open pit mining equipment are shown in Table 12-7.

It was planned to continue mining activity with the existing fleet unless there is a convincing reason to change.

**Table 12-7: Open-pit Mining Equipment**

#### 12.4.6 Conclusions and Recommendations

The open pit mining is going to be completed in near future (about three years). The final open pit designs have been applied by LXML to guide mining boundaries. Mining cycle and management have been practised for a long time. SRK considered no significant risk will be encountered for the open pit mining in future.

### 12.5 Underground Geotechnics

The following study was reviewed by AMC in the SGPS. It highlighted the stope stability parameters and ground support regime are obtained from a scoping study, as opposed to a pre-feasibility level work.

- “Discovery Deeps, High Level Geotechnical Assessment (2610\_G\5803v2)”, which was prepared by Mining One and dated on 17 June 2019.
- “Geotechnical Review - Open Pit & Underground”, which was prepared by MEC Mining Pty Ltd and dated on 4 December 2023.

Drill hole data shown in Table 12-8 was used to construct the geotechnical model. The domains include global hanging wall, immediate hanging wall, ore, immediate footwall and global footwall.

**Table 12-8: Diamond Drill Holes Used to Construct Geotechnical Model**

A statistical analysis was undertaken on logged rock mass classification factor (Q') in each domain. This analysis is summarised in Table 12-9.

**Table 12-9: Q' Statistical Analysis for Each Domain**

Domain	Minimum	Q'25	Median	Q'75	Maximum	Mean	Quality
Global Hanging wall	0.5	11.7	21.7	25.0	142.0	24.1	fair
Immediate hanging wall	1.0	10.0	17.5	25.6	138.8	24.5	fair to good
Ore	0.8	8.8	18.8	32.5	100.0	24.0	poor to good
Immediate foot wall	2.0	8.9	18.8	35.0	150.0	30.0	poor to good
Global foot wall	0.9	29.0	67.0	137.5	270.0	77.3	good to very good

Sources: SGPS

AMC completed a geotechnical assessment to estimate stable stope spans and pillar dimensions for the DSE UG deposit. The limiting stope span was assessed to be the hanging wall or crown of the stope with a hydraulic radius (“HR”) limit of 5.7.

## 12.6 Underground Mining

The exploitation of the DSE UG as an underground gold mine, commencing in 2023, was intended to extend the life of the mine

### 12.6.1 Development System

The design consists of twin declines, both developed from what would be the upper benches of the DSE OP. One decline, with a portal at 205 m ASL, provides an access to the eastern extent of the deposit and the other, with a portal at 215 m ASL, to the western extent. The design has divided the mine into 4 distinct zones – SE, NE, SW and NW. Isometric view of concept design for long-hole stoping with cemented paste backfill (“LHSB”) is shown in Figure 12-2.

Typical lateral development dimensions are shown in Table 12-10. Vertical development dimensions are likely to be in the 2.0 to 4.0 m diameter range depending on the location and purpose and subject to positive stability assessment at those diameters.

**Table 12-10: Lateral Development Profiles**

Type	Dimensions
<b>Decline and Access</b>	arch 5.5m wide x 5.8m high
<b>Deposit Access – Level</b>	arch 5.5m wide x 5.5m high
<b>Return Air Drives, Escapeway Accesses, Ore Development</b>	square 5.0m wide x 5.0m high

Sources: SGPS

**Figure 12-2: Isometric View of Concept Design (LHSP, looking south)**

Sources: SGPS

Since commencing production at the DSE UG, LXML has revised the development design. The new design consists of only one decline, which continues development from the upper benches of the DSE OP. This decline, with a portal at 196 meters ASL, provides access for intake air, transportation

of materials, waste & ore and personnel. Additionally, there are fresh air and return air raises located at approximately 220 meters ASL. The dimensions and development rates for different types are shown in Table 12-11 below. The plan view of this design for DSE UG is illustrated in the Section11.5.2.

**Table 12-11: Lateral Development Profiles**

Type	Dimension	Rate
<b>Decline</b>	arch 5.5m width x 6.0m height	60m/month
<b>Electrical Drive</b>	arch 5.0m width x 6.0m height	60m/month
<b>Fresh Air Drive</b>	arch 5.0m width x 5.0m height	60m/month
<b>Fresh Air Raise</b>	circle 4.0m/diameter	60m/month
<b>Level Access</b>	arch 5.5m width x 5.5m height	60m/month
<b>Level Connection</b>	arch 5.5m width x 5.5m height	60m/month
<b>Ore Access</b>	arch 5.0m width x 5.0m height	60m/month
<b>Ore Drive</b>	arch 5.0m width x 5.0m height	60m/month
<b>Return Air Drive</b>	arch 5.0m width x 5.0m height	60m/month
<b>Return Air Raise</b>	circle 4.0m/diameter	60m/month
<b>Sump</b>	square 5.0m width x 5.0m height	60m/month
<b>Stockpile</b>	arch 5.0m width x 5.0m height	60m/month
<b>Dia Drill Drive</b>	arch 5.0m width x 5.0m height	60m/month
<b>Pumpstation</b>	arch 5.0m width x 5.0m height	60m/month
<b>Slot Drive</b>	arch 5.0m width x 5.0m height	60m/month

Sources: LXML

## 12.6.2 Mining Methods

The proposed mining methods in the SGPS include long-hole stoping with cemented backfill ("LHSB"), long-hole stoping with pillars ("LHSP"), and post pillar cut and fill ("PPCF").

LHSB would be applied to areas where the deposit thickness is greater than 15 m. Long-hole stopes would be mined at suitable lengths then be filled and cured before mining adjacent stopes. Waste rock backfill could be used in the final secondary stope along strike. This method would require development at both the lower and upper levels of the stope to enable filling of the mined voids. The stope is 15 m wide and 45 m long after considering a hydraulic radius ("HR") limit of 5.7. Stope height varies with thickness of mineralisation domain. The mining recovery rate was assumed to be 90%. The mining dilution rate was assumed to be 15%.

LHSP would be applied to areas where the deposit thickness is greater than 10 metres. Stopes would be extracted by bottom level development and blind production up holes. Stopes would be left unfilled as the rib and sill pillars allow for ongoing stability. The stope is 20 m wide and 25 m long after considering an HR limit of 5.7. Stope height varies with thickness of mineralisation domain. The sill pillar is 10.5 m wide. The rib pillar is 11.5 m wide. The mining recovery rate was assumed to be 95%. The mining dilution rate was assumed to be 10%.

PPCF would be applied to all remaining inventory and would utilise waste rock backfill where the deposit thickness is greater than 7 metres. The bottom development style excavation would be taken at 5 to 7m height depending on the deposit thickness. Subsequent lifts would be taken in approximately 4-metre slices depending on the initial drive height. Drive width to pillar width ratio is 1:1. Opening length to pillar length (between drives) ratio is 6:5. Number of lifts varies with thickness of mineralisation domain. The mining recovery rate was assumed to be 77%. The mining dilution rate was assumed to be 5%.

Currently, LXML has revised the design based on LHSP method, with a mining recovery rate designed to be 90% and mining dilution at 15%.

After reviewing the design, SRK noticed that the stope shape designed by LXML should be updated based on the latest geological model. Consequently, SRK re-ran the Stope Optimizer (SO) based on the input parameters provided by LXML to report the Ore Reserves, with more details referred to in Section 11.5.4.

### 12.6.3 Backfill

According to SPGS, the backfill study has not yet reached the pre-feasibility level. The decision on whether to utilize pumping (if reticulated) or truck hauls (if transported) has not been finalized. The operating costs of paste backfill and the capital forecast are derived from AMC benchmarks, set at 19.5 USD/m<sup>3</sup> and 10.0 million USD, respectively.

Currently, LXML has prepared a report titled "Physical and Mechanical Properties and Proportioning Test of Copper-Gold Tailings of LXML Sepon Mine." This preliminary report indicates the following key points:

- Density Analysis: The report provides the density measurements of both historical and current operational tailings.
- Fineness Classification: The fineness classification of both historical and current tailings has been assessed.
- Tailings Classification: The report includes a comparison between full tailings and classified tailings.
- Cemented Material Comparison: A comparative analysis of two types of cemented materials is presented.
- Cement-Sand Ratio: The report discusses the cement-sand ratio used in the tailings.
- Material Consumption: An evaluation of material consumption is included in the findings.

Based on LXML's preliminary assumptions, the operating cost of paste backfill and the capital forecast would be 15-16 USD/m<sup>3</sup> and 6.0 million USD, respectively, where LXML may take advantage of suitable budget-friendly options from China. However, LXML has acknowledged that these figures are still benchmarks, and more detailed studies by a third party will be presented by October 2024.

### 12.6.4 Mining Equipment

Underground mining equipment are shown in Table 12-12.

**Table 12-12: Owner’s Underground Mining Equipment Quantity**

Service Truck	Manitou MTX 1840, CAT 950 LOADER	2
Light Vehicles		12

Sources: LXML

**12.6.5 Ventilation**

A primary ventilation flow requirement was assumed to be 390 m³/s in the SGPS.

Primary ventilation will be established initially in the SE and the SW zones and once the NE and NW shafts are constructed the primary ventilation fans would be moved from the southern shafts to the northern shafts. The southern shafts would then become intakes. Figure 12-3 provides an overview of the final primary ventilation network structure for the underground mine. Final exhaust shaft dimensions (subject to positive stability assessment) are estimated to be 3.5 m diameter with estimated fan power on each of 250 kW.

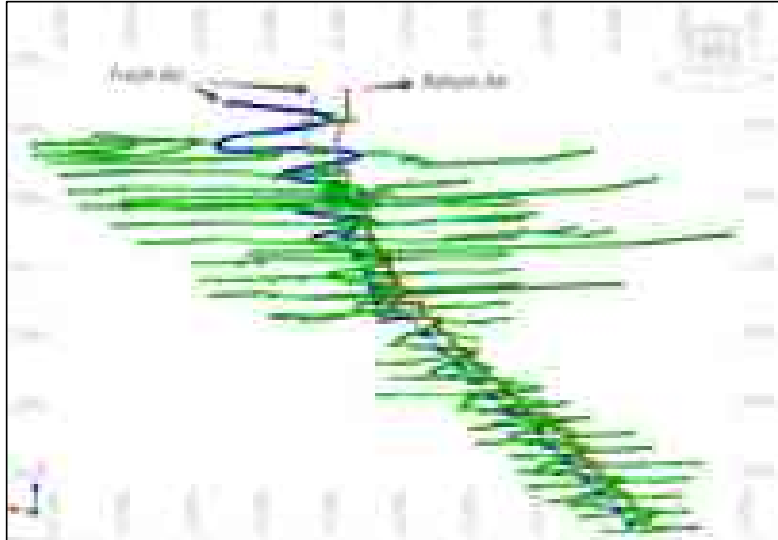

**Figure 12-3: Primary Ventilation Layout**

Sources: SGPS

As mentioned in Section 11.5, LXML has revised the development design, resulting in changes to the ventilation system. Figure 12-4 below illustrates the general layout of the updated ventilation.

Figure 12-4: Revised Primary Ventilation Layout

Sources: LXML

Generally speaking, fresh air enters through the main decline and fresh air raise, subsequently flowing into the fresh air drive or directly to the level access. A secondary fan is arranged to pressurize the fresh air, directing it to the ore drive and then to the stope or development face end. The exhaust air follows a reverse path, moving from the stope or development face end to the level access, then to the return air drive, and finally to the return air raise.

Table 12-11 in Section 12.6.1 presents the design parameters for the ventilation drive and raise.

Figure 12-5 shows the secondary fan and vent tube arranged in the main decline to level access, as observed during the underground visit on November 28, 2023.

Figure 12-5: Secondary Fan in Main Decline

Secondary Fan in Main Decline

Vent tube in Main Decline

Sources: SRK

As a general comment on the underground visit, the areas were clean, reasonably well-ventilated.

SRK was also provided with the primary and secondary ventilation survey monthly records, as shown in Figure 12-6 below. Normally, the survey is conducted on a monthly basis.

**Figure 12-6: Primary Ventilation Survey in January 2024**

**12.6.6 Conclusions and Recommendations**

In SGPS, the proposed mining methods in the DSE UG include long-hole stoping with cemented backfill (“LHSB”), long-hole stoping with pillars (“LHSP”), and post pillar cut and fill (“PPCA”).

Construction of the underground mine commenced in April 2022 at DSE UG. As of 30 September 2024, SRK was provided with revised ventilation designs and underground designs by LXML.

SRK re-ran the stope optimization based on LHSB, as selected by LXML, then applied modifying factors and prepared the production schedule based on a review of LXML’s data. SRK notes that LHSB has been widely practiced globally and is technically feasible.

SRK also noted that DSE UG would utilize cemented backfill to increase mining recovery, and more comprehensive study is on-going. Cemented backfill is widely used in various mines, it would not be a major risk which affecting Ore Reserves estimation

## 13 Recovery Methods

### 13.1 Gold Processing Plant

#### 13.1.1 Introduction

The Sepon Gold Plant started operations during 2002 as a conventional processing plant for treating oxide ores by cyanide leaching. The plant was originally designed to process ore at 1.25 Mtpa. During 2006 the processing plant was expanded to achieve a processing throughput rate of 2.5 Mtpa. The plant was placed in care and maintenance in December 2013 due to unfavourable economic conditions driven by low grades and low gold prices. During 2016, a Scoping Study evaluated the option of re-allocating existing assets from both plants (Sepon Gold plant and Sepon Copper plant) to significantly minimize the required capital expenditure. This option was considered in later studies, as it was accepted that there were challenges for increasing the reserves for copper ores. The option of pre-concentration by flotation followed by pressure oxidation ("POX") was selected as "going-forward case" taking advantage of current POX facilities.

During 2020, the Sepon Gold Project Study was completed by LXML, focused on optimising the option evaluated during 2016, and maximising the utilisation of current assets. Since 2019, several assets from the Sepon Copper plant have been allocated to processing primary gold ores, including the flotation plant and the pressure oxidation circuit.

Currently, the plant has been expanded to process oxide ore and primary/transition ores in parallel mode. The overall plant capacity is 3.8 Mtpa, including the capacity at 2.2 Mtpa to process primary/transition ores and at 1.6 Mtpa to process oxide ore.

The oxidised ore is processed by carbon in leaching process ("CIL") and the primary/transition ore is processed by the "flotation - POX - CIL process". The final product is Gold Doré. Over the past three years, 3.08 to 3.55 Mtpa ore was processed and 6.01 to 6.26 tpa of gold was produced with the gold recovery of 55.1 to 65.2%.

The Sepon Gold Plant and Copper Plant are together in a complex. Figure 13-1 shows an aerial view of the complex.

#### 13.1.2 Production Process

After crushing and grinding, the oxidised ore enters the CIL system. The primary and transitional ores are crushed and ground before entering the flotation system to produce a flotation concentrate and tailings, the tailings is discharged into the Flotation Tailing Storage Pit since cyanide free, while the concentrate enters the CIL system after acidification and POX. The gold-bearing carbon from the CIL systems is then sent to the elution-electrowinning-smelting system to produce Gold Doré. The leach residue from the CIL system is detoxified and discharged to the tailings storage facility ("TSF").

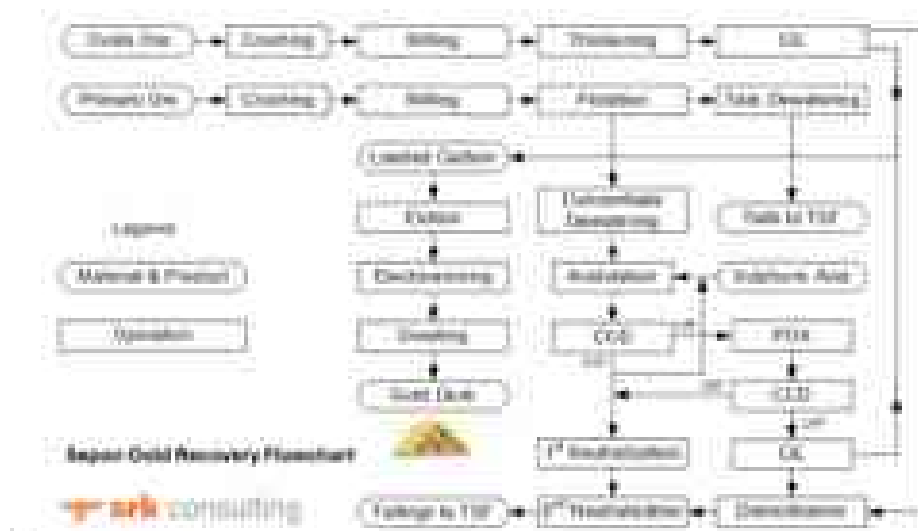

The production process is simplified in Figure 13-2 and described as follow:

Figure 13-1: Sepon Gold Plant and Copper Plant Complex

Source:LXML

Figure 13-2: Simplified Gold Recovering Flowchart

Source: SRK

- Oxide Ore Crushing and Grinding

Oxide ore is fragmental and crushed by a roller crusher then GOX Mill (2,000 kW installed capacity). The final sizing of the oxide milling circuit is  $P_{80}=90\sim 125$  microns. The milled ore is then pumped to TK01 and TK61 agitation tanks for cyanidation with air injection and lime addition. The slurry is then pumped into the back end of the CIL circuit.

- Primary Ore Crushing and Grinding

A single toggle jaw crusher (Jacques ST47) will reduce the top size from 600 mm to 90 mm. Crushed ore is stockpiled between the crushing and milling circuits. The crushed ore is then reclaimed by apron feeders and fed into the SAG Mill (2,600 kW installed capacity) and Ball Mill (1,800 kW installed capacity) circuit. The final sizing of the entire milling circuit is  $P_{80}=53\sim 65$  microns.

- Primary Ore Flotation

The milled primary ore is then pumped to the flotation facility. The flotation plant includes two Jameson cells and six 160 m<sup>3</sup> mechanical rougher-scavenger cells with prior flash flotation cells. The scavenger concentrate reports to the cleaning circuit which includes another Jameson cell and three 70 m<sup>3</sup> mechanical cells. The cleaner tails are recirculated to the rougher flotation cells. The scavenger flotation tails report to a tails thickener (CCD4) for thickening purposes prior to being pumped to the surge tank in CIL circuit or discharged to west TSF ("WTSF") as well as to Khanong Tailing Storage Pit since it is cyanide free tailing slurry.

- Concentrate Acidulation and Pressure Oxidation (POX)

The final flotation concentrate is dewatered by a concentrate thickener (CCD5). Concentrate at 40% w/w density is then pumped into two agitation tanks (TK05 and TK06) for acidulation purposes. Concentrate sulphuric acid and POX residue CCD (counter current decantation in thickeners) wash solution provides the acid source for carbonate removal. The post acidulation slurry is dewatered by thickener (CCD7). Concentrate at 40% w/w density is then pumped into the pre-heater vessel at the Pressure Oxidation facility for increasing the temperature up to 90-95 °C. Heated concentrate slurry reports to an agitation tank (TK135) for feeding the pressure oxidation facility, POX1 and POX2. The heated concentrate slurry is then fed into the autoclave vessel, where the sulphides are oxidised under aggressive leaching conditions (220 °C, 2,900 kPa total pressure, 600 kPa oxygen overpressure). Pyrite is completely oxidised to hematite and basic ferric sulphate. The pressure oxidation vessel discharge reports to two tanks (TK101 and TK102) to start the hot cure process (dissolution of basic ferric sulphate). Hot slurry is then pumped into another tanks (TK07 and TK08) allowing enough residence time for complete basic ferric sulphate dissolution. The slurry is then washed through the front end of the CCD train. Four thickeners have been allocated for washing purposes (ALT1, CCD1, CCD2 and CCD3). The washed residue is then pumped from CCD3 to a tank (TK133), where pH is increased up to 10 ahead of the CIL circuit. The slurry is then pumped into the front end of the CIL plant at the Sepon gold plant.

A concentrate regrinding and cleaning facility is in construction for the concentrate upgrade and carbonatites decreasing to save the sulphuric acid consumption of concentrate acidulation.

- Carbon in Leach (CIL), Elution and Gold Room

The CIL circuit is operated considering two activated carbon circuits. Four large CIL tanks (1,800 m<sup>3</sup> each) and three small CIL tanks (1,000 m<sup>3</sup> each) are allocated for primary ore CIL, while three small CIL tanks (1,000 m<sup>3</sup> each) are allocated for oxide ore CIL. This carbon configuration is based on minimising the cross contamination of preg-robbing material from the ore. Gold is leached by

conventional methods using sodium cyanide with air injection. Loaded carbon is transferred into the stripping facility for elution purposes and final gold pouring within the gold room. A new elution circuit is built in April 2022 to increase stripping capacity along with extension of gold room.

Mercury recovery system is included within the existing and new elution circuit and gold room, for regeneration kiln and electrowinning sludge drying. Mercury is recovered within liquid form, then storage onsite for latter exportation outside of the processing facility.

- Cyanide Destruction and Neutralization

The overall CIL residue reports to the detoxification stage, where sodium metabisulphite and copper sulphate are added for cyanide destruction. The final tails report to the neutralisation stage for increasing the pH up to 9 for final tailing disposal.

### 13.1.3 Production Performance

The overall gold recovery ranges from 55% to 64%, as shown in Table 13-1.

**Table 13-1: Sepon Gold Plant Historical Production Performance**

Parameters	Unit	2021	2022	2023	3Q2024

**13.1.4 Processing Facilities and Equipment**

The main production facilities at Sepon Gold Plant include an oxide ore crushing and grinding system, a primary ore crushing and grinding system, a primary ore flotation system, a flotation concentrate acidulation and POX -CCD system, a POX post-concentrate CIL system, an oxide ore CIL system, a gold-loaded carbon elution-electrowinning-smelting-regeneration system, and auxiliary facilities including an oxygen plant, a metallurgical and assay laboratory, and a machine shop. The main processing equipment are described in the above process description. Figure 13-3 shows part of the gold facilities.

The cryogenic oxygen plant with a demonstrated capacity of 220 tonnes of oxygen per day supports the pressure oxidation facility. An existing vacuum pressure swing adsorption (‘VPSA’) oxygen has a capacity of 50 tonnes of oxygen per day and a new VPSA oxygen plant was built in 2021 with a demonstrated capacity of 160 tonnes of oxygen per day.

**Figure 13-3: Facilities of Sepon Gold Plant**

Source: SRK

**13.1.5 Consumable**

The Sepon Gold Plant Consumable of December 2022 is shown in Table 13-2, which is largely representative of the future consumption levels of the plant.

**Table 13-2: Sepon Gold Plant Consumable**

Reagents	Unit	Consumption
<b>Total Grinding Media</b>	kg/t dry ore milled	0.86

Electricity	kWh/t dry ore milled	

**13.1.6 Utilization of low-grade ore**

There are plans to develop and utilize low-grade gold resources, but there is no technical studies, neither optionality tests and (pre-) feasibility studies, or specific plans to conduct feasibility studies.

**13.1.7 Conclusion and Recommendation**

The Sepon Gold Processing Plant uses the "flotation-POX-CIL" process for primary/transition ores to produce Gold Doré and the CIL process for oxide ores to produce Gold Doré, which is believed to be a suitable process by SRK.

In 2023, 2,111kt of primary ore was processed at a feed grade of 3.55g/t with 85.4% gold flotation recovery, 78.2% POX-CIL recovery. 5.021kg gold was produced from primary ore, the overall gold recovery is 67%.

In 2023, 974kt of oxide ore was processed at a feed grade of 1.96g/t with 51.8% gold recovery. The lower gold recovery rate is considered by SRK to be mainly due to the multiple ore types and the inherent refractory of the ore, while the reasons for the processing and operating parameters are of secondary importance. Total gold production is 6 tons from oxide and primary ores with overall gold recovery of 64%.

The primary and oxide ores will continue to be processed on existing facilities and the flowsheet is continuously upgrading. SRK proposes to forecast future production at an overall recovery of 65%. There are plans to exploit the low-grade gold resource, but no technical studies have been carried out yet in relation to this plan. It is recommended that verification and associated technical studies, including metallurgical tests and feasibility studies, be conducted on the low-grade resource.

## 13.2 Copper Processing Plant

### 13.2.1 Introduction

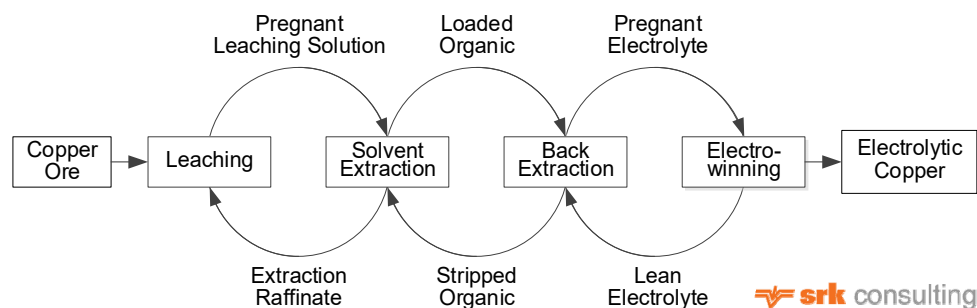

Copper processing is conducted at two different locations within the Sepon operation, utilising components of the former copper process plant together with the more recently constructed Heap Leach Operation. Each facility runs parallel to the other with the heap leach operation lying northeast of the copper processing plant at the mining ROM pad area. Final metal production occurs within the processing plant area. Previous copper operations were transitioned from July 2020 to the new gold primary circuit which included transfer of the former copper mill, pressure autoclaves, & leaching tanks. Remaining processing assets (which have not been utilised in the primary gold conversion) will be utilised to treat residual low-grade copper ore stockpiles on the ROM. The former copper process plant assets retained for copper processing include the Scrubber, cold acid leach, CCD, and solvent extraction & electrowinning (SX/EW).

Figure 13-1 of Section 13.1 shows an aerial view of the complex of Gold Plant and Copper Plant.

### 13.2.2 Production Flowsheet

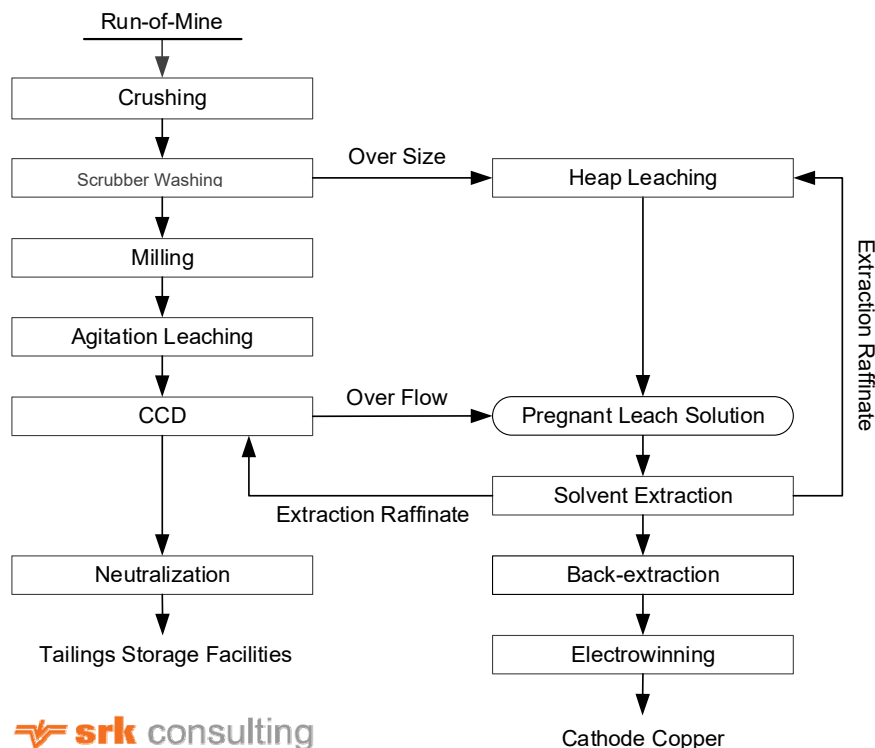

A typical hydrometallurgical process includes 3 circles as shown in Figure 13-4.

**Figure 13-4: Schematic Diagram for Copper Hydrometallurgical Recovery**

The Sepon copper production flowsheet is a typical hydrometallurgical process, including agitation leaching and heap leaching operations, and the final product is cathode copper. Simplified flow chart is presented in Figure 13-5, describes as follows:

Figure 13-5: Simplified Copper Metallurgical Flow Chart

 **srk consulting**

Source: SRK

■ **Crushing and Scrubbing**

Low grade oxide and mixed oxide & sulfide copper ores are stored on the ROM pad. The ROM is then crushed by an impact crusher. The scrubber circuit washes the crushed ore with acidic process solution and then screens out the larger particles to produce a leach slurry that is sent to leach tank.

■ **Cold Acid Leach and CCD**

Concentrated sulphuric acid is added to leach tank to dissolve the copper into solution. The leach slurry is then transferred to CCD train #2. The slurry is thickened in each of the atmospheric leach thickener (ALT2). Thickener overflow, termed pregnant leach solution (PLS), is pumped to a clarifier, and flows from there, by gravity, to the PLS pond. Underflow streams from the PLS clarifier and atmospheric leach thickeners are pumped to the first CCD thickener. CCD train comprises six thickeners arranged in series. The purpose of the CCD circuits is to wash copper, acid and iron from the atmospheric leach thickener underflow stream. In order to achieve this, solid underflow and clear overflow streams move in counter-current direction through each CCD train. The streams are mixed ahead of each thickener, in an agitated mix tank, to ensure efficient washing.

Flocculant is added to each thickener according to the settling characteristics of the ore blend. The flocculation and resulting settling rate is sensitive to thickener feed density. Internal dilution in the

feed well is used to control the feed density and the flocculated solids are injected into the feed well to improve settling rates.

Washing of the solid material in the first three CCD thickeners of each train is achieved by contacting the solid underflow from the atmospheric leach thickener with copper raffinate from solvent extraction, which enters the circuit in the second CCD mix tank. The wash ratio in this section of the CCD circuit is approximately 4:1. Due to the high levels of iron and acid in the copper raffinate, only copper is washed from the solid underflow in the first two CCD thickeners.

Overflow from each of the first CCD thickeners is stored in a surge tank. CCD overflow is returned to milling and atmospheric leaching, via the heat recovery exchangers and atmospheric leach pre-heater in Pressure Oxidation.

Underflow from each of the third CCD thickeners is pumped through the next three CCD stages of each train where it is contacted with dilution water from the flotation circuit, to further recover copper as well as iron and acid. The wash ratio in the next three thickeners is approximately 1:1. As the wash water reports with raffinate to the CCD overflow tank, the amount of water used is set to match the makeup water requirements of the overall circuit. The plant water balance limits the wash efficiency achieved in this section of the CCD circuit.

The final thickener in the CCD circuit is used to thicken the slurry, the returned underflow is pumped to Neutralisation. Process water is added to the dilution tank to make-up for the volume sent forward as wash water.

- Solvent Extraction

The solvent extraction plant consists of one train having three extraction mixer-settlers operating in series, two stripping mixer-settlers, one organic washing mixer-settler and a loaded organic tank. Each mixer-settler consists of one Dispersion Overflow Pump ("DOP") Unit, two Spirok mixing units and a settler.

The clarified and cooled PLS solution containing copper in solution is pumped from the PLS pond through two pipelines into the SX area into E1 DOP unit. The PLS flow rate is controlled with feed pump VFD.

In the E1 stage DOP, the PLS solution is mixed with semi-loaded organic coming from the E2 mixer-settler and a part of the PLS copper content is extracted into the organic phase by using copper selective organic reagent mixed with kerosene type diluent.

The formed dispersion flows through Spirok mixer units and via an uptake channel into the settler, where the dispersion flow is distributed across the full width of the settler by using a distributor fence. The organic and aqueous phases are separated by aid of set of picket fences. Because the organic phase has a lower density than the aqueous phase, it floats on top of the aqueous solution.

The extraction mixer-settlers are designed to operate with organic to aqueous phase ratio of close 1:1. The global O/A ratio is anyhow 1,7:1,0, thus the extraction mixer-settlers are furnished with aqueous inner circulations taken from the settler bulk.

There are two launder compartments at the discharge end of each settler. The copper loaded organic overflows into the first compartment and the aqueous phase flows under the organic launder into the

aqueous launder through pipes, which are furnished with bellows to control solution levels in the settler.

The aqueous phase from the E1 settler flows via an outlet box to E2 DOP unit and the copper loaded organic solution flows by gravity into a loaded organic tank. In the E2 DOP unit, the aqueous solution from the E1 stage is mixed with partly loaded organic solution from the E3 stage. The formed dispersion flows through the mixing units into the settler, where the phases are again separated.

The aqueous phase from the E2 stage continues into the E3 mixer-settler where it contacts with stripped organic coming from the S2 stage. About 88% to 95% of the PLS copper content is now transferred from the aqueous phase into the organic phase. The extraction recovery varies depending on the PLS acidity and copper content. The raffinate copper solution flows from the E3 stage by gravity into the raffinate pond.

The loaded organic tank is furnished with scrub water circulation to enhance impurity control. The PLS solution contains impurities like iron and manganese, which are harmful for the electrowinning process. Transfer of these impurities into the copper electrolyte is minimized with aid of scrubbing in the loaded organic tank and using a washing mixer-settler. The scrub water in the loaded organic tank is circulated into the organic outlet of the E1 stage with centrifugal pumps. Acidic fresh water is taken into the circulation and corresponding amount is bled out into the aqueous outlet of the E2 stage.

The pre-scrubbed loaded organic is pumped by using VFD controlled centrifugal pump from the loaded organic tank through LO pump tank into the W stage DOP unit, where it is mixed with acidic water, coming from electrolyte filter backwashing. The objective of the W stage is to wash out and dilute impurities, which have been transferred in organic phase as chemical and aqueous entrainment. Used wash water flows to the E2 DOP. The W mixer-settler is designed to operate with organic to aqueous ratio of close 1:1. However the advance ratio is about 45:1, thus the washing mixer-settler is furnished with aqueous inner circulations taken from the settler bulk.

The washed loaded organic flows from the W stage to the first stripping stage S1, where it's contacted with semi-rich electrolyte solution from the second S2 mixer-settler. Copper is transferred back into the aqueous phase by aid of acidity difference between the phases. The rich electrolyte containing close to 50 g/l copper flows from the S1 stage by gravity to the rich electrolyte after settler, which is located at the tank farm. Partially stripped organic solution continues to the S2 stage, where it's mixed with lean electrolyte solution pumped from the electrolyte circulation tank, which is located at the tank farm. The lean electrolyte contains 33-35 g/l copper and 180 g/l sulphuric acid.

The stripping mixer-settlers are also designed to operate with organic to aqueous phase ratio of close 1:1. The global O/A ratio is about 2:1, thus the stripping mixer-settlers are furnished with aqueous inner circulations taken from the settler bulk. The stripped organic returns from the S2 stage back to the E3 stage.

■ Electrowinning

Copper is recovered from the electrolyte solution by connecting direct current between the lead anodes and the stainless steel cathodes. The electrowinning layout is based on a double aisle configuration with 2 rows of cells. Two separate electrical and electrolyte circulation circuits are formed with 142 and 24 cells respectively. The electric current is fed to the electrolytic cells by two 60 kA transformer-rectifier. The bus bar system connects each group of cells together and to their

respective rectifier. During this process copper is deposited at the stainless steel cathodes and oxygen is liberated at the anodes.

The EW feed electrolyte is pumped from the electrolyte circulation tank into the electrolytic cells. Copper content of the electrolyte is 35 to 36 g/l and acid content 180 g/l. Electrolyte temperature is maintained at 45 to 50 °C. The change of the copper concentration in the electrolyte is 1.9 to 2.3 g/l. The electrolyte from the cells flows by gravity back to the circulation tank. Electrolyte outlet from the cells is equipped with screen to capture PP balls.

The Electrowinning process produces high purity 99.999% copper cathode metal. The cathodes are allowed to grow for certain days after which they are pulled from the cells. An operator controls the crane by using remote control. The crane bale is fine positioned to a cell by its positioning cones that meet the corresponding holes integrated into the cell, pulls every second cathode at a time, and during the pulling sprays the cathodes with water in order to rinse off the electrolyte.

Pulled cathodes are transferred from the cell to a cathode wash dip tank. Cathodes are washed and transferred to the receiving conveyor of the stripping machine. The Cathodes are again sprayed with hot water in a spray box fitted to the conveyor to remove any final traces of electrolyte. The Cathodes are then automatically stripped in the Cathode Stripping Machine. Stripped blanks are lifted from the discharge conveyor of the stripping machine and transferred back to the cells. The crane bale is equipped with cathode aligning combs that ensure that the cathodes are inserted safely between the anodes.

In the stripping machine, the stripped copper deposits move down and turn into horizontal position. The stacking unit automatically collects the deposits into stacks, which are discharged from the stripping machine by the stack discharge conveyor. The stacks are removed by a fork-lift truck for subsequent manual sampling station, weighing unit and strapping unit.

- Neutralisation

Thickened CCD tailings are pumped to neutralisation tanks. The tanks are arranged in a cascade such that pulp from each tank overflows to the next tank in the sequence. Upcomers are fitted to the overflow of each tank to limit short-circuiting and ensure that no build-up of large particulate material occurs. Bypass launders are provided for each tank in the train to allow individual tanks to be isolated and maintained while the rest remain online.

Spargers are installed in the first two tanks to provide oxygen for ferrous ion oxidation to maximize iron precipitation in these tanks. Air is supplied to these tanks from the atmospheric leach blowers. Limestone slurry is metered into the first three tanks and lime into the final two tanks, both from circulating ring mains. Water is added to the final tank to reduce the solid density to 35% to control slurry viscosity.

Gold plant tailings enter the second neutralisation tank and the combined tailings stream overflows into a pump hopper. The combined tailings are pumped to the western tailings storage facility by two sets of tailings pumps.

- Heap Leach

The heap leach copper processing plant was constructed in 2020 using a blend of primary copper ores, copper process scats and scrubber oversize. Ore has been stacked on 6 HDPE lined pads into heaps up to 12 metres high. The heaps are covered with plastic irrigation hosing to drip acidic

process solution from the copper process plant onto the top of the heap. The solution passes through the heap dissolving copper and is collected in HDPE lined ponds. Three (HDPE lined) ponds were also constructed in 2020 at the heap leach process plant to manage solution being fed to and from the copper heap leach pads. Pregnant Leach Solution from heap leach is transferred under gravity flow to the SX/EW PLS Pond to mix with scrubber leach solution prior to SX/EW.

### 13.2.3 Production Performance

The production process was modified in 2020 and 2021, with ore crushing followed by washing, coarse-grained fraction heap leaching, and fine-grained fraction grinding followed by stirred leaching. After 2020, heap leaching and stirred leaching simultaneously produced leach rich liquor (PLS) and copper cathode by extraction/electrolysis (SX/EW). The production performance is shown in Table 13-3. Stir leaching, with the decrease in leach grade, has a significant reduction in copper recovery, with a leach grade of 1.43% and a copper recovery of 57.2% in 2022. The integrated recovery from heap leaching for 2020, 2021 and 2022 is 76.2%, including the copper brought back to the heap leach by the extraction poor solution. The integrated recovery is 78.4% in 2021, which suffered a reduction to 61.7% in 2022 due to the decrease in ore grade. SRK believes the recovery rate will gradually increase for the long heap leach cycle.

**Table 13-3: Sepon Copper Plant Historical Production Performance**

Items	Unit	2021	2022	2023	3Q2024
<b>Agitation Leaching</b>					
Milling feed tonnes	t	255,074	772,052	1,105,175	843,337
Milling feed grade-Cu	%	2.47	1.43	1.02	0.99
Cu metal feed to agitation leach	t	5,673	10,308	11,273	8,313
Copper produced from agitation leach	t	4,052	5,891	6,136	3,446
Agitation leach recovery	%	71.22	57.15	54.43	41.45
<b>Heap Leaching</b>					
Stacked tonnes <sup>2</sup>	t	236,988	40,800	188,585	214,711
stacked copper grade	%	0.70	0.80	0.99	0.67
Cu metal stacked	t	1,659	326	1,867	1,438
Copper produced from heap leach	t	1,696	675	383	184
Heap leach recovery <sup>1</sup>	%	68.95	76.23	63.30	65.58

Copper grade of ROM	%	1.49	1.31	1.02	0.92
Cu metal feed	t	7,332	10,635	13,140	9,751
Total copper production-plated	t	3,345	6,566	6,548	3,856
Total copper production-stripped	t	5,748	6,565	6,519	3,462
Overall copper recovery	%	78.40	61.73	49.61	41.64

Notes:

<sup>1</sup> Heap leach recovery is calculated based on the total amount of copper stacked and produced.

<sup>2</sup> The oversize ore in 2024 has not heap leached.

### 13.2.4 Metallurgical Facilities

The main metallurgical facilities at Sepon Copper Plant include a crushing and scrubber washing system, a grinding system, a heap leaching system, an agitation leaching and CCD system, a SX/EW system, a residue neutralization system. Figure 13-6 shows main workshops of the copper plant.

Figure 13-6: Workshops of Copper Plant

Source: SRK site visit

### 13.2.5 Consumable

Table 13-4 lists the consumptions of the agitation leaching plant.

Table 13-4: Sepon Copper Plant Consumable

Reagents	Unit	Consumption
Grinding Media (Steel Balls)	kg/t dry ore milled	0.33
Sulphuric Acid	kg/t dry ore leached	85.00
Flocculant Addition	g/t dry ore milled	212
Lime	kg/t dry ore milled	18.58
Limestone	kg/t dry ore milled	86.80

Fresh Water	m <sup>3</sup> /t dry ore leached
Electricity	kWh/t dry ore leached

### 13.2.6 Utilization of Low-Grade Ore

Total copper potential for Sepon including tailings and stockpiles estimated is as 138Mt @ 0.68% grade for 940kt of contained copper. The resources for potential copper production is as follows:

- Tailings for leach potential 24Mt @ 0.37% for 88kt of contained copper.
- Tailings for flotation potential 1.45Mt @ 0.4% for 6kt of contained copper.
- Copper stockpile estimated as 4.65Mt @1.04% for 48kt contained copper.
- More than 85% contained copper from Thengkhamb (58%) and Khanong (27%) ,total primary copper potential estimated as 95Mt @ 0.57% for 538kt of contained copper.

There are plans to utilize the aforementioned low-grade resources by treating low-grade primary copper ore using a flotation process to produce a saleable copper concentrate. The flotation tests on primary copper ores confirmed satisfied results, the copper recovery is over 80% with a saleable grade of above 18%. A pre-feasibility study level *Thengkhamb Primary Copper Proof of Concept* has been finished in October 2023 ("POC"). The POC designed the primary copper plant adopts "crushing-milling-rougher flotation-regrinding-cleaning" process to produce saleable copper concentrate with gold and silver credit. The designed capacity of the flotation plant is 7.5 Mtpa with copper recovery no less than 80%. Copper concentrate is expected within 18% to 24%.

There are two options of the plant development scheme:

- Option 1 - Building an entire new processing facility at Thengkhamb
- Option 2 - Upgrading the existing processing plant

As a result of preliminary trade off study, the Option 2 is the preferred scheme, but the NPV is negative. The economic indicators for the option of upgrading the existing plant provide enough resolution for classifying this project within negative/marginal project minimum blue-sky potential. This option will breakeven at a copper recovery of 87%, or at a copper price of 9,119 USD/t copper. A minimum inventory of 137 Mt is required for breaking-even. A strong copper price outlook would support additional studies for this option.

The final recommendation from this study is to proceed with the update of the Resource model as a priority. The model update should be mainly focused on the primary mineralisation. The LXML Exploration team has already included additional drilling in this region for the 2024 plan. The upside potential for the Upgrading the existing processing plant case warrants this additional drilling and model update. Once the Resource model is updated, a detailed feasibility study is recommended.

### 13.2.7 Conclusion and Recommendation

Hydrometallurgy is a reliable process technology for treating copper oxide ores. The operation of Sepon copper mine for many years has shown that the copper recovery rate is greatly influenced by the leaching grade during the "Stirred Leaching-CCD-SX-EW" process. The leach grade is reduced from 2.71% in 2020 to 1.43% in 2022, and the copper recovery rate is reduced from 83.3% to 57.2%.

Heap leaching is a low-cost wet copper extraction process that can consume excess extractive solution. The combination of stirred leaching and heap leaching can better maintain the process water balance and also reduce the cost to treat lower grade ore. As a reference, the combined recovery of stirred leaching and heap is 61.7% in 2022. A recovery rate of 65% is recommended by SRK as a parameter for subsequent deposit evaluation and economic analysis, taking into account the long heap leach cycle.

The primary copper ores are amenable to flotation process. Laboratory tests results in the copper recovery over 80% in the concentrate with copper grade ranging 18% to 24%. A Proof of Concept study shows the NPV is negative. A detailed feasibility study is recommended to be conducted once the Resource Model is updated and the copper price raises to above USD9,119 per tonne.

## 14 Project Infrastructure

### 14.1 Tailings Storage Facilities

There are two Tailings Storage Facilities ("TSFs") at the Sepon copper mine and gold mine, TSF1 and the western TSF ("WTSF"). The blended tailings from Copper Plant and Gold Plant are deposited in the TSFs. The storage capacity of TSF1 has been exhausted, and WTSF is in its final raising stage (stage 8). A WTSF EXTENSION DETAILED DESIGN has been compiled by Knight Piesold Pty Ltd in August 2022, adding an extra of 44 Mt ( $37 \text{ Mm}^3 @ 1.2 \text{ t/m}^3$ ) storage capacity serving 8 years from 2023 at approximate rate 5.52Mt per year.

#### 14.1.1 TSF1

TSF1 is located approximately 1 km southeast of the Sepon processing plant. TSF1 was constructed in 2002. Gold tailings were deposited exclusively into the facility until March 2005 when both gold and copper tailings were co-disposed. Construction comprised six downstream stages undertaken between 2002 and 2008 to a crest level of RL 287.2 m with a storage capacity of 16 Mt. A final upstream lift was added in 2012.

TSF1 has a main embankment. The dam figures a drainage system constructed at upstream toe of the embankment designed to pump underdrainage from the tailings mass directly back into the supernatant pond, although this underdrainage system is currently not in use. TSF1 also has a southern and a northern saddle dam that both comprise low permeability homogenous fill. The maximum height of the main embankment is at RL 287 m, approximately 72 m. The saddle dams are approximately 5 m high. The crest length of the main embankment is approximately 850 m. The saddle dams range from 40 to 80 m in length.

The tailings beach level based on the September 2018 survey is RL 285 m. A well-developed beach is formed against the main embankment and the saddle dams. There has been minimal tailings discharge since 2018, so the  $13.9 \text{ Mm}^3$  of tailings stored in TSF1 calculated by LXML in December 2017 is assumed to be still applicable.

The current spillway is located near the northern saddle dam, through the western abutment. The current spillway discharges via a rock-lined chute to a deep valley below the northern saddle dam.

A seepage collection system is located at the downstream toe of the main embankment, returning seepage back to the TSF or directly to the process plant.

Ponded water is removed from the dam by a barge-mounted pump decant system and associated HDPE decant return pipeline, pumping directly to the process ponds at the plant site.

Tailings were delivered to the dam via a HDPE tailings delivery pipeline located within a concrete culvert for the entire distance between the plant and TSF1. An emergency dump pocket / catch dam is located at a low point along the pipeline alignment (adjacent to Hinsom Creek). The tailings distribution pipeline had 4 operating spigots and droppers located across almost the full length of the embankment. Currently, tailings deposition is not taking place, but LXML is considering the possibility of reintroducing limited discharge as part of the conversion to gold tailings.

### 14.1.2 WTSF

The WTSF is situated approximately 10 km southwest of the existing plant site. The WTSF has been operational since January 2008, storing tailings generated from the gold and copper processing plants. The copper processing plant has a current throughput rate of 2.2 Mtpa but was scheduled to be closed in 2020. The gold processing plant has been in care and maintenance since 2013 but is currently being refurbished and expected to recommence processing this year.

Stage 8 construction is ongoing, and the raise is being completed in stages. The crest was initially raised to RL 307 m and now construction of the downstream portion of the raise is underway.

The principal components of the WTSF comprise the following elements:

- Main Embankment.
- West Embankment: A major embankment located at the western side of the WTSF.
- Northern Saddle Dams: A series of saddle dams along the northern side of the WTSF.
- Spillway: The spillway is located at one of the northern saddle dams and is an overflow levee with erosion protection provided on the surface of the levee.
- Decant Facility: The decant facility is a pump barge located on the northern side of the WTSF.

The Main Embankment has a maximum height of just over 60 m with the western embankment at approximately 34 m and the saddle dams ranging in height up to approximately 7 m. The Stage 8 construction is reducing batter slopes on the downstream faces of both embankments with slopes of 1V:3.3H and 7 m wide benches at 10 m heights giving an overall slope of 1V:4H.

The crest length of the main embankment is approximately 2.4 km with the western embankment being approximately 300 m.

In February 2021, LXML conducted an optional study examining the potential to expand the WTSF to the west, north and southeast as part of ongoing extensions to the life of mine plan. Following this study, an expansion to the southeast was selected based on ultimate capacity, geological and embankment fill efficiency assessments. A tailings storage capacity of 17.4 Mt was required for the reserves nominated in the PFS, with an increased storage configuration up to 44 Mt developed for the final design. On the basis of LXML's study, Knight Piesold completed the WTSF extension design in August 2022. The extension capacity was designed to accommodate 44 Mt (37 Mm<sup>3</sup> at 1.2t/m<sup>3</sup>) tailings which is scheduled to be deposited over 8 years, starting from year 2023 at annual volume of 5.52 Mt. Figure 14-1 is the WTSF and its extension drawn by Knight Piesold in the *WTSF Extension Design*.

Figure 14-1: WTSP and Extension

## 14.2 External Transportation

Sepon site is located in central Eastern Laos, 235 km East North East of Savannakhet, 45 km North of Ban Nabo and 290 km from Da Nang in Vietnam, and centred at Co-ordinates 17° (1875000nM) N and 106° (607000nM) E with an Elevation of 260m above sea level Figure 14-2). Table 14-1 lists different access methods to the project area.

Figure 14-2: Location and Access to Sepon Project

Table 14-1: Accesses to Sepon Project

<b>Road Access</b>	From Bangkok via Savannakhet (possibly routes 2, 202,212), 9 + 28A to Ban Nabo
<b>Air Access</b>	<ul style="list-style-type: none"> <li>▪ Regular chartered flights operated by Lao Skyway from Wattay Airport domestic terminal in Vientiane, with some flights via Savannakhet Airport.</li> <li>▪ Helipad on site</li> <li>▪ Via Bangkok or Laem Chebang</li> <li>▪ Logistics of supply lines to the site will be established to suit particular packages.</li> </ul>
<b>Sea Access</b>	<p>Most likely access will be via Bangkok where accumulation of goods will take place for road shipment to site.</p> <ul style="list-style-type: none"> <li>▪ Via Vietnam</li> </ul>

### 14.3 Other Facilities in the Sepon Mine site

Historically, Sepon Mine has about 20 years of production, and various facilities were well developed.

#### 14.3.1 Industrial Sites

There are more than 20 open-pits associated with the waste dump sites and ore temporary storage sites near the pits. Now only a few of the open-pits are in operation, and some old pits have been used for waste dump sites.

There is an industrial site hosting ore processing plant and smelter, with ore dump and blending sites.

The whole mine site was separated from local communities with its own traffic control system of haulage roads and various internal roads.

#### 14.3.2 Camps

There are two camps within the mine site. One camp can host about 700 people for expats and technical personnel, as well as visitors; the other can host about 2,000 people for Lao nationals who work in the mine. Each camp has its own catering and laundry services, as well as being equipped with various sport facilities. Shuttle buses operate from 5:00am to 7:00pm in the morning and evening between work sites and camps.

#### 14.3.3 Airstrip

There is an airport within the mine site, only minutes away from the head office. Charter flights are available daily between Vientiane and the Sepon in weekdays.

## 15 Market Studies and Contracts

The final products from the Sepon project are cathode copper plates and gold bars. SRK was provided with copper sales agreement and gold refining agreement.

### 15.1 Copper Sales Contract

The copper sales agreement was signed on 14 January 2022 between LXML ("the seller") and Trafigura Pte Ltd, of Singapore ("the buyer"). The agreement sets that:

"The price shall be the LME Settlement price for Copper as quoted on the London Metal Exchange averaged over the market days of the quotational period (The quotational period shall be the month after the month of delivery (M+1) plus respective premium and minus any applicable discount below:

- **Premium:** The Codelco CIF Taiwan cathode benchmark for the respective year of delivery.
- In case the product does not meet the LME specifications, the **following discounts** shall be applicable:
  - OG 1 (max Pb 10ppm and max S 20ppm): USD 50.00 (US Dollar fifty) per Metric Tonne.
  - OG 2 (max Pb 30ppm and max S 30ppm): USD 80.00 (US Dollar eighty) per Metric Tonne.
  - OG 3 (max Pb 50ppm and max S 50ppm): USD 200.00 (US Dollar two hundred) per Metric Tonne.
- **Freight Netback:**
  - The price shall be further adjusted to EXW basis by an applicable freight netback from CIF CY Taiwan. Such freight netbacks shall be negotiated in good faith and mutually agreed between the parties for every six (6) month delivery period during the months of December and June prior to the scheduled delivery period. For 2022, Seller shall bear 1/3 of actual freight costs but no more than US Dollar 15 per Metric Tonne for cathodes shipped to countries other than Thailand."

### 15.2 Gold Refining Contract

A refining agreement was signed between ABC Refinery (Australia) Pty Ltd and LXML on 10 August 2020. The agreement defines that there is no charge on melt or assay of gold and silver Dorè, and refining charge is agreed as USD0.075/gross oz, with a retention (metal return) of 0.015% Au and 0.5% Ag.

## 16 Environmental Studies, Permitting, and Social or Community Impact

### 16.1 Environmental and Social Review Objectives

The objective of this environmental and social review is to identify and/or verify the existing and potential environmental and social liabilities and risks and assess any associated proposed remediation measures for the development and operation of the Sepon Project. During SRK's site visit in May 2024, the project was in commercial operation including multiple open pit mining, gold and copper ore processing, tailings storage facilities and waste rock dumps.

### 16.2 Environmental and Social Review Process, Scope and Standards

The process for the environmental and social preliminary review for the Project comprised a review of provided project environmental and social management documentation combined with site visit observation against relevant criteria within:

- Laos national environmental regulatory requirements; and
- World Bank/International Finance Corporation ("IFC") environmental and social standards and guidelines and internationally recognised environmental management practices.

### 16.3 Status of Environmental and Social Approvals

SRK was provided with the following Environmental and Social Impact Assessment ("ESIA") reports for the Project, where the associated ESIA report approvals were issued by the Ministry of Natural Resources and Environment ("MoNRE"):

- NSR Environmental Consultants Pty Ltd and Earth Systems Lao (September 2001), *Sepon Project Environmental and Social Impact Assessment Report*, English Version;
- NSR Environmental Consultants Pty Ltd and Earth Systems Lao (November 2002), *Sepon Project Environmental and Social Impact Assessment Addendum Report*, English Version;
- Enesar Consulting Pty Ltd (April 2004), *Sepon Project Gold Expansion Environmental and Social Impact Assessment Report*, English Version;
- Coffey (January 2008), *Sepon Gold and Copper Operations GPDA Gold Oxide Project Environmental and Social Impact Assessment Addendum Report*, English Version;
- Coffey (July 2009), *Sepon Copper Expansion Project Environmental and Social Impact Assessment Addendum Report*, English Version;
- Sustainable Solutions Global and Earth Systems Lao (2020), *Sepon Gold Expansion Project Environmental and Social Impact Assessment Report*, English Version; and
- Earth Systems Lao (October 2022), *Sepon Gold Expansion Project Stage II Environmental and Social Impact Assessment Report*, English Version.

## 16.4 Environmental Compliance and Conformance

Please note that the following are the Laos environmental laws and regulations which the Company needs to comply with:

- The 9th Five-Year National Social-Economic Development Plan (2021 - 2025);
- National Environment Strategy to 2020 (2004);
- National Biodiversity Strategy and Action Plan for 2016-2025 (2016);
- Strategic Framework for National Sustainable Development Strategy for Lao People's Democratic Republic ("PDR") (2008);
- National Environment Action Plan ("NEAP");
- National Adaptation Programme of Action on Climate Change (2009); and
- MoNRE Vision toward 2030 and National Resources and Environment Strategy, 2016-2025 (2015).

Further than these strategies and action plans, Lao Government has also formulated draft policies and strategic frameworks relating to environment such as the Draft Strategy and Action Plan for Water Resources Management.

SRK notes that these ESIA reports mentioned above have been compiled in accordance with relevant Laos environmental laws and regulations, as well as World Bank/IFC environmental and social standards and guidelines and internationally recognised environmental management practices. SRK has reviewed these ESIA reports with the associated approvals and conducted an environmental site visit against recognized international industry environmental management standards, guidelines and practices. In the following sections, SRK provides comments in respect to the Project's environmental management measures.

### 16.4.1 Water Aspects

Three classes of water are used in and around the mining, process plants and accommodation camp areas including raw water, process water and potable water.

Raw (untreated) water is pumped from the Nam Kok River through a water clarifier to a series of tanks to the east of the gold plant. Water is used to meet domestic and process water requirements. The process water is a combination of raw water from the Nam Kok River and recycled TSF decant water. Potable water for the offices and Padan Camp is supplied via a feed from the reverse osmosis plant, located at the Gold Plant, and an additional drinking water treatment plant for potable water supply at Padan camp. Potable water for Hinsom Camp is provided via a dedicated water treatment plant located adjacent to the camp supplied by a groundwater bore.

Water used at the site and surface water runoff has the potential to be impacted by process chemicals, hydrocarbons, eroded sediments, and Acid Rock Drainage ("ARD"). Effective water management is fundamental to minimising potential adverse effects to the downstream environment and community water and aquatic resource users.

A water management system is maintained at Sepon and comprises water management infrastructure such as diversion drains, settlement ponds, environmental wetlands and water

treatment facilities to remove heavy metals via lime precipitation, settlement and natural attenuation, supported by site operational procedures. The objectives of the Sepon water management system are to:

- Minimize extraction of raw water from the environment by reusing pit and process water where practical.
- Divert clean water around mining areas and mineral waste facilities to prevent impact.
- Collect all site effluent waters (runoff from mineral waste facilities, stockpiles, open pits, processing facilities and other general operations areas), test and treat to meet effluent discharge compliance criteria prior to discharge offsite.

#### **16.4.2 Waste Rock and Tailings Management**

Waste rocks are generated as part of mining activities and are dumped into various waste dump areas near the open pits. Based on an ARD assessment report dated September 2014, the recommended criteria for non-acid forming ("NAF") waste and potentially acid forming ("PAF") waste is that non-calcareous waste containing more than 0.3% S is assumed to be PAF, and calcareous rock units and non-calcareous waste containing less than 0.3% S are assumed to be NAF. Waste dump areas are generally located and constructed at the nearest proximity to mining areas to minimize haul distance. Mineral waste facilities are predominately valley fill construction, although several are mound or hill type of construction. The construction of waste dumps takes into account the acid-generating and acid-consuming characteristics of the waste rock material to ensure that the risk of acid rock drainage is reduced. The mitigation measures for the PAF waste dump area include low permeable layer on the bottom, blending with limestone, encapsulation with clay, and final dump covers with low permeable layers. PAF waste rock were also backfilled into exhausted open pits and were encapsulated with 5m thick NAF waste. NAF waste rock from any of the pits may be used for construction purposes such as the tailing storage facility embankment, haul roads and sediment control structures. Based on the observations and discussion during the site visit, this mine site generally contains significant levels of dolomites, which can neutralize the ARD naturally and reduce the impacts to the environment.

Tailings are generated from the processing plant, which contain significant amount of sulfur concentrate. In order to reduce the risk of ARD, tailings are sent to the neutralization circuit where they are neutralized with lime to a pH of 7 prior to discharging into TSFs. Since primary gold is processed by pressure oxidation, associated sulfur is converted to acid and neutralized before sending to the TSF, ARD risk could be reduced significantly. Monthly water quality monitoring undertaken previously identified elevated levels of sulphate and manganese in the surface waters of Houay Nam Laeb and Houay Aria Creek, respectively, southwest of the WTFS. Inspection conducted identified that the elevated sulphate and manganese is likely from WTFS supernatant. Three seepage containment dams were constructed in 2017 to intercept, contain and return the seepage into WTFS, associated with lime treatment on the seepage water.

#### **16.4.3 General Solid Waste Management**

The Company states that the municipal solid waste is collected in designated areas and disposed of into an on-site landfill to keep all project sites in good housekeeping. The Company has a program

to recycle iron scraps, paper, plastic bottles, aluminum cans, and cardboards, and several identified local subcontractors come to the site to collect them.

#### 16.4.4 Hazardous substance management

The main hazardous material management for the Project comprises the storage and handling of processing chemicals including cyanide, limestones, paints, lubricant oil, gasoline, diesel, etc. These materials will not only harm the environment, also impact the safety and health of the workers. The Company stores them with secondary containment, in compliance with various laws and regulations. In addition, some certain levels of fuels are stored onsite for mining and ore transporting, and they are stored properly. The Project site is equipped with a high temperature incinerator to treat medical waste. The oily waste and waste oil will be temporarily stored in the temporary storage of hazardous waste and then handed over to qualified organizations for disposal and treatment.

#### 16.4.5 Site Ecological Assessment

The development of mining and mineral processing projects may also result in impacts to or loss of wildlife habitat. The project development ESIA reports determined the extent and significance of any potential impacts to wildlife. Where these potential impacts are determined significant, the ESIA reports proposed effective measures to reduce and manage them.

The Project is located in the Annamite Range Moist Forest ecoregion, which is one of Asia's largest contiguous natural forests, and supports a number of unique species, many of which are endemic and/or highly threatened. This region is listed as 'Vulnerable' as it is threatened by human impacts including logging, wildlife trade and unsustainable natural resource exploitation. In terms of aquatic biodiversity, the Project is located in the Greater Mekong ecoregion, including wetlands, peat swamps, subterranean streams, and crater lakes, which provide habitat for many other aquatic and terrestrial flora and fauna. This ecoregion is considered 'Vulnerable' due to existing threats.

The Company implements biodiversity management through a set of prioritised steps to avoid and minimise the potential impact of the Project on biodiversity. Specific commitments to biodiversity include:

- Do not explore, mine or cause environmental impact within the boundaries of the United Nations Educational, Scientific and Cultural Organization's ("UNESCO") "World Heritage List" properties;
- Avoid disturbance of biodiversity and other ecological values, and otherwise require an approved Mitigation Management Plan or Biodiversity Offset Management Plan prior to authorisation of disturbance; and
- Implement the common Land and Biodiversity Management Critical Control Design that considers topsoil management, erosion control, priority flora management, priority fauna and habitat management, and weed, exotic flora and pest animal management.

SRK notes that the site biodiversity management for the Project follows Lao laws and regulations, and internationally recognized guidance and practices.

#### 16.4.6 Dust, Gas and Noise Emissions

Dust will be generated from the open pits, haul road and dry beach area of TSFs during dry season, and the Company uses water trucks to the open pits, haul road, and the dry beach area of the TSFs to mitigate the dust emission. In addition, the processing plant could be a significant dust and gas pollution source if without proper measures. The dust from the plant mainly comes from the coarse crushing room, medium and fine crushing room, and screening room. According to SRK's site visit, all pieces of equipment of processing plant for crushing and screening are not placed in enclosed spaces, and potentially causing fugitive dust pollution to the air. SRK recommends that all facilities of processing plant be placed in multiple warehouses equipped with dust collection systems and sprayers. Pressure Oxidation Plant ("POX") plant discharges vapor to the environment.

The main noise sources for the Project are from the operation of fixed plant (crushers, compressors, pumps, etc.) and mobile equipment (mainly ore haulage). SRK notes that the potential for significant off-site noise impact is low due to the site being remote (the nearest residence is approximately several kilometers away from the project site).

#### 16.4.7 Environmental Protection and Management Plan

The purpose of an operational Environmental Protection and Management Plan ("EPMP") is to direct and coordinate the management of the project's environmental risks. The EPMP documents the establishment, resourcing and implementation of the project's environmental management programs. The site environmental performance is monitored and feedback from this monitoring is then utilised to revise and streamline the implementation of the EPMP. SRK notes that an operational EPMP has been developed and implemented for the Project. This EPMP incorporates operational monitoring programs for the monitoring of air emissions, groundwater quality, and soil and water conservation.

#### 16.4.8 Site Closure Planning and Rehabilitation

Lao national legislation includes requirements for the closure of mining projects, including ecological rehabilitation and the continued sustainability and social development of local communities. These legislative requirements cover the need to conduct land rehabilitation, prepare a site closure report, and submit a site closure application for assessment and approval.

The recognised international industry practice for managing site closure is to develop and implement an operational site closure planning process and to document this through an operational Closure Plan. This operational closure planning process should include the following components:

- Identify all site closure stakeholders (e.g., government, employees, community);
- Undertake stakeholder consultation to develop agreed-upon site closure criteria and post-operational land use;
- Maintain records of stakeholder consultation;
- Establish a site rehabilitation objective in line with the agreed-upon post-operational land use;
- Define and describe any site closure liabilities (i.e., as determined against the agreed-upon closure criteria);

- Establish site closure management strategies and cost estimates (i.e., to address/reduce site closure liabilities);
- Establish a cost estimate and financial accrual process for site closure; and
- Describe the post site closure monitoring activities/program (i.e., to demonstrate compliance with the rehabilitation objective/closure criteria).

SRK was provided with a conceptual closure plan dated May 2020. SRK notes that the total mine closure cost estimate is around USD 255M, including rehabilitation of waste rock dumps, TSFs, roadways, industrial area, ancillary facility demolition, water management, community transition, etc. According to the MEPA between the Lao Government and the Company, the Company established a rehabilitation and mine closure fund in 2003 contributing USD 1/oz gold and an equivalent rate of all copper sales to the fund for the operational life of the mine. The rate has been increased to USD 3/zo since July 2021 according to the most recent MEPA. The Company provided a USD bank statement of a Lao national bank, and the balance was USD 8.3M in March 2023, which will be used for mine site rehabilitation exclusively. The Company is committed to conducting the mine closure progressively throughout the mine life and on-going stakeholder consultation, and follows the international standards defined by the closure plan mentioned above. Please note that under Laos law, there is no requirement that additional mine closure security bond to be paid in full, as the balance should be provided on instalment each year according on the project term. The aggregate amount contributed by the Company to the rehabilitation mine closure fund was US\$8,987,000 as at 30 September 2024. The Company has made a provision of US\$236 million for the rehabilitation work to be carried out in future in the financial statements, calculated by discounting remaining future rehabilitation cash outflow of US\$247 million to current value term.

#### 16.4.9 Social Aspects

The Sepon Mine is located in Vilabouly District, Savannakhet which has 73 villages with approximately 8,200 households and 44,000 people, the majority of whom is located in rural areas. These villages are populated by two main ethnic linguistic groups (Phou Thai and Mon-Khmer). This district has a low level of infrastructure to support local activities and the project was developed within an area of comparatively low socio-economic profile, primarily based on a subsistence economy.

Public participation and community consultation programs were confirmed as being undertaken for the Project operation as part of their ESIA's. SRK observed that the Company had a good understanding of the social dynamics and knowledge about the local society. This Project provides major employment opportunities for the locals and improves the local economy significantly. The Company stated they have social dispute resolution mechanism and reported to SRK that complains and grievance between the Company and local Laotians are resolved by communication. In addition, According to the MEPA, Community Trust Fund ("CTF") has been established to improve the livelihood of local communities, with an annual contribution of USD 750k by the Company.

Areas in and around the Sepon Mine have a rich archaeological history and the Company has been involved in archaeological and cultural heritage discovery and preservation in the area throughout mine operations. These include artefacts including bronze drums, bronze weapons potteries, and porcelains, cemeteries, spirit forests, caves and sites of local significance. One of the most significant sites is the Dragon Field, a significant cultural site with possible connections to ancient copper mining activities, which is declared as a national protected heritage site. This site is fenced by the Company

and excluded from any mining activities. The Company implements cultural heritage management through the local authorities, universities and museums.

No non-compliance notices or other notices of a breach of environmental or social conditions for the Project from the Local or Provincial governments have been sighted as part of this review. The Company also stated to SRK that they maintain a strong relationship with the local, provincial and national governments along with the local police. As part of this review, SRK has not sighted any documentation in relation to any actual or potential impacts of non-governmental organisations on the sustainability of Sepon Mine's mining and processing operations.

#### 16.4.10 Occupational Health and Safety

During SRK's site visit, SRK observed that safety signs were in place, safety provisions and rules were also displayed within the work areas, moving machinery parts were appropriately guarded and covered, guard railings were installed on all gantries, and proper Personal Protection Equipment ("PPE") was provided and was being used by the workers, such as hardhats, traffic vests, and steel toed shoes.

SRK has sighted the OHS management system and procedures, which provide the following summary in respect to the proposed OHS management measures for the Project:

- Mining, crushing, blasting and explosives handling,
- Side slope failure prevention,
- Waste rock disposal,
- Environmental dust and noise suppression,
- Emergency response,
- Fire protection and fire extinguishment,
- Sanitary provision,
- Power provision,
- Unexploded ordnance ("UXO") clearance;
- Labour and supervision, and
- Safety administration.

SRK notes that the above site occupational health and safety ("OHS") management measures are generally in line with recognised international industry practices and Laos safety regulations.

The Company's safety records indicate that there are 0, 0, 0, and 0 fatalities, 1, 1, 2, and 1 serious / lost time injuries, and 27, 32, 4, and 7 minor injuries respectively, in the past four years between 2021 and 2024, which were shown in Table 16-1. Incident descriptions for these injuries were also provided to SRK for review.

**Table 16-1: OHS Incident Statistics**

Years	Minor	Serious	Fatality
2021 OHS Incident Statistics	27	1	0
2022 OHS Incident Statistics	32	1	0

<b>2023 OHS Incident Statistics</b>	4	2	0
<b>2024 OHS Incident Statistics</b>	7	1	0

Reports analysing the cause of injuries and identifying measures to prevent a recurrence were provided to SRK. SRK notes that such analytical reports are prepared in line with internationally recognized OHS accident monitoring practice, as part of OHS management practice.

## 16.5 Evaluation of Environmental and Social Risks

The sources of environmental risk are project activities that may result in potential environmental impacts. These project activities have been previously described within this report. In summary, the most significant potential environmental and social risks for the development of the Project, currently identified as part of the project assessment and this SRK review, are:

- TSF seepage pollution;
- Fugitive dust pollution; and
- Deficit mine closure fund.

It is SRK's opinion that the above environmental risks are categorised as medium risks (i.e., requiring risk management measures) and they are generally manageable. Since various environmental protection measures are planned or conducted by the Company to solve these environmental issues, SRK considers that these environmental risks are controlled properly and not likely to develop into higher level of risks.

## 17 Capital and Operating Costs

### 17.1 Capital Expenditures

LXML has about 21 years of production history since 2003. Capital expenditures ("Capex") for construction of the mines, ore processing plants, on-site facilities etc. had been invested in the past.

LXML has made a plan for further capital expenditures as sustaining capital in next three years, as shown in Table 17-1. After reviewing the detailed sustaining capital forecast, SRK has observed that while no specific capital expenditure for the paste plant is listed, the overall capital forecast appears sufficient to cover these expenditures. Therefore, SRK has made the assumption that the capital forecast will adequately cover the capital expenditure required for the paste plant.

**Table 17-1: Three Year Investment Plan Proposed by LXML**

Item	Unit	Budget	Budget	Budget
		2024Q4	2025	2026
Growth	USD	11,382,777	23,647,600	17,160,000
Exploration	USD	3,289,314	8,282,649	8,046,405
Sustain	USD	6,989,876	18,140,200	11,432,076
<b>Total</b>	USD	<b>21,661,967</b>	<b>50,070,449</b>	<b>36,638,481</b>

Source: LXML

Sustaining capital includes capital development and all costs related to the acquisition, replacement, or major overhaul of assets during the mine life required to sustain operations. According to the data provided by LXML, the capital expenditures for the last three year from 2021 to 2023 are shown in Table 17-2.

**Table 17-2: LXML Sustaining Capital Expenditures from 2021 to 2023**

Year	Unit	2021	2022	2023
Sustaining Capital Expenditures	USD	80,045,664	13,902,841	15,486,999

Source: LXML

The unit sustaining capital costs for past three years are shown in Table 17-3. Excluding the year 2021, SRK has developed a unit sustaining capital forecast based on the average expenditures for the years 2022 and 2023.

**Table 17-3: LXML Unit Sustaining Capex from 2021 to 2023**

Year	Unit	2021	2022	2023	Average <sup>1</sup>
Unit Sustaining Capital Expenditures	USD/milled tone	21.8	3.2	3.7	3.5

Source: LXML

<sup>1</sup> The average is based on the unit sustaining Capex in 2022 and 2023.

Table 17-4 summarises the further Capex needed for the LXML.

**Table 17-4: Further Capex needed for LXML as of 30 September 2024**

Item	Unit	2024	2025	2026	2027	2028	2029	2030
Growth	USD million	11.4	23.6	17.2				
Exploration	USD million	3.3	8.3	8.0				
Sustain	USD million	7.0	18.1	11.4	2.7	1.9	1.4	0.1
<b>Total</b>	USD million	<b>21.7</b>	<b>50.1</b>	<b>36.6</b>	<b>2.7</b>	<b>1.9</b>	<b>1.4</b>	<b>0.1</b>

Sources: LXML and SRK

SRK assumes that working capital has been incorporated into the sustaining capital. During the economic analysis, non-current assets will be considered for amortization and depreciation. Together with further Capex, they will adhere to the amortization and depreciation rates as proposed in Table 18-2. It is reasonable to expect that the operation of the Sepon project will be extended with further exploration and feasibility studies, the mine closure fees and the residual value of the project will not be considered in the economic projection.

## 17.2 Historical Operating Costs

A summary of cash costs from 2021 to 3Q2024, which excludes the depreciation, amortisation and financial costs from the total costs, is shown in Table 17-5.

**Table 17-5: Operating Costs in 2021, 2022, 2023 and 2024 Q1- Q3**

Item	2021	2022	2023	Q1-Q3 2024
<b>Annual Cost (USD Million/a)</b>

### 17.4 Metal Prices

The primary project revenue is from gold and copper, Figure 17-1 shows the historic gold and copper price. Price forecast of CMF is shown in Figure 17-2.

Figure 17-1: Gold and Copper 5 Years Historic Price

Sources: Kitco

Figure 17-2: Gold and Copper Price Forecast

Sources: SRK

Notes: 2024Q1 CMF, Spot in 19 February 2024.

Table 17-7 shows the annual gold and copper price forecasts used by SRK, which is a consensus market forecast, considering various forecasts made by other professional institutions.

Table 17-7: Forecasted Gold and Copper Prices by SRK in the 3<sup>rd</sup> Quarter of 2024

Item	Unit	2024	2025	2026	2027	2028	2029	2030
Copper price	US/t	9,350	9,600					
Gold price	US/oz	2,480	2,480	2,360	2,220	2,130	2,000	2,000

Sources: SRK

**17.5 Tax Obligations**

Based on the documents signed between Laos Government and the MEPA's previous owner, CRA, the owner of the mining licenses and exploration permits has following tax obligations.

**Company Income tax:** once the project produces profit, the company will have a two year tax free period, and have to pay 16.67% income tax of taxable income for the third year, and then will pay full tax rate of 33.33% afterwards.

## 18 Economic Analysis

It is important to note that the purpose of this analysis is solely for the purpose of Ore Reserve estimation. The derived NPVs do not indicate the fair market values or the profitability of the projects. The estimated cash flows and NPVs were presented on an after-tax basis, and financing costs were not considered..

The economic analysis was conducted using conventional Discounted Cash Flow ("DCF") techniques. The Net Present Value ("NPV") was determined from the project's cash flow using a 10% discount rate. It should be noted that SRK's DCF modelling and NPV calculation are carried out with the purpose of testing the "economic viability" of the Project which is required to a reasonable Ore Reserve reporting. Additionally, a sensitivity analysis was performed to examine the effects of changes in Capex, Opex, and gold price (revenue).

### 18.1 Principal Assumptions

The assumptions used to carry out the economic analysis are listed below:

- The discounted cash flow method (the "DCF") is selected as the foundation of economic analysis. The discount rate is 10%, which is a widely used value for a simple economic analysis.
- The base date is assumed to be 30 September 2024, and all the operations related data are subject to conditions obtained at the base date.
- The production schedules are shown in Table 11-21.
- The Capex are shown in Section 17.1.
- The working capital is assumed to be incorporated into the sustaining capital. The mine closure fees and the residual value of the project will not be considered in the economic projection.
- The capital forecast would cover the expenditures for the paste plant.
- The Opex forecasts are shown in Section 17.3.
- The taxes and their rates are shown in Table 18-1.
- The financial interests were not considered (i.e. 100% interest), as it's an internal cash flow among investors for a project. It has nothing to do with a project's economic viability.
- The final product will be sold entirely in a calculating year, with no inventory at the end of each year.

**Table 18-1: Taxes and Surcharges Assumption**

Item	Unit	Value
Corporate income tax (CIT)	% taxable income	33.33

- <sup>2</sup> The column represents the ore amount, corresponding to the left axis..

### 18.1.3 Capital Costs

Figure 18-3 is Annual Capex over the LoM.

Figure 18-3: Annual Capex over the LoM

Sources: SRK

**18.1.4 Operating Costs**

Figure 18-4 are annual Opex over the LoM.

**Figure 18-4: Annual Opex over the LoM**

Sources: SRK

**18.1.5 Tax and Surcharges**

Non-income tax, royalties and other surcharges have been considered in Opex. The income tax for LXML is 33.3%.

**18.1.6 Amortization and Depreciation**

SRK uses the straight-line depreciation method as the economic analysis assumption, and the amortization and depreciation period are 10 years. Salvage value of invested Capex will NOT be considered to be reclaimed at the end of the mine's life.

**18.2 Financial Net Present Value**

The annualised net cash flow ("NCF") was calculated and shown in Table 18-3.

**Table 18-3: NCF Calculation**

Item	Unit	Total	2024	2025	2026	2027	2028	2029	2030
<b>Cash inflow</b>									
Revenue	USD million	1,252.69	142.2	440.9	372.7	128.7	92.7	71.3	4.2

Item	Unit	Total	2024	2025	2026	2027	2028	2029	2030
<b>Sub-total</b>	USD million	1,252.69	142.2	440.9	372.7	128.7	92.7	71.3	4.2
<b>Cash outflow</b>									
<b>Opex</b>	USD million	680.3	136.1	258.7	149.0	60.1	42.6	31.3	2.5

10	239.6
11	236.0
12	232.6
13	229.2
14	226.0
15	222.8

Sources: SRK

### 18.3 Sensitivity Analysis

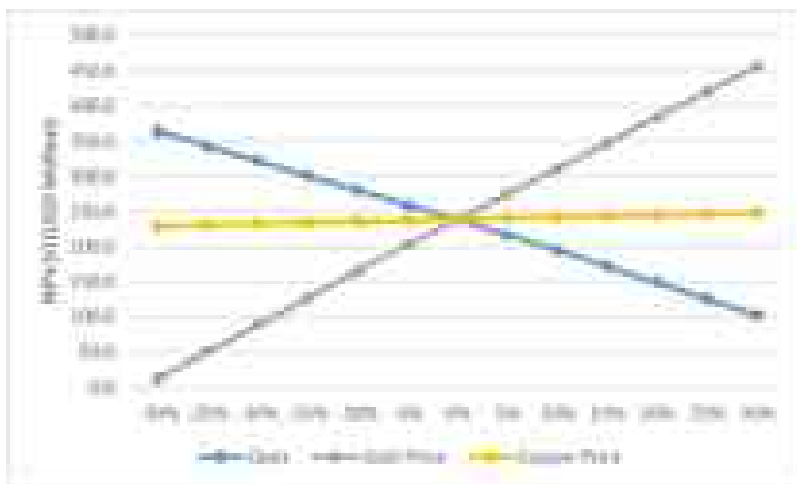

SRK applied a single factor method for the sensitivity analysis to the combined open-pit, underground gold production, and stockpile rehandling copper production of LXML. Many parameters can affect the Project's NPV. To simplify the calculations, the Opex, and the gold and copper prices were selected as the essential variable factors on cash flow. The effects of these essential factors on the NPV were analysed within a  $\pm 30\%$  range. The results are shown in Table 18-5 and Figure 18-6.

**Table 18-5: Sensitivity Study of NPV (at 10% Discount Rate, in USD Million)**

Change	Opex	Gold Price	Copper Price
-30%	364.3	12.6	230.0
-25%	343.6	50.6	231.8
-20%	322.8	88.7	233.4
-15%	302.0	126.8	235.0
-10%	281.2	164.9	236.5
-5%	260.4	202.9	238.1
0%	239.6	239.6	239.6
5%	218.0	275.6	241.2
10%	194.9	311.6	242.7
15%	171.8	347.6	244.3
20%	148.8	383.6	245.8
25%	125.7	419.6	247.4
30%	102.7	455.6	248.9

Sources: SRK

**Figure 18-6: NPV (at 10%) Vs. Gold Price or Copper Price or Opex**

Sources: SRK

As shown in the Figure 18-6 above, changes in Opex and gold prices have bigger effect on the Project's NPV than copper prices.

Preliminary analysis indicates that high mine closure costs are the major negative factor affecting the project's economic feasibility.

## 19 Conclusions and Recommendations

### 19.1 Geology, Exploration and Mineral Resources

Mineralization styles of the Sepon district can be classified as an intrusion-centred hydrothermal system with the majority of known Cu and Au mineralization spatially associated with the Padan and Thengkhamb porphyry centres. Mineralisation typically displays a zoned pattern in both mineralization type and metal content. Porphyry Mo-Cu systems occur at the core zoning outward through skarn and carbonate replacement Cu deposits to the Au dominated sediment-hosted systems which show Carlin type deposit characteristics.

A total of 1,022 DD (117,495m), 2,3732 RC (no Grade Control) (175,499.2m) RC drill holes and 45,635 RC Grade Control holes (764,831.8m) for a total of 1,057,826m were used to construct the Discovery region block model. After Chifeng Gold took over the Sepon project, the exploration programs mainly focused on discovering new gold deposits in brownfield to supply the processing plant and keep on the production, as well as discovering new types of mineralization in green field.

Although the majority of discovered gold and copper deposits had been mined out, there are still some mineral resources of oxidized and primary gold, as well as low grade copper in the Sepon project area.

LXML pays a great attention to further explore new oxide gold and copper resources suitable for open-pit operation, and the primary type of resources is possible at the deep extensions of previous and current open-pits.

### 19.2 Mining and Ore Reserves

#### 19.2.1 Gold Operation

For surface mining:

The gold open pit mining is going to be completed in near future (about three year). Based on SGPS, the final open pit designs have been applied by LXML to guide mining boundaries. Mining cycle and management have been practised for a long time. SRK considers the significant risk will be low for the open pit mining in future.

There are still 35 gold stockpiles that are economically feasible to buffer and supply the gold processing plant during periods of low production rates from open-pit mining.

In the meantime, SRK noted that LXML has already started some internal technical preliminary studies for exploitation of Far West Area to provide inventory.

For underground mining:

In SGPS, the proposed mining methods in the DSE UG include long-hole stoping with cemented backfill ("LHSB"), long-hole stoping with pillars ("LHSP"), and post pillar cut and fill ("PPCA").

Construction of the underground mine commenced in April 2022 at DSE UG. As of 30 September 2024, SRK was provided with revised ventilation designs and underground workings designs by LXML.

SRK re-ran the stope optimization based on LHSB, as selected by LXML, then applied modifying factors and prepared the production schedule based on a review of LXML's data. SRK notes that LHSB has been widely practiced globally and is technically feasible.

For DSW UG, LXML is still conducting additional exploration work to increase geological confidence.

### 19.2.2 Copper Operation

As of 30 September 2024, only hydrometallurgical process was in operation for oxide copper stockpiles.

Based on the fact mentioned above, only oxide copper stockpiles which were above cut-off grade were estimated to Ore Reserves.

In the meantime, SRK noted that LXML has already started some internal technical preliminary studies for exploitation of TKM OP to provide more oxide copper inventory and of KHN UG to provide more primary copper inventory.

## 19.3 Ore Processing and Metallurgy

Sepon gold ores are refractory due to the ultra-fine department, arsenic and organic carbon. The oxide ore is processed using CIL process in the Sepon Gold Plant, with historical throughput varying between 1.0 and 1.5 Mtpa. The gold recovery varies between 51.8% and 68.9%.

The Sepon Gold Plant adopts a complex flowsheet to process primary gold ore. The gold is first concentrated in a flotation circuit after crushing and grinding to obtain a gold concentrate, then POX process is applied to the concentrate. The post POX residue is CCD washed and then leached in CIL circuit. Gold loaded carbon from both oxide ore and primary ore is processed by elution, electrowinning, and smelting to produce Gold Doré. The historical throughput ranges from 1.9 to 2.1 Mtpa, and gold recovery ranges from 55% to 67%.

The yearly gold production of the gold plant is exceeds 6 t. Most of the facilities and equipment of the gold plant were converted from the copper plant. Historical production proves it is practicable.

The Sepon Copper Plant has a flexible capacity using heap leach and agitation leach processes. The coarse ore is sent to heap leach while the fine ore goes to agitation leach. A conventional sulfuric acid leach-CCD-SX/EW process is adopted in the plant to process oxide ore, producing electrolytic copper or cathode copper. Historical production data of the copper plant shows that 0.5 to 1.3 Mtpa of oxide copper ore is processed; cathode copper production is around 6,000 tpa with the copper recovery varying from 50% to 78%.

The well-equipped metallurgical laboratory on site strongly supports the normal operation of the plants.

Low grade primary copper ore is amenable to the flotation process. Flotation tests indicated that copper recovery above 80% with concentrate grade of 18% to 24% can be achieved using conventional flotation process. A Proof-of-Concept study has been completed for the purpose of

primary copper resource development. By using the existing facilities of the current gold plant and a throughput of 7.5 Mtpa, the NPV is negative. The break-even price is USD 9,119 per tonne of copper. The primary copper resource development would need a higher copper price and reliable resource volume. A detailed feasibility study is recommended in due time.

#### **19.4 Mine Economy**

Based on the information provided by LXML, SRK carried out preliminary review and analysis indicating that the mine plans about three years of open-pit gold operation, seven years of underground gold operation, three years of gold re-handling operation and two years of copper re-handling operation. Based on the parameters reviewed and summarized in the report, an economic analysis was conducted indicating that the operation of open-pit gold production, rehandling stockpiles and underground mine will be profitable.

## 20 Project Qualitative Risk Analysis

Mining is a relatively high-risk industry. In general, the risk may be expected to decrease from exploration, development, through to production stage. The Sepon Project is a production project. Risks exist in different areas. SRK considered various technical aspects which may affect the feasibility and future cash flow of the Project, and conducted a qualitative risk analysis which has been summarised in Table 20-1. In this risk analysis, various risk sources/ issues have been assessed for Likelihood and Consequence, and then a Risk Rating has been assigned. The qualitative risk analysis uses the following definitions for likelihood and consequence:

In the risk assessment, various risk issues have been assessed for Likelihood, Consequence, and Overall Rating. SRK has used a matrix as follows:

The Likelihood of a risk is considered within a certain time frame, e.g. 5 years, as:

**Likely:** will probably occur;

**Possible:** may occur; and

**Unlikely:** unlikely to occur.

The Consequence of a risk is classified into:

**Major Consequence:** the factor poses an immediate danger to the Project, if uncorrected, will have a material effect on the Project cash flow and performance and could lead a project failure;

**Moderate Consequence:** the factor, if uncorrected, will have a significant effect on the Project cash flow and performance; and

**Minor Consequence:** the factor, if uncorrected, will have little or no effect on the Project cash flow and performance.

The overall risk assessment combines the Likelihood and Consequence of a risk and be classified as **Low** (unlikely and possible minor risks and unlikely moderate risk), **Medium** (likely minor, possible moderate and unlikely major risks), and **High** (likely moderate and major and possible major risks).

Below is the qualitative risk analysis summary table of the Sepon Project.

Table 20-1: Project Risk Assessment of the Sepon Project

Risk Source/Issue	Likelihood	Consequence	Overall
<b>Geology and Resource</b>			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Possible	Major	High
Unexpected Groundwater Ingress	Unlikely	Minor	Low
<b>Mining</b>			
Significant Production Shortfalls	Unlikely	Major	Medium
Significant Geological Structure	Possible	Minor	Low
Excessive Surface Subsidence	Unlikely	Minor	Low
Poor Ground Conditions	Possible	Moderate	Medium
<b>Ore Processing</b>			
Lower Recovery	Unlikely	Moderate	Low
High Production Cost	Possible	Minor	Low
Poor Plant Reliability	Unlikely	Minor	Low
<b>Capital and Operating Costs</b>			
Project Timing Delays	Possible	Minor	Low
Capital Cost Increases	Unlikely	Minor	Low
Operating Cost Underestimated	Likely	Minor	Medium
High mine closure cost	Likely	Moderate	High
<b>Environmental, Social and Permitting</b>			
Impact to the ecological system	Possible	Moderate	Medium
Poor waste rock management	Possible	Moderate	Medium
Poor hazardous substances management	Possible	Minor	Low
Dust Pollution	Possible	Minor	Low
Renewal of mining licence	Unlikely	Major	Medium

Some medium and high risks have been identified for the Project. Two high risks are "Lack of significant Ore Reserves" and "High mine closure cost". To manage the risks, SRK recommends the Company should further conduct feasibility studies to develop currently available mineral resources in order to extend the mine life of the project, as well as proactively manage the environmental and mine closure issues during the production, in order to reduce the high mine closure cost at the end of the mine.

**Appendix A      Copy of the Mining License**

(English Translation)

Lao People's Democratic Republic  
Peace Independence Democracy Unity Prosperity

Ministry of Energy and Mines

No. 24-23/MEM.DMM

Department of Mines Management

License No **ML0002**

MINING LICENSE

(2nd Extension)

—Pursuant to the Minerals Law (amended version) No 31/NA dated 3 November 2017;

—With reference to the Minister of Energy and Mines' Decision (2nd Extension) No 0837/MEM, dated 10 May 2023.

The Department of Mines Management issues this permit to LANE XANG MINERALS LIMITED under the name of Mr Saman Aneka, Lao National, ID number: 01-22 026932, Director of the company.

Headquarter of the company is located at: House Number....., Bourichanh Road, Phonsinouan Village, Sisattanak District, Vientiane Capital, Tel. 021-268206; Fax. 021-268201, email. saman.aneka@lxml.la.

Authorized minerals: gold and copper ore; within: 11,696 (Eleven thousand six hundred and ninety-six) hectares, located in Nong Kadaeng Village, Vilabouly District, Savannakhet Province.

Operational costs: USD169,000,000 (One hundred sixty-nine million US Dollars).

Project timeframe: 10 (ten) years from 30 September 2023 to 29 September 2033.

Vientiane Capital, 24 May 2023

Director General

Department of Mines Management

Signed and Sealed

Mr Chanthala Keohavong

Note:

It is forbidden to alter or modify any wording in this license without proper authorization. Wrongdoers will be punished as provided by the law of Lao PDR.

This license replaces the previous License No 013-19/MEM.DMM, dated 9 September 2019.

**Application guidelines and conditions of this license:**

1. This mining license is applicable to mining of minerals within the authorized area only;
2. The timeframe shall be as indicated in this license; this license is no longer valid upon its expiry. In the event of renewal, an application is to be lodged to the Department of Mines Management within 90 days prior to expiration of this license;
3. This license may not be placed as security;
4. This license applies exclusively to the company authorized by the government;
5. This license must be displayed at an open space at the business operation site or in the office;
6. This license was printed 3 copies only, 1 copy handed to the authorized company and 2 copies kept at the Mines Management Department;
7. The recipient of this license is required to pay a license fee in accordance with rules and regulations to be enacted.

**Appendix B    JORC Table 1**

**Section 1: Sampling Techniques and Data**

*(Criteria in this section apply to all succeeding sections.)*

Criteria	Explanation	Commentary
Sampling techniques	<p>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</p> <p>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</p> <p>Aspects of the determination of mineralisation that are Material to the Public Report.</p> <p>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</p>	<p>Diamond drill core was sampled as half core at nominal 1-metre intervals to geological contacts. All 1-metre intervals start again immediately after the geological contact. Minimum samples of 0.3 metres were taken.</p> <p>Reverse Circulation (RC) chip samples were routinely collected in calico bags and chip box trays at 1-metre intervals. No field composites were created.</p> <p>To ensure representative sampling, industry standard practice has been applied. The laboratory has applied appropriate QA-QC to sample preparation and appropriate calibration to analytical instruments. Oriented diamond core was marked for recovery and samples considering mineralization intensity and veining orientations, then sawn, with half core being sampled.</p> <p>RC chip samples were collected using either a three-tiered riffle splitter, with either two or three tiers used, depending on sample size, or a rotary cone splitter. Cyclone and splitter was routinely inspected and cleaned as a minimum between each drill rod.</p> <p>Industry standard work has been undertaken for both diamond and RC samples:</p> <p>RC drilling was used to obtain 1m samples from which approximately 3kg was dried and pulverized then sub-sampled to produce a 30g charge for analysis.</p> <p>Diamond drilling was used to obtain drill core that was sampled on nominal 1m lengths except for adjustments around lithological boundaries. Most core has been sampled as half core. In early 2023, UG drill core has been sampled as whole core. Core samples (generally 3 to 6kg) are dried and pulverized then sub-sampled to produce a 30g charge for analysis.</p> <p>Until August 2021, Resource drill samples collected (both RC and DD) were analysed by ALS laboratories, using both their Lao and</p>

Criteria	Explanation	Commentary
		<p>Australian facilities. ALS standard analysis methods were used:</p> <p>Au-AA25 Au (Fire Assay Gold)</p> <p>Prepared sample with a 30g charge is fused with a mixture of lead oxide, sodium carbonate, borax, silica and other reagents as required and then cupelled to yield a precious metal bead. The bead is digested in 0.5 mL dilute nitric acid in the microwave oven. 0.5 mL concentrated hydrochloric acid is then added, and the bead is further digested in the microwave at a lower power setting. The digested solution is cooled, diluted to a total volume of 10 mL with demineralized water, and analyzed by atomic absorption spectroscopy (AAS) using matrix-matched standards.</p> <p>ME-ICP61 multi-element analysis (4 Acid Digest; Atomic Emission Spectroscopy Finish)</p> <p>A prepared sample (0.25 g) is digested with perchloric, nitric, hydrofluoric and hydrochloric acids. The residue is topped up with dilute hydrochloric acid and the resulting solution is analyzed by inductively coupled plasma-atomic emission spectrometry (ICP-AES).</p> <p>Results are corrected for spectral interferences.</p> <p>Since August 2021, all samples including resource drilling samples have been analysed in the LXML Sepon assay laboratory applying industry standard methods as follows:</p> <p>Fire assay Au: 30g charge with 150g flux (lead oxide, sodium carbonate, borax, silica, iron, flour, silver nitrate), fusion (1 hour), cupellation (1 hour), digestion with 50% nitric and hydrochloric acid, followed by AAS finish.</p> <p>ICP for Ag and As using 0.25g charge, digested with aqua regia (hydrochloric and nitric acid)</p> <p>AAS for Ca, Cu, Fe, Mg, Mn using a 0.3g charge and digested with hydrochloric, nitric and perchloric acid.</p> <p>Sulphur and Carbon analyser using a 0.3g charge digested with hydrochloric, nitric and perchloric acid.</p>

Criteria	Explanation	Commentary
		<p>Leachwell Au using a 35g charge adding 10g cyanide tablet and water, tumbled (1 hour) with AAS finish.</p> <p>PRI analysis with a 35g charge with 1.7ml of spike and 10g cyanide tablet added, tumbled (1 hour) with AAS finish.</p>
Drilling techniques	<p>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</p>	<p>Diamond drilling was carried out predominantly using HQ3 and PQ3 core-sized equipment with standard coring tube. Triple tube coring was applied historically for recovering samples in mineralised clay materials. Approximately 86% of the core at Sepon is HQ3 size.</p> <p>For RC drilling, a face sampling bit (121 mm) was used.</p> <p>All core has been oriented using predominantly the ACE orientation system or an Eastman single-shot system</p>
Drill sample recovery	<p>Method of recording and assessing core and chip sample recoveries and results assessed.</p> <p>Measures taken to maximise sample recovery and ensure representative nature of the samples.</p> <p>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</p>	<p>Recoveries from core drilling were measured and recorded in the database. Core recovery averaged 91% whilst RC recovery averages 80% by mass. Higher core loss occurred in oxide, karst infill and highly fractured (unmineralised) chert units.</p> <p>Historically RC samples were weight for the entire sample to check sample recovery. Currently the spilt sample is weighed, which indicates the total mass of the material recovered.</p> <p>Ground conditions at Sepon are generally good and drilling practices have been consistent for many years, leading to experience in gaining high core and sample recoveries.</p> <ul style="list-style-type: none"> <li>• Diamond drilling used drill muds and short runs in broken ground to maximize recovery.</li> <li>• Drilling is undertaken using auxiliary compressors and boosters to keep the hole dry and maximise sample lift.</li> <li>• Several twin hole programs assessed results obtained from both RC and core holes.</li> </ul>

Criteria	Explanation	Commentary
		<p>In general, the repeatability for gold was confirmed. An overall bias was not seen.</p> <ul style="list-style-type: none"> <li>• Diamond holes may be drilled using RC pre-collars to ensure good sample recovery of poorly or semi-consolidated rock.</li> <li>• In places, RC holes have been twinned with diamond holes to determine if any bias is detected regarding recovery between mineralised and barren material, to date it has not been deemed materially biased.</li> </ul>
Logging	<p>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</p> <p>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</p> <p>The total length and percentage of the relevant intersections logged.</p>	<p>All RC and DD core was logged on paper log sheets and entered manually into the Sepon database until 2015.</p> <p>Post 2015 logging is predominantly carried out on tablets and automatically linked to the database. Several quality control (QC) triggers are set in the database to validate data as entered.</p> <p>Drill core was logged in detail for stratigraphy, lithology, alteration, mineralization, oxidation state, structure and veining. RC cuttings were logged for various geological attributes including rock type by the mineral composition, mineralization by veining and visible minerals, and alteration including oxidation. Logging is considered sufficient to support geologic modelling and Mineral Resource estimates. Rock Quality Designation (RQD) and Rock Mass Quality (RMQ) logs were kept for geotechnical purposes only for purposely designated geotechnical holes.</p> <p>RC and diamond core logging is both qualitative and quantitative in nature depending on the feature being logged; geology, rock types, alteration and structure are recorded based on visual determination.</p> <p>All diamond core is routinely photographed, both wet and dry.</p> <p>More than 90% of all drill holes were logged in full regardless of mineralization. Since 2007, all holes have been routinely logged.</p>

Criteria	Explanation	Commentary
<p>Sub-sampling techniques and sample preparation</p>	<p>If core, whether cut or sawn and whether quarter, half or all core taken.</p> <p>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</p> <p>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</p> <p>Quality control procedures adopted for all sub-sampling stages to maximize representivity of samples.</p> <p>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</p> <p>Whether sample sizes are appropriate to the grain size of the material being sampled.</p>	<p>Diamond core was cut in half using an electrically powered diamond blade core saw in competent ground and hand split in clay at either 1 m intervals or to geological contacts.</p> <p>Since March 2023, underground grade control diamond drill core was sampled as whole core.</p> <p>RC samples were collected from a cyclone and, if dry, put through a three-stage riffle splitter for a 12.5% sub-sample. A 3-5kg (1 m) sample was collected into pre-numbered sample bags for analysis. Before 2006, if RC samples were wet, then sampling was by quartering. Due to changing to diamond drilling, after 2006 wet RC samples were no longer taken.</p> <p>The RC and DD sample preparation techniques are considered appropriate.</p> <p>All samples contain a waterproof sample ID tag in numbered calico bags and are weighed. The samples were stacked and wrapped on a pallet before being transported by truck to the laboratory.</p> <p>Industry standard diamond and RC drilling techniques were used and are considered appropriate for use in Mineral Resource estimation.</p> <p>Sample preparation is to industry standard involving drying, crushing and pulverizing of the entire sample from which a sub-sample using a scoop is selected and stored in pulp packets. A 30g subsample is selected from each pulp packet for analysis.</p> <p>For RC drilling, sample quality was maintained by monitoring sample volume and by cleaning the splitters, cyclones and hoses on a regular basis.</p> <p>Sub-sampling in the laboratory is only carried out after size reduction in the grinding process.</p> <p>Field duplicates were taken at 1 in 15 or 1 in 20 for RC drilling. Quarter splits of core have been taken and recorded as duplicates in the database.</p>

Criteria	Explanation	Commentary
		<p>Sample sizes are considered appropriate to the gold mineralization based on the style of mineralization (fine-grained gold with no visible gold), the thickness and consistency of the intersections, the sampling methodology, and assay value ranges for gold. This has been checked during a separate gold department study which examined the grain size distribution and the liberation size.</p>
<p>Quality of assay data and laboratory tests</p>	<p>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</p> <p>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</p> <p>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</p>	<p>Following sample preparation, a 110g pulp aliquot for Au Fire Assay and 20g pulp aliquot for ICP multi element was taken. The 20g pulp aliquots were transported to other ALS laboratories (usually ALS Brisbane) for ICP and Lecco furnace analysis. The analytical procedure is as follows:</p> <p>If Au grade &gt; 10g/t Au, re-assayed by Fire Assay Gravimetric.</p> <p>If Au grade &gt; 0.4g/t Au, re-assayed using CN Leachwell technique.</p> <p>Detection limit for Fire Assay is 0.01ppm.</p> <p>A multi-element suite (varying through time from 30 – 40 elements, but always including Cu, Ag, S, Mo) was analysed by ICP-AES.</p> <p>The copper multi-element suite analysed by ICP-AES (ALS laboratory code ME-ICP61) contains Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Ga, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, U, V, W and Zn.</p> <p>Copper samples above 0.2% Cu are sent for sequential copper analysis.</p> <p>If Cu &gt; 0.5% Cu, the sample was re-assayed using an Ore Grade technique (either AAS or diluted ICP). These methods are considered total methods.</p> <p>For some samples total sulphur, sulphide sulphur, sulphate sulphur, total carbon, carbonate carbon and organic carbon were analyses by Lecco Furnace following appropriate digestion, this sample selection is based on a Cu trigger that has varied overtime.</p>

Criteria	Explanation	Commentary
		<p>The fire assay gold analysis undertaken is considered to be a total assay method.</p> <p>Multi-element analyses of 31 elements by four acid digestion via ICP-AES are considered total assay methods except where they exceed the upper detection limit. In this case samples were re-assayed using a four-acid digest with HCl leach, and ICP-AES or AAS finish.</p> <p>Leachwell assays are a partial assay method used to estimate the percentage of gold in mineralisation recoverable in the standard CIL plant. This is supported by a separate gold deportment study and is a suitable indicator of gold recovery.</p> <p>No geophysical tools, spectrometers, handheld XRF instruments or similar tools were used for assays included in the Sepon database.</p> <p>Industry standard certified reference materials (CRMs) including matrix matched and CRM's made from drill core supplied from the Sepon mine were utilized to check laboratory assay quality control. The insertion rate for CRMs is a nominal 1 in 30, and 1/3 of CRMs are blanks. Different CRMs have been selected for use at varying gold grades over the life of the project. The combined insertion rate of pulp blanks and CRMs is a nominal 1 in 20 samples.</p> <p>The QA/QC program includes CRMs, blanks, preparation duplicates and field duplicates and is acceptable according to industry standards. Overall relative bias for the CRMs is within 5% and is acceptable. The assay precision determined from field duplicate samples was found to be acceptable. Blank sample results do not indicate any sample contamination issues. Assay results are acceptable for use in supporting Mineral Resource estimates.</p> <p>At a minimum, every drill hole contains at least one coarse blank, one pulp blank and one CRM standard. At a minimum 1 in 15 samples is a control sample (earlier programs vary from 1 in 25 to 3 in 25).</p> <p>Checks of the laboratory results and data import procedures are undertaken to identify any</p>

Criteria	Explanation	Commentary
		<p>spurious results for verification and re-assay. Acceptable levels of accuracy and precision have been established. Any suspect data is excluded from the Mineral Resource estimate.</p> <p>Independent / round robin laboratory checks were conducted on a quarterly or half yearly basis until 2010. The results were generally unbiased with respect to each other. Between 2010 and 2016, no independent laboratory checks were undertaken, however since 2016, an external umpire lab and round robin system have been used to validate results. To date 1841 samples have been sent for umpire review.</p> <p>In December 2015 a 3-month trial of the Sepon lab was carried out, the results at that time concluded that due to turnaround times, inability to complete all desired analysis and higher detection limits, the ALS lab would continue to be used for Mineral Resource analysis. However, Since August 2021, the Sepon Lab has been used for all analysis including resource samples.</p>
<p>Verification of sampling and assaying</p>	<p>The verification of significant intersections by either independent or alternative company personnel.</p> <p>The use of twinned holes.</p> <p>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</p> <p>Discuss any adjustment to assay data.</p>	<p>Intersections were reviewed by the senior geologist or superintendent on-site following receipt of the assay results.</p> <p>Monthly internal reviews are carried out for all assay batches returned. Any CRM samples that exceed 3 standard deviations from the expected value, or showing other issues such as significant bias or trends will have its batch returned for re-analysis.</p> <p>Sample swaps, mislabeling and incorrect control sample insertion related to human error have been identified by checking procedures and photos and are rectified.</p> <p>There are no known deficiencies in the assay data quality from ALS and Sepon laboratories that affect the resource confidence.</p> <p>Twinned or nearby holes have been undertaken throughout the history of mining at Sepon. Most</p>

Criteria	Explanation	Commentary
		<p>holes provide reasonable agreement with pre-existing drilling.</p> <p>Some twinned diamond drill holes previously found RC drilling in wet conditions to produce variably smeared and positively biased results. Areas affected by this occurrence have been mined out and do not contribute to the current Mineral Resource. Current practice is only to use DD in wet drilling conditions. RC drill holes with suspected smearing have not been used in the mineral resource estimation.</p> <p>Several deep surface holes in the DSE UG Mineral Resource were excluded from the estimate where shorter holes drilled from underground provided more accurate positioning of the deposit.</p> <p>Laboratory result files are directly uploaded into the database with no manual data entry.</p> <p>Below detection limit assay results are stored in the database as the detection limit (negative) with appropriate metadata. No other modification of the assay results is undertaken.</p> <p>All data is stored and validated within an electronic database.</p> <p>Drill collars and down-hole surveys are recorded by company staff and entered into a spreadsheet and then loaded into the database. Assays from the laboratory are received and loaded electronically.</p> <p>No adjustments were made to assay values. Where data was deemed invalid or unverifiable it was excluded from the Mineral Resource estimation.</p>
Location of data points	<p>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</p> <p>Specification of the grid system used.</p> <p>Quality and adequacy of topographic control.</p>	<p>Drill hole collars locations are located by differential GPS or total station survey instrument.</p> <p>Downhole surveys have been carried out using a variety of tools over the history of Sepon.</p> <p>Magnetic based surveys: Eastman single-shot cameras, Reflex EZ or Axis Magshot tools. Surveys were taken at depths of 12 m, 30 m and</p>

Criteria	Explanation	Commentary
		<p>then every 30 m to the bottom of hole. Additional surveys are carried out at the request of the supervising geologist where significant hole deviation is noticed.</p> <p>North Seeking Gyro: Currently used in preference for surface collared resource drill holes.</p> <p>All drill hole collars are converted from UTM / India-Thai 1960 projection to SPG06 local grid coordinate systems.</p> <p>In 2008 a LiDAR (Light Detection and Ranging) survey was completed providing an accurate topographic surface. Drill hole collar locations have been validated through a process of database and spatial checking for both historical and recent data and by comparing the collar locations to the LiDAR topographic surface.</p> <p>Several holes were identified as having suspected locations and resolved prior to modelling of the data. Holes with collars above the topography were excluded.</p>
Data spacing and distribution	<p>Data spacing for reporting of Exploration Results.</p> <p>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</p> <p>Whether sample compositing has been applied.</p>	<p>Resource drill hole spacing varies from less than 25m up to 100m to centres.</p> <p>Drill spacing is adequate to define the geological and grade continuity for Mineral Resource estimation. Classification has considered data quality, drill spacing, geological continuity and production data.</p> <p>DD samples are not composited prior to being sent to the laboratory. RC samples are 1m intervals but compositing up to 4m has occurred in the past in areas known to be waste.</p> <p>Sample lengths within the database are not composited.</p> <p>Compositing as part of the estimation process has been undertaken in the modelling software (Vulcan or Leapfrog). Composite lengths selected were set to 1-metre which is comparable to the actual sample length. Composited data was then used for statistical, geostatistical and estimation purposes.</p>

Criteria	Explanation	Commentary
Orientation of data in relation to geological structure	<p>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</p> <p>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</p>	<p>Drill orientation varies by year drilled and location within the deposit.</p> <p>Geological mapping and interpretation show that mineralisation generally strikes 060° - 090° (deposit dependent); hence drilling is conducted on north -south sections to intersect the mineralised zone at a high angle. Most drill holes dip -60° to -90°, depending on the expected dip of the target mineralisation and surface site access for drill pads.</p> <p>In parts of the project area, drill holes were drilled at -60° along 090° or 270° from 50m spaced sections in order to reduce the need for vegetation clearance and ground disturbance in areas of extremely steep topography.</p> <p>Drilling orientation is not considered to have introduced any sampling bias. This has been confirmed through variogram reviews using the varying orientation data.</p> <p>No orientation-based sampling bias has been identified to date in the data.</p>
Sample security	The measures taken to ensure sample security.	<p>Adequately trained and supervised sampling personnel, with monthly inspections and verification of training.</p> <p>Core yard facility with security fence, security guards and well-maintained sampling sheds.</p> <p>Cut core is sampled and stored in calico bags tied and clearly numbered in sequence using a tear-resistant, waterproof, pre-printed tag.</p> <p>Calico sample bags are transported on wrapped pallets to the assay laboratory.</p> <p>The laboratory checks sample dispatch numbers against submission documents, advises of any discrepancies, and signs off on receipt of each batch.</p> <p>Sample bags are photographed prior to shipment</p> <p>Assay data returned separately in both spreadsheet and PDF formats.</p>
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No recent audits or reviews have been undertaken.

Criteria	Explanation	Commentary
		<p>Historic reviews include the following:</p> <p>A review of assay services involving a trial of the Sepon Laboratory for Resource sample analysis was undertaken in 2015-2016. All samples <math>\geq 0.2\%</math> Cu and QA/QC samples were sent to ALS laboratory for comparison during the trial period. The decision was made to remain with ALS laboratory on the basis of available analytical methods, better QA/QC results and turn-around time.</p> <p>REFLEX Geochemistry completed a QC review on data from 1 January 2011 – 31 May, 2014. The conclusions indicate that the control samples have provided a satisfactory guide to the accuracy and precision of the analyses. Procedures have not significantly changed since then.</p> <p>The ALS laboratory in Vientiane has been audited on a quarterly basis by site personnel. No material issues have been identified at the laboratory.</p> <p>The ALS laboratory in Brisbane was audited in March 2016 by MMG Resource estimation personnel. No material issues were identified.</p> <p>In 2008 a QC review of assay data at the Thengkham South deposit and Phabing area was undertaken (Hackman &amp; Associates) and found that there were no obvious grade biases in the dataset, there were however quality discrepancies that required follow up. These have been addressed.</p> <p>A 2008 external audit (IO Global) of the database found post-2006 analytical data to be of appropriate integrity.</p> <p>In 2007 a twin drill hole study undertaken by QG comparing RC samples to DD samples, found that the use of all the available RC drilling is likely to be biased and overestimate tonnes above a gold cut-off. This was due to the presence of wet RC samples. Measures have been taken since this report to exclude wet RC samples from the estimate.</p>

**Section 2: Reporting of Exploration Results**

*(Criteria listed in the preceding section also apply to this section.)*

Criteria	Explanation	Commentary
<p>Mineral tenement and land tenure status</p>	<p>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</p>	<p>LXML Mineral Resources are located within the bounds of the Mineral Exploration and Production Agreement (MEPA), a direct agreement with the Laos Government. The MEPA provides for exploration, development and extraction of any Mineral Resources discovered.</p> <p>The MEPA provides for exploration, development and extraction of any Mineral Resources discovered. The Sepon MEPA occupies portions of both Savannakhet Province, and Khammouane Province to the immediate north.</p> <p>The Sepon MEPA originally occupied 5212 km<sup>2</sup>. Various relinquishments have occurred since it was granted in 1993, the most recent relinquishment in early 2005 has resulted in the current retained area of 1247 km<sup>2</sup>.</p> <p>A royalty is payable to the Government of Laos, representing 4.5 % of the FOB value of minerals received by LXML. The Lao Government also owns a 10% share in LXML. Tenement rental is payable at US\$500 per square kilometer per annum (for operational and mining areas) in accordance with Annex D of the MEPA. Taxes and other obligations are set out in Article 13 of the MEPA.</p> <p>The operating period in accordance with the MEPA is thirty (30) years, from commencement of operations. As defined in Article 10, Paragraph 2 of the MEPA for Sepon Gold Stage 1, the operating period commenced on 1 March 2003.</p> <p>The terms of the agreement provide for the right to apply for two extensions of the operating period with each extension for a period of 10 years.</p> <p>There are no known impediments to operating in the area.</p> <p>The licenses are in good standing with no known impediment to the</p>

Criteria	Explanation	Commentary
	<p>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</p>	<p>granted mining permit.</p>
<p>Exploration done by other parties</p>	<p>Acknowledgment and appraisal of exploration by other parties.</p>	<p>CRA Exploration first identified the Sepon Mineral District as an area of interest in 1990 and formed Lane Xang Minerals Limited (LXML) as holder of the MEPA.</p> <p>Between 1995 and 1999 RTZ (RTZ was formed from the merger of CRA and Rio Tinto in 1997) discovered and defined several gold only Mineral Resources and copper and gold Mineral Resources at the Khanong prospect.</p> <p>Oxiana became manager of the Sepon Project in 2000 through the purchase 80% of LXML before later buying the remaining 20% interest from RTZ. The Laos Government exercised its option to acquire a 10% interest in LXML in 2006.</p> <p>In 2008 Oxiana merged with Zinifex Ltd to form OZ Minerals.</p> <p>In 2009 MMG acquired LXML from OZ Minerals.</p> <p>In 2018, Chifeng acquired the majority ownership of LXML from MMG</p> <p>The Sepon exploration and resource geology groups have been maintained throughout the OZ Minerals, MMG and Chifeng takeovers.</p>
<p>Geology</p>	<p>Deposit type, geological setting and style of mineralisation.</p>	<p>The Sepon project area is situated near the eastern margin of the intra-continental Khorat Basin and on the western flank of the Anamite Range fold belt. It lies within the Troungson geological region covering a broad spectrum of rocks ranging in age from Upper Proterozoic to Jurassic. The regional geology is dominated by an Upper Palaeozoic sedimentary belt of arkosic and feldspathic sandstone, variably calcareous</p>

Criteria	Explanation	Commentary
		<p>and carbonaceous siltstone, shale and limestone which is variably dolomitized and locally marble. There are lesser volcanic rocks, typically comprised of agglomerate, conglomerate, tuffaceous sandstone, and rare coherent volcanics. The belt is cut by plutonic to sub-volcanic bodies of granite, monzodiorite, granodiorite, quartz porphyry, rhyodacite porphyry (RDP) and andesite porphyry. The intrusive rocks are preferentially emplaced along either east or north-west trending well-developed structures.</p> <p>Several styles of mineralisation have been recognised within the Sepon Mineral District: porphyry-like Cu-Mo-Au mineralisation, skarnoid Cu-Mo-Au mineralisation adjacent to porphyry intrusive, distal skarn related Cu-Au-Ag+/- Pb+/-Zn massive sulphide veins, Carlin type carbonate hosted gold mineralisation and carbonate hosted Mississippi Valley type Pb-Zn-Ag mineralisation. In addition, weathering and supergene re-mobilisation has created supergene copper, exotic supergene copper, oxide gold and alluvial gold in karst fill deposits.</p> <p>Gold mineralisation mostly occurs in the fault zones and adjacent to the fault zones at the contact between the dolomite of the Nalou formation and the overlying shales and nodular carbonate of the Discovery Formation. Mineralisation occurs in association with decalcification and partial silica replacement of calcareous mudstones, and typically is best developed within the Discovery formation. But can also occur as a karst-controlled residual or collapse breccia deposit within the underlying Nalou formation, with mineralised jasperoid boulders occurring within a matrix of decomposed rock and clays. Regional WNW-striking, steeply NNE-dipping normal faults are believed to have been the major pathway for ascending mineralizing fluids.</p> <p>Primary gold mineralisation occurs as Carlin style gold forming distally to the copper skarn systems. Mineralisation occurs in</p>

Criteria	Explanation	Commentary
		<p>association with decalcification and partial silica replacement of calcareous mudstones ('jasperoid') along steep faults and is typically best developed at the contact of the Nalou Formation (dolomite) and the overlying Discovery Formation (nodular calc-shale).</p> <p>Oxide gold mineralisation shows further control by weathering processes with very high-grade zones developed as karst fill (mineralised jasperoid boulders occurring within a matrix of decomposed rock and clays) on chemically weathered carbonate rocks.</p> <p>Copper mineralisation is associated with nearby skarn-hosted intrusives. Copper has subsequently migrated to the peripheries of the intrusive centre and concentrated through a supergene process.</p>
Drill hole Information	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <p>easting and northing of the drill hole collar</p> <p>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</p> <p>dip and azimuth of the hole</p> <p>down hole length and interception depth</p> <p>Hole length.</p> <p>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</p>	<p>Due to the advanced nature and extensive drilling completed for this project, no individual drill hole is material to the Mineral Resource estimate and hence this geological database is not supplied.</p>
Data aggregation methods	<p>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</p>	<p>This is a Mineral Resource Statement and is not a report on exploration results hence no additional information is provided for this section.</p>

Criteria	Explanation	Commentary
	<p>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</p> <p>The assumptions used for any reporting of metal equivalent values should be clearly stated.</p>	<p>This is a Mineral Resource Statement and is not a report on exploration results hence no additional information is provided for this section.</p> <p>No metal equivalent values have been used.</p>
Relationship between mineralisation widths and intercept lengths	<p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</p>	<p>Mineralisation true widths are captured by interpreted mineralisation 3D wireframes.</p> <p>Most drilling was at -60° to -90° dip angles in order to maximise exposure to the true width of intersections.</p> <p>Geometry of mineralisation is interpreted as sub-horizontal in the supergene and sub-vertical in the hypogene material and as such current drilling allows true width of mineralisation to be determined.</p>
Diagrams	<p>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</p>	<p>A drill collar location plan and geological sections are not included, as the Project is an operating mine, and not an exploration discovery. A summary geological map of the Sepon Mineral District and a generalized east - west cross section of Sepon deposit are provided to illustrate the gold mineralization style at Sepon.</p>
Balanced reporting	<p>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</p>	<p>This is a Mineral Resource Statement and is not a report on exploration results hence no additional information is provided for this section.</p>
Other substantive exploration data	<p>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</p>	<p>This is a Mineral Resource Statement and is not a report on exploration results hence no additional information is provided for this section.</p> <p>This is a Mineral Resource Statement and is not a report on exploration results hence no additional information is provided for this section.</p>
Further work	<p>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</p>	<p>Mining activities at all deposits as and when scheduled require additional infill drilling as part of grade control work to deliver the</p>

Criteria	Explanation	Commentary
	<p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	<p>required definition for detailed mine design and mining extraction.</p> <p>Mineral Resource definition drilling is also planned within most deposits to improve geological confidence and support the ongoing conversion of Inferred and Indicated Mineral Resources to higher classifications.</p> <p>Exploration drilling from October 2022 to September 2023 has successfully delivered new Mineral Resources at:</p> <p>Ban Mai</p> <p>Ban Non</p> <p>Nakachan</p> <p>Khanong Primary Copper (underground)</p> <p>Discovery West Underground</p> <p>And extended Mineral Resources at:</p> <p>Discovery East Underground, and</p> <p>Nalou</p> <p>Exploration drilling beyond 2023 is planned to focus on target around Discovery West, Discovery East Underground Thenkham and other nearby tenements.</p>

**Section 3: Estimation and Reporting of Mineral Resources**

*(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)*

Criteria	Explanation	Commentary
Database integrity	<p>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</p> <p>Data validation procedures used.</p>	<p>A digital field logging system (with lookups and referential integrity (RI)) or paper-based system for exploration both transferring to a data entry database (DataEntryDB), (with lookups and further RI) then transferring to the master database (LaosDB) where assays are loaded and approved.</p> <p>A senior geologist reviews all new drill data logged in exploration logging view and sign off occurs after all corrections are made prior to loading into LaoDB which is done via SQL Server with stored procedures to detect and hold any errors on import.</p> <p>Micromine Geobank software provides a front end to an SQL database for the Mineral Resource and grade control data. Analytical data is uploaded directly from laboratory SIF files.</p> <p>The measures described above ensure that transcription or data entry errors were minimized.</p> <p>Validation routines by database personnel check for overlapping sample depths, lithological and alteration information, as well as reject criteria such as logging information past EOH depth. Further validation is performed in Leapfrog software once the database is imported during the modelling process. Any errors flagged are fixed in the database then the data is reimported into Leapfrog.</p> <p>Data used in the Mineral Resource has passed several validation checks both visual and software related prior to use in the Mineral Resource.</p> <p>The gold database used in the Mineral Resource is a merger of several databases and represents the best data for the gold mineral resources, which is separate to the master database. Several major data transfers, with inherent risks, have occurred over the life of the project, several suspect holes (assays) exist within the master drill hole database. Further work is required to verify and update the master database.</p>

Criteria	Explanation	Commentary
		<p>There is spatial confidence in the occurrence of gold grades, however the accuracy of those grades is unknown.</p> <p>The database currently being used in the gold estimates is deemed to be appropriate for an Indicated Mineral Resource.</p>
Site visits	<p>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</p> <p>If no site visits have been undertaken indicate why this is the case.</p>	<p>Dr. Anson Xu and Dr. Tony Guo from SRK team visited the Sepon property from 8 December 2022 to 14 December of 2022</p>
Geological interpretation	<p>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</p> <p>Nature of the data used and of any assumptions made.</p> <p>The effect, if any, of alternative interpretations on Mineral Resource estimation.</p> <p>The use of geology in guiding and controlling Mineral Resource estimation.</p> <p>The factors affecting continuity both of grade and geology.</p>	<p>Prior to Mineral Resource estimation an underlying three-dimensional geological model (stratigraphy, structure and intrusives) was made for all deposits. All domains used for estimation were interpreted using known controls on the domain variable with the geological model as a framework. For example, the gold grade domains, whilst interpreted at a nominal gold grade, follow favorable stratigraphic contacts and controlling fault structures. Confidence in the geological (domain) interpretation for all Sepon Mineral Resource estimates is high.</p> <p>Geological models were interpreted from logged drilling data and deposit scale surface geological mapping.</p> <p>If new drill programs contradict the geological model, the model is updated to reflect new drill data.</p> <p>The geological continuity of mineralisation and mineralogy is a key input into Mineral Resource classification and targeted drilling has been conducted to ensure geological continuity rather than solely exploring for mineralised continuity.</p> <p>Sepon hosts several deposit along a 14km long belt of carbonaceous rocks. Typical widths of Sepon deposits range from five to thirty-five metres wide and all have surface expressions. The current Mineral Resource has been simplified from previous years where deposits were split and modelled separately, for example, Discovery West and Discovery East is now</p>

Criteria	Explanation	Commentary
		modelled in a single Discovery model whilst Nalou, Namkok East and Namkok West have similarly been merged to form a single model as they are geologically continuous across the span of the model with interaction between controlling structures.
Dimensions	The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.	
Estimation and modelling techniques	<p>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</p> <p>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</p> <p>The assumptions made regarding recovery of by-products.</p> <p>Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulphur for acid mine drainage characterisation).</p> <p>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</p> <p>Any assumptions behind modelling of selective mining units.</p> <p>Any assumptions about correlation between variables.</p> <p>Description of how the geological interpretation was used to control the resource estimates.</p> <p>Discussion of basis for using or not using grade cutting or capping.</p>	<p>Mineral Resource estimation was undertaken in Leapfrog Edge and Vulcan mining software with the following key assumptions and parameters:</p> <p>Ordinary Kriging interpolation has been applied for the estimation of Cu, Au, Ag, Ca, Mg, Mn, Total S, Total C, and PRI are also estimated in the gold models. Inverse distance to the power of two interpolation has been applied where there was insufficient data to model spatial continuity for kriging weights within the gold block model estimates. This is considered appropriate for the estimation of Mineral Resources at Sepon.</p> <p>Extreme grade values were managed by upper grade capping. The typical upper cap used is the 99th percentile to contain outliers.</p> <p>The estimates of gold were predominantly undertaken using hard domain boundaries and a series of elliptical search passes orientated in the plane of mineralisation. These search orientations and sizes were supported by variogram analysis.</p> <p>A composite length of 1m downhole was chosen and the compositing process validated.</p> <p>Exploratory data analysis, variography and search neighborhood optimization for each domain was performed.</p> <p>Total sulphur and carbon are estimated to assist with gold speciation and in the Mineral Resource estimation was undertaken in Leapfrog Edge and Vulcan mining software with the following key assumptions and parameters:</p>

Criteria	Explanation	Commentary
	<p>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</p>	<p>Ordinary Kriging interpolation has been applied for the estimation of Cu, Au, Ag, Ca, Mg, Mn, Total S, Total C, and PRI are also estimated in the gold models. Inverse distance to the power of two interpolation has been applied where there was insufficient data to model spatial continuity for kriging weights within the gold block model estimates. This is considered appropriate for the estimation of Mineral Resources at Sepon.</p> <p>Extreme grade values were managed by upper grade capping. The typical upper cap used is the 99th percentile to contain outliers.</p> <p>The estimates of gold were predominantly undertaken using hard domain boundaries and a series of elliptical search passes orientated in the plane of mineralisation. These search orientations and sizes were supported by variogram analysis.</p> <p>A composite length of 1m downhole was chosen and the compositing process validated.</p> <p>Exploratory data analysis, variography and search neighborhood optimization for each domain was performed.</p> <p>Total sulphur and carbon are estimated to assist with gold speciation and in the determination of the primary domain.</p> <p>The minimum and maximum number of composites allowable to interpolate a block was typically set at 4-10 and 15-24 based on KNA.</p> <p>Octant searches were used for the first two passes for ancillary elements only.</p> <p>No assumptions about the recovery of by-products have been made.</p> <p>Parent block sizes are 15m x6m x 5m (XYZ). The parent block size has considered: data spacing, mining methods and variography. Sub-blocks honoring relevant shapes and surfaces were used. The parent block size delineates mineralized zones without compromising the block variance.</p>

Criteria	Explanation	Commentary
		<p>Search distances in general for most estimates are the length of the first variogram structure in pass 1 and doubled in subsequent passes. Larger passes were used to interpolate less well-informed blocks.</p> <p>No further assumptions have been made regarding modelling of selective mining units.</p> <p>Block models are validated by: Visual inspections for true fit with the high and low grade wireframes (to check for correct placement of blocks and sub-blocks), block model to wireframe volume differences are checked, visual comparison of block model grades against composite file grades, global statistical comparison of the estimated block model grades against the composite statistics and raw data, global and local (on key sections) swath plots are used to check for bias.</p> <p>determination of the primary domain</p>
Moisture	Whether the tonnages estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.	The tonnages are estimated on a dry basis.
Cut-off parameters	The basis of the adopted cut-off grade(s) or quality parameters applied.	<p>For OP Au the Mineral Resources are reported at a cut-off grade of 0.6 g/t Au of oxidized gold ore and a cut-off grade of 1.5 g/t Au of primary gold ore.</p> <p>For UG Au the Mineral Resources are reported at a cut-off grade of 3 g/t Au of primary gold ore.</p> <p>For OP Cu the Mineral Resources are reported at a cut-off grade of 1.1% Cu of oxidized copper ore and a cut-off grade of 0.5 % Cu of primary copper ore.</p> <p>For UG Cu the Mineral Resources are reported at a cut-off grade of 0.8% Cu of oxidized copper ore.</p>

Criteria	Explanation	Commentary
Mining factors or assumptions	Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.	<p>Sepon is an active open pit and underground mining operation and mining methods, minimum mining widths and internal dilution is well understood and documented on site.</p> <p>conceptual pit shells. Underground Mineral Resources are reported within mineable panels based on long-term plan shapes and or Mine Stope Optimizer (MSO) shapes. The assists in demonstrating that the Mineral Resource meets the requirement of having reasonable prospects for eventual economic extraction criteria.</p>
Metallurgical factors or assumptions	The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.	<p>Sepon Gold Mine and Copper Mine is a production project, both metallurgical testing and historical production performance data are available, providing reliable data to Metallurgical Factors.</p> <p>The oxide gold ore is amenable to CIL process, final product is Gold Doré. The gold recovery ranges from 51.8% to 68.9% in actual production.</p> <p>The primary gold ore is amenable to the process of flotation-POX-CIL, final product is Gold Doré. The gold recovery ranges from 78% to 85% in laboratory tests.</p> <p>The oxide copper ore is amenable to the process of sulfuric acid leaching-SX/EW, the copper recovery ranges from 62% to 78% in actual production.</p> <p>The primary copper ore is amenable to flotation process, final product is copper concentrate. The concentrate grade and copper recovery are affected by the sulphur grade and ASCu/TCu ratio. A general copper recovery of 80% can be achieved.</p>
Environmental factors or assumptions	Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project,	See Section 18.

Criteria	Explanation	Commentary
	<p>may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</p>	
Bulk density	<p>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</p> <p>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</p> <p>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</p>	<p>Samples for bulk density determination are taken from diamond drill core every 6 m using the wax coated core immersion method.</p> <p>The bulk density determinations were estimated into the block models by either ordinary kriging, or where limited data exists as direct assignment from average values. All estimates are based on oxide vs primary division and then further on lithology.</p> <p>Previous reconciled mined gold ore tonnages demonstrate these values are robust in the oxide zones. Previous models created using the same method have been proved accurate by reconciliation of actual versus mine claim.</p>
Classification	<p>The basis for the classification of the Mineral Resources into varying confidence categories.</p> <p>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</p> <p>Whether the result appropriately reflects the Competent Person's view of the deposit.</p>	<p>Mineral Resource classification is directly linked to the geological confidence based on drill hole spacing, degree of variability of shape and grade of mineralization and associated geological units and structures. Each mineral deposit has been reviewed separately. Unless an entire deposit or area was classified at a uniform level, then wireframes of classification were applied to demarcate the classification.</p> <p>Measured Mineral Resources include materials that have been grade controlled, having drilling that is spaced approximately 15m or less, and exhibits low levels of variability in shape (volume and tonnes), and grade. This confidence is sufficient to confirm geological and grade continuity of the mineralisation and supports detailed mine planning.</p> <p>Indicated Mineral Resources include materials that have drill spacing up to 50m with multiple intersections on each section and consistency of size and grade of mineralised intersections sufficient to assume geological and grade continuity, and to support mine planning and evaluations of economic viability.</p>

Criteria	Explanation	Commentary
		<p>Inferred Mineral Resources include materials with a drill spacing up to 100m showing mineralisation in several holes on each section over several sections. Mineralising shape and grade may be variable between holes and sections. Evidence is sufficient to imply geological and grade continuity, and it is expected that with additional exploration that the majority of the resource would upgrade to Indicated Mineral Resources.</p> <p>In the Competent Person's view the classification is appropriate to the deposits at Sepon given the available data for estimation.</p>
Audits or reviews.	The results of any audits or reviews of Mineral Resource estimates.	<p>The input data, including geological mapping and drillhole data are comprehensive in their coverage of the mineralisation.</p> <p>The Mineral Resource estimate appropriately reflects the view of the Competent Person.</p> <p>The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the JORC Code.</p> <p>The statement relates to global volumetric estimates.</p>

**Section 4: Estimation and Reporting of Ore Reserves**

*(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)*

Criteria	Explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.	<p>The Ore Reserves estimate is based on the Mineral Resource model developed by LXML, which was subsequently reviewed by an SRK geologist. Inferred Resources have been excluded from this estimate.</p> <p>The Ore Reserves are reported inclusive of Mineral Resources.</p>
	Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.	<p>For Open Pit Mining, the Ore Reserves estimate is derived from pit optimization and pit design, accounting for mining dilution and loss. The reference point for the Ore Reserves estimates is the ROM Pad before the primary crusher and/or stockpiles at the processing and/or hydrometallurgy plant.</p> <p>For Stockpiles, the Ore Reserves estimate is derived from data provided by LXML, which has been reviewed by SRK. This review includes a detailed summary of the data and production records, particularly the feed grade. The reference point for the Ore Reserves estimates is within the stockpiles before processing and/or the hydrometallurgy plant.</p> <p>For Underground Mining, the Ore Reserves estimate is derived from stope optimization and underground design, accounting for mining dilution and loss. The reference point for the Ore Reserves estimates is the ROM Pad before the primary crusher and/or stockpiles at the processing and/or hydrometallurgy plant.</p>
Site visits	Comment on any site visits undertaken by the Competent Person and the outcome of those visits.	<p>SRK engineers, including specialists in geology discipline, visited the site in December 2022.</p> <p>SRK engineers, including specialists in mining and geology disciplines, visited the site in December 2023.</p> <p>SRK engineers, including specialists in mining, processing, geology, and environmental disciplines, visited the site in May 2024.</p>
	If no site visits have been undertaken indicate why this is the case.	

Criteria	Explanation	Commentary
Study status	<p>The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.</p>	<p>Sepon Gold Project Study ("SGPS") revised by AMC Consultants Pty Ltd ("AMC") on 18 March 2020.</p> <p>The LXML project encompasses gold and copper open-pit mining operations that have been active since the beginning of the 21st century. LXML has been overseeing the mine's operations since 2018. In 2021, LXML discontinued copper open-pit mining activities. In 2022, LXML commenced gold underground mining operations. Presently, the processing plants are engaged in processing gold extracted from open pits, underground sources, and stockpiles, as well as oxide copper from historical stockpiles. The operating practices, data, and records available are considered to be at a Pre-Feasibility Study (PFS) level, providing a reasonable basis for assessment.</p> <p>After reviewing the feasibility study and operating data, SRK opines that the project could meet the international PFS level in general and could serve as a basis for Ore Reserves conversion.</p>
	<p>The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.</p>	<p>The feasibility study, operational data, and production plan form the basis for Ore Reserves conversion.</p>
Cut-off parameters	<p>The basis of the cut-off grade(s) or quality parameters applied.</p>	<p>The ORE is defined as the three main types as practical for the treatment flowsheet, by LXML.</p> <p>Gold processing plant:</p> <ul style="list-style-type: none"> <li>Oxide gold</li> <li>Primary gold</li> </ul> <p>Copper hydrometallurgical plant:</p> <ul style="list-style-type: none"> <li>Oxide copper</li> </ul> <p>The marginal cut-off grade (MCOG) is applied for review the cut-off grades.</p> <p>The costs are based on LXML's operation records with SRK's analysis.</p>

Criteria	Explanation	Commentary
		<p>For gold processing: the processing costs are USD17.0 per ton milled and USD 55.0 per ton milled for oxide gold and primary gold respectively.</p> <p>For gold mining costs: the underground mining cost is USD 35.0 per ton mined.</p> <p>For the general &amp; administrative costs are USD 9.0 per ton milled.</p> <p>The reference gold and copper metal prices are USD 2,050 per ounce and USD 8,300 per ton, respectively. Those prices were based on the HSBC long-term forecast price and CMF long term price forecasting, released in 2024Q3.</p> <p>The processing recovery is considered the production data as 65% and 45% for gold and copper, respectively.</p> <p>The MCOG is estimated to be 0.6 g/t oxide gold and 1.5 g/t primary gold for open pit mining and gold stockpiles, which differ from the ore types applied by LXML. The MCOG for underground mining is estimated to be 2.6 g/t for primary gold, which is lower than the 2.9 g/t applied by the mine.</p> <p>The MCOG is estimated to be 0.9% oxide copper for copper stockpiles, which differs from the ore types applied by LXML.</p> <p>The Ore Reserves were reported based the SRK’s MCOG estimation.</p>
Mining factors or assumptions	<p>The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).</p> <p>The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.</p> <p>The assumptions made regarding geotechnical parameters (e.g. pit slopes, stope sizes, etc.), grade control and pre-production drilling.</p>	<p>For gold open-pit mining, the detailed design provided by LXML was used as the estimation boundary. For gold underground mining, Stope Optimization was carried out in alignment with LXML’s input parameters as the estimation boundary.</p> <p>For gold deposits, all deposits with estimated Ore Reserves are currently under operation. There are associated designs for both open pit and underground mining. For gold underground mining, AMC completed a scoping-level geotechnical assessment to estimate stable stope spans and pillar dimensions for the DSE UG</p>

Criteria	Explanation	Commentary
	<p>The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).</p> <p>The mining dilution factors used.</p> <p>The mining recovery factors used.</p> <p>Any minimum mining widths used.</p> <p>The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.</p> <p>The infrastructure requirements of the selected mining methods.</p>	<p>deposit. The limiting stope span was assessed to be the hanging wall or crown of the stope with a hydraulic radius (HR) limit of 5.7. MEC conducted an audit of the geotechnical aspects for DSE UG and concluded that geotechnical risks are well managed in LXML.</p> <p>The major assumption proposed is that backfilling will be applied for gold underground mining, which is expected to increase mining recovery.</p> <p>For gold open-pit mining, the dilution factor is 7.5%, consistent with LXML's estimate. For gold underground mining, the dilution factor is 15%, also consistent with LXML's estimate.</p> <p>For gold open-pit mining, the recovery factor is 95.0%, consistent with LXML's estimate. For gold underground mining, the recovery factor is 95.0% higher than LXML's estimate after reviewing the reconciliation data.</p> <p>For gold open pit mining, the minimum mining width is 25.0 meters.</p> <p>No Inferred Mineral Resources are included in the Ore Reserves.</p> <p>Historically, LXML has approximately 20 years of production, and various facilities are well developed. A 220 KV power line traverses the area and supplies electricity. Telephones and mobile communication are also available.</p>
Metallurgical factors or assumptions (Coal Preparation and Coal Quality)	<p>The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.</p> <p>Whether the metallurgical process is well-tested technology or novel in nature.</p> <p>The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.</p> <p>Any assumptions or allowances made for deleterious elements.</p> <p>The existence of any bulk sample or pilot scale test work and the degree to which such samples</p>	<p>Sepon Gold Mine is a production project, both metallurgical testing and historical production performance data are available, providing reliable data to Metallurgical Factors.</p> <p>The gold ore, both oxide and primary, is refractory. The oxide gold ore is amenable to CIL. The gold recovery ranges 51.8% to 68.9% in historical production.</p> <p>Flotation-POX-CIL process is applied to treat primary gold ore for producing Gold Doré. The gold recovery ranges 55% to 67% in historical production</p> <p>The oxide copper ore is amenable to the process of sulfuric acid leaching-SX/EW, the copper recovery ranges from 62% to 78% in historical production.</p>

Criteria	Explanation	Commentary
	<p>are considered representative of the orebody as a whole.</p> <p>For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?</p>	<p>The primary copper ore is amenable to flotation process, final product is copper concentrate. The concentrate grade and copper recovery are affected by the sulphur grade and ASCu/TCu ratio. A general copper recovery of 80% can be achieved in laboratory tests.</p>
Environmental	<p>The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.</p>	<p>The sources of environmental risk are project activities that may result in potential environmental impacts. These project activities have been previously described within this report. In summary, the most significant potential environmental and social risks for the development of the Project, currently identified as part of the project assessment and this SRK review, are:</p> <p style="text-align: center;">TSF seepage pollution;</p> <p style="text-align: center;">Fugitive dust pollution; and</p> <p style="text-align: center;">Deficit mine closure fund.</p>
Infrastructure	<p>The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.</p>	<p>The operation is established, and all required infrastructure is in place.</p>
Costs	<p>The derivation of, or assumptions made, regarding projected capital costs in the study.</p> <p>The methodology used to estimate operating costs.</p> <p>Allowances made for the content of deleterious elements.</p> <p>The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.</p> <p>The source of exchange rates used in the study.</p> <p>Derivation of transportation charges.</p> <p>The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.</p>	<p>Capital costs for 4Q2024 to 2026 were provided by LXML, including:</p> <p>Growth: USD 52.2 million</p> <p>Exploration: USD19.6 million</p> <p>Sustain: USD 42.6 million. (The unit sustaining cost was estimated based on data from 2022 and 2023, amounting to 3.5 USD/ milled ton. This estimate was used for forecasting the years 2027 to 2030.)</p> <p>SRK assumed that working capital has been incorporated into the sustaining capital.</p> <p>SRK considers it reasonable to expect that the operation of the Project will be extended with further exploration and feasibility studies. Consequently, mine closure fees and the residual value of the project will not be considered in the economic projection.</p>

Criteria	Explanation	Commentary
	The allowances made for royalties payable, both Government and private.	<p>The summary of cash costs from 2021 to 3Q 2024 excludes depreciation, amortization, and financial costs from the total costs. The unit cost forecast is based on the maximum value from the past three years, rounded up to the nearest whole number. If the unit cost is less than 1.0 USD per feed ore, the maximum value is used.</p> <p>No metallurgical allowances have been made for the effect of deleterious elements since none have been detected.</p> <p>Following exchange rate were used from 2021 to 3Q 2024:</p> <p>USD to CNY: 6.4515, 6.7208, 7.0467, 7.1085.</p> <p>The treatment and refining charge have been included in the processing costs.</p> <p>Government royalties are included in the unit operating cash cost.</p>
Revenue factors	The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.	<p>For economic analysis, SRK's CMF metal prices were used.</p> <p>There are no other revenue factors applied.</p>
	The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.	CMF's copper and gold prices vary in different years, considering the trends.
Market assessment	The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.	Sepon has developed and has steady buyers of its products, copper and gold.
	A customer and competitor analysis along with the identification of likely market windows for the product.	Ditto.
	Price and volume forecasts and the basis for these forecasts.	The basis of prices are the CMF forecast, and the volume are based on the production schedules.
	For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.	N/A.

Criteria	Explanation	Commentary
Economic	The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.	<p>The discount rate used for NPV calculation ranges from 5.0% to 15.0%, with increments of 1.0%. All results indicate a positive NPV.</p> <p>The operating costs, along with gold and copper prices, were selected as the essential variable factors affecting cash flow. These essential factors were analysed within a <math>\pm 30\%</math> range for their impact on NPV, using a 10% discount rate.</p>
	NPV ranges and sensitivity to variations in the significant assumptions and inputs.	The NPV is most sensitive to changes in the gold price, followed by operating costs. Copper price is the least sensitive factor affecting NPV.
Social	The status of agreements with key stakeholders and matters leading to social licence to operate.	See Section 18.4.9.
Other	To the extent relevant, the impact of the following on the Project and/or on the estimation and classification of the Ore Reserves:	<p>Two high risks have been identified: "lack of significant Ore Reserves" and "high mine closure cost."</p> <p>The project is located within the current mining license, which is valid until 29 September 2033, thereby covering the entire Life of the Mine (LoM).</p>
	Any identified material naturally occurring risks.	
	The status of material legal agreements and marketing arrangements.	
	The status of governmental agreements and approvals critical to the viability of the Project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.	
Classification	The basis for the classification of the Ore Reserves into varying confidence categories.	For gold open pit and underground mining, Measured Mineral Resources in the mine designs are classified as Proved Ore Reserves. Indicated Mineral Resources in the mine designs are classified as Probable Ore Reserves.
	Whether the result appropriately reflects the Competent Person's view of the deposit.	
	The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).	For gold and copper stockpiles, only the materials above MCOG are considered as Probable Ore Reserves based on reviewing the data provided by LXML.

Criteria	Explanation	Commentary
		<p>The classification of Ore Reserves appropriately reflects the Competent Person's view of the deposits.</p> <p>There is no Measured Mineral Resources are classified as Probable Ore Reserves.</p>
Audits or reviews	The results of any audits or reviews of Ore Reserve estimates.	The Ore Reserves estimates have been peer reviewed internally and is in line with current industry standards.
Discussion of relative accuracy/ confidence	<p>Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.</p>	<p>The Ore Reserves estimates are based on SGPS and ongoing operations. The Ore Reserves estimates are at a PFS level.</p> <p>All modifying factors have been applied for Ore Reserves estimates on a global estimate.</p> <p>SRK noted that LXML proposed the use of cemented backfill for gold underground mining to increase mining recovery, although no study is available to date. While cemented backfill is widely used in various mines, it would be prudent to conduct an individual backfilling feasibility study to support further operations.</p>
	<p>Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.</p>	<p>SRK considers the level of sampling work carried out by the client is sufficient for Probable Ore Reserves in accordance with the JORC Code.</p>
	<p>It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</p>	<p>The Sepon mine has a long history of production for the open-pit production. The historical resource models are not available to SRK. The underground mine started its production, with the accumulated production, the comparison will be possible later.</p>

## Appendix C Compliance with Chapter 18

Chapter 18		
18.01	DEFINITIONS AND INTERPRETATION	
18.02-18.04	CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES	
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.	
18.03	A Mineral Company must:—	
(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—	CPR1, CPR3.3 <sup>[1]</sup>
(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or <i>Note: 'control over a majority' means an interest greater than 50%.</i>	
(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which give it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—	CPR10.7
(a)	Indicated Resources; or	
(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—	CPR17.2. <sup>[2]</sup>
(a)	workforce employment;	
(b)	consumables;	
(c)	fuel, electricity, water and other services;	
(d)	on and off-site administration;	
(e)	environmental protection and monitoring;	
(f)	transportation of workforce;	
(g)	product marketing and transport;	
(h)	non-income taxes, royalties and other governmental charges; and	
(i)	contingency allowances;	
	<i>Note: A Mineral Company must:</i> <ul style="list-style-type: none"> <li>• set out the components of cash operating costs separately by category;</li> <li>• explain the reason for any departure from the list of items to be included under cash operating costs; and</li> <li>• discuss any material cost items that should be highlighted to investors.</li> </ul>	

<b>Chapter 18</b>		
	(4) demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—	CPR17.1 <sup>[3]</sup>
	(a) general, administrative and operating costs;	
	(b) property holding costs; and	
	(c) the cost of any proposed exploration and/or development; and	
	<i>Note: Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.</i>	
	(5) ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has available sufficient working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.	CPR17.1 <sup>[3]</sup>
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.	
	<i>Not e: A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.</i>	
<b>18.05-18.08</b>	<b>CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS</b>	
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—	
	(1) a Competent Person's Report;	CPR Executive Summary and CPR 1.1
	(2) a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;	CPR 2.8
	(3) the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;	CPR3; CPR16.3
	(4) a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;	CPR 2.3
	(5) disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and	CPR20
	(6) if relevant and material to the Mineral Company's business operations, information on the following:—	
	(a) project risks arising from environmental, social, and health and safety issues;	CPR20
	(b) any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	CPR16.4.9
	(c) compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	CPR16.3
	(d) sufficient funding plans for remediation, rehabilitation and, closure and removal	CPR16.4.8, CPR17.1 <sup>[4]</sup>

Chapter 18			
		of facilities in a sustainable manner;	
	(e)	environmental liabilities of its projects or properties;	CPR16.4
	(f)	its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	CPR16.4.9
	(g)	its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	CPR16.4.9
	(h)	any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	CPR16.4.9
<b>18.06-18.08</b>	<b>Additional disclosure requirements that apply to certain new applicant Mineral Companies</b>		
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.		CPR17.2
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.		CPR 17 <sup>[5]</sup>
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.		CPR10
<b>18.09-18.13</b>	<b>RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS</b>		
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—		
	(1)	comply with Chapter 14 and Chapter 14A, if relevant;	
	(2)	produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction; <i>Note: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.</i>	
	(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and	
	(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.	
	<i>Not e: Material liabilities that remain with the issuer on a disposal must also be discussed.</i>		
<b>18.10-18.11</b>	<b>Requirements that apply to listed issuers</b>		
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.		
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.		
<b>18.12-18.13</b>	<b>Requirements that apply to Mineral Companies and listed issuers</b>		
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer		

<b>Chapter 18</b>		
	has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.	
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.	
<b>18.14-18.17</b>	<b>CONTINUING OBLIGATIONS</b>	
<b>18.14</b>	<b>Disclosure in reports</b>	
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.	
<b>18.15-18.17</b>	<b>Publication of Resources and Reserves</b>	
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.	
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.	
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18. <i>Not e: Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.</i>	
<b>18.18-18.27</b>	<b>STATEMENTS ON RESOURCES AND/OR RESERVES</b>	
<b>18.18</b>	<b>Presentation of data</b>	
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.	CPR10.7 CPR11.8
<b>18.19</b>	<b>Basis of evidence</b>	
18.19	All statements referring to Resources and/or Reserves:— (1) in any new applicant listing document or circular relating to a Relevant Notifiable Transaction, must be substantiated in a Competent Person's Report which must form part of the document; and (2) in all other cases, must at least be substantiated by the issuer's internal experts.	
<b>18.20</b>	<b>Petroleum Competent Persons' Reports</b>	<b>Not applicable.</b>
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.	
<b>18.21-18.22</b>	<b>Competent Person</b>	
18.21	A Competent Person must:— (1) have a minimum of five years experience relevant to the style of mineralization	CPR 2.6; CPR2.7

<b>Chapter 18</b>		
	and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	
	(2) be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	CPR 2.6; CPR2.7
	(3) take overall responsibility for the Competent Person's Report.	CPR 2.6; CPR2.7
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—	CPR2.10
	(1) have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2) not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3) in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4) in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
<b>18.23</b>	<b>Additional requirements of Competent Evaluators</b>	
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—	
	(1) have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2) have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3) hold all necessary licences.	
	<i>Not e: A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.</i>	
<b>18.24</b>	<b>Scope of Competent Persons' Reports and Valuation Reports</b>	
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—	
	(1) be addressed to the Mineral Company or listed issuer;	CPR 2.2
	(2) have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	CPR 2.4
	(3) set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	CPR 2.2
<b>18.25-18.26</b>	<b>Disclaimers and Indemnities</b>	
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.	CPR 2.2
18.26	The Competent Person or Competent Evaluator must prominently disclose in the	CPR 2.11, CPR 2.12

<b>Chapter 18</b>		
	Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.	
<b>18.27</b>	<b>Obligations of sponsor</b>	
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.	CPR 1.4, CPR 1.7
<b>18.28-18.34</b>	<b>REPORTING STANDARD</b>	
<b>18.28-18.30</b>	<b>Mineral reporting standard</b>	
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.	
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—	CPR2.2
	(1) under:	
	(a) the JORC Code;	
	(b) NI 43-101; or	
	(c) the SAMREC Code,	
	as modified by this Chapter; or	
	(2) under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	<i>Not e: The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.</i>	
18.30	A Mineral Company must ensure that:—	
	(1) any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;	CPR11.2
	(2) estimates of mineral Reserves and mineral Resources are disclosed separately;	CPR10; CPR11
	(3) Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;	CPR11, CPR11.7, CPR11.8 CPR18.1
	(4) for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—	CPR17.3
	(a) the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	CPR17.3
	(b) if a contract for future prices of mineral Reserves exists, the contract price is used; and	CPR15
	(5) for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.	CPR 18
<b>18.31-18.33</b>	<b>Petroleum reporting standard</b>	<b>Not applicable.</b>
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a	

<b>Chapter 18</b>		
	Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.	
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—	
	(1) under PRMS as modified by this Chapter; or	
	(2) under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	<i>Note:</i> A Reporting Standard applied to specific assets must be used consistently.	
18.33	A Mineral Company must ensure that:—	
	(1) where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;	
	(2) if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
	(3) Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	
	(4) if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30; <i>Note: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.</i>	
	(5) if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated; <i>Note: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.</i>	
	(6) economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
	(7) where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	
<b>18.34</b>	<b>Mineral or Petroleum Asset Valuation Reports</b>	<b>Not applicable.</b>
18.34	A Mineral Company must ensure that:—	
	(1) any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from	

<b>Chapter 18</b>		
	time to time;	
(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

Note:

1. CPR is the Competent Person’s Report prepared by SRK; 1 and 3.3 are the section numbers.
2. Operating cost is breakdown according to cost center, instead of cost element.
3. Without considering current assets and current liabilities, SRK made the assumption that the working capital has been incorporated into the sustaining capital.
4. It is reasonable to expect that the operation of the Project will be extended with further exploration and feasibility studies, the mine closure fees, and the residual value of the project will not be considered in the economic projection.
5. Sepon Mine is a producing project.

---

**Appendix D Chapter 2.6 of the Guide for New Listing Applicants**

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	Section 10.4, 11.4, 11.5, 12.4, 12.6, 17.3
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	Not applicable.
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	Not applicable.
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	Section 4
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	Section 11 and Section 12
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	Section 18
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	Section 1.5
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	Section 20

Final

## Independent Competent Person's Report for Wassa Gold Mine, Akyempim, Western Region, Ghana

Wassa Project, Akyempim, Ghana  
Golden Star Wassa Limited

SRK Consulting (China) Ltd. ■ SCN849C ■ 28 February 2025

**Final**

Independent Competent Person's Report for Wassa Gold Mine, Akyempim,  
Western Region, Ghana

Wassa Project, Akyempim, Ghana

**Prepared for:**

Golden Star Wassa Limited  
(an indirect subsidiary of Chifeng Gold)

**Prepared by:**

SRK Consulting (China) Ltd.  
B1301 COFCO Plaza, No. 8 Jianguomen Inner Street  
Dongcheng District, Beijing, China

## **Acknowledgments**

SRK would like to acknowledge the support and collaboration provided by personnel of Golden Star Wassa Limited for this assignment. Their collaboration was greatly appreciated and instrumental in the completion of this technical report.

The opinions expressed in this Report have been based on the information supplied to SRK Consulting (China) Ltd. ("SRK") by Golden Star Wassa Limited (the "Client", or the "Company"). The opinions in this Report are provided in response to a specific request from the Client to do so. SRK has exercised all due care in reviewing the supplied information. Whilst SRK has compared key supplied data with expected values, the accuracy of the results and conclusions from the review is entirely reliant on the accuracy and completeness of the supplied data. SRK does not accept responsibility for any errors or omissions in the supplied information and does not accept any consequential liability arising from commercial decisions or actions resulting from them. Opinions presented in this report apply to the site conditions and features as they existed at the time of SRK's investigations, and those reasonably foreseeable. These opinions do not necessarily apply to conditions and features that may arise after the date of this Report, about which SRK had no prior knowledge nor had the opportunity to evaluate.

## Appendices

Appendix A	Table 1 (JORC)
Appendix B	Wassa Life of Mine
Appendix C	Compliance with Chapter 18
Appendix D	Chapter 2.6 of the Guide for New Listing Applicants

## Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

%	Percent/percentage
/	Per
'	Minute of arc
°	Degree(s) of arc
°C	Degree(s) Centigrade
3D	Three-dimensional
2020 PEA	Preliminary Economic Assessment of potential expansion of the underground mine to extract the Inferred Mineral Resource in the Southern Extension zone (dated 2020)
AAS	Atomic adsorption spectroscopy (sample assay)
AC	Air-core (drilling)
ADK	Adoikrom and Dabokrom (deposit)
Ag	The chemical symbol of silver element
Ai	Bond abrasion index (metallurgical testing)
AIG	Australian Institute of Geoscientists
AISC	All in sustaining cost
ALS	ALS Minerals
ARD	Acid rock drainage
ARO	Asset retirement obligations (closure planning)
ASL	Above sea level
Au	The chemical symbol of gold element
AusIMM	Australasian Institute of Mining and Metallurgy
BDG	BD Goldfields (company)
BIF	Banded iron formation
BLEG	Bulk leach extractable gold (assaying)
BWi	Bond ball mill work index (metallurgical testing)
Capex	Capital expenditure, or capital cost
Chifeng Gold	Chifeng Jilong Gold Mining Co., Ltd.
CIL	Carbon in leach (processing method)
CIM	Canadian Institute of Mining, Metallurgy and Petroleum
CMCC	Community Mine Consultative Committee
Conc.	Concentrate
CP	Competent Person, or Chartered Professional

CPR	Competent Person's Report
CRM	Certified reference material (sample QA/QC)
CSL	Compacted soil liner (civil construction)
CSR	corporate social responsibility
Cut-off grade	The grade threshold above which a mineral material is considered potentially economic and is selectively mined and processed as ore
CWi	Bond low impact crushing work index (metallurgical testing)
CYAP	Community Youth Apprenticeship Program
DCF	discounted cash flow
DMH	Dead Man's Hill
DD	Diamond (core) drilling
EIA	Environmental Impact Assessment
EIS	Environmental Impact Statement
EMP	Environmental Management Plan
EMS	Environmental and social management system
EPA	Environmental Protection Agency (Ghana)
ESR	Excavation support ratio (geotechnical)
FAusIMM	Fellow of the AusIMM
FB	Father Brown (deposit)
FOS	Factor of safety
FS	Feasibility study
FW	Footwall
g	gram
G&A	General and administration
GAI	Geochemical abundance index (geochemistry)
GC	Grade control
Ghana	Republic of Ghana
g/t	gram per tonne
GSI	Geological strength index (geotechnical)
GSOPP	Golden Star Oil Palm Plantation
GSR / Golden Star	Golden Star Resources (Ghana) Ltd
GSSTEP	Golden Star Skills Training and Employability Program
GSWL	Golden Star Wassa Limited
Halo	the mineralisation halo

HARD	Half absolute relative difference (statistics)
HBB	Hwini Butre Benso (deposit group)
HBM	Hwini Butre Minerals (company)
HG	High grade
HKEx	Stock Exchange of Hong Kong Limited
HL	Heap leach (processing/hydrometallurgical method)
HW	Hanging wall
ICOLD	International Committee on Large Dams
ICMC	International Cyanide Management Code
IFC	International Finance Corporation
ILR	In-line reactor (processing method)
Indicated Mineral Resource	An Indicated Mineral Resource is that part of a mineral resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a reasonable level of confidence. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes. The locations are too widely or inappropriately spaced to confirm geological and/or grade continuity but are spaced closely enough for continuity to be assumed
Inferred Mineral Resource	An Inferred Mineral Resource is that part of a mineral resource for which tonnage, grade and mineral content can be estimated with a low level of confidence. It is inferred from geological evidence and assumed but not verified geological and/or grade continuity. It is based on information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings, and drill holes which may be limited or of uncertain quality and reliability
IP	Induced Polarization, which is an exploration technique whereby an electrical current is pulsed through the ground and the response from the sub surface measured in order to identify minerals of interest. Strong IP responses may be a result of sulphide which may be associated with gold mineralisation
IPO	Initial Public Offering
IRR	internal rate of return
ITCZ	Inter Tropical Convergence Zone
Jn	Joint number (geotechnical)
JORC Code	Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves, 2012 edition, as published by the Joint Ore Reserves Committee.
JORC Committee	Joint Ore Reserves Committee of The Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia
Jr	Joint roughness (geotechnical)
Jw	Joint alteration (geotechnical)
kg	kilogram(s), equivalent to 1,000 grams
kg/t	kilogram(s) per tonne
km	kilometre(s), equivalent to 1,000 metres
km <sup>2</sup>	square kilometre(s)
koz	thousand ounces
kt	Thousand tonne(s)
ktpa	Thousand tonne(s) per annum
kV	kilovolt(s)
kW	kilowatt(s)
kWh/t	kilowatt(s) hour per tonne

L.I.	Legal Instrument
LG	Low grade
LHD	load-haul-dump machine
LHOS	Long hole open stoping (mining method)
LOM (or LoM)	Life of mine
LR (model)	Long-range model (geological modelling)
LVA	Locally variable anisotropy (geological modelling)
m	Meter(s)
MAIG	Member of the AIG
MAusIMM	Member of the AusIMM
Measured Mineral Resource	A Measured Resource is that part of a mineral resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a high level of confidence. It is based on detailed and reliable exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes
Mineral Resources	A concentration or occurrence of material of intrinsic economic interest in or on the earth's crust in such form, quality and quantity that there are reasonable prospects for eventual economic extraction, as defined in JORC Code. The location, quantity, grade, geological characteristics and continuity of a mineral resource are known, estimated or interpreted from specific geological evidence and knowledge
mm/yr	Millimetre(s) per year
MOU	Memoranda of Understanding
M.Eng.	Master of Engineering
M.Sc.	Master of Science
MSG	Modified Stability Graph (geotechnical)
MSO	Mineable Stope Optimiser (mine planning)
Mt	million tonnes (metric tons)
NAG	Not acid generating (geochemistry)
NI 43-101	National Instrument 43-101, which is a national instrument for the (Canadian) Standards of Disclosure for Mineral Projects, including Companion Policy 43-101 as amended from time to time.
NPV	Net present value
OHS	occupational health and safety
OK	Ordinary kriging (grade estimation)
OP	open pit
Opex	operating cost
Ore Reserves	The economically mineable part of a Measured and/or Indicated mineral resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments and studies have been carried out including consideration of and modification by realistically assumed mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental, social and government factors, as defined in the JORC definition standards. These assessments demonstrate at the time of reporting that extraction could reasonably be justified. Ore Reserves are sub-divided in order of increasing confidence into Probable Ore Reserves and Proved Ore Reserves
oz	Ounce
PCP	Practical closure plan (closure planning)
PRC	People's Republic of China

Probable Ore Reserve	A Probable Ore Reserve is the economically mineable part of an Indicated, and in some circumstances Measured Resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments, which may include feasibility studies, have been carried out including consideration of and modification by realistically assumed mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental, social and governmental factors. These assessments demonstrate at the time of reporting that extraction could reasonably be justified
Proved Ore Reserve	A Proved Ore Reserve is the economically mineable part of a Measured Resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments, which may include feasibility studies, have been carried out, and include consideration of and modification by realistically assumed mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental, social and governmental factors. These assessments demonstrate at the time of reporting that extraction could reasonably be justified.
PVC	Poly-vinyl chloride
Q	Quarter: a fixed period of three months
QA/QC	Quality assurance, quality control
RAB	Rotary air blast (drilling)
RC	Reverse circulation (drilling)
RGI	Ryal Gold Inc (company)
RGLD	RGLD Gold AG (company)
RL	Reduced level
RMR	Rock mass rating (geotechnical)
RMS	Resource Modelling Solutions (company)
ROM	Run of mine
RPEEE	Reasonable prospects for eventual economic extraction
RQD	Rock quality description (geotechnical)
SGL	Satellite Goldfields Limited (company)
SJR	Saint Jude Resources (company)
SR (model)	Short-range model (geological modelling)
SRK	SRK Consulting China Ltd.
t	Tonne(s)
TMM	Total material movement
TSF	Tailings storage facility
UCS	Unconfined compressive strength

US\$	United States dollar/s, same as USD
VAT	value-added tax
VRA	Volta River Authority (Ghana)
WGM / Wassa Mine	Wassa Gold Mine
WRD	waste rock dump
WSL	Wassa site laboratory (assaying)
WUC	Western University College, Tarkwa (Ghana)
WUG	Wassa underground mine
XRD	X-ray diffraction
XRF	X-ray fluorescence

## Executive Summary

SRK Consulting China Ltd. ("SRK") was requested by Golden Star Wassa Limited ("GSWL", the "Company" or the "Client") to prepare a Competent Person's Report ("CPR" or the "Report") for its mining property (the "Project") in the Republic of Ghana ("Ghana") in accordance with the guidelines of the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves, 2012 edition (the "JORC Code", 2012 edition) and the Rules Governing the Listing of Securities on the Stock Exchange of Hong Kong Limited (the "HKEx"), including the Chapter 18 requirements (Appendix C), Chapter 2.6 of the Guide for New Listing Applicants (Appendix D) and other relevant regulations of the HKEx. GSWL's primary asset is the Wassa Gold Mine (the "Wassa Mine" or "WGM"), and 90% equity interest of GSWL is owned by Golden Star Resources (Ghana) Ltd. ("Golden Star" or "GSR") which is a direct subsidiary of Chifeng Jilong Gold Mining Co., Ltd. ("Chifeng Gold"), and the Ghanaian government owns the remaining 10% equity interest of GSWL.

This Report consists of an independent review of the geology, exploration, Mineral Resources, Ore Reserves, mining, mineral processing, capital expenditure, operating cost, and environmental and social aspects of the Project. It is understood that the Report will enable potential equity investors and possible future shareholders to understand the Project's operations.

This Report does not express an opinion as to the value of mineral or other assets involved.

## Property Description and Ownership

The mineral concessions belonging to GSWL are listed below.

- Wassa mining lease: The Wassa Mine is an operating gold mine comprising principally underground operations with the following mineralisation domains: F Shoot, 419, B Shoot, Zone 242, Starter, South-East, Mid-East, and Dead Man's Hill (the "DMH").
- Benso mining lease: comprising the Subriso East, Subriso West, G-Zone, C-Zone, and I-Zone deposits.
- Hwini Butre mining lease: comprising the Father Brown, Adoikrom, and Dabokrom deposits.
- Benso (Chichiwelli) exploration property: comprising two mineralised zones, Chichiwelli West, and Chichiwelli East.
- Manso exploration property: located east of the Benso and Hwini Butre Concessions.

The properties and leases are spread along a trend of approximately 80 kilometres (km) southwest of the Wassa Mine. There are sufficient access and surface rights for GSWL's operations.

## Geology and Mineralisation

The Wassa Mine property lies within the southern portion of the Ashanti Greenstone Belt along the eastern margin of the belt within a volcano-sedimentary assemblage proximal to the Tarkwaian basin contact. The eastern contact between the Tarkwaian basin and the volcano-sedimentary rocks of the Sefwi group is faulted, but the fault is discrete as opposed to the Western contact of the Ashanti belt where the Ashanti fault zone can be several hundred meters wide. Deposition of the Tarkwaian sediments was followed by a period of dilation and the intrusion of late mafic dykes and sills.

The lithologies of the Wassa assemblage predominantly comprise mafic to intermediate volcanic flows which are interbedded with minor horizons of volcanoclastics, clastic sediments such as wackestone and magnetite-rich sedimentary layers, most likely banded iron formations ("BIF"). The volcano-sedimentary sequence is intruded by syn-volcanic mafic intrusives and felsic porphyries.

The Wassa deposit is located on the eastern flank of the northeast trending Ashanti Belt, a Paleoproterozoic greenstone belt which was formed and deformed, along with the dividing Birimian and Tarkwaian sedimentary basins during the Eoeburnean and Eburnean orogeny. Most deposits found within the Ashanti belt can be classified as lode gold deposits or orogenic mesothermal gold deposits, except for the Tarkwaian paleoplacer deposits which have a sedimentary origin. Orogenic gold deposits are the most common gold systems found within Archean and Paleoproterozoic terrains, in the West African shield, and these deposits are typically underlain by geology considered to be of Eoeburnean age ( $2164 \pm 22$  Ma) and are generally hosted by volcano-sedimentary sequences.

Host rocks in the Wassa mine area have been affected by at least four phases of ductile deformation, producing a polyphase fold pattern at the mine scale. Discrete high-strain zones locally dissect this fold system. The structural history of the Wassa area is important in that the various deformational events have been responsible for the emplacement of the gold mineralisation as well as the geometry of the zones themselves.

Mineralised zones at the Wassa Mine are related to vein swarms and associated sulphides that formed during the Eoeburnean deformational event. All rock types underlying the Wassa Mine appear to be altered to variable degrees with the most common alteration consisting of a carbonate-silica-sulphide assemblage.

The Wassa mineralisation is subdivided into a number of domains, namely: F Shoot, B Shoot, Zone 242, South-East, Starter, 419, Mid-East, and DMH. Each of these represents discontinuous segments of the main mineralised system. The South Akyempim (SAK) deposits are located approximately 2 km to the southwest of the Wassa Main deposit on the northern end of a well-defined mineralized trend parallel to the Wassa Main trend. The mineralisation is hosted in highly altered multi-phased greenstone-hosted quartz-carbonate veins interlaced with sedimentary pelitic units. The SAK mineralisation is subdivided into a number of domains as well, SAK 1, 2, and 3.

Mineralisation within the Wassa Mine is structurally controlled and related to vein densities and sulphide contents. The mineralisation generally consists of broadly tabular zones containing dismembered and folded ribbon-like bodies of narrow quartz vein material. Three vein generations have been distinguished on the basis of structural evidence, vein mineralogy, textures and associated gold grades.

Gold grades broadly correlate with the presence of quartz-dolomite/ankerite-tourmaline-bearing quartz veins and the presence of sulphide minerals (predominantly pyrite) within and around the quartz veins. Gold grades appear to be spatially restricted to the quartz veins, vein selvages and the immediate wall rocks. The alteration haloes developed around the veins and pervasively developed within the core of the Wassa Fold contain lower grade mineralisation.

According to the grade assays in various exploration campaigns and historic processing production records, both silver (Ag) and arsenic (As) are in relatively low content. In the Wassa Project, gold is the only prime element, and there is no concern about harmful mineral or element such as arsenic.

## Exploration

Systematic exploration work has been conducted on the GSWL properties over a couple of centuries as the earliest record of gold business within the Hwini-Butre mining lease dates back to the late 15th century with the Portuguese colonial explorers. Evidence of colonial mining and local small-scale mining still remains with pits and adits mapped within all the mining leases and prospecting licenses.

Drilling is carried out by a combination of Diamond Drill ("DD"), Reverse Circulation ("RC") and Rotary Air Blast ("RAB") techniques. In general, the RAB method is used at early stages for follow up to soil geochemical sampling and testing contacts and mineralisation extensions around the production areas and has a maximum drilling depth of around 30 meters (m).

The Wassa, Benso, and Hwini Butre Mining Leases are advanced properties, and details of all drill results have been reported in early staged reports. Recent updated technical reports provided an overview of drilling and representative plans and cross-sections.

DD and RC drilling are used as the main method for obtaining samples for Mineral Resource estimation and the resource drilling at Wassa deposit; and the drilling is generally carried out along drill lines spaced between 25 and 50 m along prospective structures and anomalies defined from soil geochemistry and RAB drilling. RC drilling is typically extended to depths in the order of 100-125 m. The DD method is used to obtain more detailed geological data where such information is required. Generally, the deeper intersections are also drilled using DD and as a result, most section lines contain a combination of RC drilling and DD.

## Mineral Resource Estimates

Mineral Resource Estimates conducted for the Project include underground ("UG") mines and open pits ("OP"). SRK has reviewed the drill hole database, definition of mineralisation domains, grade estimate parameters based on the received data and information for the footprints of Wassa Main (B Shoot UG and 242 UG), DMH, and Benso's I Zone OP. The wireframe and block models were compiled by GSR personnel and SRK performed validations on these models. The reporting of validated Mineral Resource models was done by SRK. Through cross check and validation of the procedure and key parameters, SRK is of the opinion that the reviewed models and Mineral Resource estimates have been performed in line with a standard approach which is generally accepted by international practice.

At Wassa Main's B Shoot UG deposit, the database with a total of 4,240 DD and RC holes with aggregated drilling length of 781,448 m was used to model and estimate the Mineral Resources. Mineralised domains were created and estimated using indicator approach and set parameter. Wireframes for mineralised zone(s) were modelled with a cut-off at 0.4 gram per tonne gold (g/t Au) for the low grade ("LG") or the mineralisation halo (the "Halo") domain, and a cut-off at 1.2 g/t Au for the high grade ("HG") or the Mineralised domain. SRK has reviewed and cross validated the sample composition and sample outliers outlined for grade estimation. Variograms were modelled and the Ordinary Kriging ("OK") method was used for grade estimation.

At Wassa Main's 242 UG deposit, the database with a total of 4,601 DD and grade control ("GC") RC boreholes with aggregated drilling length of 143,655 m were used for wireframe modelling and grade estimation. The mineralised domains are constrained within two envelopes (the "Halo" and the

"Mineralised") using semi-explicit method. The Halo Zone was modelled at a cut-off grade of 0.4 g/t Au with Leapfrog™ vein modelling technique. The Mineralized Zone was modelled at a cut-off grade of 1.0 g/t Au, with the same method as the Halo Zone. Variograms were modelled accordingly for each domain and the OK method was used for grade estimation.

At DMH deposit, a total of 2,137 DD and GC RC holes with an aggregated drilling length of 73,039 m were used in domain modelling and grade estimation. The domains (zone) were modelled using the intrusive technique in Leapfrog™ software by GSR. The Halo Zone was modelled at a cut-off grade of 0.4 g/t Au and the Mineralized Zone was generated with a cut-off of 1.0 g/t Au. Variograms were modelled and the OK method was applied for grade estimation.

I Zone Pit is within the Benso open pit mine. The database for I Zone Pit contained 254 DD and (GC) RC holes totalling 15,574 m. The solid model of I Zone Pit was constructed by GSR with Leapfrog™ vein modelling technique. The intervals used in the veins modelling were generated by Leapfrog™ implicit modelling technique, at a cut-off of 0.5 g/t Au. Assay data was composited to 2 m by GSR for statistics, estimation and model validation. The OK method was used for grade estimation.

With respect to Father Brown (FB)/ Adoikrom and Dabokrom (ADK) and Chichiweilli Zone, the Mineral Resources as of 30 September 2024 remain unchanged from the statement presented in the NI 43-101 Technical Report (issued in March 2021). A drilling program was initiated at Father Brown/ Adoikrom during 2022-2023, and 10,287.4m of drilling has been completed at Father-Brown/ Adoikrom. This additional drilling information has not been included in the resource estimate.

Below is a summary of GSWL's Mineral Resource Statement as of 30 September 2024, in accordance with JORC Code classifications.

**Table ES-1: GSWL Mineral Resource Statement, as of 30 September 2024**

Deposit/Category	Tonnage	Grade	Contained Au	Contained Au

## Notes:

- <sup>1</sup> The Mineral Resource is reported in accordance with the JORC Code guidelines.
- <sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr Huaixiang Li and Mr Pengfei Xiao who are full time employees of SRK Consulting. Mr Huaixiang Li is a Member of the Australian Institute of Geoscientists (the "AIG") and Mr Pengfei Xiao is a Member of the Australasian Institute of Mining and Metallurgy (the "AusIMM") and a Member of the AIG. Both Mr Li and Mr Xiao have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the "Competent Persons" as defined in JORC Code (2012). Mr Li and Mr Xiao consent to the reporting of this information in the form and context in which it appears.
- <sup>3</sup> Mt – million tonnes (metric tons), oz- ounce; koz – thousand ounces.
- <sup>4</sup> Mineral Resources for B Shoot and 242 underground deposits are reported within mineable stope optimiser (the "MSO").
- <sup>5</sup> Open Pit Mineral Resources are reported at a cut-off grade of 0.43 g/t for DMH, 0.73 g/t for I Zone and 0.55 g/t for Chichiwelli.
- <sup>6</sup> Underground Mineral Resources are reported at a cut-off grade of 1.34 g/t for B Shoot and 242; and 1.40 g/t for FB/ADK.
- <sup>7</sup> FB/ADK and Chichiwelli Mineral Resources were sourced from the Wassa NI 43-101 Technical Report (March 2021), based on a US\$1,500/ ounce (oz) gold price. No material change has been aware since then.
- <sup>8</sup> All composites have been capped where appropriate.
- <sup>9</sup> All figures are rounded to reflect the relative accuracy of the estimate.
- <sup>10</sup> It should be noted that the Mineral Resource Statement is made for GSWL on the basis of 100% ownership of the properties.
- <sup>11</sup> The conversion between ounce and gram used herein is 1 oz = 31.1035 g.
- <sup>12</sup> Mineral Resources are inclusive of Ore Reserves that have been converted from Measured and Indicated Mineral Resources.
- <sup>13</sup> The Mineral Resources Statement as of 30 September 2024 is based on the mineral resource models as of 31 March 2024 and the depletion for the Wassa Mine for the six-month period, 1 April 2024 to 30 September 2024.

## Ore Reserve Estimates

SRK has estimated the Ore Reserves of Wassa Mine for open pit and underground, and stockpiles and reported them in compliance with the JORC Code guidelines. The Ore Reserve statement for GSWL as of 30 September 2024 is in Table ES-2.

The total Ore Reserve for the Wassa Mine is estimated at about 8,842 thousand tonnes ("kt") at an average grade of 2.12 g/t Au, containing approximately 603 thousand ounces ("koz") of gold. This includes Proved Ore Reserve estimated at 3,521 kt with an average grade of 2.14 g/t gold, containing 242 koz of gold; and Probable Ore Reserve estimated at 5,291 kt at an average grade of 2.12 g/t gold, containing 360 koz of gold. The stockpiles are the ores that have spilled from conveyor belts and accumulated over time and are subsequently returned to the run of mine (ROM) Pad.

**Table ES-2: Combined Ore Reserve Statement of Wassa Mine as of 30 September 2024**

Deposit/Category	Category	Tonnage kt	Au Grade Au g/t	Contained Au koz	Contained Au t
Open Pit	Proved	183	0.97	6	0.18
	Probable	355	0.90	10	0.32
	Total	538	0.92	16	0.50
Underground	Proved	3,339	2.20	237	7.36
	Probable	4,935	2.20	349	10.87
	Total	8,274	2.20	586	18.23
Stockpile (Measured)	DMH Stockpile	25.98	1.19	1.00	0.03
	UG Stockpile	3.68	2.31	0.27	0.01
Total	Proved	3,521	2.14	242	7.53
	Probable	5,291	2.12	360	11.19
	Stockpile	30	1.33	1.27	0.04
	Total	8,842	2.12	603	19

**Notes:**

<sup>1</sup> The Ore Reserve Statement as of 30 September 2024 is based on the ore reserve models as of 31 March 2024 and the depletion for the Wassa Mine for the six-month period, 1 April 2024 to 30 September 2024.

<sup>2</sup> The Ore Reserve is reported in accordance with the JORC Code guidelines.

<sup>3</sup> The information in this report which relates to Ore Reserve is based on information compiled by Mr. Alexander Thin and Ms. TzuHsuan Chuang who are full time employees of SRK Consulting. Mr. Thin is a Fellow of the Australasian Institute of Mining and Metallurgy (the "AusIMM"), and Ms. Chuang is a Member of the AusIMM. Both Mr. Thin and Ms. Chuang have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the "Competent Persons" as defined in JORC (2012). Mr. Thin and Ms. Chuang consent to the reporting of this information in the form and context in which it appears.

<sup>4</sup> Ore Reserves in the table above and in this Report are estimated/converted from Measured and Indicated Mineral Resources, therefore double accounting of tonnage should be avoided.

**Open pit**

<sup>1</sup> Ore Reserves are reported at a cut-off grade of 0.5 g/t Au.

<sup>2</sup> Ore Reserves are reported with modifying factors.

**Underground**

<sup>1</sup> Ore Reserves are reported at a cut-off grade of 1.34 g/t Au.

<sup>2</sup> Ore Reserves are reported with Modifying Factors. (Development Overbreak: 5%; Stope Recovery: 95%; Stope Dilution: 10%)

## Mining

### Open Pit Mining

The mining at Wassa Main area was initiated mostly by open pit in 2001, with underground development commencing in 2015. The underground and open pit mining continued at the Wassa Main deposit while the underground mining has been the main ore source since 2018. From these domains, DMH and Benso (I Zone) are currently two open pits while others are depleted or planned for underground mining.

A final open pit design utilised a gold price of United State Dollars (USD or US\$) 2,050 / oz, with optimised angles of 45° and 52° for the oxide and fresh rock masses, respectively. Detailed engineering design was based on the following nominal bench and berm configurations:

- Oxides: Bench height: 6 m, bench face angle: 65°, berm width: 4 m (Inter-ramp angle:41°).
- Fresh Rocks: Bench height: 12 m, bench face angle: 75°, berm width: 4 m (Inter-ramp angle: 59°).

The overall final open pit design slopes are stable; however, the main geotechnical problem at Wassa historically has been lack of berm retention due to the well jointed nature of the rock mass and the relatively narrow berms required to achieve steep inter-ramp angles.

A conventional mining method is utilised; excavators and trucks which is considered typical for this type and style of gold mineralisation. The mining is carried out by a contract mining company who supply suitable mining equipment, manpower and supervision services. The 12 m bench heights with 72° bench face angle were designed while drilling and blasting will be conducted over bench heights of 6 m and explosives delivered to the hole by the manufacturer. Oxide or weathered material is generally only required to be lightly blasted or in some areas can be excavated as 'free dig'. Hydraulic excavators are used in conjunction with conventional blasting practices, to mine a 3.0 m flitch height. Broken rock is loaded into 60 t capacity off highway haul trucks to a central stockpile or to the waste dump.

Geovia MineSched™ software is used by GSR to plan the open pit production schedule. All criteria as detailed in the mining section of this Report has been employed plus 10% dilution and 5% ore loss to the gold grade and ore amount to make up the production schedule.

### Underground Mining

The Wassa Underground Mine commenced development in 2015 and declared commercial production in January 2017 when the open pits operation was nearly completed. The Long Hole Open Stopping ("LHOS") is the selected method for Wassa underground mining. In this method the stopes are mined with blastholes drilled vertically upwards, from the level below. The primary stope is extracted in a top-down sequence; and each stope lift is extracted below the open stope void above. Up to three stope lifts are extracted to create a continuous excavation up to 75 m high. Primary stope length is 20 m and by the width of the orebody with 20 m pillars left between, with the pillars to be mined as secondary stopes after filling the voids with waste rocks or by paste filling. When the voids are filled with paste material, the secondary stopes are mined in a bottom-up sequence to minimize paste exposure in the sidewalls. The primary stopes will be filled when the

four stopes are extracted but in secondary stopes each stope lift is planned to be filled before extracting the lift above. A sill pillar is then left when the stope excavations are up to 100 m high.

The underground mine is accessed via declines from within the completed open pit mines and then access to surface via the available open pit ramps. There are three portals and surface facilities. The main portal named the Daniel Owiredu Portal, located in Starter Pit at approximately 905 m Reduced Level ("RL"). This portal is used as the main entrance to the underground mine. Portal 2 was established in the southern end of the Main Pit at approximately 845 m RL and connects to the main decline at 820 m RL. Duplication of the main decline forms part of a haulage loop system. Portal 3 was established within the 242 open pit, at approximately 930 m RL. This portal gives access to the 242 mine.

The mining method depends on the orebody thickness and grade distributions for each panel. In panels 1 & 3, the mined voids are generally left open with some loose rock fill, to dispose of waste or for opportunistic pillar recovery. Narrower ore zones (<15 m) are mined as longitudinal stopes (>25 m length) with progressive placement of rock fill to minimize ore loss in pillars. In panel 2, the voids will be filled with paste material when primary stopes were mined out, to allow the extraction of the pillars between secondary stopes. Also, in this panel the sill pillars can be extracted after the secondary stopes are backfilled. The sill pillar extraction assumes 60% recovery of the full stope. Secondary stopes follow the primary stope front with a lag distance of between 120-140m along strike to create a sufficient buffer from active primary stopes; and development and extraction of the sill pillar commences when there is a sufficient distance from secondary stopes in the blocks above and below.

GSWL completed the mining production schedule (including mine optimisation, design and scheduling), referred to as version #13 (the "Wassa Design"), and was reviewed by SRK. The production schedules based on the Wassa Design, and is shown in Table ES-3 below, which forms the Ore Reserve reporting for the Wassa Project.

**Table ES-3: Wassa Life of Mine Plan (Based on Wassa Design)**

Source: SRK

Notes: Scheduling start date: 1 April 2024

## Mineral Processing

The ores of Wassa Mine are amenable to cyanide leaching. The processing plant adopts gravity and carbon-in-leach ("CIL") process to extract gold, and the gold recovery is higher as 95% to 97% in recent years production.

The current plant circuit for GSWL is capable of processing up to 3.5 Mtpa of total mill feed, while the processing capacity may decrease with the increase of the primary ore feed. The underground ore (fresh or primary ore) is the major source of feed into the plant whilst a blend of surface material may be added depending on availability in a ratio that averaged at 67% (OP) and 33% (UG) for 2021, 87% and 13% for 2022, and 83% and 17% for 2023, respectively. The surface ore may contain transition ore in addition to the oxides. Despite these average blend ratios, there will also periods that underground ore may be the sole feed into the plant based on the mining schedule. The blending ratio is maximised by the grade control to maintain recoveries at optimal levels throughout each year.

The processing flowsheet to treat ores from both open pit and underground operations in the Wassa Project has been proved to be mature. Recovery methods in the processing plant and forward recovery assumptions are supported by test work and plant history. The designed processing plant capacity is able to accommodate all mined ores from the mining production in all years of the life of mine (the "LoM") for the Ore Reserve plan, therefore no plant upgrades nor additional processing production lines are required to process the mine production plan.

There are no material risks identified in relation to the tailings and water balance in this Project.

## Environmental and Social Aspects

The Wassa Mine has obtained relevant environmental permits for its operations, including the environmental permit, environmental certificate, water use permits for dewatering and water abstraction for domestic purposes, mining, processing and dust suppression activities, as well as discharge. Two environmental impact statements for the expansion project and the No.2 tailings storage facility ("TSF 2"), dated March 2016 and September 2015 respectively, were reviewed by SRK. The Wassa project's haulage route crosses 12 km within the Subri River Forest Reserve, but it does not impact the reserve's Globally Significant Biodiversity Area, according to the Project Expansion Environmental Impact Statements ("EIS"). Dewatering water is partially reused to supplement fresh water for underground mining operations and the processing plant, with the remainder being discharged. All processing wastewater is recycled internally and not released externally. The project conducts comprehensive environmental monitoring regularly, covering water quality, cyanide content, noise, and dust emissions. The monitoring results are generally within the reporting limits. GSWL is a member of *International Cyanide Management Code ("ICMC")*, and Eagle Environmental conducted the most recent certification audit in April 2023.

GSWL actively engaged in a range of corporate social responsibility ("CSR") strategies, such as Stakeholder Engagement planning and consultation, foster harmonious relationships and coexistence with local communities, supporting community skills training, and contributions to foundations. Moreover, it offers a variety of employment opportunities for residents in the local communities. In the first three quarters of 2024, the direct GSWL related CSR funding amounted to an investment of approximately US\$278,214 in their host communities.

GSWL encounters a challenge with small-scale artisanal mining activities ("galamsey"), particularly in the Hwini-Butre and Benso (HBB) concessions. GSWL intensified its security monitoring activities to drive away galamsey miners that operated close to its mining areas, and local law enforcement is engaged when necessary. Several stakeholder meetings were conducted with opinion leaders and youths from both Wassa and HBB communities, especially those involved in galamsey, emphasizing the importance of refraining from such actions to preserve rehabilitated sites and the environment. GSWL is of the opinion that galamsey around Wassa Mine has little potential to impact current or future operations, since the Benso, located about 40-50 km from the Wassa Main (the primary mining operation) and Hwini-Butre, located about 80km from the Wassa Main, have had most of its economically viable surface resources extracted rendering it largely irrelevant to the Company's ongoing mining operations.

## Capital Cost and Operating Cost

The capital expenditures (the "Capex") for deeper development (depth extension to the current mine) and sustainability are estimated by GSWL. The Wassa Mine has relative stable operations, allowing the forecasting of operating expenses (the "Opex") based on historical records and current performance. All the Capex and Opex are calculated and reviewed in USD basis. The summary of Capex is presented in Table ES-4 below.

**Table ES-4: Summary of Capex for Wassa Mine**

Capex	Unit	LOM Total
Capital Development	Million USD	78
Other Sustaining Capex	Million USD	100
Closure	Million USD	27
<b>Total Capex</b>	<b>Million USD</b>	<b>205</b>

Sources: Wassa Mine, summarized by SRK

SRK has received two sets of costing data: one from Chifeng Group for the annual report and the other from Wassa Mine. The first set is organized by cost elements, while the second is grouped by activities. SRK has summarized both sets of data and used the first set, grouped by cost elements, as the input for the Technical Economic Model (TEM). Table ES-5 shows the total cost and unit cost of each category.

**Table ES-5: Summary of Opex Historical & Forecasted for Wassa Mine**

Item	Unit	2022	2023	2024 Q3	Unit Cost	TEM Input
Labor	USD/t	15.00	14.03	13.02	13.99	20.99
Material	USD/t	27.63	20.27	28.46	25.21	37.82
Electricity	USD/t	3.79	7.34	3.92	5.13	7.70
Contractors	USD/t	0.84	4.20	1.49	2.29	3.43
Engineering	USD/t	2.01	3.64	1.75	2.52	3.78
Service	USD/t	0.69	0.68	1.11	0.83	1.24
Safety	USD/t	-	-	-	-	-
Repairment	USD/t	-	-	-	-	-
Others	USD/t	3.30	-	0.14	1.05	1.58
Taxes and surcharges	USD/t	6.25	7.04	8.36	7.23	7.23
Selling costs	USD/t	-	-	-	-	-
G&A costs	USD/t	9.64	6.65	5.55	7.20	9.35
R&D costs	USD/t	-	-	-	-	-

Sources: Wassa Mine, summarized by SRK

## Project Economics

The economic analysis was conducted using conventional Discounted Cash Flow ("DCF") techniques. The Net Present Value ("NPV") was determined from the project's cash flow using a 10% discount. It should be noted that SRK's DCF modelling and NPV calculation are carried out with the purpose of testing the "economic viability" of the Project which is required to be reasonable for Ore Reserve reporting.

The cash flow estimate includes only the revenue, costs, taxes, and other factors directly associated with the Project. The assumptions are as follows:

- The currency used for the Project is US dollars.
- Annual gross revenue is calculated by applying the estimated gold price and payables to the annual recovered metal for each operating year.
- The "nominal" values are applied. SRK does not consider future inflation of currency or cost fluctuations; the cost remains constant over the LoM without any adjustments are factored in.

- Financing is assumed to be on a 100% equity basis; no debt or related financing costs have been included in the technical economic analysis.
- Neither corporate obligations nor financing costs is considered.
- Sustaining capital for future exploration, which is aimed at discovering additional Mineral Resources that is outside the Ore Reserves estimates, is not considered during this analysis, as the current project economic analysis has not employed any additional potential tonnage or grade.
- No salvage value has been included in the technical economic analysis.
- The reference date or effective date is 30 September 2024.

The projection for Ore Reserve (only) plan shows a positive economic prospect. At a discount rate of 10%, the NPV of the Project is USD 168 million, which is shown in Table ES-6.

**Table ES-6: Wassa Mine NPV versus Discount Rate**

Discount Rate (%)	NPV (Million US\$)
5%	182
6%	179
7%	176
8%	173
9%	170
<b>10%</b>	<b>168</b>
11%	165
12%	163
13%	160
14%	158
15%	155

Source: SRK

SRK conducted a single-factor sensitivity analysis for the Project to determine which factors most significantly impact its economics when considered independently. The analysis focused on gold price, Capex, and Opex, each tested within a  $\pm 30\%$  range. The results showed that the Project is most sensitive to changes in gold prices.

The break-even gold prices occur when the gold price drops by approximately 20%, resulting in an NPV of USD 0 at a 10% discount rate.

## Risk Assessment

The results of the risk assessment rating are presented in Table ES-7 below. The rating of the risks is presented before implementation of control recommendations.

**Table ES-7: Project Risk Assessment of the Wassa Gold Project**

Risk Source/Issue	Likelihood	Consequence	Overall
<b>Geology and Resource</b>			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Overestimate of Mineral Resource Grade	Possible	Moderate	Medium

Risk Source/Issue	Likelihood	Consequence	Overall
Unknown Significant Geological Structure	Unlikely	Moderate	Low
<b>Mining</b>			
Subsidence and Ground Stability	Unlikely	Moderate	Low
Hydrogeological Modeling Uncertainties	Possible	Minor	Low
Significant Production Shortfalls	Unlikely	Major	Medium
Lack of Significant Ore Reserves	Unlikely	Major	Medium
Unexpected Groundwater Ingress	Possible	Moderate	Medium
<b>Ore Processing</b>			
Significantly Lower Recovery	Unlikely	Moderate	Low
Higher Processing Cost	Possible	Moderate	Medium
Poor Plant Reliability	Unlikely	Moderate	Low
<b>Capital and Operating Costs</b>			
Project Timing Delays	Unlikely	Moderate	Low
Capital Cost and Operating Cost Increases	Possible	Moderate	Medium
Higher Mine Closure Liability	Possible	Moderate	Medium
<b>Environmental, Social and Governance</b>			
Water Management	Possible	Moderate	Medium
Waste Rock and TSF Management	Possible	Moderate	Medium
Hazardous Materials Management	Unlikely	Moderate	Low
Social Licensee to Operate	Possible	Moderate	Medium
<b>Infrastructure</b>			
Poor TSF Management	Unlikely	Moderate	Low
Shortfall of Water Supply	Possible	Moderate	Medium
Shortfall of Power Supply	Possible	Moderate	Medium
Poor Condition of the Site Road	Possible	Minor	Low

The Wassa Project is an operating project with constant open pit and open pit production. The geology, mining methods and metallurgical flowsheet have been partly verified and proved by historical operation. Overall ratings of technical risks of the Project are low and some medium risks exist in different aspects. The risks and recommended management measures are discussed below.

- The geological risks relate to the uncertainty of underground hydrogeology associated with local geological structures. SRK recommends to maintaining and enhancing the geological exploration, such as mapping the underground tunnels, especially for faults and fractures, and monitoring the underground water discharges.
- The geological risks also related to the grade estimation of underground Mineral Resources. SRK noted there are abundant Inferred Mineral Resources for the underground mine and further exploration potential, and the current Inferred Mineral Resources in deeper zones have been estimated on primarily drill core interceptions with sparse distance so there is possibility of underestimate or overestimate. SRK recommends continuous exploration to be carried out for the upgrade the underground Mineral Resources.
- The risk in relation to mining could be possible poor planning, as it is an underground mine with a relatively high production rate. Consequently, possible risk will result to production shortfall or Ore Reserve overstatement. SRK recommends carrying out in-depth engineering studies associate to LoM planning and the use of professional mine planning software. Professional services may be sourced and retained, if needed.

- The risk in relation to ore processing and metallurgy could be the possibility of high operating cost, as the current production is transitioning from underground production solely. Proper management in grade control and planning will help reduce operating costs.
- The measures and practices to manage environmental risks relating to surface water and groundwater may include separate drainage systems for production wastewater, domestic sewage, and stormwater systems; storage of hazardous materials in a dedicated area could be planned to control the risk of hazardous materials pollution. The environmental risk of land disturbances could be controlled by limiting the waste rock storage and other disturbances; scrap iron and other industrial waste collection and recycling activity may control the risks resulting from waste generation. SRK notes a conceptual closure plan should be updated with ceasing open pit production and further underground operation. TSF management associates to social responsibility, and should be taken into account.

The risks in relation to capital and operating costs include underestimates of project costs. Proper management and detailed mine scheduling may help the underground development of the Project in a proposed schedule. SRK recommends updating or adjusting the project's costs estimation from time to time according to production data in the future. It is SRK's opinion that the risks identified above are generally under control and not likely to develop into higher level of risks, as noted the Company and Wassa Project team has tracked record in production and risk management.

## Conclusions and Recommendations

### Conclusions

#### Geology and Exploration

- The Wassa deposit can be classified as an Eoeburnean folded vein system and is the only such deposit recognised to date within the Ashanti belt.
- The core drilling, geological logging etc. are implemented to a standard ensuring that the gathered data and information adequately underpin the objectives of subsequent geological modelling and Mineral Resources estimations.
- The procedures for sampling, preparation, analysis, and QA/QC are following the industry standards. SRK considers that they are acceptable for Mineral Resources estimations.

#### Mineral Resources Estimation

The Mineral Resources have been prepared in accordance with the JORC Code guidelines. Mining is assumed by open pit methods at DMH, I Zone and Chichiwelli, and underground methods at Wassa (242 and B Shoot) and Hwini Butre (FB/ADK).

The Mineral Resources have a RPEEE, with estimates constrained as follows:

- Open Pit: constrained by open pit shell and cut-off grade.
- Underground (FB/ADK): constrained by cut-off grade.
- Underground (242 and B Shoot): constrained by the MSO.

As of 30 September 2024, the Mineral Resources are estimated as:

- Measured and Indicated Mineral Resource: 16.74 Mt at 3.07 g/t, containing 1,650 koz gold.
- Inferred Mineral Resources: 60.89 Mt at 3.38 g/t, containing 6,609 koz gold.

#### **Metallurgical Testing and Recovery Method**

- Metallurgical tests were carried out before and after the construction of the processing plant in 2004. Both oxide and fresh ores have negligible preg-robbing effect and are amenable to CIL process. The gold recovery of Gravity-CIL process is as high as 90% to 95%.
- The capacity of the processing plant is 2.7 Mtpa. A traditional Crushing-Milling-CIL process with assistance of Gravity-Acacia operation in milling circuit is applied. The plant is well managed and achieved good historical performance. The gold recovery is 95.3% to 97.1% with gold production (in gold doré bars) of 4.84 to 5.31 tons per year.

#### **Infrastructure**

- The rehabilitation of TSF 1 is complete and is operated by the GSOPP for palm oil trees. The construction and management of TSF 2 is conducted properly. The planned extension of TSF 2 can meet the required capacity for tailings storage.
- The current two electricity resources (Ghanian grid power and mine generated) are sufficient for operations and domestic needs. If the solar system is implemented, it could significantly reduce power costs for offices and domestic use.
- The water balance is carefully managed. The facilities of backwater, surface water and underground water can fully support the operations of mining and processing.

#### **Recommendations**

SRK has made a number of recommendations during the review and/or site visits which have been discussed among SRK consultants and client staff. Key recommendations include:

- The large Inferred Mineral Resources need drilling programs. SRK understands that the Company is working on a long-term exploration and production plan for the Project, and the current Inferred Mineral Resources will be upgraded in next few years.
- Improve the quality of grade control model and incorporate it into the Mineral Resource/ Ore Reserve model. The current grade control model has not been incorporated in to Mineral Resource/ Ore Reserve model yet due to various reasons including grade-control sample data quality and the duration of model update. SRK is aware of that the Company has already started to work on the improvement of both models.
- Exploration potential and opportunities to be further analysed.
- Additional technical studies to examine the Measured and Indicated Mineral Resources excluded from the current Ore Reserve estimate. SRK understands that GSWL recently commissioned a third party to work with the Company's mining team in this regard.
- Further test works on the deep underground veins may be needed to assure the processing procedures and laboratory protocols being used are appropriate and suitable. This will be dependent on future exploration programs and technical studies.

- It is a feasible plan for using renewable energy such as solar to replace gradually the electricity used in offices and residential facilities, as the concept of decarbonisation has been considered by the Company.

## 1 Introduction

SRK Consulting China Ltd. ("SRK") was requested by Golden Star Wassa Limited ("GSWL", the "Company" or the "Client") to prepare a Competent Person's Report ("CPR" or the "Report") for its mining property (the "Project") in the Republic of Ghana ("Ghana") in accordance with the guidelines of the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves, 2012 edition ("JORC Code") and the Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited (the "HKEx"), including the Chapter 18 requirements (Appendix C), Chapter 2.6 of the Guide for New Listing Applicants (Appendix D) and other relevant regulations of the HKEx. GSWL's primary asset is the Wassa Gold Mine (the "Wassa Mine" or "WGM"), and 90% equity interest of GSWL is owned by Golden Star Resources (Ghana) Ltd ("Golden Star" or "GSR") which is a direct subsidiary of Chifeng Jilong Gold Mining Co., Ltd. ("Chifeng Gold"), and the Ghanaian government owns the remaining 10% equity interest of GSWL.

This Report consists of an independent review of the geology, exploration, Mineral Resources, Ore Reserves, mining, mineral processing, capital expenditure ("Capex"), operating expenses ("Opex"), and environmental and social aspects of the Project. It is understood that the Report will enable potential equity investors and possible future shareholders to understand the Project's operations.

This Report does not express an opinion as to the value of mineral or other assets involved.

## 2 Program Objectives and Work Program

### 2.1 Purpose of the Report

The purpose of this Report is to provide both existing Chifeng Gold shareholders and potential investors with a CPR of the Wassa Gold Mine, located near the village of Akyempim in the Wassa East District in the Western Region of Ghana. The SRK's report is proposed to provide an unbiased technical assessment of the risk and opportunities associated with the Project.

### 2.2 Scope of Work and Reporting Standard

#### 2.2.1 Scope of Work

The scope of work, as defined in letters of engagement executed in May 2024 between Golden Star and SRK, includes the preparation of a CPR in compliance with the JORC Code and the listing requirements of the HKEx. This work typically involves the assessment of the following key aspects of this project:

- Geology and exploration review;
- Review of exploration data quality;
- Review of Mineral Resource estimation and validation;
- Review of Ore Reserves and mining assessment;
- Ore processing flowsheet and mineral recovery assessment;
- Environmental, social aspects and permitting review;
- Preliminary economic analysis; and
- Interpretation and Conclusions.

#### 2.2.2 Basis of Technical Report

This report is based on information collected by the SRK Team during the period of the review from April to June 2024, among which a site visit has been performed, and the technical review has also included additional information provided by Golden Star throughout the course of the SRK Team's investigations.

The SRK Team has exercised due care and checked the supplied information according to the team's experience and best knowledge of the Project. SRK has no reason to doubt the reliability of the information provided by Golden Star. Other information was obtained from the public domain. Besides information collected during the SRK Team's site visits, this technical report is based on the following sources of information:

- Data provided by Golden Star prior to the site visit;
- Discussions with Golden Star personnel;
- Inspection of the open pit and underground operations;

- Review of additional exploration data and Mineral Resource models supplied by Golden Star; and
- Additional information from public domain sources.

This report has been prepared to accommodate the requirements of HKEx, and the Mineral Resources and Ore Reserves are reported according to the JORC Code (2012) which is binding upon all members of the Australasian Institute of Mining and Metallurgy ("AusIMM") and the Australian Institute of Geoscientists ("AIG").

### 2.2.3 Site Visit

Four site visits were carried out by SRK with assistance from Golden Star personnel during preparation of the Report.

- December 7 to 10, 2022, by geologist, geotechnical engineer, processing engineer and environment scientist;
- January 10 to 14, 2023, by mining engineer and underground geotechnical engineer;
- February 11 to 16, 2024, by geologist; and
- May 27 to 29, 2024, by geologist, mining engineer, processing engineer and environmental consultant.

### 2.2.4 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports (the "Valmin Code"). The Valmin Code incorporates the JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy ("AusIMM") members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the JORC Code.

## 2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm the Client's ownership of its underlying tenement and/ or the Client has any unresolved legal matters relating to any transfer of

ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Client has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Client and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

## 2.4 Effective Date

The effective date for this CPR is deemed to be 30 September 2024 (the "Effective Date"). The Mineral Resource and Ore Reserve statements set out in this CPR are reported as of 30 September 2024 and represent the Mineral Resources and Ore Reserves at the Effective Date as audited by SRK.

The life of mine (the "LoM") plans and associated technical and economic parameters included in the LoM plans and technical and economic models all commence on 1 April 2024.

## 2.5 Work Program

The technical review was jointly undertaken by SRK as well as SRK Consulting Practises in Ghana and South Africa (collectively the "SRK Team"). The technical review involves multiple disciplines covering all fundamental aspects including geology, Mineral Resource estimation, Ore Reserve estimations, mining, processing, environmental and social assessment as well as project evaluation.

The Mineral Resource statement reported herein is a collaborative effort between Golden Star and SRK personnel. The exploration database and Mineral Resource models were compiled and maintained by Golden Star, and audited by the SRK Team.

The geological model and wireframes for the gold mineralisation were constructed by Golden Star. In the opinion of SRK, the geological model is a reasonable representation of the distribution of the targeted mineralisation at the current level of sampling. The review of geostatistical analysis, variography and grade models were completed by the SRK Team during April and June 2024.

The review of Modifying Factors including mining and processing operations, underground design and constructions, environmental and social assessment, infrastructure, capital expenditure and operating costs were conducted by the SRK Team.

The draft version of technical report was jointly compiled by the SRK Team from April to June 2024.

## 2.6 SRK Experience

The SRK Consulting Group ("SRK Consulting") is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company's more than 1,500 clients are most of the world's major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting's independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK China was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices—especially SRK Australasia, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience at providing Independent Expert Reports for mining companies who have successfully listed on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-1.

**Table 2-1: SRK's Reports for Listing on the HKEx**

Company	Year	Nature of Transaction
Yanzhou Coal Limited (listed in HKEx)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on HKEx and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on HKEx
Lingbao Gold Limited	2005	IPO Listing on HKEx
Yue Da Holdings Limited (listed in HKEx)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on HKEx
Sino Gold Mining Limited	2007	Dual Listing on HKEx
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on HKEx
Kiu Hung International Holding Limited	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Limited	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Limited	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Limited	2009	Acquisition of a molybdenum mining project in Shaanxi, China

Company	Year	Nature of Transaction
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on HKEx
Citic Dameng Holdings Limited	2010	IPO Listing on HKEx
China Hanking Holdings Limited	2011	IPO Listing on HKEx
China Daye Non-Ferrous Metal Mining Limited	2012	Very Substantial Acquisition on HKEx
China Nonferrous Mining Corporation Limited	2012	IPO Listing on HKEx
Hengshi Mining Investments Limited	2013	IPO Listing on HKEx
Future Bright Mining Holdings Limited	2014	IPO Listing on HKEx
King Stone Energy Group Limited	2014	Acquisition of Shareholding in silver mines in Fujian, China
Agritrade International Pte LTD	2015	Acquisition of Shareholding in one coal mine in Indonesia
China Unienergy Group Limited	2016	IPO Listing on HKEx
Pizu Investment Co. Ltd	2020	Acquisition of Shareholding in a polymetallic project in China
China Qinfa Group Limited	2021	Annual disclosure of coal mines in Shanxi, China
China Graphite Group Limited	2022	IPO Listing on HKEx
Kinetic Development Group	2022	Major transaction of equity interest in Ningxia Sunshine
Persistence Resources Group Ltd	2023	IPO Listing on HKEx

## 2.7 Project Team

The SRK team contributed to this Report includes consultants as follows.

**Pengfei Xiao, MSc, MAusIMM, MAIG**, is the Managing Director of SRK China. He is a Principal Consultant (Geology) with a specialty in mineral exploration applying comprehensive geological and geophysical methods; and his expertise also includes resource modelling and estimation as well as project evaluation in the past 15 years. He is familiar with both theory and practice in sampling, sample preparation and chemical analysis. As a consulting geoscientist, he has been active in over 200 projects including due diligence reviews, exploration design, data verification, resource estimation, project evaluation and technical studies in over 60 countries. His experience relates precious metal (Au, Ag, PGE), base metal (Cu, Ni, Pb, Zn) and other metal deposits (Fe, Mn, V, Mo, Co), and also includes a few non-metal projects (phosphorite, potash, gypsum). *Mr Pengfei Xiao is the Project Manager and Competent Person for this Report and takes overall responsibility of the SRK team. Mr Xiao has been actively involved in the project assessment since 2022.*

**Huaixiang (Hubert) Li, MEng, MAIG**, is a senior consultant (geology) with SRK China. He graduated from the China University of Geosciences (Beijing). He has been worked in the China Railway Resources Group for 6 years and has gained lots of experiences and expertise in geological and mineral resources exploration. He is familiar with the Chinese principles and methods for metal ore deposits prospecting and exploration including gold, silver, copper, lead, zinc, molybdenum and

bauxite. He is proficient in geological modelling, mineral and ore resources estimation, data processing and GIS/RS application. Besides, he also has 5 years experiences in project management. *Mr Hubert Li assists Mr Xiao in geology and Mineral Resource review and he is the Competent Person who evaluates the Mineral Resources in this Project. He visited the Wassa Project in May 2024.*

**Ivan Doku, Pr Eng (South Africa), MSAIMM**, Principal Resource Geologist and Country Manager for SRK Ghana. Ivan's expertise is in due diligence studies and Mineral Resource estimation. With 16 years' experience spanning a range of commodities including gold, PGEs, and base metals, he has worked as a mine geologist at Driefontein Gold Mine, and as a resource geologist at South Deep Gold Mine. At SRK, Ivan has been involved with due diligent audits of several Mineral Assets, compilation of MREs, assay QA/QC analysis within South Africa and Africa in general. He has acted as Competent/Qualified Person for mining projects and operations on multiple technical studies. Ivan is registered as a Professional Natural Scientist with the South African Council for Natural Scientific Professionals (Reg: 400513/14). Ivan holds a BSc in Geological Engineering, MSc and GDE in Civil and Mining Engineering respectively. *Mr Ivan Doku reviewed the Mineral Resource estimation of the Project and he performed the site visit in February 2024.*

**Paul Blaber**, Associate Geological consultant SRK Consulting Ghana. Paul's expertise is in generative exploration, exploration development and due diligence studies. With 20 years' experience, mostly in gold and limited base metals in DRC and Cote D'Ivoire, working as Exploration geologist with Red Back Mining Inc in Ghana and Mauritania, Exploration geologist with Newmont Gold Ghana at Ahafo North, AVOCET Mining PLC in Guinea and Barrick Gold (Holdings) Ltd in Bulyanahulu, Tanzania. At SRK, Paul has been involved with due diligence audits of the Beoumi Polymetallic deposit in Cote D'Ivoire and other Projects in Tarkwa along the Ashanti Belt margins. He has acted as Competent/Qualified Person for a number of exploration projects and technical studies. Paul is a registered member with Australian Institute of Mining and Metallurgy (Reg: 305289). Paul holds a BSc in Geological Engineering and MSc Geological Engineering. *Mr Paul Blaber drafted the section of geology and exploration assessment and he performed site visit in 2022.*

**John Kwofie** is an Associate Principal Geotechnical Engineer with SRK Consulting Ghana Limited. He has a B.Sc. in Geological Engineering and an M.Sc. in Civil Engineering Construction Materials. He has over 30 years' experience in surface mining geotechnics predominantly in West African gold mines. His work experience includes open pits slope design, geotechnical risk management in fresh rock and saprolitic environments, tailings dams' operational management, and earthworks quality assurance. He has worked on multidisciplinary projects including gold mine construction, heap leach pads, raise boring, tailings and freshwater dams, metallurgical plant foundations, buildings, and road construction. He worked as an independent consultant and part-time lecturer prior to joining SRK as Country Manager in May 2011. John has many years' experience in mining operations, notably as Geotechnical Manager of AngloGold Ashanti - Mali (Sadiola, Yatela and Morila Mines) from 2008 to 2010. Prior to that, he was the General Manager - Rock Mechanics for Hindustan Zinc Limited, a member of Vedanta Resources Group in India. He is a registered member of the Southern African Institute of Mining and Metallurgy (SAIMM) and also the South African National Institute of Rock Engineering (SANIRE). *Mr John Kwofie visited the project site in 2022 and he provided geotechnical assessment to the project team.*

**Seth Owusu-Sarpong** is a holder of MSc degree in Finance and MSc Degree in Mining Engineer with specialization in Mining Rock Mechanics. He has over 30 years' experience in underground hard

rock mining and has been involved in many underground operations of varying ground conditions ranging from very shallow room and pillar mining, Cut and Fill mining to very deep and seismically active Vertical Crater Retreat, Open Stope and Sub-Level Caving environments. His experience includes numerical modelling, ground control management, ground conditions characterization for large underground excavation designs (stopes, workshops, pump chambers, etc.), mine shaft raise boring, training of mine personnel in underground geotechnics, consultancy services, as well as lecturing in Mining Principles and Rock Mechanics. His working experience covers 15 years of gold mining with AngloGold Ashanti, Obuasi Mine, Ghana; 8 years of copper mining with Mopani Copper Mines, (Mufulira, SOB Kitwe and Mindolo SV - underground and surface) in Zambia, and 8 years of consultancy service and lecturing in Ghana. *Mr Seth Owusu-Sarpong visited the Project in 2022 and contributed in geotechnical assessment.*

**Ali Rudaki, BSc (Mine Exploitation Engineering), Pr Eng (South Africa), MSAIMM**, Principal Mining Engineer of SRK Consulting (South Africa), he has been involved in the field of open pit mining engineering for the past 28 years. His expertise includes: open pit optimisation and strategic mine planning and scheduling; strategic risk management in mine design, from life of mine to global optimisation; mining and mineral processing optimisation; mining feasibility studies; and mining operations. *Mr Ali Rudaki visited the project site in 2023 and he has reviewed the mining aspects and Ore Reserves for Open Pit since 2022.*

**TzuHsuan (Shan) Chuang, M.Eng., MAusIMM**, is a Senior Consultant (Mining) at SRK China. She has experience in consulting and operation management. After graduating from Colorado School of Mines, she conducted scoping studies, pre-feasibility, feasibility studies, and project valuation in Zijin mining design company, with projects in China, Serbia, Tajikistan, Australia, Colombia, and Guyana. She then worked at Buritica underground gold mine of Continental Gold in Colombia, and was responsible for life of mine (LoM) plan, production operation, and grade control optimisation. Her expertise includes pit optimisation, mine design, and scheduling in metal mine, and is skilled in using Deswik, Whittle, Surpac, Minesched, and AutoCAD. *Ms Shan Chuang assists Mr Xiao in mining and Ore Reserve assessment and she is the Competent Person who evaluates the Underground Ore Reserves in this Project. She visited the Wassa Project in May 2024.*

**Lanliang Niu, BEng, MAusIMM, Member of MCAMRA**, is a Principal Consultant (Processing) with SRK Consulting China Ltd. He has 10 years' experience in processing research and 10 years in plant operation management and 15 years in mining technical consultancy. He has specific expertise in the processing of precious metal, nonferrous metal, ferrous metal, and some non-metallic minerals, as well as processing test, plant design and operation management, and mining project evaluation. He is actively involved with the new development of processing technologies, equipment, and reagents and has received two national awards for his achievements in this area. Since joining SRK, Lanliang has played a pivotal role in the due diligence and technical evaluation of nearly 200 mining financing or M&A projects within China and internationally. *Mr Lanliang reviews the processing part and he is the Competent Person of gold processing. He visited the Wassa Project in May 2024.*

**Xiangfeng (Freda) Yang, M.E; MAusIMM, Registered Qualification Certificate of Constructor (Mining Engineering and Mechanical & Electrical Engineering), Registered Qualification Certificate of Cost Engineer (Civil Engineering)**; is a Senior Consultant (Processing) with SRK China. Ms Yang acquired specialized knowledge of non-ferrous and non-metallic ore processing and plant design during her undergraduate studies and graduate education at Wuhan University of

Technology. Since graduating in 2010, she has been engaged in feasibility study, preliminary design and construction drawing design while employed with Bluestar Lehigh Engineering Institute Co., Ltd. and Nanchang Mineral Systems Co., Ltd., published several papers and models, and led and participated in the design of many medium and large phosphate ore, potash and sulfide ore processing plants. Ms Yang also has rich experience in processing equipment selection and procurement, processing scheme design and plant configuration. *Ms Freda Yang assists in mineral processing assessment.*

**Lawrence Darkwah** is a Senior Lecturer in Chemical Engineering at Kwame Nkrumah University of Science and Technology, Kumasi and has vast experience working as an operation metallurgist and a consultant. His expertise in Mineral Processing is in operations, technology development, and implementation for the maximisation of resource recovery. He has been involved with diligent auditing of processing assets cutting across the chemical engineering discipline in Ghana. He has also served as a panellist at a National Policy Summit in Kumasi where his knowledge and experiences in the mineral processing industries were seen in advocating solutions to the small-scale mining canker in Ghana. He has presented technical papers at various meetings and conferences on mining practices and the potential menace from untreated mine water at national and international fora. Lawrence is registered with the Ghana Institution of Engineers (GhIE) (Reg: 08263) since 2015 and holds a BSc. (Hons.) in Metallurgical Engineering, an MSc. in Industrial Biotechnology and a PhD. in Chemical Engineering respectively. *Mr Lawrence Darkwah visited the Project in 2022 and he provided additional support to the metallurgical review.*

**Hongchen (Cynthia) Huang, B.A.**, is a consultant (ESG) at SRK China, possessing 10 years of expertise in marketing, technical translation and project management within the mining industry. Currently she is transitioning her focus towards environmental, social, and governance aspects, actively contributing to environmental and social assessments while playing a key role in supporting SRK's carbon accounting program. Since joining SRK, Cynthia has provided project co-ordination and management, technical translations, and environmental review for a diverse range of projects, including Guizhou Union Coal Project, Hanking Indonesian Nickel Project, Mongolian Sujishan Graphite Project, Australian Greenbushes Lithium Project, Chilean Salar Project, Angola Binga Copper Project, and Zijin Group Tajik Gold Project. *Ms Cynthia Huang assists in environmental and social review. She visited the Wassa Project in May 2024.*

**Ekua Semuah Odoom, BSc (Environmental Science), Msc (Climate Change and Sustainable Development), PhD (Environmental Science).** Ekua Semuah Odoom is an environmental scientist and the Director of Systems Environ-Tech Ltd, an environmental consulting firm based in Accra, Ghana. She has over 7 years expertise in the areas of climate change adaptation and mitigation, natural resource management, environmental assessment and auditing. Ekua has a broad understanding of environmental legislation relevant to development projects, including Ghana EIA process, legislation and standards, and has over the years worked on environmental assessment for the mining, oil and gas, hospitality, healthcare and manufacturing sectors of Ghana. She has undertaken tasks in the domain of Environment Impact Assessment (EIA), Environmental Management Plan (EMP), Annual Environmental Report (AER), and dialogue facilitation among project stakeholders. She also provides advisory services and manages corporate environmental compliance portfolio for companies and industries in Ghana. Ekua is currently in the process of acquiring certification and membership with IEMA for practitioner level in Environmental

Management. *Mr Ekua Semuah Odoom visited the Wassa Project in 2022 and he assisted in environmental and social review.*

**Alexander (Alex) Thin, BEng, FAusIMM (CP), FIMMM, FSAIMMA**, Principal Consultant (Mining) at SRK China, he is an experienced mining professional with over 30 years' experience. His strategy and leadership experience spans feasibility studies, mineral asset audits and evaluations, independent technical reports, techno-economic studies, capital raising, merger and acquisitions, managing joint ventures, local and international stock exchange compliance, business development and investor/ stakeholder relations. Alex's industry experience spans operational (underground and open pit), technical consulting and corporate within the metalliferous resources sector, covering precious metals, base metals and bulk commodities. *Mr. Alex Thin peer reviewed the Report and he supervised the mining and Ore Reserve reviewing.*

## 2.8 Warranties

Chifeng Gold has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

## 2.9 Compliance Statement

The information in this report that relates to Mineral Resources/Ore Reserves is based on information compiled by Mr. Pengfei Xiao, a Competent Person who is a Member of AusIMM, and Ms TzuHsuan Chuang, a Competent Person who is a Member of the AusIMM. Both are full-time employees of SRK.

This Report is a Competent Person's Report in line with the Listing Rules of the Exchange and HKEX.

Mr. Pengfei Xiao and Ms TzuHsuan Chuang have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code.

Mr. Pengfei Xiao and Ms TzuHsuan Chuang consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Mr Alex Thin, *FAusIMM*, a Principal Consultant (Mining).

## 2.10 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Chifeng Gold or Chifeng Gold's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence. SRK is independent of Chifeng Gold applying all of the tests in 18.21 and 18.22 of the Listing Rules of the Exchange and HKEX.

### **2.11 Consent**

SRK consents to this Report being included, in full, in documents that Chifeng Gold proposes to submit to the HKEX and/ or disclosure to the public markets, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

### **2.12 Forward Looking Statement**

Estimates of Mineral Resources, Ore Reserves, and mine production are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

### 3 Operational Licenses and Permits

The Wassa mine is located near the village of Akyempim in the Wassa East District, in the Western Region of Ghana. It is located about 80 kilometers (km) north of Cape Coast and about 150 km west of Accra, the capital city of Ghana. The property is situated between latitudes 5°25' and 5°30' north, and between longitudes 1°42' and 1°46' east. The location of the Wassa mine is shown in Figure 3-1.

Figure 3-1: Location of Wassa Mine

Source:SRK.

The Wassa mine is operated under the Wassa mining lease which was issued on 17 September 1992. The total surface area of the Wassa Mining Lease is 63 km<sup>2</sup>. In addition to the Wassa mining lease, GSWL holds the Hwini Butre and Benso mining leases, and several prospecting licences in the Western Region of Ghana. GSWL's mineral properties are shown in Figure 3-2.

Figure 3-2: GSWL's Mineral Properties Location in Ghana

Source: GSR.

The mineral concessions belonging to GSWL are listed below.

- Wassa mining lease: The Wassa Mine is an operating gold mine comprising principally underground operations with following mineralisation domains: F Shoot, 419, B Shoot, 242, Starter, South-East, Mid-East and Dead Man's Hill.
- Benso mining lease: comprising the Subriso East, Subriso West, G-Zone, C-Zone and I-Zone deposits.

- Hwini Butre mining lease: comprising the Father Brown, Adoikrom and Dabokrom deposits.
- Benso (Chichiwelli) exploration property: comprising two mineralised zones, Chichiwelli West and Chichiwelli East.
- Manso exploration property: located east of the Benso and Hwini Butre Concessions.

The properties and leases are spread along a trend of approximately 80 km southwest of the Wassa mine. There are sufficient access and surface rights for GSWL's operations. This section summarises related operational licences and permits. SRK relied on the information provided by the Company, and SRK understands that a legal due diligence review of this Project has been undertaken by the Company's legal advisors.

### 3.1 Mineral Tenure

Table 3-1 sets out the mineral rights held by GSWL (or those in which GSWL has an interest). GSR will from time to time seek a title opinion from its legal counsel in Ghana to confirm its title in its material mineral properties, and the good standing of the underlying mineral rights. SRK viewed the copies of the mining licenses and prospecting licenses of Wassa project, while the licensing information in relation to the project needs to be further relied on legal due diligence opinions. The summary of the mineral tenure information is as below:

**Table 3-1: Mineral Tenure Information**

License Type	Lease/Permit Name	Current Lease No.	Current Grant Date	Current Expiry Date	Current Status	Area (km <sup>2</sup> )
Mining Lease	WASSA ML	LVDGAST35364682022	26-Jan-2022	25-Jan-2047	Active	63.00
	HWINI-BUTRE ML	LVDGAST37993462020	25-Aug-2020	24-Aug-2031	Active	43.00
	BENSO ML	LVDGAST38000372020	25-Aug-2020	24-Aug-2031	Active	19.45
Prospecting License	BENSO PL	LVB 9113/1994 & PL 2/155	30-Dec-2020	Pending Renewal	Awaiting Minister's Approval	24.81
	MANSO 1 PL	LVB 5528/2005 & PL 2/378	3-Apr-2022	3-Mar-2025	Active	101.57
	DWABEN (SAFRIC) RL	LVB1624/2006 & RL2/117	12-Mar-2020	Pending Renewal	Awaiting Minister's Approval	26.92
	MANSO 2 PL	LVB 8461/2003 & PL 2/337	5-Apr-2022	3-May-2025	Active	23.41

Source: GSR

Notes: The Benso PL and Dwaben RL are awaiting for the approval of Minister of Lands and Natural Resources

The Wassa Mine sits within the Wassa mining lease which comprises an area of 63.00 km<sup>2</sup> lying to the north and south of latitudes 5°25'30" and 5°30'45", respectively and bounded to the east and west by longitudes 1°41'45" and 1°46'30", respectively.

The Wassa mining lease was entered between the Government of Ghana and Satellite Goldfields Limited (SGL) on 17 September 1992 for a term of 30 years, renewable. In 2002, the mining lease was assigned by SGL to GSWL with the written consent of the Government of Ghana. GSWL is the

registered legal and beneficial holder of the Wassa mining lease. The Government of Ghana holds 10% of GSWL share capital.

### 3.2 Underlying Agreements

GSWL pays to the Government of Ghana within thirty days from the end of each quarter a royalty at a rate of 5% determined based on the total revenue of minerals produced during the quarter. This royalty is payable prior to any adjustments from the Royal Gold stream (see below). Royalties are paid through the Commissioner of Internal Revenue.

Payment of annual ground rent is made to the owner of the land except in the case of annual ground rent in respect of mineral rights over stool lands, which are paid to the Office of the Administrator of Stool Lands. A holder of a mineral right must also pay to the Minerals Commission an annual mineral right fee determined based on the type of tenure. GSWL pays annual ground rate and annual fees in relation to all the mineral rights it holds.

GSR is party to a gold purchase and sale agreement with Royal Gold, Inc. through its wholly owned subsidiary RGLD Gold AG (RGLD). The agreement was initiated on 6 May 2015, amended on 29 June 2018, 17 October 2019 and most recently 30 September 2020 before Chifeng Gold's takeover. The stream covers all gold produced within GSWL's mineral concessions and requires GSR to deliver according to two tiers:

- Tier 1: 10.5% of all production to RGLD at a cash purchase price of 20% of spot gold until 240,000 ounces have been delivered; and
- Tier 2: thereafter, to deliver 5.5% of all production to RGLD at a cash purchase price of 30% of spot gold.

Pursuant to the terms of the gold sale and purchase agreement, GSR is restricted from granting encumbrances on the Wassa gold project without RGLD's consent. In 2019, GSR entered into a credit facility agreement with Macquarie Bank Limited pursuant to which GSWL's mineral rights were, with the approval of the Minister of Lands and Natural Resources and RGLD, encumbered to secure the repayment of the loan.

SRK is not aware of legacy issues associated with the GSWL site.

### 3.3 Permits and Authorisation

In addition to the mineral rights specified in Table 3-1, GSWL requires certain permits and licenses to carry out its activities, including:

- Mining operating permit:

The Minerals and Mining (Health, Safety and Technical) Regulations, 2012 (L.I. 2182) prescribe technical and health and safety standards for mining operations and requires a person who is granted a mining lease to, before the commencement of operation of the mine, obtain a mining operating permit from the Inspectorate Division of the Minerals Commission.

- Licence to export, sell or dispose of minerals:

The exportation, sale or disposal of minerals requires a licence from the Minister for Lands and Natural Resources. Pursuant to section 46 of the Minerals and Mining Act., a mining lease authorises the holder to, inter alia, "take and remove from the land the specified minerals and to dispose of them in accordance with the holder's approved marketing plan." Under the Minerals and Mining (General) Regulations, 2012 (L.I. 2173), an application by a holder of a mining lease for a licence to export, sell or dispose of gold or other precious minerals produced by the holder must be accompanied by a refining contract and a sales and marketing agreement.

- Operating licence and permit for the acquisition, use, transportation and storage of explosives:

Under Regulation 23 of the Minerals and Mining (Explosives) Regulations, 2012 (L.I. 2177), the construction of a building or other structure to be used as a magazine for the storage of explosives is subject to an operating license delivered by the Minerals Commission. As required under Regulation 32 of L.I. 2177, the storage of explosives in a magazine is also subject to a permit from the Minerals Commission; the latter is valid for one year and is renewable upon application. Under L.I. 2177, an operating licence is required for the purchase and use or transportation of explosives. There are separate operating licences for the purchase and use of explosives and for transportation. Each is valid for a period of one calendar year and is renewable on application made one month before the end of each year. Additionally, a permit is required for each occasion on which explosives are being transported in respect of which the specific type and quantity of explosives must be indicated.

- Licence to use water resources:

The use of water resources is regulated by the Water Resources Commission Act, 1996 (Act 522) and the Water Use Regulations, 2001. Act 522 provides that no person shall (a) divert, dam, store, abstract or use water resources; or (b) construct or maintain any works for the use of water resources except in accordance with the provisions of the Act. Subject to obtaining the requisite approvals or licences, a holder of a mineral right may, for purposes of or ancillary to the mineral operations, obtain, divert, impound, convey and use water from a river, stream, underground reservoir or watercourse within the land the subject of the mineral right.

- Fire permit:

The Fire Precaution (Premises) Regulations, 2003 requires that a fire certificate be issued by the Chief Fire Officer in respect of premises used as a place of work or for a purpose which involves access to the premises by members of the public, whether on payment or not. The certificate is valid for 12 months and is renewable.

GSWL conducts its operations in accordance with applicable laws and regulations in Ghana and is in compliance with its permitting obligations in relation to its activities. With regards to environmental matters, GSWL has undertaken environmental impact assessment studies on its concessions to support the permitting of its mining projects and has considerable background data to support required environmental permitting processes.

### 3.4 Environmental Considerations

The Environmental Assessment Regulations, 1999 (L.I. 1652) require that all developmental activities likely to impact adversely on the environment be subject to environmental assessments. Pursuant to these regulations, an undertaking which in the opinion of the Environmental Protection Agency (EPA) has or is likely to have an adverse effect on the environment cannot commence unless the undertaking has been registered and an environmental permit has been issued by the EPA. The Minerals and Mining Act requires that all necessary approvals and permits required to be obtained from the Forestry Commission and the EPA for the protection of natural resources, public health and the environment.

The major environmental permits in place for the Wassa mine are:

- Wassa operations (EPA/EIA/112) and expansions (EPA/EIA/322) including South Akyempim pits (EPA/EIA/190);
- Hwini Butre and Benso operations (EPA/EIA/175) and expansion (EPA/EIA/247);
- Wassa tailings storage facility ("TSF") 2 (EPA/EIA/383) and renewal (EPA/EIA/442); and
- Wassa Expansion project, including Wassa underground, Main pits and waste dump expansion (EPA/EIA/508).

### 3.5 Mining Rights in Western Region of Ghana

There are a number of mining licenses granted for companies operating in Ghana.

The Constitution of Ghana vests title in every mineral in its natural state to the Government of Ghana. The exercise of any mineral right in Ghana requires an appropriate mineral title to be issued by the Government of Ghana acting through the Minister responsible for Lands and Natural Resources. The Minister of Lands and Natural Resources administers, promotes and regulates Ghana's mineral wealth through the Minerals Commission, a governmental organization designed in accordance with the Minerals Commission Act 1993 and the Minerals and Mining Act, 2006 Act 703 (Minerals and Mining Act).

A person must apply to the Minerals Commission and be granted a mineral right by the Minister of Lands and Natural Resources before they can search, survey, prospect, explore or mine for a mineral anywhere in Ghana. There are different types of licenses (namely, reconnaissance and prospecting licenses, and mining leases) for the different mining activities. Each type of licence details the activities that are permitted.

The Government of Ghana holds a 10% free-carried interest in all companies holding mining leases. The 10% free-carried interest entitles the Government to a pro-rata share of future dividends. The Government has no obligation to contribute development capital or operating expenses.

## 4 Accessibility, Climate, Local Resources, Infrastructure, and Physiography

### 4.1 Accessibility

The Wassa Mine is located near the village of Akyempim in the Wassa East District in the Western Region of Ghana. It is 62 km north of the district capital, Daboase, and 40 km east of Bogoso. It is located 80 km north of Cape Coast and 150 km west of the capital Accra. The main access to the site is from the east, via the Cape Coast to Twifo-Praso road, then over the combined road-rail bridge on the Pra River. There is also an access road from Takoradi in the south via Mpohor.

### 4.2 Local Resources and Infrastructure

There are four other mines in the vicinity of Tarkwa; namely, Ghana Manganese Company – Nsuta Mine, Anglo Gold Ashanti Iduapriem Gold Mine and Goldfields Ghana Limited - Damang and Tarkwa mines.

The Wassa Mine itself is located in the Wassa Mining Lease within the Subri-Akyempim Concession, which covers an area of 63 km<sup>2</sup>.

Wassa Mine is currently an operating open pit and underground mining complex yielding approximately 480kt of total material (ore and waste) per month, and the required services, infrastructure, and community support are already in place. The following are relevant to the assessment of resources and infrastructure:

- Access to the project is via the public road network that extends on to the site;
- Electricity and water are available;
- Surface infrastructure in the area consists of a variety of government, municipal, and other roads with good overall access;
- Processing will be carried out at the existing GSWL processing plant;
- Tailings will be stored in the existing GSWL TSF and the new TSF approved in April 2013;
- Waste rock generated at the site will be placed in existing waste dumps, adjacent to the Wassa open pit; and
- The extensive history of mining in Ghana provides opportunities to obtain skilled underground mine workers.

### 4.3 Climate

The climate in the project area is classified as wet semi-equatorial. The Inter Tropical Convergence Zone ("ITCZ") crosses the area twice a year, resulting in a bi-modal rainfall pattern, with peaks in March to July and September to October. During the dry season months of November to February, the climate is heavily influenced by the dry, dust-laden, northwest trade wind, known locally as the Harmattan, which blows from the Sahara Desert.

Analysis of available rainfall data, obtained from the Ateiku Meteorological survey (1944 to 2009) indicates that the average annual rainfall is  $1,996 \pm 293$  millimetres ("mm"). The wettest month of the year is generally June, with an average rainfall of about  $241 \pm 85$  mm, whilst January is the driest month of the year with an average rainfall of about  $31 \pm 35$  mm. The wettest month on record was June 2009, when 475 mm of precipitation was recorded. Rainfall is mainly influenced by south-west monsoon winds, which blow from the south-western part of the country towards the north-east.

Using data from the GSWL weather station, the average annual rainfall has been estimated at about 1,750 mm. A drier period, which is influenced predominantly by a sweep of the north-east trade winds, is experienced between the month of November and February.

Annual potential evapotranspiration is estimated to be approximately 1,337 millimetres per year ("mm/yr"), indicating a minimum precipitation excess of 288 mm/yr. Rainfall exceeds potential evapotranspiration from March to July and September to October, and groundwater recharge is most likely to be prevalent during these periods. Relative humidity is fairly constant throughout the year, ranging from 88% to 90%.

Under such climatic conditions surface mining operations can continue year-round with short breaks during storms, most of which are short-term and may be experienced throughout most of the year. Underground mining operations will not be directly affected by storms as long as effective storm water management infrastructure is in place at surface to divert runoff from mine's accesses.

#### 4.4 Physiography

The project area is characterised by gently rolling hills with elevations up to 1,100 m RL, incised by an extensive drainage network. The natural vegetation is an ecotone of the moist, semi-deciduous forest and wet rainforest zones. It has been degraded due to anthropogenic activities, giving way to broken forest, thickets of secondary forest, forb re-growth, swamps in the bottom of valleys, and cleared areas.

Extensive subsistence farming occurs throughout the area, with plantain, cassava, pineapple, maize, and cocoyam being the principal crops. Some small-scale cultivation of commercial crops is also carried out, with cocoa, teak, coconut and oil palm the most common. Forest patches are present on the steep slopes and in areas unsuitable for agriculture.

Environmental assessments carried out in the project area over the last two decades (SGS 1996 and 1998, WGL 2004, GSR 2015, Geosystems 2013, and Golder 2016) indicate that the biodiversity of the Wassa operational area is of low ecological significance and conservation status.

## 5 History

### 5.1 Wassa

#### 5.1.1 Historical Mining

The Wassa area has experienced local small-scale and colonial mining activity since the beginning of the 20th century with numerous small open pits and adits evident.

From 1988, the property was operated as a small-scale mining operation with a gravity gold recovery circuit by WMRL, a Ghanaian company.

#### 5.1.2 Satellite Goldfields Limited (1993-2002)

In 1993 WMRL formed SGL with the Irish companies Glencar Exploration Ltd. and Moydow Ltd., assigning the Wassa mining lease to SGL.

Extensive satellite imagery and geophysical interpretations were carried out which identified a strong gold target. Exploration drilling commenced in February 1994 and by March 1997, 58,709 m of drilling had been completed. Construction of the Wassa Mine was initiated in September 1998, after Glencar secured a US\$42.5 M debt-financing package from a consortium of banks and institutions.

The operation was originally developed as an open pit mine with heap leach treatment of 3.0 Mtpa and planned production of 100,000 oz/yr. First ore was mined from the open pit in October 1998.

During the first year of production, planned gold recovery of 85% from oxide ore in the heap leach was not achieved due to high clay content of the ore and poor solution management. Attempts were made to increase recovery, including doubling the leach solution application rate but recoveries for the oxide ores above 55-60% could not be achieved.

The low gold recovery resulted in debt servicing issues and Wassa was marketed for sale. GSR started negotiations to purchase Wassa in mid-2000. As part of due diligence, GSR initiated a drilling program in March 2001 to test their geological model and extensions to some of the high-grade orebodies.

SGL was placed into receivership in November 2001 and in April 2002, GSR concluded that the mineable reserve at Wassa was 30% below the 648,000 oz stated by SGL. Negotiation continued until September 2002 when the agreement for GSR to purchase the 90% share of Wassa was announced.

### 5.2 Hwini Butre, Benso and Chichiwelli

#### 5.2.1 Historical Mining

Early European reports indicate the Dabokrom area, around Hwini Butre, may have been a major source for gold sold to Portuguese explorers when they first arrived in Ghana in the late 1400's.

European interest grew in the 1800's with the presence of gold and proximity to Sekondi-Takoradi, which had developed as a port to service mines at Tarkwa, Prestea and Obuasi. Many exploration licences were granted during the gold boom of 1898-1902 and by the 1930's most of the area was under license to various local and European interests.

At Dabokrom, a shaft was sunk by Oceania Consolidated in the 1930's to follow the shallow dipping quartz veins. The property was worked for several years but stopped in 1939 at the start of World War 2.

At Chichiwelli, a shaft was sunk in 1918 following a quartz vein at the very north end of the Benso concession, close to the Subri River Forest Reserve. Mining progressed to the 260 ft level but was abandoned in 1924 after the mine was flooded.

The whole area has many historic workings which evidence mining activity, mostly from the 1930's.

### **5.2.2 Modern Exploration (1980's-2005)**

The Dabokrom concession was acquired by BD Goldfields (BDG) during the 1980's who invited Danish company Lutz Resources Limited to carry out preliminary exploration on the property. The property transferred to Hwini Butre Minerals (HBM) in the early 1990's, which was controlled by Lutz.

HBM entered a joint venture with Placer-Outokumpu who drilled several holes around Dabokrom in 1993 to assess potential of the vein systems. They concluded that potential was limited by widely spaced veins and little gold in the diorite host rock. Saint Jude Resources (SJR) acquired Dabokrom in 1994 and explored the area until 2002 when work was suspended due to a legal dispute between SJR, BDG and the Government of Ghana. The matter was resolved in 2005 before acquisition of the project by GSR.

SJR began exploring the concession in February 1995 which represented the first sustained exploration program on the concession. SJR undertook ground geophysical surveys which included magnetic, radiometric and induced polarization surveys; soil geochemical surveys were also completed on the concession area, resulting in the identification of numerous targets. Trenching and pitting were conducted in areas of geophysical and geochemical anomalies and over historical prospects or old workings in an attempt to outline near surface mineralisation. Subsequent drilling of the surface targets resulted in the delineation of the Adoikrom, Father Brown and Dabokrom prospects along a combined strike length of 900 m. Further exploration conducted in 2005 identified the Adoikrom North prospect. A total of some 22,100 m over 267 drill holes were completed on the main mineralised zones and the exploration targets.

Reconnaissance work at Chichiwelli, Subriso, Denerawah and Amantin was conducted by BHP Billiton from 1989-92, on what is now the Benso concession. This identified soil geochemical anomalies and follow-up drilling was completed at Chichiwelli but results did not meet targeting criteria and the concessions were relinquished. Tenure was then acquired by a local company, Architect Co-Partners, with a 150 km<sup>2</sup> prospecting concession which covered Amantin, Subriso and Chichiwelli, as well as a large part of the Subriso River Forest Reserve that was closed to exploration from 1996.

Canadian company Fairstar Exploration Ltd. ("Fairstar") took over the Benso concession in 1995 and carried out extensive work, particularly at Subriso and Amantin, where considerable drilling was

completed, but ceased by the end of the decade due to funding constraints. An agreement was reached in 2001 for SJR to take over the exploration work.

In 2001, SJR completed an agreement with Fairstar and took over the exploration work. From early 2002 to about mid-2004, SJR focused mainly on the Subriso area where substantial mineralisation was outlined at two prospects, Subriso East and West. Numerous other prospects, namely Subriso Central, I Zone and G Zone were identified, and drill tested, as was the Amantin area, which had also been drilled to a considerable extent by Fairstar.

### 5.3 Production History, Previously Declared Resources and Reserves

Since acquiring Wassa in 2003 GSR has produced 2.4 million ounces of gold and the mine has a remaining life of five years (2024 to 2028) as defined by the current Ore Reserve.

Milestones at Wassa under GSR management are:

- 2003: definition drilling ahead of feasibility study for a carbon-in-leach (CIL) plant.
- 2004: feasibility study completed, and construction commences on CIL plant with open pit mining.
- 2005: CIL plant commissioned.
- 2006: acquired St Jude Resources (Hwini Butre and Benso concessions). Connected to grid power.
- 2007: commenced open pit mining at South Akyempim. Construction of haul road to Hwini Butre.
- 2008: commenced open pit mining at Benso, processing at Wassa.
- 2009: commenced open pit mining at Hwini Butre and drilling to test underground potential.
- 2011: Hwini Butre mining moves from Adoikrom to Father Brown open pit.
- 2012: commenced drilling to test underground potential below Wassa.
- 2013: upgraded plant to 2.7 Mtpa capacity with fresh ore, consolidated mining at Wassa Main open pit.
- 2014: released positive Preliminary Economic Assessment for Wassa Underground and completed Hwini Butre mining at Father Brown.
- 2015: completed positive Feasibility Study for Wassa UG and commenced development, along with starting construction of TSF 2.
- 2016: mined first stope ore from Wassa UG in July and definition drilling continued to define wide zones of mineralisation in B Shoot.
- 2017: commercial production declared at Wassa UG and deep definition drilling program defines what was later to become the Southern Extension zone. UG averages 1,865 ore t/d.
- 2018: open pit mining of Main pit completed and UG ore mining rate increases to 2,945 t/d. Wassa UG Inferred Mineral Resource reported growth to 5.2 Moz with addition of Southern Extension zone.
- 2019: completed positive Feasibility Study for paste backfill commenced development. UG ore mining rate increased to 3,895 t/d (1.4 Mtpa).

- 2020: completed construction of paste backfill plant and on-site gas-fired power generation. UG ore mining rate increased to 4,480 t/d (1.6 Mtpa).
- 2023: commenced construction of B Shoot South and 242 decline

Production peaked in 2013 at 187 koz gold with the plant operating at full capacity and high-grade ore being mined from the Father Brown open pit at Hwini Butre. From 2014, open pit ore was sourced solely from the Wassa Main pit until its completion in 2017. Lower grades resulted in gold production of around 100 koz/yr.

Mining transitioned to underground from 2016, with commercial production realized in 2017 and the underground becoming the main production source by 2018. Since 2018, underground production has steadily increased to maintain and exceed 150 koz/yr, with the addition of minor amounts of low-grade ore from open pit stockpiles.

## 6 Geological Setting and Mineralisation

### 6.1 Regional Geology

The regional geological setting of the Ashanti belt has been extensively described by several authors.

The Ashanti greenstone belt in the Western Region of Ghana is composed primarily of paleoproterozoic metavolcanic and metasedimentary rocks that are divided into the Birimian Supergroup (Sefwi and Kumasi Groups) and the Tarkwa Group. Both units are intruded by abundant granitoids (Figure 6-1) and host numerous hydrothermal gold deposits such as the Wassa, Obuasi, Bogoso and Prestea mines and paleoplacer deposits such as the Tarkwa and Teberebie Mines, Perrouty et al, (2012).

Allibone et al. (2002) separated the Paleoproterozoic Eburnean orogeny into two distinct phases known as Eburnean I and II, this classification was revised by Perrouty et al. in 2012 and proposed two distinct orogenic events, the Eoeburnean orogeny and the Eburnean orogeny. The Eoeburnean orogeny predates the deposition of Tarkwaian sediments and is associated with a major period of magmatism and metamorphism in the Sefwi Group basement. The Eburnean event is associated with significant post-Tarkwaian deformation that affected both the Birimian Supergroup and overlying Tarkwaian sediments. The Eburnean orogeny is associated with major northwest to southeast shortening that developed major thrust faults, including the Ashanti Fault along with isoclinal folds in Birimian metasediments and regional scale open folds in the Tarkwaian sediments. These features are overprinted by phases of sinistral and dextral deformational events that reactivated the existing thrust faults and resulted in shear zones with strong shear fabrics.

The Birimian series was first described by Kitson (1918) based on outcrops located in the Birim River (around 80 km east of the Ashanti Belt). Since this early interpretation, the Birimian stratigraphic column has been revised significantly. Before the application of geochronology, the Birimian super group was divided in an Upper Birimian group composed mainly of metavolcanics and a Lower Birimian group corresponding to metasedimentary basins. Subsequent authors have proposed synchronous deposition of Birimian metavolcanics. Most recently, Sm/Nd and U/Pb analyses have reversed the earlier stratigraphic interpretation with the younger metasediments overlying the older metavolcanics. Proposed ages for the metavolcanics vary between  $2,162 \pm 6$  Ma and  $2,266 \pm 2$  Ma. Detrital zircons in the metasediments indicate the initiation of their deposition between  $2,142 \pm 24$  Ma  $2,154 \pm 2$  Ma. The Kumasi Group was intruded by the late sedimentary Suhuma granodiorite at  $2,136 \pm 19$  Ma (U/Pb on zircon, Adadey et al., 2009).

The Tarkwa super group was first recognised by Kitson (1928) and consists of a succession of clastic sedimentary units, which have been divided in four groups by Whitelaw (1929) and Junner (1940). The Kawere Group located at the base of the Tarkwaian super group is composed of conglomerates and sandstones with a thickness varying between 250 m and 700 m. The unit is stratigraphically overlain by the Banket Formation, which is characterized by sequences of conglomerates interbedded with cross-bedded sandstone layers, the maximum thickness of this group being 400 m. The conglomerates are principally composed of Birimian quartz pebbles (>90%) and volcanic clasts (Hirdes and Nunoo, 1994) that host the Tarkwa Placer deposits. The Banket formation is overlain by approximately 400 m of Tarkwa Phyllites.

The uppermost unit of the Tarkwa super group is the Huni Sandstone, comprised of alternating beds of quartzite and phyllite intruded by minor dolerite sills that form a package up to 1,300 m thick (Pigois et al., 2003). U/Pb and Pb/Pb geochronology dating of detrital zircons provide a maximum depositional age of  $2,132 \pm 2.8$  Ma for the Kawere formation and  $2,133 \pm 3.4$  Ma for the Banket formation (Davis et al., 1994; Hirdes and Nunoo, 1994). These ages agree with the study by Pigois et al. (2003) that yielded maximum depositional age of  $2,133 \pm 4$  Ma from 71 concordant zircons of the Banket formation. According to all concordant zircon histograms (161 grains) and their uncertainties, a reasonable estimation for the start of the Tarkwaian sedimentation could be as young as 2,107 Ma.

Abundant granites and granitoids intruded the Birimian and Tarkwaian units during the Paleoproterozoic. Eburnean plutonism in southwest Ghana can be divided into two phases between 2,180 to 2,150 Ma (Eoeburnean) and 2,130 to 2,070 Ma (Eburnean) that is supported by the current database of U/Pb and Pb/Pb zircon ages. Most of the granitoids which intruded during both phases correspond to typical Tonalite–Trondhjemite–Granodiorite (“TTG”) suites. However, in the southern part of the Ashanti Belt, intrusions within the Mporhor complex have granodioritic, dioritic and gabbroic compositions.

Dolerite dykes oriented north-south and East northeast to West southwest that are generally less than 100 m in thickness are abundant across the West African craton where they cross-cut Archean and Paleoproterozoic basement. In southwestern Ghana these dykes are well defined in magnetic data where they are characterised by strong magnetic susceptibility. Dolerite dykes are observed to cross-cut undeformed K-feldspar rich granites that formed during the late Eburnean, and are overlain by Volta basin sediments with a maximum depositional age of 950 Ma (Kalsbeek et al., 2008). These relationships constrain dyke emplacement to between 2,000 Ma and 950 Ma. In contrast some older dolerite/gabbro dykes and sills were deformed during the Eburnean orogeny and are dated at  $2,102 \pm 13$  Ma (U/Pb on zircon, Adadey et al., 2009).

With the exception of some late Eburnean granitoids, dolerite dykes and Phanerozoic sediments, all other lithologies have undergone metamorphism that generally does not exceed upper greenschist facies. Studies on amphibole/plagioclase assemblages suggest the peak temperature and pressure was 500 to 650 °C and 5 to 6 kbar (John et al., 1999), dated at  $2092 \pm 3$  Ma (Oberthür et al., 1998).

**Figure 6-1: Location of the Wassa Mine with the Geology of the Ashanti Belt**

Source: Perrouty et al., 2012.

## 6.2 Property Geology

The Wassa Mine property lies within the southern portion of the Ashanti Greenstone Belt along the eastern margin of the belt within a volcano-sedimentary assemblage located at proximity to the Tarkwaian basin contact. The eastern contact between the Tarkwaian basin and the volcano-sedimentary rocks of the Sefwi group is faulted, but the fault is discrete as opposed to the western contact of the Ashanti belt where the Ashanti fault zone can be several hundred meters wide. Deposition of the Tarkwaian sediments was followed by a period of dilation and the intrusion of late mafic dykes and sills.

The lithologies of the Wassa assemblage are predominantly comprised of mafic to intermediate volcanic flows which are interbedded with minor horizons of volcanoclastics, clastic sediments such as wackes and magnetite rich sedimentary layers, most likely banded iron formations. The volcano-sedimentary sequence is intruded by syn-volcanic mafic intrusives and felsic porphyries.

The magnetic signature of the Ashanti belt is relatively high in comparison to the surrounding Birimian sedimentary basins such as the Kumasi basin to the west of the Ashanti belt and the Akyem Basin to the East as illustrated in Figure 6-2.

**Figure 6-2: Total Magnetic Intensity Reduced to Pole of the Ashanti Belt**

Source: Modified from Perrouty et al., 2012.

Rock assemblages from the southern area of the Ashanti belt were formed between a period spanning from 2,080 to 2,240 Ma as illustrated in Figure 6-3 with the Sefwi Group being the oldest rock package and the Tarkwa sediments being the youngest. The Ashanti belt is host to numerous gold occurrences, which are believed to be related to various stages of the Eoeburnean and Eburnean deformational event. Structural evidence and relationships observed in drill core and pits at Wassa would suggest the mineralisation to be of Eoeburnean timing while other known deposits in the southern portion of the Ashanti belt such as Chichiwelli, Benso and Hwini Butre are considered to be of Eburnean age.

Figure 6-3: Compilation of Geochronology Dating from the Ashanti Belt

Source: Perrouty et al., 2012.

The Eoeburnean deformation is best observed at Wassa where the deformational event has produced a penetrative foliation with an associated lineation which is defined by mineral alignments. A period of extension occurred between the Eoeburnean and Eburnean deformational events which resulted in the formation of the Akyem Basin (Kumasi Group) to the northeast of the Wassa Mine and the Tarkwa group to the west of the Wassa concession. Both metasedimentary sequences of the Takwa and Kumasi group have not been affected by the penetrative foliation observed at Wassa.

The Eburnean deformation is divided in multiple events which vary in number depending on the authors as summarized in Table 6-1. All deposits underlying the Wassa concession have been affected by the Eburnean deformational events, the main penetrative foliation has been affected by at least three Eburnean folding events which have resulted in a large scale refolded synform. The main foliation is sub-vertical and oriented northeast to southwest on the south-eastern flank of the Wassa mine fold whereas it is dipping at around 45° to the south-southeast on the northwest flank of the Wassa mine fold.

The Wassa lithological sequence is characterized by lithologies belonging to the Sefwi Group and consisting of intercalated meta-mafic volcanic and meta-diorite dykes with altered meta-mafic volcanic and meta-sediments which are locally characterized as magnetite rich, Banded Iron

Formation ("BIF") like horizons (Bourassa, 2003), as illustrated in Figure 6-4. The sequence is characterized by the presence of multiple ankerite-quartz veins which are sub-parallel to the main penetrative foliation. The lithological sequence is also characterized by Eoeburnean felsic porphyry intrusions on the south-western flank of the Wassa mine fold.

**Figure 6-4: Lithology of the Deposit Area**

The first deformational event (D1) at Wassa is of Eoeburnean timing and consists of North-South shortening. This pre-Tarkwaian event resulted in a penetrative foliation which transposed lithological contacts along this main foliation. Early, gold bearing, synD1 quartz-ankerite veins were also formed during the Eoeburnean event.

The second event of deformation (D2) is an extension period with no local deformation at the mine scale at Wassa. Regionally, this event separates the Eoeburnean and Eburnean orogeny by an extension period of approximately 40 Ma which resulted in the sedimentation of the Birimian and Tarkwaian basins.

The Eburnean orogeny is divided in three distinct deformational events, D3 is a Northwest-Southeast shortening event which resulted in the inversion of regional detachment faults into thrust faults. At the mine scale, this event generated a second penetrative foliation at Wassa and a first phase of Eburnean folding. The D4 deformational event, a North Northwest-South Southeast shortening event

resulted in the sinistral reactivation of earlier faults at the regional scale and severely buckled the Wassa stratigraphic sequence into moderately steeply dipping, tight fold patterns (F4 Fold) and a third penetrative foliation (S4). The last deformational event, D5, is the result of sub-vertical compression which resulted in open recumbent folds at Wassa and a fourth foliation located in the axial plane of the F5 folds and is generally sub-horizontal, shallowly plunging to the South.

Folded nature of the lithological sequence due to deformation is presented in vertical sections of the Wassa Main deposit (Figure 6-5).

**Figure 6-5: Vertical Section 19975N of the Wassa Main Deposit Showing Folded Nature of the Lithological Sequence during the Eburnean D3 and D4 Deformational Events**

The Wassa mineralisation is subdivided into a number of domains; namely F Shoot, B Shoot, 242, South-East, Starter, 419, Mid-East, and Dead Man's Hill. Each of these domains, except for Dead Man's Hill, represents discontinuous segments of the main mineralised system which extends for approximately 3.5 km along strike and is still open at depth. Dead Man's Hill sits to the north-east of the main trend, proximal to the projected F4 axial fold trace. The SAK deposits are located approximately 2 km to the southwest of the Wassa Main deposit on the northern end of a well-defined mineralised trend parallel to the Wassa Main trend. The mineralisation is hosted in highly altered multi-phased greenstone-hosted quartz-carbonate veins interlaced with sedimentary pelitic units. The SAK mineralisation is subdivided into a number of domains as well, SAK 1, 2 and 3.

Mineralisation within the Wassa Mine is structurally controlled and related to vein densities and sulphide contents. In detail, the mineralisation generally consists of broadly tabular zones containing dismembered and folded ribbon-like bodies of narrow quartz vein material, zones are typically 10 m to 50 m wide within a 900 m mineralised corridor as illustrated in Figure 6-6. Three vein generations have been distinguished on the basis of structural evidence, vein mineralogy, textures and

associated gold grades. Evidence further relates the majority of gold mineralisation to the earliest recognised vein generation which is believed to be syn-Eoeburnean. Gold grades broadly correlate with the presence of quartz-dolomite/ankerite-tourmaline bearing quartz veins and the presence of sulphide minerals (predominantly pyrite) within and around the quartz veins. Gold grades appear to be spatially restricted to the quartz veins, vein selvages and the immediate wall rocks. The alteration haloes developed around the veins and pervasively developed within the core of the Wassa Fold contain lower grade mineralisation. The combined and overprinted Eburnean deformational events (D3 to D5) render precise prediction of the vein geometries and localities difficult in areas remote from drillhole data. While the general peripheries of the mineralised zones can be defined reasonably well with the drillhole data, the internal geometry is difficult to resolve with confidence.

**Figure 6-6: Vertical Section 20000N of the Wassa Main Deposit Showing the Tabular Nature of Ore Zones**

## 6.3 Deposit Types

### 6.3.1 Wassa

The Wassa deposit is located on the eastern flank of the northeast trending Ashanti Belt, a Paleoproterozoic greenstone belt which was formed and deformed, along with the dividing Birimian and Tarkwaian sedimentary basins during the Eoeburnean and Eburnean orogeny. Most deposits found within the Ashanti belt can be classified as lode gold deposits or orogenic mesothermal gold deposits, with the exception of the Tarkwaian paleoplacer deposits which have a sedimentary origin. Orogenic gold deposits are the most common gold systems found within Archean and Paleoproterozoic terrains, in the West African shield, these deposits are typically underlain by

geology considered to be of Eburnean age and are generally hosted by volcano-sedimentary sequences.

B. Dubé and P. Gosselin of the Geological Survey of Canada described these deposits as greenstone-hosted quartz-carbonate vein deposits in the 2007 special publication No. 5 entitled Mineral Deposits of Canada. The authors described these deposits as typically occurring in deformed greenstone belts and distributed along major compressional crustal scale fault zones commonly marking the convergent margins between major lithological boundaries. The greenstone-hosted quartz-carbonate vein deposits correspond to structurally controlled complex deposits characterized by networks of gold-bearing, laminated quartz-carbonate fault-fill veins. These veins are hosted by moderately to steeply dipping, compressional brittle-ductile shear zones and faults with locally associated shallow-dipping extensional veins and hydrothermal breccias. In these deposits, gold is mainly confined to the quartz-carbonate veins but can also occur within iron-rich sulphidized wall rocks or within silicified and sulphide-rich replacement zones.

The Ashanti belt is considered prospective for orogenic mesothermal gold deposits and hosts numerous lode gold deposits and paleoplacer deposits. Several major gold deposits are found within the Ashanti belt which can be classified into six different deposit types:

- Sedimentary hosted shear zones;
- Fault fill quartz veins;
- Paleoplacer;
- Intrusive hosted;
- Late thrust fault quartz veins; and
- Folded veins system.

The sedimentary hosted shear zone deposits are localized principally along a steep to sub-vertical major crustal structures located along the western margin of the Ashanti belt referred to as the Ashanti trend. The Ashanti trend shows a range of mineralisation styles associated with graphitic shear zones, which represents the principal displacement zone of a regional-scale shear zone that defines the mineral belt. These styles include highly deformed graphitic shear zones containing disseminations of arsenopyrite as the principal gold bearing phase and disseminations of sulphides in mafic volcanic rocks generally found in the footwall of the main shear zones. The sedimentary hosted shear zone deposits which occur along the Ashanti trend include Bogoso, Obuasi, Prestea and Nzema.

The second type of deposit found within the Ashanti belt are laminated quartz vein deposits containing free gold. Fault filled quartz vein deposits also occur along the Ashanti trend but are only present at Obuasi and Prestea. The third type of deposit are paleo-placer deposits within the Tarkwaian sedimentary basin which are hosted within narrow conglomerate horizons intercalated with sandstone units characterized by iron oxides cross beddings. Paleoplacer deposits occur in the southern portion of the Tarkwa basin and examples include Tarkwa, Teberebie and Iduapriem. The fourth type of deposit found within the Ashanti belt are intrusive hosted deposits which occur along second order structures such as the Akropong trend in the Kumasi basin and the Manso trend in the Southern portion of the Ashanti belt. These deposits can be hosted both within felsic and mafic intrusives and are characterized by a penetrative fabric where gold is associated with pyrite and

arsenopyrite. Examples of such deposits include Edikan and Pampe along the Akropong trend and Benso and Hwini Butre along the Manso trend. The fifth type of deposit found within the Ashanti belt is late thrust fault associated quartz vein deposits. The Damang mine which is located just west of Wassa is the only known thrust fault related deposit in the Ashanti belt. The deposit is characterized by low angle; undeformed extensional and tensional veins associated with low angle thrust faults. This type of deposit contrasts with the last type of deposit found with the belt, the multi-phase folded Wassa vein deposit. The Wassa mineralisation consists of greenstone-hosted, low sulphide hydrothermal deposits where gold mineralisation occurs within folded quartz-carbonate veins. The Wassa deposit can therefore be classified as an Eoeburnean folded vein system and is the only such deposit recognised to date within the Ashanti belt.

Host rocks in the Wassa mine area have been affected by at least four phases of ductile deformation, producing a polyphase fold pattern at the mine scale. Discrete high-strain zones locally dissect this fold system. The structural history of the Wassa area is important in that the various deformational events have been responsible for the emplacement of the gold mineralisation as well as the geometry of the zones themselves. Mineralised zones at the Wassa Mine are related to vein swarms and associated sulphides that formed during the Eoeburnean deformational event. All rock types underlying the Wassa Mine appear to be altered to variable degrees with the most common alteration consisting of a carbonate-silica-sulphide assemblage.

The Wassa mineralisation is subdivided into a number of domains, namely: F Shoot, B Shoot, Zone 242, South-East, Starter, 419, Mid-East, and Dead Man's Hill. Each of these represents discontinuous segments of the main mineralized system. The SAK deposits are located approximately 2 km to the southwest of the Wassa Main deposit on the northern end of a well-defined mineralized trend parallel to the Wassa Main trend. The mineralisation is hosted in highly altered multi-phased greenstone-hosted quartz-carbonate veins interlaced with sedimentary pelitic units. The SAK mineralisation is subdivided into a number of domains as well, SAK 1, 2 and 3.

Mineralisation within the Wassa Mine is structurally controlled and related to vein densities and sulphide contents. The mineralisation generally consists of broadly tabular zones containing dismembered and folded ribbon-like bodies of narrow quartz vein material. Three vein generations have been distinguished on the basis of structural evidence, vein mineralogy, textures and associated gold grades.

Gold grades broadly correlate with the presence of quartz-dolomite/ankerite-tourmaline bearing quartz veins and the presence of sulphide minerals (predominantly pyrite) within and around the quartz veins. Gold grades appear to be spatially restricted to the quartz veins, vein selvages and the immediate wall rocks. The alteration haloes developed around the veins and pervasively developed within the core of the Wassa Fold contain lower grade mineralisation.

According to the grade assays in various exploration campaigns and historic processing production records, both silver (Ag) and arsenic (As) are in relatively low content. In the Wassa Project, gold is the only prime element, and there is no concern around harmful mineral or element such as arsenic.

### 6.3.2 Hwini Butre

The Hwini Butre deposits can be characterized as mafic intrusive hosted, orogenic shear zones. The deposits are hosted within diorite and granodiorite intrusive rocks of the Mpohor complex. The Father

Brown deposit is characterized by well-developed fault-filled quartz veins, whereas the Adoikrom deposit is a shear zone hosted deposit characterized by intense potassium and silica alteration assemblage.

Analysis of geophysical surveys and topographical features have identified several north to north-northeast trending regional features running through the area which are tentatively interpreted as boundary faults along the margins of the Ashanti Belt. The Mpohor complex exhibits the underlying north-south trends but also has extensive cross cutting features present particularly in the north-west orientation. These structural features are second order or subsidiary structures splaying from primary structures.

The Adoikrom, Father Brown and Dabokrom deposits occur in the south portion of the Mpohor complex and appear to be controlled by a series of shallow to moderately dipping faults and shear structures with dips varying from 20° to the south at Dabokrom and steepening to 65° to the northwest at Adoikrom.

### 6.3.3 Benso

The Benso deposits can also be characterized as mafic intrusive hosted, orogenic shear zones deposits, which are hosted by Birimian metavolcanics into which coarse plagioclase porphyry units have intruded and are generally conformable with the volcanoclastic units.

At Subriso East, the metavolcanics host complex quartz vein systems associated with intense shearing and abundant sulphide mineralisation. At Subriso West, the presence of intermediate porphyry intrusive appears to play a more significant role and quartz veining is less extensive and broad scale silicification is more common. The contacts between metavolcanics and porphyry have been identified as potential targets for higher grade gold mineralisation.

The mineralisation hosting structures generally dip steeply towards the west with foliation generally parallel to the bedding. The aeromagnetic interpretation reveals a north to north-northeast striking fault system along the course of the Ben River with several other fracture systems also evident with strikes varying between the northwest and northeast. The Subriso East deposit is interpreted to dip less steeply to the west at approximately 50°.

Oxidation associated with weathering is variable but generally limited. The weathering forms a layer of lateritic clay rich material grading into a soft saprolite. The vertical depth is generally 10 m or less but can reach depths of 30 m in places. There is a sharp boundary between oxide and fresh material with a narrow and poorly developed transition zone.

### 6.3.4 Chichiwelli

The Chichiwelli deposits can also be characterized as mafic intrusive hosted, orogenic shear zones, the deposits are hosted within diorite and granodiorite intrusive rocks. The mineralisation zones at Chichiwelli are similar to those observed at Benso, with the mineralised hosting structures generally dipping to the east.

The Chichiwelli deposit consists of two sub-parallel mineralised trends which hosts two distinct types of mineralisation. Mineralisation at the Chichiwelli West zone is shear zone hosted with a carbonate,

sericite and potassic alteration assemblage, while mineralisation along the Chichiwelli East trend is quartz vein associated with an ankerite and sericite alteration assemblage. Mineralisation is spatially associated with pyrite at both deposits.

## 7 Exploration, Sampling, and Assaying

SRK has not participated in the exploration conducted for Wassa gold project. The information regarding the exploration is derived from the data provided by the client and through discussions with geologists engaged in the fieldwork.

### 7.1 Exploration

Systematic exploration work has been conducted on the GSWL properties over a couple of centuries as the earliest record of gold business within the Hwini-Butre mining lease dates back to the late 15th century with the Portuguese colonial explorers. Evidence of colonial mining and local small-scale mining still remains with pits and adits mapped within all the mining leases and prospecting licenses. A layout of current GSWL mining leases and prospecting licenses is shown in Figure 7-1.

Airborne and ground geophysical surveys consisting of aeromagnetics, radiometrics and Induced Polarization (IP) were conducted on these properties. Strong gold targets have been prioritised from these satellite imagery and geophysical interpretations followed with geochemical anomalies, which had previously been identified following multiple stream and soil geochemical sampling programs. To date, these various geophysical techniques continue to aid re-ranking of prospective targets within the various landholdings.

Detailed geochemical surveys over the mining leases and prospecting licenses has been an effective tool in locating mineralisation. Records of various geochemical surveys has been progressively reviewed since 1988 to date, around the mined-out open pits and adits.

GSWL has continued with exploration aimed at re-interpretation of geophysical and geochemical targets. Moreso, testing of surficial and historical anomalies around the mined-out open pits and along strike of known mineralisation zones.

GSWL has refocused exploration to expand the existing resources beyond the current mined out areas by following up on the prioritised and re-ranked geochemical targets along strike of known mineralisation and up/down dip of the mined-out open pits.

Untested greenfield geochemical targets are being reviewed along with surficial and up-dip potential mineralisation of underground operations. Historical brownfields targets like Dead Man Hill have been identified and prepped to contribute oxide ore for processing.

Figure 7-1: Layout of GSWL Mining Leases and Prospecting Licences Linked by Laterite Sheeted Haul Road

### 7.1.1 Wassa

Modern exploration programs on the Wassa concession began in the early 1990s with satellite imagery and geophysical surveys which identified geophysical lineaments and anomalies over small scale and colonial mining areas. Stream and soil geochemistry sampling programs were conducted over the geophysical anomalies and identified multiple linear gold in-soil anomalies as illustrated in Figure 7-2.

Figure 7-2: Wassa Au-in-Soil Anomalies with Prioritised Targets and Deposits

A high resolution, helicopter geophysical survey was conducted over the entire Wassa Mining Lease to generate different derivatives (namely, Electromagnetic, Resistivity, Magnetic, Radiometrics and Horizontal gradient of the Magnetic).

**Figure 7-3: Layout of Wassa Airborne Magnetic Survey Coverage**

Source: GSR, 2004.

Grassroots exploration was conducted concurrently during the various phases of the resource expansion drillings within the open pit areas. Areas south of the main open pit like 419 and South Akyempim open pits (SAK) were discovered through conventional exploration as a result. These phased exploration to date include:

- 1994 to 1997 Exploration for the Feasibility study by Pincock, Allen and Holt
- 2002 to 2003 Due diligence for Mineral Resource/ Ore Reserve upgrade and feasibility study update
- 2011 to 2019 Wassa underground High-Grade definition + brownfields exploration
- 2021 to 2022 Chifeng Gold group, refocused and re-interpretation of geophysical and geochemical targeting alongside upgrading of known underground resources

After the acquisition of Golden Star (Wassa) by the Chifeng Gold Group, the geochemical data review within the Wassa Mining Lease has caused re-optimisation of oxide mineralisation around the mined out Dead Man Hill open pit. Untested gold-in-soil anomalies along the multiple linear trends in Figure 7-2 above is being evaluated to generate pipeline of oxide mineralisation for the processing plant.

### **7.1.2 Benso and Chichiwelli**

Golden Star acquired the Benso and Chichiwelli concessions from St Jude Resources in 2005 and began with regional exploration programs. A number of geophysical and geochemical anomalies previously identified by St Jude were followed up per the labelled targets within Figure 7-4 below.

**Figure 7-4: Au-In-Soil Anomalies with Pit Outlines within the Benso Mining Lease**

Structural mapping and interpretation commenced in 2012 within the mining lease to aid in defining the controls of mineralisation and to determine the underground potential beneath the mined-out pits.

Induced Polarisation geophysical surveys were conducted over the Benso concessions in 2009 and the program generated targets that were coincident with lithological trends and gold in soil anomalies. Re-evaluation of surface geology and geochemical anomalies after the Chifeng Gold Group acquisition has produced the latest open pit mine within the Benso Mining Lease, namely the I-Zone pit which is a product of grassroots exploration and favourable gold price on the international market. Further re-interpretation is ongoing to further understand the surface mineralisation and underground potential beneath the mined-out pits, particularly Subriso West pit.

Benso (Chichiwelli) prospecting licence expired on December 30<sup>th</sup> 2020, awaiting for Minister of Lands and Natural Resources's approval for renewal. The satellite imagery and coincident au in soil anomaly within the Prospecting Licence (PL) has led to the delineation of Chichiwelli East and Chichiwelli West mineralised zones. Since 2012, no exploration work has been done on the concession.

### 7.1.3 Hwini Butre

Early European reports indicate the Dabokrom area, Hwini Butre mining lease, may have been a major source for gold sold to Portuguese explorers when they first arrived in Ghana in the late 1400's.

European interest grew in the 1800's with the presence of gold and proximity to Sekondi-Takoradi, which had developed as a port to service mines at Tarkwa, Prestea and Obuasi. Many exploration licences were granted during the gold boom of 1898-1902 and by the 1930's most of the area was under license to various local and European interests.

At Dabokrom within Hwini Butre Mining Lease (HBML) a shaft was sunk by Oceania Consolidated in the 1930's to follow the shallow dipping quartz veins. The property was worked for several years but stopped in 1939 at the start of World War 2.

Golden Star acquired St Jude and the Hwini Butre concession in late 2005 and commenced exploration work in early 2006. Exploration activities concentrated on the previously defined mineralisation at Adoikrom North, Adoikrom, Dabokrom and Father Brown.

Regional exploration programs over the concession were conducted by targeting a number of geochemical and geophysical anomalies previously identified by St Jude, these anomalies were mainly tested by the use of Rotary Air Blast ("RAB") drilling. A combination of 4 m deep auger and shallow auger at a grid spacing of 400 m by 50 m was also carried out to further test the existing gold-in-soil anomalies and gaps in the geochemistry sampling over the Hwini Butre concessions.

Hwini Butre exploration activities were focused on the northern parts of the concession where several colonial gold occurrences such as Breminsu, Apotunso (per Figure 7-5), Abada, Whinnie and Guadium are located. Previous soil sampling in these areas identified several anomalies and the follow up programs included deep auger and RAB drilling. The Mineral Resource definition drilling program continued in 2010 at Father Brown, Adoikrom and Dabokrom. The Mineral Resource/ Ore Reserve delineated was mined out by 2014 but exploration along strike continued to discover the continuity of mineralisation from geophysical targets and geochemical surveys on the Hwini Butre Mining Lease (HBML).

Figure 7-5: Gold in Soil Anomaly within Hwini Butre Mining Lease with Adoikrom and Father Brown Open Pits

Chifeng Gold Group has refocused brownfields prospects, grass roots exploration targets and untested greenfields targets. Re-interpretation of structural controls, geophysical targets and geochemical anomalies is being done to test five additional targets along the Hwini Butre Benso (HBB) corridor.

The regional exploration within the eastern blocks of Manso 1 PL, Manso 2 PL and Chichiwelli PL is focusing on geochemical anomalies and geophysical targets review to follow up on the fold closure, east of the mining leases.

## 7.2 Drilling

Drilling is carried out by a combination of Diamond Drill (“DD”), Reverse Circulation (“RC”) and RAB techniques. In general, the RAB method is used at early stages for follow up to soil geochemical sampling and testing contacts and mineralisation extensions around the production areas and has a maximum drilling depth of around 30 m. Exploration continues across multiple leases with mapping and soil sampling. Prospective targets may be drill tested with either air core or RC drilling.

The Wassa, Benso and Hwini Butre Mining Leases are advanced properties, so details of all drill results are not required in this report. This section provides an overview of drilling and representative plans and cross-sections as shown in Figure 7-6 to Figure 7-8.

Concurrent grass root exploration and Mineral Resource definition drilling has been conducted between 2006 and 2012.

As of 31 March 2024, the summary of the exploration data used in the Mineral Resources Estimates is listed in Table 7-1.

**Table 7-1: Summary of Exploration Data used in the Mineral Resources Estimates**

Location	Type	Holes	Drill Meters(m)
B Shoot	DD	3,755	731,162.9
	RC	485	50,314.9

### 7.2.1 Surface Drilling

RC pre-collar with DD core tail drilling is used as the main method for obtaining samples for Mineral Resource estimation and is carried out along drill lines spaced between 25 and 50 m along prospective structures and anomalies defined from soil geochemistry and RAB drilling. RC drilling is typically extended to depths in the order of 100-125 m. The DD method is used to provide more detailed geological data and where more structural and geotechnical information is required. Generally, the deeper intersections are also drilled using DD and, as a result, most section lines contain a combination of RC and DD drilling.

RC and DD drilling is conducted with a geologist on site to align the drill rig and check the drill head dip and azimuth. Downhole surveying is conducted using a single shot camera, for RC and DD holes at the bottom of holes exceeding 30 m depths and then taken progressively every 30 m up hole. The single shot camera records the dip and azimuth for each survey which is validated and recorded by the geologists or is recorded by a Reflex survey instrument and captured in the database as well as being filed in the respective drillhole file folders on site.

Drilling depths within the mining leases do not generally exceed 250 m but with the discovery of higher grades below the mined-out open pits after 2011, hole depths have increased. In the 1st half of 2014, two gyro survey instruments were utilized to resurvey several of the deeper holes. In total, 153 holes, drilled during 2012 to 2014, were resurveyed. The gyro survey readings were conducted every 10 m both in and out of the hole and the values were then averaged. The 153 gyro surveyed holes were updated in the database and subsequently used for the Mineral Resource estimates. The gyro surveys showed that there was some deviation in the holes below 250 m drilled depth. Deviations varied from location to location depending on drill orientation with a general tendency for the hole to steepen and swing to the north.

Drilling of some of the deeper targets required the use of directional drilling methods. The deeper holes, often exceeding 1,000 m, are drilled from surface using HQ (63.5mm) sized core and this initial hole (referred to as the "mother" hole) is drilled to the depth where the first directional hole would be started. The directional hole (or "daughter" hole) is drilled using a smaller core size, NQ (47.6 mm) and is deviated from the mother hole initially using a casing wedge which is oriented in the direction of the mineralised target. Once the initial deflection has been achieved with the wedge, the hole deviation is controlled using a down hole directional motor which can change the dip and azimuth of the hole by approximately plus or minus 1.5 degrees over a 10-metre run. The direction of the hole can also be controlled by using various combinations of down hole stabilisers and drill bits. The step-wise deeper drilling fences typically involve mother holes with three to four daughter holes from each of these. The deeper holes are surveyed, down hole with either a Reflex multi-shot or gyro survey instrument. The surveys are taken while the hole is being drilled as well as every 10 to 15 m from the bottom of the hole once it has been completed.

The majority of the drilling has been conducted by Golden Star (Wassa), although there are some drillholes completed by previous concession owners that have been used to inform the Wassa long-range model (by SGL) and Hwini Butre and Benso models (by SJR). The drill data from prior ownership has been validated and checked in the NI 43-101 Technical Report (GSR, 2021) to the satisfaction of the QP for inclusion in interpretation and grade estimates.

All drillhole collars were surveyed using a Nikon Total Station (DTM-332) or Sokkia Total Station by a Golden Star (Wassa) surveyor. Individual RC and DD holes are identified and marked in the field with poly-vinyl chloride (PVC) pipes. RAB drill holes were surveyed in the field and identified and marked with wooden pegs.

### 7.2.2 Underground Drilling (Wassa Main)

Underground DD is performed using electric-hydraulic diamond drills utilizing the underground mine's 1,000 V power supply. Core drilled underground is HQ, NQ or NQ2 (50.6 mm) in core size. The final drilling density for classification as Measured Mineral Resource is designed to be 15 m along strike and 13 m down dip, or tighter. With the orebody generally striking north-south (on the mine grid), typical drilling azimuths range +/-30 degrees each side of 090° or 270° azimuth, depending on whether the drills are set up on the hanging wall or footwall side of the orebody. Dips generally range between +30° to -60°.

Downhole surveying is conducted using a Reflex multi-shot downhole surveying tool. When collaring, a single survey is taken at 10-12m depth. At the first survey, the drill hole orientation must fall within  $\pm 2^\circ$  azimuth and  $\pm 1.5^\circ$  dip tolerance, when compared to design. For any hole where the first survey falls outside of tolerance, the geologist has the discretion to either terminate the drill hole and re-collar at the drilling company's expense, or to continue the hole. At the completion of the drill hole, multi-shot surveys are collected at 15 m intervals on the way out.

Drill hole collar locations are captured by the underground mine surveying team. The surveyors use either a Leica TS15 total station, or a Leica TS16 total station to record the collar position in X, Y, Z location. The total station is accurate to less than two seconds in azimuth. In cases where the mine surveyors cannot identify the drill hole collar site, the designed collar coordinates are recorded in the databases.

### 7.2.3 RAB/AC Drilling

RAB and AC drilling is used for exploration but is not used to inform any of the current Mineral Resource estimates.

## 7.3 Sample Preparation, Analyses, and Security

The measures implemented by GSR related to sample preparation, analysis and security are considered by the Competent Person to be consistent with standard industry practice and of sufficient quality to include in the estimation of Mineral Resources. Golden Star (Wassa) has a standard approach to drilling and sampling on all mining leases and prospecting licenses in Ghana. Sampling is typically carried out along the entire mineralised drilled length. Sample recovery is good across all deposits drilled to date. Ground conditions are generally good and air drilling techniques (AC/ RAB and RC) are avoided below the groundwater table where DD is applied.

### 7.3.1 Sampling

For RC drilling, samples are collected every 1 m. Where DD holes have been pre-collared using RC, the individual 1 m RC samples are combined to produce 3 m composites which are then sent for analysis. Should any 3 m composite sample return a significant gold grade assay, the individual 1 m samples are then sent separately along with those from the immediately adjacent samples.

Resource definition drill core samples are collected, logged, and then cut in half along the foliation axis using diamond core saws. Sample length range from 0.3m minimum length to 1.5m maximum length, with the standard sample length being 1.0m. The core is cut according to mineralisation, alteration, or lithology. The sampling concept is to ensure that a representative sample of the core is assayed. The remaining half core is retained in the core tray, for reference and additional sampling, if required. Grade control core is whole core sampled.

RC sampling protocols were established in 2003. The composite length of 3 m has been established to allow a minimum of at least two composites per drillhole intersection based on experience from exploration drilling and mining. The hanging wall and footwall intersections can generally be easily recognised in core from changes in pyrite content and style of quartz mineralisation.

The 3 m composite sampling methodology is:

- A sample of each drilled meter is collected by fitting a plastic bag on the lower rim of the cyclone to prevent leakage of material;
- The bag is removed once the "blow-back" for the meter has been completed and prior to the commencement of drilling the subsequent meter;
- Both the large plastic sample bags and the smaller bags are clearly and accurately labelled with indelible ink marker prior to the commencement of drilling. This is to limit error and confusion of drilling depth while drilling is proceeding;
- 3 m composite samples are taken by shaking each of the 1 m samples (approximately 20 kg) and taking equal portions of the 3 consecutive samples into a single plastic bag to form one composite sample (approximately 3 kg);

- Composite samples are taken using tube sampling, which uses a 50 mm diameter PVC tube which has been cut at a low oblique angle at one end to produce a spear of approximately 600 mm length;
- The technique assumes that a sample from the cyclone is stratified in reverse order to the drilled interval. A representative section through the entire length of the collected sample is considered to be representative of the entire drilled interval;
- The PVC tube is shuffled from the top to bottom of the sample, collecting material on the way. The "shuffling" approach ensures sample accumulated in the tube does not just push the remaining sample away; and
- Material in the tube is emptied into the appropriately labelled sample bag and in the case of 3 m composite samples, stored separately from the 1 m samples.

The 1 m sample collection methodology is:

- 1 m re-sampling of selected mineralised composite zones using the 20 kg field samples is undertaken with a single stage riffle splitter;
- Splitter is clean, dry, free of rust, and damage is used to reduce the 20 kg sample weight to a 3 kg fraction for analysis;
- Care is taken to ensure that the sample is not split when it is transferred to the splitter, and is evenly spread across the riffles;
- When considered necessary, the sample is assisted through the splitter by tapping the sides with a rubber mallet;
- Excessively damp or wet samples are not put through the splitter, but tube-sampled or grab-sampled in an appropriate manner. Alternatively, the sample is dried before splitting. A common-sense approach to wet sampling is adopted on a case-by-case basis;
- Clods of samples are not forced through the splitter, but apportioned manually in a representative manner; and
- Splitter is thoroughly cleaned between each sample using a brush. Where possible, the splitter is cleaned using an air gun attached to the drill rig compressor.

RAB and AC samples are collected and bagged at 1 m intervals. As the samples are generally smaller in size than the RC samples, 3 m composites are prepared by shaking the samples thoroughly to homogenize the sample, before using the PVC tube to collect a portion of the three individual 1 m samples. After positive results from the 3 m composites, the individual 1 m samples are split to approximately 2 to 3 kg using the Jones riffle splitter and then submitted to the laboratory for analysis.

### 7.3.2 Sample Preparation

Sample preparation on site is restricted to core logging and core cutting or RC and RAB sample splitting. The facilities consist of enclosed core and coarse reject storage facilities, covered logging sheds and areas for the splitting of RC and RAB samples. Sub-sampling of RC and RAB samples is carried out using a Jones Riffle splitter.

### 7.3.3 Sample Dispatch and Security

Samples are collated at the mine site after core cutting or sample splitting, and then transported to the primary laboratory (Intertek Minerals Ltd, Tarkwa: ISO/IEC 17025) for the completion of the sample preparation and chemical analysis. Samples are trucked by road to the laboratories in Tarkwa.

Sample security involves two aspects, namely, maintaining the chain of custody of samples to prevent inadvertent contamination or mixing of samples, and rendering active tampering of samples as difficult as possible.

The transport of samples from site to the laboratory is by road using a truck dispatched from the laboratory. As the samples are loaded, they are checked, and the sample numbers are validated. The sample dispatch forms are signed off by the driver and a company representative. The sample dispatch dates are recorded in the sample database as well as the date when results are received.

No specific security safeguards have been put in place by GSR to maintain the chain of custody during the transfer of core between drilling sites and sample preparation and assaying facilities. Core and rejects from the sample preparation are archived in secure facilities at the core yard and remain available for future testing.

### 7.3.4 Laboratory Procedures

Sample assays have been performed at the Wassa Site Laboratory (WSL), SGS Tarkwa or Intertek Minerals Ltd (formerly named Transworld Ltd. ("TWL")). The two commercial laboratories are located at Tarkwa. Golden Star (Wassa) submits quality control samples to every batch of primary samples sent to laboratory for testing purposes.

Both SGS and Intertek laboratories are independent of Golden Star (Wassa) and are accredited for international certification for testing and analysis.

- SGS, Minerals Division – Tarkwa: ISO 17025 and ISO 9001; and
- Intertek Minerals Ltd, Tarkwa: ISO/IEC 17025.

The sample preparation and analytical processes at the WSL, Intertek, and SGS differ slightly. WSL prior to July 2007 operated as a metallurgical sample processing laboratory at the Wassa mine site. Subsequently, WSL has been used as the primary laboratory for grade control open pit drilling samples and mine grab samples. The WSL is prone to contamination as the jaw crusher and secondary crushing areas are dusty. Moreso, the manual capture of assay values from the desktop computers at WSL gives room for transcription errors. For these reasons, the WSL does not assay samples related to exploration or resource definition drilling.

#### Wassa Site Laboratory

The sample preparation and analysis process at the WSL is as follows:

- Sample reception, sorting, labelling and loading;
- Dry entire sample (3 kg) at 110°C for between 4 and 8 hours;

- Jaw crush entire sample to 3 mm, and secondary Keegor crusher to 1 mm;
- Split 3 kg sample and pulverize for 3 to 8 minutes to 95% passing 75 µm;
- Sample homogenization using a mat rolling technique, and sub-sample 1 kg into bulk leach extractable gold (BLEG) roll bottle;
- Bottle roll for 12 hours with LeachWell™ accelerant. Allow to settle for 30 to 60 minutes;
- Filter 20 ml aliquot from bottle;
- Di-isobutyl Ketone extraction and atomic absorption spectroscopy (AAS) determination of gold content; and
- 1 in 10 residue samples are retained for gold determination using fire assay.

### Transworld

TWL (now Intertek) was the primary laboratory for core samples until July 2007, when it was discontinued due to the following issues:

- Contamination due to poor dust control in pulverizing area of the laboratory. Use of dust attracting cloth gloves for sample handling. BLEG aliquot preparation area containing dirt and liquids, which may result in sample cross-contamination.
- Large fluctuation in employee numbers (60 to 180), which resulted in a risk of training and quality control issues when increasing employment numbers over a short period of time.
- The use of a manual data tracking and capture system, which increased risk of data entry errors. Golden Star (Wassa) considered this to be a sub-optimal process for a commercial laboratory.

The sample preparation and analysis process used by TWL is illustrated in Figure 7-9 below.

Figure 7-9: Transworld Laboratories Sample Processing Flow Sheet

**SGS Tarkwa**

The SGS laboratory (Tarkwa) was used for drill core samples from July 2007 to August 2017, with the sample preparation and analysis process as follows:

- Sample received, entered in LIMS, worksheets, printed and samples sorted;
- Samples emptied into aluminium dishes;
- Dry entire sample at between 105 and 110°C for 8 hours;
- Jaw crush entire sample to 6 mm;
- Split sample using a single stage riffle splitter, to result in a 1.5 kg sub-sample;
- Pulverize sub-sample for 3 to 5 minutes, to give 90% passing 75 µm;

- Sample homogenization using a mat rolling technique, and put 1 kg of sample into the BLEG roll bottle;
- Remaining sample is retained as pulp and crushed sample duplicates;
- Bottle roll for 12 hours with LeachWell™ accelerant. Allow to settle for 2 hours;
- Filter 50 ml of aliquot; and
- Di-isobutyl Ketone and AAS for gold grade determination.

**Intertek Tarkwa**

Subsequent to 2017, Golden Star (Wassa) discontinued using SGS, Tarkwa laboratories and began shipping samples to Intertek, Tarkwa Laboratories. The Intertek lab sample flow sheet is shown in Figure 7-10 below. The reason for the change was attributed to poor turn-around time in assay results. Since the prior issues with Transworld/ Intertek, ownership of TWL had changed to Intertek who had implemented internationally recognised standards with changes in management and procedures.

**Figure 7-10: Intertek Sample Processing Flow Sheet**

### 7.3.5 Quality Control and Quality Assurance

Quality control measures are set in place to ensure the reliability and trustworthiness of assay data, and to ensure that it is of sufficient quality for inclusion in the subsequent Mineral Resource estimates. Quality control measures include written field procedures and independent verifications of aspects such as drilling, surveying, sampling and assaying, data management and database integrity. Appropriate documentation of quality control measures and analysis of quality control data are an integral component of a comprehensive quality assurance program and an important safeguard of project data.

The field procedures implemented by Golden Star (Wassa) are comprehensive and cover all aspects of the data collection process such as surveying, drilling, core and RC cuttings handling, description, sampling and database creation and management. At Wassa, each task is conducted by appropriately qualified personnel under the direct supervision of a qualified geologist. The measures implemented by Golden Star (Wassa) are considered to be consistent with industry best practice.

The quality controls employed by Golden Star (Wassa) include:

- Field duplicates used to check sampling precision and deposit variability. Two separate samples are collected at the drill site and bagged separately from which two individual samples are produced. The results of these checks can be useful in highlighting natural variability of the grade distribution.
- Pulp duplicates used as a check of sampling precision and coarse gold in pulps. Two separate pulp samples are prepared from a single coarse reject after sample splitting and on-site preparation. The results are useful in indicating problems with sample preparation and splitting.
- Repeats as a check of analytical precision and coarse gold. Two separate aliquots are prepared from separate samples taken from the original coarse reject and the two samples' results are compared.

Blanks for highlighting contamination problems and cross labelling when samples are mislabelled in the laboratory.

- Standards as a check of analytical precision and accuracy.

Golden Star (Wassa) relies on both the laboratory operators Quality assurance, quality control (QA/QC) processes for assaying, as well as Golden Star (Wassa)' own independent QA/QC program. The Golden Star (Wassa) program includes inserting blanks, Certified Reference Materials (CRMs), and pulp or coarse reject duplicates into sample batches, before sample submission to the lab. Golden Star (Wassa) also provides sample dispatch lists to the laboratories, to ensure that all samples dispatched from site are received at the lab.

Golden Star (Wassa) has supplied QA/QC reports to various consultants over the numerous drilling campaigns since 2004, and a summary of the historical and current QA/QC results is included here.

### 7.3.6 Comparison of Assay Methodologies

In 2003, during open-pit operations, it was recognised that there was a variance between primary and duplicate assay grades of the same sample, as well as a variance between the planned mine grade to the mill reconciled grade. The conventional 50g fire assay being used at the time displayed

poor reproducibility between field duplicates. This effect was also evident between pulp duplicates, although not as marked. The conclusion was that a component of coarse gold was present in the samples and contributed to poor reproducibility between samples. It was recommended to switch to an analytical process that made use of significantly larger sample masses, such as LeachWell™ assays.

To address this, Golden Star (Wassa) changed the assay procedure from the 50-gram fire assay method to a 1kg BLEG assay, with a LeachWell™ accelerant. Gold grade was determined using an AAS finish. Initially, samples were split by a rotary splitter and leached for six hours. Following the analysis of the leach tailings, the leach time was extended to 12 hours.

Due to time constraints, the use of the rotary splitter was discontinued, and a Jones Riffle splitter was used to split sub-samples from the larger RC drill hole samples. The difference between the reproducibility of fire assay versus larger BLEG assays is illustrated in Figure 7-11. It shows a significant improvement with respect to sample reproducibility between the fire assay and the BLEG methodologies. Using BLEG, 80% of pairs report Half Absolute Relative Difference (HARD) precisions of less than 17%, compared to the 35% precision attributable to the fire assay method. SRK recommended that Golden Star (Wassa) continue to monitor the reproducibility of the sample grades from the paired data analysis.

**Figure 7-11: ARD Plot Comparing Fire Assay and BLEG for Field Duplicates**

## 8 Data Verification

SRK has not carried out any independent collection and verification of individual samples or assay results. SRK has, however, obtained and reviewed the QA/QC results produced by Golden Star (Wassa), its consultants and the laboratories themselves.

SRK reviewed the core and samples available on site (core shed) and cross-checked them against the geological logs and assay records.

The quality of the results is generally considered good. Golden Star (Wassa) frequently sends samples with known values but "blind" test samples to the laboratory and monthly batch results are analysed, and any anomalous results are queried immediately. A small number of anomalous and/ or poor results have been noted over the years, but these have been identified and the reasons fall into two main categories, namely:

- Mislabelling of individual samples, standards and blanks.
- Individual batch issues corresponding to changes in the laboratory setup or calibration, in these cases re-assay has been carried out.

The results of the current QA/QC program indicate that performance is consistent with industry standards. The QA/QC program includes check samples which show reasonable duplicate performance. The duplicates are selected from coarse rejects from the initial preparation.

### 8.1 Verifications by Golden Star (Wassa)

The field procedures implemented by Golden Star (Wassa) involve several steps designed to verify the collection of exploration data and minimise the potential for inadvertent data entry errors. The data entry and database management involve two steps punctuated by validation steps by the logging geologist. All data is thoroughly checked prior to the incorporation into the project database.

Analytical data is also routinely checked for consistency by Golden Star (Wassa) personnel. Upon receipt of digital assay certificates, assay results together with the control samples are extracted from the certificates and imported into the Acquire database. Failures and potential failures are examined and depending on the nature of the failure, re-assaying is requested from the primary laboratory. Analysis of quality control data is documented along with relevant comments or actions undertaken to either investigate or mitigate problematic control samples.

### 8.2 Verifications by SRK (Between 2019 and 2022)

#### 8.2.1 Duplicates

SRK has reviewed the supplied QA/QC reports, and a summary of the historical and current QA/QC results is included here.

Historical data on field duplicates, from between 2003 and 2007 were poorly correlated. Supplied documentation from the time indicates that the field sampling techniques were identified as the likely cause. Improvements since 2008 are thought to be due to increased sample splitting training and

awareness amongst Golden Star (Wassa) sampling crew members, rather than improvements at the laboratory.

From 2011, Golden Star (Wassa) discontinued the use of pulp samples for determining repeatability. Instead, coarse reject material (leftover material from the laboratory primary crush stage) was used as duplicate sample material.

During the sample prep stage, after the drill core passed through primary crushing, the excess coarse reject material was collected and returned to Wassa. This material was then re-numbered and re-submitted to the laboratory for repeat analysis. Coarse reject replicates were used to monitor the sample preparation processes of the laboratory.

**Figure 8-1: Correlation Plot of Coarse Reject Replicates and Original Assays**

Laboratory coarse reject replicates pair analysis for all samples generated between 2019 and 2022 shows improved assay grade reproducibility. About 3% of the replicates below 1g/t do not correlate with the original assays but these are within acceptable limit for a gold deposit like Golden Star (Wassa).

### 8.2.2 CRMs and Blanks

CRM was introduced by GSR into the sample stream to monitor the accuracy, precision and reproducibility of the assay results. CRMs were sourced from Geostats Pty Ltd ("Geostats"), and from Gannet Holding Pty Ltd ("Gannet"). Although the CRM could be easily identified by the laboratory, the actual grade of the standard would be difficult to determine due to the large number of different CRM types used. The summary results of CRM types in use between 2019 and 2022 as supplied by both Geostats and Gannet are shown in Table 8-1 and Table 8-2; overall the results are satisfactory indicating that there are no concerns with the analytical method employed by the laboratories.

Table 8-1: CRM from Geostats Used within HBB between 2019 and 2022

Standard	Number analyzed	Certified Value	Analytical average	Lower limit	Upper limit	Failures	Bias	% Failures
G307-1	45	3.350	3.375	2.84	3.86	0	negative	0%
G307-4	51	1.360	1.324	1.15	1.57	0	negative	0%
G912-3	192	2.100	2.037	1.74	2.46	0	negative	0%
G913-2	33	2.420	2.334	1.97	2.87	0	negative	0%
G913-3	1	2.420	2.330	1.97	2.87	0	negative	0%
G913-4	1	2.420	2.400	1.97	2.87	0	negative	0%
G914-2	21	2.450	2.373	2.15	2.75	0	negative	0%
G915-2	50	4.940	4.968	4.34	5.54	0	positive	0%
G916-2	12	1.960	1.905	1.75	2.17	0	negative	0%
G916-3	9	1.000	0.979	0.85	1.15	0	no	0%
G918-6	56	3.400	3.333	3.04	3.76	0	negative	0%

Table 8-2: CRM from Geostats Used within Wassa Main between 2019 and 2022

Standard	Number analyzed	Certified Value	Analytical average	Lower limit	Upper limit	Failures	Bias	% Failures
G307-4	206	1.360	1.337	1.15	1.57	0	no	0
G312-5	172	1.560	1.610	1.23	1.89	0	no	0
G314-5	22	5.300	5.030	4.34	6.26	0	negative	0
G314-7	58	2.430	2.381	2.01	2.85	0	negative	0
G318-4	26	5.790	5.501	4.98	6.6	0	negative	0
G912-3	180	2.100	1.998	1.74	2.46	0	negative	0
G913-2	363	2.420	2.328	1.97	2.87	0	negative	0
G914-2	181	2.450	2.378	2.15	2.75	0	negative	0
G916-2	111	1.960	1.945	1.75	2.17	0	no	0
G916-3	283	1.000	0.978	0.85	1.15	0	negative	0
G918-6	179	3.400	3.352	3.04	3.76	0	negative	0
G918-7	6	5.870	5.798	5.12	6.62	0	negative	0

Blank samples are routinely inserted into the sample stream to check for possible sample contamination during the preparation and assaying process. Typically, blanks are inserted prior to the delivery of samples for preparation and analyses. Between 2019 and 2022, the blank assay data include 752 assays for HBB and 3,047 assays for Wassa main; all assays for these blanks are summarised in Table 8-3 and Table 8-4; overall, there is no indication of material cross contamination during the sample preparation stage.

Table 8-3: Blank from Hwini Butre Benso Assays

Standard	Number analyzed	Certified Value	Analytical average	Lower limit	Upper limit	Failures	Bias	% Failures
Blank	752	0.010	0.010	0.001	0.08	0	no	0

Table 8-4: Blank from Wassa Main Assays

Standard	Number Analyzed	Certified Value	Analytical Average	Lower Limit	Upper Limit	Failures	Bias	% Failures
Blank	3,047	0.010	0.010	0.0001	0.44	1	no	<0.5

### 8.2.3 Comments

SRK has conducted similar validation exercises on the historical assay QA/QC since 2014 and found no material flaws that impacts on the reliability of the assay dataset for Mineral Resource estimation.

## 8.3 Verifications by SRK (Between 2023 and March 2024)

GSR regularly inserted certified standards, blanks and coarse field duplicates for the period between 2023 and March 2024. The QA/QC summary is listed in Table 8-5.

**Table 8-5: QA/QC Summary Between 2023 and March 2024**

Zone	Category	QC samples	Total N of samples	%Coverage
B Shoot	CRMs	4,070	90,474	4.50%
	Blanks	4,362		4.82%
	Field Duplicates	4,148		4.58%
	Lab Check Duplicates	688		0.76%
242	CRMs	359	5,862	6.12%
	Blanks	337		5.75%
	Field Duplicates	1,193		20.35%
DMH	CRMs	469	9,924	8.00%
	Blanks	425		7.25%
	Field Duplicates	442		4.45%

### 8.3.1 B Shoot

For B Shoot, SRK was provided with 4,070 CRMs sample, 4,362 blanks samples, 4,147 coarse field duplicates and 688 lab check duplicates.

#### CRMs

The pass rate within 2 standard deviations ranges from 80.82% to 100% and the average is 96%. Most of the CRMs pass rate are greater than 95%. Only three CRMs pass rate are less than 90%, G319-5 is 84%, G916-1 is 80.82% and G918-2 is 87.27%, detailed in Table 8-6 and Figure 8-2

**Table 8-6: B Shoot CRMs Summary Between 2023 and March 2024**

CRM	Element	Expected	CRM SD	Samples	Samples Mean	2SD	
						Samples outside	Pass Rate
G918-6	Au	3.40	0.12	817	3.33	5	99.39%
G916-2	Au	1.96	0.07	580	1.94	19	96.72%
G913-2	Au	2.42	0.15	28	2.39	0	100.00%
G319-5	Au	3.94	0.13	25	3.76	4	84.00%
G912-3	Au	2.10	0.12	823	2.03	6	99.27%

CRM	Element	Expected	CRM SD	Samples	Samples Mean	2SD	
						Samples outside	Pass Rate
G312-5	Au	1.56	0.11	524	1.57	19	96.37%
G908-2	Au	0.21	0.02	103	0.21	0	100.00%
G912-4	Au	1.95	0.14	50	1.82	1	98.00%
G915-3	Au	9.22	0.55	78	8.66	0	100.00%
G916-3	Au	1.00	0.05	171	1.00	0	100.00%
G916-1	Au	1.70	0.06	73	1.62	14	80.82%
G918-2	Au	1.43	0.05	110	1.38	14	87.27%
G918-7	Au	5.87	0.25	423	5.74	6	98.58%
G314-7	Au	2.43	0.14	59	2.28	4	93.22%
G314-5	Au	5.30	0.32	206	5.07	0	100.00%

Figure 8-2: B Shoot CRM Samples Between 2023 and March 2024

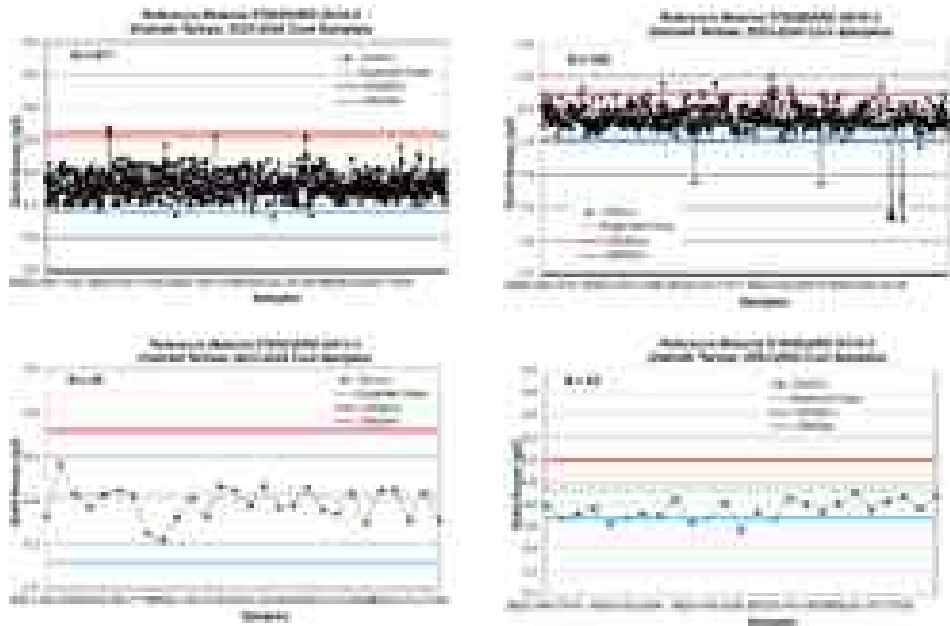

Figure 8-2: B Shoot CRM Samples Between 2023 and March 2024

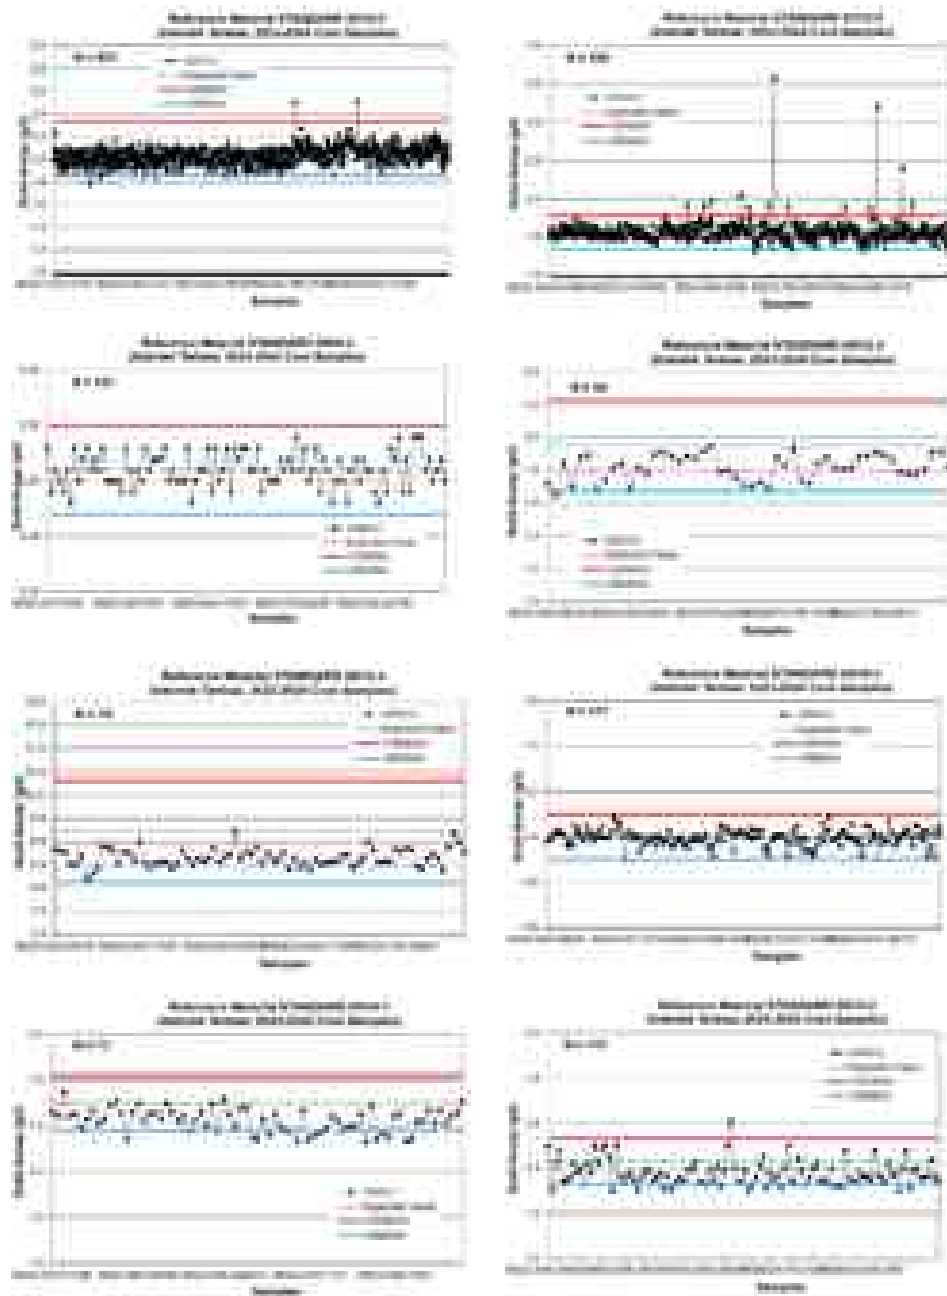

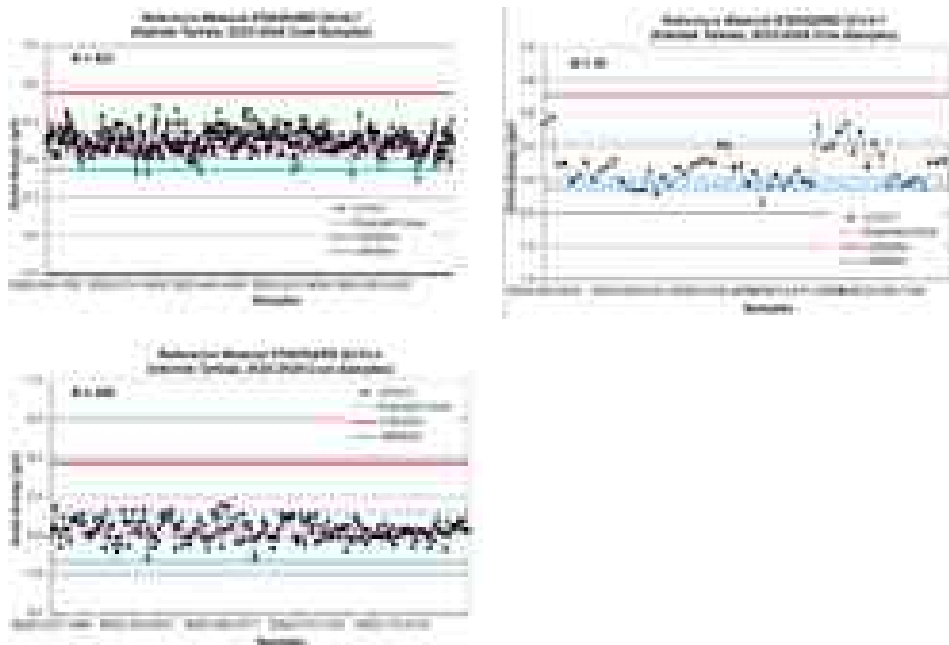

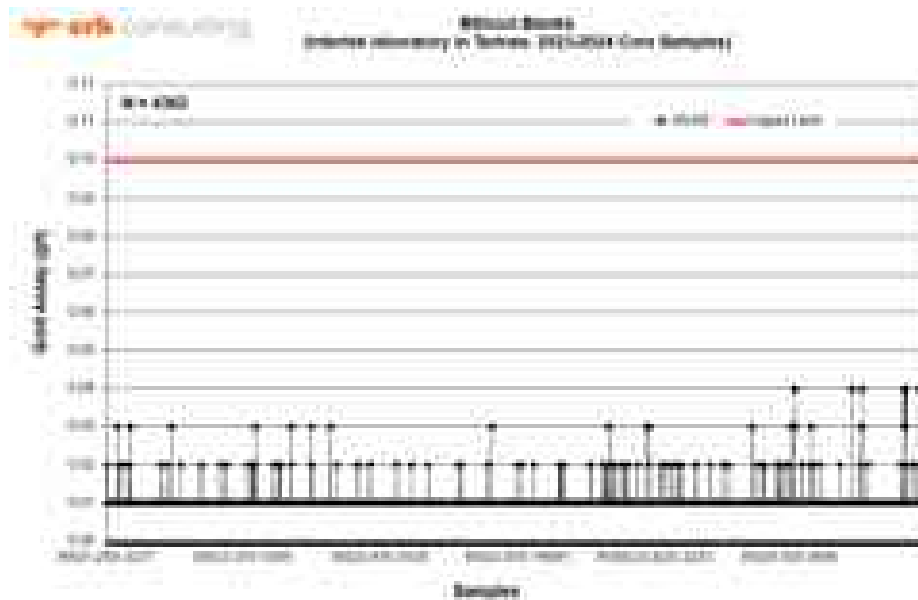

Figure 8-2: B Shoot CRM Samples Between 2023 and March 2024

**Blanks**

As shown in Figure 8-3, all samples result of gold are falling with 10X detection limit.

Figure 8-3: B Shoot Blank Samples Between 2023 and March 2024

**Field Duplicates**

Detailed in Table 8-7 and Figure 8-4, about 62% duplicate pairs are within 20% limits, however this is not uncommon with precious metals due to the nugget effect for coarse duplicates.

Table 8-7: B Shoot Field Duplicates Summary Between 2023 and March 2024

Element	Data Pairs Count	Relative Difference					
		<10%	10% - 20%	> 20%			
Au	4,148	1,589	38%	984	24%	1,575	38%

Figure 8-4: B Shoot Field Duplicates Between 2023 and March 2024

**Lab Check Duplicates**

GSR used SGS to check the gold grade. About 58% duplicate pairs are within 20% limits.

Table 8-8: B Shoot Lab Check Duplicates Summary Between 2023 and March 2024

Element	Data Pairs Count	Relative Difference					
		<10%		10% - 20%		> 20%

Figure 8-11: Correlation Plot of Coarse Reject Replicates and Original Assays

#### 8.3.4 Comments

Based on the verification of the data, SRK is of opinion that the QA/QC samples' performance are of industrial standard, which provides sufficient confidence for the mineral resource estimation.

## 9 Mineral Processing and Metallurgical Testing

### 9.1 Metallurgical Test works of 2003

Metallurgical Process Development Pty Ltd. (now known as MDM) carried out the Process Engineering aspect of the feasibility study ("FS") for a CIL commissioned by GSR when the latter took ownership of the Project in 2002. The FS was completed in 2003. The metallurgical test work was conducted on samples from the Wassa area. Samples were originally sent to SGS Lakefield in Johannesburg for both variability and bulk sample test work. Further variability test work was conducted at AMMTEC in Perth.

A total of 24 variability samples were tested: 10 of fresh mineralised material, six of oxide, and eight samples taken from the decommissioned and reclaimed Heap Leach operation ("HL"). Four bulk samples were also tested, representing fresh, oxide, HL phase 1 and HL phase 2. All these samples were taken from the Wassa Main area.

The test work also quantified the metallurgical grindability, gravity recovery and leachability that could be attained within the milling circuit. The Bond Ball Mill Work Index ("BWi") for the fresh bulk sample was 14.8 kWh/t. That sample achieved a leach recovery of 92% on a grind size of 75% passing 75 µm when leached over a 24-hour period. However, the reported values for the BWi and leach recovery are 8 kWh/t and 93% respectively under same conditions. The potential plant gravity circuit recoveries ranged between 30 to 40% and an indicative minor preg-robbing behaviour was also noted.

These were reported as per NI 43-101 Technical Report on A Feasibility Study of the Wassa Open Pit Mine and Underground Project in Ghana (SRK, 2014) and NI 43-101 Technical Report on the Wassa Gold Mine - Mineral Resource & Mineral Reserve Update and Preliminary Economic Assessment of the Southern Extension Zone (GSR, 2021).

### 9.2 Metallurgical Testwork of 2015

Further metallurgical test work was completed in 2015 as part of the Wassa Underground FS. This test work was undertaken by SGS (Cornwall, UK) and the samples were delivered and logged in the middle of December 2014 with this initial phase of test work completed and the draft report issued in early April 2015.

The scope of the test work covered evaluation of the performance of feed from underground with a series of half-core samples from definition drilling. The physical characteristics and metallurgical response of these samples were compared to those of a reference sample of the then plant feed (i.e., open pit material).

A representative of the underground feed material was obtained from the exploration decline and bulk sample from underground. The bulk sample treatment through the plant resulted in a reduced test work program that included a series of six variability and four crushability samples that were compared to a reference sample taken from the open pit ore feed.

**9.2.1 Variability, Crushability and Reference Sample**

GSR differentiated spatially the material envisaged to be processed into six underground domains or zones for processing. Six variability samples were selected, one for each zone from available HQ and NQ half cores. These are depicted in Figure 9-1 with further details presented in Table 9-1.

**Table 9-1: Ore Zones Represented by the Variability Samples**

Zone	Mining		Reference Level		Tonnage (TMR11)	Grade (g/t Au)	Grade (kg/t Au)	Tonnage (t)	Metal (kg)
	From (m)	To (m)	From (m)	To (m)					
Zone 1 Upper	20,200	19927.5	95.7	96.2	199	4.74	91.2	18%	14%
Zone 1 Lower	20,200	19917.5	96.2	97	797	4.79	154.3	18%	19%
Zone 2 Upper	19,917.5	19650	78.2	81.2	723	5.28	149.1	18%	22%
Zone 2 Lower	19,917.5	19600	81.2	90	339	4.32	74.7	24%	11%
Zone 3 Upper	19,650	19300	87	97	732	5.62	104.8	20%	19%
Zone 3 Lower	19,650	19200	97	99.2	615	4.2	82.8	19%	12%
<b>Total Processing Inventory</b>					<b>3,953</b>	<b>5.3</b>	<b>678.8</b>	<b>100%</b>	<b>100%</b>

**Figure 9-1: Locations of 2015 Metallurgical Samples (GSR, 2015)**

These core sections were further cut in half, with one section used for the metallurgical test work and the remaining quarter core sections retained for reference. Each sample of quarter core, weighed between 50 and 60 kg.

Four full core samples were selected for the crushability tests since samples with a minimum of 35 mm in two dimensions are required. As a result, quarter core samples were not suitable for such investigations due to the limited physical size of each sample. Each crushability sample consisted of seven lengths of HQ drill core each approximately 200 mm in length. Three of these samples were prepared for the uniaxial compressive strength (“UCS”) tests with the remaining core sections and material from UCS testing prepared for the Bond crushability index (low energy crushing) tests.

The reference sample used was obtained from the workings in the Starter open pit area at around the 910 m level by hand selection. Around 100 kg of material was taken, and this sample was used for both metallurgical and crushability test work. Some of the crushability samples selected were adjacent to rather than completely within the representative ore zone. The full description of each sample is given in Table 9-2.

Table 9-2: Summary of Location of 2015 Testwork Samples

Sample Type	Depth	Drifting		Leaving		Bench Level			Depth (m)
		From	To	From	To	From	To	From	
		east	west	east	west	east	west	east	
Reference		22,220	22,260	22,220	22,270	750	850	750	0
Variability	110	22,270	22,280	22,220	22,280	800	850	750	0

9.2.2 Programme of Metallurgical Test works

The following constituted the requisite metallurgical tests performed:

- Scope of work for reference and variability samples:
  - elemental scan: ICP multi-element analysis;
  - analysis of sulphide and total sulphur;
  - analysis of carbonate and graphitic carbon;
  - Bond Ball Mill Work Index; and
  - Bond Abrasion Index (Ai).
- diagnostic leach (gold deportment tests);
- Scope of work for crushability and reference samples:
  - UCS;
  - Bond Low Impact Crushing Work Index (CWi);
  - BWi; and
  - Ai.
- Standard flowsheet treatment tests – to confirm recoveries and reagent consumptions:
  - grind calibration tests;

- gravity concentration;
- cyanide leaching of the gravity tails with pre-aeration; and
- settling tests.

**9.2.3 Findings of Metallurgical Test works**

**Head Grade and Analyses**

Milled head samples were screened over an aperture of 106 µm. The gold and silver contents of the two fractions were determined using fire assay and the values are stated in Table 9-3.

**Table 9-3: Head Grades of Screened Samples**

Sample	Overall Grade		Size Fraction				Gold Distribution		Silver Distribution		
			+106µm		-106µm		+106µm	-106µm	+106µm	-106µm	
	g/g	g/t	g/t	g/g	g/g	g/g	%	%	%	%	
Reference	1.05	0.1	1.8%	11.14	0.2	0.14	0.1	11.8%	94.1%	1.7%	96.3%
Zone 1 Upper	6.51	0.8	1.8%	28.29	0.9	7.88	0.4	10.0%	89.7%	0.9%	81.0%
Zone 1 Lower	7.88	0.9	1.8%	43.29	4.2	7.51	0.9	11.0%	88.0%	11.0%	89.0%
Zone 2 Upper	9.21	0.8	1.8%	17.24	1.0	6.08	0.3	6.2%	94.8%	1.5%	96.0%
Zone 2 Lower	6.48	0.2	1.8%	6.94	0.6	6.22	0.2	9.8%	90.0%	0.8%	91.0%
Zone 3 Upper	4.07	0.0	1.8%	3.40	0.0	4.42	0.0	0.0%	96.4%	1.0%	97.8%
Zone 3 Lower	5.26	0.4	2.2%	25.8	0.8	9.29	0.0	10.0%	89.7%	10.9%	89.0%

In all cases, the gold and silver content in the coarse fraction (+106 µm) is higher than those in the finer fraction (-106 µm).

Elemental analyses were carried out using an Inductively Coupled Plasma (ICP) spectroscopy. Total carbon, organic carbon, total sulphur and sulphide sulphur contents of the reference and variability samples were determined using the Lecco Furnace method. The results are indicated in Table 9-4.

In all cases, a higher-grade variability sample registered higher contents of sulphide sulphur, iron and base metals compared to the reference sample, although the levels for the base metals were relatively lower values.

The low levels of graphitic carbon measured in all the samples is indicative of the minimal preg-robbing potential.

**Diagnostic Leach**

Diagnostic leaching is a method for determination and distribution of gold among the minerals. It is commonly utilised because of its simplicity, speed and relatively low cost. It consists of a series of cyanidation steps in between a series of progressively more aggressive acid-digestion steps. Thus, it apportions a gold assay into water-soluble, cyanidable-exposed gold, and gold enclosed in carbonates, in sulphides and in silicates.

However, diagnostic leaching is also carried out, ensuring that the various leach stages are carried out correctly and the results analysed properly.

The aim for this testwork was to determine whether the increased level of sulphide minerals was resulting in the samples being more refractory to treatment for the recovery of gold.

Each of the samples was prepared by grinding 75% passing 75 µm and was subjected to the following steps:

- Step 1. Cyanidation to determine the amount of free and exposed gold.
- Step 2. Leach with hydrochloric acid to define gold bound to carbonates, pyrrhotite, galena, goethite and other iron hydroxide minerals

- Step 3. Leach with sulphuric acid to determine amount of gold associated with uraninite, sphalerite, labile copper sulphates, labile base metal sulphides, and labile pyrite.
- Step 4. Leach with nitric acid to determine amount of gold associated with pyrite, arsenopyrite and marcasite.
- Step 5. Carbon combustion to burn off any organic carbon releasing gold previously adsorbed by the carbon and therefore not amenable to recovery by direct cyanidation.

Steps 2 to 5 constitute separate pre-treatment stages and residual gold and silver present after the above tests represent gold encapsulated in silica and other non-reactive gangue minerals inherently present in the sample.

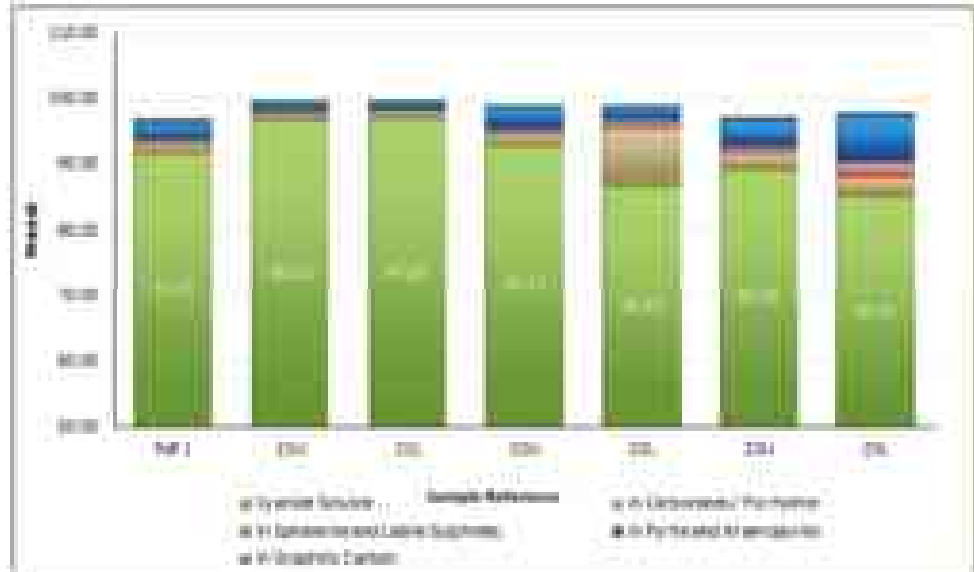

Table 9-5 shows a summary of results of the diagnostic leaching tests for gold and the deportment of gold in the samples.

**Table 9-5: Summary of Gold Deportment Using Diagnostic Leaching**

Gold Deportment	Sample Reference						
	Ref 1	Z1U	Z2	Z3U	Z3L	Z3M	Z3N
	%	%	%	%	%	%	%
Complete Solution	92.9	95.92	97.29	85.13	88.92	98.5	85.34
In Carbonates / Pyrrhotite	1.08	0.88	1.1	1.7	0.83	1.37	1.98
In Sulphates and Labile Sulphides	0.88	0.88	0.23	0.79	0.22	0.87	0.18
In Pyrite and Arsenopyrite	1.34	2.22	1.36	3.3	1.91	6.24	7.62
In Insoluble Carbon	0.39	0.27	0.3	0.42	0.39	0.48	0.6
Residual Gold	1.84	0.23	0.25	0.79	0.74	0.71	1.08
Totals	100	100	100	100	100	100	100

The mineralogy and metallurgy of the samples when compared to the reference sample, appear to have potentially more occluded gold or associated with different sulphide minerals and others less. Low levels of preg-robbing potential are indicated from the gold liberated in the burn off stage. Two samples (Z3U and Z3L) showed potentially higher levels of gold encapsulated in pyrite while sample Z2L showed higher levels of gold potentially associated with more reactive minerals such as pyrrhotite as seen in the graphical display of same data in Figure 9-2.

Figure 9-2: Gold Department in Samples Using Diagnostic Leaching

It should be noted that due to assay detection limits some of the lower departments may be marginally inaccurate. Given a detection limit of 0.01 g/t Au, measurements below this level were assigned a nominal assay of 0.005 g/t Au; hence on the lower levels the department in these fractions could be possibly overstated.

It was reported that during the hydrochloric acid digestion, a reasonably vigorous reaction took place on the majority of the variability samples with the generation of green foam. This would tend to indicate a high level of carbonate and acid soluble iron, possibly pyrrhotite.

### Crushability

Metallurgical operations in size reduction including both crushing and grinding are determined by the feed characteristics of the ore into the circuit. Key parameters needed are the “crushability or grindability”, also called Work Index (Wi) and the “Wear Profile” or Ai.

Crushability is the ease of crushing a sample under standard conditions. Various testing procedures may be used to measure crushability. The low energy crushing work index laboratory test is conducted on ore specimens larger than 50 mm, determining the CWi or impact work index (IW<sub>i</sub>).

The uniaxial UCS and the Bond CW<sub>i</sub> tests were undertaken to determine the material strength and crushability of a material. In the UCS test, a sample is prepared by cutting to pre-set dimensions (re-coring) and then subjected to a compressive load to measure the strength at which the sample fails. The Bond CW<sub>i</sub> test involves two swinging weighted pendulums which are allowed to fall and impact simultaneously on the sample in order to measure from what height the pendulum needs to fall to crush the sample.

Both tests (UCS and CWi) were undertaken on multiple individual samples notably three prepared samples in the case of the UCS tests and about 20 sample pieces for the Bond CWi test. The results of the tests are presented in Table 9-6.

**Table 9-6: Results of Crushability Tests using UCS and CWi**

	Sample ID	Depth (m RL)	UCS Results (MPa)			Crushability		Depth (m RL)
			Average	Max	Min	Average	Std Dev	
Reference	1-01	910	89.5	73.7	94.8	9.8	1.0	910
Crushability 1	1-04	750	64.7	76.9	74.3	9.7	1.1	750
Crushability 2	1-05	772	119	98.4	94.2	11.1	1.1	772
Crushability 3	1-11	730	167.4	166	166.7	11	1.1	730
Crushability 4	1-06	690	82.4	80	84.9	13.1	1.0	690

A relatively large variation between the maximum and minimum measurements on the different samples were recorded during the UCS tests. There is no correlation between the UCS results and the depth of the sample.

The values of work indices obtained are indications of the efficiencies of the machines. The general trend of samples UCS values to be within the 30 to 95 MPa range, indicating that the materials tested were medium strong to strong. One sample (Crushability 3) recorded a very strong measurement of around 240 MPa. The mineralogy of that sample appears to be consisting of quartzite (massive quartz vein), rather than schist which had been associated with the majority of the other samples tested.

The CWi test results show the samples to be in the easy to medium classification. Similar to the UCS results, the CWi test results are also relatively variable with the reference sample (910 m RL). No real correlation can be seen between the CWi results and relative level of the sample tested as shown in Figure 9-3.

Figure 9-3: Scatter Diagram of the UCS and CWi Results with Relative Levels of Samples

Thus, the ores having the highest indices are the largest energy consumers followed by intermediate and the smallest consumers. The smallest consumers of energy are those machines that apply a steady, continuous, compressive stress on the material to crush them.

#### Ball Mill Work Index and Abrasion Index

The most widely used parameter to measure ore hardness is the Bond BWi. The abrasion index is a measure of the anticipated wear on components and consumables in the comminution circuit and is applicable to wear in both crushers and mills (media and liners).

Calculations involving BWi are generally divided into steps with a different Wi determination for each size class.

The rate of production in a mill, shell liner and lifter design and simulation are dependent among other parameters on the grindability in the ball mills.

The BWi tests were undertaken at a closing screen size of 106  $\mu\text{m}$  to give a mill product of around 75-80% < 75  $\mu\text{m}$ . The BWi values for the primary and oxide ores were reported to be in the region of 14.6 and 8 kWh/t respectively in the FS of 2003.

The findings of the BWi and Ai investigations from the 2015 tests are presented in Table 9-7 and are shown as a function of the average sample depth in Figure 9-4 and Figure 9-5, respectively.

Table 9-7: Bond Work Indices and Abrasion Indices from the 2015 Testwork

Sample Description	Bond		Avg. Length
	Index	W	
Reference	15.7	0.000	100
270 Depth 1 Sample	15.2	0.000	100
270 Depth 2 Sample	14.7	0.000	100
270 Depth 3 Sample	14.0	0.000	100
270 Depth 4 Sample	14.0	0.000	100
270 Depth 5 Sample	14.5	0.000	100
270 Depth 6 Sample	14.9	0.000	100
270 Depth 7 Sample	15.7	0.000	100
Comminution 1 (200µm)	14	0.000	100
Comminution 2 (400µm)	15	0.000	100
Comminution 3 (200µm)	14.8	0.000	100
Comminution 4 (400µm)	14.8	0.000	100

From the 2015 testwork, fresh open pit ore feeding the two ball mills were expected to draw power between 14.5 and 16.5 kWh/t treated. This results in a calculated BWi of around 14 – 16 kWh/t, based on the reported mill feed and product sizes and power draw on the ball mills. An allowance was made in the calculations for mechanical and other losses between the drive motor and mill.

The experimental data of the samples does not support the suspected increasing BWi with further depth with the reference sample (910 m RL) showing the highest BWi reading.

Figure 9-4: Plot of 2015 Ball Mill Bond Work Index Against Sample Depth

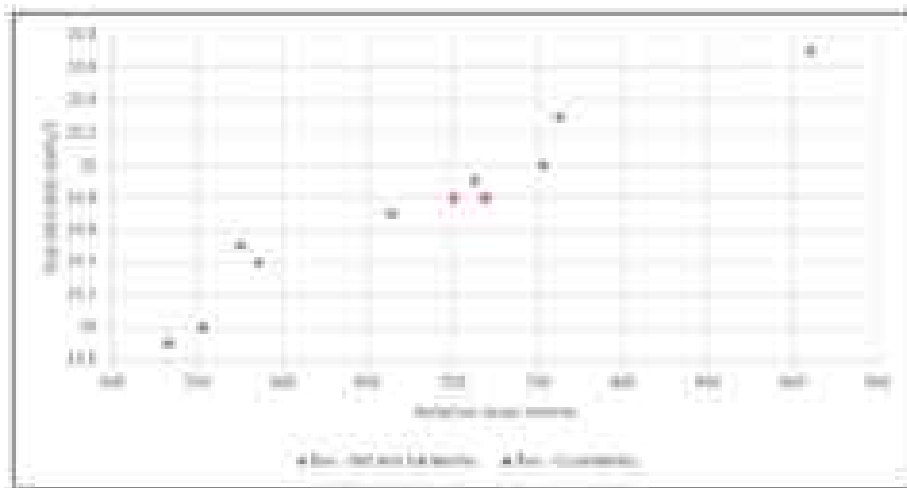

Figure 9-5: Plot of 2015 Abrasion Index Against Sample Depth

Ai has generally shown not to be increasing with depth and it appears Ai is slightly lower on deeper samples. With the exception of one sample (MET 5) of massive quartz vein, measured Ai for the reference sample is higher than all the other samples tested. This lower indicated abrasion index with depth may result in the reduced consumption of grinding media and mill crusher liners as mining proceeds deeper into the underground areas. All the samples fall into the slightly abrasive classification.

The Ai determined values are utilised in modelling and simulation of plants designed.

**Gravity Gold and Leaching Tests**

Each 1 kg representative sample from each zone or category with a grind of 75% passing 75 µm passes through a Falcon centrifugal concentrator for gravity separation of any free gold. Each batch of concentrate from the Falcon was further processed on a Mozley shaking table, with the final concentrate weighed and sent for assay. Tailings from the centrifugal concentrator and shaking table were subjected to cyanide leach testing.

Table 9-8 shows the results of the gravity tests.

Table 9-8: Gravity Gold Recovery Test Results

Sample Ref	In-situ Concentration		Slurry				Overall Recovery to Concentration	
	g	kg/t	Au (g/t)	Ag (g/t)	Au (%)	Ag (%)	Au %	Ag %
1001	0.7	12.07	94.37	19.9	93.3%	20.4%	93.3%	20.4
1004	2.3	36.44	101.46	19.8	91.3%	20.8%	91.4%	19.9%
1111	8.8	138.89	326.1	101.7	98.2%	24.8%	98.2%	24.8%
1204	10.1	157.61	354.3	101.3	91.8%	24.8%	91.8%	24.8%
1205	10.9	168.89	373.8	111.4	93.8%	26.1%	93.8%	26.1%
1202	0.7	10.87	98.01	18.8	98.1%	18.8%	98.1%	18.8%
1203	1.8	28.26	281.8	18.1	98.8%	18.8%	98.8%	18.8%

The results of the gravity recoveries were lower than in previous reports however the recovery from the reference sample is generally higher than on the variability samples.

In all the tests, a strong rare earth magnet was able to separate the magnetic components of the slurry but not for iron magnet. This magnetic component was suspected by SGS to be pyrrhotite (SRK, 2021). The claim was attributed to the sulphur to iron ratios measured in the feed analyses.

### Carbon-in-Leach Tests

These sets of CIL tests were undertaken to investigate the effective leaching conditions and reagent consumption is determined for each sample. Concurrently, any preg-robbing effect is also evaluated for each sample. A comparative assessment is designed with leach test undertaken on the reference sample with and without carbon as well.

The results obtained from the experiments are indicated in Table 9-9.

Table 9-9: Summary of CIL Results

Item	Solution (24h/48h)		Solid Tails		Gold on Carbon		Overall Recovery		Back Calc. Head Grade	
	Au g/t	Ag g/t	Au g/t	Ag g/t	Au g/t	Ag g/t	Au %	Ag %	Au g/t	Ag g/t
<b>Leach Test</b>	1.13	0.08	0.105	0.05	-	-	-	-	1.55	0.15
Distribution	93.2%	67.0%	6.8%	33.0%	-	-	93.2%	67.0%	-	-
<b>CIL Test</b>	0.14	0.01	0.1	0.05	93.4	12.7	-	-	1.21	0.19
Distribution	14.3%	6.5%	8.3%	26.4%	77.4%	67.1%	91.7%	73.6%	-	-

Preg-robbing effect was not deducible during the leaching of the sample since the difference in recoveries of gold with and without carbon in the slurry is not significant. This is impacted by the situation with a higher gold recovery for the Carbon-in-Pulp ("CIP") at 93.2% compared to the 91.7% for CIL. However, the gold reconciliation showed a significant difference for the case of head grades for CIL (Table 13-9 refers) and screened head grade (Table 13-3 refers) with values of 1.55 g/t Au and 1.53 g/t Au respectively. The worst reconciliation case was for the back-calculated value of 1.21 g/t Au for same sample under CIL (Table 13-9 refers).

**Gravity Gold and Leaching Tests**

The combined gravity tails from the centrifugal concentrator and concentrate cleaning table were subjected to cyanide leaching using the BLEG protocol.

Based on the potential presence of pyrrhotite in the gravity tails samples, the pH had to be pre-conditioned to values between pH 10.5 - 11 using lime and aerated until the pH and dissolved oxygen levels stabilized generally in line with the plant practice of injecting oxygen into the transfer line from milling to CIL. Pyrrhotite is highly reactive and can result in high consumptions of oxygen and cyanide in leach if not preconditioned.

Leach tests were conducted for up to 48 hours with samples taken at 2, 4, 6, 24 and 48h and analysed for gold and silver in solution. An initial cyanide level of 1 g/l was used and cyanide levels in solution were maintained at >0.5 g/l by dosing additional cyanide as required. The tails solids were analysed for silver and gold. No lead nitrate was added in this leach tests.

A summary of the test results is shown in Table 9-10.

**Table 9-10: Gold Recoveries from Samples, Cyanide and Lime Consumption Rates**

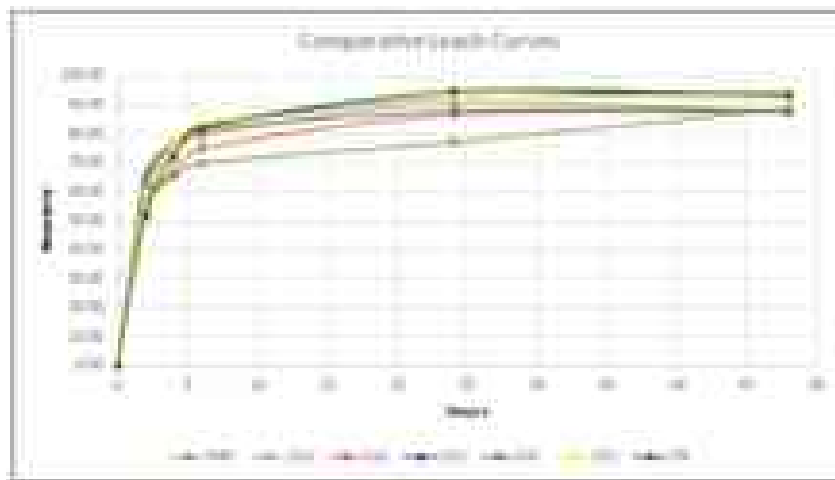

Sample Reference	Gold Recovery %		pH Adj.	Consumption kg/t		
	24h	48h		NaCN	Ca(OH) <sub>2</sub>	CaCO <sub>3</sub>
Z10	77.2%	88.8%	0.0%	0.00	0.00	0.00
Z20	78.8%	87.3%	0.0%	0.00	0.00	0.00
Z11	86.7%	87.8%	0.0%	0.00	0.00	0.00
Z21	78.8%	88.8%	0.0%	0.00	0.00	0.00
Z31	87.8%	88.8%	0.0%	0.00	0.00	0.00
Z10R	78.8%	88.8%	0.0%	0.00	0.00	0.00
Z1L	88.8%	88.8%	0.0%	0.00	0.00	0.00

It could be observed that the extended leaching period had three samples (Z1U, Z3U and Z3L) showing slightly decreased recoveries. Nonetheless, for the other 4 samples, the extra 24 hours of leaching time did not result in any significant improvement in their recoveries. The lowered recoveries could be attributed to analytical error or discrepancy. It could also arise from a desorption activity or process. Should the latter arise on the field, the gold would be re-adsorbed by the activated carbon present in the CIL circuit.

However, the cyanide consumption rates were markedly higher for the extended leaching.

A plot of the data in Figure 13-5 reveals that the rates and kinetics of leaching each of the samples were consistent and close with the exception of the reference sample after 24 hours of leaching. Nevertheless, the final recovery after 48 hours was consistent for all the samples.

Figure 12-6: Leaching Curves

**Overall Gravity / Leach Recoveries**

Comments on the gravity/ CIL testwork results are as follows:

- Gravity recoverable gold content ranges from 15% to 26% with an average of 20%.
- Overall recovery ranged from 90% to the highest at 96% whilst the average 93%.

The corresponding recoveries as determined from the sample routes are shown in Table 9-11.

**Table 9-11: Recoveries of Gold from Samples via Gravity-Leach Routes**

Sample Reference	Gold Recoveries (%)		
	Gravity	Leach	Overall
Z1L	18.42	94.97	93.09
Z1L	18.46	96.00	94.23
Z1L	22.00	97.64	95.40
Z1L	22.25	94.90	93.60
Z1L	18.07	96.90	94.60
Z1L	18.95	95.95	94.23
Z1L	20.40	98.07	95.00

It can be seen that Z1L recoveries were outliers compared to similar trends for all the other samples except for the reference sample. It rather compared very well with the reference sample. There was also a strong positive correlation between gravity and leach recoveries without Z1L sample. Similarly, positive strong correlations were seen between the leaching and overall recoveries. These observations could lead to the conclusion that the overall recoveries were extremely dependent on the recoveries obtained during leaching. The extended leach period to 48 hours alone did not appear

to have a significant impact on the overall recoveries and therefore such factors would have to be subjected to further assessment to make a direct implication to that effect.

It was observed that there appeared to be discrepancies in the head grade based on the fire assay methodology and the back-calculated approach as shown in Table 9-12.

A better correlation between the diagnostic and the gravity leach test grades however could be observed.

**Table 9-12: Reconciliation of Assay and Back-Calculated Head Grades**

Sample	Fire Assay Head Grade		Fire Assay Head Grade		Back-Calculated Head Grade	
	g/t Au	g/t Ag	g/t Au	g/t Ag	g/t Au	g/t Ag
Reference	1.14	0.10	1.10	0.11	1.08	0.14
1111	4.04	0.41	4.34	0.39	4.14	0.41
111	7.99	0.69	8.31	1.08	7.10	0.68
2111	5.33	0.56	5.41	0.52	4.81	0.58
211	4.64	0.31	4.88	0.30	4.14	0.32
3111	4.07	0.40	4.14	0.34	3.30	0.36
311	4.24	0.33	4.38	0.27	3.84	0.29

**Settling Tests**

Anionic flocculants have very wide application in the mining industry. A single variability sample was chosen and tested along the reference sample to determine the settleability of these materials. Nasaco anion flocculants N2132 and N2326 were used for the tests following the earlier trials with five different flocculants. The test results are presented in Table 9-13.

**Table 9-13: Comparative Settling Tests using Anionic Flocculants NZ2132 and NZ2326**

Sample	Feed Solids	pH	Floculant	Assay Grade	Settling Rate	Feed Solids Content	Residue Above Slurry
	%			g/t	g/200ml/min	%	g/200ml
Reference Test 1	9.4%	10.5	NZ2132	30.0%	2000.00	69	0.28%
Reference Test 2	10.0%	10.0	NZ2326	46.0%	2000.00	62.0	0.28%
1111 Test 1	9.4%	10.0	NZ2132	30.2%	2000.00	68.5	0.28%
1111 Test 2	9.4%	10.5	NZ2326	34.0%	2000.00	64.0	0.27%

Normal dosage rates for these applications are in the range 2.5-50 g/t.

The results show very similar settling performance on the reference samples and the sample with the generation of a thickened slurry from about 10% solids in the feed compared to about 59% solids content which is in the region required for good cyanide leaching without the carbon settling to the bottom of the CIL tanks.

### 9.3 Metallurgical Testwork of 2018

In August 2018, GSR commissioned another metallurgical study to profile the mining zones so as to develop a plant operations strategy. University of Mines and Technology, Tarkwa in Ghana undertook the geometallurgical characterisation of each of seven samples submitted by GSR. The scope of the study covered:

- Head assays
- BWi
- Gravity recoverable gold
- Effects of particle size on cyanidation
- Consumption of reagents such as cyanide, lime and lead nitrate; and
- Diagnostic leaching.

The head assays of the samples ranged from 3.91 g/t to 5.25 g/t whilst Bond BWi's ranged from 13.6 kWh/t to 15.7 kWh/t. Five samples (constituting 71%) were classified as hard rocks because their BWi were above 14 kWh/t whilst two other samples were classified to be of medium hardness. The details are shown in Table 9-14.

Table 9-14: Summary of Bond Ball Work Indices

No	Sample Name	Breakthrough Size (µm)		Net grams per sample (g)	Bond Index
		F <sub>80</sub>	F <sub>100</sub>		
1	WASSA GOLD MINE - ZONE 1	360µ	31	345	13.7
2	WASSA GOLD MINE - ZONE 2	374µ	12	1131	21.4
3	WASSA GOLD MINE - ZONE 3	376µ	23	1742	24.8
4	WASSA GOLD MINE - ZONE 4	389µ	48	2188	24.8
5	WASSA GOLD MINE - ZONE 5	440µ	31	1679	15.2
6	WASSA GOLD MINE - ZONE 6	511µ	42	1126	14.6
7	WASSA GOLD MINE - ZONE 7	526µ	39	1117	14.7
Feeding particle size = 106 µm					

Most often cyclone underflow material moving for gravity concentration may be of size -1 mm however this may not be the liberation size. The results of gravity studies done at 40% passing 106 µm is presented in Table 9-15.

Table 9-15: Gravity Gold Recovery at different P80s

Sample	Sample Name	Final leach residue (leached tailings) Gravity gold recovery %	
		40% passing 106 µm	40% passing 75 µm
1	WASSA-10-10-10-10-10	47.6	87.8
2	WASSA-10-10-10-10-10	48.1	87.9
3	WASSA-10-10-10-10-10	47.1	87.9
4	WASSA-10-10-10-10-10	47.1	88.0
5	WASSA-10-10-10-10-10	48.3	87.7
6	WASSA-10-10-10-10-10	47.5	87.8
7	WASSA-10-10-10-10-10	47.7	88.1

The concentrate grades were from 50 g/t to 120 g/t with gravity concentration at particle size 40% passing 106 µm generated gold recoveries in the range of 26% to 44% with an average recovery of 32%. The study clearly substantiated that CIL performance was superior to direct cyanidation. However, gold extraction by leaching was very sensitive to grind size. At 40%, 60% and 80% passing 106 µm the recoveries were 76%, 84.2% and 89.2% respectively.

All the samples had a basic paste pH within the range of 9.1 and 9.6. The calcium oxide consumption was 0.8 kg/t and cyanide consumption ranged between 0.13 and 0.19 kg/t. These consumption values were deemed moderate.

The overall recoveries based on gravity gold and cyanidation at 80% passing 106 µm, were between 90% and 96% as shown in Table 9-16.

Table 9-16: Metal Accounting

Sample name	Gravity	Gold (g/t) at each stage			Total	Overall recovery %
		Before	Leach	Final		
WASSA-10-10-10-10-10	119.2	8.7	7.9	8.1	135.2	94.3
WASSA-10-10-10-10-10	118.1	8.6	7.8	8.0	134.1	94.1
WASSA-10-10-10-10-10	120.9	8.6	7.8	8.0	136.1	94.3
WASSA-10-10-10-10-10	117.2	8.6	7.8	8.0	134.1	94.3
WASSA-10-10-10-10-10	121.1	8.7	7.9	8.1	136.2	94.3
WASSA-10-10-10-10-10	117.9	8.7	7.9	8.1	134.1	94.3
WASSA-10-10-10-10-10	118.0	8.7	7.9	8.1	135.1	94.3

Diagnostic leaching of these samples revealed that the residual gold was distributed in all the other minerals with sulphides generally having higher gold values of up to 6.3%. Gold extraction in the first stage ranged between 85% and 94%.

## 10 Mineral Resource Estimates

### 10.1 Introduction

The Mineral Resource Statement presented herein represents a Mineral Resource evaluation prepared for the Wassa Main (B Shoot UG and 242 UG) deposit and the satellite deposits Dead Man's Hill (DMH), Benso's I Zone, Hwini Butre and Chichiwelli. The Mineral Resource Statement is presented in accordance with the JORC Code guidelines. SRK has reviewed, but not re-modelled or re-estimated the Mineral Resources and the mineral resource models were prepared by GSR.

At Wassa B Shoot deposit, GSR provided SRK with borehole database, structural control lines, grade wireframes, variogram models, resource classification footprints and block models. Mineralised wireframes were created by the Indicator radius basis function (RBF) Interpolant in Leapfrog™ software and the estimation technique was Ordinary Kriging (OK).

At Wassa 242 deposit, GSR provided SRK with borehole database, grade wireframes, variogram models, resource classification footprints and block models. Mineralised wireframes were created by the semi-explicit method in Leapfrog™ software and the estimation technique was OK.

At DMH deposit, SRK was provided with topographic surface, database, mineralised wireframe, and block models. The mineralisation domains were modelled using the intrusive technique in Leapfrog™ software and the estimation technique was OK.

At Benso, four estimation domains, Subriso East (including C Zone), Subriso West, G Zone and I Zone, were modelled. OP mining finished for Subriso East (including C Zone), Subriso West, G Zone and I Zone Pit. For I Zone Pit, GSR provided topographic surface, database, composites, mineralised wireframe, and a grade control model. The wireframes were created using Leapfrog™ software vein modelling technique and the estimation technique was OK.

At Hwini Butre, two estimation models, Father Brown (FB) and Adoikrom (ADK), were modelled. A drilling program was initiated at FB/ADK during 2022-2023, and 10,287.4m of drilling has been completed. But the additional drilling information has not been included in this resource estimate. For Chichiwelli, there has been no exploration or mining activity since 2020. Therefore, the Mineral Resources for FB/ADK and Chichiwelli remain unchanged from the previous NI 43-101 Technical Report (March 2021). The descriptions for Hwini Butre and Chichiwelli are thus based on the NI 43-101 Technical Report (March 2021).

The effective date of the current Mineral Resource Statement is 30 September 2024.

This section describes the Mineral Resource estimation methodology and summarizes the key parameters and assumptions considered by GSR. In the opinion of SRK, the Mineral Resource evaluation reported herein is a reasonable representation of the global gold Mineral Resources found in the Wassa project at the current level of sampling. The Mineral Resources estimates are reported in accordance with the JORC Code. Mineral Resources are not Ore Reserves and there is no certainty that all or any part of the Mineral Resource will be converted into Ore Reserve. It should be noted that the Mineral Resources reported in this Report are inclusive of, not in addition to, the Ore Reserves.

The database used to estimate the Mineral Resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for gold mineralisation and that the assay data are sufficiently reliable to support Mineral Resource estimation.

SRK has reviewed the databases, wireframes, grade estimation parameters, resource classification footprints and reported the Mineral Resource.

## 10.2 Resource Estimation Procedures

The Mineral Resources review and validation methodology involved the following procedures:

- Database verification
- Review of the definition of resource domains
- Data conditioning (compositing and capping) for data analysis
- Grade estimation review
- Mineral Resource classification review and model validation
- Assessment of “reasonable prospects for eventual economic extraction” (RPEEE) and selection of appropriate cut-off grades
- Preparation of the Mineral Resource Statement

## 10.3 Resource Database

### 10.3.1 Zone B Shoot

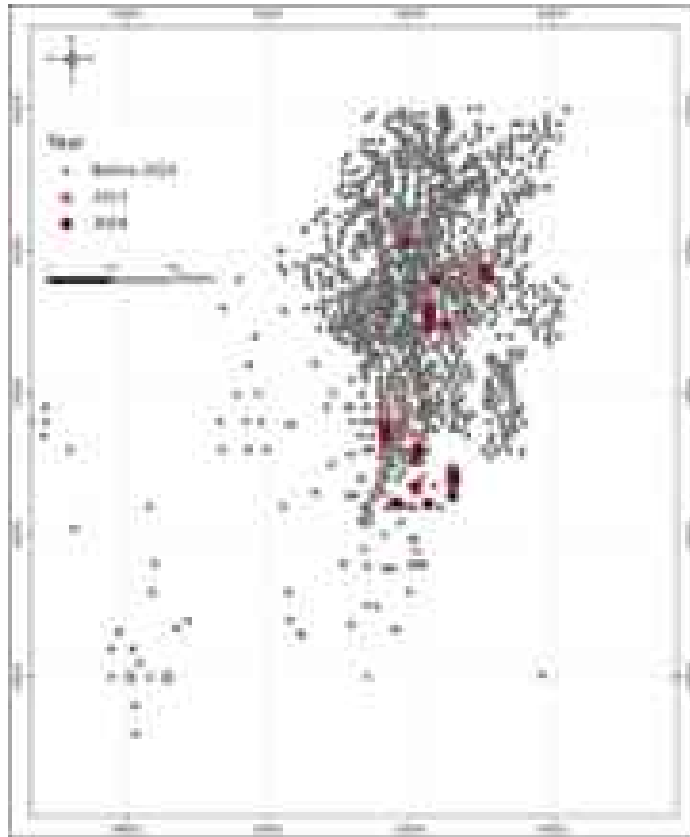

The database SRK received consist of assay, collar, density, lithological and weathering logs, and downhole survey data. They were loaded into Surpac software for the following validations:

- Checks for holes without samples
- Checks for duplicate samples
- Checks and adjusts the missing or wrong intervals

Only DD and RC holes were included in the grade estimate.

Figure 10-1 shows the locations of the DD and RC holes and Table 10-1 summaries the database statistics.

Figure 10-1: DD and RC Holes Plane Projection Map of Zone B Shoot

Source: Arcgis Mapping by SRK

Table 10-1: Mineral Resource Database Statistics of B Shoot

Location	Type	Holes	Drill Meters (m)	Assay Samples
Zone B Shoot	DD	3,755	731,162.9	559,927
	RC	485	50,314.9	37,484
	Total	4,240	781,477.8	597,411

### 10.3.2 Zone 242

The database SRK received consist of assay, collar, density, lithological and weathering logs, and downhole survey data. They were loaded into Surpac for the following validations:

- Checks for holes without samples
- Checks for duplicate samples
- Checks and adjusts the missing or wrong intervals

DD, RC and grade control RC (GCRC) holes were included in the grade estimate. Figure 10-2 shows the locations of the DD, RC and GCRC holes and Table 10-2 summaries the database statistics.

**Figure 10-2: DD, RC and GCRC Holes Plane Projection Map of Zone 242**

Source: Arcgis Mapping by SRK

**Table 10-2: Mineral Resource Database Statistics of Zone 242**

Location	Type	Holes	Drill Meters (m)	Assay Samples
Zone 242	DD	190	42,023.4	18,794
	RC	79	8,773.0	8,020
	GCRC	4,332	92,859.0	83,430

Location	Type	Holes	Drill Meters (m)	Assay Samples
	Total	4,601	143,655.4	110,244

### 10.3.3 DMH

The database provided to SRK contain assay, collar, lithological logs, weathering, structure and downhole survey data. They were loaded into Surpac software for the following validations:

- Checks for holes without samples
- Checks for duplicate samples
- Checks and adjusts the missing or wrong intervals

DD, RC and grade control RC (GC-RC) holes were included in the grade estimate. Figure 10-3 shows the locations of the holes. Table 10-3 summaries the database.

**Figure 10-3: DD, RC and GC-RC Holes Plane Projection Map of DMH**

Source: Arcgis Mapping by SRK

**Table 10-3: Mineral Resource Database Statistics of DMH**

Location	Type	Holes	Drill Meters (m)	Assay Samples
DMH	DD	32	4453.8	2,678
	RC	205	15,618.4	7,195
	GC-RC	1,900	52,967.0	30,034
	Total	2,137	73,039.2	39,907

**10.3.4 I Zone**

The database (hbb\_database.accdb) consists of assay, collar, lithological and weathering logs, and downhole survey data, covering the areas of Benso, Hwini Butre, and so on. SRK extracted the data used for I Zone and reconstructed the database. They were loaded into Surpac software for validation, which included:

- Checks for holes without samples
- Checks for duplicate samples
- Checks and adjusts the missing or wrong intervals

DD, RC and GCRC holes were included in the grade estimate. Table 10-4 summaries the database statistics and Figure 10-4 shows the locations of the DD and (GC) RC holes.

**Table 10-4: Mineral Resource Database Statistics of I Zone**

Location	Type	Holes	Drill Meters(m)	Assay Samples
I Zone	DD	21	2,245.4	1,192
	RC	42	4,114.7	4,878
	GCRC	191	9,214.0	4,594
	Total	254	15,574.1	10,664

Figure 10-4: DD, RC and GCRC Holes Plan Projection Map of I Zone

Source: Arcgis Mapping by SRK

### 10.3.5 Hwini Butre

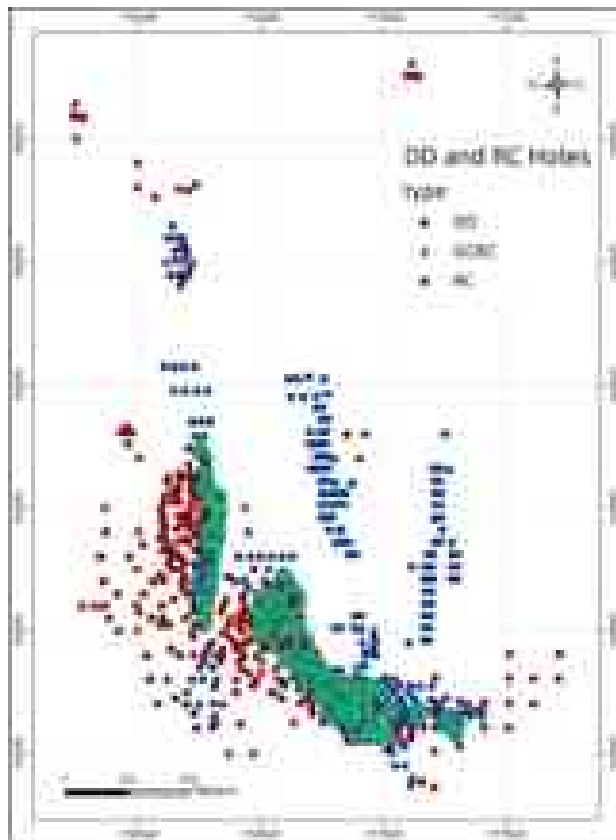

The database used in 2020-year-end Mineral Resource estimate is made up of DD, RC and GCRC holes, as summarized in Table 10-5 and Figure 10-5.

Table 10-5: Mineral Resource Database Statistics of Father Brown/Adoikrom

Location	Type	Holes	Drill Meters (m)
Father Brown/Adoikrom	DD	435	66,229
	RC	214	16,323
	GCRC	3,087	72,037
	Total	3,736	154,589

Source: NI 43-101 Technical Report on the Wassa Gold Mine, GSR, 2021

Figure 10-5: DD, RC and GCRC Holes Plan Projection Map of Father Brown/Adoikrom

Source: Arcgis Mapping by SRK

GSR has performed validation to the database and in SRK’s opinion the database is appropriate for the Mineral Resource estimate.

### 10.3.6 Chichiwelli

The database used in 2020-year-end Mineral Resource estimate is made up of DD and RC holes, as summarised in Table 10-6. No exploration has taken place at Chichiwelli since 2012, the database has no changes.

Table 10-6: Mineral Resource Database Statistics of Chichiwelli

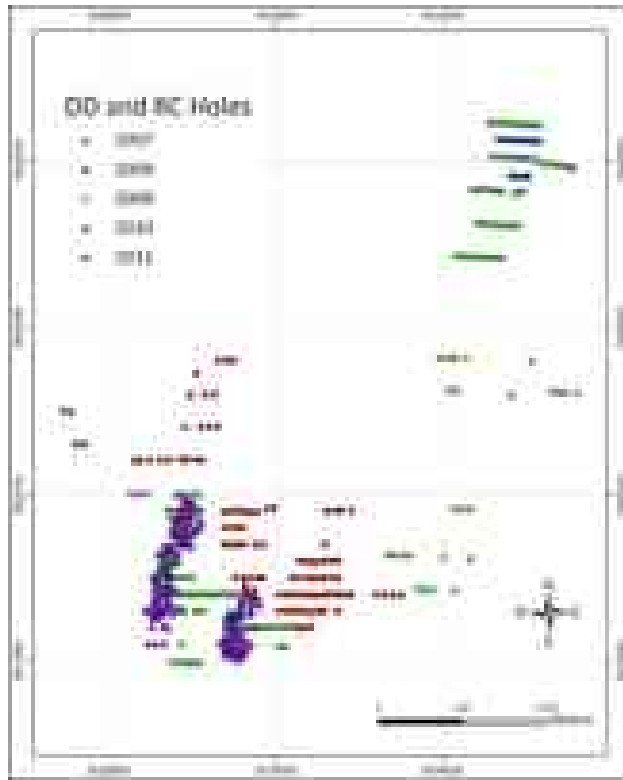

Location	Type	Holes	Drill Meters (m)
Chichiwelli	DD	23	3,692
	RC	483	29,802

Location	Type	Holes	Drill Meters (m)
	Total	506	33,494

Source: NI 43-101 Technical Report on the Wassa Gold Mine, GSR, 2021

GSR has performed validation to the database and in SRK’s opinion the database is appropriate for the Mineral Resource estimate.

**Figure 10-6: DD and RC Holes Plan Projection Map of Chichiwelli**

Source: Arcgis Mapping by SRK

## 10.4 Solid Body Modelling

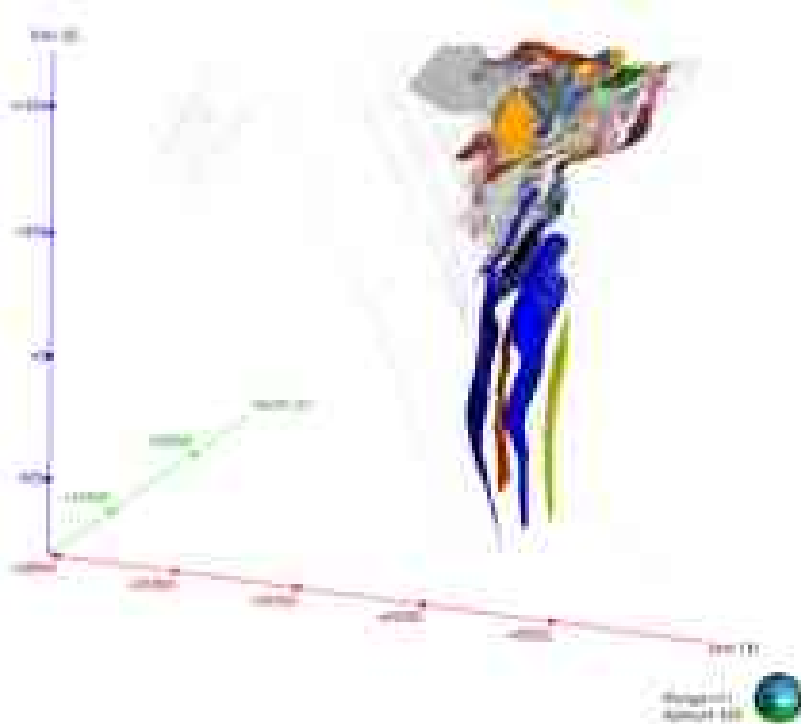

### 10.4.1 Zone B Shoot

For the model “wug\_bm\_eng\_20240409.mdl”, the wireframe modelling was carried out by GSR using Leapfrog™ software. The mineralisation wireframes are constrained within two mineralisation envelopes (Halo and Mineralised). A Halo zone at 0.4g/t cut-off at an ISO value of 0.35 have a hard boundary with each other modelled based on Leapfrog™ implicit modelling technique. The mineralisation zone was modelled at 1.20 g/t, with domains for (3101 & 4101) modelled with

Leapfrog™ Vein option whilst the other lodes were based on implicit modelling approach with same parameters as the Halo zone. The structural trend surfaces used for grade shell modelling are shown in Figure 10-7.

**Figure 10-7: Structural Trend Surfaces Used for Wassa Grade Shell Modelling**

Source: SRK, Leapfrog Mapping Using the Surfaces Provided by GSR

Prior to generating the indicator RBF interpolant shells, the raw assay file was composited to 2 m, with a minimum end composite length of 1 m. Any composite less than the end composite length of 1 m was added to previous interval for HG domain but discarded for LG domain. Indicator interpolants were defined at 0.4 g/t Au and 1.2 g/t Au threshold.

**Table 10-7: B Shoot Grade Shell Modelling Parameters**

Domain	Interpolant Type	Range	Nugget	Iso Value	Resolution	Volumes Excluded
LG (Halo)	Spheroidal	200	0.5	0.35	3.5 m	/
HG (Mineralised)	Spheroidal	200	0.3	0.35	2.5 m	10,000 m <sup>3</sup>

GSR used different zones to classify mineralised domains, detailed in Figure 10-8. All mineralised domains were shown in Figure 10-9 and detailed in Table 10-8.

Figure 10-8: Estimation Zones Used to Classify Mineralised Domains

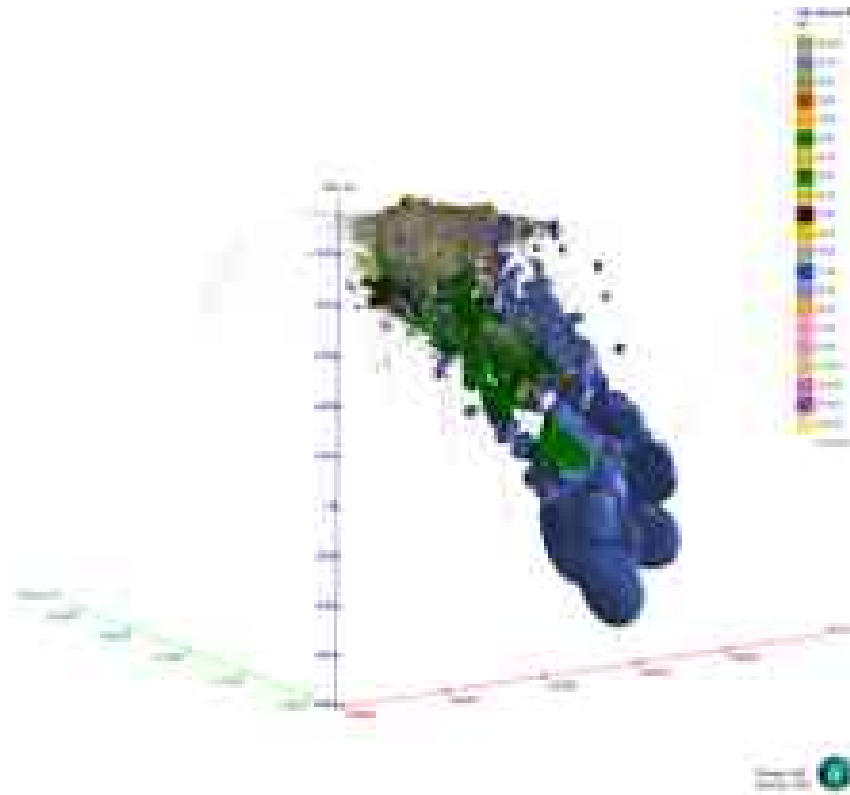

Source: GSR

Table 10-8: Descriptions for Zone B Shoot Mineralised Domains

Domain Code	Description
2001	F Shoot Halo Domain
2101	F Shoot Mineralised Domain
3001	B Shoot South Halo Domain
3101	B Shoot South Mineralised Domain
4001	Southwest Zone Halo Domain
4101	Southwest Zone Mineralised Domain
5001	B Shoot Halo Domain
5101	B Shoot Mineralised Domain

Domain Code	Description
6001	HW Zone Halo Domain
6101	HW Zone Mineralised Domain
7001	Link Zone Halo Domain
7101	Link Zone Mineralised Domain
8001	All Other South Zone Halo Domain
8101	All Other South Zone Mineralised Domain
10001	All Other North Zone Halo Domain
10101	All Other North Zone Mineralised Domain

**Figure 10-9: All Mineralised Domains for Zone B Shoot**

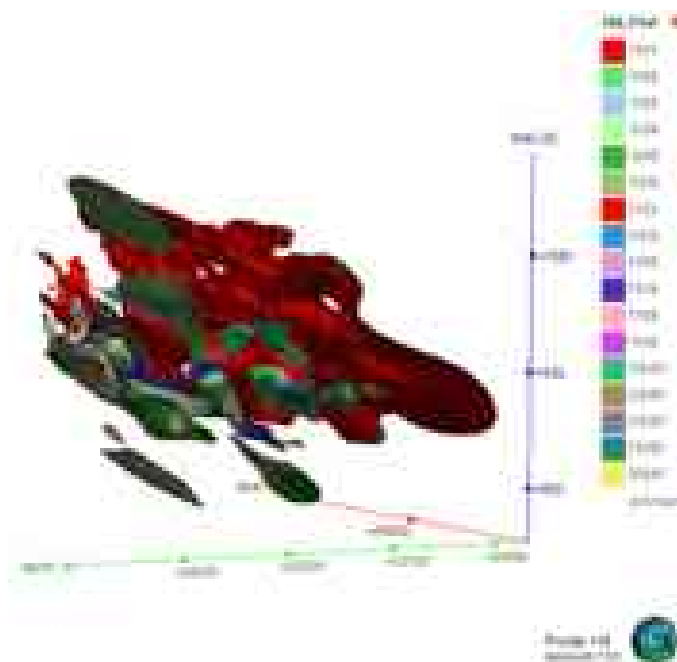

Source: SRK, Leapfrog Mapping Using the Solids Provided by GSR

SRK has reviewed the grade shells, displayed in Figure 10-9 and believes that they are reasonable and can be used for a Mineral Resource estimation.

**10.4.2 Zone 242**

For the model “242\_bm\_gc\_231019.mdl”, the wireframe modelling was carried out by GSR using Leapfrog™ software. The mineralised domains are constrained within two envelopes (Halo and Mineralised) using semi explicit method. The Halo zone was modelled at 0.4 g/t Au cut-off grade based on Leapfrog™ vein modelling technique. The mineralisation zone was modelled at 1.0 g/t Au cut-off grade, with the same method as the Halo zone.

**Figure 10-10: Mineralised Domains for Zone 242**

Source: SRK, Leapfrog Mapping Using the Solids Provided by GSR

The description of all mineralised domains is listed in Table 10-9 below.

**Table 10-9: Descriptions for Zone 242 Mineralised Domains**

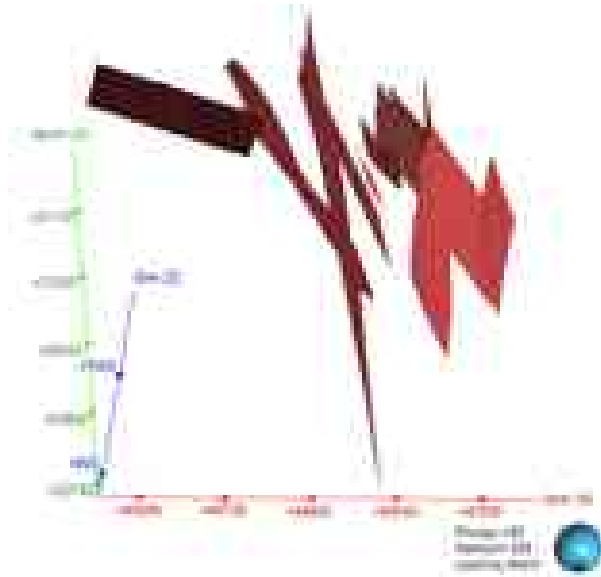

Domain Code	Description
1001, 1002, 1003, 1004, 1005, 1006	Halo Domain
1101, 1102, 1103, 1104, 1105, 1106	Mineralised Domain
10019, 10049	Internal Dilution Zone of Halo Domain
11019, 11039	Internal Dilution Zone of Mineralised Domain

SRK has reviewed the grade shells, displayed in Figure 10-10, and believes that they are reasonable and can be used for a Mineral Resource estimation.

### 10.4.3 DMH

For the model "dmh\_gc\_model\_20240518.mdl", the mineralisation domains were modelled using the intrusive technique in Leapfrog™ software by GSR. The Halo domains, 1001, 1002, 1003, 1004, and 1005, were modelled with an Au cut-off grade of 0.4 g/t. The mineralised domain 2102 was generated with a cut-off of 1.0 g/t. A total of 12 structural trends was developed to guide the intrusive implicit modelling, as shown in Figure 10-11.

**Figure 10-11: Structural Surfaces Used in Mineralised Domain Modelling for DMH Pit**

Source: SRK, Leapfrog Mapping Using the Surfaces Provided by GSR

Figure 10-12: Mineralised Domains for DMH Pit

Source: SRK, Leapfrog Mapping Using the Solids Provided by GSR

SRK has reviewed the solid models as shown in Figure 10-12 and believes that they are reasonable and can be used for the Mineral Resource estimation.

#### 10.4.4 I Zone

For the model “izone\_bm\_res\_20230901.mdl”, mineralised domains were developed using Leapfrog™ vein modelling technique by GSR. The intervals used in the veins modelling were generated by Leapfrog™ implicit modelling technique, at 0.5 g/t gold cut-off at an ISO value of 0.35 have a hard boundary.

Prior to generating the indicator RBF interpolant shells, the raw assay file was composited to 2 m, with a minimum end composite length of 0.5 m. Any composite less than the end composite length of 0.5 m was discarded. Indicator interpolants were defined at 0.5 g/t gold threshold. The global trend dips to 270° with a dip angle of 50°.

Table 10-10: I Zone Pit Grade Shell Modelling Parameters

Domain	Interpolant Type	Range	Nugget	Iso Value	Resolution	Volumes Excluded
I Zone	Spheroidal	100	0.2	0.35	5 m	/

SRK reviewed the solid models (1001, 1002, 1003, 1004, 1005, 1006, 1007,1008,2001,2002,2003 and 2004, Figure 10-13) and is of the opinion that they are reasonable and can be used for Mineral Resource estimation.

Figure 10-13: Solid Models for I Zone

Source: SRK, Leapfrog Mapping Using the Solids Provided by GSR

#### 10.4.5 Hwini Butre

The solid models for Father Brown (FBZ) and Adoikrom (ADK) were created by GSR and Resource Modelling Solutions (RMS). They were modelled using a vein modelling technique, with estimating both vein thickness and grade.

GSR provided RMS with drill hole intercepts with hanging wall (HW), main mineralised zone (ADK or FBZ) (HG) and footwall (FW) 'from' and 'to' intervals.

Each vein unit is created by estimating the position of the vein and each one of the thicknesses, HW, HG and FW. The position of the vein is defined by the intercept with the top of HW unit, the first thickness is the difference between the intercept of the contact between HW and HG with the top of

HW, the second thickness is defined by the difference between the contact HW and HG and the contact between HG and FW and the third thickness is defined by the base of the FW contact.

Intercepts within a horizontal distance tolerance of 2.0 m are used to calculate position and thicknesses to check any possible relationship between these variables and determine whether independent modelling is adequate for the modelling of each vein unit. The scatterplots between each variable showed no significant correlation between the variables, therefore, the independent modelling of each one of these variables in a stepwise manner is deemed appropriate.

The final vein model is defined by stacking the modelled thicknesses below the vein position model. A cross section at U = -28.0 m in transformed space is shown in Figure 10-14. Note that these sections are shown in transformed coordinates, after gold estimations models were rotated back to the original Easting-Northing-Elevation coordinates.

**Figure 10-14: Model section at U=-28.0 in Transformed Space Generated with 2.0 Tolerance in V Direction**

Source: A Report to Golden Star Father Brown Resource Model, RMS, 2020

#### 10.4.6 Chichiwelli

Mineralisation solids were undertaken by GSR, and the mineralised zone modelling was conducted by GSR with the 2D polylines being snapped to drill hole grade intercepts using a cut-off grade of 0.5 g/t Au. The 2D polylines were then linked together to create a 3D mesh for grade estimation. The modelled wireframe solids are shown in Figure 10-15.

The mineralisation zones of Chichiwelli are structurally controlled with gold emplacement related to the density of quartz veining and sulphide content. The mineralisation hosting structures generally trend north-south and dip moderate-steeply to the east at 60°.

**Figure 10-15: Solid Models for Chichiwelli**

Source: Surpac Mapping, SRK

SRK has reviewed the solid models and is of the opinion that they are reasonable and can be used for a Mineral Resource estimation.

## **10.5 Compositing**

Prior to the statistical analysis, the samples were generally combined so the length of each sample was basically equivalent.

### **10.5.1 Zone B Shoot**

The average distribution was generally around 1 m and raw sample assay data was composited to 2 m intervals by GSR in Leapfrog™ (Figure 10-16). The 2 m interval composite was applied by GSR for subsequent statistic, geostatistical analysis, and grade interpolation.

SRK summarised statistics of composites against raw samples for each domain as listed in Table 10-11.

Figure 10-16: Histogram of Interval Length for Zone B Shoot

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

Table 10-11: Summary Statistics of Composites against Raw Samples for Zone B Shoot

	Count	Min	Max	Mean	Variance	Std Dev	CoV
Raw	630,884	0.005	1,547.97	0.73	15.36	3.92	5.38
Composite	387,782	0.05	314.05	0.73	9.37	3.06	4.18

Based on the above results, SRK notes that there is a good correspondence in the basic statistics between the raw assay dataset and composites.

### 10.5.2 Zone 242

The average distribution was generally around 1 m and raw sample assay data was composited to 2 m intervals by GSR in Leapfrog™ software (Figure 10-17). The 2 m interval composite was applied by GSR for subsequent statistic, geostatistical analysis, and grade interpolation.

SRK summarised statistics of composites against raw samples for each domain as listed in Table 10-12.

	Composite	9	0.16	2.73	1.02	1.18	1.08	1.07

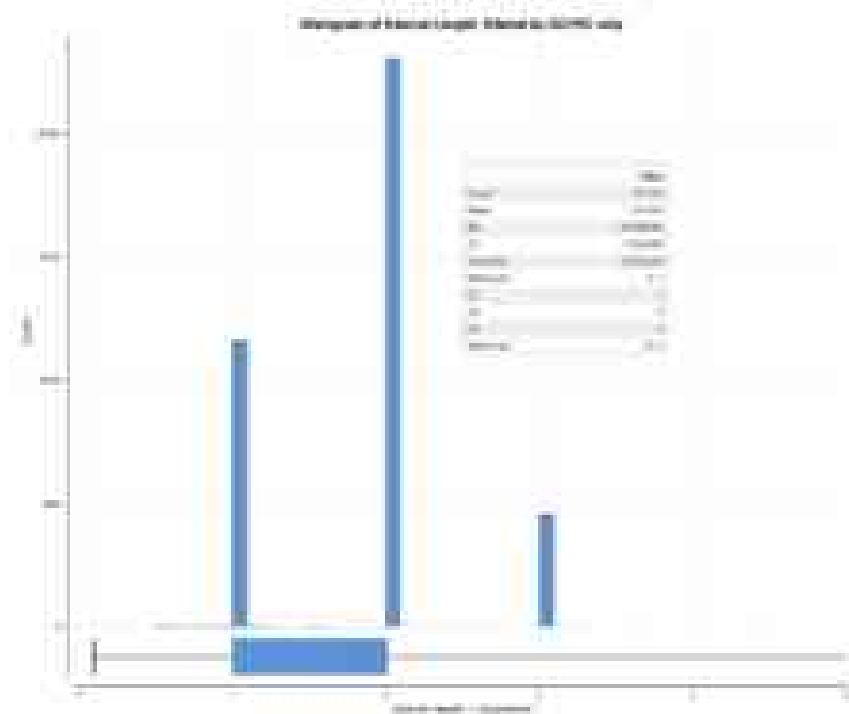

Based on the above results, SRK notes that there is a good correspondence in the basic statistics between the raw assay dataset and composites.

**10.5.3 DMH**

The average distribution for DMH was generally around 2 m and raw sample assay data was composited to 2 m intervals by GSR in Leapfrog™ software (Figure 10-18). The 2 m interval composite was applied by GSR for subsequent statistic, geostatistical analysis, and grade interpolation.

SRK summarised statistics of composites against raw samples for each domain as listed in Table 10-13.

**Figure 10-18: Histogram of Interval Length for DMH**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

**Table 10-13: Summary Statistics of Composites against Raw Samples for DMH**

	Count	Min	Max	Mean	Variance	Std Dev	CoV
Raw	43,597	0.005	44.34	0.39	0.95	0.98	2.53
Composite	39,965	0.005	39.78	0.39	0.84	0.92	2.36

Based on the above results, SRK notes that there is a good correspondence in the basic statistics between the raw assay dataset and composites.

**10.5.4 I Zone**

The average distribution for I Zone was generally around 2 m and raw sample assay data was composited to 2 m intervals by GSR in Leapfrog™ software (Figure 10-19). The 2 m interval composite was applied by GSR for subsequent statistic, geostatistical analysis, and grade interpolation.

SRK summarised statistics of composites against raw samples for each domain as listed in Table 10-14.

**Figure 10-19: Histogram of Interval Length for I Zone**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

**Table 10-14: Summary Statistics of Composites against Raw Samples for I Zone**

	Count	Min	Max	Mean	Variance	Std Dev	CoV
Raw	44,135	0.005	357.12	0.62	19.98	4.47	7.18
Composite	25,958	0.005	166.00	0.53	4.26	2.06	3.91

Based on the above results, SRK notes that there is a good correspondence in the basic statistics between the raw assay dataset and composites.

### 10.5.5 Chichiwelli

Assay data was composited to 2 m by GSR. The 2 m composites were applied for grade estimation, statistic, and model validation.

## 10.6 Evaluation of Outliers

### 10.6.1 Zone B Shoot

SRK has reviewed the sample outliers used for the grade estimation by GSR. Outliers of pre mineralised domain were determined using Leapfrog statistical tool by GSR. The coefficient of variation (CV), histograms, probability plots and cumulative metal plots were analysed carefully to select the appropriate top cuts for all domains. The CV variations of different capping grade for each domain are listed in Figure 10-20.

Figure 10-20: CV Variations of Different Capping Grade for Each Domain (B Shoot)

Figure 10-20: CV Variations of Different Capping Grade for Each Domain (B Shoot)

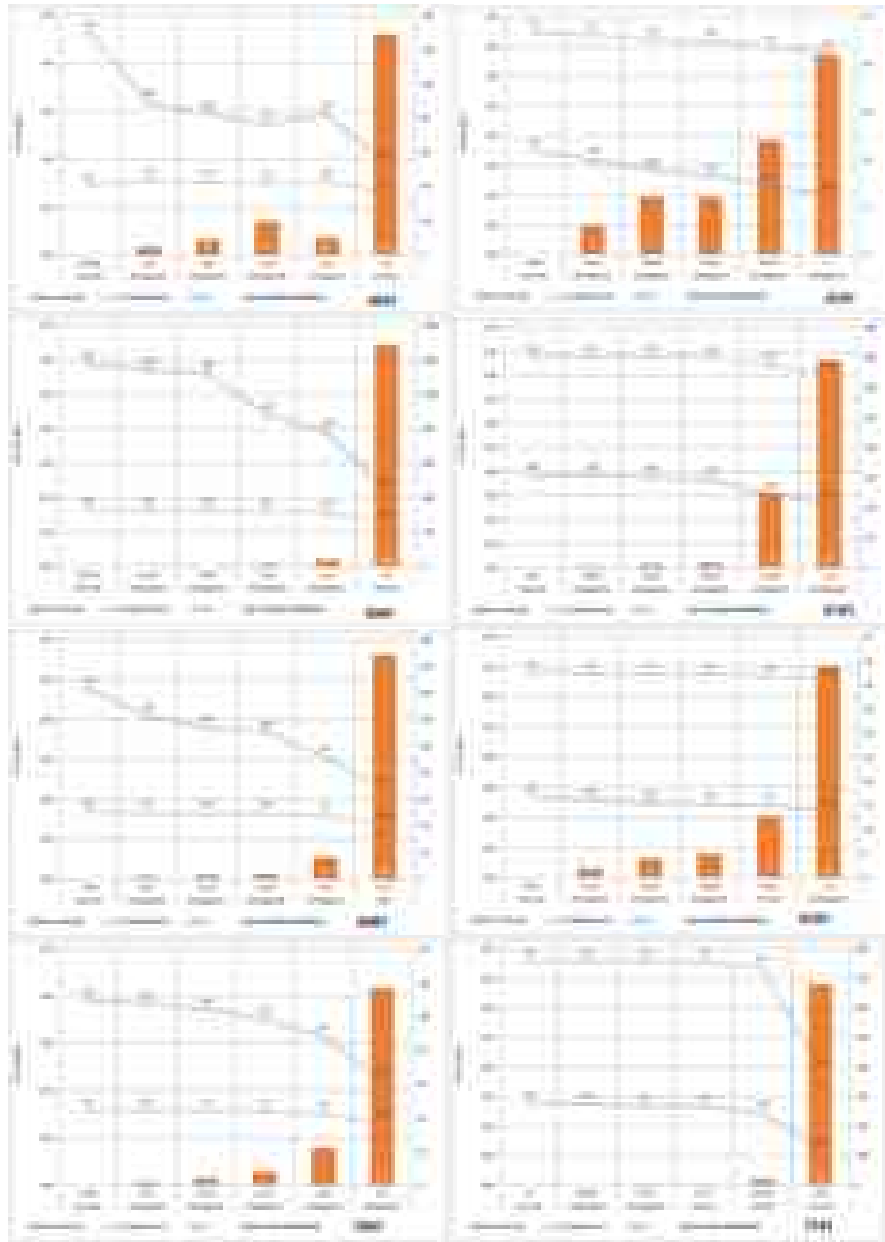

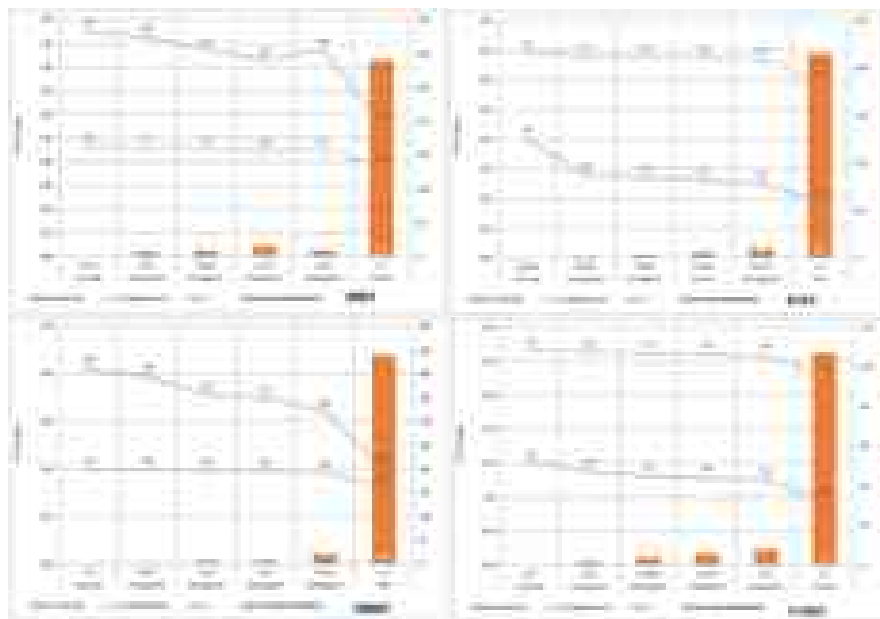

Figure 10-20: CV Variations of Different Capping Grade for Each Domain (B Shoot)

Source: GSR

Table 10-15: Zone B Shoot Au Grade Capping

Domain Code	Capped	Mean before Capped	Mean after Capped	Difference (%)
2001	10.0	0.78	0.75	-3
2101	31.6	3.04	2.99	-1
3001	14.6	0.78	0.76	-3
3101	29.3	3.82	3.62	-5
4001	9.4	0.76	0.72	-7
4101	30.4	3.74	3.50	-6
5001	20.5	0.83	0.79	-4
5101	50.2	4.40	4.22	-4
6001	9.5	0.84	0.79	-6
6101	30.01	3.40	3.35	-1
7001	8.7	0.80	0.76	-5
7101	25.5	3.80	3.70	-3
8001	18.4	0.92	0.91	-1
8101	33.7	3.47	3.35	-3
10001	15.1	0.99	0.96	-3
10101	27.6	3.16	3.09	-2

In SRK's opinion, the grade capping is appropriate.

**10.6.2 Zone 242**

SRK has reviewed the sample outliers used in grade estimation by GSR. Outliers of pre mineralised domain were determined using statistical method by GSR. The CV variations of different capping grade for each domain are listed in Figure 10-21.

**Figure 10-21: CV Variations of Different Capping Grade for Each Domain (242)**

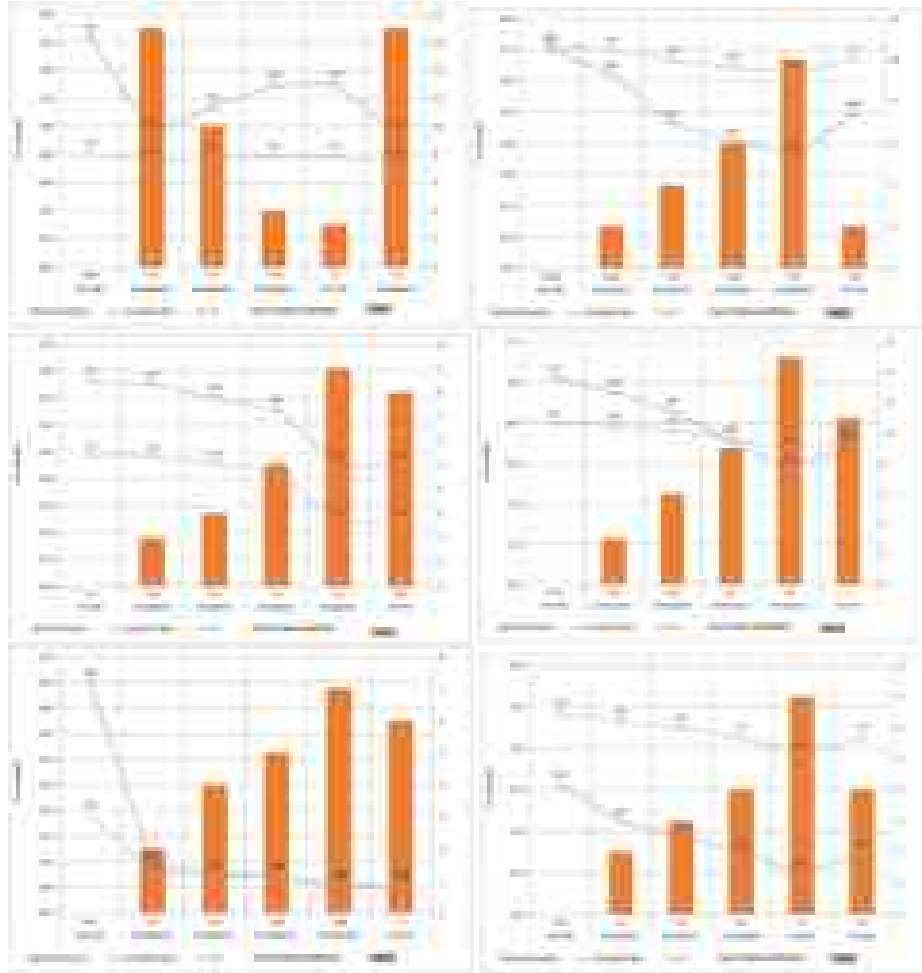

Figure 10-21: CV Variations of Different Capping Grade for Each Domain (242)

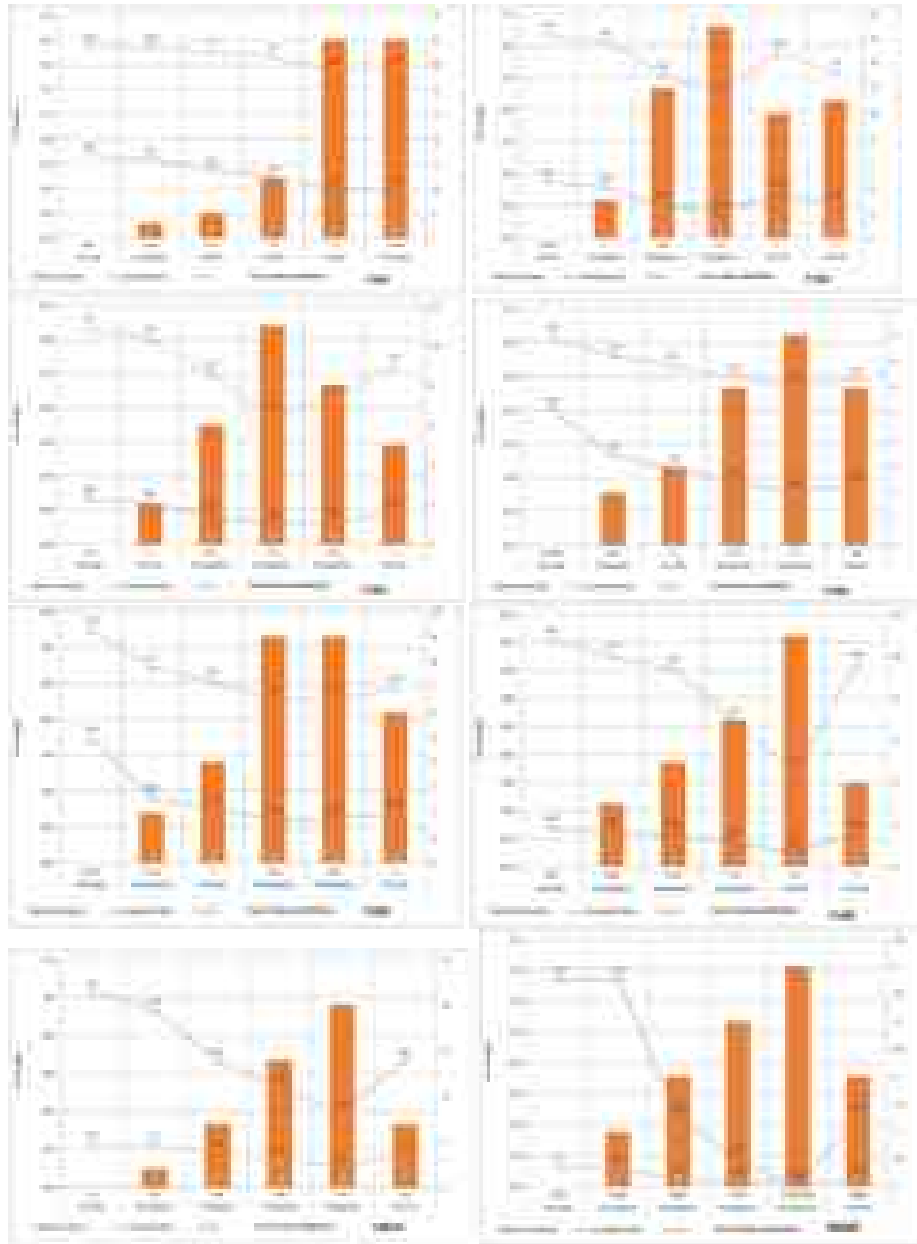

Figure 10-21: CV Variations of Different Capping Grade for Each Domain (242)

Source: GSR

Table 10-16: Zone 242 Grade Capping

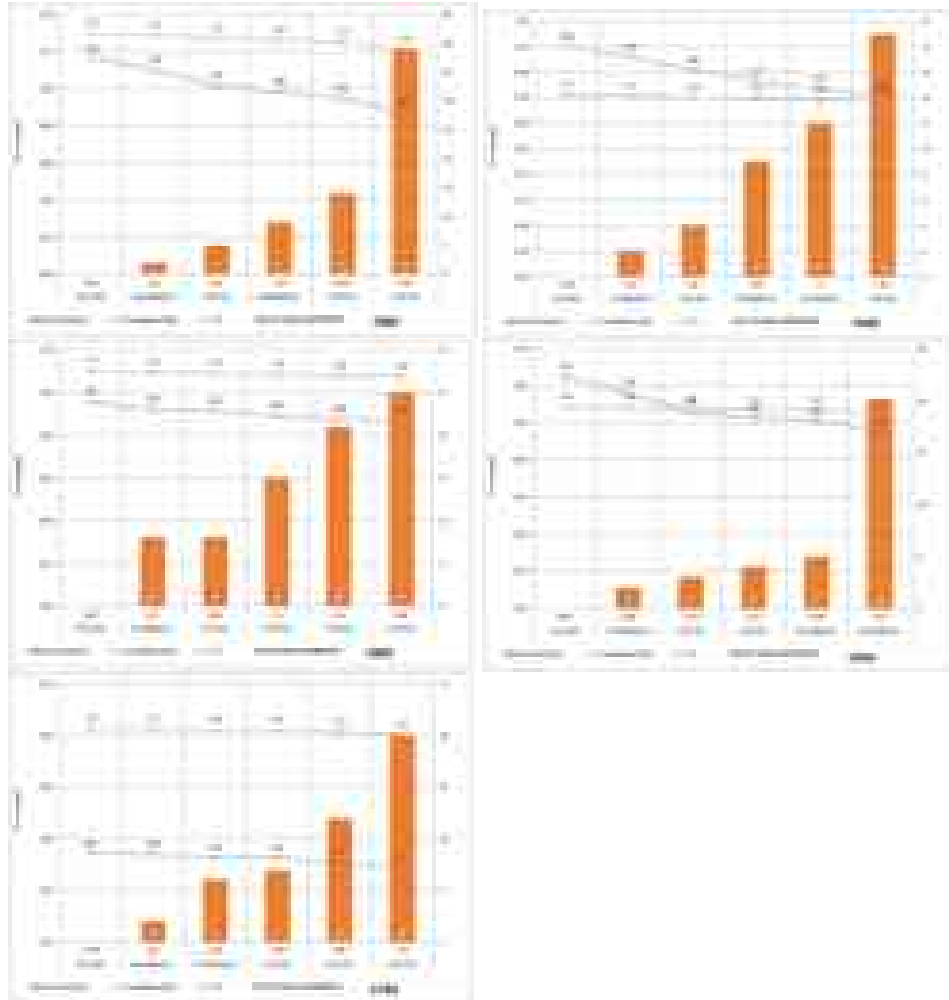

Domain Code	Capped	Mean before Capped	Mean after Capped	Difference (%)
1001	10	0.81	0.79	-3
1002	1.16	0.71	0.65	-8
1003	0.87	0.49	0.46	-7
1004	2	0.80	0.71	-11
1005	1.1	1.92	0.60	-69
1006	0.6	0.49	0.46	-5
1101	30	3.88	3.66	-6
1102	9	3.18	3.06	-4
1103	6	3.17	3.02	-5
1104	17	3.08	2.67	-13
1105	7	3.23	2.53	-22
1106	6	4.03	3.60	-11
10019	0.75	0.20	0.20	0
10049	0.065	0.12	0.05	-62
11019	0.7	0.44	0.36	-16
11039	0.94	1.07	0.54	-50

In SRK's opinion, the grade capping is appropriate.

### 10.6.3 DMH

SRK has reviewed the sample outliers used in grade estimation by GSR. Outliers of pre mineralised domain were determined using statistical method by GSR. The CV variations of different capping grade for each domain are listed in Figure 10-22.

Figure 10-22: CV Variations of Different Capping Grade for Each Domain (DMH)

Source: GSR

Table 10-17: DMH Grade Capping

Domain Code	Capped	Mean before Capped	Mean after Capped	Difference (%)
1001	8.91	1.30	1.27	-2
1002	4.4	0.71	0.70	-1
1003	6.05	1.10	1.09	-1
1004	10.44	1.08	1.07	-2
1005	10	1.08	1.06	-2

Domain Code	Capped	Mean before Capped	Mean after Capped	Difference (%)
2102	11.44	2.07	2.05	-1

In SRK's opinion, the grade capping is appropriate.

**10.6.4 I Zone**

SRK has reviewed the sample outliers used in grade estimation by GSR. Outliers of pre mineralised domain were determined using Excel statistics by GSR. The CV variations of different capping grade for each domain are listed in Figure 10-23.

**Figure 10-23: CV Variations of Different Capping Grade for Each Domain (I Zone)**

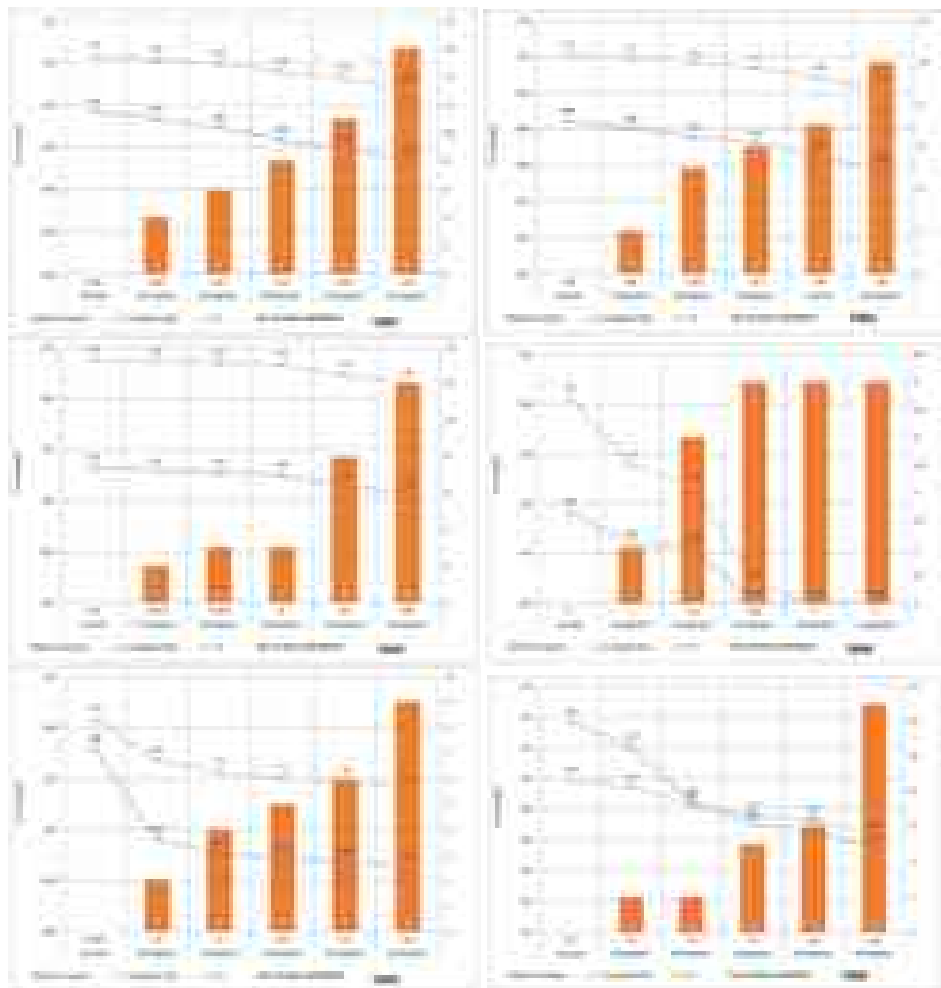

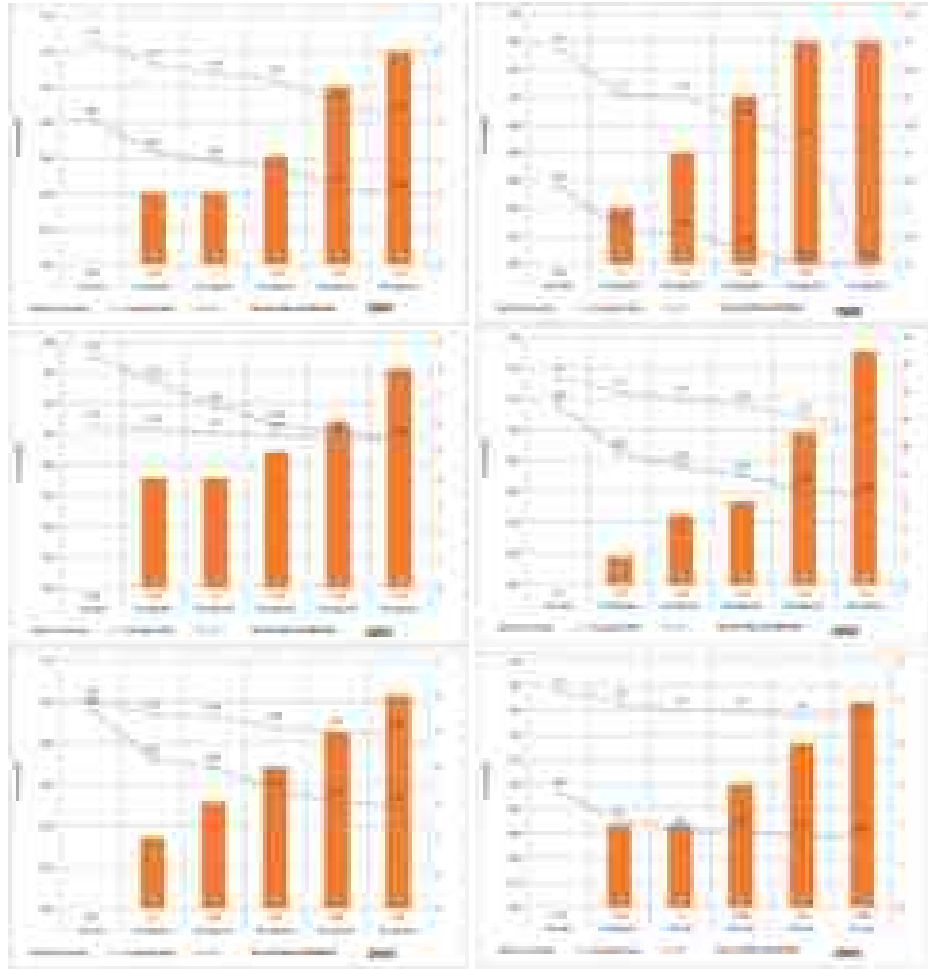

Figure 10-23: CV Variations of Different Capping Grade for Each Domain (I Zone)

Source: GSR

SRK noticed a big mean difference of Domain 1004, 1005, 1006, 1007 and 1008. The reason was that each domain has a small amount of samples but has a very high grade of gold.

Table 10-18: I Zone Grade Capping

Domain Code	Capped	Mean before Capped	Mean after Capped	Difference (%)
1001	2.64	1.04	1.00	-4
1002	3.01	1.21	1.16	-4
1003	15	2.38	2.35	-1
1004	2	2.07	1.39	-33

Domain Code	Capped	Mean before Capped	Mean after Capped	Difference (%)
1005	4.4	2.09	1.57	-25
1006	2.75	1.35	0.83	-16
1007	2	1.26	1.08	-14
1008	1.43	1.55	1.2	-22
2001	10	1.05	1.01	-4
2002	3.64	1.34	1.20	-10
2003	2.88	1.00	0.93	-7
2004	4	1.77	1.6	-10

In SRK’s opinion, the grade capping is appropriate.

**10.6.5 Hwini Butre**

Probability plots for each vein unit for each domain are generated and shown in Figure 10-24. The capping values selected from the probability plots are summarized in Table 10-19.

**Figure 10-24: Au Grade Probability Plot with Outliers and Far Out Thresholds Highlighted**

Source: A Report to Golden Star Father Brown Resource Model, RMS, 2020

**Table 10-19: Capping Values Selected from Analysis of the Probability Plot**

Deposit	Vein Unit	Capped Values Used	Mean Grade before Cap	Mean Grade after Cap	Percentage Difference
FBZ	FW	5	1.02	0.74	-27.45
FBZ	HG	46	11.41	9.28	-18.67
FBZ	HW	5	0.81	0.60	-25.93
ADK	FW	5	1.19	0.95	-20.17

Deposit	Vein Unit	Capped Values Used	Mean Grade before Cap	Mean Grade after Cap	Percentage Difference
ADK	HG	23	7.58	5.90	-22.16
ADK	HW	5	1.31	1.03	-21.37

Source: A Report to Golden Star Father Brown Resource Model, RMS, 2020

### 10.6.6 Chichiwelli

The caps were determined based on the shape of the tail of the log histogram and the log probability plots. Details are listed in Table 10-20. In SRK's opinion, the capping is appropriate.

**Table 10-20: Chichiwelli Au Grade Capping**

Domain	Cap Applied g/t	Mean Grade before Cap g/t	Mean Grade after Cap g/t	Percentage difference %
East	25	1.75	1.65	-6.06
West	15	1.69	1.59	-6.29

Source: NI 43-101 Technical Report on the Wassa Gold Mine, GSR, 2021

## 10.7 Statistical Analysis and Variography

### 10.7.1 Zone B Shoot

The variogram models for each mineralised domain were developed by GSR for grade estimation. Domain 5101 and 8101 variogram models are shown in Figure 10-25 and Figure 10-26. The variogram models are listed in Table 10-21.

**Table 10-21: Variogram Structure of Au for B Shoot Domain 5101 and 8101**

Domain		Nom.Sill	Type	Major	Semi-Major	Minor
5101	Nugget	0.38				
	Structure 1	0.55	Spherical	5.259	4.357	4.266
	Structure 2	0.07	Spherical	30.21	25.2	18.36
8101	Nugget	0.28				
	Structure 1	0.43	Spherical	15.9	6.39	3.49
	Structure 2	0.29	Spherical	31.09	27.36	8.45

**10.7.5 Hwini Butre**

The variography was performed for each deposit and for each vein unit (FBZ and ADK) with capped values. Experimental semi variograms were calculated for full range of possible azimuths with steps of 15 degrees totalling 24 directions. The direction with most continuous experimental points from visual inspection of the 24 directions were utilised for nugget inference. These directions may not coincide with the final major continuity direction when considering all experimental points for final model fit. The nugget was inferred by fitting a single structure spherical variogram to the first few (up to three) experimental semi variogram points.

The variogram nugget inference for all veins in FBZ are shown in Figure 10-33. The directions used for nugget inference are detailed in each plot in Figure 10-33.

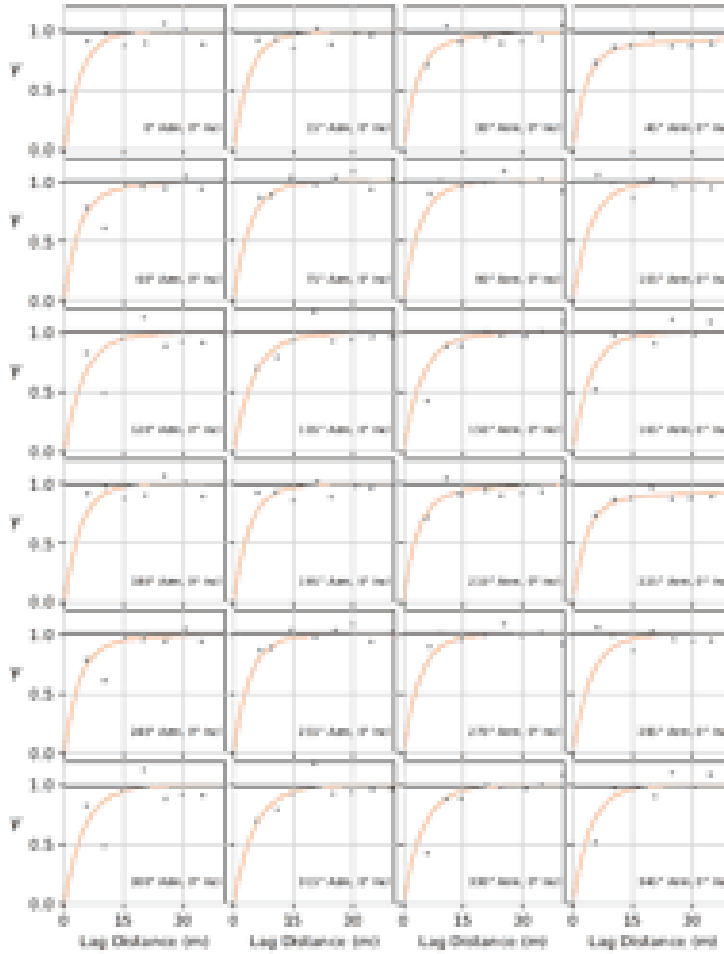

Figure 10-33: Inferred Nugget Effect for Au in Each Vein for FBZ

Source: A Report to Golden Star Father Brown Resource Model, RMS, 2020

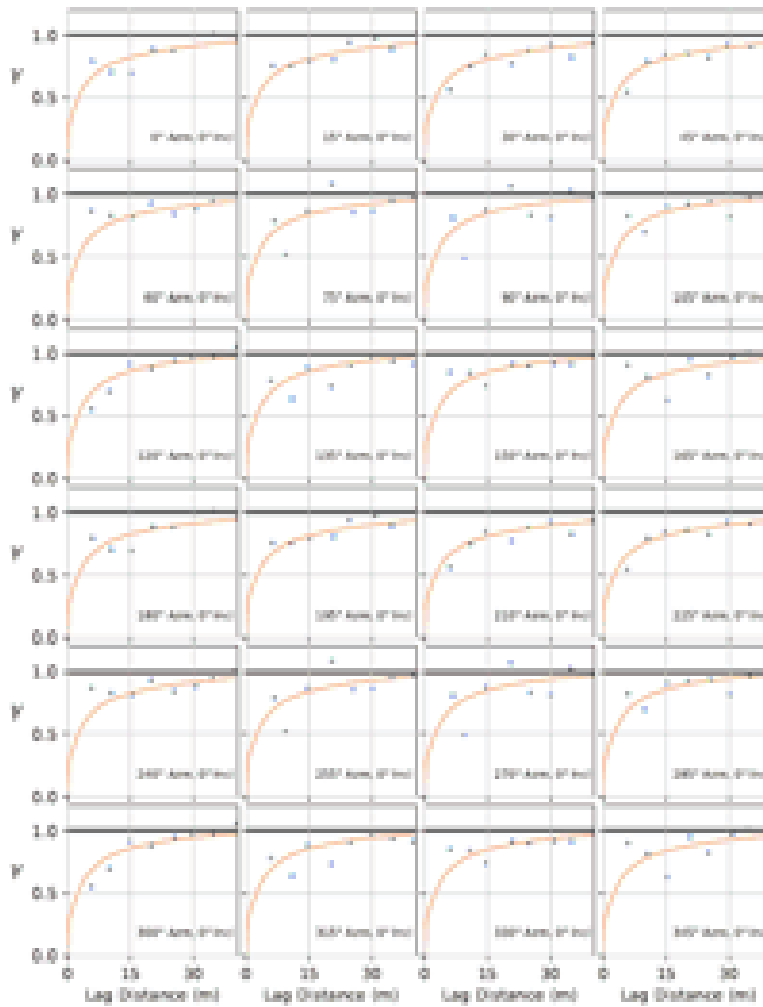

The experimental semi variogram and fitted model for FW unit in FBZ is shown in Figure 10-34. The parameters of the fitted model are summarised in Table 10-25. The experimental semi variogram and fitted model for HG unit in FBZ is shown in Figure 10-35. The parameters of the fitted model are summarised in Table 10-26. The experimental semi variogram and fitted model for HW unit in FBZ is shown in Figure 10-36. The parameters of the fitted model are summarised in Table 10-27.

### 10.7.6 Chichiwelli

Variograms were modelled for the East and West domains separately. The experimental semi variogram in real space is poorly structured, and so a Gaussian transformation was applied to the data. The first stage was to define the nugget effect from a short-lag omnidirectional variogram, which was calculated along the drillhole, and then modelled the variogram ranges from directional variograms from along strike, down-dip and across dip directions. The directional variograms were then back transformed into "real" space and used for subsequent estimation. The back transformed variograms and resultant variogram parameters are as shown in Table 10-32.

**Table 10-32: Variogram Parameters for Chichiwelli**

Parameter	East	West
C0	7.94	3.06
C1	3.60	1.59
Nugget Effect (%)	68.8	65.81
Range (m)		
a1 (strike)	25	4
a1 (dip)	25	35
a1 (normal to strike)	5	4.7

## 10.8 Block Model and Grade Estimation

### 10.8.1 Zone B Shoot

For the model "wug\_bm\_eng\_20240409.mdl", the block size of 5 m easting (X) by 10 m northing (Y) by 5 m elevation (Z) was used. A summary of the block model specifications is listed in Table 10-33. The attribute and description of the block model are presented in Table 10-34.

**Table 10-33: Specifications of Zone B Shoot Block Model**

	Min	Max	Block Size	Sub Block Size	Rotation
N	18,200	21,050	10	2.5	0
E	39,275	40,575	5	1.25	0
Z	-975	1,100	5	2.5	0
Total Blocks					9,735,066

**Table 10-34: Attribute and Description of Zone B Shoot Block Model**

Attribute	Description
au_ok	Au grade.
density	Density.
domain	All Mineralised Domains.
resclass	1=Measured, 2=Indicated, 3=Inferred.

For Zone B Shoot UG, the bulk density in the model was set to 2.8 g/cm<sup>3</sup> (fresh rock) as before.

The OK method was used for grade estimation by GSR. As shown in Figure 10-7, variable search orientations were developed for each mineralised domain. The parameters are summarised in Table 10-35.

**Table 10-35: Grade Estimation Parameters Used in Zone B Shoot**

Pass	Major	Semi-Major	Minor	Min Samples	Max Samples	Max Samples Per Hole
1	25	25	10	3	8	2
2	50	50	20	2	12	4
3	150	150	50	1	15	

A classed post plot of the gold estimate is as shown in Figure 10-41.

**Figure 10-41: Au Grade for Zone B Shoot**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

**10.8.2 Zone 242**

For the model “242\_bm\_gc\_231019.mdl”, the block size of 5 m easting (X) by 10 m northing (Y) by 5 m elevation (Z) was used. A summary of the block model specifications is listed in Table 10-36. The attribute and description of the block model are presented in Table 10-37.

**Table 10-36: Specifications of Zone 242 Block Model**

	Min	Max	Block Size	Sub Block Size	Rotation
N	20,179	20,709	10	2.5	50

	Min	Max	Block Size	Sub Block Size	Rotation
E	39,198	39,768	5	1.25	50
Z	740	1,090	5	2.5	0
Total Blocks			240,654		

**Table 10-37: Attribute and Description of Zone 242 Block Model**

Attribute	Description
au_ok	Au grade.
density	Density.
domain	All Mineralised Domains.
res_class	1=Measured, 2=Indicated, 3=Inferred.

For 242 UG, the bulk density in the model was set to 2.8 (fresh rock).

The OK method was used for grade estimation by GSR. Variable search orientations were developed for each mineralised domain. The parameters are summarised in Table 10-38.

**Table 10-38: Grade Estimation Parameters Used in Zone 242**

Pass	Major	Semi-Major	Minor	Min Samples	Max Samples	Max Samples Per Hole
1	40	30	2.5	3	12	2
2	70	60	5	2	12	4
3	150	100	50	1	15	

A classed post plot of the gold estimate is as shown in Figure 10-42.

**Figure 10-42: Au Grade for Zone 242**

### 10.8.3 DMH

For the model "dmh\_gc\_model\_20240518.mdl", the block size of 5 m easting (X) by 5 m northing (Y) by 3 m elevation (Z) was used. A summary of the block model specifications is listed in Table 10-39. The attribute and description of the block model are presented in Table 10-40.

**Table 10-39: Specifications of DMH Block Model**

	Min	Max	Block Size	Sub Block Size	Rotation
N	20,705	21,210	5	1.25	0
E	40,500	41,110	5	1.25	0
Z	724	1,132	3	1.5	0
Total Blocks				1,175,800	

**Table 10-40: Attribute and Description of DMH Model**

Attribute	Description
Au_ok	Gold grade.
density	Density.
est_domains	All Mineralised Domains.
weathering	1=Fresh, 2=Trans, 3=Oxide.
res_class	1=Measured, 2=Indicated, 3=Inferred, 4=Bluesky

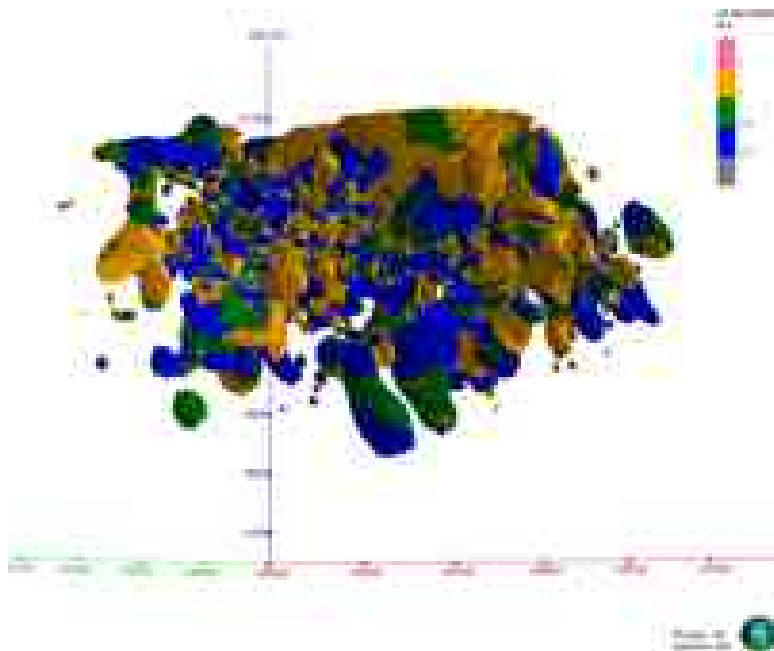

The density values for the tonnage estimation were coded to 1.8 g/cm<sup>3</sup> for oxide, 2.25 g/cm<sup>3</sup> for transition and 2.7 g/cm<sup>3</sup> for fresh by GSR. The OK method was used for grade estimation by GSR. Variable search orientations were developed for each mineralised domain. Parameters are listed in Table 10-41.

**Table 10-41: Grade Estimation Parameters Used in DMH**

Pass	Major	Semi-Major	Minor	Min Samples	Max Samples	Max Samples Per Hole
1	10	5	5	9	15	3
2	15	9	9	9	15	3
3	22.5	13.5	13.5	6	12	3
4	45	27	27	6	10	
5	90	54	54	4	8	

A classed post plot of the Au estimate is as shown in Figure 10-43.

Figure 10-43: Au Grade for DMH

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

#### 10.8.4 I Zone

For the model “zone\_bm\_res\_20230901.mdl “, the block size of 10 m easting (X) by 20 m northing (Y) by 6 m elevation (Z) was used. A summary of the block model specifications is listed in Table 10-42. The attribute and description of the block model are presented in Table 10-43.

Table 10-42: Specifications of I Zone Block Model

	Min	Max	Block Size	Bub Block Size	Rotation
N	57,180	57,740	20	2.5	0
E	174,470	174,880	10	1.25	0
Z	764	1,100	6	1.5	0
Total Blocks			199,693

### 10.8.5 Hwini Butre

Two block models were created; one for FBZ and the other for ADK. No rotation was applied to the models. Block sizes were chosen to reflect the geometry of the deposits. Grade data for each of the modelled units was interpolated into the individual structures only. Block model parameters for FBZ and ADK are shown in Table 10-45 and Table 10-46.

**Table 10-45: FBZ Block Model Parameters**

Coordinate	Origin	Boundary Size	Block Size (m)
X	175,681.47	1,443	1
Y	32,345.73	683	2
Z	1,176.72	482	2

Source: A Report to Golden Star Father Brown Resource Model, RMS, 2020

**Table 10-46: ADK Block Model Parameters**

Coordinate	Origin	Boundary Size	Block Size (m)
X	175,731.38	718	1
Y	32,394.43	804	2
Z	1271.61	721	2

Source: A Report to Golden Star Father Brown Resource Model, RMS, 2020

The density used for estimation was provided by GSR with the value of 2.7 g/cm<sup>3</sup>.

The estimation was performed using OK with uncapped and capped gold grades. The number of composites and maximum search radius utilized for each vein unit in each deposit are shown in Table 10-47.

**Table 10-47: Kriging Search Parameters for Each Vein in Each Deposit**

Deposit	Vein	Max Search (m)	Max Composites
FBZ	FW	250	8
FBZ	HG	500	4
FBZ	HW	500	4
ADK	FW	250	4
ADK	HG	1,000	24
ADK	HW	1,000	2

Source: A Report to Golden Star Father Brown Resource Model, RMS, 2020

### 10.8.6 Chichiwelli

A block model was created by GSR for the whole Chichiwelli area. Block sizes were chosen to reflect the average spacing of drill lines along the strike. Grade data for each of the modelled units was interpolated into the individual structures only, with soft boundaries between oxidation states, and subsequently reported as oxide or fresh. Block model parameters for Chichiwelli are summarized in Table 10-48.

**Table 10-48: Chichiwelli Block Model Parameters**

Coordinate	Origin	Block Size (m)	No. of Blocks
X	631,093.64	12.5	100
Y	580,787.20	25	60
Z	1216(Max)	8	65

Source: NI 43-101 Technical Report on the Wassa Gold Mine, GSR, 2021

GSR modelled the oxidation surface to determine the boundary between oxide and fresh material. No transition zone was modelled. The density values used for the estimation were provided by GSR with the values of 1.8 g/cm<sup>3</sup> for oxide and 2.68 g/cm<sup>3</sup> for fresh.

Block grades for each of the mineralised zones were estimated using OK. OK was carried out in four passes for each mineralised zone, and the search parameters for the individual domains shown below in Table 10-49. Octants were used on the 1st and 2nd pass searches with three consecutive empty sectors; however, they were not applied on the 3rd search pass, hence the same number of minimum and maximum samples for the 2nd and 3rd searches.

**Table 10-49: Chichiwelli Estimation Parameters**

Domain		Pass1	Pass2	Pass3	Rotation
East	X	60	120	120	Azimuth 20
	Y	60	120	120	Dip 60
	Z	20	40	4	
	Min Samples	3	3	3	
	Max Samples	80	80	80	
West	X	80	160	120	Azimuth 20
	Y	80	160	120	Dip 60

## 10.9 Model Validation and Sensitivity

Model validation is a common approach for determining whether grade estimation has performed as expected. An acceptable or preferred validation result does not necessarily imply that the model is correct or derived from the right estimation approach. It suggests only that the model is a reasonable representation of the Mineral Resource data used and of the estimation method applied. Other issues such as the relationship between the model-selective assumptions and mining practices are equally important when determining the appropriateness of the Mineral Resource estimate.

SRK adopted the swath plot validation approaches to validate the model for B Shoot, 242, DMH and I Zone.

Swath plots of gold were created in three orthogonal directions (easting, northing, and vertical, as X, Y, and Z) in particular slice thicknesses in each direction to validate the resultant block models.

Figure 10-45: Au Swath Plot for Domain 5101 of B Shoot

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

Figure 10-46: Au Swath Plot for Domain 8101 of B Shoot

Figure 10-46: Au Swath Plot for Domain 8101 of B Shoot

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

Table 10-50: Comparison of Composites and Block Model (B Shoot)

Domain Code	Mean Grade (Composites)	Mean Grade (Block Model)	Difference
2001	0.73	0.72	-1.13%
2101	3.14	2.65	-15.79%
3001	0.94	0.88	-6.18%
3101	3.68	3.84	4.39%
4001	0.77	0.77	0.64%
4101	3.68	3.65	-0.85%
5001	0.82	0.81	-1.27%
5101	4.35	3.78	-13.14%
6001	0.80	0.72	-9.50%
6101	3.39	3.04	-10.34%
7001	0.84	0.73	-12.69%
7101	3.91	3.37	-13.75%
8001	0.96	0.84	-12.92%
8101	3.52	3.37	-4.36%
10001	1.03	0.90	-12.84%
10101	3.14	2.83	-9.87%

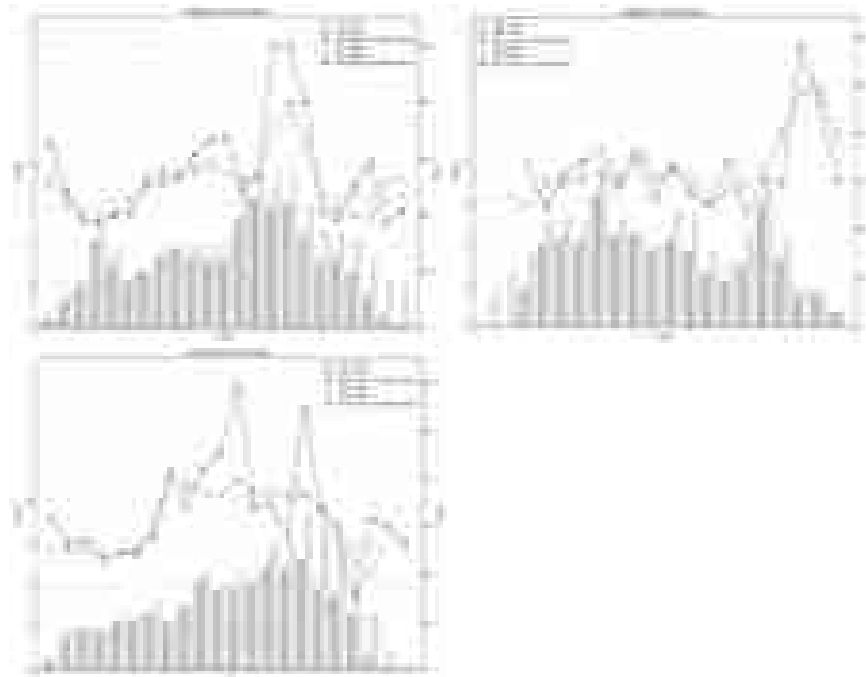

For the model "wug\_bm\_eng\_20240409.mdl", as shown in Figure 10-45 and Figure 10-46, the block models and composites match reasonably well in all orthogonal directions. This comparison shows close agreement between the block model and composites in terms of overall distribution as a function of X, Y, and Z location. The gold grade comparison of composites and global mean are listed in Table 10-50. The estimation method and parameters are appropriate. The data indicates that the block models constructed by GSR are reliable.

For the model "242\_bm\_gc\_231019.mdl", as shown in Figure 10-47 and Figure 10-48, the block models and composites match reasonably well in all orthogonal directions. This comparison shows

close agreement between the block model and composites in terms of overall distribution as a function of X, Y, and Z location. The comparison of the composites and global gold grade of the block model are listed in Table 10-51. The estimation method and parameters are appropriate. The data indicates that the block models constructed by GSR are reliable.

Table 10-51: Comparison of Composites and Block Model (242)

Domain Code	Mean Grade (Composites)	Mean Grade (Block Model)	Difference
1001	0.80	0.75	-5.71%
1002	0.65	0.64	-1.09%
1003	0.44	0.39	-11.43%
1004	0.72	0.67	-7.75%
1005	0.60	0.49	-18.41%
1006	0.46	0.45	-2.40%
1101	3.75	3.75	0.01%
1102	3.10	2.97	-4.30%
1103	3.11	2.88	-7.62%
1104	2.74	2.63	-4.18%
1105	2.51	2.34	-6.79%
1106	3.79	3.93	3.64%
10019	0.18	0.17	-3.82%
10049	0.05	0.05	-0.37%
11019	0.36	0.35	-2.68%
11039	0.54	0.58	6.93%

For the model "dmh\_gc\_model\_20240518.mdl", as shown in Figure 10-49 and Figure 10-50, the block models and composites match reasonably well in all orthogonal directions. This comparison shows close agreement between the block model and composites in terms of overall distribution as a function of X, Y, and Z location. The comparison of the composites and global gold grade of the block model are listed in Table 10-52. The estimation method and parameters are appropriate. The data indicates that the block models constructed by GSR are reliable.

Figure 10-49: Au Swath Plot for Domain 1001 of DMH

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

Figure 10-50: Au Swath Plot for Domain 2101 of DMH

Figure 10-50: Au Swath Plot for Domain 2101 of DMH

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

Table 10-52: Comparison of Composites and Block Model (DMH)

Domain Code	Mean Grade (Composites)	Mean Grade (Block Model)	Difference
1001	1.20	1.24	4.05%
1002	0.71	0.66	-6.86%
1003	1.06	1.00	-6.17%
1004	1.05	1.07	1.91%
1005	1.06	1.01	-4.91%
2102	1.93	1.82	-5.60%

For the I Zone model, as shown in Figure 10-51 and Figure 10-52, the block models and composites match reasonably well in all orthogonal directions. This comparison shows close agreement between the block model and composites in terms of overall distribution as a function of X, Y, and Z location. The comparison of the composites and global gold grade of the block model are listed in Table 10-53. The estimation method and parameters are appropriate. The data indicates that the block models constructed by GSR are reliable.

Figure 10-51: Au Swath Plot for Domain 1003 of I Zone

Figure 10-51: Au Swath Plot for Domain 1003 of I Zone

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

Figure 10-52: Au Swath Plot for Domain 2001 of I Zone

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

Table 10-53: Comparison of Composites and Block Model (I Zone)

Domain Code	Mean Grade (Composites)	Mean Grade (Block Model)	Difference
1001	1.01	1.01	-0.01%
1002	1.16	1.12	-3.16%

Domain Code	Mean Grade (Composites)	Mean Grade (Block Model)	Difference
1003	2.35	2.28	-2.72%
1005	1.58	1.57	-0.73%
1006	1.07	0.87	-18.41%
1007	1.04	1.07	2.88%
2001	1.03	1.00	-2.34%
2002	1.19	1.23	3.48%
2003	0.92	0.92	-0.52%
2004	1.62	1.70	5.09%

For the FBA/ADK model, thickness and gold grade were both checked. For the thickness, the difference ranges from -6.34% to 7.67% for FBZ and ranges from 0.93% to 12.41% for ADK. The scatterplot of measured and estimated gold grades at data locations for FBZ and ADK. The scatter plots for both FBZ and ADK indicate good data reproduction.

For the Chichiwelli model, block model was validated by comparing the block model mean grades with the declustered composite mean grades and through validation slices through the block models. The block model was also compared to the composite grades within defined sectional criteria in a series of validation slices, the results of which are displayed on graphs to check for visual discrepancies between grades along the defined coordinate line. The expected outcome of the estimation process is to observe a relative smoothing of block model grades around the composite values. Overall, the estimation of the Chichiwelli domains is robust and the results have been verified to a reasonable degree of confidence. Globally, the block model average grade is relatively like that of the declustered input data, indicating that no biases have been found.

## 10.10 Mineral Resource Classification

Block model quantities and grade estimates for the Wassa project were classified according to the JORC Code guidelines.

Mineral Resource classification is typically a subjective concept. Industry best practices suggest that Mineral Resource classification should consider the confidence in the geological continuity of the mineralised structures, the quality and quantity of exploration data supporting the estimates, and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar Mineral Resource classification.

GSR has considered the following general criteria:

- Confidence in the geological interpretation.
- Knowledge of the grade continuities gained from observations and geostatistical analyses.
- Number, spacing, and orientation of drillhole intercepts through mineralised domains.
- Quality and reliability of the raw drillhole data (i.e., sampling, assaying and surveying).

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data primarily by DD and (GC)RC are sufficiently reliable to support the Mineral Resource evaluation.

Using the above criteria, 3D surfaces and solids were created by GSR to delineate the respective Mineral Resource categories.

For the B Shoot model, Mineral Resource classification was performed by wireframing the Measured and Indicated Mineral Resources by GSR, based on drill spacing displayed on sections, which were spaced every 15 m along northing.

For Measured Mineral Resources: as detailed in Figure 10-53, defined in areas where the drill intercepts were consistently no greater than 15 m apart, up dip or down dip.

**Figure 10-53: B Shoot Measured Areas in both Plane and Section Map**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

For Indicated Mineral Resources: as detailed in Figure 10-54, defined in areas where the drill intercepts were consistently no greater than 50 m apart.

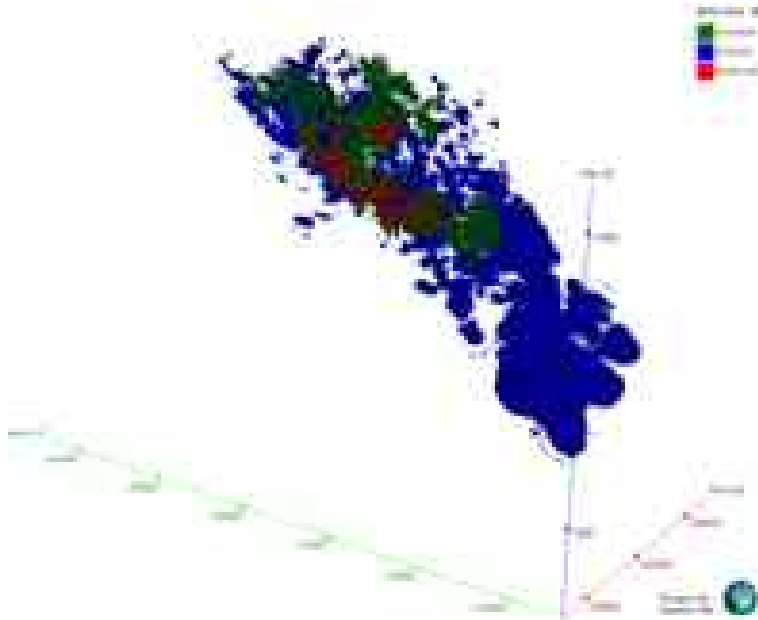

The rest within each domain with little known information is classified as Inferred Mineral Resources, as their reliability is not sufficient to apply meaningful economic and technical parameters or to evaluate economic feasibility.

**Figure 10-54: B Shoot Indicated Areas in both Plane and Section Map**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

The Mineral Resource classification is as shown in Figure 10-55.

**Figure 10-55: B Shoot Mineral Resource Classification Distribution**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

For the 242 model, blocks in the areas with drill hole spacing not more than 15 m were classified as Measured Mineral Resources, those with drill hole spacing not greater than 30 m were classified as Indicated Mineral Resources and those with drill hole spacing not greater than 45 m were classified as Inferred Mineral Resources, detail in Figure 10-56.

**Figure 10-56: 242 Mineral Resource Classification Distribution**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

For the DMH model, blocks in the areas with drill hole spacing not more than 15 m were classified as Measured Mineral Resources, those with drill hole spacing not greater than 30 m were classified as Indicated Mineral Resources and the rest within mineralised domains were classified as Inferred Mineral Resources, detail in Figure 10-57.

**Figure 10-57: DMH Mineral Resource Classification Distribution**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

For I Zone model, as shown in Figure 10-58, Measured Mineral Resource was defined by the area with an average sample distance of 15 m. Indicated Mineral Resource was defined by the area with a sample distance of 30 m. And the rest within the mineralised domain was defined as Inferred Mineral Resources.

**Figure 10-58: I Zone Mineral Resource Classification Distribution**

Source: SRK, Leapfrog Mapping Using the Data Provided by GSR

For the FAB/ADK models, delineation of the Mineral Resource categories was based on a combination of criteria involving drillhole spacing, geological and confidence in mineralisation interpretation, as well as slope of regression values from the estimation process. The classification was modelled visually by digitizing a wireframe to define contiguous zones of confidence.

Indicated Mineral Resources were classified in the areas of Father Brown and Adoikrom where drilling is sufficient to demonstrate geological and grade continuity to a reasonable level.

Inferred Mineral Resources were classified by two 3D solids that included the wider spaced drilling at depth (100 to 200m spacing), shown in Figure 10-59. All other material outside of the 3D mesh/ surface constraints remained unclassified.

**Figure 10-59: Mineral Resource Classification Distribution For FBZ/ADK**

Source: NI 43-101 Technical Report on the Wassa Gold Mine, GSR, 2021

For Chichiwelli, delineation of the Mineral Resource categories was based on a combination criteria drillhole spacing, geological and wireframe confidence, and was modelled visually by digitizing a wireframe.

Wireframes were digitized for East Domain and West Domain, with the areas inside the modelled solids considered to be Indicated Mineral Resources, and outside, Inferred Mineral Resources.

### 10.11 Mineral Resource Statement

The JORC Code defines a Mineral Resource as:

*“a concentration or occurrence of material of solid material of economic interest in or on the Earth’s crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.”*

Mineral Resources are reported inclusive of Ore Reserves.

The RPEEE requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the Mineral Resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries.

For DMH and I Zone, in order to determine the quantities of material offering RPEEE by an open pit, GSR used an open pit optimiser, based on a US\$2,050/ ounce (oz) gold price, and reasonable mining assumptions to evaluate the proportions of the block model that could be “reasonably expected” to be mined from an open pit. The optimisation parameters were selected based on actual costs from the operations. The reader is cautioned that the results from the open pit optimisation are used solely for the purpose of testing RPEEE by an open pit and do not represent an attempt to estimate Ore Reserves. SRK considers that the blocks located within the conceptual open pit shells and above the cut-offs (based on a US\$2,050/ ounce (oz) gold price) show “reasonable prospects for economic extraction” and can be reported as a Mineral Resource.

For Wassa B Shoot and 242 underground operations, the underground Mineral Resources were reported within Mineable Stope Optimiser (“MSO”), generated by GSR based on a US\$2,050/ oz gold price and mining, processing and general administrative costs that were adjusted from actual costs.

Other factors and assumptions in relation to environment, permitting, legal, taxations, socio-economic, marketing, and political facts have been considered for Mineral Resource and Ore Reserve statements in this Report.

There is no exploration and mining activities for Chichiwelli since 2020. Whilst a drilling program was initiated at FB/ADK during 2022-2023, and 10,287.4m of drilling has been completed. Despite this, the additional drilling information has not been included in the resource estimate. Therefore, the Chichiwelli and FB/ADK Mineral Resources are reported the same as the previous 2021 Mineral Resource Estimate. The Chichiwelli Mineral Resources were reported at a cut-off grade of 0.55 g/t gold, within the open pit shell calculated at a US\$1,500/ oz gold price. The FB/ADK Mineral Resources were reported above a gold cut-off grade of 1.4 g/t based on a US\$1,500/ oz gold price.

Table 10-54 shows the Mineral Resource statement for the Wassa Operation/Project.

**Notes:**

- <sup>1</sup> The Mineral Resource is reported in accordance with the JORC Code guidelines.
- <sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr Huaixiang Li and Mr Pengfei Xiao who are full time employees of SRK Consulting. Mr Huaixiang Li is a Member of the Australian Institute of Geoscientists (the "AIG") and Mr Pengfei Xiao is a Member of the Australasian Institute of Mining and Metallurgy (the "AusIMM") and a Member of the AIG. Both Mr Li and Mr Xiao have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the "Competent Persons" as defined in JORC (2012). Mr Li and Mr Xiao consent to the reporting of this information in the form and context in which it appears.
- <sup>3</sup> Mt – million tonnes (metric tons), oz- ounce; koz – thousand ounces.
- <sup>4</sup> Mineral Resources for B Shoot and 242 underground deposits are reported within mineable stope optimiser (the "MSO").
- <sup>5</sup> Open Pit Mineral Resources are reported at a cut-off grade of 0.43 g/t for DMH, 0.73 g/t for I Zone and 0.55 g/t for Chichiwelli.
- <sup>6</sup> Underground Mineral Resources are reported at a cut-off grade of 1.34 g/t for B Shoot and 242; and 1.40 g/t for FB/ADK.
- <sup>7</sup> FB/ADK and Chichiwelli Mineral Resources were sourced from the Wassa NI 43-101 Technical Report (March 2021), based on a US\$1,500/ ounce (oz) gold price. No material change has been aware since then.
- <sup>8</sup> All composites have been capped where appropriate.
- <sup>9</sup> All figures are rounded to reflect the relative accuracy of the estimate.
- <sup>10</sup> It should be noted that the Mineral Resource Statement is made for GSWL on the basis of 100% ownership of the properties.
- <sup>11</sup> The conversion between ounce and gram used herein is 1 oz = 31.1035 g.

<sup>12</sup> Mineral Resources are inclusive of Ore Reserves that have been converted from Measured and Indicated Mineral Resources.

<sup>13</sup> The Mineral Resources Statement as of 30 September 2024 is based on the mineral resource models as of 31 March 2024 and the depletion for the Wassa Mine for the six-month period, 1 April 2024 to 30 September 2024.

### 10.12 Grade Sensitivity Analysis

The Mineral Resources are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Figure 10-60 to Figure 10-63 at different gold cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of gold cut-off grades.

Figure 10-60: DMH Grade Tonnage Curve

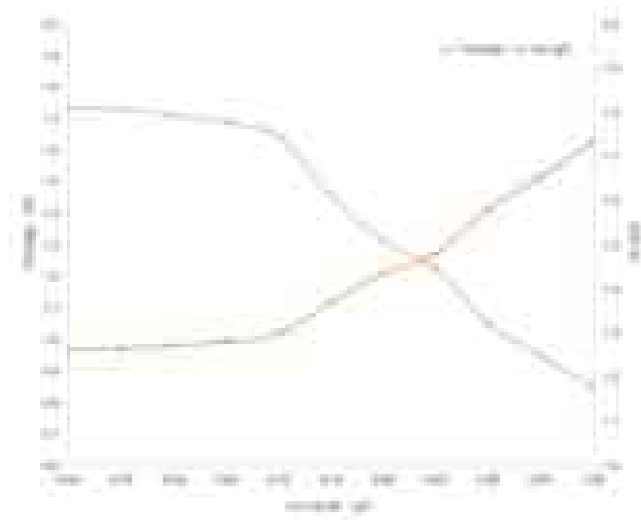

Source: SRK

Notes:

<sup>1</sup> The reader is cautioned that the figures should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of gold cut-off grades.

<b>Measured and Indicated</b>	<b>29.26</b>	<b>3.76</b>	<b>3,537</b>
<b>Inferred</b>	<b>74.02</b>	<b>3.44</b>	<b>8,183</b>

Sources: Matthew Varvari, S. Mitchel Wasel and Philipa Varris. NI 43-101 Technical Report on the Wassa Gold Mine, Golden Star Resources, Wassa Gold Mine, Ghana.

**Notes:**

- <sup>1</sup> The Mineral Resource estimate complies with the requirements of National Instrument 43-101 and has been prepared and classified in accordance with the 2014 CIM Definition Standards and 2019 Best Practice Guideline.
- <sup>2</sup> Underground deposits within the Mineral Resource are reported at a gold cut-off grade of 1.4 g/t.
- <sup>3</sup> Open pit deposits within the Mineral Resource are reported at a gold cut-off grade of 0.55 g/t, within optimised open pit shells calculated at a US\$1,500 /oz gold selling price.
- <sup>4</sup> Mineral Resources are reported in-situ without modifying factors.
- <sup>5</sup> All figures are rounded to reflect the relative accuracy of the estimate.

SRK Canada updated the Year End 2021 resource estimate in February 2022 as detailed in Table 10-56.

**Table 10-56: Mineral Resource Statement of Wassa Main (UG), as of December 31 2021**

Category	Tonnage Mt	Grade Au g/t	Contained Au koz
Measured	8.76	3.38	951
Indicated	22.52	2.99	2,166
Measured and Indicated	31.28	3.10	3,117
Inferred	61.73	3.47	6,893

Source: Golden Star Wassa Resource Model Update, SRK Consulting (Canada) Inc.

**Notes:**

- <sup>1</sup> Mineral Resources are not Ore Reserves and have not demonstrated economic viability. All figures have been rounded to reflect the relative accuracy of the estimates. Reported at underground resource cut-off grades of 1.4 g/t gold considering a gold price of US\$1,500 per troy ounce and assuming metallurgical recoveries of 95% for fresh rock.

SRK reviewed and report the 2022 year-end Mineral Resources, as detailed in Table 10-57.

Table 10-57: Mineral Resource Statement of Wassa Project, as of 31 December 2022

Category	Tonnage Mt	Grade Au g/t	Contained Au koz
<b>Total</b>			
<b>Measured</b>	<b>9.56</b>	<b>3.02</b>	<b>929</b>
<b>Indicated</b>	<b>21.30</b>	<b>3.18</b>	<b>2,175</b>
<b>Measured and Indicated</b>	<b>30.86</b>	<b>3.13</b>	<b>3,104</b>
<b>Inferred</b>	<b>66.11</b>	<b>3.52</b>	<b>7,484</b>

Notes:

<sup>1</sup> The Mineral Resource estimate complies with the requirements of National Instrument 43-101 and has been prepared and classified in accordance with the 2014 CIM Definition Standards and 2019 Best Practice Guideline.

<sup>2</sup> Underground deposits within the Mineral Resource are reported at a cut-off grade of 1.4 g/t gold.

<sup>3</sup> Open pit deposits within the Mineral Resource are reported at a cut-off grade of 0.55 g/t gold.

<sup>4</sup> All composites have been capped where appropriate.

<sup>5</sup> All figures are rounded to reflect the relative accuracy of the estimate.

<sup>6</sup> It should be noted that the Mineral Resource Statement is made for GSWL on the basis of 100% ownership of the properties.

<sup>7</sup> The conversion between ounce and gram used herein is 1 oz = 31.1035 g.

## 10.14 Mineral Resource Risks and Opportunities

### Risks:

- At Wassa, the gold mineralised bodies are complex and will require additional drilling to ensure robustness of the grade profile.

### Opportunities:

- Exploration works are ongoing to estimate Benso's UG resource potential.
- At ADK south, Abada and C3PR, Mineral Resource was report in the 2021 NI 43-101 report. Additional exploration may result in larger resource footprint.

## 11 Ore Reserve Estimates

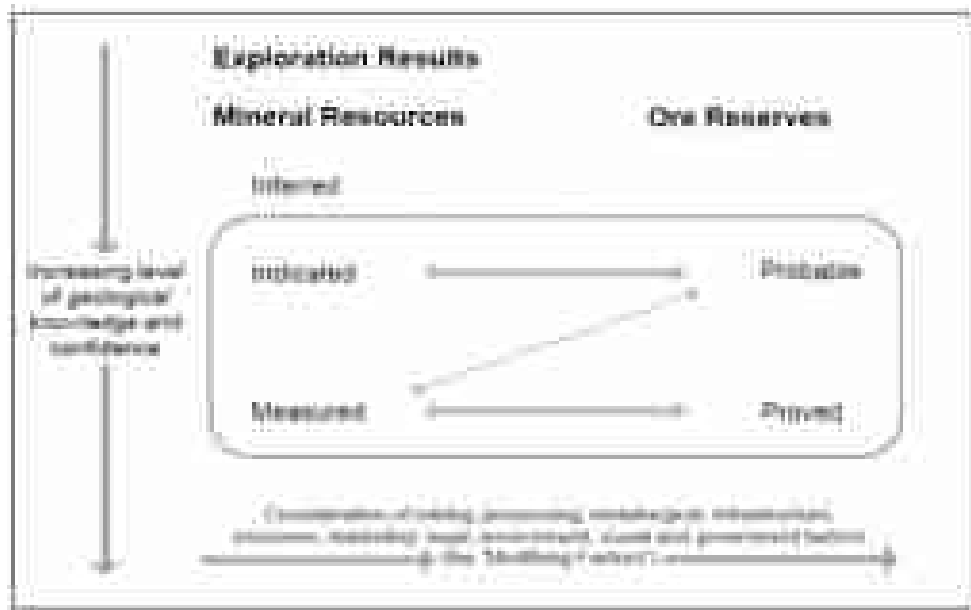

According to the JORC Code:

*an ‘Ore Reserve’ is the economically mineable part of a Measured and/ or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.*

*The Modifying Factors are considerations used to convert Mineral Resources to Ore Reserves. These include, but are not restricted to mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental, Social and governmental factors.*

Figure 11-1 provide for a direct relationship between Indicated Mineral Resources and Probable Ore Reserve and between Measured Mineral Resources and Proved Ore Reserve.

**Figure 11-1: Relationship Between Mineral Resources and Ore Reserve**

Sources: JORC Code, page 9

According to the JORC Code, a Probable Ore Reserve is the economically mineable part of an Indicated, and in some cases, a Measured Mineral Resource. The confidence in the modifying factors for a Probable Ore Reserve is lower compared to a Proved Ore Reserve. A Proved Ore Reserve, on the other hand, is the economically mineable part of a Measured Mineral Resource and implies a high degree of confidence in the “Modifying Factors” as the term is defined in the JORC Code.

The Ore Reserve estimates for the Wassa Mine have been prepared in accordance with the JORC Code guidelines. These estimates were derived by applying modifying factors to the Mineral

Resource Estimate, with only Measured and Indicated Mineral Resources being converted to Ore Reserve. Inferred Mineral Resources were treated as waste with zero grade. Wassa Mine is an operational mine, the designs and operating practices were reviewed to at least a pre-feasibility study ("PFS") level.

## 11.1 Open Pit Mining

### 11.1.1 Source of Information

The major files and information provided by Wassa Open Pit Mine are listed below:

- DMH Reserve block model: "dmh\_bm\_eng\_20230901.mdl"
- DMH surface topo: "eom-sept24-with-dump-updates.dtm"
- DMH mine practical pit design: "dmh\_pit\_design2023\_opt9b\_clipped.str"
- DMH cut-off grade and optimisation parameters: "Cut\_off Grade Calculation – DMH.xls"
- DMH Pit shell: "dmh-export-25-shell-final.dtm"
- Open Pit 2023 production records: "Wassa\_Public Stats\_2023.xls"
- Open Pit 2024 Q1 production records: "Mining Data\_Jan-Mar 2024.xlsx"
- Open Pit 2024 Q2-Q3 production records: "Wassa Operations Statistics\_Apr. 24 - Sept. 24.xlsx"
- Open Pit 2024 Q2-Q3 depletion: "SRK\_Apr-Sep2024\_recon\_rescat.xlsx"
- Open Pit Production plan: "GSR\_2024 LOM PLAN\_DMH.xls"
- Open Pit Production plan: "OP\_Pit\_Budget\_2024.minesched"

### 11.1.2 Cut-off Grade

The economic parameters, along with a gold price of USD2,050/oz provide a cut-off grade of 0.5 g/t gold for the DMH open pit as shown in Table 11-1.

**Table 11-1: Cut-off Grades and Parameters**

Parameter	Unit	DMH
<b>Revenue</b>		
Au price	USD/oz	2,050
Government and stream royalty	% of revenue	13.5
<b>Mining Parameters</b>		
Dilution	%	10
<b>Processing Parameters and Costs</b>		
Haul to Plant	USD/t	0.3
Process plant recovery	%	95.5
Process Cost	USD/t	15.09
G&A Cost	USD/t	7.35
<b>Au Cut-off Grade</b>	<b>g/t</b>	<b>0.5</b>

Source: GSR and SRK

### 11.1.3 Ore Reserve Statement

Modifying factors such as mining, metallurgical, economic, and marketing factors are considered and applied when converting a Mineral Resource (only Measured and Indicated Mineral Resource categories) to an Ore Reserve.

When applying the modifying factors, SRK estimated the Ore Reserves of Wassa Open Pit Mine in compliance with the JORC Code guidelines. Ore Reserve Estimates as of 30 September 2024 is summarised in Table 11-2.

**Table 11-2: Ore Reserve Statement, Wassa Open Pit Mine, as of 30 September 2024**

Deposit/Category	Tonnage	Grade	Contained Au	Contained Au
	kt	Au g/t	koz	t
<b>Open Pit</b>				
Proved	183	0.97	6	0.18
Probable	355	0.90	10	0.32
<b>Total</b>	<b>538</b>	<b>0.92</b>	<b>16</b>	<b>0.50</b>

Source: GSR, and re-run by SRK based on the following data

**Notes:**

<sup>1</sup> The Ore Reserves Statement is based on the depletion data provided by Wassa Mine for the six-month period, 1 April 2024 to 30 September 2024. The reported Wassa Mine data may differ from that reported by SRK, due the updated Block model now used by Wassa Mine for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the Wassa Mine provided data as the basis for this statement.

<sup>2</sup> DMH Resource block model: "dmh\_bm\_eng\_20230901.mdl"

<sup>3</sup> DMH surface topo: "eom-oct23-with-dump.dtm" (note: no mining activity in November and December 2023)

<sup>4</sup> DMH practical pit design: "dmh\_pit\_design2023\_opt9b\_clipped.str"

<sup>5</sup> No mining recovery and dilution applied.

<sup>6</sup> Only Measured and Indicated Mineral Resource considered.

<sup>7</sup> Cut-off grades of 0.5 g/t Au for DMH.

<sup>8</sup> The accuracy of the Ore Reserve depends on the accuracy of Mineral Resource estimation and data provided.

## 11.2 Underground Mining

### 11.2.1 Source of Information

SRK has received the following information from Wassa Mine as below:

1. Geological models
  - 242\_bm\_eng\_230913.gmdl
  - 242bm\_240806\_dep\_MI.gmdl
  - wug\_bm\_eng1\_20230928\_dep.gmdl
  - WUDBM\_240806\_dep\_MI.gmdl
2. As-builts/Production records

### 11.2.2 Cut-off Grade

The cut-off grade for Wassa Underground Mine is based on historical cost data and processing recovery rates, as summarised in Table 11-3. It is reviewed and updated on an annual basis. As of the latest update, the current mining cut-off grade is 1.34 g/t Au.

- Gold price of USD 2,050 / oz;
- Mining royalty of 5% and gold royalty of 8.3%;
- Gold processing recovery of 95.5%; and
- Total cash cost USD 72.71 / t.

**Table 11-3: Gold Cut-off Grade Calculation**

Description	Units	Value
<b>Revenue Parameters</b>		
Gold Price	USD/oz	2,050
Process Plant Gold Recovery	%	95.5%
Mining Royalty	USD/oz	102.5
Gold Royalty	USD/oz	170.15

Description	Units	Value
<b>Cost Parameters</b>		
<b>Mine Production</b>	USD/t	42.47
<b>Sustaining Capital</b>	USD/t	8.08
<b>Processing</b>	USD/t	14.93
<b>Site G&amp;A</b>	USD/t	7.23
<b>Total unit Cash costs</b>	USD/t	72.71
<b>Mining Cut Off Grade</b>	g/t Au	1.34

Sources: GSR

### Stope Optimisation

Stope optimisations were run with a 1.34 g/t Au cut-off grade in Deswik's Stope Optimiser™ software. Both 242 area and B Shoot area were optimised with the same parameters. Stope orientation of 242 area is run with a 45- degree rotation along the Z-axis.

A summary of the MSO parameters is presented in Table 11-4.

**Table 11-4: Stope Optimisation Parameters**

MSO Parameters	Value
<b>Vertical Method</b>	<b>YZ plane</b>
Minimum Mining Width	5m
Maximum Mining Width	60m
Stope Pillar	10m
Cut-off grade	1.34 g/t Au
Wall Minimum Dip	80°
Wall Maximum Dip	100°
Variable Overbreak or Slough (VOS)	
Bottom	0.2
Midpoint	0.4
Top	0.8
Section (length) Intervals	20m
Level (Height) Intervals	25m
Sections (U)	Variable based on mining method and mining lode

Sources: GSR

The stope optimisation result is shown in Figure 11-2.

Figure 11-2: Stope Optimisation Results (View from West)

Source: GSR, organized by SRK

### 11.2.3 Modifying Factors

The mining dilution and recovery rate for stopes and development varies depending on the production performance. In this report, the dilution rate and recovery rate are shown in Table 11-5. It should be noted that any diluted material is considered waste and is assumed to contain no gold (zero grade).

Table 11-5: Dilution and Loss

Development	Dilution	Recovery
Development (Au $\geq$ Development CoG)	0%	100%
Development (Au < Development CoG)	14%	100%
Stope	10%	95%

Source: GSR

### 11.2.4 Ore Reserve Statement

Modifying factors such as mining, metallurgical, economic, and marketing factors are considered and applied when converting a Mineral Resource (only Measured and Indicated Mineral Resource categories) to an Ore Reserve.

When applying the modifying factors, SRK estimated the Ore Reserves of Wassa Underground Mine in compliance with the JORC Code guidelines. Ore Reserve Estimates as of 30 September 2024 is in Table 11-6.

Table 11-6: Ore Reserve Statement, Wassa Underground Mine, as of 30 September 2024

Deposit/Category	Tonnage	Grade	Contained Au	Contained Au
	kt	Au g/t	koz	t
<b>Underground</b>				
Proved	3,339	2.20	237	7.36
Probable	4,935	2.20	349	10.87
<b>Total</b>	<b>8,274</b>	<b>2.20</b>	<b>586</b>	<b>18.23</b>

Source: GSR, and re-run by SRK

**Notes:**

- <sup>1</sup> The Ore Reserves Statement is based on the depletion data provided by Wassa Mine for the six-month period, 1 April 2024 to 30 September 2024. The reported Wassa Mine data may differ from that reported by SRK, due the updated Block model now used by Wassa Mine for reporting. SRK considers this updated block model to be more representative of actual production conditions and has therefore adopted the Wassa Mine provided data as the basis for this statement.
- <sup>2</sup> The Ore Reserve estimate complies and has been prepared and classified in accordance with the JORC code guidelines.
- <sup>3</sup> Ore Reserves within the underground mine are reported at a cut-off grade of 1.34 g/t Au.
- <sup>4</sup> Ore Reserves are reported with modifying factors.
- <sup>5</sup> All figures are rounded to reflect the relative accuracy of the estimate.

### 11.3 Combined Ore Reserves Statement

SRK has estimated the Ore Reserves of Wassa Mine for open pit, underground, and stockpiles in compliance with the JORC Code guidelines. The Ore Reserve Estimates as of 30 September 2024 is in Table 11-7. The total Ore Reserve for the Wassa Mine is estimated at about 8,842 thousand tonnes ("kt") at an average grade of 2.12 g/t Au, containing approximately 603 thousand ounces ("koz") of gold. This includes Proved Ore Reserve estimated at 3,521 kt with an average grade of 2.14 g/t gold, containing 242 koz of gold; and Probable Ore Reserve estimated at 5,291 kt at an average grade of 2.12 g/t gold, containing 360 koz of gold. The stockpile are the ore that have spilled from conveyor belts and accumulated over time and are subsequently returned to the ROM Pad.

Table 11-7: Combined Ore Reserve Statement of Wassa Mine as of 30 September 2024 by SRK Consulting China Ltd

Deposit/Category	Category	Tonnage	Au Grade	Contained Au	Contained Au
		kt	Au g/t	koz	t
<b>Open Pit</b>	Proved	183	0.97	6	0.18
	Probable	355	0.90	10	0.32
	<b>Total</b>	<b>538</b>	<b>0.92</b>	<b>16</b>	<b>0.50</b>
<b>Underground</b>	Proved	3,339	2.20	237	7.36
	Probable	4,935	2.20	349	10.87
	<b>Total</b>	<b>8,274</b>	<b>2.20</b>	<b>586</b>	<b>18.23</b>
<b>Stockpile (Measured)</b>	DMH Stockpile	25.98	1.19	1.00	0.03
	UG Stockpile	3.68	2.31	0.27	0.01
<b>Total</b>	Proved	3,521	2.14	242	7.53

Deposit/Category	Category	Tonnage	Au Grade	Contained Au	Contained Au
		kt	Au g/t	koz	t
	Probable	5,291	2.12	360	11.19
	Stockpile	30	1.33	1.27	0.04
	Total	8,842	2.12	603	19

**Notes:**

<sup>1</sup> The Ore Reserve Statement as of 30 September 2024 is based on the ore reserve models as of 31 March 2024 and the depletion for the Wassa Mine for the six-month period, 1 April 2024 to 30 September 2024.

<sup>2</sup> The Ore Reserve is reported in accordance with the JORC Code guidelines.

<sup>3</sup> The information in this report which relates to Ore Reserve is based on information compiled by Mr. Alex Thin and Ms. TzuHsuan Chuang who are full time employees of SRK Consulting. Mr. Thin is a Fellow of the Australasian Institute of Mining and Metallurgy (the "AusIMM") and Ms. Chuang is a Member of the AusIMM. Both Mr. Thin and Ms. Chuang have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the "Competent Persons" as defined in JORC Code (2012). Mr. Thin and Ms. Chuang consent to the reporting of this information in the form and context in which it appears.

<sup>4</sup> Ore Reserves in the table above and in this Report are estimated/ converted from Measured and Indicated Mineral Resources, therefore double accounting of tonnage should be avoided.

## Open pit

<sup>5</sup> - Ore Reserves are reported at a cut-off grade of 0.5 g/t Au.

<sup>6</sup> - Ore Reserves are reported with modifying factors.

## Underground

<sup>1</sup> - Ore Reserves are reported at a cut-off grade of 1.34 g/t Au.

<sup>2</sup> - Ore Reserves are reported with modifying factors.

## 12 Mining Methods

### 12.1 Open Pit Mining

There is one operational open pit (DMH) with a LoM until mid-2025. The open pit planning process is a conventional (drill, blast load & haul) best practise industry standard. The open pit mining plan employed an optimisation technique that utilised the key practical and economic elements and with a practical open pit design to estimate the Ore Reserves.

#### 12.1.1 Open Pit Optimisation

An open pit optimisation was undertaken by Wassa Mine utilizing Whittle™ software (Whittle). For the DMH open pit, the updated Mineral Resource model was imported, along with input assumptions, including:

- Gold price of USD 2,050/ oz;
- Selling cost of 13.3% of the revenue including a government gross revenue royalty of 5%;
- A process plant recovery for oxide and fresh material of 95.5%;
- Mining Factors of 10% dilution and 5% ore loss;
- General and administration (G&A) cost of USD 7.23/ t, hauling cost of USD 0.3/ t, and treatment costs of USD 15.09/t;
- Mining cost of USD 3.1/ t for weathered material and USD 4.2/ t fresh rock; and
- Open pit slope angle: 52° in fresh rock and 39° in the weathered zone.

SRK found the parameters used in optimisation are based on the historical mining database and therefore are reasonable. SRK was unable to access the Whittle source files but assumed that the parameters were allocated appropriately.

Table 12-1 summarises the DMH open pit optimisation parameters.

The open pit shell from this practice as shown in Figure 12-1 and is a guide for practical open pit design.

**Table 12-1: DMH open pit Optimisation Parameters**

Parameter	Unit	DMH
<b>Revenue</b>		
Au price	USD/oz	2,050
Government and stream royalty	% Revenue	13.5
<b>Mining Parameters and Costs</b>		
Mining recovery	%	95.5
Dilution	%	10
Overall slope angle (Ox/ Fr)	deg.	39/ 52
Base mining cost (Ox/ Fr)	USD/t	3.1/ 4.2
<b>Processing Parameters and Costs</b>		

Parameter	Unit	DMH
Haul to plant	USD/t	0.3
Process plant recovery	%	95.5
Process cost	USD/t	15.09
<b>Other Costs</b>		
G&A cost	USD/t	7.3
Rehab cost	USD/t treat	0.12

Source: GSR and SRK

**Figure 12-1: An Isometric View of the DMH Open Pit Shell from the Optimisation Practice**

Source: GSR and SRK

### 12.1.2 Practical Open Pit Design

The DMH deposit is to the north-east of the Wassa old open pits, and Wassa are carrying out preparation by removing the topsoil (pre-stripping) from the outcrop quartz veins. The mining method is currently quarrying that starts on the hill and will convert to an open pit in time.

Figure 12-2 provides a plan view of the DMH final open pit design. SRK evaluated the design and did not identify any critical flaws; however, it does recommend some modifications to improve the mining capabilities:

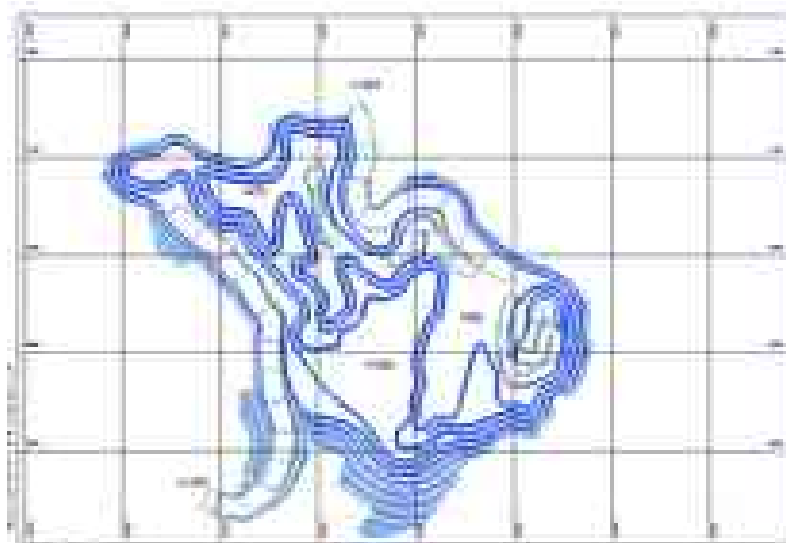

- When designing the open pit, the minimum mining width should be incorporated. Certain areas have extremely restricted access, which poses a significant challenge for mining equipment; and
- The removal of a permanent ramp situated in the western section of the open pit could result in a reduction of mining waste.

The 20 m ramp width with a gradient of 10% was utilised to access the open pit levels; this is wide enough for two-way hauling with 60 t capacity off-highway haul trucks. A conventional open pit mining method is used by employing excavators and trucks (load and haul) which are considered typical for

this type and style of gold mineralisation. Mining will be conducted by a contract mining company who will supply equipment, workforce and supervision services.

SRK did not review the open pit slope angle designs (supporting design analysis); however, the open pit design slopes and benches are based on the historical geotechnical parameters for the open pits in the area, with an overall angle of 40° in the weathered zone and 52° in fresh rock. The 12 m bench height, with a 72° bench face angle designed, while drilling and blasting will be conducted over bench heights of 6 m. Oxide or weathered material is generally only required to be lightly blasted or in some areas can be excavated as ‘free dig’. Hydraulic excavators are used in conjunction with conventional blasting practice, to mine a 3.0 m flitch height. Broken rock is loaded into the haul trucks to a central stockpile or to the waste dump.

Figure 12-2: DMH Practical Open Pit Design General View

Source: GSR and SRK

**12.1.3 Production Schedule**

Geovia MineSched software was employed by Wassa Mine to schedule the open pit production. The ore within the open pit plus 10% dilution and 4.5% ore loss (mining recovery 95.5 %) were applied to the gold grade and ore tonnage.

Wassa Mine intends to deplete the open pit by June 2025, with an average total mining rate of circa 275 kt per month. The ore mined from the open pit will initially be stockpiled and blended with the ore recovered from the underground mines to feed the processing plant. The other material will be sent to the nominated waste dump area or stockpiled separately if required.

Table 12-2: Wassa OP Mining Production Schedule

Mine Production & Development	Unit	Total	2024 Q4	2025
-------------------------------	------	-------	---------	------

<b>OPEN PIT</b>				
OPEN PIT - Ore Tonnes	t	538,041	79,981	458,061
OPEN PIT - Au Grade	g/t	0.92	1.08	0.90
OPEN PIT - Au Metal	oz	15,965	2,767	13,198
OPEN PIT - Waste Tonnes	t	1,681,405	635,265	1,046,140
OPEN PIT - Total Material Movement	t	2,219,446	715,246	1,504,200

Source: GSR

### 12.1.4 Conclusion and Recommendation

This report has been prepared using block models and data supplied by Wassa Mine. It was assumed that the economic parameters utilised in the optimisation and cut-off grade calculation are from historical data from the mining database. As such, the report was deemed reasonable. Nevertheless, the accuracy of the outputs is reliant upon the economic parameters and the accurate estimation of the Mineral Resource. Any changes in the Mineral Resource estimations, also in the economic parameters such as gold price may cause the changes in open pit limits and therefore in the estimated Ore Reserves.

## 12.2 Underground Mining

### 12.2.1 Introduction

Development of the Wassa Underground Mine began in 2015, and it started commercial production in January 2017.

Wassa has provided SRK the Wassa Design and Wassa Sched, utilising Deswik™ software. The mine consists of two primary mining areas: Zone 242 and Zone B Shoot, with Zone B Shoot comprising the main, south, and south deep sections (refer to Figure 12-3). The majority of the Measured and Indicated Mineral Resources are within the Zone 242 and the main/ south areas of Zone B Shoot.

Figure 12-3: Wassa Underground Mining Areas (Zone 242 and Zone B Shoot)

Source: GSR and SRK

### 12.2.2 Geotechnics

The geotechnical analysis presented in section 12.2.2, is based on the studies and analyses undertaken by SRK Consulting South Africa ("SRK ZA"), and reported in March 2021 ("SRK ZA, March 2021").

#### Geotechnical Domain and Characterisation

Previous SRK reports classified the Wassa deposit into three main geotechnical domains as:

- Footwall Domain;
- Orebody Domain; and
- Hanging wall Domain.

The geotechnical characterisation has been based on the following data sources:

- Geotechnical data available in the GSWL surface exploration and underground drilling geological logs;
- Logs of the underground boreholes that had been subject to detailed geotechnical logging;
- A limited set of laboratory strength and deformation test results; and
- Review of underground mapping data.

The joint sets presented in the stereonet plot shown in Figure 12-4 and summarized in Table 12-3 form the basis for the slope stability assessment. The structural information at the mine site has not been updated since last reported.

Figure 12-4: Stereonet Plot of Wassa Joint Set Database

Source: SRK ZA, March 2021

Table 12-3: Joint Sets Used for Slope Design

Discontinuity Set	Dip (°)	Dip Direction (°)	Comments
Foliation	52	275	Tightly healed foliation planes
J1	45	11	Set of tightly healed North-east trending joints
J2	62	155	Set of tightly healed South-east trending joints
J3	15	276	Set of sub-Horizontal North-west trending joints
J4	79	42	Set of steeply dipping North trending joint

Source: SRK ZA, March 2021

**In-Situ Stress**

In September 2019, Wassa mine conducted an Over-Coring stress measurements to measure in-situ stress levels in the mine. The measurement was carried out from the footwall of the 570 decline and the hanging-wall at 645-DD7. The 645-DDT was discarded due to its closeness to and the potential influence from the open pit mining with regards to stress redistribution.

The results from the 570 decline are shown in Table 12-4 and the interpreted depth gradient is shown in Figure 12-5.

Table 12-4: 570 Decline Stress Measurement

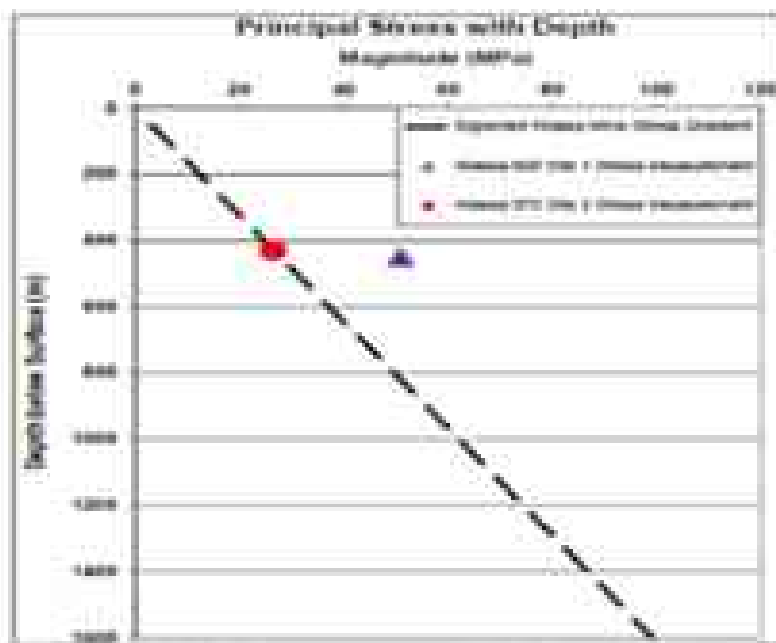

Principal Stress	Magnitude (Mpa)	Depth (m)	Ratio	Gradient (MPa/m)	Dip	Direction
Major	26.5	430	2.23	0.062	4°	339°

Principal Stress	Magnitude (Mpa)	Depth (m)	Ratio	Gradient (MPa/m)	Dip	Direction
Intermediate	18.9	430	1.59	0.044	6°	69°
Minor	11.9	430	1.00	0.028	83°	219°

Source: SRK ZA, March 2021

The In Situ stress measurement indicates that the major principal stress is horizontal and parallel to the main orebody. The intermediate principal stress is perpendicular to the strike of the orebody, and the minor Principal stress corresponds to the overburden stress. These orientations have been applied in principle to the design of the Huni Butre and Benso underground projects – particularly the Adoikrom and Father Brown underground project. These projects lay with the proximity of the Wassa main.

Figure 12-5: Principal Stress Measurement Magnitude vs Depth

Source: SRK ZA, March 2021

**Rock Mass Characteristics**

The geotechnical cores and underground exposures were mapped as per CSIR Rock Mass Rating. The data was then processed to produce the modified NGI (Norwegian Geotechnical Institute) Rock Mass Quality Q-system and the Geological Strength Index. These rock mass parameters were then employed in the development and stope support designs. The representative rock mass parameters are based on laboratory testing. The rock mass condition data of the Wassa geotechnical domains used for geotechnical analyses or numerical modelling are shown in Table 12-5.

The rock mass quality is classified Very Good, using Barton’s (Barton et al, 1974) classification and Geological Strength Index (GSI) rating systems.

Table 12-5: Wassa Rock Mass Characterization Parameters (Barton et al, 1974)

Parameter		Footwall / Orebody / Hanging			Source
		MIN	Wall MAX	Average	
Rock Quality Desc.	<b>RQD%</b>	85	90	85	Geotechnical and mapping Borehole structural data and mapping

Source: SRK ZA, March 2021

### Development Support

The ground support design for Wassa underground operations is based on Barton's Q-Index support chart. The designed width of major long-term excavations is 5.5 m. As long term mine excavations (main access ramp/ decline, footwall drive and level access drive) an Equivalent Support Ratio ("ESR"), of 1.6 is assumed, Barton and Grimstad (1993). The estimated Equivalent dimension is plotted on the Q-Index support chart and the support requirement read from it. Based on the rock mass characterisation the excavations within the Wassa mine, will not require systematic ground support.

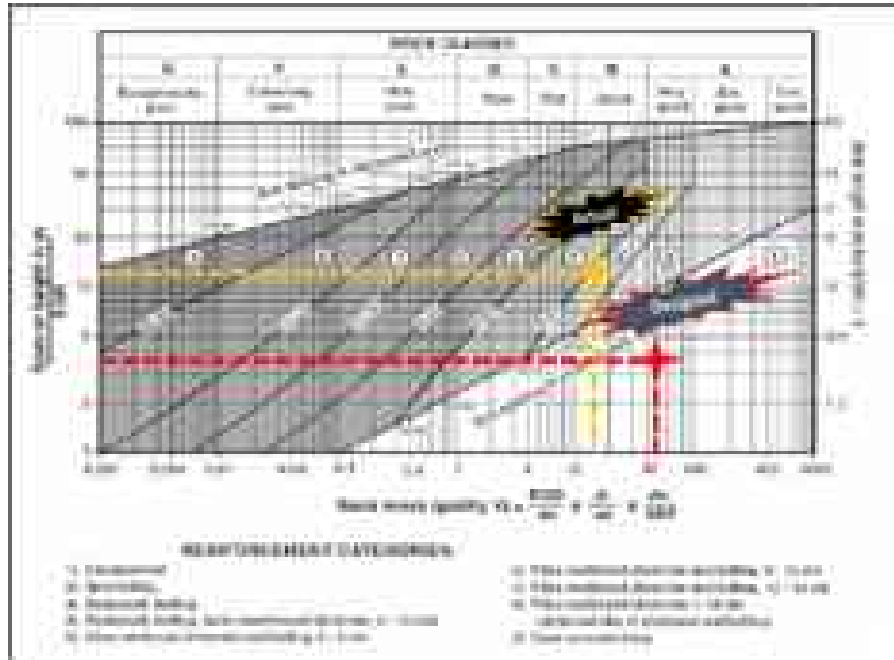

As part of management's risk aversion all excavations are supported. The actual support plots in category 3 whilst the designed plots in category 1 as shown in Figure 12-6.

Wassa has two systematic support patterns for good and poor ground conditions. The support for poor ground conditions is actioned by the geotechnical engineer, otherwise the good ground condition support pattern applies to all excavations.

The standard support pattern consists of galvanized 2.4 m long, 46 mm diameter Split Sets (a form of friction stabilizer) and 4.2 x 2.4 m sheets of wire meshing. Wire mesh is installed on the roof, from corner to corner, for good ground conditions with an additional two split sets installed below the top corners on either side. The wire mesh extends from grade line to grade line for poorer ground conditions. Any change in the support standards may have to be based on fall-out measurements and minimum bond length required to hold such fall-outs.

The empirical support design is supported with numerical analysis with software such as UNWEDGE™, (analysis of structurally controlled instability), and PHASES 2D™, (analysis of stress induced failure).

Figure 12-6: Support, Barton’s Q-Index Chart (Barton and Grimstad, 1993)

Source: Geotechnics, GSR

**Modified Stability Number**

The Q' value derived from the geotechnical characterisation has been used in conjunction with the stability graph parameters A, B and C to determine the Modified Stability Number (N) for slope roof, end walls and hanging walls. Stress parameter A has been estimated by calculating the gravitational stress generated from the weight of the overburden rock above the mining.

The structural parameters B and C were derived from an assessment of the interaction of the dominant joint sets with the stope boundaries. The Table 12-6 and Table 12-7 show the Modified stability number (N) for the transverse and longitudinal stopes as applied to the Wassa main orebody.

Table 12-6: Modified Stability Number (N') for Panels 1-3, Transverse Stopes (Potvin, 1988)

Parameters		Stope Wall, Transverse			Comments
		Back	Side	End	
Q'		47.9	47.9	47.9	
UCS, Sigma C	Mpa	130	130	130	Average intact rock strength

$N=Q' \times A \times B \times C$		17.3	106.3	69	N-value for all stopes $\geq 64^\circ$ slope

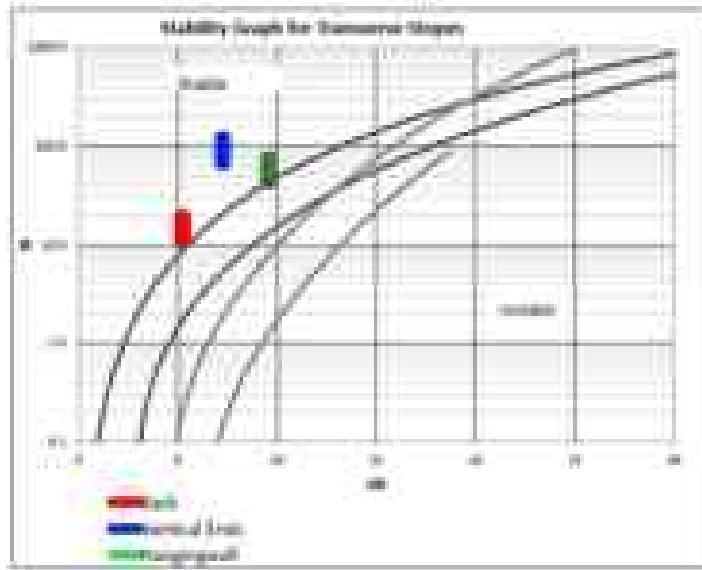

Source: SRK ZA, March 2021

**Modified Stability Graph**

The calculated stability number, 'N', for each stope surface is plotted on 'N' vs Hydraulic Radius, (HR), chart to determine its stability. The stope back, hanging wall, footwall and end wall all plotted in stable without support envelop. Figure 12-7 and Figure 12-8 show the stability graph of the transverse and longitudinal stopes.

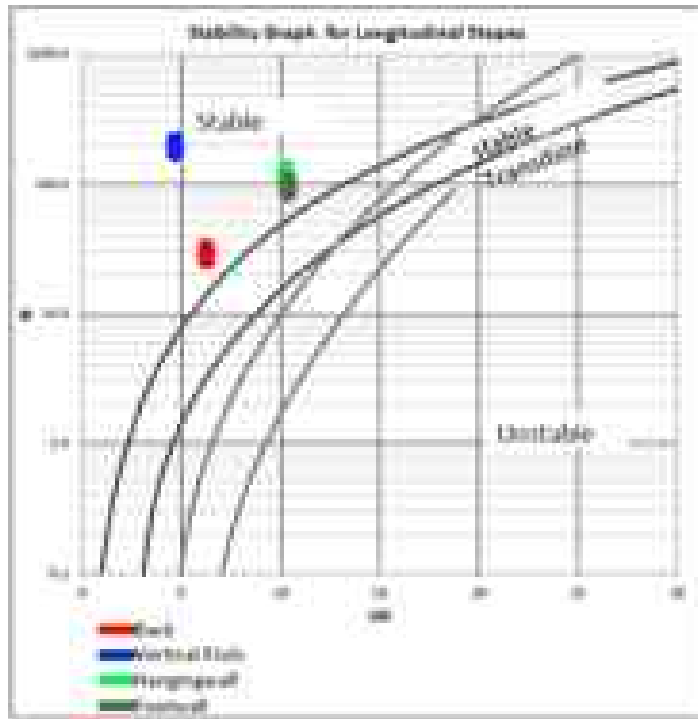

The hanging wall stability number ranges from 40 to 76.7. Plotting the stability graph in a different style using  $N=40$ , as shown in Figure 12-9, gives different combinations of stope strike lengths and hanging wall vertical heights for any given HR value. This indicates that a stope of 20 m strike length can be mined to an infinite depth with a stable hanging wall exposure. This supports the field observations in S12 which has a height of 125 m after damaging the 10 m sill pillar at Level 520. It is reported that many of the 100 m high stopes remain stable with minimum wall failures from Cavity Monitoring System (CMS) surveys. (Wassa Site Engineer).

**Stable Slope Design Geometry**

The Wassa mine operates within a certain range of stable slope dimension as detailed in Table 12-8. These parameters were computed from the stability graph and cover both transverse and longitudinal mining for Wassa main. Panel 2 is currently active and employs both mining methods. Panels 4 to 8 will employ mainly longitudinal mining method.

**Table 12-8: Stable Slope Dimensions, Panels 1-8**

Stope Dimension		Transverse Slope			Longitudinal Slope		
		MIN	MAX	DESIGNED [M]	MIN	MAX	DESIGNED [M]
Height	m	25	100	100	<15	25	25
Strike Length	m	25	25	25	<60	70	70
Width across Strike	m	15	30	25	<15	15	15
Dip, end/sidewall		65°	65°	65°	65°	65°	65°

Source: Geotechnics, GSR

**Major Pillars**

- B Shoot Crown Pillar

A 25 m crown pillar separates the main orebody, B Shoot, and the bottom of the open pit. See Figure 12-10. The stability of the Crown Pillar between the B Shoot Main open pit and 720-N1 stope was assessed during the FS by SRK using Phases 2D software. A factor of Safety of 1.58 was assigned.

There are also several 10 m sill pillars separating mined out stopes in Panels 1 & 2 which are filled with either waste rock fill or pastefill. Similarly, the sill Pillar between 720-N1 and 745-S1 was assigned a Safety factor of 1.58. See Figure 12-11.

### Geotechnical Assessment for Wassa Design

During the development of the Wassa Design, a geotechnical assessment was conducted by Mr. Amir Karami, Principal Geotechnical Engineer and Competent Person in Geotechnical Discipline, from BGC Engineering Inc. ("BGC"). The assessment primarily focused on two aspects:

- If GSR reduced the crown pillar thickness from the previously recommended 30 m to 20 m. This involved evaluating the stability of the proposed 20 m thick crown pillar for the planned openings immediately below and adjacent to the existing open pit.
- Reviewing the stability of the proposed permanent footwall drives near the planned open stopes.

The empirical Scaled Crown Span methodology was used for the crown pillar stability assessment, leading to the following conclusions:

- For the Q rock mass rating, with a crown pillar thickness of 20 m, a stope span of 20 m, and a stope length of 30 m, the crown pillars immediately below the open pit bottom and adjacent to open pit walls remain stable (FoS > 1.6) with a low probability of failure.
- Increasing the stope span to 25 m reduces the FoS to below 1.5 and increases the probability of failure, though it remains low.
- Increasing the stope length to 50 m also reduces the FoS and increases the probability of failure, but the impact is less pronounced than increasing the stope span.
- Increasing the crown pillar thickness enhances stability (FoS > 1.9) and reduces the probability of failure to approximately 4%, but this comes at the cost of sterilizing ore within the crown pillar.

BGC provides the following considerations for rib pillar design between the footwall drives and the open stopes:

- Stopes with at least a 10 m offset from footwall drives can be mined, but ground conditions and support performance should be monitored and evaluated, with proper remediation carried out as needed before commencing open stope mining near footwall drives.
- Although GSR has not experienced instability issues in footwall drives from nearby stope blasting, future damage may occur due to rock mass variability and stope blasting.
- If there are concerns about the stability of the footwall drive, GSR should consider delaying the mining of nearby open stopes. A potential option is to mine these stopes on retreat or at the end of the mine life.

### 12.2.3 Mining Method

The Wassa Mine operations started as an open pit and transitioned into an underground mine in 2015. It will continue to be mined by underground methods using a top-down sublevel open stoping (SLOS) method.

#### Stoping Methodology

The stopes are mined using transverse stoping, with longitudinal stoping. Stope dimensions are 20 m along strike, various width depending to the stope shapes and 25 m height (level spacing).

- Transverse stoping: Stopes are defined as primary and secondary. The primary stopes would be mined and then paste backfilled. Once mined, the secondary stopes would be backfilled with either paste or waste rock. Generic sections for a primary transverse stope are shown in Figure 12-12. The Wassa Mine assumes that no sill pillar would be left behind.
- Longitudinal stoping: Stopes are be mined in a backward direction from the end. Once the first stope has been mined, the paste wall would be built away from the open stope in two cuts (6m). This is followed by a "plug pour" and then a "main pour." There will be a 7-day curing delay from the "plug pour" to allow the plug strength to develop. To mine the subsequent stope, the paste wall would be broken, and two cuts (6m) would be made back into the previously paste-filled stope to allow a production drill to come in and set up on the first ring. After this slot drive development, cable bolting of the stope and production drilling of the slot and rings begin.

Figure 12-12: Schematic of Primary Transverse Stope (Illustration Not to Scale)

Source: 02Tec Report-Wassa-Dec2020-NI43-101-Tech-Report-DRAFT-v20210301-(final)-CONFORMED.pdf

#### 12.2.4 Development Design

In Figure 12-13, the main decline portals (including 242 Portal, B Shoot Portal and Portal 3) are from the open pit and are designed with a cross-section of 5.8 m (H) by 5.5 m (W) to allow 45 t and 55t capacity haul trucks to haul ore and waste.

**Figure 12-13: Wassa Underground Development Design (Looking East)**

Source: GSR and SRK

### 12.2.5 Production

The current ore production target from the stopes and developments is between 7,000 and 8,000 tonnes per day. The ore is transported by 45 t and 55t articulated dump trucks ("ADT") to the stockpile designated at Portal 3. Waste material is primarily used for backfilling voids or is transported to waste rock dumps on surface.

Blasting operations occur twice daily, at 6AM and 6PM. These times also mark the shift changes, with workers transitioning from the day shift to the night shift and vice versa.

Mining operations at the Wassa Main are conducted by the owner, while the 242 and Wassa South areas are managed by contractors.

### 12.2.6 Equipment

The Wassa underground equipment is listed in Table 12-9. The model of production drill rig is DL 411, DL421 and DL 431. The model of jumbo is DD421-60. There are several LHD (load-haul-dump) models: R2900; LH517; LH 621. The model of the ADT is A45G. The availability of the equipment is above 80%. The contractor's equipment is listed in Table 12-10.

Table 12-9: Wassa Underground Equipment List

Equipment	Model	Quantity	Availability
Truck	Volvo A45G ADT	9	85%
Loader	CAT R2900G	3	80%
Loader	Sandvik LH517	1	80%
Loader	Sandvik LH621	2	80%

### 12.2.7 Production Schedule

There are two main components in the production schedule: development and stopes. For development, the main activity types, their respective scheduled rates, and section sizes are presented in Table 12-11 below.

Table 12-11: Development Tasks in Schedule

Development Tasks	Task Rate	Section
Decline	50m/mo & 90m/mo	5.5mW x 5.8mH
Level Access	50m/mo & 60m/mo	5.0mW x 5.0mH

Development Tasks	Task Rate	Section
Escapeway Access	50m/mo	5.0mW x 5.0mH
Electrical Cuddy	50m/mo	5.0mW x 5.0mH
Exploration Drive	50m/mo	5.0mW x 5.0mH
Ore Drive	50m/mo	5.0mW x 5.0mH
Stockpile	50m/mo	5.5mW x 5.8mH
Sump	50m/mo	5.0mW x 5.0mH
Vent Access	50m/mo	5.5mW x 5.8mH

Source: GSR

The Table 12-12 below indicates the primary activities during stoping and the designed rates.

**Table 12-12: Stope Task in Schedule**

Stope Tasks	Task Rate
Backfill Development	1.5 days
Slot Drive	60m/mo
Cable Bolt Support	230m/d
Boxhole Rise	4m/d
Stope Rise	1.3d
Production Drilling	250m/d
Bogging	1,700t/d
Backfill Preparation	13.9d
Backfill Paste	1,200m <sup>3</sup> /d
Backfill Waste Rock	600m <sup>3</sup> /d
Backfill Cure Delay	7d

Source: GSR

**Ore Reserves Plan**

Ore Reserves Plan (Only Measured and Indicated Mineral Resources, as per the JORC Code guidelines for the reporting of Ore Reserves) is based on the Wassa Design and Wassa Sched, with a LoM of five years, as shown in Table 12-13. Ore Reserve schedule will be used in the technical economic analysis.

**Table 12-13: Ore Reserves Plan**

## 12.2.8 Mine Service

### Paste Backfill

In 2015, Kovit Engineering ("Kovit"), based in Sudbury, Canada, undertook the design and cost estimates that formed the basis of the paste backfill system. The overall system is depicted in Figure 12-14.

**Figure 12-14: Backfill system proposed by Kovit**

Source: Kovit, 2015

According to the FS 2015, cement rock fill (CRF) and waste rock fill (RF) were nominated for transverse primary and secondary stopes, respectively. Later on, paste backfill studies were carried out by Outotec (Canada) Ltd. and completed in 2019. In 2020, the Wassa Mine completed the construction of the paste backfill plant.

In Wassa Design and Updated Wassa Design, paste backfill will be required to maintain support for mining the secondary transverse stopes and longitudinal stopes, thereby increasing the overall level of extraction. Secondary stopes for transverse stopes will be filled with RF as required.

### Ventilation

Ghanaian mining regulations stipulate the following:

- A maximum velocity of 6 m/ s in travelling roadways.
- For diesel engine equipment, a minimum airflow of 0.06 m<sup>3</sup>/ kW/ s.
- A minimum velocity of 0.2 m/ s in headings and 0.1 m/ s in large openings.
- A maximum wet bulb temperature of 32.5°C for working conditions.
- Continuous monitoring of CO levels in return airways with information transmitted to the surface.

According to FS 2015, SRK conducted an analysis of ventilation requirements at Wassa using VENTSIM VISUAL™ software. The aim of this analysis was to determine the primary and secondary fan requirements, as well as duct and airway sizes. The analysis was carried out in two phases, depending on the mining panels and levels. The Figure 12-15 below indicates the Phase 2 ventilation system.

**Figure 12-15: Phase 2 Ventilation System**

Source: FS, 2015

Upon completion of the FS 2015, several changes occurred in the underground mine:

- The mine development in FS 2015 reached 412 m RL, while the lowest development levels for Wassau Design/ Sched and Updated Wassau Design have reached 370 m RL and 270 m RL, respectively.
- The production capacity has increased from 0.8 Mtpa to 2.8 Mtpa.
- The number of main production fleet units has correspondingly increased.
- For B Shoot, the main ventilation intake has changed from solely B Shoot Portal to both B Shoot Portal and Portal 3.

The mine continuously updates the ventilation systems as mining expands laterally and with depth.

During the site visit, SRK observed that the ventilation is adequate and effective, and mined-out areas have been properly barricaded. However, SRK recommends that Wassau Mine conduct a comprehensive ventilation assessment to support the ventilation design as the mine plans depth extension in the future.

### **Communication**

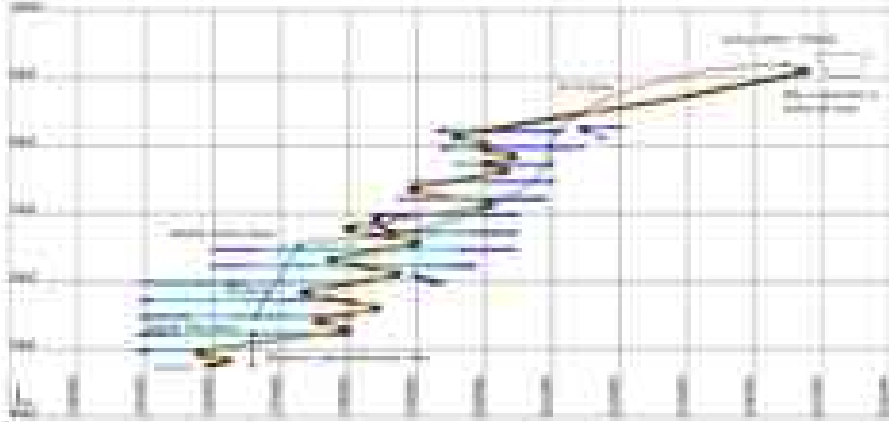

Frontline mine communication is facilitated via a leaky feeder VHF communications system and a two-way radio network. An antenna on the surface, along with cabling in the decline and all waste development headings, provides reliable communication to the working areas at Wassau.

All mobile equipment is equipped with radios in the operators' cabins, and portable handsets are available for mechanics, supervisors, and other personnel as required.

### Dewatering

The mine dewatering system is designed to remove both groundwater and service water. The system is designed to handle a flow rate of 35 l/s. The Figure 12-16 indicates the final dewatering design as per the FS 2015.

**Figure 12-16: Final Dewatering**

Source: FS, 2015

The mine continuously updates the dewatering systems as mining expands laterally and with depth.

During the site visit, SRK observed that the tunnel and stoping areas were dry and clean, and that housekeeping has been well maintained.

SRK recommends that Wassa Mine conduct a comprehensive dewatering assessment to support the dewatering design as the mine plans depth extension in the future.

### Water Supply

Water tanks are installed above the portal area to supply the underground mine with service water for drilling, dust suppression, and general use. Service water is sourced from either the starter open pit sump or the Dead Man Hill open pit sump. It is reticulated throughout the mine via 110 mm high-density polyethylene ("HDPE") lines installed in the primary headings, reducing to 63 mm HDPE lines for supply to end-use locations. Pressure reducers are installed as required to always maintain the pressure within the range of 4-12 bar. There are number of surface catchment areas situated in close proximity of the underground portals, that form part of the closed-loop water supply system.

### Compressed Air

It is planned that compressed air will only be needed for minor service work. To this end, a 110 mm poly pipes are reticulated underground down the main decline. A compressor house situated at the B-Shoot portal equipped with 90 kW compressors, provide pressure of 6.5 bar and a flow rate of 17.5 m<sup>3</sup>/ min to the mining areas, making use of a ring main system.

### Underground Magazines

Detonators, explosives and blasting agents are stored at the existing Wassa magazine on surface, delivered from existing suppliers in Ghana, currently African Explosives Limited ("AEL"). Utility vehicles transport the explosives underground for storage in approved underground magazines that are constructed to hold 3-4 days' worth of explosives.

### Emergency Egress

A series of manways between levels, each approximately 15 to 20 m in length and inclined at 65-75° to the horizontal with a cross-sectional area of 1.2 m by 1.2 m, have been constructed. Each manway is fitted with ladders and rest platforms in compliance with Ghanaian mining regulations.

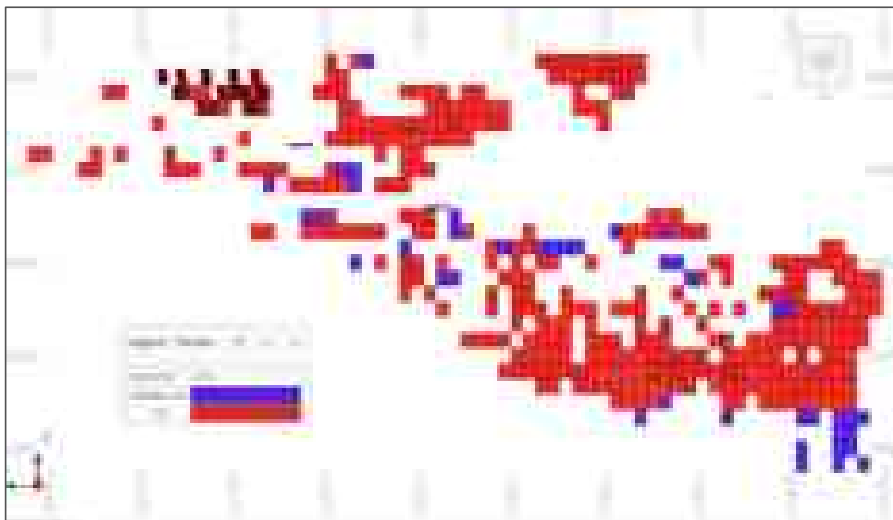

The escapeway system provides a secondary means of access from every sub-level and is separate from the main decline.

Several Sixteen-person Refuge/ emergency chambers have been installed in the mine as development progresses.

### 12.2.9 Wassa Ore Reserves and Upside Plan

The Wassa Mine has provided SRK the Ore Reserves plan (Wassa Design/ Schedule) and an upside/ opportunities plan, based on the Wassa Design/ Schedule, but including immediately identifiable upside/ opportunities (though not classified as Ore Reserve in this evaluation). The comparison of the two is highlighted in Figure 12-17.

Figure 12-17: Stope comparison between Wassa Design and Updated Wassa Design

Source: GSR and SRK

Notes:

The purple blocks are the additional 'non Ore Reserve stopes'/ addition material included in Update Wassa Design

During discussions with the Wassa Mine, SRK understands that Updated Wassa Design includes Residual material in the upper area and Material in the lower area. Due to time limitation of preparing Updated Wassa Design, SRK would consider this as an opportunity for eventual economic material but does not regard it as classified as Ore Reserves.

To classify the additional Mineral Resources as Ore Reserves, comprehensive technical studies across various disciplines (geotechnical, hydrogeology, ventilation, infrastructure, etc.) must be conducted to determine the feasibility of their exploitation. These studies should be at least at a PFS level, including an assessment of the methods of exploitation.

Although SRK cannot currently classify the Residual Material in upper area ("Residual Material (upper area)") and Material in lower area ("Material (lower area)") from Updated Wassa as Ore Reserves, SRK considers this material under a scoping study level and has reasonable grounds for disclosing a production target that includes this amount of Indicated Mineral Resource as an upside opportunity case.

The schedule is shown in Table 12-14.

**Table 12-14: Wassa Ore Reserves and Upside Plan**

### 12.2.10 Life of Mine Schedule

During the SRK site visit, GSR presented their in-fill drilling plan and budget aimed at upgrading the Inferred Mineral Resource to Indicated/ Measured Mineral Resource in the near future.

The Wassa Mine has developed a life of mine plan that includes Inferred Mineral Resource and outlines two designs/ studies for future expansion. SRK note that this cannot be considered as an Ore Reserve as it is based on Inferred Mineral Resource. In order to classify as Proved or Probable Ore Reserve category, technical studies need to be completed to at least a PFS level with an appraisal of how access would be achieved, mining methodology (including extraction and dilution factors), the geotechnical understanding as well as ventilation. Along with the technical understanding and extraction achievability, the economics of each area needs to be proved, i.e. with the application of Capex and Opex, is it economic to mine, cash flow positive.

The first design, with a Preliminary Economic Assessment ("PEA") for the Wassa's Southern Extension conducted by GSR in 2021, divides the Wassa Underground mine into 8 panels with the same stope optimization parameters but different other stope modifying factors such as dilutions and stope recoveries. The PEA has considered a long-term LoM scheduling, which is conceptual and outlines a mining inventory based on Inferred Mineral Resources. The term "run of mine ('ROM') material" is used in the PEA to describe potentially economic Mineral Resource included in the mining and processing plans. According to the PEA, a total of approximately 29.6 Mt of ROM material averaging about 3.9 g/t Au is scheduled for an additional 17-year LoM based on the Inferred Mineral Resources at Wassa underground (the Southern Extension), including 2 years for definition drilling and 2 years for underground development.

The second design, developed using Deswik software and shown in Figure 12-18, estimates a 26-year mine life extending to 2049 with an annual mining capacity of approximately 3 Mt of ore, detailed in Appendix B. This design includes the V13 Design, which is the Ore Reserve plan and schedule, employing a top-down LHOS method with either transverse or longitudinal stoping, depending on the orebody, and using pastefill for backfill for deeper stopes. The stope optimization parameters align with the Ore Reserve plan, except the gold grade for Inferred Mineral Resource is not set to zero.

**Figure 12-18: Wassa Underground Life of Mine Design (Looking East)**

Source: GSR

The main decline is a spiral ramp on both sides of the ore body, extending to -800 m RL, as shown in Figure 12-19. However, during the discussions with GSR, it is suggested that a vertical shaft may be developed for deeper ore extraction due to the extensive travel distance for material transport via the decline.

Figure 12-19: Wassa Underground Life of Mine Decline Design (Looking East)

Source: GSR

### 12.2.11 Conclusions and Recommendations

SRK has reviewed the parameters for calculating cut-off grade, underground design, and schedules provided by the Wassa Mine and concludes that there are no significant inaccuracies in the data or procedures used.

It is important to highlight, however, that the Wassa Mine's overall design strategy is based on an operational perspective, and therefore Inferred Mineral Resources have been considered in the development design. This could lead to unnecessary capital expenditure if only Measured and Indicated Mineral Resources were considered.

The Updated Wassa Design has included additional Indicated Mineral Resource. Due to the time limitations in preparing the design by the Wassa Mine, this inventory is considered to be at a scoping study level. SRK would consider this inventory as an upper case for eventual economic extraction results.

Ore Reserves estimation has been conducted based on the mine design (Wassa Design), previous studies, and historical operating conditions. SRK suggests that the Wassa Mine conduct an independent study to compile such data to guide further production.

It is recommended to upgrade the Mineral Resource category in the B Shoot south deeps to extend mine life through in-fill drilling exploration and/or underground exploration.

## 13 Recovery Methods

### 13.1 Processing History

Wassa started exploiting gold from ores in 1998 utilising a heap leach ("HL") technology which is a well-established extractive metallurgical technology enabling the economic processing of various kinds of low-grade ores, which could not otherwise be exploited. However, the process remains limited by low recoveries and long extraction times. The process involved crushing, screening and agglomeration of the mined material before being stacked on leach pads which were irrigated with a weak cyanide solution to recover the gold. The solution was processed through carbon columns, stripped from the loaded carbon and smelted through to gold Doré bars. In 2001, the HL operation was suspended since the actual plant recoveries of 55-60% were far below the design and expected recovery of 85%, making the process non-economical.

A FS commenced to evaluate construction of a CIL plant in 2003. The positive outcome led to the construction of the existing plant in 2004 which was commissioned in 2005. The plant circuit has crushing, milling and CIL sections with new facilities for the mills and CIL circuit in that upgrade. A feed blend comprising 45% fresh material, 25% oxidized material and 30% reclaimed spent HL material was feed to the plant which had processing design capacity 3.5 Mtpa. Until 2014, the spent HL material reclaimed from the pads was added to the mill feed via a scrubber when it was exhausted. The plant was fed with only fresh material from the open pit until 2016 when underground material was added to the feed. Open pit mining was suspended in 2018 and since then, the predominant feed has been underground ore with supplementary addition of open pit stockpiles fresh, low-grade ore since 2021.

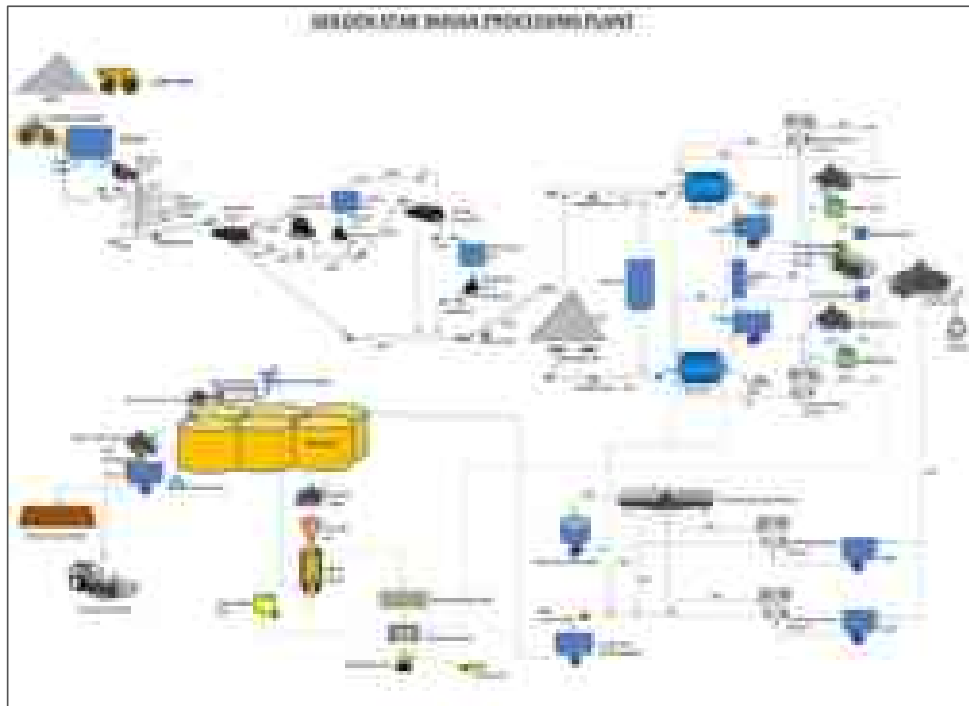

### 13.2 Process Description

The current plant circuit for GSWL is capable of processing up to 3.5 Mtpa of total mill feed but processed 2.55 Mtpa against a target of 2.7 Mtpa in 2023. As at the end of March 2024, processing stood at 0.72 Mtpa. The underground ore (fresh or competent ore) is the major source of feed into the plant whilst a blend of surface material may be added depending on availability in a ratio that averaged at 87% and 13% for 2022 and 83% and 17% for 2023 respectively. The surface ore may contain transition ore in addition to the oxides. Despite these average blend ratios, there are also periods that underground ore may be the sole feed into the plant. The blending ratio is maximised by the grade control to maintain recoveries at optimal levels throughout each year. The historical production records indicated that the ratio of oxide to primary has no obvious effect on the gold recovery.

The process flow diagram is shown in Figure 13-1. The operational circuit is made of the following sections:

- Crushing and Milling Circuit
- Gravity Gold Circuit
- Leaching Circuit
- Smelting

Figure 13-1: Current Process Flowsheet for GSWL

### 13.2.1 Crushing and Grinding

The Run-Of-Mine ("ROM") Pad receives ore from underground and surface via dump trucks such as CAT 777 and Volvo trucks (ADT).

A Front-end Wheel Loader transfers the dumped ore into the ROM bin under the guidance of a grade controller. An apron feeder underneath the ROM bin discharges the boulders into a Grizzly feeder that feeds a 150 mm Single toggle Jaw Crusher which is in an open circuit with series of Secondary and Tertiary Cone crushers which are fed through a network of screens with specified apertures and conveyors. Overall, eight (8) crushers are used in size reduction in the plant.

The tertiary screen is in closed circuit with the tertiary bin. Two weightometers are connected to the set of conveyors (CV2 and CV10) to be able to quantify the crushed ore.

The particles with size  $-12$  mm ( $P_{80}=8$ mm) are heaped at the crushed ore stockpile ("COS") which has a space to store 18,900 tonnes of crushed ore but has a live stockpile of 4,400 t. Each of a pair of conveyors (CV12 and CV13) carries 165 tonnes per hour ("tph") of crushed ore to feed a 5.03 m diameter x 6.71 m long Ball mill each. Each of the Polymet lined mills is driven by a 3 MW motor and uses a combination of 60 mm and 80 mm steel balls in a ratio of 2:1 as grinding media. The mill product is about 70% passing 75  $\mu$ m discharges into a hopper and is pumped into two sets of primary

cyclone cluster. Each cluster of cyclones has seven individual cyclones, each with their individual inlet valves for each of control and maintenance.

Pressure swing absorption ("PSA") oxygen plant located in the milling area.

### 13.2.2 Gravity Gold Extraction

One-seventh (1/7) portion of the cluster of cyclone feed is directed unto a scalping screen. The undersize feeds two 48" Knelson Concentrators ("KC"). The combined concentrates are fed into Concep Acacia CS 3000 Intensive Leach Reactor ("ILR") and Electrowinning Cell for gold recovery. This section accounts for between 28% and 30% of the total plant gold output.

The KC overflow discharges into the mill discharge hopper through a splitter box.

The Acacia Barren Solids ("ACBS") and the ILR residue are pumped back into the mills splitter box.

### 13.2.3 Leaching

Both overflow streams of the combined primary cyclone overflows are directed to another trash screen to remove further traces of debris. The screen undersize discharges into two sumps each of which feeds two secondary clusters of cyclones each with a 15% solids. The combined cyclone overflow feeds a 25 m Pre-Leach High Rate Thickener into which are added flocculants for dewatering purposes. The overflow is reused as the Ball mills water addition.

The thickener underflow is pumped by a 260 kW pump into a transfer vessel together with the secondary cyclone underflow where cyanide is added before the slurry is transferred to the CIL circuit. The year-to-date cyanide consumption rate is 0.48 kg/t against a budget of 0.44 kg/t. Oxygen which is generated from the PSA is injected into the transfer line after the transfer pumps. The transfer pipeline acts as an ILR, where most leaching occurs.

Six CIL tanks, each with a designed capacity of 2,500m<sup>3</sup> but a live volume of 2,250m<sup>3</sup> each constitutes a train for counter-current leaching of gold and adsorption unto activated carbon.

The slurry residence time in the CIL tanks is 36 hours whereas the carbon has a residence time of 24 hours. The gold loaded carbon is pumped from the third tank to a vibrating screen to separate the carbon from the slurry with water spraying washing. The washed loaded carbon is then transferred to the storage silo above the top of the elution column.

### 13.2.4 Elution, Electrowinning, Smelting and Regeneration

The gold is desorbed during elution and the loaded carbon is acid washed and then stripped of gold using caustic soda in an 11.5 t pressure Zadra elution system. Eluted carbon is thermally regenerated and returned to the last stage of the CIL circuit. The carbon is regenerated in a kiln with an operating temperature of 128°C to 130°C and a pressure of 220 kPa with a 12 tonnes quench tank.

The solution gold then precipitated during electrowinning in the gold house ahead of smelting. The CIL circuit accounts for the remaining 71% of the total gold output from the mine. The gravity gold concentrate and electrowon gold are smelted separately to produce gold doré bars.

### 13.3 Production Performance

The historical production performance of the plant for the past three years is shown in Table 13-1. The actual ore throughput is 2.12 to 2.55 Mtpa against the target of 2.7 Mtpa. The overall gold recovery including gravity and CIL is 95.3% to 97.1% with gold production of 4.84 to 5.31 tonnes per year.

**Table 13-1: Wassa Gold Plant Historical Production Performance**

Parameter	Unit	2020	2021	2022	2023	Q1-Q3 2024

### 13.4 Processing Facility

Wassa processing plant is a conventional CIL plant. Processing facilities include a ROM pad for ore blending and grade control, a complex crushing system, a crushed ore stockpile pad, two parallel grinding circuits with Knelson Concentrators, a standalone Accia intensive leach and electrowinning room for gravity concentrate, a standard CIL circuit and loaded carbon process circuit.

The main equipment is detailed in the description of the plant flowsheet. Figure 13-2 shows some facilities and equipment of the Wassa processing plant.

The crushing circuit is complex with four crushing stages, although performing normal function. If a semi-autogenous ("SAG") mill is used, the three-stage crushing after primary crushing can be replaced. The crushing circuit will be simplified.

There are six agitation leach tanks for CIL currently. An additional two CIL tanks are planned to be added to the existing tanks chain to extend the CIL time for enhancing gold recovery.

Figure 13-2: Photo of Wassa Processing Plant

### 13.5 Proposed Changes to the Treatment Circuit

- An additional two CIL tanks are expected to be added to increase recoveries and total gold output following several successful test work studies that confirms this again in extended leaching. The expansion requires additional installation of a 2 tonne Oxygen plant to meet the demand.
- The expected Mill Expansion project will incorporate the isolation and modernisation of the gold room by increasing the working space therein.
- Future metallurgical test works are to accompany the drilling programme scheduled for 2024 in expectation to meet the envisaged target of 3.5 Mtpa. However, the critical element is the availability of ores yielding additional 2,000 tph to the current 7,000 tph.
- The metallurgical test works are envisioned to cost around US\$ 0.2 Million.
- The technical studies have commenced and are in progress. These findings have led to the acceptance and approved extension of the leaching time in the plant circuit by building two new CIL tanks.
- Considerations of the enhancement of the sustainability indicators for the mine through possible:

- replacement of the secondary, tertiary and quaternary crushing units with SAG mill in order to improve upon performance and also reduce cost
- haulage options for carriage of ore to the processing plant by using conveyor systems versus usage of electric trucks to improve the carbon footprint
- The mine has an *International Cyanide Management Code* ("ICMC") certificate since 2010.

## 13.6 Laboratories Tests

### 13.6.1 Wet Chemistry and Assay

Routine samples from the exploration (muck samples), grade control, processing unit points including solid tailings samples are obtained for analyses.

Solid samples are crushed to obtain 74% passing 106 µm and then pulverised to 90% passing 75 µm.

Loaded and eluted carbon gold contents are also assessed.

The routine analyses carried out cover the determination of gold, silver, copper and some base metals using fire assay and BLEG protocols.

Periodically, comparative round robin assessments are carried out on blind samples with SGS (Tarkwa) and Intertek (Tarkwa). Preliminary data appear to compare very well.

QA/QC methods are followed which have also been certified by South African National Accreditation Service ("SANAS"), South Africa.

### 13.6.2 Metallurgical Laboratory

Routine metallurgical plant simulation test works (crush test, grinding/ milling and bottle roll tests) are carried out to determine head grade, reagents consumption and recoveries. The outputs compare well with the plant performance, within acceptable limits.

The simulated outcomes are claimed to match well with similar outcomes in a 2018 reference work by the University of Mines and Technology, Tarkwa ("UMaT").

An extended leach test works has proven and led to the approval for additional two CIL tanks to be added to the existing train.

The comprehensive metallurgical test works leading to an FS are carried out by the company with reference laboratories alongside drilling programmes.

## 14 Project Infrastructure

### 14.1 Tailings Storage Facility

There were two TSFs, TSF 1 and TSF 2, designed to accommodate the anticipated tailings produced. TSF 1 was stage-constructed with the most recent raise, Stage VI, in 2014, and it was raised to 1,039 m RL. The starter embankment was constructed in 2004. The raising of TSF 1 was to provide sufficient storage capacity until 2017 when TSF 2 was scheduled to be operational.

TSF 1 is located northwest of the processing plant at the head of a southerly draining valley and immediately adjacent to the historical leach pad area. The ground levels range from 1,000 m RL on the valley floor to above 1,060 m RL on the surrounding hills. It is a cross-valley impoundment created by the construction of a main embankment in the south with confining saddle embankments at the north of the facility. Containment to the east and west is provided by natural ridges. Access is via unsealed road west of the plant site area. The catchment area of TSF 1 is estimated to be approximately 140 Ha, of which 124 ha is covered with tailings as the facility proceeds through closure revegetation trials. Deposition into TSF 1 ceased in 2019 with paddock deposition completed to achieve the approximate closure surface topography requirements of the closure landform. Revegetation trials commenced in 2017 towards the next land use, and by the end of 2020, the revegetation planting was almost complete. TSF 1 has been replanted with palm oil trees under a scheme operated by Golden Star Oil Palm Plantation ("GSOPP"). The palm trees are growing well, and farm workers are harvesting the fruits as in Figure 14-1.

Figure 14-1: Reclaimed TSF 1

TSF 2 is close to TSF 1 in the valley that extends eastward from the north embankment of TSF 1. It is approximately 2.5 km from the processing plant and 1.3 km downstream of TSF 1 Saddle Dam 5. TSF 2 has a footprint of 260 ha, of which 72 ha has been developed to date, and lies within a total project area of 340 ha including the buffer zones. The remaining capacity of TSF 2 significantly exceeds the needs for processing of ore defined by the Ore Reserves, even after allowing for use of tails solids for paste backfill.

The TSF 2 has two cells currently with the first cell (TSF 2 Cell 1) under care and maintenance, and the secondary cell (TSF 2 Cell 2) in use and being filled. A safety audit report for 2022 issued by Geosystems Consulting Limited stated that the section is generally in compliance with the regulatory and design requirements. A third cell (TSF 2 Cell 3) is under geotechnical investigation by Knight

Piesold Consulting Limited ("KP"). The configuration of the three cells is as Figure 14-2. It is planned that the three cells will merge together in the future to enlarge the volume and for reclamation purposes.

The TSF 2 basin was to be entirely lined with high-density polyethylene ("HDPE") sheets and was to provide a storage capacity of 41 Mt by staged construction up to Stage 6, although only 19.5 Mt was required for the LOM at the time. It is designed as a downstream embankment, and future raises are planned to be downstream as well. All embankments are designed with 1V:2H upstream and 1V:3H downstream slopes, with 8 m wide crest. It is envisaged that the facility will be developed as follows:

- Cell 2 – Stages 1 to 3 through years 1, 2 and 3;
- Cell 3 – Stage 4 at year 4;
- Cell 1 – Stages 5 and 6 at years 5 and 6; and
- Cells 1 and 3 – Stages 7 to 11 through years 7 to 11.

**Figure 14-2: TSF 2 Cells**

GSWL has an on-site tailings management team that takes care of the day-to-day activities at the TSFs. The Environmental Department oversees the water quality testing at the TSFs. KP conducts quarterly TSF inspections and a consultancy named Glocal Engineering in Ghana conducts quarterly independent reviews. Geotech Systems conducts an annual safety audit.

There is currently no detoxification plant at GSWL. However, mine personnel report that this does not hamper the TSF operation as the general water balance on the mine is negative. Occasionally when excess supernatant water must be pumped off the TSF, a lined holding pond with 200,000m<sup>3</sup> capacity is used for storage. The holding pond was part of the former Heap Leach facilities. The stored supernatant water is ultimately used by the treatment plant. The use of this holding pond has enabled GSWL to continue to operate the TSFs without discharging contaminated water into the environment.

The new Global Industry Standard on Tailings Management (GISTM) is yet to be implemented at GSWL.

## 14.2 Water Supply

The processing plant has a negative water balance and therefore does not discharge process water into the environment. However, it reuses the dam return water (current TSF 2) for processing whilst part of the underground dewatering section is pumped to the plant as supplementary raw water. The

rest of the underground water is used to suppress dust in the mine environment, and also utilised in the Backfill Paste plant.

There are two surface ponds in the mine area to collect and store the surface water and groundwater for processing plant supplement, mining and dust depression. The ground water comes from the mining section. Figure 14-3 shows the two catchment ponds. The 2<sup>nd</sup> pond is adjacent to the Genser Generator, and the water is also used as cooling water of the Generator.

**Figure 14-3: Catchment Ponds in Wassa Mine Site**

### 14.3 Power Supply

There are two sources of electricity, the National Grid of Ghana ("GRIDCO") and Genser Energy. The Genser generator is in the vicinity of Wassa mine. GSWL has the objective of providing a continuous, stable and cheaper supply of power. Genser Energy meets GSWL's monthly average need of 14.2 MW power. Genser Energy produces its power from natural gas and sells the power to GSWL at US\$0.11/ kWh. It has an installed capacity of 23-24 MW with additional space to add another system. GSWL currently uses GRIDCO power as an alternative source of power for its operations.

It is planned to set up a 1 MW solar power plant to supply cheaper energy to offices and living areas, but SRK didn't get the details. Figure 14-4 is a photo of the main transformer station between the mine offices.

Figure 14-4: Main Transformer Station

## 15 Market Studies and Contracts

### 15.1 Market Studies

All gold product from the Wassa Project is shipped to a South Africa based gold refinery under a long-term sales contract. Shipping is in the form of gold doré bars, which average approximately 90% gold by weight with the remaining portion being silver and other metals. The sale price is generally set with reference to the London p.m. fix on the day of the shipment to the refinery.

SRK has used a fixed gold price of US\$2,050/ oz for cut-off grade calculation and the technical economic analysis for the Wassa Mine. Table 15-1 shows the prices trend and long-term price for Gold from Deutsche Bank, which issued in April 2024. The commodity price forecast is considered to reflect a reasonable outlook for the future.

**Table 15-1: Gold Price Forecasts**

Year	2021	2022	2023	2024	2025	2026	Long-term Price
Gold Price	1,800	1,798	1,940	2,025	2,100	2,141	2,050

Source: Deutsche Bank

### 15.2 Contracts

SRK has not reviewed any contracts relating to the product market, and SRK is aware of gold is a freely traded commodity on the world market and whilst the selling price is subject to fluctuation, and the volume of gold produced at Wassa will not be material to the supply/ demand balance and will not influence the selling price.

## 16 Environmental Studies, Permitting, and Social or Community Impact

### 16.1 Environmental and Social Review Objective

The objective of this due diligence review is to identify and/or verify the existing and potential environmental, social and occupational safety liabilities and risks, and assess any associated proposed remediation measures for the Wassa Project.

### 16.2 Review Process, Scope and Standards

The process for the verification of the environmental compliance and conformance for the Project comprises a review and inspection of the project's environmental management performance against:

- Ghanaian national environmental regulatory requirements; and
- Equator Principles (World Bank/ International Finance Corporation ("IFC") environmental standards and guidelines) and internationally recognised environmental management practices.

The methodology applied for this environmental review of the Project consists of a combination of desktop review and interviews with GSWL technical representatives.

### 16.3 Relevant Legislation and Required Approvals

The mineral and mining sector between 1986 and 2005 was governed by the *Minerals and Mining Law, 1986 (P.N.D.C.L. 153)* and this was the basic mining legislation in Ghana. While it was regarded as the trendsetter in terms of mining legislation in Sub-Saharan Africa, major changes in the international mining sector led to its revision. After a protracted review in the early 2000s, the current *Minerals and Mining Act, Act 703 of 2006* became the governing legislation for the country's minerals and mining sector.

*The Minerals and Mining Act, 2006 (Act703)*, and its related mining regulations and other relevant regulations such as the *Environmental Assessment Regulations, 1999, L.I 1652* and mining-related guidelines and standards constituted the legal framework and regulations for the mining sector.

#### 16.3.1 Permitting Requirements in Ghana

##### Environmental Assessment Requirements

*The Environmental Protection Agency ("EPA") Act, 1994 (Act 490)* established the authority, responsibility, structure and funding of the EPA. Part 2 of the Act mandates the EPA, with the formulation of environmental policies, issuing of environmental permits and pollution abatement notices and prescribing standards and guidelines. The Act defines the requirement and responsibilities of the environmental protection inspectors and empowers the EPA, to request that the EIA process be undertaken. The EIA process is legislated through the *Environmental Assessment Regulations, 1999 (L.I. 1652)*, which is the main legal framework used by EPA, for regulating and monitoring mineral operations which cover requirements for:

- Environmental Impact Assessment (EIA);
- Preparation of Environmental Impact Statements (EIS);
- Environmental permitting;
- Environmental Management Plan (EMP); and
- Reclamation bonding.

The EPA grants environmental approval to all undertakings through an Environmental Permit, which is issued subject to the submission of a well-documented Environmental Impact Statement. For a mine, an EIS must include a reclamation plan and a provisional EMP. Prior to formal review by the EPA, the EIS may be subject to public exhibition and hearing, with responses from regulators and community to be incorporated into the EIS before an Environmental Permit is granted.

Two years from receipt of an Environmental Permit, an Environmental Certificate is required from the EPA to confirm:

- Acquisition of all permits and approvals;
- Compliance with mitigation commitments in the EIS and/or EMP; and
- Submission of annual Environmental reports.

Within 18 months of commencement of work an EMP is to be submitted to and approved by the EPA. The provisional EMP in the EIS is updated and incorporated into the mine's active EMP which is subjected to update every three years renewal cycle. Reclamation plans are a necessary document for all mines in Ghana (*Regulation 14 of L.I. 1652*) and mining operations submit annual environmental reports (*Regulation 25 of L.I. 1652*) and monthly environmental quality monitoring results to EPA, with notes where values exceed thresholds and response plans as required.

#### **Minerals and Mining Requirements**

*Act 703* establishes laws on the process for obtaining mineral rights, the administration and management of these rights and protection of the environment. Supporting *Act 703* are the *Minerals and Mining Regulations, 2012* which cover:

- General aspects (L.I. 2173);
- Compensation and resettlement (L.I. 2175);
- Explosives (L.I. 2177);
- Support services (L.I. 2174); and
- Health, safety and technical requirements (L.I. 2182).

#### **Water Resource Legislation Requirements**

*The Water Resources Commission Act, 1996 (Act 552)* establishes the Water Resources Commission as a body corporate, responsible for the regulation, management, and coordination of policies related to water resources. Key functions include developing water use and conservation plans, granting water rights, coordinating water resource development and utilisation, and advising

on water pollution control. Additionally, the *Water Use Regulations, 2001 (L.I. 1692)*, and *Drilling Licence and Groundwater Development Regulations, 2006 (L.I. 1827)*, complement the Act by specifying the requirements for obtaining permits for water use, water rights, and priorities for water use; and water drilling licences, and well construction requirements; respectively.

### 16.3.2 Status of Environmental Approvals and Permits

In accordance with the Environmental Assessment Regulations, 1999 (LI 1652), Regulation 25, as well as Articles 28 to 30 of the Minerals and Mining (Health, Safety and Technical) Regulations, 2012 (LI 2182) and the conditions of the GSWL Environmental Certificate and various Environmental Permits, GSWL is required to submit an Annual Environmental Report initially twelve months after the start of operations and thereafter, every calendar year.

In addition to the Annual Environmental Report, GSWL is required to submit an EMP after 18 months from the commencement of operations, and thereafter every 3 years. Based on the EMP 2022-2025 and Annual Environmental Report 2023, the key environmental approvals held by GSWL are summarized in Table 16-1.

**Table 16-1: Key Environmental Approvals Obtained for Wassa Mine**

Approval	Permit No.	Date of Issue	Expiry Date	Comments
Environmental Permit to pursue operations	EPA/EIA/112	18-Mar-2004	None	Based on Wexford Goldfields Limited Wassa project EIS (2004)
Gold Mining Project at Mpohor	EPA/EIA/175	24-Feb-2006	None	Issued to St Jude Resources (Ghana) Limited based on Hwini Butre EIS and Subriso EIS
South Akyempim Environmental Permit	EPA/EIA/190	2-Jun-2006	None	Based on EIS on South Akyempim Project (2005)
Hwini Butre / Benso Project Environmental Permit	EPA/EIA/247	2-Oct-2007	None	Based on the Hwini Butre and Benso EIS (2005)
Wassa Pits Expansion Project Environmental Permit	EPA/EIA/322	20-Dec-2010	N/A	Based on Wassa Pits Expansion EIS (2010)
TSF 2 Environmental Permit	EPA/EIA/383	5-Apr-2013	N/A	Based on corresponding EIS (2013); Transitioned to EPA/EIA/442
TSF 2 (re-design) Environmental Permit	EPA/EIA/442	25-Nov-2015	N/A	Based on TSF 2 EIS (2015)
Wassa Expansion Project Environmental Permit	EPA/EIA/508	30-Oct-2017	N/A	Based on Wassa Expansion EIS (2016)
Environmental Certificate	EPA/EMP/278	Dec-2022	Dec-2025	2022-2025 EMP

GSWL operates under Environmental Certificate EPA/EMP/278 issued on 22<sup>nd</sup> December 2022. The Environmental Certificate for the EMP 2022-2025 expires in December 2025.

SRK also reviewed eight copies of water use permits for the Wassa mine, covering domestic purposes, pit dewatering, processing, mining, and dust suppression. All permits are currently within their valid periods.

In this environmental review, SRK viewed the following documents on the environmental and social impact assessment of the Project:

- Draft Environmental Impact Statement on Wassa Expansion Project (“Expansion Project EIS”) dated March 2016 and its approval;
- Environmental Impact Statement on Updated TSF 2 Project (“TSF 2 EIS”) dated September 2015 and its approval;
- Environmental Management Plans for Surface and Underground Operations (2022-2024) and its approval;
- Annual Environmental Reports (2021, 2022, and 2023);
- NI 43-101 Report for the Golden Star Wassa Mine Project Akyempim Ghana dated April 2023 (2023 NI 43-101 Report); and
- Other related documents.

SRK viewed the above EIS reports, and concluded that the Wassa Mine prepared the EIS reports in accordance with the relevant laws, regulations and decrees of Ghana. In the following sections, SRK provides comments in respect to the study and management measures from the EIS reports and other related documents.

## 16.4 Environmental and Social Aspects

### 16.4.1 Ecological Impact

Based on the EIS reports, comprehensive baseline studies were carried out in Wassa during 1996, 2010, and 2012. Wassa is situated in a region transitioning between moist, semi-deciduous forests and wet rainforest zones. Initial observations highlighted vegetation degradation due to impacts from logging and farming. The studies recorded 73, 214, and 70 floral species in the years 1996, 2010, and 2012, respectively. A 2016 review by the International Union for Conservation of Nature (IUCN) identified *Tieghemella heckelii* as endangered and listed several species as vulnerable, including *Mitragyna stipulosa*, *Turraeanthus africanus*, and *Guarea cedrata*, among others. Additionally, three species identified at the Genus level in the baseline studies — *Terminalia*, *Entandrophragma*, and *Pterocarpus* sp — may have updated conservation statuses due to their overexploitation for timber and other uses. The Wassa project also includes a haulage route (12 km of the Hwini Butre Benso access road) that traverses the Subri River Forest Reserve, however, the Globally Significant Biodiversity Area within the Subri River Forest Reserve is not impacted by the road based on the Project Expansion EIA.

Baseline studies in the project area have documented a diverse array of fauna, including small and large mammals, bats, birds, butterflies, herpetofauna, amphibians, and aquatic species. Indiscriminate hunting and clearing of forest for agricultural purposes have both played major roles in causing the decline and extinction of wildlife species in the area. The 2016 IUCN classifications highlight several notable species and their conservation statuses: the Hooded Vulture (*Necrosyrtes monachus*) is critically endangered, facing threats from indiscriminate poisoning, traditional medicine, hunting, and persecution. The Hinge-back Tortoise (*Kinixys homeana*) and the African White-bellied Pangolin (*Phataginus tricuspis*) are classified as vulnerable. The Grey Parrot (*Psittacus erithacus*),

also vulnerable, is primarily threatened by the international pet trade. Additionally, the Pohle's Fruit Bat (*Scotonycteris ophiodon*) is listed as near threatened, and the Pel's Flying Squirrel (*Anomalurus pelii*) was considered near threatened in 1996 but has since been updated to data deficient, indicating a need for more current data to assess its status accurately.

SRK reviewed the EIS reports and EMPs of the project, and the EIS pointed out the main impacts of the project construction, operational, and decommissioning/ closure phases on terrestrial and aquatic organisms, and measures to reduce these impacts. SRK believes that the ecological protection measures, such as establishment of seed banks, progressive revegetation, vehicle speed controls, etc. mentioned in the EIS reports and EMPs are reasonable and feasible, but SRK also recommends that the ecological baseline study of the project in the EIS should include on-site surveys of multiple seasons to assess the local ecological environment status more comprehensively. Furthermore, in addition to the protection measures mentioned in the EIS and EMPs, methods, such as the establishment of biological corridors, restoration of habitats, and implementation of biodiversity compensation, can be adopted to reduce the impact of project on ecological environment.

#### 16.4.2 Water Management

The GSWL mining concessions are located within the Pra River Basin, one of three major river basins in southwestern Ghana. The Wassa concession area is drained by the Toe, Kubekro, and Petetwum, which are tributaries of Pra. The Benso concession is near the Ben River and a stream informally called the "Subri River". The Hwini Butre concession lies in the Butre River catchment area and is drained by streams such as the Pamaa, Besama, and Whanawhana.

The project's drinking water comes from boreholes. In 2023, 18 out of 31 monitoring boreholes at Wassa served as sources of drinking water for Tara Camp, Camp II, the mine site, and surrounding communities. The remaining boreholes were for monitoring at the TSFs. At HBB, 3 out of 8 monitoring boreholes served as sources of drinking water for the Benso residential site and the HBB mine site, while the others were for monitoring at the G-Zone open pit. Drinking water boreholes at Wassa and HBB are monitored monthly for *Escherichia coli*, total coliform, and fecal coliform bacteria. A quarterly disinfection program was carried out for all community drinking water boreholes as part of the GSWL community outreach programs.

Service water for mining and supplementary raw water for the processing plant comes from open pit dewatering. Water is pumped from the Starter Open Pit sump to the processing plant via a settling sump to augment supply during the dry season, combined with return water from the TSF to minimize groundwater extraction. In the first three quarters of 2024, 141,048 m<sup>3</sup> of open pit water was reused at the processing plant. Water for dust suppression typically comes from raw water along the haul road and open pit dewatering, totalling 76,175 m<sup>3</sup>. All open pit water usage, dewatering discharge, and water used for dust suppression were well below the permitted volumes specified in the water use permit.

SRK recommends that the project should implement a sustainable water supply management plan to minimize its impact on natural systems through the management of water use, avoid the depletion of aquifers, and reduce the impact on water users. Meanwhile, GSWL shall consult with major stakeholders (i.e., government, civil society, and potentially-affected communities) to learn about any conflicts that may arise from water use requirements, community dependence on water resource, and/ or existing local protection requirements.

Routine analyses of cyanide and nitrates in surface waters were undertaken at selected sites. Free cyanide is analysed bi-weekly, whilst Weak Acid Dissociable ("WAD") and total cyanide analyses were completed monthly. All GSWL surface water monitoring locations are within the EPA guidelines for free, WAD and total cyanide. All cyanide concentrations were less than their method reporting limits of 0.005 mg/L.

The water quality monitoring programme at Wassa includes monitoring of water in boreholes, surface water, TSF supernatant pond, and seepage wells. The water quality results obtained showed no notable variations from the baseline conditions, although elevated total suspended solids (TSS) were detected on a few occasions at some sites, due to illegal mining. Piezometers located in the vicinity of the Father Brown open pit at Hwini Butre are monitored monthly.

Based on the EIS reports, the groundwater and hydrogeological impact assessment showed that the project has limited potential for impact on groundwaters; the host rock is highly impermeable and leachate qualities are good. As a result, impacts of dewatering are highly localised to the mining areas and are not expected to have any effect on existing community groundwater supply sources, and groundwater levels will substantially recover at closure, and without impact to the receiving environment.

The main wastewater pollution of the Wassa Project may be derived from open pit dewatering water, processing wastewater, TSF return water, waste dump/ ore stockpile leaching water, machine repair wastewater, industrial site rainwater, and domestic sewage. Sewage from the mine site and residential areas is removed by a third-party contractor for disposal at a designated area close to the TSF at Wassa, and to Subriso West at Benso and treated. A stream diversion around the processing plant and administration area, TSF drainage diversions, and a French drain are set up to prevent water inflow to the southern end of the Main open pit area. Additionally, secondary drainage works are in place around the site to direct water runoff from dumps and roads away from active mining areas or toward dewatering infrastructure. Supernatant water from the TSF is pumped back to the processing plant for use as process water. Regular monitoring of surface waters in the vicinity of the TSF embankments is carried out to check for any potential discharge.

#### **16.4.3 Waste and Tailings Management**

The waste rocks from the Underground and Surface operations of Wassa are transported to the 419 dump. Sections of the dump are currently on 1,040 m RL and 1,030 m RL on the west while the eastern stretch is on 1,020 m RL and 1,010 m RL. As part of waste management for economic value, part of waste rock was recycled as aggregates for construction and road works. The waste dump is continuously monitored according to relevant environmental requirements. For specific information on waste rock output and the waste dump, please refer to the mining chapter.

One potential risk to the environment from waste rock and TSF is acid rock drainage ("ARD"), that is created when reducing sulphide minerals are exposed to air, precipitation and bacteria and, through an oxidation reaction, produce sulphuric acid, during mining, transportation, processing, waste rock discharge, and tailings storage, etc. ARD has the potential to introduce acidity and dissolved metals into water, which can be harmful to surface and groundwater. A comprehensive ARD experiment can help the Company predict problems and avoid long-term environmental risks.

According to the EIS, the geochemical characterization was undertaken to determine the acid rock drainage/metal leaching potential of ore and waste rock lithologies. Classification of acid rock drainage potential showed that all previous rock samples from the different open pits and waste rock dumps were not acid generating (NAG). Additionally, acid base accounting of rocks to be mined in the future mine development, demonstrated that the geochemical characteristics continue at depth, with limited to no potential for ARD. Synthetic precipitation leaching procedure (SPLP) and NAG leach tests, a worse case indication of drainage quality, indicate that underground mine drainage is likely to be neutral to alkaline with no constituents expected to exceed the EPA guidelines. Furthermore, on the studies conducted for the EIS, GSWL continues to assess the geochemical characteristics of the ore, waste and tailings materials annually. These assessments consistently demonstrate a low potential for acid generation.

The Wassa project includes two TSFs. TSF 1 is currently under maintenance, while TSF 2 is actively used for tailings discharge. During operation, tailings are distributed via a HDPE pipeline, and the TSF 2 basin is lined with HDPE sheets to meet the regulatory requirement. For detailed information on tailings emissions and the TSFs, refer to processing (Section 13) and TSF (Section 14.1). A series of environmental protection measures are in place, including a spillway, decant barge, secondary confinement, and groundwater drains for containment. As part of GSWL's environmental monitoring plan, regular monitoring of water quality within the catchment of the mine's TSFs is carried out to ensure early detection of impacts on water resources due to the operations of the TSFs and its ancillary facilities.

#### 16.4.4 Air and Noise Pollution

The dust emission sources of the Project mainly come from open pit mining, blasting, loading and unloading, ore stockpile, crusher, waste dump, topsoil dump, TSF, and movement of vehicles and mobile equipment. The project carried out monthly monitoring of air quality for inhalable particulate matter ("PM<sub>10</sub>") and total suspended particulate ("TSP"). In 2023, all the communities monitored were within the EPA guidelines of 70 µg/m<sup>3</sup> and 150µg/m<sup>3</sup> for PM10 and TSP respectively. However, the expansion project EIS reported based on the history monitoring data that periodic seasonal peaks exceed the guideline, as the seasonal Harmattan brings dry and dusty winds from the Sahara across West Africa. Consequently, the operations have employed an array of dust suppression mitigations throughout dry season conditions. Besides, SRK suggests adding the monitoring of PM<sub>2.5</sub>, which is in line with current international industry practice. Moreover, SRK notes that the EIS did not address the management of greenhouse gas (GHG) emissions, which is required by some international standards. In the 2023 Environmental Monitoring Report, GSWL provided data on electricity consumption and total direct CO<sub>2</sub> emissions, calculated from the total amount of diesel used each month. However, this approach does not provide a comprehensive calculation of GHG emissions, as it excludes indirect emissions from electricity use and other potential sources of GHGs, such as fugitive emissions from mining activities and emissions from the transportation of materials and personnel. SRK proposes conducting research on the energy consumption coefficient per unit output, GHG emission levels, and intensity.

The main noise emissions of the Project are from mining equipment, blasting, crushing and screening equipment, various types of pumps, fans, vehicles and mobile machinery equipment. During the noise status monitoring conducted for the EIS, the ambient noise of the project site was rarely exceeded the EPA guidelines, which was caused by the church worship activities, animals, vehicular

movements, and the operation of machines in the community. The noise levels peaked in the evening, as a result of increased noise from wildlife towards sunset. Mining-related noise, such as truck movements and waste rock dumping, was periodically audible at this time. In 2023, all blast events at Wassa were monitored in the Akyempim and Kubekro communities. Out of 1,263 blast events and 2,723 monitoring readings, 52 blasts (0.59%) recorded air blast values above the 117 decibel ("dB") limit, and 9 blasts (0.003%) resulted in ground vibration levels greater than 2 mm/s. Measures have been put in place by the Technical Service Department to mitigate this by considering the amount of explosive used, number of holes, hole depths, and pattern size. GSWL has developed and implemented an atmospheric and noise monitoring plan. SRK believes that the air and noise pollution management measures proposed in the project EIS and EMPs are reasonable and feasible. It is recommended that the project shall implement the above measures during operation.

#### **16.4.5 Hazardous Materials Management**

Hazardous materials have the characteristics of corrosive, reactive, explosive, toxic, flammable and potentially biologically infectious, which pose a potential risk to human and/or environmental health. The hazardous materials will be generated mainly by the project's construction, mining, processing and include of hydrocarbons (i.e. fuels, waste oils, and lubricants), processing reagent, chemical and oil containers, batteries, medical waste, and paint.

The Wassa explosives magazine, managed by AEL, is located in the backfilled Mid-East 1 open pit. Blasting for both underground and open pit operations is conducted by AEL under contract and overseen by GSWL to ensure compliance with Explosives Regulation LI 2177. In addition, hazardous materials such as diesel and mineral processing chemicals will be stored on the project site. The handling, storage and transportation of hazardous materials shall prevent leakage, overflow or other accidental discharge into soil, surface water and groundwater. Solid waste generated is predominantly managed onsite using a 10 m<sup>3</sup> semi-automated incinerator, a landfill site, a land farm and a scrapyards. Empty cyanide boxes/ plastics are dismantled and treated offsite. All waste oil generated by the operations is removed from site for recycling and disposal by a sub-contractor. During the site visit, SRK observed that the processing reagents are stored on a cement surface and secured with locked fences. SRK suggests taking measures to mitigate the risk of pollution caused by leakage, such as second containment facility, double-layer or thickened pipelines at key locations, shut-off valves to reduce spillage and avoid flowing into key areas. GSWL is a member of ICMC. Eagle Environmental Inc. conducted the most recent certification audit in April 2023.

#### **16.4.6 Occupational Health and Safety ("OHS")**

A well-developed and comprehensive safety management system comprises site inductions, site policies, safe work procedures, training, risk/hazard management (including signage), use of personal protective equipment ("PPE"), emergency response process, incident/accident reporting, an onsite first aid/ medical centre, designated safety responsibilities for site personnel and regular safety meetings, and a work permit/ tagging system, etc. SRK reviewed the occupational health and safety plan in EMPs, Policy on Health, Safety and Wellbeing, Emergency Response Plan, and Health and Safety Management System, and concluded that the development of these plans complies with relevant Ghanaian requirements.

During SRK's site visit, it was observed that safety signs were in place and safety provisions and rules were also displayed within the work areas, moving machinery parts were appropriately protected and covered, guard railings were installed on all gantries, and proper PPE was provided and being used by the workers, such as hardhats, reflective safety vest, dust masks, earplugs, and steel-toed shoes. The company has provided SRK with a historical OHS records for the project. No fatal accidents have occurred in the past three years.

#### **16.4.7 Environmental Protection and Management Plan ("EPMP")**

The purpose of an operational Environmental Protection and Management Plan ("EPMP") is to direct and coordinate the management of the project's environmental risks. The EPMP documents the establishment, resourcing, and implementation of the project's environmental management programs. The site environmental performance should be monitored and feedback from this monitoring could then be utilized to revise and streamline the implementation of the EPMP.

SRK notes that EMPs for surface and underground operations at Wassa Mine were developed for 2022-2024, and an Environmental Certificate was issued based on these EMPs. The EMPs include the policy, environmental impact and management, occupational health and safety plan, program for meeting environmental requirements, reclamation and decommissioning plan, and environmental action plan with a monitoring program. In the first three quarters of 2024, the monitoring of groundwater quality, surface water quality, air quality, noise and vibration, soil quality, and ARD testing, among other parameters, was carried out for the Wassa project.

#### **16.4.8 Mine Closure Plan and Rehabilitation**

Closure management is a key component of the overall business activities of GSWL. Closure management is integrated in all phases of mine life, from concept, exploration, and project development through to operations, closure, and post-closure activities. Closure aspects are integrated into project-level EIS and environmental permitting processes. Reclamation security agreements (RSAs) are negotiated with the EPA to establish mine closure completion requirements and to establish long-term closure costs. Closure costs are estimated using conventional reclamation sequences, expected agreed-upon post-mining land uses, and prevailing operating and contractor rates that incorporate in-country inflation costs. Based on the cost estimates, the company posts security with the EPA to help ensure that all closure costs are accounted for. The security is returned to the company once the site has been reclaimed to agreed-upon levels and there are no ongoing monitoring and maintenance requirements.

SRK reviewed a Decommissioning Plan and Associated Asset Retirement Obligations by Golder Associates, dated June 2015. The total rehabilitation and closure cost was estimated at approximately USD 27 million, covering the infrastructure, mining areas, general surface reclamation, water management, post closure activities for Wassa, Benso and Hwini-Butre concessions. However, this estimate did not include TSF 2 and the expansion project. Over the years, GSWL has rehabilitated an area of 419.67 hectares, while the total disturbed area on the mining lease was 990.43 hectares as of September 30 2024. The Environmental Permit and EIS require a reclamation bond to be posted within one year of commencing operations. The initial reclamation bond for Wassa was posted in November 2004 and has been updated periodically as new projects or changes are approved. SRK viewed a copy of the bank guarantee of USD 144,441,629 for the Wassa

rehabilitation and reclamation dated 14 June 2023. Rehabilitation and closure of the existing operations, including the processing plant, TSFs, open pit excavations, waste dumps, and transport routes, are covered under the EMP, Reclamation Security Agreement, and the associated bank guarantee (bond). Two years before mine closure, the final rehabilitation and closure plan should be prepared and submitted to the EPA.

#### 16.4.9 Social Aspects

The Wassa Mine is in the Wassa East District of the Western Region of Ghana, and is 62 km north of the district capital Daboaase, 35 km northeast of Tarkwa and 40 km east of Bogoso. The District was separated from Wassa Fiase Mpohor District in 1988 and occupies an area of 1,880 km<sup>2</sup> (464,553 ha) of which 344 km<sup>2</sup> and 85,000 ha are used as cultivable land. The population of the District according to the 2021 population and housing census stands at 99,641 with 51,200 males and 48,441 females (GSS 2021). The project vicinity is predominantly rural and there are no large urban settlements within a 50 km radius by road. The villages of Akyempim, Akyempim New Site, and Kubekro are the closest communities to the Wassa mine. Historic gold workings are also known to occur in the lease area but are on a relatively small scale.

Based on the 2023 NI 43-101 Report, GSWL applies the requirements of the International Finance Corporation, Performance Standard 5 for land acquisition and involuntary resettlement. Where physical, social and/ or economic displacement is anticipated, if compensation is required for future operations this is done in accordance with applicable laws, and GSWL Farm Compensation and Land Acquisition procedures. Previous application of these processes has shown that resettlement can be achieved with positive outcomes, evidenced most recently with the resettlement of the Togbekrom community to Ateiku in 2013. Stakeholder meetings and consultations are periodically held with leadership of Awunakrom, Pretea Ridge and Togbekrom resettlement communities. The agenda basically focuses on post resettlement issues, socio-economic programmes and general concerns.

The EIS included a stakeholder consultation programme, which identified 10 key stakeholders, including government regulatory agencies, government agencies, traditional leadership and communities. GSWL cultivates strong relationships, foster peaceful coexistence, and highlight the value-adding potential of key stakeholders. This is achieved through a well-organized three-tier stakeholder engagement plan, allowing active participation in decision-making on community concerns and needs.

Most predominant socio-economic concern of stakeholders who live within local communities around the mine site is employment, where working at the mine is viewed as a preferred occupation. GSWL over the years have provided employment through direct employment and through Corporate Social Responsibility (CSR) projects such as GSOPP and Golden Star Skills Training and Employability Program (GSSTEP). GSWL implemented a variety of targeted initiatives to support community skills training, development, and employability.

In the first three quarters of 2024, the company successfully implemented its CSR as planned and the strategies adopted included but not limited to the following:

- Teachers' quarters at Kubekro, Accra town, and Odumasi communities
- Community center at Juabeng community

- 12-seater WC facility at Kubekro community
- Expansion of GSOPP plantations by 34 hectares

In the first three quarters of 2024, the direct GSWL related corporate social responsibility funding amounted to an investment of approximately US\$ 278,214 in their host communities.

GSWL maintains a grievance mechanism enabling catchment communities to document concerns and grievances for investigation and/ or action. The mechanism is well publicized by GSWL and used actively by the community and other stakeholders. Details of registered grievances and resolutions are recorded and reported internally and to the regulators. SRK viewed a complaint register for the first three quarters of 2024, and a total of 8 community complaints were recorded. Complaints range from false allegations of cable theft tarnishing reputations, reduced salaries for employees, trainee grievances, mistreatment of youth apprentices, galamsey activity threatening a gas pipeline, flooding of the villager's house caused by mining operations and etc. Seven complaints have been resolved, with some follow-up actions, and the rest were still under investigation.

In Ghana, small-scale artisanal mining is termed "galamsey". It is mostly unauthorized or illegal and is often associated with environmental degradation, safety hazards and general community and social concerns. The mine also encounters a challenge with galamsey, particularly in the Benso administration office area. The area was attacked by galamsey miners from Subriso community on 16 March 2023, and this led to the destruction of company assets such as Tipper trucks, light vehicles, office buildings, and office equipment which led to a temporary suspension of operations. GSWL intensified its security monitoring activities to drive away galamsey miners that operated close to its mining areas. Several stakeholder meetings were conducted with opinion leaders and youths from both Wassa and HBB communities, especially those involved in galamsey, emphasizing the importance of refraining from such actions to preserve rehabilitated sites and the environment. Upon discussion with on-site personnel during the site visit, GSWL is of the opinion that galamsey around Wassa Mine has little potential to impact the current or future operations. Generally, the removal of unauthorized persons from the project area has posed no difficulty, and local law enforcement is engaged when necessary. Since the Benso, located about 40-50 km from the main Wassa site (the primary mining operation) and Hwini-Butre, located about 80km from the Wassa Main, have had most of its economically viable surface resources extracted rendering it largely irrelevant to the Company's ongoing mining operations.

## 17 Capital and Operating Costs

This section summarises the Capex and Opex.

The Wassa mine has been in operation since 2017, consisting of one open pit and one underground mine. The associated Capex for deeper development and sustainability are estimated by the mine. The Wassa mine has relative stable operation, allowing the forecasting of Opex based on historical records. All the Capex and Opex are provided in USD by the mine management.

### 17.1 Capital Expenditure

#### 17.1.1 Summary

The Capex for Wassa over the LoM includes capitalised mine development, sustaining capex, and mine closure and reclamation. A summary of the Capex is presented in Table 17-1, with the Capex investment plan over the LoM detailed in Figure 17-1. The sunk and forecast capital expenditure over the LoM is shown in Table 17-2.

**Table 17-1: Summary of Capex for Wassa Mine**

Capex	Unit	LOM Total
Capital development	Million USD	78
Other Sustaining Capex	Million USD	91
Closure	Million USD	27
<b>Total Capex</b>	<b>Million USD</b>	<b>197</b>

Sources: GSR, summarized by SRK

**Figure 17-1: Capex Investment Plan over LOM**

Sources: SRK

**Table 17-2: Consolidated Capital Expenditure (Sunk and Forecast) over LOM**

Capex	Unit	LoM	2021	2022	2023	2024	2025	2026	2027	2028
Capital development	USD Million	102.5				36.5	42.7	20.0	3.3	-

Capex	Unit	LoM	2021	2022	2023	2024	2025	2026	2027	2028
Other capital expenses	USD Million	102.1				22.2	25.6	54.3	-	-
Closure	USD Million	27.2				5.4	5.4	5.4	5.4	5.4
Sunk Capex	USD Million	222.7	83.7	69.0	70.1					
<b>Total Capex</b>	USD Million	454.5	83.7	69.0	70.1	64.1	73.7	79.8	8.7	5.4

### 17.1.2 Capitalisation

Capitalisation involves treating expenditures on equipment and mine development for servicing the mine, for more than one year, as long-term assets, which is then depreciated or amortized over time rather than expensed immediately, Table 17-3 shows the capitalisation for the last three years.

**Table 17-3: Capitalisation over the LoM**

Item	Unit	2022	2023	2024 Q1-Q3
Capitalisation	'000 USD	18,844	25,715	39,836

Sources: GSR, summarized by SRK

### 17.1.3 Sustaining Capex

The sustaining Capex for Wassa is categorized into two main areas: development and other sustaining capital expenditures, which include essential investments in mining, metallurgy, maintenance, and various support departments.

#### Development

For mine development that services the mine for more than one year, the assumed unit cost of development is US\$3,620.03/ m. The development meter over the LoM is shown in Table 17-4.

**Table 17-4: Capital Development Meters over the LoM**

Development Meters	Unit	Total	2024	2025	2026	2027
Lateral capital development	m	20,140	3,121	11,067	5,123	828
Vertical capital development	m	1,448	220	733	414	82

Sources: GSR, summarized by SRK

#### Other Sustaining Capex

Other sustaining capex is summarised in Table 17-5. The sustaining Capex for Wassa Mine, excluding development, totals US\$94 million. Key expenditures include US\$ 74 million for mining, US\$4 million for the Metallurgy Department, and US\$3.9 million for Mine Maintenance. Additional costs are allocated to Human Resources, Environment & CSR, Health & Safety, Finance & IT, carryover projects, and exploration activities.

**Table 17-5: Other Sustaining Capex over the LoM**

Item	Unit	Total	2024 Q4	2025	2026
Mining (excl. dev)	'000 USD	74,736	9,411	16,967	48,358

Item	Unit	Total	2024 Q4	2025	2026
Metallurgy Department Total	'000 USD	4,086	79	1,199	2,808
Mine Maintenance Department	'000 USD	3,922	1,290	595	2,037

Sources: GSR, summarized by SRK

#### 17.1.4 Closure

Closure costs refer to the expenses incurred for safely shutting down and rehabilitating a mine site at the end of LOM. SRK reviewed a Decommissioning Plan by Golder Associates, dated June 2015. The total rehabilitation and closure cost was estimated at approximately USD 27 million, covering infrastructure, mining areas, general surface reclamation, water management, and post-closure activities for the Wassa, Benso, and Hwini Butre area.

Although this is not the final figure and is not recommended for use, it is the only available estimate currently. SRK will allocate the USD 27 million evenly over the LOM in the technical economic analysis.

### 17.2 Operating Cost

SRK has received two sets of costing data: one from Chifeng Group for the annual report and the other from Wassa Mine. The first set is organized by cost elements, while the second is grouped by activities. SRK has summarized both sets of data and used the first set, grouped by cost elements, as the input for the Technical Economic Model (TEM).

#### 17.2.1 Cost by Elements

##### Historical Operating Cost

The total operating cash costs from 2022 to 2024 Q3, which exclude depreciation, amortization, and financial costs, are presented in Table 17-6. Table 17-7 presents the unit costs for the same period, along with the average unit cost and the unit cost for TEM (technical economic model) input.

**Table 17-6: Operating Costs from 2022 to 2024 Q3**

Item	Unit	2022	2023	2024 Q3
Labor	USD M	31.75	35.80	29.96
Material	USD M	58.50	51.72	65.47
Electricity	USD M	8.03	18.72	9.02
Contractors	USD M	1.78	10.71	3.43

Item	Unit	2022	2023	2024 Q3
Engineering	USD M	4.25	9.29	4.02
Service	USD M	1.46	1.74	2.56

17.2.2 Cost by Activities

Summary

The operating costs are categorized into open pit mining, underground mining, processing, G&A. Table 17-9 shows the total cost and unit cost of each category.

The overall cost trends from 2022 to the 2024 Q3 indicate a dynamic shift in unit costs across various mining operations. The Total Cash Unit Cost has decreased from US\$75.19 per tonne in 2022 to US\$65.56 per tonne in the 2024 Q3, reflecting a gradual reduction in overall expenses.

Table 17-9: Summary of Historical Opex for Wassa Mine

Item	Unit	2022	2023	2024 Q3
Open Pit Mining	USD/t TMM	4.69	6.47	6.78
Underground Mining	USD/t ROM	41.76	45.38	40.04
Processing	USD/t Feed	19.09	13.63	13.19
G&A	USD/t Feed	9.64	6.65	5.55
Total Cash Unit Cost	USD/t Feed	75.19	72.13	65.56
OP Mine TMM	kt	1,392	3,024	1,765
UG Mine ROM	kt	1,816	1,701	1,785
Plant Feed	kt	2,117	2,551	2,300

Sources: GSR, summarized by SRK

Figure 17-2 shows that Underground Mining accounts for the largest share of total costs at 54%, followed by Processing at 25%. G&A expenses and Open Pit Mining make up 12% and 9% of the costs, respectively.

Figure 17-2: Pie Chat of Percentage for Wassa Mine Opex

Sources: GSR, summarized by SRK

Figure 17-3 illustrates the breakdown of Total Cash Costs by category for the years 2022, 2023, and the 2024 Q4. Total Cash Costs increased from US\$143.2 million in 2022 to US\$148.5 million in 2023, before decreasing to US\$127.1 million in 2024 Q3, reflecting shifts in operational expenditures across these categories. The main reason for the declining OPEX is the increased allocation of capitalized OPEX and the rise in diamond drilling, which is logical due to the deeper development and in-fill drilling plan.

**Figure 17-3: Operating Costs for historical three-year (in '000USD)**

Sources: GSR, summarized by SRK

### Open Pit Mining

The open-pit mining costs from 2022 to the first half of 2024, as illustrated in Table 17-10. The unit cost per total material movement (TMM) was US\$4.69 in 2022, US\$6.47 in 2023, and US\$7.16 in the 2024 Q3.

**Table 17-10: Breakdown of Open Pit Mining Cost**

Item	Unit	2022	2023	2024 Q3
Ancillary Equipment (Maint.)	'000 USD	83	-21	514

### Underground Mining

The underground mining costs from 2022 to the 2024 Q3, as shown in Table 17-11, show a steady level of expenditures with total costs of US\$75.9 million in 2022, US\$77.2 million in 2023, and US\$71.5 million in the 2024 Q3.

The unit cost per tonne was US\$41.76 in 2022, US\$45.38 in 2023, and US\$40.0 in the 2024 Q3. The main reason for the declining opex is the increased allocation of capitalized opex and the rise in diamond drilling, which is logical due to the deeper development and in-fill drilling plan.

For future cost estimation (Opex); the development cost will be calculated based on the meters of mined development, while the backfill cost will be calculated based on cubic meters (m<sup>3</sup>) or tons, depending on the scheduling.

**Table 17-11: Breakdown of Underground Mining Cost**

Item	Unit	2022	2023	2024 Q3
Ancillary Equipment (Maint.)	'000 USD	4,291	3,244	3,503
Backfill (Maint.)	'000 USD	516	417	306
Backfill (Ops.)	'000 USD	7,031	9,211	1,421
Blasting (Ops.)	'000 USD	6,023	7,337	5,459
Capitalised Opex Allocation	'000 USD	-18,844	-25,715	-39,836

### Development

The assumed unit cost of development is US\$3,620.03/ m. The development meter over the LoM is shown in Table 17-12.

**Table 17-12: Operating Development Meters over the LoM**

Development Meters	Unit	LoM	2024	2025	2026	2027	2028
Lateral operating development	m	18,541	4,333	5,372	3,945	1,635	194

Sources: GSR, summarized by SRK

### Backfill

There is no detailed breakdown of backfill costs available, so SRK has used historical backfill costs to estimate future expenses. There are two types of backfill: rockfill and pastefill. For the 2024 Q3, the estimated backfill cost is approximately US\$1/t, with SRK aware that only rockfill was used, making the cost for rockfill US\$1/t. In 2023, the backfill cost was US\$5.66/t. Since there is no specified ratio between rockfill and pastefill, SRK assumes this to be the pastefill cost, which is considered reasonable based on industry benchmarks.

### Processing

The processing costs from 2022 to 2024 Q3, as illustrated in Table 17-13. The total processing cost was US\$40.4 million in 2022, US\$34.8 million in 2023, and US\$30.3 million in the 2024 Q3.

The unit cost per ton milled was US\$19.09 in 2022, US\$13.63 in 2023, and US\$13.19 in the 2024 Q3.

## G&A

The G&A costs from 2022 to 2024 Q3, as illustrated in Table 17-14, show the allocation of expenses across various administrative functions. The total G&A cost was US\$20.4 million in 2022, US\$17 million in 2023, and US\$12.8 million in the 2024 Q3.

The unit cost per tonne milled decreased from US\$9.64 in 2022 to US\$6.65 in 2023, and further to US\$5.55 in the 2024 Q3.

**Table 17-14: Breakdown of G&A Cost**

## 18 Economic Analysis

The economic analysis presented in this section is based purely on the results of the technical review provided above and some key assumptions and is provided for technical evaluation and Ore Reserve estimation purposes only.

The economic analysis was conducted using conventional Discounted Cash Flow ("DCF") techniques. The Net Present Value ("NPV") was determined from the project's cash flow using a 10% discount rate. It should be noted that SRK's DCF modelling and NPV calculation are carried out with the purpose of testing the "economic viability" of the Project which is required to a reasonable Ore Reserve reporting. Additionally, a sensitivity analysis was performed to examine the effects of changes in Capex, Opex, and gold price (revenue).

### 18.1 Principal Assumptions

#### 18.1.1 General

The cash flow estimate includes only the revenue, costs, taxes, and other factors directly associated with the Project. The assumptions are as follows:

- The currency used for the Project is US dollars.
- Annual gross revenue is calculated by applying the estimated gold price and payables to the annual recovered metal for each operating year.
- The "nominal" values are applied. SRK does not consider future inflation of currency or cost fluctuations; the cost remains constant over the LoM without any adjustments are factored in.
- Financing is assumed to be on a 100% equity basis; no debt or related financing costs have been included in the technical economic analysis.
- Neither corporate obligations, financing costs, or corporate-level taxes are not considered.
- Sustaining capital for future exploration, which is aimed at discovering more Mineral Resources that is outside the Ore Reserves estimates, is not considered during this analysis, as the current project economic analysis has not employed any additional potential tonnage or grade.
- No salvage value has been included in the technical economic analysis.
- The reference date or effective date is 30 September 2024.

#### 18.1.2 LOM Physical

The mine production and key technical inputs parameters are described in the previous section.

The summary of the key physical assumptions is presented in Table 18-1.

**Table 18-1: LOM Physical Inputs for Economic Analysis**

Item	Unit	LOM Total or Average
<b>Open Pit</b>		
Open Pit Ore Reserves	t	538,041
Open Pit Au Grade	g/t	0.92
<b>Underground</b>		
Underground Ore Reserves	t	8,274,022
Underground Au Grade	g/t	2.20
Ore Reserves	t	8,812,064
Gold Grade	g/t	2.12
Life of Mine	yr	5
Recovery Rate	%	96

Source: GSR, organized by SRK

**18.1.3 Pricing Assumptions**

Table 18-2 shows the price trend and long-term price for Gold, which is dynamic and is derived from consensus market forecasts provided by the Energy and Metals Consensus Forecast, published by Consensus Economics Inc., to which SRK subscribes annually.

**Table 18-2: Gold Price Forecasts**

Year	2024	2025	2026	2027	2028	2029	Long-term Price
Gold	2,410	2,400	2,200	2,090	2,000	1,700	1,700

Source: CMF, end of August

**18.1.4 Tax and Royalties**

The income tax rate in Ghana is 35%.

**18.1.5 Depreciation and Amortization**

The capital and sustaining expenditures, including development costs, have been depreciated on a unit production basis over the LOM. The assumed depreciation follows the straight-line method over a period of 5 years.

**18.1.6 Working Capital**

Working capital is the capital needed to fund operations before revenue is received from the finished product. It was calculated as 30% of the operating cost for the initial year. Over the project's life, the working capital nets to zero.

**18.2 DCF Projection**

The key economic results from the technical economic model is shown in Table 18-3.

**Table 18-3: LOM Profit, Loss & Cash Flow Forecasting**

Item	Unit	LOM Total	Annually Average over LOM
Revenue (incl. VAT)	Million USD	1,358	272
Opex	Million USD	(821)	(164)
Closure	Million USD	(27)	(5)
<b>EBITDA</b>	<b>Million USD</b>	<b>510</b>	<b>102</b>

### 18.3 Sensitivity Analysis

SRK conducted a single-factor sensitivity analysis for the Project to determine which factors most significantly impact its economics when considered independently. The analysis focused on gold price, Capex, and Opex, each tested within a ±30% range.

The results showed that the Project is most sensitive to changes in gold price. Results of the sensitivity tests are presented in Table 18-5 and Figure 18-2.

The break-even gold prices occur when the gold price drops by approximately 20%, resulting in an NPV of 0 at a 10% discount rate.

Table 18-5: Sensitivity Analysis Result

Variance	Opex	Capex	Price
	NPV @ 10% Annual Discount Rate (US\$M)		
-30%	319	207	-83
-25%	294	201	-39

### 18.4 Wassa Ore Reserves and Upside Plan

The Wassa Mine has provided the Ore Reserves and upside plan, based on the Wassa Design. During discussions with the Wassa Mine, SRK understood that the Updated Wassa Design includes Residual material in the upper area and Material in the lower area. However, due to the time constraints in preparing and reviewing the Updated Wassa Design, SRK considers this an opportunity for potential economic material but does not classify it as an Ore Reserve, as detailed in Chapter 12.2.9. This section is intended to demonstrate the economic viability of the Ore Reserves and upside plan (Updated Wassa Design).

A summary of the Capex is presented in Table 18-6, with the Capex investment plan over the LoM detailed below.

**Table 18-6: Summary of Capex for Wassa Mine (Ore Reserves and Upside Plan)**

Capex	Unit	LOM Total
Capital development	Million USD	78
Other Sustaining Capex	Million USD	91
Closure	Million USD	27
<b>Total Capex</b>	<b>Million USD</b>	<b>197</b>

Sources: GSR, summarized by SRK

The operating cost over the LOM is shown in Table 18-7.

**Table 18-7: Operating Cost Forecast (Million USD)**

Item	2024 Q4	2025	2026	2027	2028
Labor	21	67	53	34	28

Selling costs	-	-	-	-	-
G&A costs	9	30	24	15	12
R&D costs	-	-	-	-	-

Sources: GSR, summarized by SRK

The principal assumptions outlined in Chapter 18.1, along with the above Capex and Opex, resulting in a positive NPV, indicating that the Ore Reserves and upside plan is economically mineable with both scenarios.

At a discount rate of 10%, the NPV of the Project is USD 167 million.

The sensitivity of NPV against discount rate is presented in Table 18-8.

**Table 18-8: Wassa Mine NPV versus Discount Rate**

## 19 Risk Analysis

Mining is a relatively high-risk industry. In general, the risk may be expected to decrease from exploration, development, through to production stage. The Wassa Gold Project is a production project. Risks exist in different areas. SRK considered various technical aspects which may affect sustainable operation and future cash flow of the Project, and conducted a qualitative risk analysis which has been summarised in Table 19-1. In this risk analysis, various risk sources/ issues have been assessed for Likelihood and Consequence, and then a Risk Rating has been assigned. The qualitative risk analysis uses the following definitions for likelihood and consequence.

The Likelihood of a risk is considered within a certain time frame, e.g. 5 years, as:

- **Likely:** will probably occur;
- **Possible:** may occur; and
- **Unlikely:** unlikely to occur.

The Consequence of a risk is classified into:

- **Major Consequence:** the factor poses an immediate danger to the Project, if uncorrected, will have a material effect on the Project cash flow and performance and could lead a project failure;
- **Moderate Consequence:** the factor, if uncorrected, will have a significant effect on the Project cash flow and performance; and
- **Minor Consequence:** the factor, if uncorrected, will have little or no effect on the Project cash flow and performance.

The overall risk assessment combines the Likelihood and Consequence of a risk and be classified as **Low** (unlikely and possible minor risks and unlikely moderate risk), **Medium** (likely minor, possible moderate and unlikely major risks), and **High** (likely moderate and major and possible major risks).

Below is the qualitative risk analysis summary table of the Wassa Gold Project.

**Table 19-1: Project Risk Assessment of the Wassa Gold Project**

Risk Source/Issue	Likelihood	Consequence	Overall
<b>Geology and Resource</b>			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Overestimate of the Mineral Resource Grade	Possible	Moderate	Medium
Unknown Significant Geological Structure	Unlikely	Moderate	Low
Unexpected Groundwater Ingress	Possible	Moderate	Medium
<b>Mining</b>			
Subsidence and Ground Stability	Unlikely	Moderate	Low
Hydrogeological Modeling Uncertainties	Possible	Minor	Low
Significant Production Shortfalls	Unlikely	Major	Medium
Lack of Significant Ore Reserves	Unlikely	Major	Medium
<b>Ore Processing</b>			
Significantly Lower Recovery	Unlikely	Moderate	Low
Higher Processing Cost	Possible	Moderate	Medium

Risk Source/Issue	Likelihood	Consequence	Overall
Poor Plant Reliability	Unlikely	Moderate	Low
<b>Capital and Operating Costs</b>			
Project Timing Delays	Unlikely	Moderate	Low
Capex and Opex Increases	Possible	Moderate	Medium
Higher Mine Closure Liability	Possible	Moderate	Medium
<b>Environmental, Social and Governance</b>			
Water Management	Possible	Moderate	Medium
Waste Rock and TSF Management	Possible	Moderate	Medium
Hazardous Materials Management	Unlikely	Moderate	Low
Social Licensee to Operate	Possible	Moderate	Medium
<b>Infrastructure</b>			
Poor TSF Management	Unlikely	Moderate	Low
Shortfall of Water Supply	Possible	Moderate	Medium
Shortfall of Power Supply	Possible	Moderate	Medium
Poor Condition of the Site Road	Possible	Minor	Low

The Wassa Project is an operating project with constant open pit and open pit production. The geology, mining methods and metallurgical flowsheet have been partly verified and proved by historical operation. Overall ratings of technical risks of the Project are low and some medium risks exist in different aspects. The risks and recommended management measures are discussed below.

- The geological risks relate to the uncertainty of underground hydrogeology associated with local geological structures. SRK recommends to maintaining and enhancing the geological exploration, such as mapping the underground tunnels, especially for faults and fractures, and monitoring the underground water discharges.
- The geological risks also related to the grade estimation of underground Mineral Resources. SRK noted there are abundant Inferred Mineral Resources for the underground mine and further exploration potential, and the current Inferred Mineral Resources in deeper zones have been estimated on primarily drill core interceptions with sparse distance so there is possibility of underestimate or overestimate. SRK recommends continuous exploration to be carried out for the upgrade the underground Mineral Resources.
- The risk in relation to mining could be possible poor planning, as it is an underground mine with a relatively high production rate. Consequently, possible risk will result to production shortfall or Ore Reserve overstatement. SRK recommends carrying out in-depth engineering studies associate to LoM planning and the use of professional mine planning software. Professional services may be sourced and retained, if needed.
- The risk in relation to ore processing and metallurgy could be the possibility of high operating cost, as the current production is transitioning from underground production solely. Proper management in grade control and planning will help reduce operating costs.
- The measures and practices to manage environmental risks relating to surface water and groundwater may include separate drainage systems for production wastewater, domestic sewage, and stormwater systems; storage of hazardous materials in a dedicated area could be planned to control the risk of hazardous materials pollution. The environmental risk of land disturbances could be controlled by limiting the waste rock storage and other disturbances; scrap iron and other industrial waste collection and recycling activity may control the risks resulting from waste generation. SRK notes a conceptual closure plan should be updated with ceasing

open pit production and further underground operation. TSF management associates to social responsibility, and should be taken into account.

- The risks in relation to capital and operating costs include underestimates of project costs. Proper management and detailed mine scheduling may help the underground development of the Project in a proposed schedule. SRK recommends updating or adjusting the project's costs estimation from time to time according to production data in the future. It is SRK's opinion that the risks identified above are generally under control and not likely to develop into higher level of risks, as noted the Company and Wassa Project team has tracked record in production and risk management.

## 20 Conclusions and Recommendations

### 20.1 Conclusions

#### 20.1.1 Geology and Exploration

- The Wassa deposit can be classified as an Eoeburnean folded vein system and is the only such deposit recognised to date within the Ashanti belt.
- The core drilling, geological logging etc. are implemented to a standard ensuring that the gathered data and information adequately underpin the objectives of subsequent geological modelling and Mineral Resources estimations.
- The procedures for sampling, preparation, analysis, and QA/QC are following the industry standards. SRK considers that they are acceptable for Mineral Resources estimations.

#### 20.1.2 Mineral Resources Estimation

The Mineral Resources have been prepared in accordance with the JORC Code guidelines. Mining is assumed by open pit methods at DMH, I Zone and Chichiwelli, and underground methods at Wassa (242 and B Shoot) and Hwini Butre (FB/ADK).

The Mineral Resources have a RPEEE, with estimates constrained as follows:

- Open Pit: constrained by open pit shell and cut-off grade.
- Underground (FB/ADK): constrained by cut-off grade.
- Underground (242 and B Shoot): constrained by the MSO.

As of 30 September 2024, the Mineral Resources are estimated as:

- Measured and Indicated Mineral Resource: 16.74 Mt at 3.07 g/t, containing 1,650 koz gold.
- Inferred Mineral Resources: 60.89 Mt at 3.38 g/t, containing 6,609 koz gold.

#### 20.1.3 Metallurgical Testing and Recovery Method

- Metallurgical tests were carried out before and after the construction of the processing plant in 2004. Both oxide and fresh ores have negligible preg-robbing effect and are amenable to CIL process. The gold recovery of Gravity-CIL process is as high as 90% to 95%.
- The capacity of the processing plant is 2.7 Mtpa. A traditional Crushing-Milling-CIL process with assistance of Gravity-Acacia operation in milling circuit is applied. The plant is well managed and achieved good historical performance. The gold recovery is 95.3% to 97.1% with gold production (in gold doré bars) of 4.84 to 5.31 tons per year.

#### 20.1.4 Infrastructure

- The rehabilitation of TSF 1 is complete and is operated by the GSOPP for palm oil trees. The construction and management of TSF 2 is conducted properly. The planned extension of TSF 2 can meet the required capacity for tailings storage.
- The current two electricity resources (Ghanian grid power and mine generated) are sufficient for operations and domestic needs. If the solar system is implemented, it could significantly reduce power costs for offices and domestic use.
- The water balance is carefully managed. The facilities of backwater, surface water and underground water can fully support the operations of mining and processing.

#### 20.2 Recommendations

SRK has made a number of recommendations during the review and/or site visits which have been discussed among SRK consultants and client staff. Key recommendations include:

- The large Inferred Mineral Resources need drilling programs. SRK understands that the Company is working on a long-term exploration and production plan for the Project, and the current Inferred Mineral Resources will be upgraded in next few years.
- Improve the quality of grade control model and incorporate it into the Mineral Resource/ Ore Reserve model. The current grade control model has not been incorporated into Mineral Resource/ Ore Reserve model yet due to various reasons including grade-control sample data quality and the duration of model update. SRK is aware of that the Company has already started to work on the improvement of both models.
- Exploration potential and opportunities to be further analysed.
- Additional technical studies to examine the Measured and Indicated Mineral Resources excluded from the current Ore Reserve estimate. SRK understands that GSWL recently commissioned a third party to work with the Company's mining team in this regard.
- Further test works on the deep underground veins may be needed to assure the processing procedures and laboratory protocols being used are appropriate and suitable. This will be dependent on future exploration programs and technical studies.
- It is a feasible plan for using renewable energy such as solar to replace gradually the electricity used in offices and residential facilities, as the concept of decarbonisation has been considered by the Company.

## Section 1: Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	Explanation	Commentary
<p><b>Sampling techniques</b></p>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report. <i>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<ul style="list-style-type: none"> <li>Diamond Drill ("DD") samples were collected with maximum 1.2 m and minimum 0.3 lengths, usually 1m lengths.</li> <li>Reverse Circulation drilling ("RC") samples were collected every 1 m. Where DD holes have been pre-collared using RC, the individual 1 m RC samples were combined to produce 3 m composites</li> <li>Half core taken for DD samples.</li> <li>Sub-sampling of RC samples was carried out using a Jones Riffle splitter.</li> <li>Sample preparation on site is restricted to core logging and cutting, or RC and Rotary Air Blast ("RAB") sample splitting.</li> <li>Industry standards have been undertaken for both DD and RC samples.</li> <li>Wassa site laboratory was used as the primary laboratory for 3 m composites and grade control RC samples from July 2007 onwards.</li> <li>Transworld Laboratories was the primary laboratory until July 2007.</li> <li>SGS (Tarkwa) was used for core samples from July 2007 to August 2017.</li> <li>Core samples have been sent to Intertek (Tarkwa) since 2017.</li> <li>GSR changed the assay procedure from the 50 g fire assay method to 1 kg bulk leach extractable gold ("BLEG") assay because a component of coarse gold was present in the samples.</li> <li>Atomic absorption spectroscopy (AAS) for gold grade determination.</li> </ul>
<p><b>Drilling techniques</b></p>	<ul style="list-style-type: none"> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</li> </ul>	<ul style="list-style-type: none"> <li>Drilling is carried out by a combination of DD, RC) and RAB techniques.</li> <li>Most of the drilling has been conducted by GSR, although there are some holes completed by previous concession owners by SGL (Wassa) or SJR (Hwini Butre and Benso).</li> <li>RC and DD drilling was conducted with a GSR geologist on site to align the drill rig and check the drill head dip and azimuth.</li> <li>Downhole surveying was conducted using a single shot camera, for RC and DD holes at the bottom of holes exceeding 30 m depths and then taken progressively every 30 m up hole.</li> <li>For Wassa, the deeper holes, often exceeding 1,000 m, are drilled from surface using HQ (63.5mm) sized core and this initial hole (referred to as the "mother" hole) is drilled to the depth where the first directional hole would be started. The directional hole (or "daughter" hole) is drilled</li> </ul>

Criteria	Explanation	Commentary
		<p>using a smaller core size, NQ (47.6 mm) and is deviated from the mother hole initially using a casing wedge which is oriented in the direction of the mineralised target.</p> <ul style="list-style-type: none"> <li>• All drillhole collars were surveyed using a Nikon Total Station (DTM-332) or Sokkia Total Station by a Golden Star (Wassa) surveyor.</li> <li>• Wassa UG holes were drilled using HQ, NQ or NQ2 (50.6 mm) core size. Downhole surveying was conducted using a Reflex multi-shot downhole surveying tool. Drill hole collar locations were captured by the underground mine surveying team.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>• Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>• Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>• Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>• Sample recovery is good across all deposits drilled to date.</li> <li>• There was no relationship between sample recovery and grade.</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li>• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>• Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</li> <li>• The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>• All borehole cores were logged by geologists.</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li>• If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>• If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</li> <li>• For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>• Quality control procedures adopted for all sub-sampling stages to maximize representivity of samples.</li> <li>• Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>• Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>• Half core taken for DD samples.</li> <li>• Sub-sampling of RC samples was carried out using a Jones Riffle splitter.</li> <li>• GSR has a standard approach to drilling and sampling on all mining leases and prospecting licenses.</li> <li>• Sampling is typically carried out along the entire mineralised drilled length.</li> <li>• Sample preparation is to industry standard involving drying, crushing and pulverizing of the entire sample.</li> <li>• Sample sizes are considered appropriate.</li> <li>• Sample weights were sufficient for the mineralised materials.</li> </ul>

Criteria	Explanation	Commentary
<b>Quality of assay data and laboratory tests</b>	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>Sample assays have been performed at the Wassa Site Laboratory (WSL), SGS Tarkwa or Intertek Minerals Ltd (formerly named Transworld Ltd).</li> <li>The sample preparation and analytical processes at the WSL, Intertek, and SGS differ slightly.</li> <li>AAS for gold grade determination.</li> <li>GSR changed the assay procedure from the 50 g fire assay method to 1 kg BLEG assay because a component of coarse gold was present in the samples.</li> <li>GSR QA/QC program includes inserting blanks, Certified Reference Materials (CRMs), and pulp or coarse reject duplicates into sample batches, before sample submission to the lab.</li> </ul>
<b>Verification of sampling and assaying</b>	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>Analytical data is also routinely checked for consistency by GSR.</li> <li>SRK has obtained and reviewed the QA/QC results produced by GSR.</li> <li>SRK is of opinion that the QA/QC samples' performance are of industrial standard, which provides sufficient confidence for the mineral resource estimation.</li> </ul>
<b>Location of data points</b>	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>All drillhole collars were surveyed using a Nikon Total Station (DTM-332) or Sokkia Total Station by a Golden Star (Wassa) surveyor.</li> <li>Wassa UG drill hole collar locations were captured by the underground mine surveying team.</li> </ul>
<b>Data spacing and distribution</b>	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>For Wassa, the final drilling density for classification as Measured Mineral Resource is designed to be 15 m along strike and 13 m down dip, or tighter.</li> <li>For the 242 I Zone, DMH, blocks in the areas with drill hole spacing not more than 15m were classified as Measured Mineral Resources.</li> <li>Composites were applied.</li> </ul>
<b>Orientation of data in relation to geological structure</b>	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul style="list-style-type: none"> <li>Drill orientation varies by location within the deposit.</li> <li>Drilling orientation is not considered to have introduced any sampling bias.</li> <li>No orientation-based sampling bias has been identified.</li> </ul>
<b>Sample security</b>	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>Samples are trucked by road to the laboratories in Tarkwa.</li> <li>As the samples are loaded, they are checked, and the sample numbers are</li> </ul>

Criteria	Explanation	Commentary
		validated. The sample dispatch forms are signed off by the driver and a company representative. The sample dispatch dates are recorded in the sample database as well as the date when results are received.
Audits or reviews	<ul style="list-style-type: none"><li>The results of any audits or reviews of sampling techniques and data.</li></ul>	<ul style="list-style-type: none"><li>As part of the Mineral Resource estimation, SRK conducted a review of sampling methods and data and determined that the database was of adequate quality to support the Mineral Resource estimation.</li></ul>

## Section 2: Reporting of Exploration Results

*(Criteria listed in the preceding section also apply to this section.)*

Criteria	Explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>GSR possesses three mining licenses, Wassa, Hwini-Butre and Benso.</li> <li>GSR possesses four prospecting licenses, Benso, Manso 1, Dwaben and Manso 2.</li> <li>Wassa mining license was current granted on 26 January 2022, and will be expire on of 25 January 2047, with an area of 63 km<sup>2</sup>.</li> <li>Hwini-Butre and Benso mining license were current granted on 25 August 2020, with areas of 43 km<sup>2</sup> and 19.45 km<sup>2</sup> respectively.</li> <li>Manso 1 and Manso 2 prospecting licenses were current granted on 3 April 2022, with areas of 101.57 km<sup>2</sup> and 23.41 km<sup>2</sup> respectively.</li> <li>Benso and Dwaben licenses are renewing and waiting for the approval of Minister of Lands and Natural Resources, Ghana.</li> </ul>
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<p><b>Wassa</b></p> <ul style="list-style-type: none"> <li>The Wassa area has experienced local small-scale and colonial mining activity since the beginning of the 20th century with numerous small pits and adits evident.</li> <li>From 1988, the property was operated as a small-scale mining operation with a gravity gold recovery circuit by WMRL, a Ghanaian company.</li> <li>Exploration drilling commenced in February 1994 and by March 1997 58,709 m of drilling had been completed.</li> <li>First ore was mined from the open pit in October 1998.</li> </ul> <p><b>Hwini Butre, Benso and Chichiwelli</b></p> <ul style="list-style-type: none"> <li>Early European reports indicate the Dabokrom area, around Hwini Butre, may have been a major source for gold sold to Portuguese explorers when they first arrived in Ghana in the late 1400's.</li> <li>The Dabokrom concession was acquired by BD Goldfields (BDG) during the 1980's who invited Danish company Lutz Resources Limited to carry out preliminary exploration on the property.</li> <li>SJR began exploring the concession in February 1995 which represented the first sustained exploration program on the concession.</li> </ul>

Criteria	Explanation	Commentary
		<ul style="list-style-type: none"> <li>• Reconnaissance work at Chichiwelli, Subriso, Denerawah and Amantin was conducted by BHP Billiton from 1989-92, on what is now the Benso concession.</li> <li>• Canadian company Fairstar Exploration Limited took over the Benso concession in 1995 and carried out extensive work, particularly at Subriso and Amantin.</li> <li>• From early 2002 to about mid-2004, SJR focused mainly on the Subriso area where substantial mineralisation was outlined at two prospects, Subriso East and West.</li> </ul>
<p style="text-align: center;"><b>Geology</b></p>	<ul style="list-style-type: none"> <li>• Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>• The Wassa deposit is located on the eastern flank of the northeast trending Ashanti Belt, a Paleoproterozoic greenstone belt which was formed and deformed, along with the dividing Birimian and Tarkwaian sedimentary basins during the Eoeburnean and Eburnean orogeny. The Wassa mineralisation consists of greenstone-hosted, low sulphide hydrothermal deposits where gold mineralisation occurs within folded quartz-carbonate veins. The Wassa deposit can therefore be classified as an Eoeburnean folded vein system and is the only such deposit recognised to date within the Ashanti belt.</li> <li>• The Hwini Butre deposits can be characterized as mafic intrusive hosted, orogenic shear zones. The deposits are hosted within diorite and granodiorite intrusive rocks of the Mpohor complex. The Father Brown deposit is characterized by well-developed fault-filled quartz veins.</li> <li>• The Benso deposits can also be characterized as mafic intrusive hosted, orogenic shear zones deposits, which are hosted by Birimian metavolcanics into which coarse plagioclase porphyry units have intruded and are generally conformable with the volcanoclastic units.</li> <li>• The Chichiwelli deposits can also be characterized as mafic intrusive hosted, orogenic shear zones, the deposits are hosted within diorite and granodiorite intrusive rocks. The mineralisation zones at Chichiwelli are similar to those observed at Benso, with the mineralised hosting structures generally dipping to the east.</li> </ul>

Criteria	Explanation	Commentary
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>Hole length.</li> </ul> </li> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>Surveys are conducted on drill hole collars (by total station) and downhole (by either multi-shot downhole camera, or gyro instrument for deeper holes).</li> <li>For B Shoot, the Mineral Resource database includes 3,755 DD holes and 485 RC holes.</li> <li>For 242, the Mineral Resource database includes 190 DD holes and 4,411 (GC)RC holes.</li> <li>For I Zone, the Mineral Resource database includes 21 DD holes and 233 (GC)RC holes.</li> <li>For FB/ADK, the Mineral Resource database includes 435 DD holes and 3,301 (GC)RC holes.</li> <li>For Chichiwelli, the Mineral Resource database includes 23 DD holes and 483 RC holes.</li> <li>All information of boreholes were collected, including collar, elevation, survey, depth, weathering data, specific gravity/ density, lithology etc.</li> </ul>
<b>Data aggregation methods</b>	<ul style="list-style-type: none"> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<ul style="list-style-type: none"> <li>Exploration data is reported as the average sample grade. Top cutting was used report the exploration results. For each mineralised domain of B shoot, 242, DMH and I Zone, the coefficient of variation (CV), probability plots were used to determine the capping grade. For each domain of Hwini Butre, the capping values were selected from the probability plots. For each domain of Chichiwelli, the caps were determined based on the shape of the tail of the log histogram and the log probability plots.</li> <li>No such aggregate intercepts short lengths of high-grade results or longer lengths of low-grade results is presented.</li> <li>No metal equivalent values have been used.</li> </ul>
<b>Relationship between mineralisation widths and intercept lengths</b>	<ul style="list-style-type: none"> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</li> </ul>	<ul style="list-style-type: none"> <li>Mineralisation intercept lengths were reported.</li> <li>Drill dip varies by location within the deposit.</li> </ul>
<b>Diagrams</b>	<ul style="list-style-type: none"> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	<ul style="list-style-type: none"> <li>Appropriate maps and typical sections were reported in this report.</li> </ul>

Criteria	Explanation	Commentary
<b>Balanced reporting</b>	<ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>Reporting was fully representative of the data collected at this stage.</li> </ul>
<b>Other substantive exploration data</b>	<ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	<ul style="list-style-type: none"> <li>No additional information was provided.</li> </ul>
<b>Further work</b>	<ul style="list-style-type: none"> <li>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<ul style="list-style-type: none"> <li>Further drilling program is recommended due to Wassa's large portion of Inferred Mineral Resources.</li> </ul>

**Section 3: Estimation and Reporting of Mineral Resources***(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)*

Criteria	Explanation	Commentary
<b>Database integrity</b>	<ul style="list-style-type: none"> <li>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</li> <li>Data validation procedures used.</li> </ul>	<ul style="list-style-type: none"> <li>Digitalized Mineral Resource databases were provided to SRK, and SRK conducted crossing-checking against logging data and typical interpretation. All relevant data was imported to Leapfrog™, and validation routines were run to confirm validity of all data.</li> <li>Checks for holes without samples.</li> <li>Checks for duplicate samples.</li> <li>Checks and adjusts the missing or wrong intervals.</li> </ul>
<b>Site visits</b>	<ul style="list-style-type: none"> <li>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</li> <li>If no site visits have been undertaken indicate why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>Four site visits were carried out by SRK with assistance from Golden Star personnel during preparation of the Report.</li> <li>7 to 10 December 2022, by geologist, geotechnical engineer, processing engineer and environment scientist.</li> <li>10 to 14 January 2023, by mining engineer and underground geotechnical engineer.</li> <li>11 to 16 February 2024, by geologist.</li> <li>27 to 29 May 2024, by geologist, mining engineer, processing engineer and environmental consultant.</li> </ul>
<b>Geological interpretation</b>	<ul style="list-style-type: none"> <li>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</li> <li>Nature of the data used and of any assumptions made.</li> <li>The effect, if any, of alternative interpretations on Mineral Resource estimation.</li> <li>The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>The factors affecting continuity both of grade and geology.</li> </ul>	<ul style="list-style-type: none"> <li>The mineralisation boundaries were determined by lithological and sampling data.</li> <li>For B Shoot, the mineralised wireframes were modelled by GSR using Leapfrog™ within two type envelopes, with cut-off grade of 0.4 g/t and 1.2 g/t respectively.</li> <li>For 242 and DMH, the mineralised wireframes were modelled by GSR using Leapfrog™ within two type envelopes, with cut-off grade of 0.4 g/t and 1.0 g/t respectively.</li> <li>For I Zone, the mineralised domains were generated at a cut-off of 0.5 g/t.</li> <li>For FB/ADK, the solids were created by GSR and Resource Modelling Solutions (RMS).</li> <li>For Chichiwelli, the mineralised solids were conducted by GSR with the 2D polylines using a cut-off grade of 0.5 g/t.</li> </ul>
<b>Dimensions</b>	<ul style="list-style-type: none"> <li>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</li> </ul>	<ul style="list-style-type: none"> <li>The Wassa mineralisation is subdivided into several domains; namely F Shoot, B Shoot, 242, Southeast, Starter, 419, Mid East and Dead Man's Hill. Each of these represents discontinuous segments of the main mineralised system which extends for approximately 3.5 km along strike from surface and is still open at depth.</li> <li>The mineralisation generally consists of broadly tabular zones containing dismembered and folded ribbon-like bodies of narrow quartz vein material, zones are typically 10 m to 50 m wide within a 900 m</li> </ul>

Criteria	Explanation	Commentary
<p><b>Estimation and modelling techniques</b></p>	<ul style="list-style-type: none"> <li>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</li> <li>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</li> <li>The assumptions made regarding recovery of by-products.</li> <li>Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulphur for acid mine drainage characterisation).</li> <li>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</li> <li>Any assumptions behind modelling of selective mining units.</li> <li>Any assumptions about correlation between variables.</li> <li>Description of how the geological interpretation was used to control the resource estimates.</li> <li>Discussion of basis for using or not using grade cutting or capping.</li> <li>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</li> </ul>	<p>mineralised corridor.</p> <ul style="list-style-type: none"> <li>For B Shoot, 242, DMH, Chichiwelli and I Zone, Au was estimated using Ordinary Kriging ("OK"). The solid models for Father Brown ("FBZ") and Adoikrom ("ADK") were created by GSR and Resource Modelling Solutions ("RMS"). They were modelled using a vein modelling technique, with estimating both vein thickness and grade.</li> <li>This is the first Mineral Resource estimation in accordance with JORC Code.</li> <li>For B Shoot and 242, the block model was constructed using a block size of to 5 m × 10 m × 5 m (East × North × Elevation), with a sub block size of 1.25 m × 2.5 m × 2.5 m. For DMH, the block model was constructed using a block size of to 5 m × 5 m × 3 m (East × North × Elevation), with a sub block size of 1.25 m × 1.25 m × 1.5 m. For I Zone, the block model was constructed using a block size of to 10 m × 20 m × 6 m (East × North × Elevation), with a sub block size of 1.25 m × 2.5 m × 1.5 m. For FBA/ADK, the block model was constructed using a block size of to 1 m × 2 m × 2 m (East × North × Elevation). For Chichiwelli, the block model was constructed using a block size of to 12.5 m × 25 m × 8 m (East × North × Elevation).</li> <li>All samples were composited to 1-meter.</li> <li>The cumulative frequency and distribution characteristics of the sample histogram were used to do the top capping.</li> <li>SRK has validated both block models by swath plot and visual inspection, indicating that the models were validated.</li> </ul>
<p><b>Moisture</b></p>	<ul style="list-style-type: none"> <li>Whether the tonnages estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.</li> </ul>	<ul style="list-style-type: none"> <li>The tonnages are estimated on a dry basis.</li> </ul>
<p><b>Cut-off parameters</b></p>	<ul style="list-style-type: none"> <li>The basis of the adopted cut-off grade(s) or quality parameters applied.</li> </ul>	<ul style="list-style-type: none"> <li>The underground Mineral Resources were reported within the Mineable Stope Optimiser ("MSO"), based on a US\$2,050/ ounce (oz) gold price and mining, processing and general administrative costs that were adjusted from actual costs at the Wassa B Shoot and 242 underground operations.</li> <li>Open pit Mineral Resources were reported within the optimised/ designed open pit shell.</li> <li>Underground Mineral Resources are reported at a cut-off grade of 1.38 g/t for B Shoot and 242 and 1.40 g/t for FB/ ADK.</li> <li>Open pit Mineral Resources are reported at a cut-off grade of 0.438 g/t for DMH, 0.749 g/t</li> </ul>

Criteria	Explanation	Commentary
<b>Mining factors or assumptions</b>	<ul style="list-style-type: none"> <li>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.</li> </ul>	<p>for I Zone and 0.55 g/t for Chichiwelli.</p> <ul style="list-style-type: none"> <li>B Shoot and 242 are two active underground mining operations. DMH is an active open pit operation.</li> <li>The mining method for FBZ/ADK is underground mining, for I Zone and Chichiwelli is open pit mining.</li> <li>Underground Mineral Resources are reported within MSO and open pit Mineral Resources are reported within the optimised/ designed open pit shells.</li> <li>This assists in demonstrating that the Mineral Resource meets the requirement of having reasonable prospects for eventual economic extraction criteria.</li> </ul>
<b>Metallurgical factors or assumptions</b>	<ul style="list-style-type: none"> <li>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>Wassa Gold Mine is a production project, both metallurgical testing and historical production performance data are available, providing reliable data to Metallurgical Factors.</li> <li>The oxide and primary ore of Wassa deposit are amenable to cyanide leaching ("CIL"). The CIL with Gravity Separation is a suitable process for gold extraction. Gold recovery of 90% to 95% can be achieved.</li> </ul>
<b>Environmental factors or assumptions</b>	<ul style="list-style-type: none"> <li>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>The EIS reports have been completed and approved for the Wassa Gold Project, covering the current mining areas, the processing plant, the tailings storage facilities, and the expansion project.</li> </ul>
<b>Bulk density</b>	<ul style="list-style-type: none"> <li>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</li> <li>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</li> </ul>	<ul style="list-style-type: none"> <li>For B Shoot and 242 underground, the bulk density in the model was set to 2.8 (fresh rock).</li> <li>For DMH and I Zone, the density values for the tonnage estimation were coded to 1.8 g/cm<sup>3</sup> for oxide, 2.25 g/cm<sup>3</sup> for transition and 2.7 g/cm<sup>3</sup> for fresh by GSR.</li> <li>For FBZ/ADK, the density used for estimation was provided by GSR with the value of 2.7 g/cm<sup>3</sup>.</li> <li>For Chichiwelli, the density values used for</li> </ul>

Criteria	Explanation	Commentary
	<ul style="list-style-type: none"> <li>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</li> </ul>	<p>the estimation were provided by GSR with the values of 1.8 g/cm<sup>3</sup> for oxide and 2.68 g/cm<sup>3</sup> for fresh.</p>
<p><b>Classification</b></p>	<ul style="list-style-type: none"> <li>The basis for the classification of the Mineral Resources into varying confidence categories.</li> <li>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</li> <li>Whether the result appropriately reflects the Competent Person's view of the deposit.</li> </ul>	<ul style="list-style-type: none"> <li> <p><b>B Shoot</b></p> <p>Measured Mineral Resources were defined in areas the drill intercepts were no greater than 15 m.</p> <p>Indicated Mineral Resources were defined in areas the drill intercepts were no greater than 50 m.</p> <p>The rest within each domain with little known information is classified as Inferred Mineral Resources.</p> </li> <li> <p><b>242</b></p> <p>The blocks in the areas with drill hole spacing not more than 15m were classified as Measured Mineral Resources, those with drill hole spacing not greater than 30m were classified as Indicated Mineral Resources and those with drill hole spacing not greater than 45m were classified as Inferred Mineral Resources.</p> </li> <li> <p><b>DMH</b></p> <p>Blocks in the areas with drill hole spacing not more than 15m were classified as Measured Mineral Resources, those with drill hole spacing not greater than 30m were classified as Indicated Mineral Resources and the rest within mineralised domains were classified as Inferred Mineral Resources.</p> </li> <li> <p><b>I Zone</b></p> <p>Measured Mineral Resource was defined by the area with an average sample distance of 15 m. Indicated Mineral Resource was defined by the area with a sample distance of 30 m. And the rest within the mineralise domain was defined as Inferred Mineral Resources.</p> </li> <li> <p><b>FBA/ADK</b></p> <p>Indicated Mineral Resources were classified in the areas where drilling is sufficient to demonstrate geological and grade continuity to a reasonable level.</p> <p>Inferred Mineral Resources were classified by two 3D solids that included the wider spaced drilling at depth (100 to 200m spacing),</p> </li> <li> <p><b>Chichiwelli</b></p> <p>Wireframes were digitized for East Domain and West Domain, with the areas inside the modelled solids considered to be Indicated Mineral Resources, and outside, Inferred Mineral Resources.</p> </li> </ul>

Criteria	Explanation	Commentary
Audits or reviews	<ul style="list-style-type: none"><li>• The results of any audits or reviews of Mineral Resource estimates.</li></ul>	<ul style="list-style-type: none"><li>• The input data, including geological mapping and drillhole data are comprehensive in their coverage of the mineralisation.</li><li>• The Mineral Resource estimate appropriately reflects the view of the Competent Person.</li><li>• The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the JORC Code.</li><li>• The statement relates to global volumetric estimates.</li></ul>

## Section 4: Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	Explanation	Commentary
<b>Mineral Resource estimate for conversion to Ore Reserves</b>	<ul style="list-style-type: none"> <li>Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.</li> <li>Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.</li> </ul>	<ul style="list-style-type: none"> <li>The open pit Ore Reserves are based on a block model and Mineral Resource estimate discussed in section three.</li> <li>The underground Ore Reserves are based on a block model and Mineral Resource estimate discussed in section three.</li> <li>The stockpile Ore Reserve is the ore that has spilled from conveyor belts and accumulated over time and are subsequently returned to the ROM Pad.</li> <li>Inferred Mineral Resources have been excluded from this estimate.</li> <li>The reported Ore Reserves are included in the tonnage of Measured and Indicated categories of Mineral Resources and diluted material.</li> </ul>
<b>Site visits</b>	<ul style="list-style-type: none"> <li>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</li> <li>If no site visits have been undertaken indicate why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>Four site visits were carried out by SRK with assistance from GSR personnel during preparation of the Report.</li> <li>7 to 10 December, 2022, by geologist, geotechnical engineer, processing engineer and environment scientist.</li> <li>10 to 14 January 2023, by mining engineer and underground geotechnical engineer.</li> <li>11 to 16 February, 2024, by geologist.</li> <li>27 to 29 May 2024, by geologist, mining engineer, processing engineer and environmental consultant.</li> <li>Ali Rudaki, a Principal Mining Engineer from SRK Consulting South Africa, conducted a site visit from 10 to 13 January 2023.</li> <li>TzuHsuan (Shan) Chuang, a Senior Mining Engineer from SRK Consulting China, conducted a site visit from 27 to 29 May 2024.</li> </ul>
<b>Study status</b>	<ul style="list-style-type: none"> <li>The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.</li> <li>The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.</li> </ul>	<ul style="list-style-type: none"> <li>The Wassa Mine is an operational mine with open pit and underground mining. Open pit mining commenced in 2007 and underground mining commenced in 2016.</li> <li>SRK Consulting (UK) Ltd. (2015) and Golden Star Resources Ltd (2021) provided the basis for the Ore Reserves estimate, referencing the NI 43-101 Technical Report on the Wassa Open Pit Mine and Underground Project in Ghana (2015), and the NI 43-101 Technical Report on the Wassa Gold Mine (2021).</li> <li>The feasibility study, along with the operational data and production plan, constitutes the foundational basis for the conversion of Ore Reserves.</li> </ul>
<b>Cut-off parameters</b>	<ul style="list-style-type: none"> <li>The basis of the cut-off grade(s) or quality parameters applied.</li> </ul>	<ul style="list-style-type: none"> <li>Open Pit Mines: Revenue Parameters: <ul style="list-style-type: none"> <li>Gold price: 2,050 USD/oz</li> <li>Process plant recovery: 95.5%</li> <li>Government and royalty: 13.5% of revenue</li> </ul> </li> </ul>

Criteria	Explanation	Commentary
		<p>Costs Parameters:</p> <ul style="list-style-type: none"> <li>○ Base Mining cost (Ox/ Fr): 3.1/ 4.2 USD/t</li> <li>○ Haul to Plant: 0.3 USD/t</li> <li>○ Process Cost: 15.09 USD/t</li> <li>○ Dilution: 10%</li> <li>○ Gold Cut-off Grade: 0.5 g/t</li> </ul> <ul style="list-style-type: none"> <li>• Underground Mines:</li> </ul> <p>Revenue Parameters:</p> <ul style="list-style-type: none"> <li>○ Gold Price: 2,050 USD/oz</li> <li>○ Process Plant Gold Recovery: 95.5%</li> <li>○ Mining royalty of 5% and gold royalty of 8.3%;</li> </ul> <p>Cost Parameters:</p> <ul style="list-style-type: none"> <li>○ Mine Production: 42.47 USD/t</li> <li>○ Sustaining Capital: 8.08 USD/t</li> <li>○ Processing: 14.93 USD/t</li> <li>○ Site G&amp;A: 7.23 USD/t</li> <li>○ Gold Cut-Off Grade: 1.34 g/t</li> </ul> <ul style="list-style-type: none"> <li>• The Ore Reserves were reported based on the above respective cut-off grade estimation.</li> </ul>
Mining factors or assumptions	<ul style="list-style-type: none"> <li>• The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).</li> <li>• The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.</li> <li>• The assumptions made regarding geotechnical parameters (e.g. pit slopes, stope sizes, etc.), grade control and pre-production drilling.</li> <li>• The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).</li> <li>• The mining dilution factors used.</li> <li>• The mining recovery factors used.</li> <li>• Any minimum mining widths used.</li> <li>• The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.</li> <li>• The infrastructure requirements of the selected mining methods.</li> </ul>	<ul style="list-style-type: none"> <li>• Underground: <ul style="list-style-type: none"> <li>○ Mineable Stope Optimiser (MSO)</li> <li>○ Vertical Method: YZ plane</li> <li>○ Minimum Mining Width: 5 meters</li> <li>○ Maximum Mining Width: 60 meters</li> <li>○ Stope Pillar: 10 meters</li> <li>○ Cut-off Grade: 1.34 g/t Au</li> <li>○ Wall Minimum Dip: 80°</li> <li>○ Wall Maximum Dip: 100°</li> <li>○ Variable Overbreak or Slough (VOS):</li> <li>○ Bottom: 0.2</li> <li>○ Midpoint: 0.4</li> <li>○ Top: 0.8</li> <li>○ Section (Length) Intervals: 20 meters</li> <li>○ Level (Height) Intervals: 25 meters</li> <li>○ Sections (U): Variable based on mining method and mining lode</li> <li>○ Dilution/ Recovery:</li> <li>○ Development (gold &gt;= Development cut-off grade): 0% dilution, 100% recovery</li> <li>○ Development (gold &lt; Development cut-off grade): 14% dilution, 100% recovery</li> <li>○ Stope: 10% dilution, 95% recovery</li> </ul> </li> <li>• Open Pit: <ul style="list-style-type: none"> <li>○ Ore Reserves are based on open pit shape designs, with appropriate modifications made to the original Whittle Shell outlines (Lercsh Grossman open pit optimisations) to ensure they meet practical mining parameters.</li> <li>○ No additional mining dilution or recovery factors were applied, as the regularized model already accounts for both dilution and mining recovery.</li> <li>○ The open pit design includes a 20-meter-wide ramp with a 10% gradient, which is wide enough for two-way hauling using 60-ton capacity off-highway haul trucks.</li> </ul> </li> </ul>

Criteria	Explanation	Commentary
		<ul style="list-style-type: none"> <li>○ The open pit design incorporates slopes and benches based on historical geotechnical data for the open pits in the area, featuring an overall slope angle of 40° in the weathered zone and 52° in fresh rock. The bench height is set at 12 meters, with a 72° bench face angle, while drilling and blasting will be conducted over bench heights of 6 meters.</li> <li>• Two mining methods were applied depending on the material. Oxide or weathered material was typically excavated using the free-dig method. For fresh material, conventional mining techniques were used, drill, blast, load and haul, involving hydraulic excavators and blasting to flitches with a height of 3.0 meters. The broken rock was then loaded onto 60-ton capacity off-highway haul trucks and transported to a central stockpile or waste dump.</li> </ul>
<b>Metallurgical factors or assumptions</b>	<ul style="list-style-type: none"> <li>• The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.</li> <li>• Whether the metallurgical process is well-tested technology or novel in nature.</li> <li>• The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.</li> <li>• Any assumptions or allowances made for deleterious elements.</li> <li>• The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.</li> <li>• For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?</li> </ul>	<ul style="list-style-type: none"> <li>• Wassa Gold Mine is a production project, both metallurgical testing and historical production performance data are available, providing reliable data to Metallurgical Factors.</li> <li>• The oxide and primary ore of Wassa deposit are amenable to cyanide leaching. The CIL supplemented with Gravity Separation is a suitable process for gold extraction. Gold recovery of 90% to 95% can be achieved in laboratory tests.</li> <li>• The processing plant adopt CIL with Gravity Separation process to extract gold, and the actual gold recovery is higher as 95% to 97% in recent years production. Yearly gold production (in gold Doré bars) is around five tons.</li> <li>• The processing flowsheet to treat ores from both open pit and underground operations has been proved to be mature. Recovery methods in the processing plant and forward recovery assumptions and are supported by test work and plant history production.</li> </ul>
<b>Environmental</b>	<ul style="list-style-type: none"> <li>• The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.</li> </ul>	<ul style="list-style-type: none"> <li>• Waste rocks from the project are transported to the 419 dump, part of which was recycled as aggregates for construction and road works. The EIS report states that the waste rocks are not acid generating (NAG) based on the geochemical characterization. Tailings are pumped to the TSF for storage, and return water from the TSF is pumped back to the processing plant for reuse. Routine analyses of cyanide were undertaken, and all cyanide concentrations were less than reporting limits (m RL) of 0.005 mg/L. GSWL is a member of International Cyanide Management Code (ICMC).</li> </ul>

Criteria	Explanation	Commentary
Infrastructure	<ul style="list-style-type: none"> <li>The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.</li> </ul>	<ul style="list-style-type: none"> <li>The Wassa mine is a well-established project with 20-year production history and adequate infrastructure. The power and water supply can support the mining and processing capacity of 2.7Mtpa ore.</li> </ul>
Costs	<ul style="list-style-type: none"> <li>The derivation of, or assumptions made, regarding projected capital costs in the study.</li> <li>The methodology used to estimate operating costs.</li> <li>Allowances made for the content of deleterious elements.</li> <li>The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co-products.</li> <li>The source of exchange rates used in the study.</li> <li>Derivation of transportation charges.</li> <li>The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.</li> <li>The allowances made for royalties payable, both Government and private.</li> </ul>	<ul style="list-style-type: none"> <li>Capital expenditures:</li> <li>Capitalised development: 78 million USD (3,620.03 USD/m for underground development).</li> <li>Other capital expenditure: 91 million USD (includes mine maintenance, environment, in-fill drilling, etc.)</li> <li>Initial working capital is assumed to be 30% of the operating costs in 2024, fully recovered by 2028.</li> <li>Mine closure expenditure is estimated at 27 million USD and allocate evenly over the LOM.</li> <li>Operating costs were categorized into the following components: labor, material, electricity, contractors, engineering, service, safety, repairment, others, taxes and surcharges, selling costs, G&amp;A costs, R&amp;D cost. Income tax is 35%.</li> </ul>
Revenue factors	<ul style="list-style-type: none"> <li>The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.</li> <li>The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.</li> </ul>	<ul style="list-style-type: none"> <li>For economic analysis, gold metal price was dynamic and was derived from consensus market forecasts provided by the Energy and Metals Consensus Forecast, published by Consensus Economics Inc., to which SRK subscribes annually.</li> <li>There is no other revenue factor considered.</li> <li>A 99.1% payable rate is applied to the metal price based on Wassa's cost analysis.</li> </ul>
Market assessment	<ul style="list-style-type: none"> <li>The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.</li> <li>A customer and competitor analysis along with the identification of likely market windows for the product.</li> <li>Price and volume forecasts and the basis for these forecasts.</li> <li>For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.</li> </ul>	<ul style="list-style-type: none"> <li>The market of the commodity of gold is well established and analysed.</li> <li>The gold industry is a mature commodity market comparing to other commodities in mining.</li> <li>The gold price forecast used in this Report is referred to institutional analysis and referenced by the past actual gold prices.</li> <li>A long term price of gold at US\$ 2,050 per ounce has been applied for Ore Reserve study and project economics analysis.</li> </ul>
Economic	<ul style="list-style-type: none"> <li>The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.</li> <li>NPV ranges and sensitivity to variations in the significant assumptions and inputs.</li> </ul>	<ul style="list-style-type: none"> <li>The discount rate used for NPV calculation ranges from 5.0% to 15.0%, with increments of 1.0%. All results indicate an economic outcome.</li> <li>The "nominal" values are applied. The cost remains constant over the life of mine without any adjustments are factored in.</li> <li>The operating costs, capital expenditure, and gold prices were selected for sensitivity analysis. These factors were analysed within a</li> </ul>

Criteria	Explanation	Commentary
		<p>±30% range for their impact on NPV, using a 10% discount rate.</p> <ul style="list-style-type: none"> <li>The NPV is most sensitive to changes in the gold price, followed by operating costs.</li> </ul>
Social	<ul style="list-style-type: none"> <li>The status of agreements with key stakeholders and matters leading to social licence to operate.</li> </ul>	<ul style="list-style-type: none"> <li>The public consultation of the EIS report shows that stakeholders have generally expressed their support for the project and willingness to engage with the company to enhance benefits. GSWL actively engages in a range of cooperate social responsibility strategies to cultivate strong relationships and highlight the value-adding potential of key stakeholders.</li> </ul>
Other	<ul style="list-style-type: none"> <li>To the extent relevant, the impact of the following on the Project and/or on the estimation and classification of the Ore Reserves:</li> <li>Any identified material naturally occurring risks.</li> <li>The status of material legal agreements and marketing arrangements.</li> <li>The status of governmental agreements and approvals critical to the viability of the Project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.</li> </ul>	<ul style="list-style-type: none"> <li>The current Ore Reserve estimates and statement are based on PFS level studies, along with the operational data and production plan, constitutes the foundational basis for the conversion of Ore Reserves, which is considered appropriate by SRK.</li> <li>SRK is not aware of any material risk in social or legal aspects that will impact on the Ore Reserve statement.</li> </ul>
Classification	<ul style="list-style-type: none"> <li>The basis for the classification of the Ore Reserves into varying confidence categories.</li> <li>Whether the result appropriately reflects the Competent Person's view of the deposit.</li> <li>The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).</li> </ul>	<ul style="list-style-type: none"> <li>For the open pit and underground mining, Measured Mineral Resources in the mine designs are classified as Proved Ore Reserves. Indicated Mineral Resources in the mine designs are classified as Probable Ore Reserves.</li> <li>For ore stockpiles, the materials are considered as Probable Ore Reserve based on reviewing the data provided by Wassa Mine.</li> <li>The classification of Ore Reserves appropriately reflects the Competent Person's view of the deposits.</li> <li>There is no Measured Mineral Resources, classified as Probable Ore Reserves.</li> </ul>
Audits or reviews	<ul style="list-style-type: none"> <li>The results of any audits or reviews of Ore Reserve estimates.</li> </ul>	<ul style="list-style-type: none"> <li>The Ore Reserves estimates have been peer reviewed internally and is in line with current industry standards.</li> </ul>

Criteria	Explanation	Commentary
<p><b>Discussion of relative accuracy/ confidence</b></p>	<ul style="list-style-type: none"> <li>• Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.</li> <li>• Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.</li> <li>• It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</li> </ul>	<ul style="list-style-type: none"> <li>• The Ore Reserves estimates are based on data (studies and assessment) provided by Wassa Mine and ongoing operations. The Ore Reserves estimates are at a PFS level.</li> <li>• All modifying factors have been applied for Ore Reserves estimates on a global estimate.</li> <li>• Considering the Wassa project is an operating mine with track record, SRK is of opinion that Ore Reserve estimates based on short-term LoM plan based on Measured and Indicated Mineral Resources are of low risk.</li> </ul>

**Appendix C      Compliance with Chapter 18**

Chapter 18		Sections in SRK's Report
18.01	DEFINITIONS AND INTERPRETATION	Not applicable. <sup>[1]</sup>
18.02-18.04	CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES	
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.	
18.03	A Mineral Company must:—	
	(1) establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—	3.1
	(a) through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or	
	<i>Note: 'control over a majority' means an interest greater than 50%.</i>	
	(b) through adequate rights (arising under arrangements acceptable to the Exchange), which gives it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
	(2) establish to the Exchange's satisfaction that it has at least a portfolio of:—	Executive Summary Table ES-1, and 10.11
	(a) Indicated Resources; or	
	(b) Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
	(3) if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—	17.2. <sup>[2]</sup>
	(a) workforce employment;	
	(b) consumables;	
	(c) fuel, electricity, water and other services;	
	(d) on and off-site administration;	
	(e) environmental protection and monitoring;	
	(f) transportation of workforce;	
	(g) product marketing and transport;	
	(h) non-income taxes, royalties and other governmental charges; and	
	(i) contingency allowances;	
	<i>Note</i> : A Mineral Company must: • set out the components of cash operating costs separately by category; • explain the reason for any departure from the list of items to be included under cash operating costs; and • discuss any material cost items that should be highlighted to investors.	
	(4) demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—	17.1 <sup>[3]</sup>
	(a) general, administrative and operating costs;	
	(b) property holding costs; and	
	(c) the cost of any proposed exploration and/or development; and	
	<i>Note</i> : Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.	
	(5) ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has sufficient available working capital for 125% of the group's present requirements, that is for at least 12 months from the date of its listing document.	17.1 <sup>[3]</sup>
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of	Not applicable. <sup>[4]</sup>

Chapter 18		Sections in SRK's Report
	the new applicant. <i>Note:</i> A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.	
<b>18.05-18.08</b>	<b>CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS</b>	
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—	
	(1) a Competent Person's Report;	1, 2.2.4
	(2) a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;	2.4
	(3) the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;	3, 16.3
	(4) a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;	2.3
	(5) disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and	19
	(6) if relevant and material to the Mineral Company's business operations, information on the following:—	
	(a) project risks arising from environmental, social, and health and safety issues;	19
	(b) any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	16.4.9
	(c) compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	16.3
	(d) sufficient funding plans for remediation, rehabilitation and closure and removal of facilities in a sustainable manner;	16.4.8, 17.1 <sup>[5]</sup>
	(e) environmental liabilities of its projects or properties;	16.4
	(f) its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	16.4.9
	(g) its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	16.4.9
	(h) any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	16.4.9
<b>18.06-18.08</b>	<b>Additional disclosure requirements that apply to certain new applicant Mineral Companies</b>	
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.	17.2
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.	Not applicable. <sup>[6]</sup>
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.	10
<b>18.09-18.13</b>	<b>RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS</b>	<b>Not applicable. <sup>[7]</sup></b>
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—	
	(1) comply with Chapter 14 and Chapter 14A, if relevant;	
	(2) produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction;	
	<i>Note:</i> : The Exchange may dispense with the requirement for a Competent Person's	

Chapter 18		Sections in SRK's Report
	<i>Report on disposals where shareholders have sufficient information on the assets being disposed of.</i>	
(3)	in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and	
(4)	comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired.	
	<i>Not e: Material liabilities that remain with the issuer on a disposal must also be discussed.</i>	
<b>18.10-18.11</b>	<b>Requirements that apply to listed issuers</b>	
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.	
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.	
<b>18.12-18.13</b>	<b>Requirements that apply to Mineral Companies and listed issuers</b>	
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.	
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such person or firm is retained by the listing applicant or the issuer.	
<b>18.14-18.17</b>	<b>CONTINUING OBLIGATIONS</b>	<b>Not applicable.</b> <sup>[7]</sup>
<b>18.14</b>	<b>Disclosure in reports</b>	
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.	
<b>18.15-18.17</b>	<b>Publication of Resources and Reserves</b>	
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.	
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.	
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18. <i>Not e: Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.</i>	
<b>18.18-18.27</b>	<b>STATEMENTS ON RESOURCES AND/OR RESERVES</b>	
<b>18.18</b>	<b>Presentation of data</b>	
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.	10.11 11.3
<b>18.19</b>	<b>Basis of evidence</b>	
18.19	All statements referring to Resources and/or Reserves:— (1) in any new applicant listing document or circular relating to a Relevant Notifiable Transaction must be substantiated in a Competent Person's Report which must form part of the document; and (2) in all other cases, must at least be substantiated by the issuer's internal experts.	
<b>18.20</b>	<b>Petroleum Competent Persons' Reports</b>	<b>Not applicable.</b> <sup>[8]</sup>

<b>Chapter 18</b>		<b>Sections in SRK's Report</b>
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.	
<b>18.21-18.22</b>	<b>Competent Person</b>	
18.21	A Competent Person must:—	
	(1) have a minimum of five years' experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	2.7
	(2) be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	2.7
	(3) take overall responsibility for the Competent Person's Report.	2.7, 2.9
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—	2.7, 2.10
	(1) have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2) not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3) in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4) in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
<b>18.23</b>	<b>Additional requirements of Competent Evaluators</b>	
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—	
	(1) have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2) have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3) hold all necessary licences.	
	<i>Note:</i> A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.	
<b>18.24</b>	<b>Scope of Competent Persons' Reports and Valuation Reports</b>	
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—	
	(1) be addressed to the Mineral Company or listed issuer;	1, 2.24
	(2) have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	2.4
	(3) set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	1, 2.24
<b>18.25-18.26</b>	<b>Disclaimers and Indemnities</b>	
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.	2.11, 2.12
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent	2.11, 2.12

Chapter 18		Sections in SRK's Report
	Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.	
<b>18.27</b>	<b>Obligations of sponsor</b>	<b>Not applicable<sup>[1]</sup></b>
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.	
<b>18.28-18.34</b>	<b>REPORTING STANDARD</b>	
<b>18.28-18.30</b>	<b>Mineral reporting standard</b>	
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.	
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—	1, 2.2.4
	(1) under:	
	(a) the JORC Code;	1, 2.2.4
	(b) NI 43-101; or	
	(c) the SAMREC Code,	
	as modified by this Chapter; or	
	(2) under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	<i>Not e: The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.</i>	
18.30	A Mineral Company must ensure that:—	
	(1) any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;	11.1.1; 11.2.1
	(2) estimates of mineral Reserves and mineral Resources are disclosed separately;	10; 11
	(3) Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;	11, 12.1.3, 12.2.7 18.1
	(4) for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—	18.1.3
	(a) the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	18.1.3
	(b) if a contract for future prices of mineral Reserves exists, the contract price is used; and	15
	(5) for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.	Not applicable. <sup>[9]</sup>
<b>18.31-18.33</b>	<b>Petroleum reporting standard</b>	<b>Not applicable. <sup>[8]</sup></b>
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.	
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—	
	(1) under PRMS as modified by this Chapter; or	
	(2) under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	<i>Not e: A Reporting Standard applied to specific assets must be used consistently.</i>	
18.33	A Mineral Company must ensure that:—	
	(1) where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels	

Chapter 18		Sections in SRK's Report
	applied must be stated;	
(2)	if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
(3)	Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	
(4)	if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	
	<i>Note</i> : <i>In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.</i>	
(5)	if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
	<i>Note</i> : <i>Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.</i>	
(6)	economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
(7)	where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	
<b>18.34</b>	<b>Mineral or Petroleum Asset Valuation Reports</b>	<b>Not applicable.</b> <sup>[8, 9]</sup>
18.34	A Mineral Company must ensure that:—	
(1)	any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
(2)	the Competent Evaluator states clearly the basis of valuation, relevant assumptions and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

**Notes:**

<sup>1</sup> It's not the work scope of SRK.

Operating cost is breakdown according to cost centre, instead of cost element.

Without considering current assets and current liabilities, SRK made the assumption that the working capital has been incorporated into the sustaining capital.

The simple economic analysis shown in "18 Economic Analysis" provides an indication that the Wassa Mine is economically viable.

It is reasonable to expect that the operation of the Project will be extended with further exploration and feasibility studies, the mine closure fees, and the residual value of the project will not be considered in the economic projection.

Wassa Mine is a producing project.

Upon listing, Chifeng Gold/GSWL will comply with the relevant requirements under the Listing Rules.

Mineral Resources and Ore Reserves of GSWL are Au minerals.  
The report prepared by SRK is not an Evaluation Report.

---

**Appendix D      Chapter 2.6 of the Guide for New Listing  
Applicants**

Chapter 2.6		Section in SRK's Report
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	Section 10.11
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	Not applicable.
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	Not applicable.
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	Section 3
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	Section 11 and Section 12
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	Section 18.2
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	Section 1.5
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	Section 19

Final

## Competent Person's Report for Sepon Rare Earth Element and Mengkham Rare Earth Element Projects in Lao People's Democratic Republic

## **Acknowledgments**

SRK would like to acknowledge the support and collaboration provided by Sepon and Mengkham personnel for this assignment. Their collaboration was greatly appreciated and was instrumental to the success of this project.

The opinions expressed in this Report have been based on the information supplied to SRK Consulting China Ltd. (SRK) by Chifeng Jilong Gold Mining Co., Ltd.(the "Client"). The opinions in this Report are provided in response to a specific request from the Client to do so. SRK has exercised all due care in reviewing the supplied information. Whilst SRK has compared key supplied data with expected values, the accuracy of the results and conclusions from the review are entirely reliant on the accuracy and completeness of the supplied data. SRK does not accept responsibility for any errors or omissions in the supplied information and does not accept any consequential liability arising from commercial decisions or actions resulting from them. Opinions presented in this report apply to the site conditions and features as they existed at the time of SRK's investigations, and those reasonably foreseeable. These opinions do not necessarily apply to conditions and features that may arise after the date of this Report, about which SRK has no prior knowledge nor has the opportunity to evaluate.

## Useful Definitions

This list contains definitions of symbols, units, abbreviations, and terminology that may be unfamiliar to the reader.

%	Percent
'	Minute
°	Degrees
ASL	above sea level
C	Carboniferous System; Chemical symbol for element carbon
°C	Degree(s) Centigrade Celsius, a unit of temperature
Ce	Chemical symbol for the rare earth element cerium
cm	centimeter
CPR	Competent Person's Report
CREO	critical rare earth oxides, the sum of Nd <sub>2</sub> O <sub>3</sub> + Eu <sub>2</sub> O <sub>3</sub> + Tb <sub>4</sub> O <sub>7</sub> + Dy <sub>2</sub> O <sub>3</sub> + Y <sub>2</sub> O <sub>3</sub>
CRMs	Certified reference materials.
DTM	Digital Terrain Models
Dy	Chemical symbol for the rare earth element dysprosium
E	East
EDTA	Ethylene Diamine Tetraacetic Acid
Er	Chemical symbol for the rare earth element erbium
Eu	Chemical symbol for the rare earth element europium
g/t	gram per tonne
Gd	Chemical symbol for the rare earth element gadolinium
GPS	Global Positioning System
Ho	Chemical symbol for the rare earth element holmium
JORC	The Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves, edition 2012
IAC	Ion Adsorption Clay
IDW	Inverse Distance Weighting
Indicated Mineral Resource	that part of a resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a reasonable level of confidence. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes. The locations are too widely or inappropriately spaced to confirm geological and/or grade continuity but are spaced closely enough for continuity to be assumed
Inferred Mineral Resource	that part of a resource for which tonnage, grade and mineral content can be estimated with a low level of confidence. It is inferred from geological evidence and assumed but not verified geological and/or grade continuity. It is based on information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings, and drill holes which may be limited or of uncertain quality and reliability
kg	kilogram
km	kilometer
km <sup>2</sup>	square kilometer
kt	kiloton
KV	Kilovolts, equivalent to 1,000 volts
La	Chemical symbol for the rare earth element lanthanum
LXML	Lane Xang Minerals Limited Company

%	Percent
Lu	Chemical symbol for the rare earth element lutetium
m	meter
MREO	magnet rare earth oxides, the sum of $Pr_6O_{11}+Nd_2O_3+Tb_4O_7+Dy_2O_3$
Mt	million tonnes
N	North
Nd	Chemical symbol for the rare earth element neodymium
P	Permian System
Pr	Chemical symbol for the rare earth element praseodymium
QA/QC	quality assurance and quality control
REE	Rare Earth Elements, consists of a set of seventeen chemical elements in the periodic table, specifically the fifteen lanthanides (from element number 57 to 71), as well as scandium and yttrium
RPEEE	Reasonable Prospects for Eventual Economic Extraction
Sm	Chemical symbol for the rare earth element samarium
SREO	Soluble rare earth oxides, only including rare earth elements in the form of ionic adsorption of the deposit.
$t/m^3$	Tonne per cubic metre
T2	Middle Triassic Series
T3	Upper Triassic Series
Tb	Chemical symbol for the rare earth element terbium
Tm	Chemical symbol for the rare earth element thulium
TREO	The total rare earth oxides equivalent, the sum of $La_2O_3, CeO_2, Pr_6O_{11}, Nd_2O_3, Sm_2O_3, Eu_2O_3, Gd_2O_3, Tb_4O_7, Dy_2O_3, Ho_2O_3, Er_2O_3, Tm_2O_3, Yb_2O_3, Lu_2O_3, Y_2O_3$ , including rare earth elements present in the crystal lattice as well as those in the form of ionic adsorption of the deposit
UTM	Universal Transverse Mercator Projection
Xiamen Tungsten	Xiamen TUNGSTEN CO.,LTD
Y	Chemical symbol for the rare earth element yttrium
Yb	Chemical symbol for the rare earth element ytterbium
Z	Elevation

## Executive Summary

SRK Consulting China Ltd. (“**SRK**”) was requested by Chifeng Jilong Gold Mining Co., Ltd. (“**Chifeng Gold**” or the “**Client**”) to prepare a Competent Person’s Report (“**CPR**” or the “**Report**”) for its Sepon Rare Earth Element (“**REE**”) Project and Mengkham Rare Earth Element Project (the “**the Projects**”) located in Savannakhet Province and Xieng Khouang Province, Lao People’s Democratic Republic (“**Laos**”) in accordance with the guidelines of the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves, 2012 edition (“**JORC Code (2012)**”) and the Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited (the “**HKEx**”). The projects include exploration licenses, mining licenses, as well as the in-situ leaching mining facilities, and associated ore processing and metallurgic plants in construction and metallurgical leach testing. The Sepon REE project is currently operated by Lane Xang Minerals Limited Company (“**LXML**”), which is a subsidiary of Chifeng Gold. The Mengkham REE project has a trial mining permit and an exploration permit, which are held by China Investment Rare Earth Mining Co., Ltd. and China Investment Rare Earth Mining XiangKhouang Co., Ltd., respectively. China Investment Mining (Laos) Sole Co., Ltd. holds an 86% equity interest in both China Investment Rare Earth Mining Co., Ltd. and China Investment Rare Earth Mining XiangKhouang Co., Ltd. Since March 2024, Chixia Laos Holdings Limited (“Chixia Laos”) has been in the process of acquiring a 90% equity interest in China Investment Mining (Laos) Sole Co., Ltd.

This report consists of an independent review of the geology, exploration, Mineral Resources, Ore Reserves, mining, mineral processing and smelter-refinery, capital investment, operating cost, and environmental and social aspects of the Projects.

## Outline of Work Programs

The scope of work, as defined in letters of engagement reached in November 2022, and May 2024 between Chifeng Gold and SRK, includes reviewing and estimating of the mineral resource of the REE mineralisation delineated within the Sepon Project’s tenements and the Mengkham REE project, and reviewing a preliminary feasibility study on the Mengkham REE project, and preparation of a CPR on the projects in accordance with JORC (2012) and the listing requirements of the HKEx.

SRK has conducted the work programs on the projects in phases:

**Phase 1:** SRK conducted a desktop review on documents provided by the client before conducting site visits to the project site.

**Phase 2:** SRK conducted site visits to both projects. During the period from 9 December 2022 to 14 December 2022, SRK’s personnel conducted site visits to the Sepon Project, to gather data and interview related personnel who conducted exploration and feasibility study on the project. During the period from 13 to 16 May 2024, SRK further conducted a site visit to the Sepon REE Project. During the period from 9 to 11 May 2024, SRK conducted site visits to the Mengkham REE project, inspected and observed the status of the project, held meetings with the managements and technical personnel, sighted geology, exploration, mineralization, as well as the mining facilities, ore processing and metallurgic facilities in construction and metallurgical leach testing, also conducted its own data verification programs, and carried out review in environmental and social aspects.

**Phase 3:** SRK team reviewed the information provided by Chifeng Gold, and estimated Mineral Resources and reviewed the preliminary feasibility study on the Mengkham REE project, conducted

a preliminary economic assessment on the project, and compiled a technical report about the projects and reported the Exploration Results, Mineral Resources and Ore Reserves according to the JORC Code 2012, and submitted it to the client for comments in August and November 2024.

SRK will further revise the report based on feedbacks from the client and related third parties, and will finalize it in the due course.

## Results

### Overall

Chifeng Gold owns the Sepon REE Project through its subsidiaries and is acquiring Mengkham REE Project. The REE deposits in both projects are ion-adsorption type with the REEs enriched in the weathered zones over granite rock bodies.

The Sepon REE Project is an exploration and resource project within the exploration permit of LXML. Exploration programs, including trenching, drilling to take samples, and assaying results of the samples and other related database, can support a mineral resource estimate. SRK has reviewed the database obtained and re-estimated the Mineral Resources of the project. As of 30 September 2024, the Sepon REE Project possesses 26.78 million tonnes ("Mt") of Indicated Mineral Resources with an average grade of 383.75 grams per tonne ("g/t") total rare earth oxide equivalent ("TREO"), and 63.79 Mt of Inferred Mineral Resources averaging 339.22 g/t TREO, at a cut-off grade of 170g/t TREO.

The Mengkham REE Project is a development production project. Previous exploration programs defined the REE mineralized bodies, and the database obtained may support a mineral resource estimate. As of 30 September 2024, SRK estimated that the project has a resource basis of 139.05 Mt Inferred Mineral Resources with an average grade of 241.79 g/t soluble rare earth oxide ("SREO"), at a cut-off grade of 100 g/t SREO.

SRK reviewed a feasibility study ("FS") done internally by Chixia Laos for developing the Mengkham REE Project, and considers that it may match the study level of a preliminary feasibility study ("PFS"). The PFS proposed that the in-situ leaching mining method would be adopted to develop the project, with wet smelter facilities to further process the leaching solutions to finally produce REE oxide for sales to the buyers in China. The proposed production capacity is 3,675 tonnes ("t") per annum.

Chixia Laos obtained a trial production license over 8 square kilometres ("km<sup>2</sup>") of the deposit, and has been constructing the mining and processing facilities for the production.

SRK opines that the current resource basis can support a preliminary economic assessment on the project. SRK reviewed the PFS and held discussions with related technical personnel of the project, using the parameters proposed in the PFS with some modification, and projected that the project is economically viable.

SRK recommends that a supplemental exploration program should be conducted to enhance the resource category, and then a feasibility study should be conducted based on the updated resources.

## Operational Licences and Permits

LXML owns a copper and gold exploration permit which covering the Sepon REE Project.

SRK sighted a trial mining license for the Mengkham mine site, and land use agreements with the locals. Other licenses and permits including water use permit or site discharge permit are under the application.

## Geology and Mineralization

Rare earth elements ("REE") typically refer to the 15 lanthanide elements on the periodic table from lanthanum (La) to lutetium (Lu) and the transition metals scandium (Sc) and yttrium (Y) due to the similarity of the chemical property. From industrial development perspective, scandium is typically excluded from REE mineral development operations as it's normally not the paragenetic mineral with the lanthanide rare earth elements. The promethium (Pm) is also not included in the mineral development due to its radioactive property.

Ion-adsorption rare earth deposit is formed through weathering and leaching of minerals bearing rare earth elements from primary rocks, typically in tropical climates. Rare earth elements leached from granitic or alkaline igneous rocks were adsorbed onto clay minerals in soil, sometimes forming economically viable deposits.

### Sepon

The content of total rare earth oxides ("TREO") gradually decreases from top to bottom, the upper part can be enriched into a rare earth ore body, and the end hole position of a small part of the drill hole has a higher grade, and it may not be able to penetrate the weathering layer. The elevation of the ore body is between 240 and 410 meters ASL, the lowest erosion base level in this area is 210 meters, and the ore body is above the lowest erosion base level. The depth of the ore body is generally 0-5 meters. The TREO grade ranges from 310 to 830 g/t, averaging 440 g/t.

### Mengkham

The geological layers were summarised as the completely weathered layer, semi-weathered layer and the fresh layer, with the completely weathered layer being the main ore-bearing layer. The top of the mineralised zone is defined by a thin surficial soil zone that averages 2 m in thickness. The base of the mineralised zone extends to an average vertical depth of 9.0 m. And the SREO grade range from 9.5 to 2,857 g/t, averaging 243.5 g/t.

## Exploration Status

The procedures for sample collection, preparation, and analysis are following the REE industry standards. SRK considers that the procedure, as well as the data and information obtained, are acceptable for resource estimation purposes.

### Sepon

For Sepon project, LXML Exploration Department conducted an exploration program from November 2021 to July 2022. A total of 607 boreholes (4,441 metres) were drilled during the exploration on a 200-metre x 100-metre or 100-metre x 100-metre pattern.

Sampling was conducted as well, and the whole drilling core was taken as sample at 1m interval by using the method of diagonal quarters to reduce the sample, with one half as the sample for assaying, and the other half as the spare sample for storage. The samples were all properly numbered, recorded before sent out to the labs.

All basic assaying samples (TREO) were prepared and assayed in the ALS lab in Australia. The assaying method is ME-MS81. Quality Control and Assurance ("QA/QC") procedures were undertaken on an on-going basis to certify that the assay results from the drilling programme would be confidently relied upon. These procedures included the insertion of QA/QC samples comprising standards or Certified Reference Materials (CRMs), i.e., material containing known quantities of the element being assayed for; blanks i.e., material that has been prepared known to contain trace material; and duplicates.

In the general exploration report, 10 specific gravity samples were also taken from drilling cores and were measured in the lab of the mine. In SRK's opinion, it was unable to collect density sample from GN Auger hole cores. A dry bulk density of 1.5 t/m<sup>3</sup> was used in resource estimation for Sepon project.

### **Mengkham**

For Mengkham REE Project, Longyan Dadi Mining Development Service Co., Ltd conducted an exploration program from January 2022 to December 2023. A total of 13,656 boreholes (198,957 metres) were drilled during the exploration, which were spaced 30-100 m apart.

Before sample collection, a quick test procedure was conducted on-site to identify REE mineralized intervals. This test dissolved REE ions in clay using ammonium sulphate and oxalic acid to obtain a precipitate. The samples were collected and prepared according to the Chinese Rare Earth Mineral Geological Exploration Standard (DZ/T0204-2022). All samples were analysed (SREO) in the mine lab onsite with the method of Ethylene Diamine Tetraacetic Acid ("EDTA") volumetric.

A total of 6,017 samples (about 6% of the samples used in Mineral Resource estimation) were collected as internal lab check samples with a pass rate of 82%. And a total of 3,500 samples (about 4% of the samples used in Mineral Resource estimation) were collected as internal lab check samples with a pass rate of 92%.

SRK conducted a data verification program and collected 169 core duplicate samples from 13 boreholes in Mengkham REE project. The results showed that bias was observed between original assay and verification results. SRK has checked with both onsite laboratory and SGS staff, found that the sample preparation and assaying method were different. SRK has downgraded Indicated Mineral Resources to Inferred Mineral Resource.

A total of ten bulk density samples were implemented across the project areas with the natural bulk density (wet basis) ranging from 1.7 to 1.81 t/m<sup>3</sup>, averaging 1.75 t/m<sup>3</sup>, dry bulk density ranging between 1.35 and 1.55 t/m<sup>3</sup>, averaging 1.47 t/m<sup>3</sup>.

### **Mineral Resource Estimates**

The resource estimation methodology involved consolidating and verifying borehole and topographic data. Wireframe models delineated mineralization boundaries based on assay data and lithology. Resource domains were defined, and sample results were composited and capped for statistical

analysis. Block models were interpolated, and resources classified and validated to determine economic prospects and cut-off grades.

Based on the Reasonable Prospects of Eventual Economic Extraction ("RPEEE") assessment and considering the characteristics of the leaching mining method, SRK used a cut-off grade of 170 g/t TREO for Sepon project to report Mineral Resources and a cut-off grade of 100 g/t SREO for Mengkham project, based on a price of 239,000 RMB/t REO.

As of 30 September 2024, by applying a cut-off grade of 170 g/t TREO, the Mineral Resources SRK estimated and reported are as follows:

- 26.78 Mt of Indicated Mineral Resource with an average grade of 383.75 g/t TREO, equivalent to 10.28 kt of total rare earth oxides within the Project area.
- 63.79 Mt Inferred Mineral Resource with an average grade of 339.22 g/t TREO, equivalent to 21.64 kt of total rare earth oxides within the Project area.

**Table ES- 1: Mineral Resource Statement<sup>1</sup> of Sepon REE Project, as of 30 September 2024**

Category	Tonnage (Mt)	TREO (g/t)	TREO (kt)	PrNd Oxides (%)	MREO(%)	CREO(%)
Indicated	26.78	383.75	10.28	19.14	21.97	33.87
Inferred	63.79	339.22	21.64	18.78	21.45	32.59

**Notes:**

<sup>1</sup> Mineral Resources are not Ore Reserves and have not demonstrated economic viability. All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

<sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Huaixiang Li and Dr. Anson Xu who are full time employees of SRK Consulting China. Mr. Huaixiang Li is a Member of AIG and Dr. Anson Xu is a Fellow of AusIMM. Dr. Xu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined by JORC Code (2012). Mr. Li and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>3</sup> Mineral Resources are reported at a cut-off grade of 170 g/t TREO. Cut-off grades are based on a price of 239,000 RMB/t REO.

<sup>4</sup> MREO: Pr<sub>6</sub>O<sub>11</sub>+Nd<sub>2</sub>O<sub>3</sub>+Tb<sub>4</sub>O<sub>7</sub>+Dy<sub>2</sub>O<sub>3</sub>.

<sup>5</sup> CREO: Nd<sub>2</sub>O<sub>3</sub> + Eu<sub>2</sub>O<sub>3</sub> + Tb<sub>4</sub>O<sub>7</sub> + Dy<sub>2</sub>O<sub>3</sub> + Y<sub>2</sub>O<sub>3</sub>, determined by US Department of Energy 2023.

<sup>6</sup> TREO: Total Rare Earth Oxides include Y<sub>2</sub>O<sub>3</sub>+ La<sub>2</sub>O<sub>3</sub> + CeO<sub>2</sub> + Pr<sub>6</sub>O<sub>11</sub> + Nd<sub>2</sub>O<sub>3</sub> + Sm<sub>2</sub>O<sub>3</sub> + Eu<sub>2</sub>O<sub>3</sub> + Gd<sub>2</sub>O<sub>3</sub> + Tb<sub>4</sub>O<sub>7</sub> + Dy<sub>2</sub>O<sub>3</sub> + Ho<sub>2</sub>O<sub>3</sub> + Er<sub>2</sub>O<sub>3</sub> + Tm<sub>2</sub>O<sub>3</sub> + Yb<sub>2</sub>O<sub>3</sub> + Lu<sub>2</sub>O<sub>3</sub>.

The project is in the construction and commissioning phase, and currently, no REE oxides are available for sale.

As of 30 September 2024, applying a cut-off grade of 100 g/t SREO, the Mineral Resources of Mengkham project are as follows:

- 139.05 Mt Inferred Mineral Resource with an average grade of 241.79 g/t SREO, equivalent to 33.62 kt of soluble rare earth oxides within the Project area.

**Table ES- 2: Mineral Resource Statement<sup>1</sup> of Mangkham REE Project, as of 30 September 2024**

License	Category	Dry BD (t/m <sup>3</sup> )	Tonnage (Mt)	SREO (g/t)	SREO (kt)
Trial Mining	Inferred	1.47	55.59	267.75	14.88
Exploration	Inferred	1.47	83.47	224.51	18.74
<b>Total</b>	<b>Inferred</b>	1.47	139.05	241.79	33.62

**Notes:**

<sup>1</sup> Mineral Resources are not Ore Reserves and have not demonstrated economic viability. All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

<sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Huaixiang Li and Dr. Anson Xu who are full time employees of SRK Consulting China Ltd. Mr. Huaixiang Li is a Member of AIG and Dr. Anson Xu is a Fellow of AusIMM. Dr. Xu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined by JORC Code (2012). Mr. Li and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>3</sup> Mineral Resources are reported at a cut-off grade of 100 g/t SREO. Cut-off grades are based on a price of 239,000 RMB/t REO.

## Ore Reserve Estimates

For Sepon REE Project, the current study indicates that the project would not be financially feasible. Following discussions with LXML, it has been decided that only Mineral Resources will be reported in the report.

According to the JORC 2012, only Measured Resources and Indicated Resources can be considered when estimating Ore Reserves. In this case of Mengkham Ion Rare Earth Project, based on SRK's resource review and re-estimate, all of the Mineral Resources of the Mengkham REE Project are categorized as Inferred Mineral Resources. The mineral resource basis may only support a preliminary economic assessment to analyse the project's potential economics. Therefore, there is no Ore Reserve for the Mengkham REE Project.

### For Mengkham REE Project only

## In-situ Leaching Mining

CHIXIA Laos commenced to operate a leaching test in March 2024. The leaching test facilities were constructed basically according to the design proposed in a preliminary feasibility study ("PFS") to develop the project. SRK reviewed the PFS and visited the leaching test facilities. CHIXIA Laos used in-situ leaching mining to extract REEs from the deposits, The process of the in-situ leaching mining involves mainly two parts: leaching solution injection and pregnant leach solution ("PLS") collection.

**The injection system** introduces a leaching solution into the ore body to dissolve the REEs through injection holes. The leaching solution enters the ore body via holes and absorbs the REEs.

**The collection system** consists of a series of tunnels and/or collection holes under the ore body to gather the PLS, which is then pumped to the plant for further processing via pipes.

The key technical parameters listed in Table ES- 3 below are summarized based on the PFS with SRK's modification.

**Table ES- 3: In-situ Leaching Mining Design Parameters, as of 30 September 2024**

<b>Design Parameter</b>	<b>Unit</b>	<b>PFS's Inputs</b>	<b>SRK's Inputs</b>
<b>Overall</b>			
In-situ Leaching Mining Recovery	%	90.0	90.0
Processing Recovery	%	85.5	85.5
Overall Recovery	%	77.0	77.0
Wet Plant – REO	tpa	3675 & 2800	3675 & 2800
PLS Capacity	million m <sup>3</sup> pa	16.3 & 11.6	16.3 & 11.6
<b>In-situ Leaching Mining</b>			
Average Orebody Depth	m	8.7	7.9

Design Parameter	Unit	PFS's Inputs	SRK's Inputs
Injection Holes	m	4.0	4.0
Injection holes Cover Area	m <sup>2</sup>	5.0	5.0
Collection Tunnel Cover Area	m <sup>2</sup>	3.5	3.5

Source: CHIXIA

## Mining Schedule

A mining schedule has been planned in terms of the proposed processing capacity as shown in Table ES- 4.

**Table ES- 4: Mining Schedule of the CHIXIA Project**

Section	Unit	Total	2024	2025	2026	2027	2028	2029	2030	2031
Tonnage	kt	138,040	4,620	19,700	18,040	19,590	19,650	25,020	19,150	12,270
Grade (SREO)	g/t	239.42	221.94	266.10	236.15	237.71	218.51	220.33	263.75	245.12

Source: SRK

## Metallurgical Testing and Recovery Methods

The Mengkham ore belongs to the ion-adsorbed type rare earth ore, with average soluble rare earth oxide ("SREO") content of 0.025%. The minerals are mainly quartz, feldspar, biotite, ilmenite, magnetite, followed by zircon, apatite, xenotime, fluorite, sphene minerals and so on.

A simple laboratory column leaching test had been conducted on the samples from #2 ore body. The results showed that the permeability coefficient is  $0.89 \times 10^{-3} \sim 1.11 \times 10^{-3} \text{cm/s}$  and the pregnant leaching solution ("PLS") concentration can reach 2.0 g/L with the SREO leaching rate of about 94%.

The PLS undergoes four steps of processing to yield primary product of rare earth carbonate ("REC"), which will be sent to the calcination workshop to produce mixed rare earth oxide ("REO"). The residue generated from the processing will be dissolved by acid to recycle REO, which would improve the REO processing recovery and the economic benefits.

The full production capacity of the first hydrometallurgical plant is 3,675 tpa REO, and SRK deems that it is appropriate. The designed total recovery was 77%, with the ISL rate of 90% and the hydrometallurgical recovery rate of 85.5%.

After the review of all design data and site visit for the Project, SRK comes to the following conclusions and recommendations:

- Representative ore samples from each ore body should be taken to carry out test studies before production, and add the following experimental contents:
  - i. SREO content analysis of ore samples, and
  - ii. PLS purification and precipitation tests to determine the purification and precipitation conditions and reagents consumption.
- Three hydrometallurgical plants and one calcination plant are planned to be built during the life of mine. The Project had completed most of the construction of the Leaching Test Plant until May 2024, except for the filter press workshop and calcination workshop. Additionally, North Plant

with production capacity of 3,675 tpa REO and South Plant of 2,800 tpa REO are scheduled to be constructed in 2026 and 2028, respectively.

### Environmental and Social Aspects

Currently what are identified as part of the project assessment and this SRK review would include:

- Environmental approval to be obtained;
- Water pollution; and
- Mine closure fund to be established.

It is SRK's opinion that the above environmental risks are categorised as medium risks (i.e., requiring risk management measures) and they are generally manageable.

### Capital Expenditures and Operating Expenses

The estimated Capex primarily encompasses the main production facilities of three hydrometallurgical plants, public auxiliary facilities and other engineering construction expenses (mainly associated with the mining rights or licence cost).

The total estimated Capex over the LOM is RMB130.32 million, which includes the historical investment of RMB66.35 million, the sustaining investment of RMB 48.80 million and the closure investment of RMB15.17 million. Table ES- 5 summarized the Capex breakdown for the Project.

**Table ES- 5: The Capex Breakdown for the Mengkham REE Project (Unit: RMB M)**

Item	Historical Investment	Sustaining Investment	Closure Investment	Total
Hydrometallurgy Plant Construction	7.93	25.80	-	33.73
Public Auxiliary Facilities	19.44	13.00	-	32.44
Engineering Construction Other Expenses	38.98	10.00	-	48.98
Closure Investment	-	-	15.17	15.17
Subtotal Investment	66.35	48.80	15.17	130.32

The project's cash Opex primarily include workforce employment, consumables, fuel & electricity & water and other services, on and off-site administration, environmental protection and monitoring, transportation of workforce, product marketing and transport, non-income taxes & royalties & other governmental charges and contingency allowances.

Table ES- 6 summarized the forecasted Opex for the Project, with a total Opex of RMB4,264.61 million and a unit cost of approximately 30.90 RMB/t RoM or 167,697 RMB/t REO. All costs are current as of 30 September 2024, with no escalation factored in.

**Table ES- 6: Forecasted Opex of the Mengkham REE Project**

Item	LOM Total Cost (RMB M)	Unit Cost (RMB/t RoM)	Unit Cost (RMB/t REO)
Workforce employment	150.80	1.09	5,930
Consumables	2,020.41	14.64	79,448
Fuel, electricity, water and other services	153.65	1.11	6,042
On and off-site administration	29.65	0.21	1,166

Item	LOM Total Cost (RMB M)	Unit Cost (RMB/t RoM)	Unit Cost (RMB/t REO)
Environmental protection and monitoring	30.52	0.22	1,200
Transportation of workforce	5.48	0.04	216
Product marketing and transport	38.15	0.28	1,500
Non-income taxes, royalties and governmental charges	1,613.60	11.69	63,451
Contingency allowances	222.35	1.61	8,743
Total	4,264.61	30.90	167,697

### Preliminary Economic Analysis

The Discounted Cash Flow (“DCF”) method was used for the economic analysis, as the project is under the construction and pre-operation stage with a completed PFS. It is important to note that the purpose of this analysis is solely to demonstrate the economic viability of the project. The derived NPVs do not indicate the fair market values or the profitability of the projects. The estimated cash flows and NPVs were presented on an after-tax basis, and financing costs were not considered.

The net present value (“NPV”) of RMB471.23 million at 10% discount rate was estimated by SRK through DCF model. The NPVs based on different discount rate were also estimated, presented in Table ES- 7, which has demonstrated the economic viability of the Project.

**Table ES- 7: Estimated NPVs at Different Discount Rate (Unit: RMB M)**

Discount Rate	8%	9%	10%	11%	12%
NPV	527.96	498.69	471.23	445.47	421.26

Sensitivity analysis was conducted on Capex, Opex and price. The result indicates the NPV is most sensitive to price, followed by Opex and Capex.

### Risk Assessment

The results of the risk assessment rating are presented in Table ES- 8 below. The rating of the risks is presented before implementation of control recommendations.

**Table ES- 8: Project Risk Assessment of the Mengkham REE Project**

Risk Source/Issue	Likelihood	Consequence	Overall
<b>Geology and Resource</b>			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Possible	Major	High
Unexpected Groundwater Ingress	Unlikely	Minor	Low
<b>Mining</b>			
Subsidence and Ground Stability	Possible	Moderate	Medium
Hydrogeological Modeling Uncertainties	Unlikely	Moderate	Low
Significant Production Shortfalls	Unlikely	Major	Medium
Significant Geological Structure	Possible	Minor	Low
<b>Ore Processing</b>			
Lower Recovery	Unlikely	Moderate	Low

<b>Risk Source/Issue</b>	<b>Likelihood</b>	<b>Consequence</b>	<b>Overall</b>
High Production Cost	Possible	Minor	Low
Poor Plant Reliability	Unlikely	Minor	Low
<b>Capital and Operating Costs</b>			
Project Timing Delays	Possible	Minor	Low
Capital Cost and Operating Cost Increases	Possible	Moderate	Medium
High mine closure cost	Possible	Moderate	Medium
<b>Environmental, Social and Permitting</b>			
Environmental approval to be delayed	Possible	Moderate	Medium
Water eutrophication	Possible	Moderate	Medium
Fund not available and without proper mine closure	Possible	Moderate	Medium

Some medium to high risks have been identified for the Project. Two high risks are "Lack of significant Ore Reserves" and "Capital Cost and Operating Cost Increases". To manage the risks, SRK recommends the Company should further conduct supplemental exploration programs following guidelines of the best practice to improve the mineral resource basis, and then conduct a feasibility study.

## **Recommendations**

### **Geology and Mineral Resources**

The core drilling and geological logging were carried out to a standard that ensures the data and information collected sufficiently support the goals of subsequent geological modelling and resource estimation.

SRK considers that the depth capacity of manual auger drilling may not be enough to penetrate potentially semi-weathered hard layers or boulders. This limitation could potentially result in incomplete intersections of the ore-bearing horizon during drilling.

#### **Sepon**

Looking ahead, the Sepon REE mine is considering in-situ leaching to be their main extraction technique. However, the available data, which only includes 8 ionic analyses, falls short in providing an accurate estimate of the mine's potential and productivity. The scant data does not paint a holistic picture of what the mine can offer. For this reason, SRK suggests a re-analysis of the ionic REE grade. Through this, a clearer view of the mine's potential can be ensured, which is crucial in devising and executing efficient mining plans.

#### **Mengkham**

SRK considers that the rapid test method, which entails visually observing rare earth precipitates before conducting core sampling for laboratory analysis, is qualitative in nature. This approach serves merely as an initial indication to assess the mineralization within the sampled core interval. Due to its inherent subjectivity, this method may result in overlooking certain shallow-occurring intervals containing REE sufficient for subsequent laboratory testing, potentially leading to an underestimation of orebody thickness.

The 1:5,000 topographic aerial survey only covered an area of 2.3 km<sup>2</sup>. SRK suggests the mine to conduct a detailed topographic survey covering the whole project area.

The mine's current approach is to analyse all basic samples in the lab onsite. While this might be convenient and efficient, it may not provide the most accurate results. Large bias was observed between original assay and SRK verification results. It is recommended that all the samples should be sent to a qualified laboratory for assaying again.

There are merely 30 samples that possess REE compositions. This limited number prompts SRK to recommend that the mine increase its efforts in conducting more composition analyses. This is to ensure a more reliable and expansive dataset for evaluation purposes.

SRK also recommends carrying out more research on structure or fault system. This is because faults may have a substantial influence on the in-situ leaching mining method.

### **Prefeasibility Study**

SRK would recommends the Company to conduct a prefeasibility study on the Mengkham REE Project once the supplemental exploration programs and resource update have been completed to optimize the development scheme of the project.

## 1 Introduction

SRK Consulting China Ltd. (“**SRK**”) was requested by Chifeng Jilong Gold Mining Co., Ltd. (“**Chifeng Gold**” or the “**Client**”) to prepare a Competent Person’s Report (“**CPR**” or the “**Report**”) for its Sepon REE Project and Mengkham REE Project (the “**Projects**” ) located in Savannakhet Province, and Xiengkhouang Province, Lao People’s Republic (“**Laos**”), respectively, in accordance with the guidelines of the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves, 2012 edition (“**JORC Code (2012)**”) and the Rules Governing the Listing of Securities on The Stock Exchange of Hong Kong Limited (the “**HKEx**”).

The projects include exploration licenses, mining licenses, currently in-situ leaching mine, and associated ore processing and metallurgic plants under construction and metallurgical leach testing. The Sepon REE project is currently operated by Lane Xang Minerals Limited (“**LXML**”), which is a subsidiary of Chifeng Gold. The Mengkham REE project has a trial mining permit and an exploration permit, which are held by China Investment Rare Earth Mining Co., Ltd. and China Investment Rare Earth Mining XiangKhouang Co., Ltd., respectively. China Investment Mining (Laos) Sole Co., Ltd. holds an 86% equity interest in both China Investment Rare Earth Mining Co., Ltd. and China Investment Rare Earth Mining XiangKhouang Co., Ltd. Since March 2024, Chixia Laos Holdings Limited (“Chixia Laos”) has been in the process of acquiring a 90% equity interest in China Investment Mining (Laos) Sole Co., Ltd.

This report consists of an independent review of the geology, exploration, mineral resources, Ore Reserves, mining, mineral processing and smelter-refinery, capital investment, operating cost, and environmental and social aspects of the Projects. The mineral resource statement reported herein was prepared in conformity with JORC (2012).

## 2 Program Objectives and Work Program

### 2.1 Purpose of the Report

The purpose of this Report is to provide both existing Chifeng Gold shareholders and potential investors with a CPR of the Sepon REE Project and Mengkham REE Project in Laos. The SRK's report is proposed to provide an unbiased technical assessment of the risk associated with the Project.

### 2.2 Scope of work and Reporting Standard

#### 2.2.1 Scope of Work

The scope of work, as defined in letters of engagement executed in November 2022 and in May 2024 between Chifeng Gold and SRK, includes the reviewing/updating of mineral resource models for the REE mineralization, delineated on the Projects, and reviewing of a prefeasibility study done on the Mengkham REE project and preparation of a CPR in compliance with JORC (2012) and the listing requirements of the HKEx. This work involved the assessment of the following aspects of the Projects.

- Regional, local and mine geology
- Exploration history, quality and independent data verification
- Geological modelling, mineral resource estimation and validation
- Mining assessment
- Processing and mineral recovery, smelter and refinery
- Environmental and social
- Operating and capital costs; and economic analysis
- Preparation of a Mineral Resource Statement and an Ore Reserve Statement, if any
- Recommendations for additional work

#### 2.2.2 Basis of Technical Report

This report is based on information collected by SRK during site visits carried out in December 2022 and May 2024 and on additional information provided by the Company throughout the course of SRK's investigations. SRK has no reason to doubt the reliability of the information provided by the company. Other information was obtained from the public domain. This technical report is based on the following sources of information:

- Discussions with personnel of the Sepon and Mengkham REE Projects
- Inspection of the Sepon and Mengkham REE Projects area, including outcrop and drill core
- Review of exploration data collected by the Company
- Additional information from public domain sources

This report has been prepared to accommodate the requirements of HKEx, and the Mineral Resources and Ore Reserves are reported according to the JORC (2012), which is binding upon all Australasian Institute of Mining and Metallurgy ("AusIMM") members.

### 2.2.3 Site Visit

SRK conducted site visits to both projects. During the period from 9 to 14 December 2022, SRK's personnel conducted site visits to the Sepon Project, gathered data and interviewed related personnel who conducted exploration and feasibility study on the project. During the period from 13 to 16 May 2024, SRK further conducted a site visit to the Sepon REE Project including an examination of historical drill holes. No relevant production equipment was observed on site. The Sepon Project is an exploration project, and during the exploration process, sampling activities might take place. During the period from 9 to 11 May 2024, SRK conducted site visits to the Mengkham REE project, inspected and observed the status of the project, held meetings with the managements and technical personnel, sighted geology, exploration, mineralization, the mining, ore processing and metallurgic facilities in construction and metallurgical leach testing, as well as conducted its own data verification programs, and assessed environmental and social aspects.

SRK was given a full access to relevant data and conducted interviews with Sepon/Mengkham REE Project personnel to obtain information on the past exploration work, to understand procedures used to collect, record, store and analyse historical and current exploration data, as well as operating issues and data.

### 2.2.4 Reporting Standard

This Report has been prepared to the standard of, and is considered by SRK to be, a Technical Assessment Report under the guidelines of the 2015 edition of the *Code for Technical Assessment and Valuation of Mineral Petroleum Assets and Securities for Independent Expert Reports* (the "Valmin Code"). The Valmin Code incorporates The JORC Code for the reporting of Mineral Resources and Ore Reserves and is binding upon all the Australasian Institute of Mining and Metallurgy ("AusIMM") members.

This Report is not a Valuation Report and does not express an opinion as to the value of mineral assets. Aspects reviewed in this Report do include product prices, socio-political issues and environmental considerations; however, SRK does not express an opinion regarding the specific value of the assets and tenements involved.

In this Report, identified Mineral Resources and Ore Reserves are quoted using categorisation in accordance with the JORC Code. However, it should not be assumed that these Mineral Resource and Ore Reserve Estimates have necessarily been carried out in accordance with the guidelines and recommendations laid out in the JORC Code, at least until further documentation can be obtained on the estimates and they have been formally endorsed by a "Competent Person" in accordance with the JORC Code.

## 2.3 Limitations Statement

SRK is not professionally qualified to opine upon and/ or confirm that the Client has 100% ownership of its underlying tenement and/ or has any unresolved legal matters relating to any transfer of

ownership or associated fees and royalties. SRK has therefore assumed that there are no legal impediments regarding the existence of the relevant tenements and that the Client has legal right to all underlying tenements as purported. Assessing the legal tenures and rights to the prospects of the Client and or any of its subsidiary companies are the responsibility of legal due diligence conducted by entities other than SRK.

## 2.4 Effective Date

SRK's opinion contained herein and effective as of **30 September 2024**, is based on information collected by SRK throughout the course of SRK's investigations. The information in turn reflects various technical and economic conditions at the time of writing this report. Given the nature of the mining business, these conditions can change significantly over relatively short periods of time. Consequently, actual results may be significantly more or less favourable.

This report may include technical information that requires subsequent calculations to derive subtotals, totals, and weighted averages. Such calculations inherently involve a degree of rounding and consequently introduce a margin of error. Where these occur, SRK does not consider them to be material.

## 2.5 Work Program

The scope of work, as defined in letters of engagement reached in November 2022, and May 2024 between Chifeng Gold and SRK, includes the reviewing and estimating of the mineral resource of the REE mineralisation delineated within the Sepon Project' tenements and the Mengkham REE project, and reviewing of a preliminary feasibility study on the Mengkham REE project, and the preparation of a CPR on the projects in accordance with JORC (2012) and the listing requirements of the HKEx.

SRK conducted the work programs on the projects in phases:

**Phase 1:** SRK conducted a desktop review on the documents provided by the client, before conducting the site visits the project site;

**Phase 2:** SRK conducted site visits to both projects. During the period from 9 to 14 December 2022, SRK's personnel conducted site visits to the Sepon Project, to gather data and interview related personnel who conducted exploration and feasibility study on the project. During the period from 13 to 16 May 2024, SRK further conducted a site visit to the Sepon REE Project. During the period from 9 to 11 May 2024, SRK conducted site visits to the Mengkham REE project, inspected and observed the status of the project, held meetings with the managements and technical personnel, sighted geology, exploration, mineralization, mining, ore processing and metallurgic facilities in construction and metallurgical leach testing, as well as conducted its own data verification programs, and assessed environmental and social aspects.

**Phase 3:** SRK team reviewed the information provided by Chifeng Gold, and estimated mineral resources and reviewed the preliminary feasibility study on the Mengkham REE project, conducted a preliminary economic assessment on the project, and compiled a technical report about the projects, and submitted it to the client for comments in June, August and November 2024.

SRK will further revise the report based on the feedbacks from the client and related third parties, and will finalize it in the due course.

## 2.6 SRK Experience

The SRK Consulting Group (“SRK Consulting”) is an independent, international consulting practice that provides focused advice and solutions to clients, mainly from earth and water resource industries. For mining projects, SRK Consulting offers services from exploration through feasibility, mine planning, and production to mine closure.

Among the company’s more than 1,500 clients are most of the world’s major and medium-sized metal and industrial mineral mining houses, exploration companies, banks, petroleum exploration.

Formed in 1974 in Johannesburg, South Africa, SRK Consulting now employs more than 1,800 professionals internationally in 42 permanent offices across 20 countries on six continents. A broad range of internationally recognised associate consultants complements the core staff.

SRK Consulting employs leading specialists in each field of science and engineering. Its seamless integration of services, along with its global base, has made the company a world leader in due diligence, feasibility studies, and confidential internal reviews.

SRK Consulting’s independence is ensured by the fact that it holds no equity in any project and that its ownership rests solely with its staff. This enables the company to provide its clients with objective, conflict-free recommendations on crucial judgement issues.

SRK China was established in 2005 and has three offices located in Beijing, Nanchang and Kunming. Either independently or together with other SRK Consulting offices—especially SRK Australasia, SRK has been providing independent technical services for the Chinese mining companies. SRK has considerable experience at providing Independent Expert Reports for mining companies who have successfully listed on the stock exchanges in Hong Kong, Australia, United Kingdom, Canada, South Africa and the United States.

SRK has provided dozens of independent technical reports for the Chinese mining companies who have completed successfully listed and/or acquired on the Stock Exchange of Hong Kong Ltd., as shown in Table 2-1.

**Table 2-1: SRK’s Reports for Listing on the HKEx**

Company	Year	Nature of Transaction
Yanzhou Coal Limited (listed in HKEx)	2000	Sale of Jining III coal mine to the listed operating company
Chalco (Aluminium Corporation of China)	2001	Listing on HKEx and New York Stock Exchange
Fujian Zijin Gold Mining Group	2004	IPO Listing on HKEx
Lingbao Gold Limited	2005	IPO Listing on HKEx
Yue Da Holdings Limited (listed in HKEx)	2006	Acquisition of shareholding in mining projects in Yunnan, China
China Coal Energy Company Ltd (China Coal)	2006	IPO Listing on HKEx

Company	Year	Nature of Transaction
Sino Gold Mining Limited	2007	Dual Listing on HKEx
Xinjiang Xinxin Mining Industry Co., Ltd	2007	IPO Listing on HKEx
Kiu Hung International Holding Limited	2008	Acquisition of shareholding in coal projects in Inner Mongolia, China
Hao Tian Resource Group Limited	2009	Very Substantial Acquisition of two coal mines in Inner Mongolia, China
Green Global Resources Holdings Ltd	2009	Very Substantial Acquisition of shareholding in one iron project in Mongolia
Ming Fung Jewellery Group Holdings Ltd	2009	Acquisition of shareholding in gold project in Inner Mongolia, China
Continental Holdings Limited	2009	Acquisition of a gold project in Henan, China
North Mining Shares Company Limited	2009	Acquisition of a molybdenum mining project in Shaanxi, China
CNNC International Ltd	2010	Acquisition of a uranium mine in Africa
Sino Prosper Mineral Products Ltd	2010	Acquisition of shareholdings in one gold project in Inner Mongolia, China
New Times Energy Corporation Ltd	2010	Acquisition of shareholding in gold projects in Hebei, China
United Company RUSAL Limited	2010	IPO Listing on HKEx
Citic Dameng Holdings Limited	2010	IPO Listing on HKEx

## 2.7 SRK Project Team

The SRK project team and responsibilities are shown in Table 2-2.

**Table 2-2: SRK Project Team**

<b>Consultant</b>	<b>Title</b>	<b>Discipline and Task</b>
Dr. Anshun Xu	Corporate Consultant (Geology)	Project Manager, whole report, CP
Huaixiang (Hubert) Li	Senior Consultant (Geology)	Geology, Mineral Resource Estimation
Erwei Lu	Consultant (Mining)	Mining Review
Yonggang Wu	Principal Consultant (Mining)	Mining Review, CP
Lanliang Niu	Principal Consultant (Processing)	Processing Review
Xiangfeng Yang	Senior Consultant (Processing)	Processing Review
Yuanhai Li	Principal Consultant (Environment)	Environment, Social, and Permitting Review
Dr Yonglian Sun	Corporate Consultant (Mining)	Internal Peer Review and Quality Control

The short bios of key SRK personnel are shown below:

**Anshun Xu (Anson Xu), Ph.D., FAusIMM**, is a Corporate Consultant (Geology) who specializes in the exploration of mineral deposits. He has more than 30 years’ experience in exploration and development of various types of mineral deposits including Cu-Ni sulphide deposits related to ultra-basic rocks, tungsten and tin deposits, diamond deposits, and REE deposits. He recently completed several due diligence jobs for clients from both China and overseas including technical review projects such as Canadian NI43-101 reports and HKEx IPO technical reports. Dr. Xu was the Projects Manager of this project and the Competent Person (“CP”) who takes overall responsibility for this report.

**Huaixiang (Hubert) Li, MEng, MAIG**, is a senior consultant (geology) with SRK China. He graduated from the China University of Geosciences (Beijing) and has worked in a geological exploration company for more than 6 years and gained lots of experiences and expertise in geological and mineral resources exploration. As a consulting geologist, he has participated a number of metal mineral projects, including exploration design review, data verification, due diligence reviews and mineral resource estimation. He is familiar with the principles and methods for metal ore deposits prospecting and exploration including lithium, gold, silver, PGE, REE, copper, lead, zinc, molybdenum, bauxite, etc. He is proficient in geological modelling, resources estimation, data processing and GIS/RS application. Mr. Li is responsible for the geology, exploration and mineral resources, and is the Competent person of the mineral resources.

**Yonggang Wu, (Mining and Reserves), M.Eng., is a Principle Consultant (Mining)**. He joined SRK after graduation from Jiangxi University of Science and Technology in 2007. He has acquired specialized knowledge in mining engineering, MineSight software and has been involved in various projects to date. He has worked on a wide range of commodities including Au, Ag, Pb, Zn, Mn, Cu, Fe, W, Sn, fluorite, potassium salts, alum, phosphorus, serpentine, and many more. He has accumulated extensive experience in Mineral Resource/ Ore Reserve estimation, pit limit optimization and design, underground mining design, long-term production planning, mining assessment, public facilities and infrastructures assessment and due diligence studies. Yonggang has expertise in geological and mining modelling and is proficient in using MineSight, Surpac, AutoCAD, and other specialized software packages. He has been involved in dozens of independent technical reports, due diligence reports and annual reports to provide investors, decision makers and shareholders with unbiased technical opinions. Mr. Wu supervises Mr. Lu for the mining assessment, and acts as the CP of ore reserves.

**Erwei Lu, M.Eng.;** Consultant (Mining) at SRK China, he obtained his bachelor's degree and master's degree in mining engineering from Central South University. He has over five years of practice of underground operation, and about one year's mineral project evaluation experience. He worked as an on-site mining engineer in Zambia for China Nonferrous Metal Mining (Group) Co., Ltd. after graduation in 2017. He also worked for an autonomous driving application and mineral project investment companies since 2022. He is familiar with large scale underground mobile equipment operation and training, long-hole blasting, mine design and scheduling, and production management, as well as autonomous driving application in open pit mine, and project evaluation. Mr. Lu conducted mining assessment under the supervision of Mr. Yonggang Wu.

**Lanliang Niu, B.Eng., MAusIMM,** is a **Principal Consultant (Mineral Processing)**, who graduated in 1987 from Beijing University of Science and Technology majoring in ore processing. He has worked on the industrial testing of gold leaching with low grade ores, managed or participated in processing and metallurgical testing for more than 10 precious and non-ferrous metals projects. With SRK, he has been responsible for the ore processing and metallurgical scope of work and involved in many key projects. Mr. Niu was responsible for the metallurgical and processing review. Mr. Niu peer reviewed Ms. Xiangfeng Yang's work.

**Xiangfeng Yang, MEng; MAusIMM, Chinese Certified Mine Constructor, Chinese Certified Mineral Right Value, Certified Cost Engineer,** is a Senior Consultant (Mineral Processing) with SRK Consulting China Ltd. She has over 12 years' experience in processing Feasibility Study, processing design and technical consultancy service, especially in industrial minerals including gold, silver, lead, zinc, copper as well as phosphate. She obtained bachelor's degree and master's degree in mineral processing engineering from Jiangxi University of Science and Technology and Wuhan University of Science and Technology, during which she systematically studied the processing flowsheet and plant design on nonferrous metals ore and non-metallic ores. Before joining SRK, she engaged in ore Feasibility Study, preliminary design, construction drawing design and equipment procurement evaluation in Bluestar Lehigh Engineering Institute Co., Ltd and Nanchang Mineral Systems Co. Ltd. She has published several journal papers and utility models, conducted and participated in the plant design of many medium and large phosphate ore, potash salt, sulfide ore, iron ore and other projects. Ms. Yang reviewed the processing and metallurgic aspects, as well as the economic analysis.

**Andy Li, PhD, MAusIMM,** is a **Principal Environmental Consultant** with SRK Consulting China Ltd. Having graduated with a doctoral degree in Environmental Engineering from the Florida State University, he has over 12 years' experience in the environmental engineering field and has worked in various environmental projects in the USA, China, Mongolia, and a number of South Asian countries. He has particular expertise in environmental due diligence reviews, environmental compliance, and impact assessments for mining, mineral processing, refining, and smelting; in contaminated-site assessments and remedial design; in wetland and landfill rehabilitation; and in environmental-risk assessment. He also has extensive experience in water/wastewater treatment design, water distribution systems, and storm water management system design. Dr. Li was responsible for the environmental, permit, social and community review.

**Yonglian Sun, B.Eng. PhD, FAusIMM, FIEAust, CPEng.,** is a Corporate Consultant and a Practice Leader of SRK China. Dr Sun has over 30 years experience in geotechnical engineering and mining engineering in five countries across four continents. He also has extensive international experience in mining project evaluation for project financing and overseas stock market listings. Over the last

decade, Dr Sun has led and coordinated dozens of due diligence projects for many mining companies and most of them have been successfully financed or listed on the HKEx. Dr Sun provided internal peer review to ensure the quality of the report meets the required standard.

## 2.8 Warranties

Chifeng Gold has warranted to SRK that full disclosure has been made of all material information and that, to the best of their knowledge and understanding, such information is complete, accurate and true. SRK has no reason to doubt these warranties.

Based on the information provided by Chifeng Gold, there are no events that have occurred since the Effective Date that are likely to have a material impact on the Mineral Resource and Mineral Reserve statements for the Sepon and Mengkham REE Projects at the date of publication of this CPR.

## 2.9 Compliance Statement

The information in this report that relates to Mineral Resources/Ore Reserves is based on information compiled by Dr. Anshun Xu, a Competent Person who is a Fellow of the AusIMM, and Mr. Yonggang Wu, a Competent Person Who is a Member of the AusIMM. Both are full time employee of SRK Consulting China Ltd.

This Report is a Competent Person's Report in line with the Listing Rules of the Exchange and HKEX.

Dr. Anshun Xu has no prior association with Chifeng Gold in regard to the mineral assets that are the subject of this Report. Dr. Anshun Xu has no beneficial interest in the outcome of the technical assessment being capable of affecting its independence.

Dr. Anshun Xu and Mr. Yonggang Wu have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code".

Dr. Anshun Xu and Mr. Yonggang Wu consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Peer review and quality control of the Report were conducted by Dr. Yonglian Sun, *FAusIMM (CP Eng)*, a Corporate Consultant (Mining and geotech).

## 2.10 Independence Statement

Neither SRK nor any of the authors of this Report have any material present or contingent interest in the outcome of this Report, nor do they have any pecuniary or other interest that could be reasonably regarded as being capable of affecting their independence or that of SRK.

SRK's fee for completing this Report is based on its normal professional daily rates plus reimbursement of incidental expenses. The payment of that professional fee is not contingent upon the outcome of the Report.

SRK has no prior association with Chifeng Gold or Chifeng Gold's employees or in regard to the mineral assets that are the subject of this Report. SRK has no beneficial interest in the outcome of

the technical assessment being capable of affecting its independence. SRK is independent of Chifeng Gold applying all of the tests in 18.21 and 18.22 of the Listing Rules of the Exchange and HKEX.

SRK is not an insider, associate or an affiliate of Chifeng Gold, and neither SRK nor any affiliate has acted as advisor to Chifeng Gold, its subsidiaries or its affiliates in connection with the projects. The results of the technical review by SRK are not dependent on any prior agreements concerning the conclusions to be reached, nor are there any undisclosed understandings concerning any future business dealings.

## **2.11 Consent**

SRK consents to this Report being included, in full, in documents that Chifeng Gold proposes to submit to the HKEX and/ or disclosure to the public markets, in the form and context in which the technical assessment is provided, and not for any other purpose.

SRK provides this consent on the basis that the technical assessments expressed in the Executive Summary and in the individual sections of this Report are considered with, and not independently of, the information set out in the complete Report and the Cover Letter.

## **2.12 Forward Looking Statement**

Estimates of Mineral Resources, Ore Reserves (if applicable), and mine production (if applicable) are inherently forward-looking statements, which being projections of future performance will necessarily differ from the actual performance. The errors in such projections result from the inherent uncertainties in the interpretation of geologic data, in variations in the execution of mining and processing plans, in the inability to meet construction and production schedules due to many factors including weather, availability of necessary equipment and supplies, fluctuating prices, ability of the workforce to maintain equipment, and changes in regulations or the regulatory climate.

The possible sources of error in the forward-looking statements are addressed in more detail in the appropriate sections of this report. Also provided in the report are comments on the areas of concern inherent in the different areas of the mining and processing operations.

### 3 Operational Licenses and Permits

This section summarises related operational licences and permits. SRK relied on the information provided by the Company, and SRK understands that a legal due diligence review of this Project has been undertaken by the Company's legal advisors.

#### 3.1 Sepon REE Project

Currently, LXML possesses an exploration permit with a total area of 996.12 km<sup>2</sup> for copper and gold only, which is valid till June 2026. The exploration permit consists of 66 inflection points which have been provided in Table 3-1 below. Please note that the Sepon REE Project area is located within the southeastern corner of the permitted area, and the REE exploration permit application is in process. REE exploration activities is intended to be carried out upon the approval of the application.

**Table 3-1: Inflection Points of Sepon Exploration Permit**

Coordinates (Indian60/UTM zone 48N)								
No.	Easting	Northing	No.	Easting	Northing	No.	Easting	Northing
1	576400	1882200	23	627800	1878000	45	592000	1871800

#### 3.2 Mengkham REE Project

##### 3.2.1 Trial Mining License

Table 3-2 which is renewable, and the scanned copy of the original trial mining license is attached in Appendix A. Please note that the Company is in the process of renewing this license.

**Table 3-2: Trial Mining License**

<b>Name of Mine</b>	Mengkham Rare Earth Mine
<b>Ming License No.</b>	MPL0156
<b>Issued to</b>	China Investment Rare Earth Mining Co. Ltd
<b>Issued by</b>	Ministry of Mine and Energy
<b>Area (km<sup>2</sup>)</b>	8.0
<b>Issuing Date</b>	28 December 2022
<b>Expiry Date</b>	December 2025

### 3.2.2 Exploration Permit

Table 3-3 summarizes the key information of the exploration permit.

**Table 3-3: Exploration Permit**

<b>Name of Mine</b>	Mengkham Rare Earth Mine
<b>Ming License No.</b>	2122 No.3
<b>Issued to</b>	China Investment Rare Earth Mining Xiangkhouang Co. Ltd
<b>Issued by</b>	Ministry of Mine and Energy
<b>Area (km<sup>2</sup>)</b>	42.0
<b>Issuing Date</b>	28 December 2022
<b>Expiry Date</b>	December 2024

### 3.2.3 Other Key Operational Licenses and Permits

The Company has obtained land use agreements with the locals for the site operation, and SRK was provided with sample agreements for review. They include information regarding land area, items for compensation, etc. Other license and permits for water use permit or discharge permit are under application process.

## 4 Accessibility, Climate, Local Resources, Infrastructure and Physiography

The Sepon project is in Sepon County, Savannakhet Province, Lao PDR. The property is situated in the southern part of the Sepon gold and copper Mine.

The Mengkham REE Project is located in Mengkham County, Xiengkhouang Province, Lao People's Democratic Republic. The property is situated between latitudes 19°48' and 19°51' north, and between longitudes 103°39' and 103°41' east.

The locations of the two projects are shown in Figure 4-1.

**Figure 4-1: Locations of The Sepon and Mengkham REE Projects**

Source:SRK

## 4.1 Sepon Rare Earth Element Deposit

### 4.1.1 Accessibility

The Sepon REE project is in Savannakhet province, south-central Laos (Figure 4-2). Access to the project area from Vientiane, the capital of Laos may take about 1.5 hours flight or about 8 hour drive for a distance about 560 km. There are daily charter flights available between Vientiane and Sepon mine in weekdays. There are also daily flights between Vientiane and Chinese, Vietnam and Thailand cities. Alternate access to the project is about 1 hour flight between Vientiane and Savannakhet and then about 4-hours bus ride between Savannakhet to Sepon.

**Figure 4-2: Location of Sepon REE Project**

Sources: SRK

### 4.1.2 Local Resources and Infrastructure

In the Sepon Project region, the vegetations are abundant with eucalyptus forest and bushes.

Villages are widely distributed in the area, and villagers generally work in agriculture and forestry productions. Rice is the main crop and Manihot is also important crop. Industry is not well developed. Labours are abundant, while technical personnel are absent.

Power line of 220 KV goes through the area and supplies the electricity. Telephones and mobile communication are available.

#### 4.1.3 Climate and Physiography

The climate in the project area belongs to tropic climate with northeast monsoon and southwest monsoon. The raining season relates to the southwest monsoon and is characteristics of heavy rainfall, high temperatures and high moistures, and lasts from mid-April to mid-October. The dry season lasts from mid-October to mid-April in the following year with the characteristics of less rains and relatively lower temperatures and moistures, while the driest season is from mid-November to mid-February of the following year.

#### 4.1.4 Physiography

The Sepon project area has a geomorphology of low-mid mountains. The elevations generally range from 240 to 420m above sea level ("ASL"). The highest point in the mountainous area in the north is 755.0m ASL. In the mine area, the relative elevation differences are about 50 to 100m.

The mountain ranges generally strike near East-West. Water runs from the slope of each side to small streams. During dry the season, most of the small streams are dried out, while the small rivers which the small streams flow into have the running water all year round. The small rivers flow into Sebanghiang River in the foot of the south slope, and the Sebanghiang River flows into Mekong River.

### 4.2 Mengkham REE Project

#### 4.2.1 Accessibility

The project is situated in Longmou Village and Soumont Village, Mengkham County, in the northern part of Xiengkhouang Province (Figure 4-3). There are daily commercial flights available between Vientiane, the capital of Laos, and Phongsavan, the capital of Xiengkhouang Province. Provincial highway, 1C, runs through the mining area, linking Phongsavan and Sangnu, the capital of Houaphan Province. Traveling from Mengkham County town to the project area along highway 1C is approximately 45 kilometers, all of which are winding mountain roads with asphalt surfaces. These roads can be dangerous due to many curved turns. The project is roughly 100 kilometers away from Phongsavan and around 140 kilometres from Sangnu, making transportation generally straightforward. Certain parts of the mining area have been surfaced with sand and stone, allowing for vehicular access in both rainy and dry seasons.

**Figure 4-3: Location of Mengkham REE Project**

Sources: SRK

#### 4.2.2 Local Resources and Infrastructure

Xiengkhouang province is located in the northeast of Laos, bordering Vietnam to the east. The capital is Phongsavan and the province is divided into eight districts. As of 2020, it has a population of 267,179 and covers an area of 15,800km<sup>2</sup>.

Xiengkhouang province is a multi-ethnic region primarily inhabited by Lao Long (Dai), Lao Song (Miao), and Lao Listen (Yao). It has a pleasant climate and fertile land, making it suitable for growing semi-plateau plants, cultivating vegetables, and breeding cattle and other livestock. The province is rich in minerals like iron, antimony, zinc, silver, copper, alluvial gold, and coal.

Traditional industries include silk weaving, bamboo weaving, ironwork, pottery, and food processing. The region is also home to sewing factories, ice factories, beverage factories, sawmills, waterworks, and automobile repairing shops. Rice paddies dot the river valleys and parts of the shallow hills. The Shigang Plain, a famous tourist attraction in Laos, is also located there.

The mine is located near two villages, Longmou and Soumont, which collectively house about 394 households or 2,907 people, including 1,512 men and 1,395 women. The residents primarily engage in farming, hunting, and storekeeping, though the economic condition of the area is relatively poor.

Locals mainly use diesel and gasoline for fuel, which are conveniently supplied in townships, counties, and urban areas. Construction materials such as cement, sand, stone, and steel bars are available in urban areas.

Mobile communication companies, LAO TELECOM and UNITEL, provide domestic and international telephone services within the mining rights area.

The mining area has sufficient power supply with a township power grid. However, due to high power consumption, a new substation is required to supply electricity in the mining area.

#### 4.2.3 Climate

The climate in the area belongs to the Southeast Asian tropical rainforest climate zone, characterized by changeability, long sunshine hours, strong ultraviolet radiation, large diurnal temperature differences, and year-round hot and humid weather. Influenced by the monsoon climate, the year is divided into dry and rainy seasons. The rainy season is from June to October, with occasional thunderstorms and heavy rains, abundant rainfalls, which cause roads muddy, air humid, travel difficult, so it is unsuitable for outdoor geological work. The dry season is from November to the following May. The weather is clear and less rainy, and the temperature is relatively mild, making it the golden season for outdoor geological work. However, in April, it is often continuously hot, which is the highest temperature period of the year. Temperatures hover between 36°C and 43°C. Outdoor activities should be avoided as much as possible to prevent heatstroke. The province of Xiengkhouang belongs to the Laotian plateau, where the temperature varies greatly between day and night in the dry season. From November to February of the following year, the lowest temperature is 5-6°C.

The mining area is relatively high in terrain, with undeveloped surface water bodies. The only recharge source of groundwater is atmospheric precipitation. In addition to running off along the slope into nearby streams, atmospheric precipitation is partly consumed by evaporation and plant transpiration. The remaining part infiltrates down through the loose layer of the Quaternary and the fissures of the weathered crust of the bedrock to form underground seepage, with the recharge degree mainly controlled by the terrain. In areas with steeper terrain, atmospheric precipitation easily forms surface runoff into nearby streams. In areas with relatively gentle terrain, the main method is infiltration, partly recharging deep groundwater. The direction of groundwater seepage in the mining area flows from relatively high to relatively low terrain.

The mining area is located in the mountains and is the watershed area of the hydrogeological units in the region. There are no large-scale surface water bodies, but many mountain streams have developed, branching out like tree branches. There are two types of water source replenishment methods: one is precipitation replenishment, and the other is groundwater seeping out along the bank of the ditch. There are no centralized water outlets. The stream flow gradually increases from upstream (the source is located in the mining area) to downstream. The surface water is clear and transparent, slightly turbid in the rainy season, and the content of mud and sand increases. All areas within the mining area are above the local erosion base level, and there is no impact of surface water on future mining.

**4.2.4 Physiography**

One-fifth of Xiengkhouang province is plains, while the remaining four-fifths consist of mountains and plateaus. The average elevation in the northern part exceeds 1,500 meters above sea level. The highest peak, Bia Mountain, located in Xiengkhouang province, stands at 2,820 meters. Other peaks in the province rise over 2,000 meters.

The northwestern region of the province is rugged, remote, and isolated, with rivers that swell in the rainy season. The Truong Son Mountain range in the eastern part of the province descends gradually from north to south, with an average elevation of 1,200 meters in the south. The Truong Son range acts as the natural boundary between Laos and Vietnam. Areas near the Truong Son range are characterized by highlands and mountains.

## 5 History

### 5.1 Sepon Rare Earth Element Deposit

The REE project of Sepon is located in the southeast of the mining area, with an area of 209km<sup>2</sup>, and is about 20-50km straight line distance from the main mining area. The exploration history is summarized as follows:

From 1995 to 1996, CRAE Company conducted prospective work in this area.

From 1997 to 1998, CRAE Company carried out mapping, water system sediment measurement, block sample analysis, etc. in this area. The highest grade of Au ore found in the grabbed sample is 4.7 g/t.

In 2008, OZ Company carried out mapping work in the western part of this block and delineated the distribution range of granite.

In 2009, OZ Company carried out geological mapping and soil sampling work in the eastern part of the project and delineated the distribution range of granite. During the mapping, silicified conglomerates were found on the surface, the highest Au grade was 2.18 g/t, and sulfide veinlets could be seen in the Highway group sandstone.

In 2021, the exploration department of LXML restarted geological exploration work in the area, carried out geological mapping and physical and chemical measurement work, and found that granite was widely distributed in the area during the mapping and soil measurement, and the granite-covered area had a significant rare earth anomaly, with the characteristics of ion-adsorption type rare earth deposits in the weathering crust.

### 5.2 Mengkham Rare Earth Project

Since 1987, Laos has been carrying out 1:200,000 geological mapping. The 1:200,000 geological map with the code E-48- II (KHANGKHAI AREA) includes the mining area.

In 1988, the Soviet Union and Vietnam published six geological maps for Vietnam, Laos, and Cambodia. In 1990, the United Nations published a 1:500,000 geological map of Laos, a Laos mineral resources distribution map, and explanatory notes. These were edited by the United Nations Economic and Social Commission for Asia and the Pacific ("ESCAP").

In 1991, Peter J. Cook of the British Geological Survey and Dr. Bosay Kham of the Lao Geology and Minerals Bureau published a Lao People's Democratic Republic mineral distribution map (1:1,000,000).

From September 1990 to March 1991, a five-person team from the British Geological Survey created two new English computer databases for geological books and mineral resources of the Vientiane Geology and Minerals Bureau. The creation was supported by the West Asia Development Bank. The team also prepared a new coloured geological and mineral map (1:1,000,000).

With the progress of China's "One Belt, One Road" initiative and funding from the China Geological Survey, Laos completed a 1:1 million geochemical filling map. This filled the gap in the national scale geochemical filling map of Laos. The project collected 1905 geochemical samples in the territory (net

degree 10km×10km). The content of 71 elements was analysed using various testing methods, and geochemical maps and geochemical anomaly maps were compiled.

In 2022, China Investment Mining (Laos) Sole Co., Ltd. organized detailed exploration work. It resulted in a cumulative total of 13,656 drilling holes and approximately 200,000 meters.

From 2022 to 2023, detailed exploration work was carried out in the mining area. The resources of ionic rare earth oxides within the mineral rights range were estimated based on the detailed exploration data.

## 6 Geological Setting and Mineralization

### 6.1 Regional Geology

Tectonically, Sepon and Mengkham REE project lie within the Truongson Fold Belt (or Annamite Cordillera) and the Kontum Massif. The Truongson Fold Belt is a NW elongated belt between South China Terrane and Indochina Terrane (Figure 6-1).

The Truongson Fold Belt is consisted of Early to Middle Palaeozoic sediments and lesser volcanic rocks, interspersed with lesser tectonic slices of metamorphic terranes, bound to the north by the Song Ma-Song Da suture zone and to the south by the NW trending Truongson Fault. The Kontum Massif comprises an Upper Proterozoic basement of ortho- and para-gneiss, crystalline schist and migmatite which abuts the Truongson Fold Belt to the south.

**Figure 6-1: Regional Geology Setting**

The main strata in the region include the Proterozoic low to mid-high grade metamorphic rocks, such as schist, marble and gneiss; Palaeozoic marine volcanic and sedimentary rocks with some continental volcanic and sedimentary rocks, such as limestone, sandstone, siltstone, shale, mudstone and marlstone; Mesozoic continental sedimentary rocks, such as red sandstone and clay; and Cenozoic loose sand and gravel. In the Sepon district, the Truongson Fold Belt is represented by a series of E-W trending basins which are truncated by the NW-striking Truongson Fault (Figure 6-1). Affected by the Fault, NW and nearly S-N striking faults were developed, with some secondary faults striking NE and nearly E-W.

Granitic intrusions have been mapped in the district as well as rhyodacite and andesite dykes and stocks, interpreted to be part of the Late Palaeozoic Variscan Orogeny. At least three phases of around 300 Ma rhyodacite porphyry intrusion are recognised, including a late, quartz-stockwork

veined phase, which is interpreted to be genetically associated with all known Cu and Au mineralisation in the field. Minor remnants of Jurassic to Cretaceous Khorat Basin continental sedimentary rocks unconformably overlie the Palaeozoic marine sedimentary sequences to the east and north, while west of the Kontum Massif and south of the Truongson Fault, Khorat sedimentary rocks are dominant. Cenozoic volcanic rocks unconformably overlie the Palaeozoic rocks to the north-east.

There are abundant mineral resources in the region, including gold, copper, lead-zinc and limestone resources, as well as coal, iron, REE and bauxite resources.

## 6.2 Property Geology

### 6.2.1 Sepon Rare Earth Element Deposit Property Geology

The exposed strata in Sepon area mainly include Archean gneiss, Ordovician Highway Group, Silurian Vang Ngang Group, Devonian calcareous shale and limestone, and Quaternary (Figure 6-2), with the lithological characteristics described as follows:

**Archean gneiss:** This includes biotite gneiss, two mica gneiss, white mica plagioclase gneiss, biotite quartzite, and schist. It is mainly distributed in the southern part of the work area.

**Ordovician Highway Group:** The Highway Group mainly consists of clastic rock marine sedimentary sequences. The lower segment of the Highway Group is mainly composed of thickly bedded feldspar sandstone, irregularly interbedded with a small amount of siltstone, mudstone, and shale. Lenticular, thinly bedded to bedded calcareous sandstone and limestone layers appear at the top of this segment. The composition of the upper segment of the Highway Group is similar to the lower segment, characterized by medium to thick beds (0.1 ~ 1m, averaging 0.4 m thick) blocky quartz-feldspar-mica sandstone interbedded with thin to bedded siltstone, banded siltstone, and mudstone-shale. It mainly distributed in the northern part of the work area.

**Silurian Vang Ngang Group:** The Vang Ngang Group is characterized by very good bedding, thin layers (2 cm-15 cm) and rhythmically bedded red and green siltstone, which is often silicified into flint. Unlike the underlying Highway Group, the sediments of the Vang Ngang Group are non-mica-bearing. The siliceous rock is underlain by a limestone unit, which is typically light gray, fossil-free, massive, and almost devoid of internal structure except for sutures. The top of the Vang Ngang Group is marked by graptolite shale, which is a thin-bedded black carbonaceous shale unit containing common graptolite fossils. The Vang Ngang Group is exposed in a small area in the central-northern part of the work area.

**Devonian calcareous shale and limestone:** A small area of nodular or angular calcareous shale and limestone bedrock is exposed in the middle eastern part of the work area. It is currently believed that the Jaspoid metamorphic rock found in the mining area, which is gold-mineralized, may be related to this.

**Quaternary:** These mainly consist of Quaternary colluvial and alluvial sediments. The colluvial deposits are widely distributed in the broad gentle slopes and footslope areas within the region, mainly composed of residual, slope, alluvial sand, clay and other rock fragments, with a large thickness variation, generally greater than 2m; the alluvial deposits are mainly distributed along rivers

and channels, mainly composed of gravel, sand, and clay, with a large thickness variation, generally greater than 5m.

Folds and fault structures are well developed in this area. According to the direction, the fault structures can be divided into two groups: northeast and northwest. They are large in scale. The northeast faults developed earlier and are of a compressive-torsional nature. They are offset by northwest tension-torsional faults, with displacements ranging from tens to hundreds of meters.

There is intense magmatic activity in the area, mainly composed of granites of Indosinian period. These granites are contemporaneous with the Que Son mixtures in Vietnam. The Permian-Triassic intrusions consist of granites and granodiorites, representing the main stage of the Indosinian orogeny/rise. Magmatic rocks are followed by a small number of andesite veins developed near east-west. The granodiorite and granite bodies are generally distributed in an east-west band, with the mining area mainly divided into two east-west areas, covering an area of about 50 square kilometres.

The ion-adsorption type rare earth ores in this area are housed in the weathering crusts of granodiorite and granite. Granite is directly exposed to the surface, and under surface weathering, the original rock decomposes, and rare earth elements selectively migrate, forming a weathered crust rich in ionic rare earths. The main conditions controlling the development and preservation degree of the weathering crust are climate and topographic conditions.

**Figure 6-2: Local Geological Map of the Sepon Project**

Sources: LXML.

### 6.2.2 Mengkham Rare Earth Project

The strata exposed in the area primarily consist of the Carboniferous, Permian, Triassic, and Quaternary. The area features pronounced faults and folds, vertical and horizontal zoning, cleavage and fault zones, and frequent volcanic activity. As a region favourable for non-ferrous and precious metal mineralization, this area demonstrates significant mineral potential.

The exposed strata in the area are the Carboniferous-Permian Nonghei Group (C-Pnh), the Upper Triassic Namu Group (T3n-rnn), and the Middle Triassic (T2anm2), detailed in Figure 6-3, mainly as follows:

Carboniferous-Permian Nonghei Group (C-Pnh): Grey and black recrystallized limestone, white quartzite.

Upper Triassic Namu Group (T3n-rnn): Coarse conglomerate, quartz sandstone and lenticular peat.

Middle Triassic (T2anm2): Siltstone, mica-bearing sandstone, sheet limestone.

**Figure 6-3: Local Geological Map of the Mengkham REE Project**

Sources: Modified after China Investment Mengkham Rare Earth Minerals Limited.

The North Changshan metallogenic belt where the mine is located is one of the oldest blocks in Indo-China Peninsula. Influenced by the evolution of the Tethys Ocean basin, the main tectonic direction is NW, and secondary EW trending fault structures are developed. The working area is located at the junction of the "T" structure. The Himalayan Indochina plate rotates clockwise to form the right-lateral strike-slip structure which has a profound influence on it.

The magmatic rocks of Mengkham REE Project are mainly Triassic granite and biotite granite, which are also the main ore-bearing horizon of rare earth ore.

Granite: the colour is grey-white, and the main composition is quartz (about 55%) and plagioclase (about 40%). The rock surface is strongly weathered, sand like, sericite, kaolin, rare earth mineralization is weak.

Biotite granite: the colour is clay yellow to grey white, the main composition is Quartz (about 50%), plagioclase (about 35%), biotite (about 15%). The rock surface is strongly weathered and sandy. The local characteristics of the rock are potassium mineralization, sericite mineralization, kaolin mineralization and rare earth mineralization.

## **6.3 Mineralization**

### **6.3.1 Sepon Rare Earth Element Deposit Property Geology**

This deposit is a granite weathering crust ion-adsorption type rare earth deposit. The ore bodies are all in the middle and lower parts of the weathering crust, and the ore from the surface can be seen in a few boreholes. The weathering crust is vertically stratified from top to bottom as completely weathered layer and semi-weathered zone.

Completely weathered layer: brown-yellow, light yellow, light red, and gray-white. The main components are clay and a small amount of quartz. The structure is loose and porous, and the original rock structure is no longer visible. The content of rare earth oxides (TREO) is relatively high, generally between 0.030% and 0.167%. The thickness is generally 3 to 10 meters, mostly 5 to 8 meters. The fully weathered layer is the main location of the rare earth ore body.

Semi-weathered layer: brown-yellow, light yellow, and light red. The main components are clay, a small amount of feldspar weathering residues, and quartz. The original rock structure is still preserved, and the feldspar has a complete shape and is relatively hard. The thickness varies greatly, generally 1 to 3 meters, and the thickest can reach 5 meters. The content of rare earth oxides (TREO) gradually decreases from top to bottom, the upper part can be enriched into a rare earth ore body, and the end hole position of a small part of the drill hole has a higher grade, and it may not be able to penetrate the weathering layer.

The elevation of the ore body is 240 to 410 meters, the lowest erosion base level in this area is 210 meters, and the ore body is above the lowest erosion base level.

The depth of the ore body is generally 0-5 meters. The TREO grade ranges from 310 to 830 g/t, averaging 440 g/t.

Figure 6-4: Section Map of Sepon Project (633610E)

Sources: LXML.

The typical TREO composition chart is presented in Figure 6-5. The approximate range of TREO composition is as follows: praseodymium-neodymium (PrNd) oxides 18.9%, magnet rare earth oxides (“MREO”) 21.62%, and critical rare earth oxides (CREO) account for 33% of the total TREO content (Table 6-1).

Figure 6-5: TREO Composition of Sepon Project

### 6.3.2 Mengkham REE Project

The rare earth minerals in Mengkham area consist of a medium-fine biotite granite regolith. Notably, there are significant differences among the rock regolith. As a result, the ore composition and type are directly linked to the regolith characteristics and its rock types. The weathering crust can be divided into three layers: topsoil, completely weathered zone, and semi-weathered zone. These layers transition gradually, with the ore primarily composed of full regolith and a portion of the topsoil.

**Topsoil:** This layer mainly consists of biotite granite residuum. Its thickness varies, usually thinner at the mountain top and thicker at the slope and foot of the mountain. It often mixes with more Quaternary slope deposits. Its upper part often includes tens of centimeters of humus. The layer, typically about 1-2 meters thick, is mainly gray-brown to black-brown, composed of quartz sand, weathered fragments of biotite granite, clay, and a small amount of biotite and feldspar. Its texture is loose. Generally, this layer doesn't contain rare earth, or it has weak rare earth mineralization.

**Completely weathered zone:** This rare earth bearing mineral layer is the main part of the ore body. It is often flesh-red, light red, and gray white. It largely consists of kaolin, the weathering product of feldspar, mica, and other minerals. A few minerals retain the structure of feldspar and can be easily broken by hand. Rare residual detrital minerals such as quartz, feldspar, and mica make up 1-3%. Other weathered residual accessory minerals like ilmenite, monazite, phosphoyttrite, and zircon constitute less than 1%. Minerals such as sphenite, epidote, and apatite are rare or very rare. The thickness generally ranges from 2.0-15 meters, with an average thickness of 7 meters.

**Semi-weathered zone:** This layer is gray-white, with a granite structure, composed mainly of quartz, feldspar, and biotite. It serves as the bottom of the rare earth layer. The weathering degree of rocks in this layer is weak, with feldspar weathering decreasing and kaolinization common at the edge of feldspar grains, about 30%. Feldspar crystals are relatively complete and generally not easy to crush. This layer typically doesn't contain rare earth ore, or it has weak rare earth mineralization.

The ore body is formed by the weathering of medium-fine grained biotite granite, which is the main ore-forming rock and a product of later alteration, in which the altered residues of medium-coarse grained biotite granite can be seen, indicating that the ore-forming parent rock in this area has

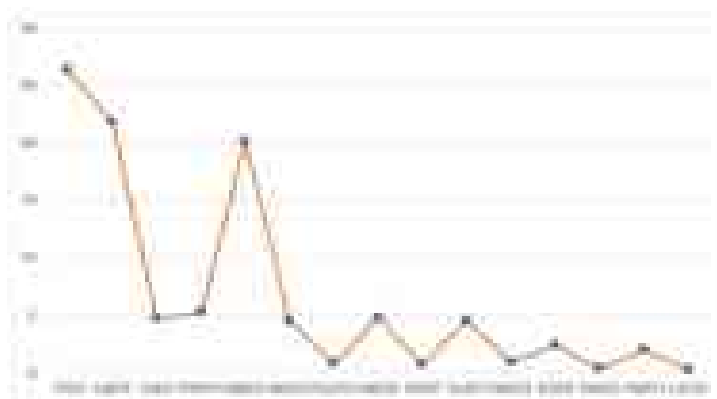

undergone at least two periods of magmatic alteration. The structure within the mining area is simple, and the rock body (ore body) is held between faults extending from northwest to southeast, where no folding structures are seen.

The favorable climate and geographical environment have led to the extensive development and complete preservation of the weathering crust in the mining area; through geological surveys and drilling operations in the mining area, it was found that the rare earth mineralization is influenced by factors such as lithology, uneven weathering, and topography, and the rock weathering intensity varies in both vertical and horizontal directions, causing the rare earth ore (mineralization) to undulate along the terrain. Ores rich in clay minerals have better grades. In terms of individual micro-geomorphological units, the grades are high at the tops and sides of the mountains, and gradually decrease to non-ore bodies towards the valleys and foot of the mountains. The ore (mineralization) body is pseudo-layered, locally lens-shaped, and the continuity of mineralization is general. A complete weathering crust is preserved from the surface soil layer, fully weathered layer, and semi-weathered layer, with the fully weathered layer being the main ore-bearing layer. The thickness of the regolith is between 10 and 32 metres from surface.

At Mengkham the top of the mineralised zone is defined by a thin surficial soil zone that averages 2 m in thickness. The base of the mineralised zone extends to an average vertical depth of 9.0 m. And the SREO grade range from 9.5 to 2857 g/t, averaging 243.5 g/t.

Based on 30 holes composite assays, the typical SREO composition chart is presented in Figure 6-6. The approximate range of SREO composition is as follows: praseodymium-neodymium (PrNd) oxides 25.5%, magnet rare earth oxides ("MREO") 30.84%, and critical rare earth oxides ("CREO") account for 52.77% of the total SREO content (Table 6-2).

## 6.4 Deposit Types

Both Sepon REE Project and Mengkham REE Project are ion adsorption type of REE deposits, which was developed over granite bodies by weathering the rock bodies and transferring and enriching the REEs bearing in the minerals into clay minerals of the weathered zones by adsorption.

The REE-bearing regolith profile provides a vertical cross-section of the soil layers created by weathering and other breakdown processes. The soil profile is generally recognized to have three fundamental layers: Horizons A, B, and C.

Horizon A, the uppermost layer, is typically composed of organic matter, humus, and mineral particles. Its thickness can vary based on factors such as vegetation cover and rainfall. This layer can be further subdivided into smaller sub-layers, including Ah (humus-rich) and Ae (eluvial horizon with leached minerals). Due to leaching and organic complexation (and occasionally chemical reduction), Horizon A usually has low REE concentrations. These processes move REE ions deeper into the soil profile.

Horizon B, the subsurface layer, is enriched with minerals leached from the overlying Horizon A. It serves as the key zone for IAC REE accumulation due to:

- Adsorption onto clay minerals like kaolinite and halloysite, prevalent in Horizon B.
- Chemical conditions conducive to REE precipitation with specific minerals.

Horizon B, a layer essential for rare earth exploration and potential resource extraction, can be further classified based on features such as color and clay content. Factors like rock type, climate, and weathering intensity affect the thickness and rare earth elements (REE) concentration within Horizon B. Often referred to as the main REE-bearing layer within the project area, Horizon B typically occurs approximately 2 to 10 metres below the topsoil and averages about eight metres in thickness.

Horizon C, the layer beneath Horizon B, represents the unweathered or partially weathered parent rock. It contains the original source of REE within the weathered regolith deposits.

The projects area are located in a tropical region with a warm and humid climate. The granite rock in the area undergoes intense weathering due to favourable topographic conditions where erosion is

less significant than weathering. This has led to the widespread formation of weathered layers, which range from less than 1 metre to over 50 metres thick in some parts of the project area.

The distribution of the weathered layer is typically irregular due to erosion from the river drainage system. Depending on the extent of the weathered layer covering the mountainous terrain, it can be classified into two types from the in-situ leaching perspective: full coverage and exposed base types.

**Full-coverage type:** This type refers to the complete coverage of the entire mountain by the weathered layer, where no bedrock is visible at the mountain base or in the gullies. Predominantly observed in the low hills characterized by gentle, rolling topography, this type maintains each section of the weathered layers well. Erosion along the mountain base leads to a thinner weathered layer compared to the hillside and mountain top.

**Base-exposure type:** This type includes the weathered layer covering most of the mountain base, as well as the entire hillside and mountain top. In some parts of the mountain base, the bedrock is exposed due to strong erosional processes. This type is mainly found in the low hills with a medium rolling style.

**Figure 6-7: Typical IAC-REEs Bearing Profile**

Source: N Bustos, C Marquardt, A Belmar, P Cordeiro; Regolith-hosted rare earth exploration in the Chilean Coastal Range of the Central Andes

The Mengkham and Seop REE projects are primarily characterized by low hills and gentle, undulating terrain. Influenced by a tropical climate, these areas have a relatively thick regolith cover. According to the classification, the regolith layer developed within most of the project area can be categorized as the full-coverage type of IAC deposit.

## 7 Exploration, Sampling and Assaying

SRK has not participated in the explorations conducted for both Mengkham and Sepon projects. The information regarding the exploration is derived from the data provided by the client and through discussions with geologists engaged in the fieldwork.

### 7.1 Exploration Programs

#### 7.1.1 Sepon Rare Earth Element Deposit

During the geological mapping program in 2021, the anomalies of REE have been discovered in the weathered crust of granite bodies in the Sepon project area. In November 2021, LXML drilled three test shallow holes in the granite rock body in the south part of the Sepon project area and identified cation REE enrichment in the weathered zone. Further work defined three preliminary targets to look for REE mineralized bodies in the granite rock bodies.

In the period from December 2021 to January 2022, first drilling program was conducted totalling 53 holes. The program defined two advanced targets (Block01 and Block02) in the No.1 preliminary target. In February 2022, a drilling program with 100 m by 100m grid was conducted in the two advanced targets, and then in-fill drilling was also conducted. From May 2021, step out drilling program with a grid of 200m by 100m was conducted in the area surrounding the advanced targets. By July 2021, totally 607 holes with a meterage of 4,441m were completed in an area of about 9.1km<sup>2</sup>. Totally 4,443 samples were taken for assaying.

Table 7-1 summarizes the work completed in the exploration of REE deposits.

**Table 7-1: Programs Completed in Sepon Project**

<b>Working item</b>	<b>Unit</b>	<b>Quantity</b>	<b>Remark</b>
1/10000 Geological mapping	km <sup>2</sup>	10	
Drilling	M	4440.8	
Assaying	Sample	4443	
QAQC samples	Sample	445	
Cation phase analysis	Sample	8	
Specific gravity measures	Sample	10	
Hydrogeological survey	km <sup>2</sup>	10	
Geotechnical survey	km <sup>2</sup>	10	
Environmental survey	km <sup>2</sup>	10	

The locations of collars of drilling holes were surveyed by using 63csx GPS hand-held meter, compass and topographic map. The relative error of such survey is 3-5m, which matches the Chinese requirements of a general exploration program.

Shallow holes conducted in the exploration program were usually drilled 8-11 m deep with almost 100% recovery and good quality.

#### 7.1.2 Mengkham Rare Earth Element Project

From January 2022 to June 2023, China Investment Mining (Laos) Sole Co., Ltd. carried out a detailed exploration for Mengkham REE Project.

Table 7-2 summarizes the work completed in the exploration.

**Table 7-2: Programs Completed in Mengkham REE Project**

<b>Working item</b>	<b>Unit</b>	<b>Quantity</b>	<b>Remark</b>
1/5000 Geological mapping	km <sup>2</sup>	50	
Drilling	m	198,956.9	
Assaying	Sample	105,279	
QAQC samples	Sample	9,517	
Bulk density measures	Sample	10	
1/10000 Hydrogeological survey	km <sup>2</sup>	50	
1/5000 Topo aero survey	km <sup>2</sup>	2.3	

The 1:5,000 topographic aerial survey was organized and implemented by Longyan Minde Surveying and Mapping Co., Ltd., which has a Class A qualification in topographic surveying. The indoor work was assisted by China Investment Mining company, and the field work started in December 2022, with the results and data finished in early July 2023.

The locations of drilling holes were surveyed by using hand-held GPS.

Geological survey of 1:5,000 was carried out in the rare earth exploration area, basically finding out the scale, shape, occurrence and ore-forming relationship of different periods and different lithology intrusive rocks; basically finding out the distribution of the Quaternary and the river system in the area; basically finding out the types of landforms, micro-geomorphological features and types and distribution of weathering crust in the work area, providing a reliable basis for the deployment of manual impact sampling drilling and resource estimation.

### 7.1.3 SRK Comments

For the Mengkham REE project, the 1:5,000 topographic aerial survey only covered an area of 2.3 km<sup>2</sup>. SRK suggests the mine to conduct a detailed topographic survey covering the entire project area.

## 7.2 Drilling Programs

For Sepon project, LXML Exploration Department conducted an exploration program from November 2021 to July 2022. A total of 607 boreholes (4,441 metres) were drilled during the exploration on a 200-metre x 100-metre or 100-metre x 100-metre pattern, as shown in Figure 7-1.

**Figure 7-1: Borehole Distribution of Sepon Project**

Source: SRK

For Mengkham REE Project, Longyan Dadi Mining Development Service Co., Ltd conducted an exploration program from January 2022 to December 2023. A total of 13,656 boreholes (198,957 metres) were drilled during the exploration with a spacing of 30-100 m, as shown in Figure 7-2.

**Figure 7-2: Borehole Distribution of the Mengkham REE Project**

Source: SRK

The design of the drilling grid follows the exploration principle of ion-adsorption rare earth deposit outlined in Chinese standard *DZ/T 0204-2002: Geological Exploration Specifications of Rare Earth deposit*.

The manual GN auger was employed to delineate and identify economically viable zones in the regolith. This auger is extensively used for exploring IAC rare earth deposits in China. Under optimal operating conditions, it can reach a maximum drilling depth of 45 meters in the fully weathered regolith horizon. This method provides a swift and cost-effective drilling solution compared to other techniques.

The specifications of the GN auger include a 95 cm diameter x 0.5 m long auger bucket equipped with 2 m drill rods. According to the drilling records, the auger drilling achieved over 100% core recovery during the programs.

During the drilling, the retrieved core soil from each run was separately placed on plastic film, labelled, recorded, and prepared for sampling.

After completion of a borehole, a wooden stick marked with the borehole ID (Figure 7-3), start and end date, and end-hole-depth is placed at the drilling site to assist the surveyor in conducting the collar survey.

**Figure 7-3: The GN Auger Utilization and Hole Sealing**

The core drilling and geological logging were carried out to a standard that ensures the data and information collected sufficiently support the goals of subsequent geological modelling and resource estimation.

SRK considers that the depth capacity of manual auger drilling may not be enough to penetrate potentially semi-weathered hard layers or boulders. This limitation could potentially result in incomplete intersections of the ore-bearing horizon during drilling.

## **7.3 Sample Preparation, Analyses and Security**

### **7.3.1 Sepon Rare Earth Element Deposit**

#### **Sample Collection**

During the general exploration program, three types of samples were taken, i.e. basic assaying samples, QAQC samples and specific samples.

Sampling was conducted as, whole drilling core was taken as sample at 1m interval by using the method of diagonal quarters to reduce the sample, with one half as the sample for assaying, and the other half as the spare sample for storage.

The samples were all properly numbered, recorded before sent to labs.

#### **Sample Preparation and Analyses**

All basic assaying samples were prepared and assayed in the ALS lab in Australia. The assaying method is ME-MS81, which uses lithium borate to fuse, and then use acid to dissolve, and finally use ICP-MS for assaying. The method can achieve a precision of 0.1ppm.

Eight samples were sent to the testing centre of Guilin non-ferrous metallic mineral resources Institute, China, for analysing REE compositions. The analytical results show that the deposit possesses mid-heavy REE, which is scarce.

#### **Quality Assurance and Quality Control Program**

Quality Control and Assurance (QA/QC) procedures were undertaken on an on-going basis to certify that the assay results from the drilling programme would be confidently relied upon. These procedures included the insertion of QA/QC samples comprising standards or Certified Reference Materials (CRMs), i.e., material containing known quantities of the element being assayed for; blanks i.e., material that has been prepared known to contain trace material; and duplicates.

#### **Bulk Density Test**

In the general exploration report, 10 specific gravity samples were also taken from drilling cores and were measured in the lab of the mine.

In SRK's opinion, it was unable to collect density sample from GN Auger hole cores. A dry bulk density of 1.5 t/m<sup>3</sup> was used in resource estimation for Sepon project.

#### **SRK Comments**

The procedures for sample collection, preparation, and analysis are following the REE industry standards. SRK considers that the procedure, as well as the data and information obtained, are acceptable for resource estimation purposes.

Going forward, the Sepon REE mine is considering in-situ leaching to be their main extraction technique. However, the available data, which only includes 8 ionic analyses, falls short in providing an accurate estimate of the mine's potential and productivity. The scant data does not paint a holistic picture of what the mine can offer. For this reason, SRK suggests a re-analysis of the ionic REE grade. Through this, we can have a clearer view of the mine's potential, which is crucial in devising and executing efficient mining plans.

### 7.3.2 Mengkham REE Project

#### Sample Collection

Prior to conducting sample collection, an on-site quick test procedure was conducted to qualitatively identify rare earth elements ("REE") mineralized intervals. Once the quick test confirmed the presence of mineralization in the retrieved core interval, the corresponding interval was collected for further laboratory analysis.

The quick test employs ammonium sulphate to dissolve the REE ions in the clay and using oxalic acid to obtain the precipitate. The quick test utilizes ammonium sulphate to dissolve any potentially present REE ions in the clay. The solution is then filtered through filter paper, and oxalic acid is added to the filtrate in a test tube to see whether white precipitate is observed. If the solution remains clear, it is deemed non-mineralized, and no sampling is conducted. Conversely, if a precipitate is observed, the interval is sampled for further analysis.

The quick test employs ammonium sulphate to dissolve the rare earth elements ("REE") ions potentially present in the clay. The process involves the following steps:

- Ammonium sulphate is used to dissolve any potentially present REE ions in the clay sample.
- The resulting solution is filtered through filter paper.
- Oxalic acid is added to the filtrate in a test tube, and,
- Check whether white precipitate is observed.

If the solution remains clear after the addition of oxalic acid, indicating the absence or trace amounts of REE ions, the interval is deemed non-mineralized, and no sampling is conducted. Conversely, if a white precipitate is observed, indicating the presence of REE ions, the interval is sampled for further laboratory analysis. Once the white precipitate is observed, all samples downwards from that depth are collected for laboratory analysis.

**Figure 7-4: The Quick REE Mineralization Distinguish on Mengkham Drilling Site**

The samples are collected from the core of the GN Auger holes, and continuous samples are taken according to different weathering layers. According to the Chinese Rare Earth Mineral Geological Exploration Standard (DZ/T0204-2022), the sample length is generally 1m, and cross-layer sampling

is prohibited. If the different weathering layers are less than 1m, they are sampled separately. On the site, the rock core within the same sample is first mixed evenly on a non-polluting sample cloth, and then the diagonal method is used for subdivision, repeated several times until the sample standard is met, and finally bagged and numbered and sent to the laboratory in time. The sample position, number, and sample length are clearly recorded on the spot in time. Each sample has an original weight of more than 1~1.5kg.

### Sample Preparation and Analyses

All samples were prepared and analysed in the Mangkham mine laboratory.

The samples were split according to the formulation  $Q = Kd^2$ , while K ranged from 0.2 to 0.5.

The original sample was not washed in any way to prevent the loss of useful, beneficial, and harmful components. Before preparation, the sample was dried and weighed. The balance should be calibrated. The preparation utensils and equipment used before and after sample preparation should be kept clean. It was strictly forbidden to mix in other substances. Effective measures should be taken to ensure the quality of sample preparation. During the whole preparation process, the total loss rate of the sample should not exceed 5%, and the error of each splitting should not exceed 3% of the original mass.

**Figure 7-5: The Drying Oven on Mengkham Mine Site**

The analyse method was EDTA (Ethylene Diamine Tetraacetic Acid) volumetric method as follows:

- Take 19.95-20.05g of the dry sample and put it into a long funnel, then place it on a triangular flask, rinse it with 100ml-120ml of ammonium sulfate for more than three times, and wait until there is no more liquid leaking from the bottom of the funnel, then take the volume of the leachate and record it.
- Take 20ml of extract, add acetone, sulfonyl salicylate, dimethyl phenol orange, methyl tetramine, titrate with calibrated EDTA until the solution changes from purple-red to bright yellow as the endpoint, record the amount of EDTA used.
- Conduct two independent measurements and take their average value.

Figure 7-6: The Mine Laboratory

The external laboratory check samples were analysed in Longyan Rare Earth Development Co., Ltd and the composition of REE oxide samples were analysed in China Rare Earth Laboratory.

#### Quality Assurance and Quality Control Program

A total of 6,017 samples (about 6% of the samples used in Mineral Resource estimation) were collected as internal lab check samples with a pass rate of 82%. And a total of 3,500 samples (about 4% of the samples used in Mineral Resource estimation) were collected as internal lab check samples with a pass rate of 92%.

#### Bulk Density Test

A total of ten bulk density samples were implemented across the project areas with the natural bulk density (wet basis) ranging from 1.7 to 1.81 t/m<sup>3</sup>, averaging 1.75 t/m<sup>3</sup>, dry bulk density ranging between 1.35 and 1.55 t/m<sup>3</sup>, averaging 1.47 t/m<sup>3</sup>.

The average dry bulk density of 1.47 t/m<sup>3</sup> is determined to be used in resource estimation for the entire project area.

#### SRK Comments

SRK considers that the onsite laboratory was poorly equipped, and no CRMs or blank samples were used for quality control. It is recommended that all the samples should be sent to a qualified laboratory for assaying again.

There are merely 30 samples that possess REE compositions. This limited number prompts SRK to recommend that the mine should increase its efforts in conducting more composition analyses. This is to ensure a more reliable and expansive dataset for evaluation purposes.

The mine's current approach is to analyse all basic samples in the lab onsite. While this might be convenient and efficient, it may not provide the most accurate results. Therefore, to enhance the

validity of the results, SRK recommend collecting a substantial portion, specifically 30%, of the samples for further validation at an external lab. This will provide a more robust cross-checking mechanism and thus, ensuring a higher level of accuracy in the analysis results.

SRK also considers that the rapid test method, which entails visually observing rare earth precipitates before conducting core sampling for laboratory analysis, is qualitative in nature. This approach serves merely as an initial indication to assess the mineralization within the sampled core interval. Due to its inherent subjectivity, this method may result in overlooking certain shallow-occurring intervals containing REE sufficient for subsequent laboratory testing, potentially leading to an underestimation of REE mineralization thickness.

## 8 Data Verification

### 8.1 Sepon Rare Earth Element Deposit

#### 8.1.1 Verifications by the Client

SRK has checked samples results provided by the Client, including 11 CRMs, 393 blank samples and 29 field duplicate samples.

**Table 8-1: QAQC Sample Summary for Sepon Project**

Zone	Category	QC samples	Total N of samples	%Coverage
Sepon	CRMs	11	4443	0.25%
	Coarse Blanks	327		7.36%
	Pulp Blanks	66		1.49%
	Field Duplicates	29		0.65%

#### CRMs

Sepon supplied only one CRM, namely Ox-P1L, as detailed in Table 8-2.

**Table 8-2: CRM Summary for Sepon Project**

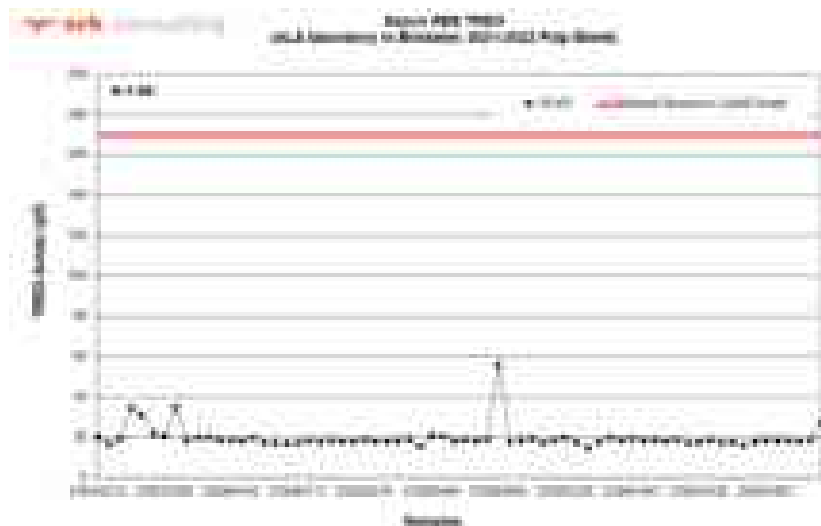

Count	Minimum	Maximum	Range	Mean	SD
11	109.02	116.38	7.36	111.65	2.51

#### Blanks

Coarse and pulp blanks were used. As shown in Figure 8-1 and Figure 8-2, all samples are less than 170 TREO g/t, the cut-off grade of Mineral Resource.

**Figure 8-1: Coarse Blanks for Sepon Project**

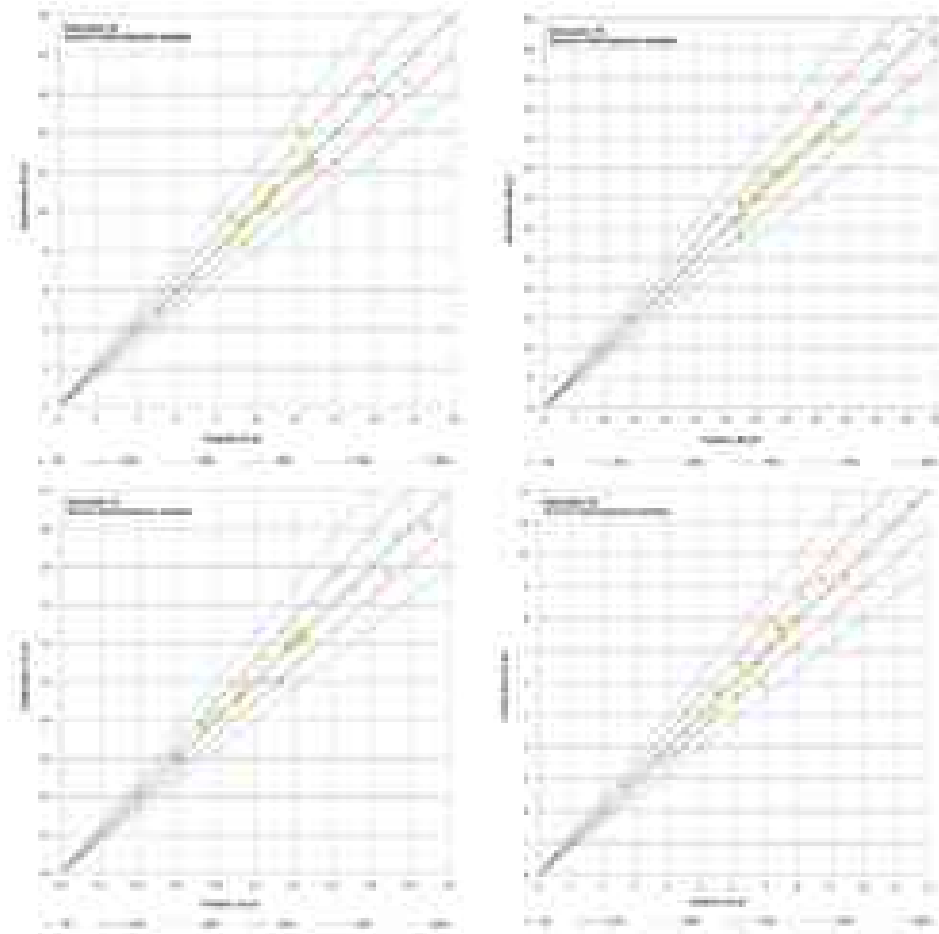

**Figure 8-2: Pulp Blanks for Sepon Project****Filed Duplicates**

All duplicate pairs are within 20% limits, as shown in Table 8-3 and Figure 8-3.

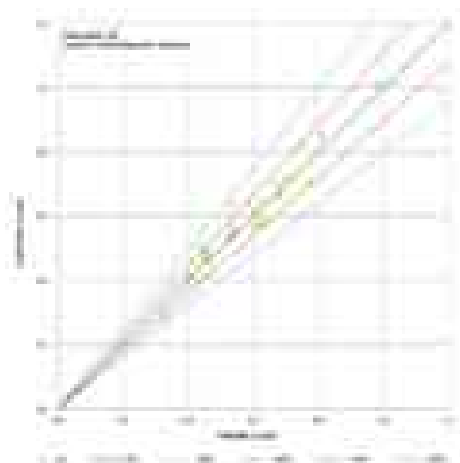

**Table 8-3: Field Duplicates Summary for Sepon Project**

Element	Data Pairs Count	Relative Difference					
		<10%	10% - 20%	> 20%			
Pr	29	26	90%	3	10%	-	0%
Nd	29	25	86%	4	14%	-	0%
Tb	29	26	90%	3	10%	-	0%
Dy	29	25	86%	4	14%	-	0%
Lu	29	23	79%	6	21%	-	0%

Figure 8-3: Field Duplicates for Sepon Project

### 8.1.2 SRK Comments

SRK is of opinion that the exploration data has been validated and is appropriate for a mineral resource estimate.

## 8.2 Mengkham REE Project

### 8.2.1 Verifications by the Client

SRK was provided with 6,017 pairs of samples for internal lab check and 3,500 pair of samples for external lab check. As shown in Table 8-4 and Figure 8-4, the above 20% relative differences are 18% for internal and 8% for external. The exploration data was appropriate for the mineral resource estimate.

**Table 8-4: QAQC Sample Summary for Mengkham REE Project**

Category	Element	Data Pairs Count	Percentage of Assays	Relative Difference					
				<10%	10% - 20%	> 20%	<10%	10% - 20%	> 20%
Internal	SREO	6,017	6%	2,723	45%	2,196	36%	1,098	18%
External	SREO	3,500	4%	2,191	63%	1,028	29%	281	8%

**Figure 8-4: Duplicates of Mengkham REE Project**

### 8.2.2 Verifications by SRK

During the period from 13 to 16 May 2024, SRK conducted a site visit to the Mengkham REE project and collected 169 core duplicate samples from 13 boreholes, detailed in Table 8-5. The samples were sent to SGS Mineral Laboratory located in Tianjin, China for verification assay.

**Table 8-5: Summary of SRK Verification Borehole Samples**

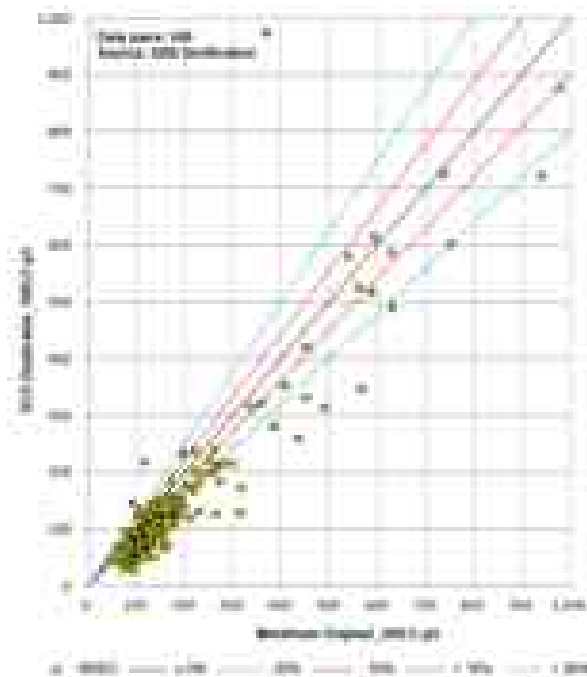

Hole	Easting	Northing	Depth	Duplicate Samples
KT8-35	360932	2193253	10	10
KT8-27-2	360971	2193207	14	14
YZ33	360933	2195189	25	25
YZ02-1	361589	2189949	25	25
KT7-121	360673	2192876	12	12
KT6-103-1	360049	2193819	10	10
KT3-16	359369	2193759	13	13
KT6-82	359948	2194108	9	9
KT7-7	360038	2192800	13	13
ZKF16-179	360945	2196321	14	12
ZK17-115	360391	2193631	18	10
ZKF18-104	360308	2196387	14	7
ZKF29-140	361003	2194583	11	9

The results were shown in Table 8-6 and Figure 8-5, large bias was observed between original assay and verification results. About 32% results for SREO are within  $\pm 20\%$ . About 68% results are out of  $\pm 20\%$ . SRK has checked with both onsite laboratory and SGS staff, found that the sample preparation and assaying method were different. The samples were crushed to 75  $\mu\text{m}$  (200 mesh) in SGS and the assaying method was ICP-MS. And in onsite laboratory, the samples were crushed to 1 mm and the assaying method was EDTA. SRK has downgraded Indicated Mineral Resources to Inferred Mineral Resource.

Table 8-6: SRK Verification Samples Summary for Mengkham Project

Element	Data Pairs Count	Relative Difference					
		<10%	10% - 20%	> 20%			
SREO	169	30	18%	24	14%	115	68%

Figure 8-5: SRK Verification Duplicates of Mengkham REE Project

8.2.3 SRK Comments

Large bias was observed between original assay and SRK verification results. It is recommended that all the samples should be sent to a qualified laboratory for re-assaying.

## 9 Mineral Processing and Metallurgical Testing

This section is only prepared for the Mengkham REE project.

### 9.1 Ore Properties

The Mengkham ore belongs to the ion-adsorbed type rare earth ore, and the rare earth elements ("REE") are adsorbed in the clay minerals in the granite weathering crust, with average SREO content of 0.025%.

The minerals are mainly quartz, feldspar, biotite, ilmenite, magnetite, followed by zircon, apatite, xenotime, fluorite, sphene minerals and so on. The main impurities are  $Al_2O_3$  with an average content of 57.47%, CaO with an average content of 26.38% and  $SiO_2$  with an average content of 5.80%.

### 9.2 Metallurgical Test

The Client conducted a simple laboratory column leaching test on a composite sample collected from #2 ore body in March 2024. The SREO content of the test sample was 0.0245%. The test uses ammonium sulphate as RE leaching reagent, mainly includes ammonium sulphate dosage test, pH value condition test and permeability test. The photos of test process are shown in Figure 9-1 and the test results are as follows:

- The permeability coefficient of the RE samples is  $0.89 \times 10^{-3} \sim 1.11 \times 10^{-3} \text{ cm/s}$ .
- With the consumption of ammonium sulphate of over 12 t/t REO and the pH value of 4.5, the peak REO concentration of the pregnant leaching solution ("PLS") can reach over 2.0 g/L, and the SREO leaching rate can reach 94% along with the leaching time of 120 hours.

The results indicate the ore is easy to leach, and the In-situ Leaching method is probably applicable. SRK noted that the test report is relatively simple and can only be used as a basic reference for in-situ leaching of #2 ore body. Due to the differences in ROM properties and grades of different ore bodies, SRK recommends that ore samples should be taken from each ore body representatively to carry out test studies before production, and the following experimental contents should be added:

- SREO content analysis of RE ore samples, and
- PLS purification and precipitation tests to determine the purification and precipitation conditions and reagents consumption.

Figure 9-1: Laboratory Leaching Test

## 10 Mineral Resource Estimates

### 10.1 Sepon Rare Earth Element Deposit

#### 10.1.1 Introduction

The Mineral Resource Statement presented herein represents the first mineral resource evaluation prepared for the Sepon REE project in accordance with the JORC Code 2012.

The mineral resource model prepared by SRK considers the core boreholes drilled by the client during the period of November 2021 to July 2022. The effective date of the Mineral Resource Statement is 30 September 2024.

This section describes the methodology, procedure and key assumptions applied in Resource estimation. In the opinion of SRK, the resource estimation reported herein is a reasonable representation of the global rare earths resource found in the Sepon IAC REE Project at the current level of sampling. The mineral resources are reported in accordance with the JORC Code 2012. Mineral resources are not Ore Reserves and have not demonstrated economic viability. There is no certainty that all or any part of the mineral resource will be converted into Ore Reserve.

The database used to estimate the Project mineral resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for rare earths mineralization and that the assay data are sufficiently reliable to support mineral resource estimation.

The Leapfrog Geo and Edge (Version 2023.2) software was used to create both geological model and block model for the Project. The software is considered as a proper modelling tool for this regolith type of deposit.

#### 10.1.2 Resource Estimation Procedures

The resource evaluation methodology involved the following procedures:

- Database compilation and verification
- Construction of wireframe models for the boundaries of the REE mineralization
- Definition of resource domains
- Data conditioning (compositing and capping) for analysis
- Block modelling and grade interpolation
- Resource classification and validation
- Assessment of “reasonable prospects for eventual economic extraction” and selection of appropriate cut-off grades
- Preparation of the Mineral Resource Statement

### 10.1.3 Resource Database

The datasets and information used in the models were provided by the client, including geological exploration reports and associated maps and tables, topographic data, geological maps, borehole databases, etc. The coordinate system applied for the entire project is the UTM projection (Zone 48N) using the Indian 1960 Datum.

Prior to conducting Mineral Resource modelling, SRK performed a data validation procedure to assess the reliability of the received datasets.

Digital terrain models ("DTM") were created from AutoCAD contour maps provided by the client. These contour maps were derived from the site survey activity. SRK considers that the created DTMs are acceptable to be used in the mineral resource estimation.

The summary statistics of the holes (Table 10-1) used in Mineral Resource estimation is listed in Table 10-5.

**Table 10-1: Drillhole Statistics used for the Resource Estimation**

Drillhole Type	Drillholes	Length (m)	Samples	Year
GN Auger	591	4,296	4,298	2021-2022

### 10.1.4 Solid Body Modelling

Solid models were created in Leapfrog Geo software based on the following considerations, principles, and steps.

The deposit type in the Sepon project is an ion-adsorption type hosted in weathered regolith. The development level of the weathered regolith layer largely shaped the distribution and geometry of the REE mineralization. The ore-bearing layers are mainly present in the middle part of the fully weathered regolith profile and the upper part of the semi-weathered layer.

The REE mineralized bodies generally exhibit a stratiform appearance, with their morphology controlled by the occurrence of the weathered regolith. In relatively flat mountaintop areas, the bodies tend to be thicker and have a more pronounced sheet-like shape. Whereas in steep hillside and valley areas, the bodies tend to have a thinner and more complex shape due to erosion and transportation effects.

In Leapfrog software, SRK created a geological model based on the drillhole assay data and employed an implicit modeling approach.

The distribution maps of mineralized bodies were illustrated in Figure 10-1.

Figure 10-1: Plan View (Up) and Section View (Down) of Sepon Mineralized Bodies

Source:SRK

#### 10.1.5 Bulk Density Test

In the general exploration report, 10 specific gravity samples were also taken from drilling cores and were measured in the lab of the mine.

In SRK's opinion, it was unable to collect density sample from GN Auger hole cores. A dry bulk density of 1.5 t/m<sup>3</sup> was used in resource estimation for Sepon project.

#### 10.1.6 Compositing

Prior to conducting the statistical analysis, the samples were combined so the length of each sample was basically equivalent. The distribution of sample length is provided in Figure 10-2. The database indicates that most of the sample intervals are 1 m.

All data from the database containing the flagged raw sample intervals were composited to 1.0 m downhole lengths, with a minimum length of 0.5 m required to create a composite. SRK applied 1.0 m composite for all subsequent analyses and grade interpolations.

**Figure 10-2: Histogram of Sample Length**

Source:SRK

The sampling methods in the Sepon Project are essentially consistent, and the approach to handling composite samples is also the same.

### 10.1.7 Evaluation of Outliers

To identify the appropriate top cuts for every mineralised orebody, the cumulative frequency and distribution characteristics of the sample histogram, as shown in from Figure 10-3 to Figure 10-16 were used, in addition, the coefficient of variation statistic and 3D visualisations were also considered. The cutoff grades for each rare earth oxides used in estimation listed in Table 10-2.

### 10.1.8 Block Model and Grade Estimation

SRK generated non-rotational model via Leapfrog software for grade and tonnage estimation. A suitable block interval and unit size was adopted to build a block model which was able to contain the mineralized zones. The block size was set to 10 m × 10 m × 2 m (East × North × Elevation). A summary of the block model specifications is presented in Table 10-3.

**Table 10-3: Block Model Parameters**

	Base Point	Boundary	Block Size	Sub Block Size	Rotation
E	630,487.98	7,020	10	10	0
N	1,857,207.27	2,630	10	10	0
Z	560.00	544	2	2	0

The estimation method for SREO was Inverse Distance Weighting (“IDW”). The model underwent three searches. The specific search parameters are detailed in Table 10-4.

**Table 10-4: Search Ellipsoid Parameters**

Element	Runs	Search Distance (m)	Minimum Samples	Maximum Samples	Maximum samples in a single drillhole
15 Rare Earth Oxide	1	110	6	24	2
	2	220	6	24	2
	3	220	2	24	2

### 10.1.9 Model Validation and Sensitivity

Swath plots are an important validation tool for providing comparisons between sample points and estimated values to identify any bias towards under-estimation or over-estimation or any smoothing in the results. The effect of different estimation methods and parameters can also be compared.

The swath plot is a one-dimensional graph in a specific direction of interest. A swath is a sectional slice through the block model with a specified thickness. The swath plot shows the average grade for the blocks in the swath, along with the averaged sample values in the swath.

Swath plots have been generated in three orthogonal (north, east, and vertical) directions at a certain distance for  $\text{Pr}_6\text{O}_{11}$  and  $\text{Nd}_2\text{O}_3$  grade by SRK, as shown in Figure 10-17 and Figure 10-18. The block models and the composites correspond well in all orthogonal directions. This comparison shows close consistency between the blocks and composites in terms of overall distribution as a function of X, Y, and Z coordinates.

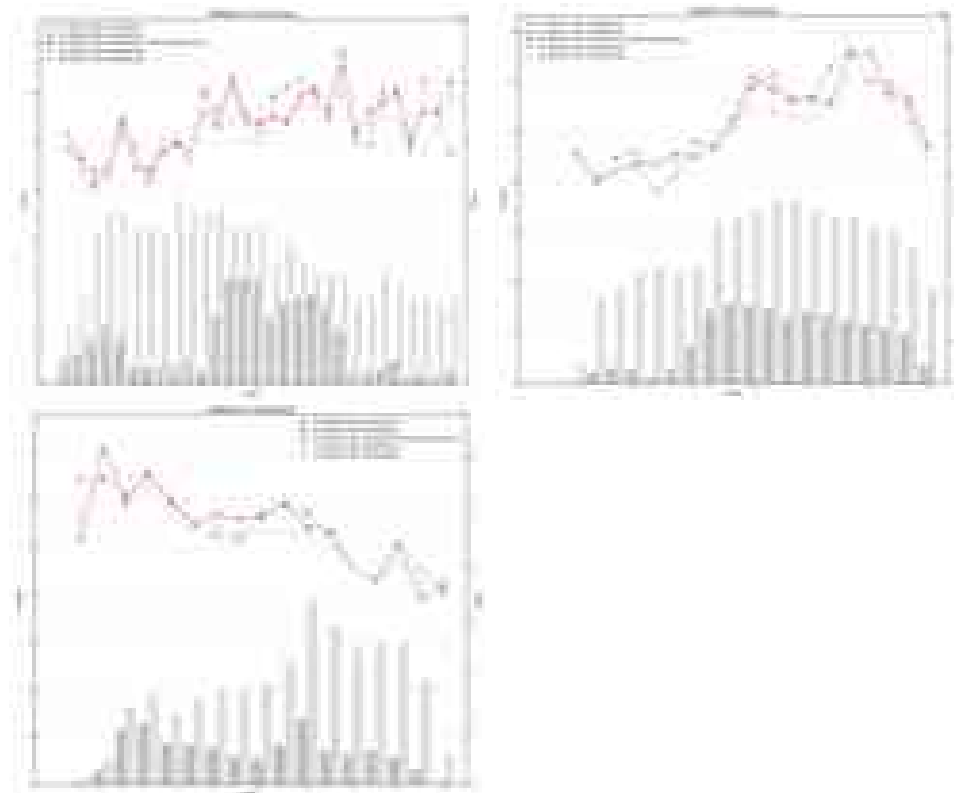

**Figure 10-17:  $\text{Pr}_6\text{O}_{11}$  Grade Swath Plot for Sepon Project**

Figure 10-18: Nd<sub>2</sub>O<sub>3</sub> Grade Swath Plot for Sepon Project

Source:SRK

#### 10.1.10 Mineral Resource Classification

Block model quantities and grade estimates for the Sepon project were classified according to the JORC Code 2012.

Mineral resource classification is typically a subjective concept. Industry best practices suggest that resource classification should consider the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates, and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support resource evaluation. The sampling information was acquired primarily by GN Auger holes drilling on spaced at 100-200 metres. As such the Mineral Resource is classified based on the following principles:

- Indicated Mineral Resource: the areas less than 100 m spacing of the drillholes.
- Inferred Mineral Resource: the areas greater than 100 m and less than 200 m spacing of the drillholes.

Typical Mineral Resource classification maps are presented in Figure 10-19.

**Figure 10-19: Sepon Project Mineral Resource Classification**

Source:SRK

#### 10.1.11 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

“a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological

evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.”

The “reasonable prospects for eventual economic extraction” requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the mineral resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries.

In contrast to conventional mining method, the in-situ leaching operation and wet plant cannot be treated as separate business units as the output PLS produced from the leaching process is directly fed into a wet plant for processing and the processed solution from the PLS is then recycled for leaching utilization. Therefore, this RPEEE assessment considers the technical and cost factors associated with both the leaching process and the wet plant.

SRK considers that the blocks with the TREO grade greater than 170 g/t show “reasonable prospects for economic extraction” and can be reported as a Mineral Resource.

As of 30 September 2024, by applying a cut-off grade of 170 g/t TREO, The Mineral Resources which SRK estimated and reported are as follows:

- 26.78 Mt of Indicated Mineral Resource with an average grade of 383.75 g/t TREO, equivalent to 10.28 kt of total rare earth oxides within the Project area.
- 63.79 Mt Inferred Mineral Resource with an average grade of 339.22 g/t TREO, equivalent to 21.64 kt of total rare earth oxides within the Project area.

**Table 10-5: Mineral Resource Statement<sup>1</sup> of Sepon REE Project, as of 30 September 2024**

Category	Mass (Mt)	TREO (g/t)	TREO (kt)	PrNd Oxides (%)	MREO(%)	CREO(%)
Indicated	26.78	383.75	10.28	19.14	21.97	33.87
Inferred	63.79	339.22	21.64	18.78	21.45	32.59

**Notes:**

<sup>1</sup> Mineral Resources are not Ore Reserves and have not demonstrated economic viability. All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

<sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Huaixiang Li and Dr. Anson Xu who are full time employees of SRK Consulting China Ltd. Mr. Huaixiang Li is a Member of AIG and Dr. Anson Xu is a Fellow of AusIMM. Dr. Xu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in JORC (2012). Mr. Li and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>3</sup> Mineral Resources are reported at a cut-off grade of 170 g/t TREO. Cut-off grades are based on a price of 239,000 RMB/t REO.

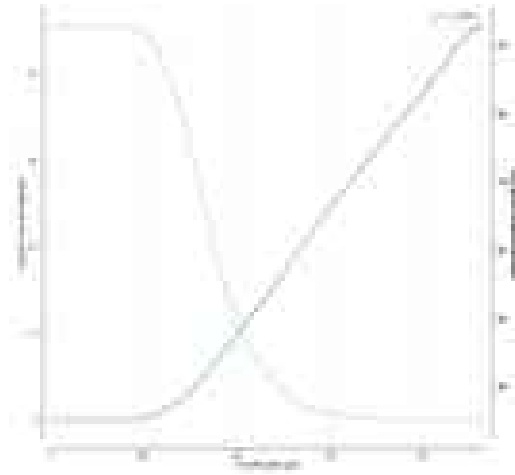

<sup>4</sup> MREO: Pr<sub>6</sub>O<sub>11</sub>+Nd<sub>2</sub>O<sub>3</sub>+Tb<sub>4</sub>O<sub>7</sub>+Dy<sub>2</sub>O<sub>3</sub>.

<sup>5</sup> CREO: Nd<sub>2</sub>O<sub>3</sub> + Eu<sub>2</sub>O<sub>3</sub> + Tb<sub>4</sub>O<sub>7</sub> + Dy<sub>2</sub>O<sub>3</sub> + Y<sub>2</sub>O<sub>3</sub>, determined by US Department of Energy 2023.

<sup>6</sup> TREO: Total Rare Earth Oxides include Y<sub>2</sub>O<sub>3</sub>+ La<sub>2</sub>O<sub>3</sub> + CeO<sub>2</sub> + Pr<sub>6</sub>O<sub>11</sub> + Nd<sub>2</sub>O<sub>3</sub> + Sm<sub>2</sub>O<sub>3</sub> + Eu<sub>2</sub>O<sub>3</sub> + Gd<sub>2</sub>O<sub>3</sub> + Tb<sub>4</sub>O<sub>7</sub> + Dy<sub>2</sub>O<sub>3</sub> + Ho<sub>2</sub>O<sub>3</sub> + Er<sub>2</sub>O<sub>3</sub> + Tm<sub>2</sub>O<sub>3</sub> + Yb<sub>2</sub>O<sub>3</sub> + Lu<sub>2</sub>O<sub>3</sub>.

### 10.1.12 Grade Sensitivity Analysis

The Mineral Resources of the Sepon project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Figure 10-20 at various cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

**Figure 10-20: Sepon Project Grade Tonnage Curve**

Source:SRK

**Notes:**

<sup>1</sup> The reader is cautioned that the figures should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of a cut-off grade.

## 10.2 Mengkham REE Project

### 10.2.1 Introduction

The Mineral Resource Statement presented herein represents the first mineral resource evaluation prepared for the Mengkham REE project in accordance with the JORC Code 2012.

The mineral resource model prepared by SRK considers the core boreholes drilled by the client during the period of January 2022 to December 2023. The effective date of the Mineral Resource Statement is 30 September 2024.

This section describes the methodology, procedure and key assumptions applied in Resource estimation. In the opinion of SRK, the resource estimation reported herein is a reasonable representation of the global rare earths resource found in the Mengkham IAC REE Project at the current level of sampling. The mineral resources have been estimated in accordance with the JORC Code 2012. Mineral resources are not Ore Reserves and have not demonstrated economic viability. There is no certainty that all or any part of the mineral resource will be converted into Ore Reserve.

The database used to estimate the Project mineral resources was audited by SRK. SRK is of the opinion that the current drilling information is sufficiently reliable to interpret with confidence the boundaries for rare earths mineralization and that the assay data are sufficiently reliable to support mineral resource estimation.

The Leapfrog Geo and Edge (Version 2023.2) software was used to create both geological model and block model for the Project. The software is considered as a proper modelling tool for this regolith type of deposit.

### **10.2.2 Resource Estimation Procedures**

The resource evaluation methodology involved the following procedures:

- Database compilation and verification
- Construction of wireframe models for the boundaries of the REE mineralization
- Definition of resource domains
- Data conditioning (compositing and capping) for analysis
- Block modelling and grade interpolation
- Resource classification and validation
- Assessment of "reasonable prospects for eventual economic extraction" and selection of appropriate cut-off grades
- Preparation of the Mineral Resource Statement

### **10.2.3 Resource Database**

The datasets and information used in the models were provided by the client, including geological exploration reports and associated maps and tables, topographic data (only covering an area of 2.3 km<sup>2</sup>), geological maps, borehole databases, etc. The coordinate system applied for the entire project is the UTM projection (Zone 48N) using the WGS84 Datum.

Prior to conducting Mineral Resource modelling, SRK performed a data validation procedure to assess the reliability of the received datasets. 736 holes with 15,067 assays were excluded due to the reasons of wrong coordinates, duplicate assay at the same interval or extremely high SREO grade (from 0.4% to 2.68%).

Digital terrain models ("DTM") of an area of 2.3 km<sup>2</sup> were created from AutoCAD contour maps provided by the client, as shown in Figure 10-21. These contour maps were derived from the site survey activity. SRK considers that the created DTMs are acceptable to use in the mineral resource estimation. The rest area of the project's DTM was created using the Copernicus data downloaded by SRK.

**Figure 10-21: Topo Survey Area of Mengkham REE Projects**

Source:SRK

The summary statistics of the holes (Figure 7-2) used in Mineral Resource estimation is listed in Table 10-6.

**Table 10-6: Drillhole Statistics used for the Resource Estimation**

Drillhole Type	Drillholes	Length (m)	Samples	Year
GN Auger	13,251	192,008	92,935	2022-2023

#### 10.2.4 Solid Body Modelling

Solid models were created in Leapfrog Geo software based on the following considerations, principles, and steps.

The deposit type in the Mengkham REE Project is an ion-adsorption type hosted in weathered regolith. The development level of the weathered regolith layer largely shaped the distribution and geometry of the REE mineralization. The ore-bearing layers are mainly present in the middle part of the fully weathered regolith profile and the upper part of the semi-weathered layer.

The REE mineralized bodies generally exhibit a stratiform appearance, with their morphology controlled by the occurrence of the weathered regolith. In relatively flat mountaintop areas, the bodies tend to be thicker and have a more pronounced sheet-like shape. Whereas in steep hillside and valley areas, the bodies tend to have a thinner and more complex shape due to erosion and transportation effects.

Based on the above considerations, a terrain analysis was conducted to identify steep areas (typically slopes greater than 40 degrees) and valley areas with creeks or rivers. Through cross-checking with drillhole assay data, areas were identified as unlikely to retain weathered regolith or host mineralization of insufficient thickness to be economically viable. Subsequently, these areas were excluded from the delineation of mineralized boundaries.

Due to the REE quick test before sampling, SRK considers all the intervals with REE grades as the mineralized zone and above the mineralized zone is the topsoil zone. In Leapfrog software, SRK created a geological model based on the drillhole assay data and employed an implicit modeling approach. Additionally, constraints on the mineralized zones are applied using data related to valleys and water systems.

The distribution maps of mineralized orebodies were illustrated from Figure 10-22.

**Figure 10-22: Plan View (Up) and Section View (Down) of Mengkham Mineralized Bodies**

Source:SRK

### 10.2.5 Bulk Density Test

A total of ten bulk density samples were implemented across the project areas with the natural bulk density (wet basis) ranging from 1.7 to 1.81 t/m<sup>3</sup>, averaging 1.75 t/m<sup>3</sup>, dry bulk density ranging between 1.35 and 1.55 t/m<sup>3</sup>, averaging 1.47 t/m<sup>3</sup>.

The average dry bulk density of 1.47 t/m<sup>3</sup> is determined to use in resource estimation for the entire project area.

### 10.2.6 Compositing

Prior to conducting the statistical analysis, the samples were combined so the length of each sample was basically equivalent. The distribution of sample length is provided in Figure 10-23. The database indicates that most of the sample intervals are 1 m.

All data from the database containing the flagged raw sample intervals were composited to 1.0 m downhole lengths, with a minimum length of 0.5 m required to create a composite. SRK applied 1.0 m composite for all subsequent analyses and grade interpolations.

**Figure 10-23: Histogram of Sample Length**

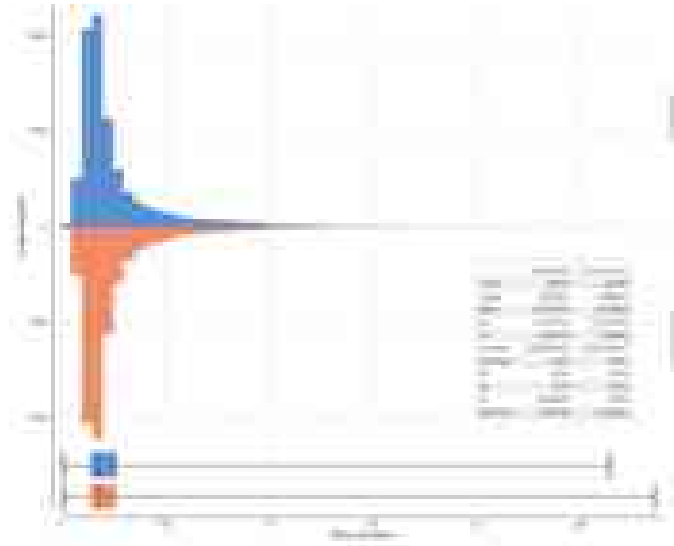

Source:SRK

The sampling methods in the Mengkham REE Project are essentially consistent, and the approach to handling composite samples is also the same, as shown in Figure 10-24.

**Figure 10-24: SREO Grade Before and After Compositing**

Source:SRK

### 10.2.7 Evaluation of Outliers

Due to the specific nature of the drilling method, over 99% of the sample lengths are 1.0 meter. Therefore, the original data statistics and composite data statistics for samples within the orebodies show almost identical results, listed in Table 10-7.

**Table 10-7: Raw and Composite Sample Statistics within Mineralized Domain**

Items	Raw	Composite
Count	82,895	82,926
Mean	0.0245	0.0245
Length	82,896.3	82,925.3
Std	0.02	0.02
CV	0.81	0.80
Variance	0.0004	0.0004
Minimum Value	0.001	0.001
Q1	0.014	0.014
Q2	0.018	0.018
Q3	0.026	0.027
Maximum Value	0.286	0.264

To identify the appropriate top cuts for the mineralised body, the cumulative frequency and distribution characteristics of the sample histogram, as shown in Figure 10-25 were used, in addition, the coefficient of variation statistic and 3D visualisations were also considered. After reaching a SREO grade of 0.105%, the continuity of samples becomes sparse. The cutoff grades used in estimation listed in Table 10-8.

**Figure 10-25: Histogram and Cumulative Histogram of the Mineralized Domain**

Source:SRK

**Note:**

- <sup>1</sup> The mean is indicated by the red diamond.
- <sup>2</sup> The median is indicated by the line that crosses the inside of the box.

**Table 10-8: Outlier Value for Mengkham REE Project**

Assay Cap SREO (%)	Capped Samples	Capped Ratio (%)	SREO Mean (%)	
			Before Capping	After Capping
0.105	794	0.96	0.0245	0.0243

**10.2.8 Block Model and Grade Estimation**

SRK generated non-rotational model via Leapfrog software for grade and tonnage estimation. A suitable block interval and unit size was adopted to build a block model which was able to contain the mineralized zones. The block size was set to 10 m × 10 m × 4 m (East × North × Elevation). A summary of the block model specifications is presented in Table 10-9.

**Table 10-9: Block Model Parameters**

	Base Point	Boundary	Block Size	Sub Block Size	Rotation
E	357,495.35	7,060	10	5	0
N	2,186,283.81	12,290	10	5	0
Z	1,800.00	612	4	2	0

The estimation method for SREO was Inverse Distance Weighting (“IDW”). The model underwent three searches. The specific search parameters are detailed in Table 10-10.

**Table 10-10: Search Ellipsoid Parameters**

Element	Runs	Search Distance (m)	Minimum Samples	Maximum Samples	Maximum samples in a single drillhole
SREO	1	60	6	24	2
	2	120	6	24	2
	3	120	2	24	2

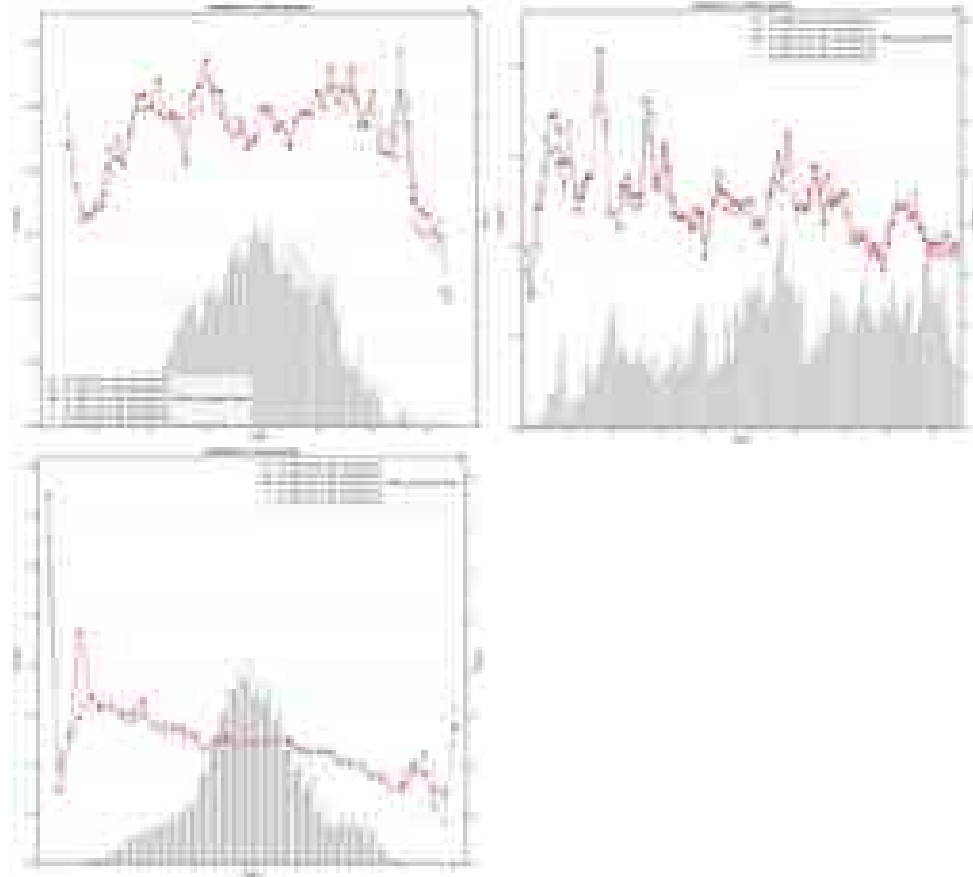

### 10.2.9 Model Validation and Sensitivity

Swath plots are an important validation tool for providing comparisons between sample points and estimated values to identify any bias towards under-estimation or over-estimation or any smoothing in the results. The effect of different estimation methods and parameters can also be compared.

The swath plot is a one-dimensional graph in a specific direction of interest. A swath is a sectional slice through the block model with a specified thickness. The swath plot shows the average grade for the blocks in the swath, along with the averaged sample values in the swath.

Swath plots have been generated in three orthogonal (north, east, and vertical) directions at a certain distance for SREO grade by SRK, as shown in Figure 10-26. The block models and the composites correspond well in all orthogonal directions. This comparison shows close consistency between the blocks and composites in terms of overall distribution as a function of X, Y, and Z coordinates.

**Figure 10-26: SREO Grade Swath Plot for Mengkham REE Project**

Source:SRK

### 10.2.10 Mineral Resource Classification

Block model quantities and grade estimates for the Mengkham REE Project were classified according to the JORC Code 2012.

Mineral resource classification is typically a subjective concept. Industry best practices suggest that resource classification should consider the confidence in the geological continuity of the mineralized structures, the quality and quantity of exploration data supporting the estimates, and the geostatistical confidence in the tonnage and grade estimates. Appropriate classification criteria should aim at integrating these concepts to delineate regular areas at similar resource classification.

SRK is satisfied that the geological modelling honours the current geological information and knowledge. The location of the samples and the assay data are sufficiently reliable to support resource evaluation. The sampling information was acquired primarily by GN Auger holes drilling on spaced at 30-100 metres. As such the Mineral Resource is classified based on the following principles:

- Indicated Mineral Resource: the areas less than 100 m spacing of the drillholes.
- Inferred Mineral Resource: the areas greater than 100 m and less than 200 m spacing of the drillholes.

Considering the specific IAC deposit type, SRK only categorised Indicated Mineral Resources in the area have been topo surveyed as described in resource database section. All the blocks within the area using Copernicus DTM were classified as Inferred Mineral Resources.

Due to the large bias between Mengkham original assay and SRK verification results, Indicated Mineral Resources were downgraded to Inferred Mineral Resources by SRK.

### 10.2.11 Mineral Resource Statement

The JORC Code 2012 defines a mineral resource as:

“a concentration or occurrence of material of solid material of economic interest in or on the Earth's crust in such form, grade (or quality) and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade (or quality), continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.”

The “reasonable prospects for eventual economic extraction” requirement generally implies that the quantity and grade estimates meet certain economic thresholds and that the mineral resources are reported at an appropriate cut-off grade that takes into account extraction scenarios and processing recoveries.

In contrast to conventional mining method, the in-situ leaching operation and wet plant cannot be treated as separate business units as the output PLS produced from the leaching process is directly fed into a wet plant for processing and the processed solution from the PLS is then recycled for leaching utilization. Therefore, this RPEEE assessment considers the technical and cost factors associated with both the leaching process and the wet plant.

The block model quantities and grade estimates were also reviewed to determine the portions of the Mengkham deposit having “reasonable prospects for economic extraction, based on parameters summarized in Table 10-11. The product price was sourced from the guide REO price of Xiamen Tungsten 2024. Detailed in Figure 18-1, the REO price was between 220,000 RMB/t and 341,000 RMB/t from 2019 to 2023, averaging 263,000 RMB/t.

**Table 10-11: Simplified Cost Model used for RPEEE Assessment**

Item	Unit	Value	Remarks
<i>Unit Cost</i>			
Production Cost	RMB/t RoM	15.7	SRK collected and analyzed
Injection and Collection Cost	RMB/t RoM	2.3	SRK collected and analyzed
Raw Material	RMB/t RoM	7.7	SRK collected and analyzed
Pipes and Accessories	RMB/t RoM	1.6	SRK collected and analyzed
Power Cost	RMB/t RoM	1.1	SRK collected and analyzed
Safety and Environmental Cost	RMB/t RoM	0.2	SRK collected and analyzed
Staff Salary	RMB/t RoM	1.2	SRK collected and analyzed
Other Cost	RMB/t RoM	1.6	SRK collected and analyzed
Reclamation Cost	RMB/t RoM	0.6	SRK collected and analyzed
G&A	RMB/t RoM	0.3	SRK collected and analyzed
Sales Cost	RMB/t RoM	0.3	SRK collected and analyzed
Total Unit Cost	RMB/t RoM	16.9	SRK collected and analyzed
<i>Recovery Rate</i>			
Leaching Rate	%	90.0	Mengkham REE PFS Report
Processing Recovery Rate	%	85.5	Mengkham REE PFS Report
Overall REE Recovery	%	77.0	Mengkham REE PFS Report
<i>Revenue</i>			
Product Price	RMB/t REO	239,000.0	Mengkham REE PFS Report

Based on the RPEEE assessment and considering the characteristics of the leaching mining method, SRK selected a cut-off grade of 100 g/t SREO to report Mineral Resources. The reader is cautioned that the results of the estimate are used solely for the purpose of testing the “reasonable prospects for eventual economic extraction” by in-situ leaching mining and do not represent an attempt to estimate Ore Reserves. The results are to be used as a guide for assisting in the preparation of a Mineral Resource Statement and for selecting an appropriate resource-reporting cut-off grade.

The project is in the construction and commissioning phase., and currently, no REE oxides are available for sale.

As of 30 September 2024, by applying a cut-off grade of 100 g/t SREO, The Mineral Resources which SRK estimated and reported are as follows:

- 139.05 Mt Inferred Mineral Resource with an average grade of 241.79 g/t SREO, equivalent to 33.62 kt of soluble rare earth oxides within the Project area.

**Table 10-12: Mineral Resource Statement<sup>1</sup> of Mangkham REE Project, as of 30 September 2024**

License	Category	Dry BD (t/m <sup>3</sup> )	Mass (Mt)	SREO (g/t)	SREO (kt)
Trial Mining	Inferred	1.47	55.59	267.75	14.88
Exploration	Inferred	1.47	83.47	224.51	18.74
<b>Total</b>	<b>Inferred</b>	<b>1.47</b>	<b>139.05</b>	<b>241.79</b>	<b>33.62</b>

**Notes:**

<sup>1</sup> Mineral Resources are not Ore Reserves and have not demonstrated economic viability. All figures are rounded to reflect the relative accuracy of the estimate. All composites have been capped where appropriate.

<sup>2</sup> The information in this report which relates to Mineral Resource is based on information compiled by Mr. Huaixiang Li and Dr. Anson Xu who are full time employees of SRK Consulting China. Mr. Huaixiang Li is a Member of AIG and Dr. Anson

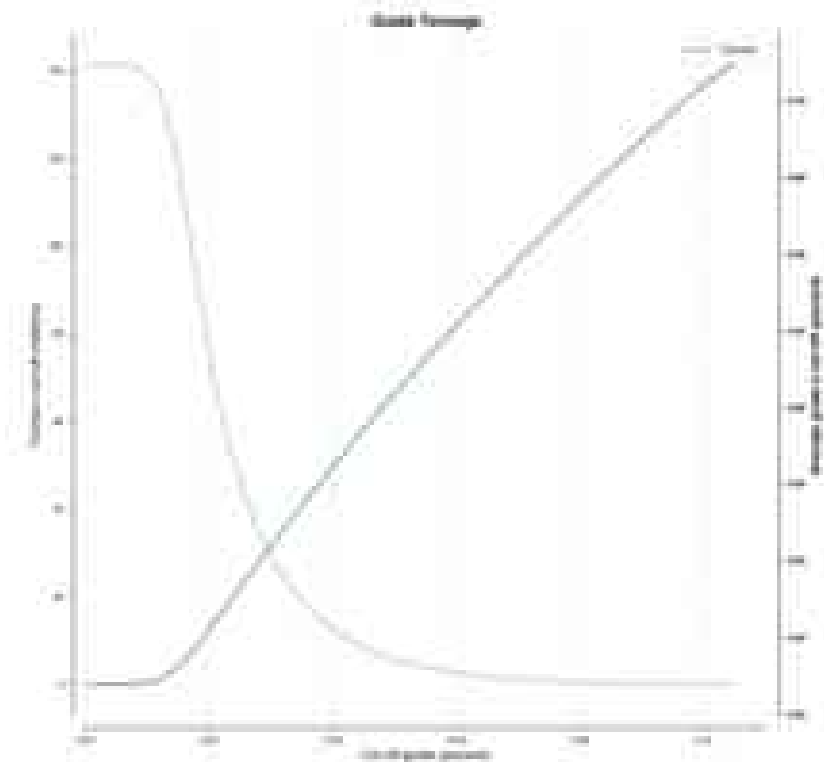

Xu is a Fellow of AusIMM. Dr. Xu have sufficient experience which is relevant to the style of mineralisation and the type of deposits under consideration and to the activity which they are undertaking to qualify as the Competent Persons as defined in JORC (2012). Mr. Li and Dr. Xu consent to the reporting of this information in the form and context in which it appears.

<sup>3</sup> Mineral Resources are reported at a cut-off grade of 100 g/t SREO. Cut-off grades are based on a price of 239,000 RMB/t REO.

### 10.2.12 Grade Sensitivity Analysis

The mineral resources of the Mengkham project are sensitive to the selection of the reporting cut-off grade. To illustrate this sensitivity, the global model quantities and grade estimates are presented in Figure 10-27 at different cut-off grades. The reader is cautioned that the figures presented in this table should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of cut-off grade.

**Figure 10-27: Mengkham REE Project Grade Tonnage Curve**

Source:SRK

**Notes:**

<sup>1</sup> The reader is cautioned that the figures should not be misconstrued with a Mineral Resource Statement. The figures are only presented to show the sensitivity of the block model estimates to the selection of a cut-off grade.

**10.3 SRK Comments**

Mineral Resources have been estimated through creating resource models. The data and information used for this resource model generation are acquired from the exploration and were reviewed by SRK to ensure the data reliability.

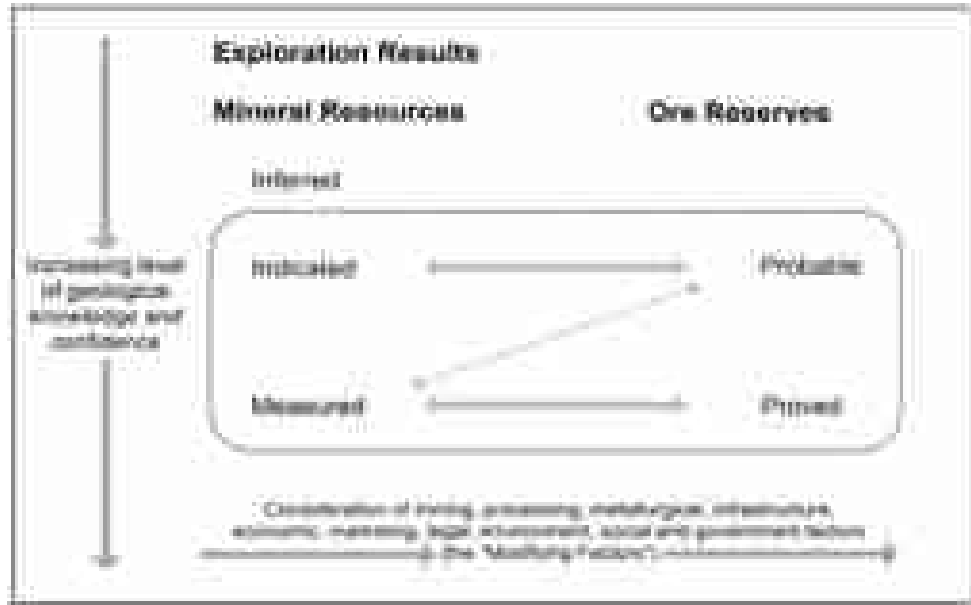

Due to the drilling and sampling methods employed in the exploration, there is a possibility of misidentification of certain sections potentially bearing REE. Consequently, this could lead to under-delineation of the mineralized domains during resource modelling, potentially resulting in a conservative resource estimate.

## 11 Ore Reserve Estimates

### 11.1 Introduction

JORC Code 2012 provides for a direct relationship between Indicated Mineral Resources and Probable Ore Reserves and between Measured Mineral Resources and Proved Ore Reserves. As shown in Figure 11-1 below.

**Figure 11-1: Relationship Between Mineral Resources and Ore Reserve**

Sources: JORC Code 2012

The following statement has been extracted from the JORC Code 2012 for reference:

*“An ‘Ore Reserve’ is the economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.”*

*“The reference point at which Reserves are defined, usually the point where the ore is delivered to the processing plant, must be stated. It is important that, in all situations where the reference point is different, such as for a saleable product, a clarifying statement is included to ensure that the reader is fully informed as to what is being reported.”*

For Sepon REE Project, the current study indicates that the project would not be financially feasible. Following discussions with LXML, it has been decided that only Mineral Resources will be reported in the report .

For Mengkham REE Project, there are technical situations as of 30 September 2024 as followings:

According to the eligible JORC Code 2012 for Mineral Resources, considering the resource within both mining license and exploration license, when utilizing a SREO cut-off grade of 0.01%, the following resources have been identified:

- Inferred Mineral Resource: 139.05 million tonnes at a grade of 241.79 g/t SREO.

The technical study is entitled "Mengkham Ion Adsorption Rare Earth Project Feasibility Study" ("PFS") and was prepared by CHIXIA Laos Holdings Limited ("CHIXIA") on February 23, 2024.

According to JORC Code 2012, only Measured Mineral Resource and Indicated Mineral Resource can be considered when estimating Ore Reserves. In this instance, the Mengkham REE Project contains solely Inferred Mineral Resource. After discussions with CHIXIA, it has been decided that only a preliminary economic analysis based on PFS would be conducted to analyse the project's economic feasibility and report project's modified Mineral Resources, and none of the Mineral Resources would be converted to Ore Reserves.

Additionally, SRK has recommended to CHIXIA that necessary works and studies be conducted to increase geological confidence as well as technical and economic confidence.

## 11.2 Leaching Test of Mengkham REE Project

In the leaching test area, some of the topography has been cleared, and the PLS collection Tunnel has been developed to approximately 7,000 meters, according to PFS. During the site visit in May 2024, it was observed that the injection process had already commenced. However, the collection of the PLS had not yet been completed, and there was no final product as of 30 September 2024. Figure 11-2 below shows the in-situ injection system at the mountaintop.

**Figure 11-2: In-Situ Injection System at The Mountaintop**

Source: SRK

### 11.2.1 In-situ Leaching Mine Design

As described in the PFS, the mine is going to adopt the "in-situ leaching" process. The PFS has explained the procedures of the mining method, which will be discussed in more detail in Section 12.

SRK constructed a preliminary mining model based on the PFS's description and industrial standards. For more explanations, refer to Section 11.

### 11.2.2 Modified Mineral Resources

As mentioned at the beginning of Section 11, Ore Reserves were not estimated. Based on reviewing PFS, the modified Mineral Resources is shown in Table 11-1 below.

**Table 11-1: Modified Mineral Resources of the CHIXIA Project, as of 30 September 2024**

Item	Tonnage (Mt)	SREO (g/t)
<b>Total</b>	138.04	239.42

Source: SRK.

Notes:

- <sup>1</sup> The term "Modified Mineral Resources" refers to the Mineral Resource incorporated into the mining and processing plans.
- <sup>2</sup> The ONLY modifying factor is the design loss caused by significant faults in the areas which make some Mineral Resources unmineable/unleachable.
- <sup>3</sup> Modified Mineral Resources are not Ore Reserves and have not demonstrated economic viability.
- <sup>4</sup> During the preliminary economic analysis, other factors in considerations included a "mining/leaching rate" of 90% and a "processing recovery rate" of 85.5%. However, these factors are not included in the estimation of Modified Mineral Resources.

## 12 In-situ Leaching Mining

CHIXIA commenced to operate a testing operation in March 2024, in order to fine-tune the parameters. In April 2024, CHIXIA requested SRK to conduct an independent review of the project. The PFS was prepared by CHIXIA. The key technical parameters listed in Table 12-1 below are summarized based on the PFS with SRK's modification.

**Table 12-1: In-situ Leaching Mining Design Parameters, as of 30 September 2024**

Design Parameter	Unit	PFS's Inputs	SRK's Inputs
<b>Overall</b>			
In-situ Leaching Mining Recovery	%	90.0	90.0
Processing Recovery	%	85.5	85.5
Overall Recovery	%	77.0	77.0
Wet Plant - REO	tpa	3675&2800	3675&2800
PLS Capacity	million m <sup>3</sup> pa	16.3 &11.6	16.3 &11.6
<b>In-situ Leaching Mining</b>			
Average Mineralized Body Depth	m	8.7	7.9
Injection Holes	m	4.0	4.0
Injection holes Cover Area	m <sup>2</sup>	5.0	5.0
Collection Tunnel Cover Area	m <sup>2</sup>	3.5	3.5

Source: CHIXIA

SRK's preliminary economic analysis was conducted based on the PFS, as well as information collected from site visits and discussions with CHIXIA's technical team.

### 12.1 Introduction

The extraction of REEs involves several mining methods, each suited to different types of deposits.

- Open-pit mining is used for shallow deposits and involves removing overburden, drilling, blasting, and transporting the ore, but it has significant environmental impacts.
- Underground mining is suitable for deeper deposits and involves creating shafts and tunnels, but it is costlier and riskier.
- In-situ leaching, used for specific geological conditions, involves injecting a leaching solution into the ore body to dissolve REEs, which are then pumped to the surface or collected from the tunnels and subsequently pumped to the processing plant; it has minimal surface disturbance but potential groundwater contamination risks.
- Placer mining, used for alluvial deposits, involves excavating, screening, and concentrating REE minerals, with lower environmental impact but limited to specific deposits.

The choice of method depends on deposit depth, type, economic factors, and environmental considerations.

The in-situ leaching process can be divided into two stages:

- Leaching solution injection
- Collection of the PLS

The choice of leaching solution is crucial and typically consists of a weak acid or salt solution designed to selectively bind with the adsorbed REEs while minimizing harmful environmental impacts. Common choices include ammonium sulfate, sodium chloride, or organic acids.

The leaching solution used in the CHIXIA project primarily comprises ammonium sulfate, which is widely used in similar in-situ leach mines in China. Figure 12-1 below shows the schematic view of in-situ leaching mining.

**Figure 12-1: Schematic Cross-section View of In-situ Leaching Mining**

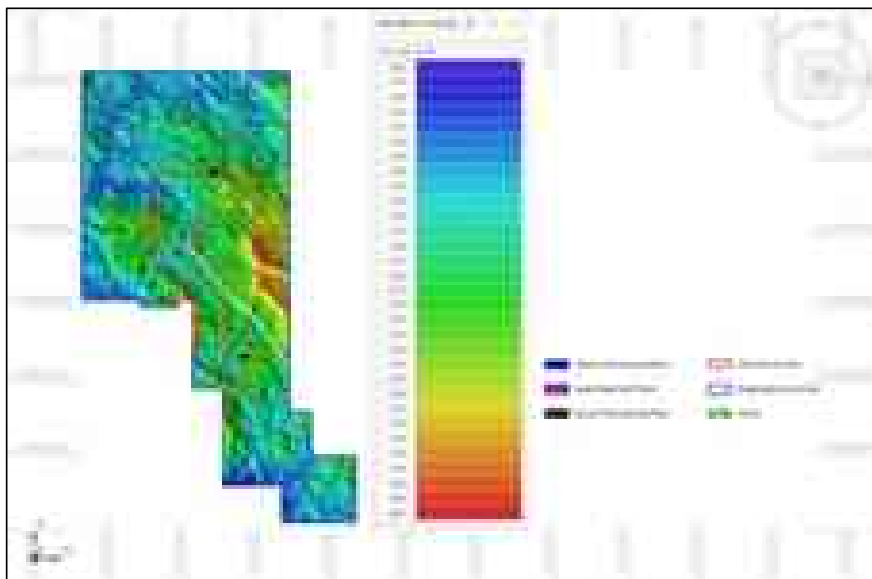

Source: SRK

## 12.2 Leaching Conditions

### 12.2.1 Topographic Condition

As illustrated in Figure 12-2, the elevation of the rare earth exploration area generally ranges from 1,251 to 1,851 meters ASL, with the highest elevation in the eastern exploration area reaching 1,851 meters ASL. The relative elevation difference within the area varies between 15 and 173 meters.

**Figure 12-2: General Topographic Elevations within Exploration License**

Source: SRK

<sup>1</sup> It should be noted that the locations of the three processing plants depicted in the figure only demonstrate the approximate layout and do not indicate the actual coordinates.

The topographic conditions are conducive to the strategic placement of leaching solution ponds and injection holes. These conditions facilitate an acceptable duration for the migration of PLS and provide a suitable hydraulic head for the delivery of PLS.

### 12.2.2 Occurrence and Lithology of the Mineralized Body

The PFS did not provide adequate information about the lithology of the mineralized body; it only explains the geological characteristics and weathering profile, which are as follows:

The deposit is formed by the weathering of medium-fine grained biotite granite, the main ore-forming parent rock. The mining area's structure is simple, with the deposit located between NW-SE faults and lacking fold structures.

Favourable climate and geography have preserved the weathered crust well. Geological surveys and drilling show that the weathering strength of rare earth minerals varies due to lithology, uneven weathering, and topography, resulting in a wavy distribution of mineralization. Generally, clay-rich mineralized body have better grades, with higher grades at the mountain top and waist, decreasing towards the col and foot of the mountain.

The mineralized body is stratified and locally lenticular, with general continuity. The intact regolith develops from topsoil, full regolith, and semi-regolith, with the full regolith being the main mineral-bearing layer.

- Topsoil Layer: Mainly composed of biotite granite residuum, its thickness varies, being thinner or absent at the mountain top and thicker at the slope and foot. It often contains humus and quaternary slope deposits, with a thickness of about 1-2 meters. This layer generally does not contain rare earth minerals.
- Full Regolith: The primary rare earth-bearing layer, often flesh-red, light red, or grayish-white, mainly composed of kaolin. It contains residual minerals like quartz, feldspar, and mica (1%-3%), and accessory minerals such as ilmenite, monazite, and zircon (<1%). The thickness ranges from 2.0 to 15 meters, with an average of 7 meters.
- Semi-Regolith: Grayish-white with a granite structure, composed mainly of quartz, feldspar, and biotite. This layer is the bottom of the rare earth layer, with weak weathering and kaolinization around feldspar grains. It generally does not contain rare earth minerals.

Given the thickness of the topsoil layer within the project area, conventional open-pit mining methods could potentially cause significant surface disturbance. Furthermore, the regolith derived from the weathered granite possesses a certain degree of hydraulic conductivity. Therefore, this rare earth deposit is amenable to the application of in-situ leaching techniques for the extraction of REEs.

### **12.2.3 Geotechnical and Hydrogeological Conditions**

#### **Geotechnical condition**

No geotechnical testing has been conducted on the regolith within the project area.

#### **Hydrological and Hydrogeological Condition**

In April 2024, CHIXIA conducted two experiments and summarized the results in the "Experimental Research Report on the Specific Consumption of Leaching Agent and Injection Intensity for Mineralized Body #2 of the Mengkham Rare Earth Project." Figure 12-3 shows the schematic diagram of the experiment.

**Figure 12-3: Schematic Diagram of Leaching Injection Intensity Experiment**

Source: CHIXIA

According to the report, the hydraulic conductivity of Mineralized Body #2 is 3.2-4.0 cm/h.

CHIXIA has not submitted any other hydrological and hydrogeological condition investigations or studies as of 30 September 2024. During the site visit, SRK was informed by CHIXIA that groundwater is not abundant in the project area. Currently, water is being sourced from a river ditch located 1.3 km in a straight line from the mining area and the water resources can meet the operational needs of the project now. SRK checked the local surface water condition as it shows in Figure 12-4 below.

Figure 12-4: Local Surface Water Condition

Source: SRK

## 12.3 Leaching System

An independent in-situ leaching system primarily consists of an injection system and a collection system.

- The injection system is situated at the mountaintop and gentle slopes and is divided into three components.
- The collection system is located at the foot of the mountain and may vary slightly depending on the design approach for solution collection.

### 12.3.1 The Injection System

The injection system is designed to introduce a leaching solution into the mineralized body to dissolve the REEs for extraction. The process involves preparing the mineralized body, injecting the leaching solution, and closely monitoring the operation. The injection system offers several advantages, including efficiency, reduced environmental impact, and cost-effectiveness. However, it requires precise control and careful management to ensure complete recovery and avoid environmental contamination.

The main three components are: leaching solution pond, injection holes and injection pipeline system.

#### Leaching Solution Pond

The leaching solution pond is designed for storing the leaching solution before injection and is typically constructed at the mountaintop. The leaching solution is prepared in the wet plant and pumped to the leaching solution pond using stainless steel pumps. From the pond, the leaching solution flows through a pipeline system to the various injection holes. Figure 12-5 shows the leaching solution pond during the site visit on 11 May 2024.

**Figure 12-5: Leaching Solution Pond**

Source: SRK

#### **Injection Hole**

Injection holes are arranged on the surface of each mineralized block at intervals of 2 to 3 meters by 2 to 3 meters. The specifications for these holes are as follows: diameter of 0.1 to 0.15 meters, with the depth determined based on the burial depth of the mineralized bed, generally extending 0.5 to 2 meters into the mineralized bed roof. Each injection hole is equipped with an injection pipeline and a gate valve to control the injection volume. Ammonium sulfate solution is introduced into the mineralized bed through the injection holes to recover REEs. Figure 12-6 shows the auger and injection hole during the site visit on 11 May 2024.

**Figure 12-6: Auger and Injection Hole**

Source: SRK

**Injection Pipeline Network**

In an in-situ leaching operation for REEs, the injection pipeline network would transport an ammonium sulfate solution from leaching solution level pond to multiple injection. Control valves and monitoring systems would ensure that the solution is delivered at the correct flow rate and pressure, allowing for efficient dissolution and recovery of the REEs. Figure 11-2 shows the injection pipeline network during the site visit on 11 May 2024.

**12.3.2 PLS Collection System**

The PLS collection system is a critical component of the in-situ leaching process, designed to efficiently collect the leachate containing dissolved REEs. The system comprises four main components:

**PLS Collection Tunnel**

A primary horizontal tunnel, known as the PLS collection tunnel, is excavated in the semi-weathered rock beneath the mineralized bed, following the contour lines of the mineralized bed's floor. This tunnel is strategically placed to avoid barren zones and ensure maximum efficiency in capturing the leachate.

According to PFS, the typical dimensions of the PLS collection tunnel have a top width of 0.3 to 0.4 meters, a bottom width of 0.6 to 0.8 meters, and a height of 1.6 to 1.8 meters. The length of the tunnel varies based on the mineralized bed's extension, generally ranging from 60 to 200 meters.

Sub-tunnels are arranged at intervals of 8 to 20 meters on both sides of the main collection tunnel. These sub-tunnels form a grid-like collection system, optimizing the capture of the leachate. All tunnel floors are treated to prevent leakage and are sloped at 3% to 5% towards the tunnel entrance with a collection pool. If the mineralized bed's floor has a significant dip angle, additional fan-shaped drill holes may be constructed in the roof of the sub-tunnels to shorten the leachate's infiltration distance and enhance collection efficiency.

The specifications of the PLS collection tunnel are shown in the beginning of Section 11.

**Figure 12-7: Main PLS Collection Tunnel in Construction**

Source: SRK

#### **PLS Collection Hole**

As described in the PLS collection tunnel section, fan-shaped drill holes may be constructed to enhance collection efficiency. Since the PFS does not specify the parameters, standardized parameters were adopted in preparing this report. These parameters include five holes on both wall side of the tunnel, spaced 1 meter apart, with each hole having a depth of 12 meters, refer to the beginning of Section 11.

#### **Main Collection Pipelines and Ditches**

A system of pipelines and ditches transports the PLS from the collection tunnels to the PLS hub pond. The pipelines ensure a controlled and efficient flow of the PLS, while the ditches provide additional pathways for the leachate, minimizing the risk of overflow and ensuring consistent delivery.

#### **PLS Hub Pond**

The hub pond is designed to accommodate large volumes of PLS, providing a buffer that ensures a steady supply to the processing plant and allowing for any necessary adjustments in the leaching process.

**Figure 12-8: PLS Hub Ponds**

Source: SRK

#### **12.3.3 Recycled Solution System**

After processing the PLS in the wet plant, the filtrate and supernatant flow into the ammonium sulfate preparation ponds. Ammonium sulfate and sulfuric acid are added, and the solution is then pumped by stainless steel pumps to the leaching solution pond at the mine for continued leaching. This injection treatment continues until the rare earth content in the collected PLS declines to a level that is no longer economically recoverable. The PFS does not specify the grade indicator for the suspension of exploitation.

#### **12.4 Leaching Unit Identification**

The in-situ leaching unit determination normally involves following considerations:

**Terrain:** The stability of the surface terrain is important to ensure safe operations and to prevent subsidence or collapse during and after the leaching process.

**SREO Content:** The grade of the SREO, should be high enough to make the leaching process economically viable.

**Water Table:** areas below the groundwater table have relatively poor ion-adsorption rare earth grades. Therefore, suitable mining areas are selected above the groundwater table.

According to PFS, it does not specify the leaching unit based on the factors mentioned above. In preparing this report, SRK has considered the SREO content, wet plant capacity and strategic exploitation plan only based on the data collected.

It should be noted that there are two significant faults in the southeast and northeast part of the project as it shows in Figure 12-9. When conducting in-situ leaching in areas with faults, the mining recovery can be lower than expected. If fault areas are defined by offsetting 50 meters on both sides of the faults, and the Mineral Resources within these fault areas are reported, it is estimated that approximately 1-2% of the Mineral Resources are affected by the faults. During this preliminary analysis, it is assumed that the mineral resources in the fault areas are unrecoverable.

Below, Figure 12-9 shows the leaching unit identified for the project.

**Figure 12-9: In-situ Leaching Unit Identification**

Source: SRK

Notes:

<sup>1</sup> It should be noted that the locations of the three processing plants in the figure only demonstrate the approximate layout and do not indicate the actual coordinates.

**12.5 Construction and Production Plan**

**12.5.1 Production Schedule**

In Section 13, according to PFS, SRK has summarized the strategic plan for the construction of the wet plant. The current operating plant, named the Leaching Test Plant, has a full production capacity of 3,675 tpa REO. Additionally, there are two more plants planned: one with a production capacity of 3,675 tpa REO, named the North Plant, and another with a production capacity of 2,800 tpa REO, named the South Plant. These are scheduled to be put into operation in 2026 and 2028, respectively.

Based on the calculations in PFS, the total annual PLS throughput is 16.34 million cubic meters for the 3,675 tpa REO plants and 11.55 million cubic meters for the 2,800 tpa REO plant.

The construction and operation plan are shown in Figure 12-10.

**Figure 12-10: Construction and Production Chart**

Source: SRK

The in-situ leaching schedule aligns with the annual PLS throughput capacity of the wet plants.

A mining schedule has been planned in terms of the proposed processing capacity as it shows in Table 12-2.

**Table 12-2: Mining Schedule of the CHIXIA Project**

Section	Unit	Total	2024	2025	2026	2027	2028	2029	2030	2031
Tonnage	kt	138,040	4,620	19,700	18,040	19,590	19,650	25,020	19,150	12,270
Grade (SREO)	g/t	239.42	221.94	266.10	236.15	237.71	218.51	220.33	263.75	245.12

Source: SRK

## **12.6 Conclusions and Recommendations**

After reviewing PFS, SRK has conducted preliminary analysis based on PFS and industry best practices. In-situ leaching mining is widely used and should not pose major risks. However, SRK has the following recommendations:

- Increase geological confidence: Enhance the understanding of the geological conditions to ensure accurate resource estimation and effective leaching operations.
- Collect production data: Gather production data to provide a better understanding of the in-situ leaching recovery rates and to optimize the leaching process.
- Conduct geotechnical and hydrogeological investigations as well as studies: Guide the design parameters for in-situ leaching, ensuring safe and efficient operations.

## 13 Recovery Methods

This section is only for the Mengkham REE project.

### 13.1 Overview

The ore of the Mengkham RE deposits is an ion-adsorption type rare earth, with an average SREO grade of 0.025%. A preliminary feasibility study for the Project development had been carried out by CHIXIA Laos Holdings Limited ("CHIXIA") in 2023, with a designed production capacity of 3,675 tpa REO.

The PFS adopts the "in-situ leaching ("ISL")" process to extract the RE from the ore bodies. The rare earth pregnant leaching solution ("PLS") from ISL is then processed in hydrometallurgical plant to produce final product - mixed REO. The hydrometallurgical process includes purification (impurities removal), RE precipitation, REC filtration and calcination operations. The designed total recovery was 77%, with the ISL rate of 90% and the hydrometallurgical recovery rate of 85.5%.

Three hydrometallurgical plants and one calcination plant are planned to be built during the life of mine. The Project had completed most of the construction of the Leaching Test Plant until May 2024, except for the filter press workshop and calcination workshop. Additionally, North Plant with production capacity of 3,675 tpa REO and South Plant of 2,800 tpa REO are scheduled to be constructed in 2026 and 2028, respectively.

SRK's assessment on the hydrometallurgical processing is based on the Feasibility Study, as well as information collected from site visits and discussions with the technical team of the client.

### 13.2 Hydrometallurgical Process

The PLS from ISL operation undergoes four steps of processing which consists of purification, precipitation, crystallization and filtration. The primary product is rare earth carbonate ("REC"), which will be sent to the calcination workshop to produce mixed REO. The processing flowsheet is shown in Figure 13-1, and specified as follows:

#### **PLS Purification**

The PLS collected from the ISL area is gathered and subsequently pumped into the PLS purification ponds at the hydrometallurgical plant. The PLS contains some impurities which can influence the quality of the product, so that need to be removed. Ammonium bicarbonate solution is introduced into the ponds, and the blend is consistently stirred by compressed air. The pH value of the PLS in the pond is maintained within a range of 5.0 to 5.2, and the impurity ions will precipitate by forming insoluble compounds.

The residue that precipitate from the PLS purification operation is primarily composed of  $\text{Al}(\text{OH})_3$ ,  $\text{Fe}(\text{OH})_3$ ,  $\text{SiO}_2$ , clay, etc., and containing a small amount of REO. It is then dissolved by acid to recycle REO, which would improve the REO processing recovery.

#### **Precipitation and Crystallization**

After impurity removal, the purified PLS enters the precipitation ponds. Saturated ammonium bicarbonate solution is introduced into the ponds, and a consistent and uniform stirring is maintained

using compressed air. The amount of the ammonium bicarbonate solution is carefully controlled until reaching to a suitable pH value leading to the precipitation of the REC, which is then flowed into the crystallization pond for still settlement, allowing the REC crystals to grow up. It is then pumped into the filter press for dehydration. The supernatant can be recycled for ISL injection. The corresponding reaction equation is as follows:

**REC Dehydration and Calcination**

The REC crystals are pumped into the filter press for dehydration. The resulting filter cake, which is the wet REC product, is then conveyed to the calcination workshop to produce mixed REO. The filtrate is collected and pumped into the leaching solution preparation ponds.

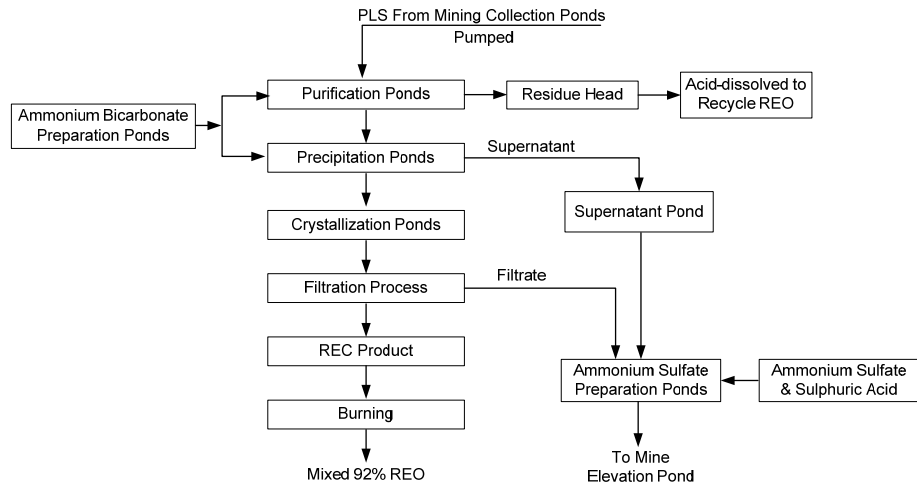

**Preparation of Leaching Solution**

The ISL solution preparation pond contains a mixture of supernatant and filtrate, and the solution is of alkaline as significant quantity of ammonium bicarbonate contained. As such the sulfuric acid is added to convert the excess ammonium bicarbonate to ammonium sulphate and maintain a pH value of about 5 for the solution. The reaction equation is as follows:

After converting, the solution is tested to determine the concentration of ammonium ions. Ammonium sulphate is subsequently added to formulate the leaching solution. This prepared solution is then pumped into the mine elevation pond and injected into the orebodies through the injection system.

**Figure 13-1: Processing Flowsheet of Hydrometallurgical Plant**

Source: PFS report of Mengkham RE mine project in Mengkham County, Xieng Khouang Province, Laos, CHIXIA ,2023 and is prepared by SRK.

### 13.3 Production Capacity and Technical Parameters

The production capacity of the mine depends on the scope area of the liquid injection holes and the collection tunnels. Compared with the actual production capacity of other similar mines, the full production capacity of the first hydrometallurgical plant is 3,675 tpa REO, and SRK deems that it is appropriate. Further considering the leaching unit classification and the distribution of different ore bodies, it is planned to construct additional two hydrometallurgical plants, one with production capacity of 3,675 tpa REO and the other one of 2,800 tpa REO, which are scheduled to put into operation in 2026 and 2028, respectively.

The hydrometallurgical plant adopts continuous working system, which is 330 working days per year, with 2 shifts per day, and 12 hours per shift.

According to the FS report and discussion with the technical team of the client, SRK summarizes the technical parameters of the hydrometallurgical plant, which are shown in Table 13-1.

**Table 13-1: Main Technical Parameters of the Hydrometallurgical Plant**

Design Parameter	Unit	Value
Annual Operational Days	dpa	330
Overall Availability	%	90.41
Daily Operating Hours	hpd	24
PLS Flow Volume	m <sup>3</sup> /d	44,545
PLS Flow Volume	1,000 m <sup>3</sup> /a	14,700
Average PLS Grade – REO	g/l	0.25
Processing Recovery	%	85.5
Overall Recovery	%	77
pH Value of Purification	n/a	5.0~5.2
pH Value of REE Precipitation	n/a	6.8-7.2
Production - REO	tpa	3,675

### 13.4 Main Equipment & Facilities & Plant Layout

The existing hydrometallurgical plant equipment mainly consist of pumps, filter press and compressor machines, which are shown in Table 13-2. The facilities mainly include reagent warehouse, ammonium bicarbonate solution preparing ponds, purification ponds, REC precipitation ponds, REC crystallization ponds, residue turnover ponds, leaching solution preparation ponds, filter press workshop, calcination workshop, product warehouse, sulfuric acid tank, power station, laboratory, maintenance workshop, etc, which are listed in Table 13-3. All the ponds above are impermeable with geotextiles.

**Table 13-2: Main Equipment of the Existing Hydrometallurgical Plant**

No.	Equipment Name	Specifications and Models	Unit	Quantity	Remark
1	Acid-resisting Centrifugal Pump	DF85-45*6	Set	20	Pump the ammonium sulfate solution

According to the distribution of ore body and terrain conditions, hydrometallurgical plant is arranged in the middle flat area of the mine. Considering the requirements of the process order, the plant is structured in a stepped manner along the hillside, which can make the mother liquor flow by itself and reduce the power consumption.

Till May 2024, the Project had completed most of the construction of the first hydrometallurgical plant, except for the filter press workshop and calcination workshop. The general view of the plant is shown in Figure 13-2.

Figure 13-2: General View of the Hydrometallurgical Plant in Construction

Source: SRK site visit

### 13.5 Conclusions and Recommendations

The PLS undergoes four steps of processing to yield primary product of rare earth carbonate (“REC”), which will be sent to the calcination workshop to produce mixed rare earth oxide (“REO”). The residue will be dissolved by acid to recycle REO, which would improve the REO processing recovery and the economic benefits.

The full production capacity of the existing hydrometallurgical plant is 3,675 tpa REO. The designed total recovery was 77%, with the ISL rate of 90% and the hydrometallurgical recovery rate of 85.5%. SRK deems that it is appropriate.

Three hydrometallurgical plants and one calcination plant are planned to be built during the life of mine. The Project had completed most of the construction of the Leaching Test Plant till May 2024, except for the filter press workshop and calcination workshop. Additionally, North Plant with production capacity of 3,675 tpa REO and South Plant of 2,800 tpa REO are scheduled to be constructed in 2026 and 2028, respectively.

## 14 Project Infrastructure

This section only reports the project infrastructure of Mengkham REE project.

### 14.1 Industrial Sites

The industrial sites of the Mengkham REE Project, based on the PFS and the observation during the site visit, mainly include the mining site, PLS processing plants and officing and living facilities etc.

The mining sites are the mineralized bodies designed for in-situ leaching mining. Current leaching test has developed the mining facilities in the first mining section.

The sites for PLS processing plants will be determined by considering various factors in order to efficiently develop and utilize the mineral resources with optimal operating costs and minimizing the environmental risks. The first PLS processing has been constructed and put in the leaching test.

Waste dumping sites will be the valleys near the mineralized blocks to be mined.

The officing and living sites should be chosen by considering safety factors. For the leaching test, some facilities, such as office, conference rooms, dining rooms, storages and lab etc. have been constructed.

Table 14-1 lists the land area needed for the industrial sites proposed in the PFS.

**Table 14-1: Proposed Land Area needed for the industrial sites proposed in the PFS**

Item	Unit	Area
Mining sites	m <sup>2</sup>	3,152,029.00
PLS Processing plants	m <sup>2</sup>	78,237.65
Waste dumping sites	m <sup>2</sup>	206,698.87
Officing and living site	m <sup>2</sup>	5000
Water pumping station	m <sup>2</sup>	100

### 14.2 Internal and External Transportation

Since the in-situ leaching method is adopted to mine and extract the REE in the mineralized bodies. The transportation of various liquid between mining sites to the PLS processing plants will use pipes. The dirt and/or gravel paved roads will connect various sites within the project area.

The project is near the provincial highway C1, and the highway will be used for the transportation of supportive materials from outside, and the final products of the project will be trucked to outside.

### 14.3 Water Supply and Drainage

According to the PFS, in order to produce 3,674tpa REO, the water consumption is 7,425m<sup>3</sup>/day for production. Other water consumption includes for living and fire fight.

Water sources in the project area are not abundant on the surface. There are two streams near the plant, while their volume is small. The PFS has proposed to constructing water storage facilities where the two streams join.

Surrounding the PLS processing plants, ditches will be dug for water drainage of rainfalls. Civil waste water will be discharged into valleys after treatment. The water in the production will be recycled, without any discharge.

#### **14.4 Power Supply**

The mine has been connected to the high-voltage feeder of 115KV, and constructed a transformer substation to transform the electricity to 10KV. Through overhead lines, the power line connects to substations of various sites, such as mining sites, plants, as well as living facilities.

#### **14.5 Other Supportive Facilities**

Other Supportive Facilities include communication systems, supportive constructions and machinery maintenance and repairing.

## **15 Market Studies and Contracts**

There are abundant uses of REEs in various aspects, such as metallurgy, petroleum, chemical industry, glass and ceramics, textile, medicine, agriculture and environmental protection etc. With the development of science and technology, people will recognize new properties of REEs, and REEs have been becoming important materials for modern industry.

In recent years, the production of REE production in China constantly increased, and the market is bright for the REEs.

There is no information at the moment on the contracts of product sales of the project.

## 16 Environmental, Social and Community Impact for Mengkham REE Project

### 16.1 Environmental and Social Review Objectives

The objective of this environmental and social review is to identify and/or verify the existing and potential environmental and social liabilities and risks, and assess any associated proposed remediation measures for the development and operation of the Mengkham REE Project. During SRK's site visit in May 2024, the project was in the construction and metallurgical leach testing stage.

### 16.2 Environmental and Social Review

The process for the environmental and social preliminary review for the Project comprised a review of provided project environmental and social management documentation combined with site visit observation against relevant criteria within:

- Laos national environmental regulatory requirements; and
- World Bank/International Finance Corporation ("IFC") environmental and social standards and guidelines and internationally recognised environmental management practices.

SRK notes that an Environmental and Social Impact Assessment ("ESIA") report has not been prepared at this stage, and the Company is in the process to prepare such a document to be submitted for approval by the environmental authorities. SRK reviewed the environmental section from the provided feasibility study report dated 2024 prepared by Chixia Laos Holdings Ltd against recognized international industry environmental management standards, guidelines and practices. SRK provides comments in respect to the Project's environmental management measures by the following.

The environmental impact of mining encompasses erosion, sedimentation, biodiversity loss, and the contamination of soil, groundwater, and surface water by chemicals from the mining industry. During mining operations, the key pollutants anticipated to enter the river and affect the ecological system are ammoniacal nitrogen and sulphate from the in-situ leaching process. The potential for chemicals to leak into groundwater, especially through bedrock cracks, poses threats not only to the environment but also to public health and socio-ecological stability.

Since the injection solution contains ammonia nitrogen, there is a high risk of eutrophication and water pollution. To address these concerns, a series of mitigation strategies are proposed. These include conducting clear water injections to detect potential cracks prior to injecting leaching solutions, installing PVC linings in solution collection tunnels to prevent seepage, transforming existing wells into groundwater monitoring sites while sourcing new water supplies, initiating a comprehensive groundwater monitoring program, and implementing engineering solutions such as anti-seepage layers and containment bunds.

The project might cause ecological disturbances, primarily due to the destruction of plant and crop habitats during its development, mining, and operational phases. Additionally, the employment of chemicals such as ammonium sulphate and ammonium bicarbonate in mining processes poses a risk to local vegetation, including rubber trees, by altering the soil composition.

The impact from noise and air quality might arise from site clearing and construction activities. To mitigate these impacts, several measures are proposed: dampening or covering access roads, stockpiles, and vehicles transporting loose construction materials; establishing a periodic maintenance schedule for all motorized machinery and equipment, focusing on the efficiency of mufflers/silencers to reduce noise emissions, and implementing a Monitoring Plan. During the site visit, SRK did not observe significant noise and fugitive dust emissions.

The recognised international industry practice for managing site closure and rehabilitation is to develop and implement an operational site closure and rehabilitation planning process and document this through an operational Closure and Rehabilitation Plan. This operational closure planning process generally includes the following components:

- Identify all site closure stakeholders (e.g., government, employees, community);
- Undertake stakeholder consultation to develop agreed site closure criteria and post operational land use;
- Maintain records of stakeholder consultation;
- Establish a site rehabilitation objective in line with the agreed post operational land use;
- Describe/define the site closure liabilities determined against agreed closure criteria;
- Establish site closure management strategies and cost estimates to address/reduce site closure liabilities;
- Establish a cost estimate and financial accrual process for site closure; and
- Describe the post site closure monitoring activities/program to demonstrate compliance with the rehabilitation objective/closure criteria.

At this stage, no comprehensive mine closure plan has been developed. Based on SRK's estimate, the total cost of mine closure for this 8.0 km<sup>2</sup> is approximately US\$ 1.50 M. However, a mine closure bond has not been established.

The proposed project is situated in an area characterized by a mix of land uses, including agricultural land primarily planted with latex rubber trees. In addition to direct employment for local people, mining industry can lead to promote local people's living if natural resource extraction occurs responsibly and well managed to meet government and community requirements. A well-developed Corporate social responsibility ("CSR") and community development ("CD") can be the vehicle for achieving the above objectives. No non-compliance notices or other notices of a breach of environmental or social conditions for the Project from the Local or Provincial governments have been sighted as part of this review. As part of this review, SRK has not sighted any documentation in relation to any actual or potential impacts of non-governmental organisations on the sustainability of the mining and processing operations.

### 16.3 Evaluation of Environmental and Social Risks

The sources of environmental risk are project activities that may result in potential environmental impacts. These project activities have been previously described within this report. In summary, the most significant potential environmental and social risks for the development of the Project, currently identified as part of the project assessment and this SRK review, are:

- Environmental approval to be obtained;
- Water pollution; and
- Mine closure fund to be established

It is SRK's opinion that the above environmental risks are categorised as medium risks (i.e., requiring risk management measures) and they are generally manageable. Since various environmental protection measures are planned or conducted by the Company to solve these environmental issues, SRK considers that these environmental risks are controlled properly and not likely to develop into higher level of risks.

## 17 Capital Expenditures and Operating Expenses

### 17.1 Summary

A preliminary feasibility study (“PFS”) for the Mengkham REE Project had been carried out by CHIXIA Laos Holdings Limited (“CHIXIA”) in 2023. The Leaching Test Plant with designed capacity of 3,675 tpa REO has been put into leaching test. Additionally, North Plant with designed capacity of 3,675 tpa REO and South Plant of 2,800 tpa REO are scheduled to be constructed in 2025 and 2027, respectively.

The historical capital expenditures (“Capex”) are provided by the Client, and future Capex and operating expenses (“Opex”) for the project are estimated according to the PFS. It is assumed that all the Capex is own capital invested by the Client, no financial cost is considered.

Given the typical service life of each injection hole and collection tunnel being less than 1-2 years, SRK deems it appropriate to allocate the related costs into the Opex. This approach ensures a comprehensive consideration of all relevant expenditures over the project’s Life-of-mine (“LOM”).

### 17.2 Capital Expenditures

The estimated Capex primarily consists of the main production facilities of three hydrometallurgical plants, public auxiliary facilities and engineering construction other expenses (mainly the mining rights or licence cost).

The total estimated Capex over the LOM is RMB130.32 million, which includes the historical investment of RMB 66.35 million, the sustaining investment of RMB 48.80 million and the closure investment of RMB 15.17 million. Table 17-1 summarized the Capex breakdown for the Project.

The historical investment of RMB 66.35 million is used for the construction of Leaching Test Plant, which is shown in Table 17-2. SRK take the historical investment as the sunk Capex, participating in the depreciation and amortization over the LOM, but not participating in the net present value (“NPV”) calculation.

The sustaining investment of RMB 48.8 million is estimated for the construction of North Plant and South Plant, also including public facilities and other expenses. The future investment schedule are summarized in Table 17-1.

The closure investment are used for the reclamation of each hydrometallurgical plant and mine lot, which is estimated to RMB 1.3 per square meter of mining area.

**Table 17-1: The Capex Breakdown for the Mengkham REE Project (Unit: RMB M)**

Item	Historical Investment	Sustaining Investment	Closure Investment	Total
Hydrometallurgy Plant Construction	7.93	25.80	-	33.73
Public Auxiliary Facilities	19.44	13.00	-	32.44
Engineering Construction Other Expenses	38.98	10.00	-	48.98
Closure	-	-	15.17	15.17

Subtotal Investment	66.35	48.80	15.17	130.32
---------------------	-------	-------	-------	--------

**Table 17-2: Historical Investment Breakdown (Unit: RMB M)**

Item	Construction Engineering	Equipment	Other Expenses	Total Value
Hydrometallurgy Plant Construction	7.93	-	-	7.93
Public Auxiliary Facilities	4.23	15.21	-	19.44
Transport equipment	-	2.65	-	2.65
Machinery equipment	-	0.34	-	0.34
Office equipment	-	0.13	-	0.13
Power equipment	-	12.09	-	12.09
Office Place	1.18	-	-	1.18
Camp	2.39	-	-	2.39
Road	0.66	-	-	0.66
Engineering Construction Other Expenses	-	-	38.98	38.98
Land compensation fees	-	-	2.49	2.49
Exploration right fees	-	-	35.49	35.49
Mining right fees	-	-	1.00	1.00
<b>Total Investment</b>	<b>12.16</b>	<b>15.21</b>	<b>38.98</b>	<b>66.35</b>

**Table 17-3: Future Investment Schedule (Unit: RMB M)**

Item	Total	2024	2025	2026	2027	2028	2029	2030	2031
<b>Sustaining Investment</b>	48.80	8.80	25.00	-	15.00	-	-	-	-
Leaching Test Plant	8.80	8.80	-	-	-	-	-	-	-
North Plant	15.00	-	15.00	-	-	-	-	-	-
South Plant	15.00	-	-	-	15.00	-	-	-	-
Mining Right Fee	10.00	-	10.00	-	-	-	-	-	-
<b>Closure Investment</b>	15.17	-	-	-	4.76	-	-	6.96	3.46

In addition to the Capex, the working capital cost will be invested into the project according to the production schedule which will be recovered during closure of the project. It is estimated by expanded index method which is 45% of Opex.

### 17.3 Operating Expenses

The Project's cash Opex primarily include the following items:

- a. workforce employment;
- b. consumables;
- c. fuel, electricity, water and other services;
- d. on and off-site administration;
- e. environmental protection and monitoring;

- f. transportation of workforce;
- g. product marketing and transport;
- h. non-income taxes, royalties and other governmental charges; and
- i. contingency allowances;

Table 17-4 summarized the forecasted Opex for the Project, with a total Opex of RMB 4,264.61 million and unit cost of approximately 30.90 RMB/t RoM or 167,697 RMB/t REO. All costs are current as of 30 September 2024, with no escalation factored in.

**Table 17-4: Forecasted Opex of the Mengkham RE Project**

Item	LOM Total Cost (RMB M)	Unit Cost (RMB/t RoM)	Unit Cost (RMB/t REO)
Workforce employment	150.80	1.09	5,930
Consumables	2,020.41	14.64	79,448
Fuel, electricity, water and other services	153.65	1.11	6,042
On and off-site administration	29.65	0.21	1,166
Environmental protection and monitoring	30.52	0.22	1,200
Transportation of workforce	5.48	0.04	216
Product marketing and transport	38.15	0.28	1,500
Non-income taxes, royalties and governmental charges	1,613.60	11.69	63,451
Contingency allowances	222.35	1.61	8,743
<b>Total</b>	<b>4,264.61</b>	<b>30.90</b>	<b>167,697</b>

## 18 Preliminary Economic Analysis for Mengkham REE Project

Given that the project is currently at leaching test stage with the FS completed, the Discounted Cash Flow ("DCF") modelling method under the income approach was considered an appropriate technique to conduct the preliminary economic analysis.

The Capex and Opex estimated in the FS allowed SRK to create a technical economic model and analyse the economic viabilities of the future mining operation. In addition to the FS, SRK's estimation also relied on information collected through site visits and experience in this field.

The economic analysis presented in this section contains forward-looking information related to the ore production estimate, commodity prices, exchange rates, proposed production plan, projected recovery rates, production cost, etc. The results of the economic analysis are subject to several known and unknown risks, uncertainties, and other factors that may cause actual results to differ materially from those presented herein.

It is important to note that the purpose of this analysis is solely to demonstrate the economic viability of the projects. The derived NPVs do not indicate the fair market values or the profitability of the projects. The estimated cash flows and NPVs were presented on an after-tax basis, and financing costs were not considered.

The Net Present Value ("NPV") was estimated from the project's cash flow projections based on an 10% discount rate. Furthermore, a sensitivity analysis was conducted to assess the potential impacts of variations in project capital costs, operating costs, and commodity prices.

### 18.1 Principal Assumptions

The assumptions applied to the economic model is based on the following principles:

- Product prices were based on Xiamen Tungsten 2024 REO guidance price which is described in the FS report.
- The model utilizes a constant REO price during the life-of-mine and assumes that the final REO product will be sold within the same year of production.
- The financial model utilizes Renminbi ("RMB") as the currency unit.
- Capex is depreciated and/or amortized using the straight-line method. Working capital will be fully recovered in the final year of the Project.
- Discount rate of 10% will be used in base case.

The principal assumptions and parameters applied in the DCF model are presented in Table 18-1.

**Table 18-1: Principal Assumptions for the DCF Model of the Project**

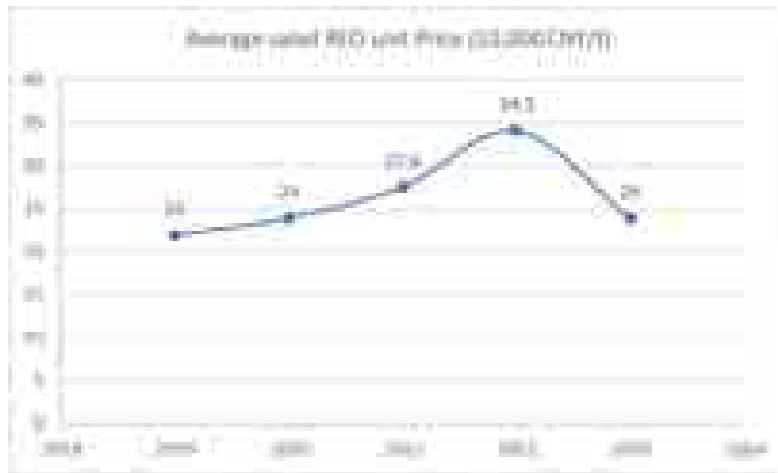

Item	Unit	Value
Total ore output	kt	138,036
SREO grade	%	0.0239
Total REO Product	t	25,431

Item	Unit	Value
Life-of-Mine	Year	8
Leaching rate	%	90
Processing recovery rate	%	85.5
Overall REE recovery rate	%	77
Historical investment	RMB M	66.35
Sustaining investment	RMB M	48.8
Unit Opex	RMB/t RoM	30.90
Unit Opex	RMB/t REO	167,697
Royalty	%	20% @Sales Revenue
Export Tax	%	10% @Sales Revenue
Discount rate	%	10
Corporate income tax	%	20% @Gross Profit

## 18.2 REO Price

The Project is an ion-type rare earth mine, and the ore belongs to middle yttrium rich europium ("MYRE") mixed REO. Figure 18-1 shows the MYRE price trend from 2019 to 2023. It can be seen from the figure that the price has shown a trend of rising initially and then starting to fall in 2022. The lowest price including tax is 220,000 RMB/t REO, and the highest price including tax is 341,000 RMB/t REO. The average annual price for 5 years is 263,400 RMB/t REO including tax.

**Figure 18-1: Mixed REO Price Trend in History**

Source: SMM

The price of mixed REO is determined by the allocation of each rare earth product and the price of each REO. At present, the Project is under the construction and early production stage, and without sales agreement or pricing formula yet. Therefore, SRK adopts Xiamen Tungsten guide REO price in 2024, which is of 239,000 RMB/t REO (including tax) for DCF model calculation according to the FS report. The value-added tax rate is 13%, thus the price excluding tax is 211,504 RMB/t REO.

### 18.3 Depreciation, Amortization and Taxes

According to the accounting standards of Laos, the depreciation life of equipment such as machinery, electronic equipment and transportation equipment is 5 years, and the salvage value is 0. Intangible assets and other assets are amortized according to the REO output.

The Taxes and Surcharges primarily consist of royalties and export tax. The Client has informed SRK that the royalty rate is 20%, while the export tax rate is 10% of the sales revenue. Additionally, SRK has applied a Corporate Income Tax ("CIT") of 20% on the gross profit, with royalties and export tax being deductible expenses before calculating taxes.

### 18.4 Net Present Value Result

The net present value ("NPV") of RMB 471.23 million at 10% discount rate was estimated by SRK using DCF model with the assumptions as outlined in the above section. The NPVs based on different discount rate were also estimated, presented in Table 18-2, which has demonstrated the economic viability of the Project.

**Table 18-2: Estimated NPVs at Different Discount Rate (Unit: RMB M)**

Discount Rate	8%	9%	10%	11%	12%
NPV	527.96	498.69	471.23	445.47	421.26

### 18.5 Sensitivity Analysis

SRK applied the single factor method for conducting the sensitivity analysis. Many parameters can affect the Project's NPV. To simplify the calculations, the Opex, Capex, and REO product price were selected as the essential variable factors on cash flow. The effects of these essential factors on the NPV were analysed within a  $\pm 30\%$  range. The corresponding results for the Project are presented in Table 18-3 and Figure 18-2, respectively.

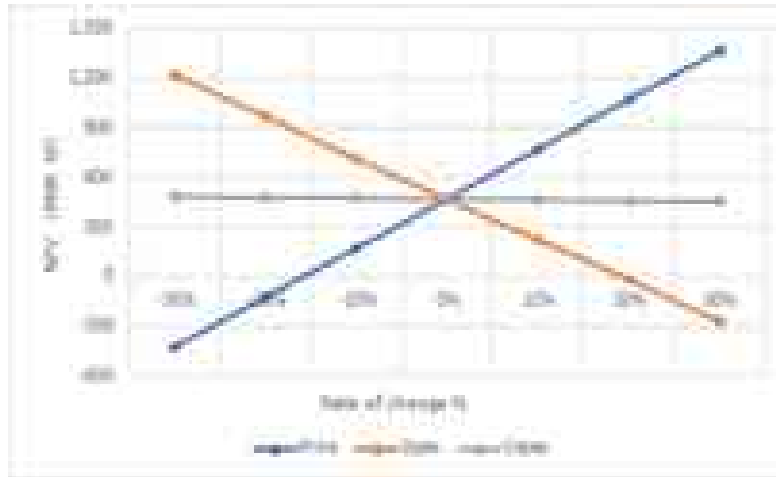

**Table 18-3: Sensitivity Coefficient of NPV (at 10% Discount Rate, in RMB M)**

Factors	Changes							Average +1%	Average -1%
	-30%	-20%	-10%	0%	10%	20%	30%		
Price	-427.34	-127.82	171.71	471.23	770.76	1,070.28	1,369.81	6.36	-6.36
Opex	1,213.19	965.87	718.55	471.23	223.92	-23.40	-270.72	-5.25	5.25
Capex	486.49	481.40	476.32	471.23	466.15	461.06	455.98	-0.11	0.11

The table showcases the sensitivity of the NPV with changes in price, Opex, and Capex. Price fluctuations exhibit the most substantial impact, with a 30% increase boosting NPV to RMB 1,369.81 million, while Opex changes moderately influence NPV. Capex variations have the least effect on NPV.

Figure 18-2: Sensitivity Analysis on NPV

## 19 Risk Analysis

Mining is a relatively high-risk industry. In general, the risk may be expected to decrease from exploration, development, through to production stage.

The Sepon REE Project is in its early phases, primarily focused on exploration and resource identification. Given the inherent risks at this stage, determining whether the identified mineral resources can be economically developed will depend on the outcomes of a comprehensive technical and economic analysis or feasibility study.

The Mengkham REE Project is a development-construction project. In this risk analysis, SRK only focus on the Mengkham REE Project. Risks exist in different areas. SRK considered various technical aspects which may affect the feasibility and future cash flow of the Project, and conducted a qualitative risk analysis which has been summarised in Table 19-1. In this risk analysis, various risk sources/ issues have been assessed for Likelihood and Consequence, and then a Risk Rating has been assigned. The qualitative risk analysis uses the following definitions for likelihood and consequence:

In the risk assessment, various risk issues have been assessed for Likelihood, Consequence, and Overall Rating. SRK has used a matrix as follows:

The Likelihood of a risk is considered within a certain time frame, e.g. 5 years, as:

**Likely:** will probably occur;

**Possible:** may occur; and

**Unlikely:** unlikely to occur.

The Consequence of a risk is classified into:

**Major Consequence:** the factor poses an immediate danger to the Project, if uncorrected, will have a material effect on the Project cash flow and performance and could lead a project failure;

**Moderate Consequence:** the factor, if uncorrected, will have a significant effect on the Project cash flow and performance; and

**Minor Consequence:** the factor, if uncorrected, will have little or no effect on the Project cash flow and performance.

The overall risk assessment combines the Likelihood and Consequence of a risk and be classified as **Low** (unlikely and possible minor risks and unlikely moderate risk), **Medium** (likely minor, possible moderate and unlikely major risks), and **High** (likely moderate and major and possible major risks).

Below is the qualitative risk analysis summary table of the Mengkham REE Project.

**Table 19-1: Project Risk Assessment of the Mengkham REE Project**

<b>Risk Source/Issue</b>	<b>Likelihood</b>	<b>Consequence</b>	<b>Overall</b>
<b>Geology and Resource</b>			
Lack of Significant Mineral Resources	Unlikely	Moderate	Low
Lack of Significant Ore Reserves	Possible	Major	High
Unexpected Groundwater Ingress	Unlikely	Minor	Low
<b>Mining</b>			
Subsidence and Ground Stability	Possible	Moderate	Medium
Hydrogeological Modeling Uncertainties	Unlikely	Moderate	Low
Significant Production Shortfalls	Unlikely	Major	Medium
Significant Geological Structure	Possible	Minor	Low
<b>Ore Processing</b>			
Lower Recovery	Unlikely	Moderate	Low
High Production Cost	Possible	Minor	Low
Poor Plant Reliability	Unlikely	Minor	Low
<b>Capital and Operating Costs</b>			
Project Timing Delays	Possible	Minor	Low
Capital Cost and Operating Cost Increases	Possible	Moderate	Medium
High mine closure cost	Possible	Moderate	Medium
<b>Environmental, Social and Permitting</b>			
Environmental approval to be delayed	Possible	Moderate	Medium
Water eutrophication	Possible	Moderate	Medium
Fund not available and without proper mine closure	Possible	Moderate	Medium

Some medium and high risks have been identified for the Project. Two high risks are “Lack of significant Ore Reserves” and “Capital Cost and Operating Cost Increases”. To manage the risks, SRK recommends the Company should further conduct supplemental exploration programs following guidelines of the best practice to upgrade the mineral resource basis, and then conduct a feasibility study accordingly.

## 20 Interpretation and Conclusions

### 20.1 Sepon Rare Earth Element Deposit

#### 20.1.1 Geology and Exploration

The Sepon Project is classified as an ion-adsorption type of rare earth deposit, wherein the majority of REE occurs in an ion-exchangeable form, adsorbed onto clay minerals.

The core drilling, geological logging, and topographic survey were implemented to a standard ensuring that the gathered data and information adequately underpin the objectives of subsequent geological modelling and resource estimation.

SRK opines that the depth capacity of manual auger drilling might be insufficient to penetrate potentially semi-weathered hard layers or boulders. This limitation could potentially lead to incomplete intersections of the bottom of ore-bearing horizon during drilling.

The procedures for sample collection, preparation, and analysis are following the REE industry standards. SRK considers that the procedure, as well as the data and information obtained, are acceptable for resource estimation purposes.

#### 20.1.2 Mineral Resource Estimation

Mineral Resources have been estimated through creating resource models. The data and information used for this resource model generation are acquired from the exploration and were reviewed by SRK to ensure the data reliability.

Due to the drilling and sampling methods employed in the exploration, there is a possibility of misidentification of certain sections potentially bearing REE. Consequently, this could lead to under-delineation of the mineralized domains during resource modelling, potentially resulting in a conservative resource estimate.

### 20.2 Mengkham REE Project

#### 20.2.1 Geology and Exploration

The Mengkham REE Project is classified as an ion-adsorption type of rare earth deposit, wherein the majority of REE occur in an ion-exchangeable form, adsorbed onto clay minerals.

Exploration activities have revealed that the ion-exchangeable rare earth elements ("REE") are primarily concentrated within the mid-section of the regolith horizon. At Mengkham the top of the mineralised zone is defined by a thin surficial soil zone that averages 2 m in thickness. The base of the mineralised zone extends to an average vertical depth of 9.0 m. And the SREO grade ranges from 9.5 to 2857 g/t, averaging 243.5 g/t.

The core drilling, geological logging, and topographic survey were implemented to a standard ensuring that the gathered data and information adequately underpin the objectives of subsequent geological modelling and resource estimation.

SRK opines that the depth capacity of manual auger drilling might be insufficient to penetrate potential semi-weathered hard layers or boulders. This limitation could potentially lead to incomplete intersections of the bottom of ore-bearing horizon during drilling.

The implementation of sample collection, preparation, and analysis in accordance with relevant Chinese standards is a common practice employed across China for IAC REE exploration projects. After reviewing the entire process and the duplicate sample test results, SRK considers that the procedure, as well as the data and information obtained, are acceptable for resource estimation purposes.

However, SRK considers that the rapid test method, which entails visually observing rare earth precipitates before conducting core sampling for laboratory analysis, is qualitative in nature. This approach serves merely as an initial indication to assess the mineralization within the sampled core interval. Due to its inherent subjectivity, this method may result in overlooking certain shallow-occurring intervals containing REE sufficient for subsequent laboratory testing, potentially leading to an underestimation of orebody thickness.

### 20.2.2 Mineral Resource Estimation

Due to the drilling and sampling methods employed in the exploration, there is a possibility of misidentification of certain sections potentially bearing REE. Consequently, this could lead to under-delineation of the mineralized domains during resource modelling, potentially resulting in a conservative resource estimate.

Large bias was observed between Mengkham original assay and SRK verification results. The Mineral Resource are not abiding JORC (2012).

### 20.2.3 Metallurgical Testing and Recovery Methods

The Mengkham ore belongs to the ion-adsorbed type rare earth ore, with average soluble rare earth oxide ("SREO") content of 0.025%. The minerals are mainly quartz, feldspar, biotite, ilmenite, magnetite, followed by zircon, apatite, xenotime, fluorite, sphene minerals and so on.

A simple laboratory column leaching test had been conducted on the samples from #2 ore body. The results showed that the permeability coefficient is  $0.89 \times 10^{-3} \sim 1.11 \times 10^{-3} \text{cm/s}$  and the pregnant leaching solution ("PLS") concentration can reach 2.0 g/L with the SREO leaching rate of about 94%.

The PLS undergoes four steps of processing to yield primary product of rare earth carbonate ("REC"), which will be sent to the calcination workshop to produce mixed rare earth oxide ("REO"). The residue generated from the processing will be dissolved by acid to recycle REO, which would improve the REO processing recovery and the economic benefits.

The full production capacity of the Leaching Test Plant is 3,675 tpa REO. The designed total recovery was 77%, with the ISL rate of 90% and the hydrometallurgical recovery rate of 85.5%. SRK deems that it is appropriate.

## 21 Recommendations

### 21.1 Sepon REE Project

#### 21.1.1 Mineral Resources Estimation

Looking ahead, the Sepon REE mine is considering in-situ leaching to be their main extraction technique. However, the available data, which only includes 8 ionic analyses, falls short in providing an accurate estimate of the mine's potential and productivity. The scant data does not paint a holistic picture of what the mine can offer. For this reason, SRK suggests a re-analysis of the ionic REE grade. Through this, SRK can have a clearer view of the mine's potential, which is crucial in devising and executing efficient mining plans.

### 21.2 Mengkham REE Project

#### 21.2.1 Mineral Resources Estimation

For the Mengkham REE project, the 1:5000 topographic aerial survey only covers an area of 2.3 km<sup>2</sup>. SRK suggests the mine to conduct a detailed topographic survey covering the entire project area.

The mine's current approach is to analyse all basic samples in the lab onsite. While this might be convenient and efficient, it may not provide the most accurate results. Large bias was observed between original assay and SRK's verification results. It is recommended that all the samples should be sent to a qualified laboratory for assaying again.

There are merely 30 samples that possess REE compositions. This limited number prompts SRK to recommend that the mine increase its efforts in conducting more composition analyses. This is to ensure a more reliable and expansive dataset for evaluation purposes.

SRK also recommends carrying out more research on structure or fault system. This is because faults may have a substantial influence on the in-situ leaching mining method.

#### 21.2.2 Metallurgical Testing and Recovery Methods

The column test is relatively simple and can only be used as a basic reference for in-situ leaching of #2 ore body. Due to the differences in ROM properties and grades of different ore bodies, SRK recommends that each ore body should take representative ore samples to carry out test studies before production.

According to the production schedule, North Plant with production capacity of 3,675 tpa REO and South Plant of 2,800 tpa REO have been planned to be constructed in 2026 and 2028, respectively. SRK suggested that the site selection and design of the two plants should be carried out as soon as possible.

<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li>• If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>• If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</li> <li>• For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>• Quality control procedures adopted for all sub-sampling stages to maximize representivity of samples.</li> <li>• Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>• Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>• All core taken.</li> <li>• Sampled wet.</li> <li>• After logging, sample location and length were marked and numbered by logging geologists. And then core samples were put into numbered bags.</li> <li>• Sample weights were sufficient for the mineralized materials.</li> </ul>
<b>Quality of assay data and laboratory tests</b>	<ul style="list-style-type: none"> <li>• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>• For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>• Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>• For Sepon project, samples were prepared and assayed in the ALS lab in Australia. For Mengkham project, samples were prepared and assayed in lab onsite.</li> <li>• For Sepon project, the assaying method is ME-MS81. For Mengkham project, the assaying method is EDTA (Ethylene Diamine Tetraacetic Acid) volumetric method.</li> <li>• For Sepon project, QAQC procedures included CRMs, blanks and duplicates.</li> <li>• For Mengkham project, internal and external lab check samples were used as control samples.</li> </ul>
<b>Verification of sampling and assaying</b>	<ul style="list-style-type: none"> <li>• The verification of significant intersections by either independent or alternative company personnel.</li> <li>• The use of twinned holes.</li> <li>• Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>• Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>• For Sepon project, a total of 29 pairs field duplicates were used and all pairs were within 20% limits. For Mengkham project, a total of 6,017 samples were collected as internal lab check samples with a pass rate of 82%. And a total of 3,500 samples were collected as external lab check samples with a pass rate of 92%.</li> <li>• For Mengkham project, SRK collected 169 duplicates in May 2024, but a large bias was observed between original assay and verification results. Only about 19% of the results for SREO are within <math>\pm 20\%</math>. About 78% results are out of <math>\pm 20\%</math>.</li> </ul>
<b>Location of data points</b>	<ul style="list-style-type: none"> <li>• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> </ul>	<ul style="list-style-type: none"> <li>• The locations of drilling holes were surveyed by using hand-held GPS.</li> <li>• The coordinate system applied for the entire project is the UTM projection (Zone 48N) using the Indian 1960 Datum.</li> </ul>

Criteria	Explanation	Commentary
	<ul style="list-style-type: none"> <li>• Specification of the grid system used.</li> <li>• Quality and adequacy of topographic control.</li> </ul>	
<b>Data spacing and distribution</b>	<ul style="list-style-type: none"> <li>• Data spacing for reporting of Exploration Results.</li> <li>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>• Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>• For Sepon project, holes were drilled on a 200-metre x 100-metre or 100-metre x 100-metre pattern.</li> <li>• For Mengkham project, holes were drilled with a spacing of 30-100m.</li> <li>• Current borehole spacing was sufficient to establish geological and grade continuity for Mineral Resources estimation classification.</li> <li>• Composites were applied.</li> </ul>
<b>Orientation of data in relation to geological structure</b>	<ul style="list-style-type: none"> <li>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>• If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul style="list-style-type: none"> <li>• All boreholes were vertical.</li> </ul>
<b>Sample security</b>	<ul style="list-style-type: none"> <li>• The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>• The samples were all properly numbered, recorded before being sent to labs.</li> </ul>
<b>Audits or reviews</b>	<ul style="list-style-type: none"> <li>• The results of any audits or reviews of sampling techniques and data.</li> </ul>	<ul style="list-style-type: none"> <li>• For Sepon project, LXML completed the audits during the exploration.</li> <li>• For Mengkham project, Longyan Dadi Mining company completed the audits during the exploration.</li> </ul>

**Section 2: Reporting of Exploration Results**

*(Criteria listed in the preceding section also apply to this section.)*

Criteria	Explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>• The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>• LXML possesses an exploration permit with an area of 1,010.40 km<sup>2</sup>, which is valid until June 2026. The Sepon REE project is in the southeast corner of the permit.</li> <li>• For Mengkham project, China Investment Xieng Khouang Rare Earth Minerals Limited possesses a trial mining license of 8.0 km<sup>2</sup> and a exploration permit of 42.0 km<sup>2</sup>. The expiry date of the trial mining license is December 2025, and the exploration permit is December 2024.</li> </ul>
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>• Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>• For Sepon project, LXML Exploration Department conducted an exploration program from November 2021 to July 2022.</li> <li>• For Mengkham project, Longyan Dadi Mining Development Service Co., Ltd conducted an exploration program from January 2022 to December 2023.</li> </ul>
<b>Geology</b>	<ul style="list-style-type: none"> <li>• Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>• Both Sepon REE Project and Mengkham REE Project are ion adsorption type of REE deposits, which was developed over granite bodies by weathering the rock bodies and transferring and enriching the REEs bearing in the minerals into clay minerals of the weathered zones by adsorption.</li> <li>• The REE-bearing regolith profile provides a vertical cross-section of the soil layers created by weathering and other breakdown processes.</li> <li>• The projects area is in a tropical region with a warm and humid climate. The granite rock in the area undergoes intense weathering due to favourable topographic conditions where erosion is less significant than weathering. This has led to the widespread formation of weathered layers, which range from less than 1 metre to over 50 metres thick in some parts of the project area.</li> <li>• The distribution of the weathered layer is typically irregular due to erosion from the river drainage system. Depending on the extent of the weathered layer covering the mountainous terrain, it can be classified into two types from the in-situ leaching perspective: full coverage and exposed base types.</li> </ul>

Criteria	Explanation	Commentary
		<ul style="list-style-type: none"> <li>The Mengkham and Seop REE projects are primarily characterized by low hills and gentle, undulating terrain. Influenced by a tropical climate, these areas have a relatively thick regolith cover. According to the classification, the regolith layer developed within most of the project area can be categorized as the full-coverage type of IAC deposit.</li> </ul>
<p style="text-align: center;"><b>Drill hole Information</b></p>	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:               <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>Hole length.</li> </ul> </li> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>For Sepon project, a total of 607 boreholes (4,441 metres) were drilled. For Mengkham project, a total of 13,656 boreholes (198,957 metres) were drilled.</li> <li>For Sepon project, 591 holes were used in the Mineral Resources estimation and for Mengkham project, 13,251 holes were used in the Mineral Resource estimation.</li> <li>All information of boreholes were collected, including collar, elevation, depth, lithology etc.</li> </ul>
<p style="text-align: center;"><b>Data aggregation methods</b></p>	<ul style="list-style-type: none"> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<ul style="list-style-type: none"> <li>Exploration data is reported as the average sample grade. Top cutting was used report the exploration results.</li> <li>No such preferential reporting of high-grade results is presented.</li> </ul>
<p style="text-align: center;"><b>Relationship between mineralisation widths and intercept lengths</b></p>	<ul style="list-style-type: none"> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</li> </ul>	<ul style="list-style-type: none"> <li>All boreholes were vertical.</li> <li>The rare earth minerals consist of a medium-fine biotite granite regolith. Notably, there are significant differences among the rock regolith. As a result, the ore composition and type are directly linked to the regolith characteristics and its rock types.</li> </ul>

Criteria	Explanation	Commentary
<b>Diagrams</b>	<ul style="list-style-type: none"> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	<ul style="list-style-type: none"> <li>Appropriate maps and typical sections were reported in this report.</li> </ul>
<b>Balanced reporting</b>	<ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>Reporting was fully representative of the data collected at this stage.</li> </ul>
<b>Other substantive exploration data</b>	<ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	<ul style="list-style-type: none"> <li>For Sepon project, in the general exploration report, 10 specific gravity samples were also taken from drilling cores and were measured in the lab of the mine. In SRK's opinion, it was unable to collect density sample from GN Auger hole cores. A dry bulk density of 1.5 t/m<sup>3</sup> was used in resource estimation for Sepon project.</li> <li>For Mengkham project, a simple laboratory column leaching test had been conducted.</li> <li>A total of ten bulk density samples were implemented across the project areas with the natural bulk density (wet basis) ranging from 1.7 to 1.81 t/m<sup>3</sup>, averaging 1.75 t/m<sup>3</sup>, dry bulk density ranging between 1.35 and 1.55 t/m<sup>3</sup>, averaging 1.47 t/m<sup>3</sup>.</li> </ul>
<b>Further work</b>	<ul style="list-style-type: none"> <li>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<ul style="list-style-type: none"> <li>Further drilling program is recommended.</li> </ul>

**Section 3: Estimation and Reporting of Mineral Resources**

*(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)*

Criteria	Explanation	Commentary
<b>Database integrity</b>	<ul style="list-style-type: none"> <li>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</li> <li>Data validation procedures used.</li> </ul>	<ul style="list-style-type: none"> <li>A digitalized resource database was provided to SRK, and SRK conducted crossing - checking against logging data and typical interpretation. All relevant data were imported to Leapfrog, and validation routines were run to confirm validity of all data.</li> </ul>
<b>Site visits</b>	<ul style="list-style-type: none"> <li>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</li> <li>If no site visits have been undertaken indicate why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>During the period from 13 to 16 May 2024, SRK conducted a site visit to the Sepon REE Project.</li> <li>During the period from 9 to 11 May 2024, SRK conducted site visits to the Mengkham REE project.</li> </ul>
<b>Geological interpretation</b>	<ul style="list-style-type: none"> <li>Confidence in (or conversely, the uncertainty of the geological interpretation of the mineral deposit.</li> <li>Nature of the data used and of any assumptions made.</li> <li>The effect, if any, of alternative interpretations on Mineral Resource estimation.</li> <li>The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>The factors affecting continuity both of grade and geology.</li> </ul>	<ul style="list-style-type: none"> <li>SRK has a high confidence regarding the geological interpretation for both Sepon and Mengkham project.</li> <li>Both Sepon and Mengkham project databases were composed of collar, survey, assay, lithological data. Detailed geological logging and surface mapping allowed extrapolation, with a distance no more than 50 m.</li> <li>The geological boundaries were determined by lithological and sampling data. SRK has defined the REE mineralization zones, which were mainly controlled by the topography.</li> </ul>
<b>Dimensions</b>	<ul style="list-style-type: none"> <li>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</li> </ul>	<ul style="list-style-type: none"> <li>The deposit type is an ion-adsorption type hosted in weathered regolith. The development level of the weathered regolith layer largely shaped the distribution and geometry of the REE mineralization. The ore-bearing layers are mainly present in the middle part of the fully weathered regolith profile and the upper part of the semi-weathered layer.</li> <li>The REE mineralized bodies generally exhibit a stratiform appearance, with their morphology controlled by the occurrence of the weathered regolith. In relatively flat mountaintop areas, the bodies tend to be thicker and have a more pronounced sheet-like shape. Whereas in steep hillside and valley areas, the bodies tend to have a thinner and more complex shape due to erosion and transportation effects.</li> <li>For Sepon project, the elevation of the ore body is 240 to 410 meters, the lowest erosion base level in this area is 210 meters, and the ore body is above the lowest erosion base level. The depth of the ore body is generally 0-5 meters.</li> <li>For Mengkham project, the top of the</li> </ul>

Criteria	Explanation	Commentary
		mineralised zone is defined by a thin surficial soil zone that averages 2 m in thickness. The base of the mineralised zone extends to an average vertical depth of 9.0 m.
<p style="text-align: center;"><b>Estimation and modelling techniques</b></p>	<ul style="list-style-type: none"> <li>• The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</li> <li>• The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</li> <li>• The assumptions made regarding recovery of by-products.</li> <li>• Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulphur for acid mine drainage characterisation).</li> <li>• In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</li> <li>• Any assumptions behind modelling of selective mining units.</li> <li>• Any assumptions about correlation between variables.</li> <li>• Description of how the geological interpretation was used to control the resource estimates.</li> <li>• Discussion of basis for using or not using grade cutting or capping.</li> <li>• The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</li> </ul>	<ul style="list-style-type: none"> <li>• For Sepon project, Y<sub>2</sub>O<sub>3</sub>, La<sub>2</sub>O<sub>3</sub>, CeO<sub>2</sub>, Pr<sub>6</sub>O<sub>11</sub>, Nd<sub>2</sub>O<sub>3</sub>, Sm<sub>2</sub>O<sub>3</sub>, Eu<sub>2</sub>O<sub>3</sub>, Gd<sub>2</sub>O<sub>3</sub>, Tb<sub>4</sub>O<sub>7</sub>, Dy<sub>2</sub>O<sub>3</sub>, Ho<sub>2</sub>O<sub>3</sub>, Er<sub>2</sub>O<sub>3</sub>, Tm<sub>2</sub>O<sub>3</sub>, Yb<sub>2</sub>O<sub>3</sub>, Lu<sub>2</sub>O<sub>3</sub> were estimated using IDW2 in Leapfrog. For Mengkham project, SREO was estimated using IDW2 in Leapfrog.</li> <li>• This is the first mineral resource estimation in accordance with JORC Code for both Sepon and Mengkham project.</li> <li>• The block model was constructed using a block size of to 10 m × 10 m × 2 m (East × North × Elevation) for Sepon project and for Mengkham project the size is to 10 m × 10 m × 4 m with a sub-block size of to 5 m × 5 m × 2 m.</li> <li>• All samples were composited to 1-meter.</li> <li>• The cumulative frequency and distribution characteristics of the sample histogram were used to do the top capping.</li> <li>• SRK has validated the both block models by swath plot and visual inspection, indicating that the models was validated.</li> </ul>
<p style="text-align: center;"><b>Moisture</b></p>	<ul style="list-style-type: none"> <li>• Whether the tonnages estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.</li> </ul>	<ul style="list-style-type: none"> <li>• The tonnages are estimated on a dry basis.</li> </ul>
<p style="text-align: center;"><b>Cut-off parameters</b></p>	<ul style="list-style-type: none"> <li>• The basis of the adopted cut-off grade(s) or quality parameters applied.</li> </ul>	<ul style="list-style-type: none"> <li>• For Sepon project, the Mineral Resources are reported at a cut-off grade of 170 g/t TREO. Cut-off grades are based on a price of 239,000 RMB/t REO.</li> <li>• For Mengkham project, the Mineral Resources are reported at a cut-off grade of 100 g/t SREO. Cut-off grades are based on a price of 239,000 RMB/t REO.</li> </ul>

Criteria	Explanation	Commentary
<b>Mining factors or assumptions</b>	<ul style="list-style-type: none"> <li>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>For Sepon project, the feasibility study has not undertaken yet.</li> <li>For Mengkham project, a preliminary feasibility study was carried out. The mining method is in-situ leaching. The process of the in-situ leaching mining involves mainly two parts: leaching solution injection and pregnant leach solution ("PLS") collection.</li> </ul>
<b>Metallurgical factors or assumptions</b>	<ul style="list-style-type: none"> <li>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>A simple laboratory column leaching test had been conducted on the samples from 2# ore body. The results showed that the permeability coefficient is <math>0.89 \times 10^{-3} \sim 1.11 \times 10^{-3} \text{ cm/s}</math> and the pregnant leaching solution ("PLS") concentration can reach 2.0 g/L with the SREO leaching rate of about 94%.</li> <li>The FS designed total recovery was 77%, with the ISL rate of 90% and the hydrometallurgical recovery rate of 85.5%. SRK deems that it is appropriate.</li> <li>The details are depicted in Section 12 and Section 13.</li> </ul>
<b>Environmental factors or assumptions</b>	<ul style="list-style-type: none"> <li>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</li> </ul>	<p>The sources of environmental risk are project activities that may result in potential environmental impacts. These project activities have been previously described within this report. In summary, the most significant potential environmental and social risks for the development of the Project, currently identified as part of the project assessment and this SRK review, are:</p> <ul style="list-style-type: none"> <li>Environmental approval to be obtained;</li> <li>Water pollution; and</li> <li>Mine closure fund to be established</li> </ul>
<b>Bulk density</b>	<ul style="list-style-type: none"> <li>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</li> <li>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</li> </ul>	<ul style="list-style-type: none"> <li>For Sepon project, in the general exploration report, 10 specific gravity samples were also taken from drilling cores and were measured in the lab of the mine. In SRK's opinion, it was unable to collected density sample from GN Auger hole cores. A dry bulk density of <math>1.5 \text{ t/m}^3</math> was used in resource estimation.</li> <li>For Mengkham project, a total of ten bulk density samples were implemented across</li> </ul>

Criteria	Explanation	Commentary
	<ul style="list-style-type: none"> <li>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</li> </ul>	<p>the project areas with the natural bulk density (wet basis) ranging from 1.7 to 1.81 t/m<sup>3</sup>, averaging 1.75 t/m<sup>3</sup>, dry bulk density ranging between 1.35 and 1.55 t/m<sup>3</sup>, averaging 1.47 t/m<sup>3</sup>. The average dry bulk density of 1.47 t/m<sup>3</sup> is determined to use in resource estimation.</p>
<b>Classification</b>	<ul style="list-style-type: none"> <li>The basis for the classification of the Mineral Resources into varying confidence categories.</li> <li>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</li> <li>Whether the result appropriately reflects the Competent Person's view of the deposit.</li> </ul>	<ul style="list-style-type: none"> <li>Indicated Mineral Resource were defined by the boreholes with the spacing less than 100 m.</li> <li>Inferred Mineral Resource were defined by the boreholes with the spacing less than 200 m.</li> <li>For Mengkham project, Indicated Mineral Resources were downgraded to Inferred Mineral Resources due to the large bias between Mengkham original assay and SRK verification results.</li> </ul>
<b>Audits or reviews.</b>	<ul style="list-style-type: none"> <li>The results of any audits or reviews of Mineral Resource estimates.</li> </ul>	<ul style="list-style-type: none"> <li>The input data, including geological mapping and drillhole data are comprehensive in their coverage of the mineralisation.</li> <li>The Mineral Resource estimate appropriately reflects the view of the Competent Person.</li> <li>The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the JORC Code.</li> <li>The statement relates to global volumetric estimates.</li> </ul>

---

**Appendix C      Compliance with 18 Chapter**

Chapter 18		
18.01	<b>DEFINITIONS AND INTERPRETATION</b>	
18.02-18.04	<b>CONDITIONS FOR LISTING OF NEW APPLICANT MINERAL COMPANIES</b>	
18.02	In addition to satisfying the requirements of Chapter 8, a Mineral Company which has applied for listing must also satisfy the requirements of this Chapter.	CPR 2.2.2 <sup>(1)</sup>
18.03	A Mineral Company must:—	
(1)	establish to the Exchange's satisfaction that it has the right to participate actively in the exploration for and/or extraction of Natural Resources, either:—	CPR 3.1
(a)	through control over a majority (by value) of the assets in which it has invested together with adequate rights over the exploration for and/or extraction of Natural Resources; or <i>Note: 'control over a majority' means an interest greater than 50%.</i>	
(b)	through adequate rights (arising under arrangements acceptable to the Exchange), which give it sufficient influence in decisions over the exploration for and/or extraction of the Natural Resources;	
(2)	establish to the Exchange's satisfaction that it has at least a portfolio of:—	CPR 10.1.11; CPR 10.2.11
(a)	Indicated Resources; or	
(b)	Contingent Resources, identifiable under a Reporting Standard and substantiated in a Competent Person's Report. This portfolio must be meaningful and of sufficient substance to justify a listing;	
(3)	if it has commenced production, provide an estimate of cash operating costs including the costs associated with:—	<b>Not applicable.</b>
(a)	workforce employment;	
(b)	consumables;	
(c)	fuel, electricity, water and other services;	
(d)	on and off-site administration;	
(e)	environmental protection and monitoring;	
(f)	transportation of workforce;	
(g)	product marketing and transport;	
(h)	non-income taxes, royalties and other governmental charges; and	
(i)	contingency allowances;	
	<i>No te: A Mineral Company must:</i> <ul style="list-style-type: none"> <li>• set out the components of cash operating costs separately by category;</li> <li>• explain the reason for any departure from the list of items to be included under cash operating costs; and</li> <li>• discuss any material cost items that should be highlighted to investors.</li> </ul>	
(4)	demonstrate to the Exchange's satisfaction that it has available working capital for 125% of the group's present requirements, that is for at least the next 12 months, which must include:—	CPR 17.2; CPR 17.3
(a)	general, administrative and operating costs;	
(b)	property holding costs; and	
(c)	the cost of any proposed exploration and/or development; and	
	<i>No te: Capital expenditures do not need to be included in working capital requirements. Where they are financed out of borrowings, relevant interest and loan repayments must be included.</i>	
(5)	ensure that its working capital statement in the listing document under Listing Rule 8.21A states it has available sufficient working capital for 125% of the group's	CPR 17.2; CPR 17.3

Chapter 18		
	present requirements, that is for at least 12 months from the date of its listing document.	
18.04	If a Mineral Company is unable to satisfy either the profit test in rule 8.05(1), the market capitalisation/revenue/cash flow test in rule 8.05(2), or the market capitalisation/revenue test in rule 8.05(3), it may still apply to be listed if it can establish to the Exchange's satisfaction that its directors and senior managers, taken together, have sufficient experience relevant to the exploration and/or extraction activity that the Mineral Company is pursuing. Individuals relied on must have a minimum of five years relevant industry experience. Details of the relevant experience must be disclosed in the listing document of the new applicant.	
	<i>No te: A Mineral Company relying on this rule must demonstrate that its primary activity is the exploration for and/or extraction of Natural Resources.</i>	
<b>18.05-18.08</b>	<b>CONTENTS OF LISTING DOCUMENTS FOR NEW APPLICANTS</b>	
18.05	In addition to the information set out in Appendix 1A, a Mineral Company must include in its listing document:—	
	(1) a Competent Person's Report;	CPR Executive Summary and CPR 1.1
	(2) a statement that no material changes have occurred since the effective date of the Competent Person's Report. Where there are material changes, these must be prominently disclosed;	CPR 2.8
	(3) the nature and extent of its prospecting, exploration, exploitation, land use and mining rights and a description of the properties to which those rights attach, including the duration and other principal terms and conditions of the concessions and any necessary licences and consents. Details of material rights to be obtained must also be disclosed;	CPR 3
	(4) a statement of any legal claims or proceedings that may have an influence on its rights to explore or mine;	CPR 2.3
	(5) disclosure of specific risks and general risks. Companies should have regard to Guidance Note 7 on suggested risk analysis; and	CPR 19
	(6) if relevant and material to the Mineral Company's business operations, information on the following:—	CPR 16.3
	(a) project risks arising from environmental, social, and health and safety issues;	
	(b) any non-governmental organisation impact on sustainability of mineral and/or exploration projects;	
	(c) compliance with host country laws, regulations and permits, and payments made to host country governments in respect of tax, royalties and other significant payments on a country by country basis;	
	(d) sufficient funding plans for remediation, rehabilitation and, closure and removal of facilities in a sustainable manner;	
	(e) environmental liabilities of its projects or properties;	
	(f) its historical experience of dealing with host country laws and practices, including management of differences between national and local practice;	
	(g) its historical experience of dealing with concerns of local governments and communities on the sites of its mines, exploration properties, and relevant management arrangements; and	
	(h) any claims that may exist over the land on which exploration or mining activity is being carried out, including any ancestral or native claims.	

Chapter 18		
<b>18.06-18.08</b>	<b>Additional disclosure requirements that apply to certain new applicant Mineral Companies</b>	
18.06	If a Mineral Company has begun production, it must disclose an estimate of the operating cash cost per appropriate unit for the minerals and/or Petroleum produced.	CPR 17.2; CPR 17.3
18.07	If a Mineral Company has not yet begun production, it must disclose its plans to proceed to production with indicative dates and costs. These plans must be supported by at least a Scoping Study, substantiated by the opinion of a Competent Person. If exploration rights or rights to extract Resources and/or Reserves have not yet been obtained, relevant risks to obtaining these rights must be prominently disclosed.	CPR 11.2; CPR 12
18.08	If a Mineral Company is involved in the exploration for or extraction of Resources, it must prominently disclose to investors that its Resources may not ultimately be extracted at a profit.	CPR 10
<b>18.09-18.13</b>	<b>RELEVANT NOTIFIABLE TRANSACTIONS INVOLVING THE ACQUISITION OR DISPOSAL OF MINERAL OR PETROLEUM ASSETS</b>	
18.09	A Mineral Company proposing to acquire or dispose of assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must:—	
	(1) comply with Chapter 14 and Chapter 14A, if relevant;	
	(2) produce a Competent Person's Report, which must form part of the relevant circular, on the Resources and/or Reserves being acquired or disposed of as part of the Relevant Notifiable Transaction; <i>No te: The Exchange may dispense with the requirement for a Competent Person's Report on disposals where shareholders have sufficient information on the assets being disposed of.</i>	
	(3) in the case of a major (or above) acquisition, produce a Valuation Report, which must form part of the relevant circular, on the Mineral or Petroleum Assets being acquired as part of the Relevant Notifiable Transaction; and	
	(4) comply with the requirements of rules 18.05(2) to 18.05(6) in respect of the assets being acquired. <i>No te: Material liabilities that remain with the issuer on a disposal must also be discussed.</i>	
<b>18.10-18.11</b>	<b>Requirements that apply to listed issuers</b>	
18.10	A listed issuer proposing to acquire assets which are solely or mainly Mineral or Petroleum Assets as part of a Relevant Notifiable Transaction must comply with rule 18.09.	
18.11	On completion of a Relevant Notifiable Transaction involving the acquisition of Mineral or Petroleum Assets, unless the Exchange decides otherwise, a listed issuer will be treated as a Mineral Company.	
<b>18.12-18.13</b>	<b>Requirements that apply to Mineral Companies and listed issuers</b>	
18.12	The Exchange may dispense with the requirement to produce a new Competent Person's Report or a Valuation Report under rules 18.05(1), 18.09(2) or 18.09(3), if the issuer has available a previously published Competent Person's Report or Valuation Report (or equivalent) which complies with rules 18.18 to 18.34 (where applicable), provided the report is no more than six months old. The issuer must provide this document and a no material change statement in the listing document or circular for the Relevant Notifiable Transaction.	
18.13	An issuer must obtain the prior written consent of a Competent Person(s) or Competent Evaluator for their material to be included in the form and context in which it appears in a listing document or circular for the Relevant Notifiable Transaction, whether or not such	

<b>Chapter 18</b>		
	person or firm is retained by the listing applicant or the issuer.	
<b>18.14-18.17</b>	<b>CONTINUING OBLIGATIONS</b>	
<b>18.14</b>	<b>Disclosure in reports</b>	
18.14	A Mineral Company must include in its interim (half-yearly) and annual reports details of its exploration, development and mining production activities and a summary of expenditure incurred on these activities during the period under review. If there has been no exploration, development or production activity, that fact must be stated.	
<b>18.15-18.17</b>	<b>Publication of Resources and Reserves</b>	
18.15	A listed issuer that publicly discloses details of Resources and/or Reserves must give an update of those Resources and/or Reserves once a year in its annual report, in accordance with the reporting standard under which they were previously disclosed or a Reporting Standard.	
18.16	A Mineral Company must include an update of its Resources and/or Reserves in its annual report in accordance with the Reporting Standard under which they were previously disclosed.	
18.17	Annual updates of Resources and/or Reserves must comply with rule 18.18. <i>No</i> <i>te: Annual updates are not required to be supported by a Competent Person's Report and may take the form of a no material change statement.</i>	
<b>18.18-18.27</b>	<b>STATEMENTS ON RESOURCES AND/OR RESERVES</b>	
<b>18.18</b>	<b>Presentation of data</b>	
18.18	Any data presented on Resources and/or Reserves by a Mineral Company in a listing document, Competent Person's Report, Valuation Report or annual report, must be presented in tables in a manner readily understandable to a non-technical person. All assumptions must be clearly disclosed and statements should include an estimate of volume, tonnage and grades.	CPR 10.1.11; CPR 10.2.11
<b>18.19</b>	<b>Basis of evidence</b>	
18.19	All statements referring to Resources and/or Reserves:—	
	(1) in any new applicant listing document or circular relating to a Relevant Notifiable Transaction, must be substantiated in a Competent Person's Report which must form part of the document; and	
	(2) in all other cases, must at least be substantiated by the issuer's internal experts.	
<b>18.20</b>	<b>Petroleum Competent Persons' Reports</b>	<b>Not applicable.</b> <sup>[2]</sup>
18.20	A Competent Person's Report for Mineral Companies involved in the exploration for and/or extraction of Petroleum Resources and Reserves must include the information set out in Appendix 25.	
<b>18.21-18.22</b>	<b>Competent Person</b>	
18.21	A Competent Person must:—	
	(1) have a minimum of five years experience relevant to the style of mineralization and type of deposit under consideration or to the type of Petroleum exploration, reserve estimate (as appropriate), and to the activity which the Mineral Company is undertaking;	CPR 2.6; CPR2.7
	(2) be professionally qualified, and be a member in good standing of a relevant Recognised Professional Organisation, in a jurisdiction where, in the Exchange's opinion, the statutory securities regulator has satisfactory arrangements (either by	CPR 2.6; CPR2.7

<b>Chapter 18</b>		
	way of the IOSCO Multilateral MOU or other bi-lateral agreement acceptable to the Exchange) with the Commission for mutual assistance and exchange of information for enforcing and securing compliance with the laws and regulations of that jurisdiction and Hong Kong; and	
	(3) take overall responsibility for the Competent Person's Report.	CPR 2.6; CPR2.7
18.22	A Competent Person must be independent of the issuer, its directors, senior management and advisers. Specifically the Competent Person retained must:—	CPR 2.10
	(1) have no economic or beneficial interest (present or contingent) in any of the assets being reported on;	
	(2) not be remunerated with a fee dependent on the findings of the Competent Person's Report;	
	(3) in the case of an individual, not be an officer, employee or proposed officer of the issuer or any group, holding or associated company of the issuer; and	
	(4) in the case of a firm, not be a group, holding or associated company of the issuer. Any of the firm's partners or officers must not be officers or proposed officers of any group, holding or associated company of the issuer.	
<b>18.23</b>	<b>Additional requirements of Competent Evaluators</b>	
18.23	In addition to the requirements set out in rules 18.21(2) and 18.22, a Competent Evaluator must:—	
	(1) have at least ten years relevant and recent general mining or Petroleum experience (as appropriate);	
	(2) have at least five years relevant and recent experience in the assessment and/or valuation of Mineral or Petroleum Assets or securities (as appropriate); and	
	(3) hold all necessary licences.	
	<i>No te: A Competent Person's Report or Valuation Report may be performed by the same Competent Person provided he or she is also a Competent Evaluator.</i>	
<b>18.24</b>	<b>Scope of Competent Persons' Reports and Valuation Reports</b>	
18.24	A Competent Person's Report or Valuation Report must comply with a Reporting Standard as modified by this Chapter, and must:—	
	(1) be addressed to the Mineral Company or listed issuer;	CPR 2.2
	(2) have an effective date (being the date when the contents of the Competent Person's Report or Valuation Report are valid) less than six months before the date of publishing the listing document or circular relating to a Relevant Notifiable Transaction required under the Listing Rules; and	CPR 2.4
	(3) set out what Reporting Standard has been used in preparing the Competent Person's Report or Valuation Report, and explain any departure from the relevant Reporting Standard.	CPR 2.2
<b>18.25- 18.26</b>	<b>Disclaimers and Indemnities</b>	
18.25	A Competent Person's Report or Valuation Report may contain disclaimers of sections or topics outside their scope of expertise in which the Competent Person or Competent Evaluator relied upon other experts' opinions, but must not contain any disclaimers of the report in its entirety.	CPR 2.2
18.26	The Competent Person or Competent Evaluator must prominently disclose in the Competent Person's Report or Valuation Report the nature and details of all indemnities provided by the issuer. Indemnities for reliance placed on information provided by issuers and third party experts (for information outside the Competent Person's or Competent Evaluator's expertise) are generally acceptable. Indemnities for fraud and gross negligence are generally unacceptable.	CPR 2.11, CPR 2.12

Chapter 18		
<b>18.27</b>	<b>Obligations of sponsor</b>	
18.27	Any sponsor appointed to or by a new applicant Mineral Company under Chapter 3A must ensure that any Competent Person or Competent Evaluator meets the requirements of this Chapter.	CPR1.4, CPR 1.7
<b>18.28-18.34</b>	<b>REPORTING STANDARD</b>	
<b>18.28-18.30</b>	<b>Mineral reporting standard</b>	
18.28	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting mineral Resources and Reserves must also satisfy rules 18.29 and 18.30.	
18.29	A Mineral Company must disclose information on mineral Resources, Reserves and/or exploration results either:—	CPR 2.2
	(1) under:	
	(a) the JORC Code;	
	(b) NI 43-101; or	
	(c) the SAMREC Code,	
	as modified by this Chapter; or	
	(2) under other codes acceptable to the Exchange as communicated to the market from time to time, provided the Exchange is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	<i>No</i> <i>te: The Exchange may allow presentation of Reserves under other reporting standards provided reconciliation to a Reporting Standard is provided. A Reporting Standard applied to specific assets must be used consistently.</i>	
18.30	A Mineral Company must ensure that:—	
	(1) any estimates of mineral Reserves disclosed are supported, at a minimum, by a Prefeasibility Study;	<b>Not applicable</b>
	(2) estimates of mineral Reserves and mineral Resources are disclosed separately;	CPR 10; CPR11
	(3) Indicated Resources and Measured Resources are only included in economic analyses if the basis on which they are considered to be economically extractable is explained and they are appropriately discounted for the probabilities of their conversion to mineral Reserves. All assumptions must be clearly disclosed. Valuations for Inferred Resources are not permitted;	<b>Not applicable</b>
	(4) for commodity prices used in Pre-feasibility Studies, Feasibility Studies and valuations of Indicated Resources, Measured Resources and Reserves:—	<b>Not applicable</b>
	(a) the methods to determine those commodity prices, all material assumptions and the basis on which those prices represent reasonable views of future prices are explained clearly; and	
	(b) if a contract for future prices of mineral Reserves exists, the contract price is used; and	
	(5) for forecast valuations of Reserves and profit forecasts, sensitivity analyses to higher and lower prices are supplied. All assumptions must be clearly disclosed.	<b>Not applicable</b>
<b>18.31-18.33</b>	<b>Petroleum reporting standard</b>	<b>Not applicable.<sup>[2]</sup></b>
18.31	In addition to satisfying the requirements of Chapter 13 (as modified by this Chapter), a Mineral Company exploring for and/or extracting Petroleum Resources and Reserves must also satisfy rules 18.32 and 18.33.	
18.32	A Mineral Company must disclose information on Petroleum Resources and Reserves either:—	

Chapter 18		
	(1) under PRMS as modified by this Chapter; or	
	(2) under other codes acceptable to the Exchange if it is satisfied that they give a comparable standard of disclosure and sufficient assessment of the underlying assets.	
	<i>No</i> <i>te: A Reporting Standard applied to specific assets must be used consistently.</i>	
18.33	A Mineral Company must ensure that:—	
	(1) where estimates of Reserves are disclosed, the method and reason for choice of estimation are disclosed (i.e. deterministic or probabilistic methods, as defined in PRMS). Where the probabilistic method is used, the underlying confidence levels applied must be stated;	
	(2) if the NPVs attributable to Proved Reserves and Proved plus Probable Reserves are disclosed, they are presented on a post-tax basis at varying discount rates (including a reflection of the weighted average cost of capital or minimum acceptable rate of return that applies to the entity at the time of evaluation) or a fixed discount rate of 10%;	
	(3) Proved Reserves and Proved plus Probable Reserves are analysed separately and principal assumptions (including prices, costs, exchange rates and effective date) and the basis of the methodology are clearly stated;	
	(4) if the NPVs attributable to Reserves are disclosed, they are presented using a forecast price as a base case or using a constant price as a base case. The bases for the forecast case must be disclosed. The constant price is defined as the unweighted arithmetic average of the closing price on the first day of each month within the 12 months before the end of the reporting period, unless prices are defined by contractual arrangements. The basis on which the forecast price is considered reasonable must be disclosed and Mineral Companies must comply with rule 18.30;	
	<i>No</i> <i>te: In the forecast case under PRMS, the economic evaluation underlying the investment decision is based on the entity's reasonable forecast of future conditions, including costs and prices, which will exist during the life of the project.</i>	
	(5) if estimated volumes of Contingent Resources or Prospective Resources are disclosed, relevant risk factors are clearly stated;	
	<i>No</i> <i>te: Under PRMS, wherever the volume of a Contingent Resource is stated, risk is expressed as the chance that the accumulation will be commercially developed and graduate to the reserves class. Wherever the volume of a Prospective Resource is stated, risk is expressed as the chance that a potential accumulation will result in a significant discovery of Petroleum.</i>	
	(6) economic values are not attached to Possible Reserves, Contingent Resources or Prospective Resources; and	
	(7) where an estimate of future net revenue is disclosed, whether calculated without discount or using a discount rate, it is prominently disclosed that the estimated values disclosed do not represent fair market value.	
<b>18.34</b>	<b>Mineral or Petroleum Asset Valuation Reports</b>	<b>Not applicable.</b> <sup>[2,3]</sup>
18.34	A Mineral Company must ensure that:—	
	(1) any valuation of its Mineral or Petroleum Assets is prepared under the VALMIN Code, SAMVAL Code, CIMVAL or such other code approved by the Exchange from time to time;	
	(2) the Competent Evaluator states clearly the basis of valuation, relevant assumptions	

Chapter 18		
	and the reason why a particular method of valuation is considered most appropriate, having regard to the nature of the valuation and the development status of the Mineral or Petroleum Asset;	
(3)	if more than one valuation method is used and different valuations result, the Competent Evaluator comments on how the valuations compare and on the reason for selecting the value adopted; and	
(4)	in preparing any valuation a Competent Evaluator meets the requirements set out in rule 18.23.	

## Note:

1. CPR is the Competent Person's Report prepared by SRK; and 2.2.2 is the section number.
2. Mineral Resources of this Project are the rare earth project.
3. The report prepared by SRK is not an Evaluation Report.

---

**Appendix D Chapter 2.6 of the Guide for New Listing  
Applicants**

<b>Chapter 2.6</b>		<b>Section in SRK's Report</b>
(i)	The cut-off grade (which should be an industry standard commonly used), minimum mining width, economic parameters (e.g. waste to ore ratio, stope productivity), specific gravity derivation, prevailing commodity price assumptions;	Section 10.1.11 and Section 10.2.11
(ii)	If the Competent Person has a different view on certain assumptions (e.g. processing recovery rate) made by the applicant, both views should be disclosed in the listing document, with differences highlighted and underlying reasons for the different views, and the impact on the applicant if the more conservative view is adopted;	Not applicable
(iii)	Detailed analysis for harmful elements identified at mines (e.g. mercury or arsenic at lead and zinc mines) to give a better picture of whether there are material concentrations of these elements within particular lodes, and the impact on the saleability of the minerals;	Not applicable.
(iv)	Clear and meaningful drawings and diagrams, shown to scale, of the location of the applicant's principal Mineral or Petroleum Assets;	Section 4
(v)	The procedures, amount of testing, assessment and time required to ascertain the amount of Reserves, and the existing Reserves of the mine over its entire mine life, expected average Resource and Reserve grades of ore that can be extracted in future years (preferably covering the whole economic life of the mine), depletion charges and hedging activities;	Not applicable
(vi)	Whether the historical or expected improved recovery rate is used for estimating the net present value ("NPV"), and the basis on which the discount rates are considered appropriate;	Section 18.4
(vii)	If the Competent Person did not conduct a site visit, the applicant should disclose in the "Business" section of the listing document the basis on which the Reserves/Resources, cost forecasts and other data relating to the mines/oilfields as disclosed in the CPR are arrived at, how the lack of a site visit would affect the reliability of the information, and an appropriate risk factor 3; and	Section 2.2.3
(viii)	All material risks mentioned in the CPR should be disclosed in the "Risk Factors" section of the listing document.	Section 19

## TAXATION FOR HOLDERS OF SECURITIES

Income tax and capital gains tax of holders of H Shares is subject to the laws and practices of the PRC and of jurisdictions in which holders of H Shares are residents or otherwise subject to tax. The following summary of certain relevant taxation provisions is based on current laws and practices, and has not taken into account the expected change or amendment to the relevant laws and policies and does not constitute any opinion or advice. The discussion does not deal with all possible tax consequences relating to an investment in the H shares, nor does it take into account the specific circumstances of any particular investor, some of which may be subject to special regulation. Accordingly, you should consult your own tax advisor regarding the tax consequences of an investment in the H shares. The discussion is based upon laws and relevant interpretations in effect as of the Latest Practicable Date, all of which are subject to change and may have retrospective effect.

No issues on PRC or Hong Kong taxation other than income tax, capital gain tax and profits tax, business tax/VAT, stamp duty and estate duty were referred in the discussion. Prospective investors are urged to consult their financial advisors regarding the PRC, Hong Kong and other tax consequences of owning and disposing of the H Shares.

## THE PRC TAXATION

### Taxation on Dividends

#### *Individual Investors*

Pursuant to the Individual Income Tax Law of the PRC (《中華人民共和國個人所得稅法》), which was most recently amended on August 31, 2018 and the Implementation Provisions of the Individual Income Tax Law of the PRC (《中華人民共和國個人所得稅法實施條例》), which was most recently amended on December 18, 2018 (hereinafter collectively referred to as the “**IIT Law**”), dividends distributed by PRC enterprises are subject to individual income tax levied at a flat rate of 20%. For a foreign individual who is not a resident of the PRC, the receipt of dividends from an enterprise in the PRC is normally subject to individual income tax of 20% unless specifically exempted by the tax authority of the State Council or reduced by relevant tax treaty.

Pursuant to the Arrangement between Mainland China and the Hong Kong Special Administrative Region for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion with Respect to Taxes on Income (《內地和香港特別行政區關於對所得避免雙重徵稅和防止偷漏稅的安排》) (hereinafter referred to as the “**Arrangement for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion with respect to Taxes on Income** (《對所得避免雙重徵稅和防止偷漏稅的安排》)”) signed by Mainland China and the Hong Kong Special Administrative Region on August 21, 2006, the PRC government may impose tax on dividends paid by a PRC company to a Hong Kong resident (including natural person and legal entity), but such tax shall not exceed 10% of the total amount of dividends payable. If a Hong Kong resident directly holds 25% or more of equity interest in a PRC company and the

Hong Kong resident is the beneficial owner of the dividends and meets other conditions, such tax shall not exceed 5% of the total amount of dividends payable by the PRC company. The Fifth Protocol to the Arrangement between Mainland China and the Hong Kong Special Administrative Region for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion with Respect to Taxes on Income (《國家稅務總局關於<內地和香港特別行政區關於對所得避免雙重徵稅和防止偷漏稅的安排>第五議定書》) (the “**Fifth Protocol**”) issued by the SAT and became effective on December 6, 2019, provides that such provisions shall not apply to arrangements or transactions made for one of the primary purposes of obtaining such tax benefits.

### **Enterprise Investors**

In accordance with the Enterprise Income Tax Law of the PRC (《中華人民共和國企業所得稅法》) issued by NPC on March 16, 2007 and most recently amended on December 29, 2018 and the Implementation Provisions of the Enterprise Income Tax Law of the PRC (《中華人民共和國企業所得稅法實施條例》) issued by the State Council on December 6, 2007, came into effect on January 1, 2008 and amended on April 23, 2019 (hereinafter collectively referred to as the “**EIT Law**”), a non-resident enterprise is generally subject to a 10% enterprise income tax on PRC-sourced income (including dividends received from a PRC resident enterprise), if it does not have an establishment or premise in the PRC or has an establishment or premise in the PRC but its PRC-sourced income has no real connection with such establishment or premise. The aforesaid income tax payable by non-resident enterprises are withheld at source, where the payer of the income is required to withhold the income tax from the amount to be paid to the non-resident enterprise. Such withholding tax may be reduced or exempted pursuant to an applicable treaty for the avoidance of double taxation.

The Circular of the State Administration of Tax on Issues Relating to the Withholding and Remitting of Enterprise Income Tax by PRC Resident Enterprises on Dividends Distributed to Overseas Non-Resident Enterprise Shareholders of H Shares (《國家稅務總局關於中國居民企業向境外H股非居民企業股東派發股息代扣代繳企業所得稅有關問題的通知》), which was issued and implemented by the SAT on November 6, 2008, further clarified that a PRC-resident enterprise must withhold corporate income tax at a rate of 10% on the dividends paid to non-PRC resident enterprise holders of H Shares which are derived out of profit generated since 2008. Non-PRC resident enterprise shareholders who need to enjoy tax treaty benefits, the relevant provisions of such tax treaty shall apply.

Pursuant to the Arrangement for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion with Respect to Taxes on Income, the PRC government may impose tax on dividends paid by a PRC company to a Hong Kong resident (including natural person and legal entity), but such tax shall not exceed 10% of the total amount of dividends payable. If a Hong Kong resident directly holds 25% or more of equity interest in a PRC company and the Hong Kong resident is the beneficial owner of the dividends and meets other conditions, such tax shall not exceed 5% of the total amount of dividends payable by the PRC company. The Fifth Protocol provides that such provisions shall not apply to arrangements or transactions made for one of the primary purposes of obtaining such tax benefits.

Although there may be other provisions under the Arrangement for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion with Respect to Taxes on Income, the treaty benefits under the criteria shall not be granted in the circumstance where relevant gains, after taking into account all relevant facts and conditions, are reasonably deemed to be one of the main purposes for the arrangement or transactions which will bring any direct or indirect benefits under this Arrangement, except when the grant of benefits under such circumstance is consistent with relevant objectives and goals under the Arrangement. The application of the dividend clause of tax agreements is also subject to the requirements of PRC tax laws and regulations, such as the Notice of the State Administration of Taxation on the Issues Concerning the Application of the Dividend Clauses of Tax Agreements (《國家稅務總局關於執行稅收協定股息條款有關問題的通知》).

### **Tax Treaties**

Non-resident investors residing in jurisdictions which have entered into treaties or adjustments for the avoidance of double taxation with the PRC might be entitled to a reduction of the Chinese corporate income tax imposed on the dividends received from PRC companies. The PRC currently has entered into treaties or adjustments for the avoidance of double taxation with a number of countries and regions including Hong Kong Special Administrative Region, Macau Special Administrative Region, Australia, Canada, France, Germany, Japan, Malaysia, the Netherlands, Singapore, the United Kingdom and the United States. Non-PRC resident enterprises entitled to preferential tax rates in accordance with the relevant taxation treaties or arrangements are required to apply to the Chinese tax authorities for a refund of the corporate income tax in excess of the agreed tax rate, and the refund application is subject to approval by the Chinese tax authorities.

### **Taxation on Share Transfer**

#### ***VAT and Local Additional Tax***

Pursuant to the Notice on Fully Implementing the Pilot Reform for the Transition from Business Tax to Value-added Tax (《關於全面推開營業稅改徵增值稅試點的通知》) (the “**Circular 36**”), which was implemented on May 1, 2016 and partially repealed on July 1, 2017, January 1, 2018 and April 1, 2019, entities and individuals engaged in the services sale in the PRC are subject to VAT and “engaged in the services sale in the PRC” means that the seller or buyer of the taxable services is located in the PRC. Circular 36 also provides that transfer of financial products, including transfer of the ownership of marketable securities, shall be subject to VAT at 6% on the taxable revenue (which is the balance of sales price upon deduction of purchase price), for a general or a foreign VAT taxpayer. However, individuals who transfer financial products are exempt from VAT, which is also provided in the Notice of Ministry of Finance and State Administration of Taxation on Several Tax Exemption Policies for Business Tax on Sale and Purchase of Financial Commodities by Individuals (《財政部、國家稅務總局關於個人金融商品買賣等營業稅若干免稅政策的通知》) effective on January 1, 2009. According to these regulations, if the holder is a non-resident individual, the PRC VAT is exempted from the sale or disposal of H shares; if the holder is a non-resident enterprise and the H-share buyer is an individual or entity located outside the PRC, the holder is not necessarily required to pay the PRC VAT, but if the H-share buyer is an individual or entity located in China, the holder may be required to pay the PRC VAT.

However, in view of no clear regulations, it is still uncertain whether the non-Chinese resident enterprises are required to pay the PRC VAT for the disposal of H shares in practice.

At the same time, VAT payers are also required to pay urban maintenance and construction tax, education surtax and local education surcharge, which shall be usually subject to 12% of the actual VAT payable (if any).

## **Income tax**

### ***Individual Investors***

According to the IIT Law, gains on the transfer of equity interests in the PRC resident enterprises are subject to individual income tax at a rate of 20%.

Pursuant to the Circular on Declaring that Individual Income Tax Continues to be Exempted over Income of Individuals from the Transfer of Shares (《關於個人轉讓股票所得繼續暫免徵收個人所得稅的通知》) issued by the SAT on March 30, 1998, from January 1, 1997, income of individuals from transfer of the shares of listed enterprises continues to be exempted from individual income tax. The SAT has not expressly stated whether it will continue to exempt tax on income of individuals from transfer of the shares of listed enterprises in the most recently amended IIT Law.

However, on December 31, 2009, the Ministry of Finance, SAT and CSRC jointly issued the Circular on Related Issues on Levying Individual Income Tax over the Income Received by Individuals from the Transfer of Listed Shares Subject to Sales Limitation (《關於個人轉讓上市公司限售股所得徵收個人所得稅有關問題的通知》), which came into effect on January 1, 2010, which states that individuals' income from the transfer of listed shares obtained from the public offering of listed companies and transfer market on the Shanghai Stock Exchange and the Shenzhen Stock Exchange shall continue to be exempted from individual income tax, except for the relevant shares which are subject to sales restriction (as defined in the Supplementary Notice on Related Issues on Levying Individual Income Tax over the Income Received by Individuals from the Transfer of Listed Shares Subject to Sales Limitation (《關於個人轉讓上市公司限售股所得徵收個人所得稅有關問題的補充通知》) jointly issued and implemented by such departments on November 10, 2010). As of the Latest Practicable Date, no aforesaid provisions have expressly provided that individual income tax shall be levied from non-PRC resident individuals on the transfer of shares in PRC resident enterprises listed on overseas stock exchanges.

### **Enterprise Investors**

According to the EIT Law, a non-resident enterprise is generally subject to a 10% enterprise income tax on PRC-sourced income (including dividends received from a PRC resident enterprise), if it does not have an establishment or premise in the PRC or has an establishment or premise in the PRC but its PRC-sourced income has no real connection with such establishment or premise. The aforesaid income tax payable by non-resident enterprises are withheld at source, where the payer of the income is required to withhold the income tax from the amount to be paid to the non-resident enterprise. Such withholding tax may be reduced or exempted pursuant to an applicable treaty for the avoidance of double taxation.

The Circular of the State Administration of Tax on Issues Relating to the Withholding and Remitting of Enterprise Income Tax by PRC Resident Enterprises on Dividends Distributed to Overseas Non-Resident Enterprise Shareholders of H Shares (《國家稅務總局關於中國居民企業向境外H股非居民企業股東派發股息代扣代繳企業所得稅有關問題的通知》), which was issued and implemented by the SAT on November 6, 2008, further clarified that a PRC-resident enterprise must withhold corporate income tax at a rate of 10% on the dividends paid to non-PRC resident enterprise holders of H Shares which are derived out of profit generated since 2008. Non-PRC resident enterprise shareholders who need to enjoy tax treaty benefits, the relevant provisions of such tax treaty shall apply.

### Stamp Duty

According to the Stamp Duty Law of the PRC (《中華人民共和國印花稅法》), which was promulgated on June 10, 2021 and came into effect on July 1, 2022, PRC stamp duty only applies to specific taxable document executed or received within the PRC, having legally binding force in the PRC and protected under the PRC laws, thus the requirements of the stamp duty imposed on the transfer of shares of PRC listed companies shall not apply to the acquisition and disposal of H Shares by non-PRC investors outside of the PRC.

### Estate Duty

As of the Latest Practicable Date, no estate duty has been levied in the PRC under the PRC laws.

### Enterprise Income Tax

According to the EIT Law, enterprises and other income-generating organizations (hereinafter collectively referred to as “**an enterprise**” or “**enterprises**”) within the territory of the PRC are the taxpayers of enterprise income tax and shall pay enterprise income tax in accordance with the provisions of the EIT Law. The Enterprise Income Tax rate is 25%.

According to the Administrative Measures for Determination of High and New Tech Enterprises (《高新技術企業認定管理辦法》), which was promulgated by the Ministry of Science and Technology, the Ministry of Finance and the State Administration of Taxation on April 14, 2008, amended on January 29, 2016 and became effective on January 1, 2016, an enterprise recognized as a high and new technology enterprise may apply for a preferential enterprise income tax rate of 15% pursuant to the relevant requirements of the EIT Law.

### VAT

Pursuant to the Interim Regulations on Value-added Tax of the PRC (《中華人民共和國增值稅暫行條例》) issued on December 13, 1993 by the State Council, came into effect on January 1, 1994, and revised on November 10, 2008, February 6, 2016 and November 19, 2017, as well as the Implementation Rules for the Interim Regulations on Value-Added Tax of the PRC (《中華人民共和國增值稅暫行條例實施細則》) issued on December 25, 1993 by the

MOF, came into effect on the same day and revised on December 15, 2008 and October 28, 2011, any entities and individuals engaged in the sale of goods, supply of processing, repair and replacement services, and import of goods within the territory of the PRC are taxpayers of VAT and shall pay the VAT in accordance with the law. The rate of VAT for sale of goods is 17% unless otherwise specified, such as the rate of VAT for sale of transportation is 11%. With the VAT reforms in the PRC, the rate of VAT has been changed several times. The Notice of the Ministry of Finance and the State Administration of Taxation on the Adjustment to VAT Rates (《財政部、國家稅務總局關於調整增值稅稅率的通知》) which was promulgated by the Ministry of Finance and the State Administration of Taxation on April 4, 2018 to adjust the tax rates of 17% and 11% applicable to any taxpayer's VAT taxable sale or import of goods to 16% and 10%, respectively, and this adjustment became effective on May 1, 2018. Subsequently, the Announcement of the Ministry of Finance and the State Administration of Taxation on Relevant Policies for Deepening the VAT Reform (《財政部、國家稅務總局關於深化增值稅改革有關政策的公告》) which was jointly promulgated by the MOF, the SAT and the General Administration of Customs on March 20, 2019 to make a further adjustment, which came into effect on April 1, 2019. The previous tax rate of 16% applicable to the VAT taxable sale behavior or import of goods shall be adjusted to 13%, and the previous tax rate of 10% applicable thereto shall be adjusted to 9%.

## TAXATION IN HONG KONG

### Tax on Dividends

Under the current practice of the Inland Revenue Department of Hong Kong, no tax is payable in Hong Kong in respect of dividends paid by us.

### Capital Gains Tax and Profits Tax

No tax is imposed in Hong Kong in respect of capital gains from the sale of H Shares. However, trading gains from the sale of the H Shares by persons carrying on a trade, professional services or business in Hong Kong, where such gains are derived from or arise in Hong Kong from such trade, professional services or business, will be subject to Hong Kong profits tax, which is currently imposed at the maximum rate of 16.5% on corporations and at the maximum rate of 15% on unincorporated businesses. Certain categories of taxpayers (for example, financial institutions, insurance companies and securities dealers) are likely to be regarded as deriving trading gains rather than capital gains unless these taxpayers can prove that the investment securities are held for long-term investment purposes. Trading gains from sales of H Shares effected on the Hong Kong Stock Exchange will be considered to be derived from or arise in Hong Kong. Liability for Hong Kong profits tax would thus arise in respect of trading gains from sales of H Shares effected on the Hong Kong Stock Exchange realized by persons carrying on a business of trading or dealing in securities in Hong Kong.

**Stamp Duty**

Hong Kong stamp duty, currently charged at the ad valorem rate of 0.1% on the higher of the consideration for or the market value of the H Shares, will be payable by the purchaser on every purchase and by the seller on every sale of Hong Kong securities, including H Shares (in other words, a total of 0.2% is currently payable on a typical sale and purchase transaction involving H Shares). In addition, a fixed stamp duty of HK\$5.00 is currently payable on any instrument of transfer of H Shares. Where one of the parties is a resident outside Hong Kong and does not pay the ad valorem duty due by it, the duty not paid will be assessed on the instrument of transfer (if any) and will be payable by the transferee. If no stamp duty is paid on or before the due date, a penalty of up to ten times the duty payable may be imposed.

**Estate Duty**

The Revenue (Abolition of Estate Duty) Ordinance 2005 (《2005年收入(取消遺產稅)條例》) came into effect on February 11, 2006 in Hong Kong, pursuant to which, no Hong Kong estate duty is payable and no estate duty clearance papers are needed for an application of a grant of representation in respect of holders of H Shares whose deaths occur on or after February 11, 2006.

**FOREIGN EXCHANGE ADMINISTRATION IN THE PRC**

The lawful currency of the PRC is Renminbi, which is currently subject to foreign exchange control and cannot be freely converted into foreign currency. The SAFE, with the authorization of the People's Bank of China, is empowered with the functions of administering all matters relating to foreign exchange, including the enforcement of foreign exchange control regulations.

The Administrative Regulations on Foreign Exchange of the PRC (《中華人民共和國外匯管理條例》) which was issued by the State Council on January 29, 1996, implemented on April 1, 1996 and latest amended on August 5, 2008, classifies all international payments and transfers into current items and capital items. Current items are subject to the reasonable examination of the veracity of transaction documents and the consistency of the transaction documents and the foreign exchange receipts and payments by financial institutions engaging in conversion and sale of foreign currencies and supervision and inspection by the foreign exchange administrative authorities. For capital items, overseas organizations and overseas individuals making direct investments in the PRC shall, upon approval by the relevant authorities in charge, process registration formalities with the foreign exchange administrative authorities. Foreign exchange income received overseas can be repatriated or deposited overseas, and foreign exchange and foreign exchange settlement funds under the capital account are required to be used only for purposes as approved by the competent authorities and foreign exchange administrative authorities. In the event that international revenues and expenditure occur or may occur a material imbalance, or the national economy encounters or may encounter a severe crisis, the State may adopt necessary safeguard and control measures on international revenues and expenditure.

The Regulations for the Administration of Settlement, Sale and Payment of Foreign Exchange (《結匯、售匯及付匯管理規定》), which was promulgated by the People's Bank of China on June 20, 1996 and implemented on July 1, 1996, removes other restrictions on convertibility of foreign exchange under current items, while imposing existing restrictions on foreign exchange transactions under capital account items.

According to the Announcement on Improving the Reform of the Renminbi Exchange Rate Formation Mechanism (《關於完善人民幣匯率形成機制改革的公告》), which was issued by the People's Bank of China and implemented on July 21, 2005, the PRC has started to implement a managed floating exchange rate system in which the exchange rate would be determined based on market supply and demand and adjusted with reference to a basket of currencies since July 21, 2005. Therefore, Renminbi exchange rate was no longer pegged to U.S. dollar. The People's Bank of China would publish the closing price of the exchange rate of Renminbi against trading currencies such as U.S. dollar in the interbank foreign exchange market after the closing of the market on each working day, as the central parity of the currency against Renminbi transactions on the following working day.

According to the relevant laws and regulations in the PRC, PRC enterprises (including foreign investment enterprises) which need foreign exchange for current item transactions may, without the approval of the foreign exchange administrative authorities, effect payment through foreign exchange accounts opened at the designated foreign exchange bank, on the strength of valid transaction receipts and proof. Foreign investment enterprises which need foreign exchange for the distribution of profits to their shareholders and PRC enterprises (such as our Company) which, in accordance with regulations, are required to pay dividends to their shareholders in foreign exchange may, on the strength of resolutions of the board of directors or the shareholders' meeting on the distribution of profits, effect payment from foreign exchange accounts at the designated foreign exchange bank, or effect exchange and payment at the designated foreign exchange bank.

According to the Decisions on Matters including Canceling and Adjusting a Batch of Administrative Approval Items (《國務院關於取消和調整一批行政審批項目等事項的決定》) which was promulgated by the State Council on October 23, 2014, it decided to cancel the approval requirement of the SAFE and its branches for the remittance and settlement of the proceeds raised from the overseas listing of the foreign shares into RMB domestic accounts.

According to the Notice of the State Administration of Foreign Exchange on Issues Concerning the Foreign Exchange Administration of Overseas Listing (《國家外匯管理局關於境外上市外匯管理有關問題的通知》) issued by the SAFE and implemented on December 26, 2014, a domestic company shall, within 15 business days from the date of the end of its overseas listing issuance, register the overseas listing with the local branch office of state administration of foreign exchange at the place of its establishment; the proceeds from an overseas listing of a domestic company may be remitted to the domestic account or deposited in an overseas account, but the use of the proceeds shall be consistent with the content of the prospectus and other disclosure documents.

According to the Notice of the State Administration of Foreign Exchange on Revolutionizing and Regulating Capital Account Settlement Management Policies (《國家外匯管理局關於改革和規範資本項目結匯管理政策的通知》) which was promulgated by the SAFE and implemented on June 9, 2016, foreign currency earnings in capital account that relevant policies of willingness exchange settlement have been clearly implemented on (including the recalling of raised capital by overseas listing) may undertake foreign exchange settlement in the banks according to actual business needs of the domestic institutions.

This Appendix sets out summaries of certain aspects of PRC laws and regulations, which are relevant to the Company's operations and business. Laws and regulations relating to taxation in the PRC are discussed separately in "Appendix III — Taxation and Foreign Exchange" to this Prospectus. The principal objective of this summary is to provide potential investors with an overview of the principal PRC legal and regulatory provisions applicable to the Company. This summary is not intended to include all the information which may be important to potential investors. For more details on laws and regulations which are relevant to our business, please refer to the section headed "Regulatory Overview" in this Prospectus.

## THE PRC LEGAL SYSTEM

The PRC legal system is based on the *Constitution of the PRC* (《中華人民共和國憲法》) (the "**Constitution**") and is made up of written laws, administrative regulations, local regulations, separate regulations, autonomous regulations, rules and regulations of departments, rules and regulations of local governments and international treaties of which the PRC government is a signatory, and other regulatory documents. Court verdicts do not constitute binding precedents. However, they may be used as judicial reference and guidance.

Pursuant to the *Constitution* and the *Legislation Law of the PRC* (2023 revision) (《中華人民共和國立法法(2023年修訂)》) (the "**Legislation Law**"), the NPC and the Standing Committee of the NPC (SCNPC) are empowered to exercise the legislative power of the State. The NPC has the power to formulate and amend basic laws governing civil and criminal matters, state organs and other matters. The SCNPC is empowered to formulate and amend laws other than those required to be enacted by the NPC and to supplement and amend any parts of laws enacted by the NPC during the adjournment of the NPC, provided that such supplements and amendments are not in conflict with the basic principles of such laws.

The State Council is the highest organ of the PRC administration and has the power to formulate administrative regulations based on the Constitution and laws.

The people's congresses of provinces, autonomous regions and municipalities and their respective standing committees may formulate local regulations based on the specific circumstances and actual requirements of their own respective administrative areas, provided that such local regulations do not contravene any provision of the Constitution, laws or administrative regulations.

The ministries and commissions of the State Council, PBOC, National Audit Office of the PRC as well as the other organs endowed with administrative functions directly under the State Council may, in accordance with the laws as well as the administrative regulations, decisions and orders of the State Council and within the limits of their power, formulate rules.

The people's congresses of cities divided into districts and their respective standing committees may formulate local regulations in terms of urban and rural development and management, environmental protection, and historical and cultural protection based on the specific circumstances and actual requirements of such cities, which will become enforceable after being reported to and approved by the standing committees of the people's congresses of the relevant provinces or autonomous regions but such local regulations shall conform with the Constitution, laws, administrative regulations, and the relevant local regulations of the relevant provinces or autonomous regions. People's congresses of national autonomous areas have the power to enact autonomous regulations and separate regulations in light of the political, economic and cultural characteristics of the nationality (nationalities) in the areas concerned.

The people's governments of the provinces, autonomous regions, and municipalities directly under the central government and the cities divided into districts or autonomous prefectures may enact rules, in accordance with laws, administrative regulations and the local regulations of their respective provinces, autonomous regions or municipalities. The Constitution has supreme legal authority and no laws, administrative regulations, local regulations, autonomous regulations or separate regulations may contravene the Constitution. The authority of laws is greater than that of administrative regulations, local regulations and rules. The authority of administrative regulations is greater than that of local regulations and rules. The authority of local regulations is greater than that of the rules of the local governments at or below the corresponding level. The authority of the rules enacted by the people's governments of the provinces or autonomous regions is greater than that of the rules enacted by the people's governments of the city divided into districts or autonomous prefecture within the administrative areas of the provinces and the autonomous regions.

The NPC has the power to alter or annul any inappropriate laws enacted by the SCNPC, and to annul any autonomous regulations or separate regulations which have been approved by the SCNPC but which contravene the Constitution or the Legislation Law. The SCNPC has the power to annul any administrative regulations that contravene the Constitution and laws, to annul any local regulations that contravene the Constitution, laws or administrative regulations, and to annul any autonomous regulations or local regulations which have been approved by the standing committees of the people's congresses of the relevant provinces, autonomous regions or municipalities directly under the central government, but which contravene the Constitution and the Legislation Law. The State Council has the power to alter or annul any inappropriate ministerial rules and rules of local governments. The people's congresses of provinces, autonomous regions or municipalities directly under the central government have the power to alter or annul any inappropriate local regulations enacted or approved by their respective standing committees. The people's governments of provinces and autonomous regions have the power to alter or annul any inappropriate rules enacted by the people's governments at a lower level.

According to the Constitution and the Legislation Law, the power to interpret laws is vested in the SCNPC. According to the *Decision of the Standing Committee of the NPC Regarding the Strengthening of Interpretation of Laws* (《全國人民代表大會常務委員會關於加強法律解釋工作的決議》) passed on June 10, 1981, the Supreme People's Court of the PRC (the “**Supreme People's Court**”) has the power to give general interpretation on questions involving the specific application of laws and decrees in court trials. The State Council and its ministries and commissions are also vested with the power to give interpretation of the administrative regulations and department rules which they have promulgated. At the regional level, the power to give interpretations of the local laws and regulations as well as administrative rules is vested in the regional legislative and administrative organs which promulgate such laws, regulations and rules.

### THE PRC JUDICIAL SYSTEM

Under the *Constitution* and the *PRC Law on the Organization of the People's Courts* (2018 revision) (《中華人民共和國法院組織法(2018年修訂)》), the PRC judicial system is made up of the Supreme People's Court, the local people's courts and special people's courts.

The local people's courts are comprised of the primary people's courts, the intermediate people's courts and the higher people's courts. The higher-level people's courts supervise the primary and intermediate people's courts. The people's procuratorates also have the right to exercise legal supervision over the civil proceedings of people's courts of the same level and lower levels. The Supreme People's Court is the highest judicial body in the PRC. It supervises the judicial administration of the people's courts at all levels.

The *PRC Civil Procedure Law* (2023 revision) (《中華人民共和國民事訴訟法(2023年修訂)》) (the “**Civil Procedure Law**”), which was adopted in 1991 and amended in 2007, 2012, 2017, 2021 and 2023, sets forth the criteria for instituting a civil action, the jurisdiction of the people's courts, the procedures to be followed for conducting a civil action and the procedures for enforcement of a civil judgment or order. All parties to a civil action conducted within the PRC must comply with the Civil Procedure Law. Generally, a civil case is initially heard by a local court of the municipality or province in which the defendant resides. The parties to a contract may, by express agreement, select a judicial court where civil actions may be brought, provided that the judicial court is either the plaintiff's or the defendant's domicile, the place of execution or implementation of the contract or the place of the object of the action, provided that such choice shall not violate the requirements of the level of jurisdiction and exclusive jurisdiction.

A foreign national or enterprise generally has the same litigation rights and obligations as a citizen or legal person of the PRC. If a foreign country's judicial system limits the litigation rights of PRC citizens and enterprises, the PRC courts may apply the same limitations to the citizens and enterprises of that foreign country within the PRC.

If any party to a civil action refuses to comply with a judgment or ruling made by a people's court or an award made by an arbitration panel in the PRC, the other party may apply to the people's court for the enforcement of the same. There are time limits of two years imposed on the right to apply for such enforcement. If a person fails to satisfy a judgment made by the court within the stipulated time, the court will, upon application by either party, enforce the judgment in accordance with the law.

A party seeking to enforce a judgment or ruling of a people's court against a party who is not personally or whose property is not within the PRC may apply to a foreign court with jurisdiction over the case for recognition and enforcement of the judgment or ruling. A foreign judgment or ruling may also be recognized and enforced by the people's court according to PRC enforcement procedures if the PRC has entered into or acceded to an international treaty with the relevant foreign country, which provides for such recognition and enforcement, or if the judgment or ruling satisfies the court's examination according to the principle of reciprocity, unless the people's court finds that the recognition or enforcement of such judgment or ruling will result in a violation of the basic legal principles of the PRC, its sovereignty or security or against social and public interest.

Pursuant to the *Arrangements for Reciprocal Recognition and Enforcement of Judgments in Civil and Commercial Cases between Courts of the Mainland and Hong Kong Special Administrative Region* (《最高人民法院關於內地與香港特別行政區法院相互認可和執行民商事案件判決的安排》), which came into effect on January 29, 2024, a party with an enforceable final court judgment rendered by any designated people's court of China or any designated Hong Kong court requiring payment of money in a civil and commercial case according to a written choice of court agreement, may apply for recognition and enforcement of the judgment in the relevant people's court of China or Hong Kong court.

#### **THE PRC COMPANY LAW, OVERSEAS LISTING TRIAL MEASURES AND GUIDANCE FOR ARTICLES OF ASSOCIATION**

A joint stock limited company incorporated in the PRC and seeking a listing on the Stock Exchange is mainly subject to the following laws and regulations in the PRC:

- The *Company Law of the PRC* (《中華人民共和國公司法》) (the “**Company Law**”) which was promulgated by the Standing Committee of the NPC on December 29, 1993, came into effect on July 1, 1994, revised on December 25, 1999, August 28, 2004, October 27, 2005, December 28, 2013 and December 29, 2023 respectively and the latest revision of which was implemented on July 1, 2024.
- The Overseas Listing Trial Measures and five relevant guidelines which were promulgated by the CSRC on February 17, 2023 pursuant to the *PRC Securities Law* and are applicable to the direct and indirect overseas share offering or listing of domestic companies; and

- The *Guidelines for Articles of Association of Listed Companies* (《上市公司章程指引》) (the “**Guidance for Articles of Association**”) which was most recently amended on December 15, 2023 by the CSRC. The Articles of Association are formulated based on the *Guidance for Articles of Association* on a reference basis, the summary of which is set out in the section entitled “Appendix V — Summary of the Articles of Association” to this Prospectus.

Set out below is a summary of the major provisions of the currently effective *Company Law*, the Overseas Listing Trial Measures and the *Guidance for Articles of Association* which are applicable to the Company.

### General

A joint stock limited company refers to an enterprise legal person incorporated in accordance with the *Company Law* with its registered capital divided into shares of equal par value. The liability of its shareholders is limited to the amount of shares held by them and the company is liable to its creditors for an amount equal to the total value of its assets.

A joint stock limited company shall conduct its business in accordance with laws and administrative regulations. It may invest in other limited liability companies and joint stock limited companies and its liabilities with respect to such invested companies are limited to the amount invested. Unless otherwise provided by laws, the joint stock limited company may not be a contributor that undertakes joint and several liabilities for the debts of the invested companies.

### Incorporation

A joint stock limited company may be incorporated by promotion or public subscription.

A joint stock limited company may be incorporated by a minimum of one but not more than 200 promoters, and at least half of the promoters must have residence within the PRC. Companies incorporated by promotion are companies of which the entire registered capital is subscribed for by the promoters. Shares in the company incorporated by promotion shall not be offered to others unless the registered capital has been fully paid up. If laws, administrative regulations and decisions of the State Council have separate provisions on paid-in registered capital and the minimum registered capital, the company should follow such provisions.

For companies incorporated by way of promotion, the promoters shall subscribe in writing for the shares required to be subscribed for by them and pay up their capital contributions under the articles of association. Procedures relating to the transfer of titles to non-monetary assets shall be duly completed if such assets are to be contributed as capital. Promoters who fail to pay up their capital contributions in accordance with the foregoing provisions shall assume default liabilities in accordance with the covenants set out in the promoters’ agreements. After the promoters have confirmed the capital contribution under the

articles of association, a board of directors and a board of supervisors shall be elected and the board of directors shall apply for registration of incorporation by filing the articles of association with the company registration authority, and other documents as required by laws or administrative regulations.

Where companies are incorporated by public subscription, not less than 35% of their total number of shares must be subscribed for by the promoters, unless otherwise provided for by laws or administrative regulations. The promoters shall preside over and convene an inauguration meeting within thirty days from the date of the full payment of subscription capital. The inauguration meeting shall be formed by the promoters and subscribers. Where the shares issued are not fully subscribed for within the offer period stipulated in the share offering prospectus, or where the promoter fails to convene an inauguration meeting within thirty days of the subscription capital for the shares issued being fully paid up, the subscribers may demand that the promoters refund the subscription capital so paid together with the interest calculated at bank rates of a deposit for the same period. Within thirty days of the conclusion of the inauguration meeting, the board of directors shall apply to the registration authority for registration of the establishment of the company. A company is formally established and has the status of a legal person after the registration with the relevant administration for market regulation has been completed and a business license has been issued.

### **Registered Capital**

The promoters may make a capital contribution in currencies, or non-monetary assets such as in kind, intellectual property rights or land use rights which can be appraised with monetary value and transferred lawfully, except for assets which are prohibited from being contributed as capital by laws or administrative regulations. If a capital contribution is made in non-monetary assets, a valuation of the assets contributed must be carried out pursuant to the provisions of laws or administrative regulations on valuation without any over-valuation or under-valuation.

The shares of a company are represented by stocks. A stock is a certificate issued by the company to certify the share held by a shareholder. The stock issued by the company shall be in the form of registered stock.

All issue of shares of a joint stock limited company shall be based on the principles of equality and fairness. The same class of shares must carry equal rights. Shares issued at the same time and within the same class must be issued on the same conditions and at the same price. It may issue shares at par value or at a premium, but it may not issue shares below the par value.

Under the Overseas Listing Trial Measures, if a domestic company offers shares overseas, it may raise funds and dividend distributions in foreign currency or Renminbi.

Under the *Company Law*, a company issuing registered share certificates shall maintain a shareholder registry which sets forth the following matters:

- the name and domicile of each shareholder;
- the type of shares and number of shares subscribed by each shareholder;
- the serial numbers of shares held by each shareholder; and
- the date on which each shareholder acquired the shares.

### **Increase of Registered Capital and Issue of Shares**

In light of its operational and development needs and in accordance with laws and regulations, a company may increase its share capital under any of the following methods, subject to the resolutions be passed at a shareholders' general meeting: (i) a public offering of shares; (ii) a private placement of shares; (iii) offering of bonus shares to existing shareholders; (iv) the conversion of reserve funds into shares; and (v) any other methods provided in law and administrative regulations and approved by the CSRC.

Pursuant to the *Company Law*, a company may, according to its articles of association, issue the following classified shares, which have different rights from those of the ordinary shares: (i) shares with priority or inferior rights to profits or remaining property in distribution; (ii) shares with more or less voting rights per share than those of the ordinary shares; (iii) shares whose transfer is subject to the consent of the company and other restrictions; and (iv) other classified shares provided by the State Council. A company making a public offering of shares shall not issue any of the classified shares as prescribed on items (ii) and (iii), except those issued prior to the public offering. Where a company is issuing new shares, resolutions shall be passed at general meeting in accordance with the articles of association in respect of the class and amount of the new shares, the issue price of the new shares, the commencement and end dates for the issue of the new shares and when the new shares are proposed to be issued to existing shareholders, the class and amount of such new shares.

To offer shares overseas, the domestic company shall report the application documents for offering and listing to the CSRC for record-filing within three business days after submission of the application documents for offering and listing overseas.

### **Reduction of Registered Capital**

A company may reduce its registered capital in accordance with the following procedures prescribed by the *Company Law*:

- the company shall prepare a balance sheet and an inventory of the assets;

- the reduction of registered capital shall be approved by a general meeting;
- the company shall inform its creditors of the reduction in registered capital within 10 days and publish an announcement of the reduction in the newspaper within 30 days after the resolution approving the reduction has been passed;
- creditors shall within 30 days after receiving the notice, or within 45 days of the public announcement if no notice has been received, require the company to pay its debts or provide corresponding guarantees covering the debts;
- the company shall apply to the relevant administration of registration for the registration of the reduction in registered capital.

### Repurchase of Shares

According to the *Company Law*, a joint stock limited company may not purchase its shares other than for one of the following purposes: (i) to reduce its registered capital; (ii) to merge with another company that holds its shares; (iii) to grant its shares for carrying out an employee stock ownership plan or equity incentive plan; (iv) to purchase its shares from shareholders who vote against the resolution regarding the merger or division with other companies at a general meeting; (v) to apply shares for conversion of convertible corporate bonds issued by a listed company; and (vi) to maintain the company value and protect the shareholders' interests of a listed company as necessary.

Repurchase of its own shares on the grounds set out in (i) and (ii) above shall be subject to resolution passed by the general meeting; repurchase of its own shares on the grounds set out in (iii), (v) or (vi) above shall be subject to a resolution of the company's board of directors shall be made by a two-third majority of directors attending the meeting in accordance with the provisions of the company's articles of association or as authorized by the general meeting.

Following the repurchase of its own shares in accordance with (i) above, such shares shall be canceled within 10 days from the date of repurchase; the shares shall be transferred or canceled within six months if the repurchase of its own shares is in accordance with either (ii) or (iv) above; and the shares repurchased in accordance with (iii), (v) or (vi) above shall not exceed 10% of the company's total issued shares, and shall be transferred or canceled within three years.

A listed company shall perform its obligation of information disclosure according to the provisions of the *Securities Law* when repurchasing its own shares. In the event the repurchase of its own shares is in accordance with (iii), (v) or (vi) above, centralized public trading shall be adopted.

A company shall not accept its own shares as the subject matter of a mortgage.

**Transfer of Shares**

Shares held by shareholders may be transferred in accordance with the relevant laws and regulations. Pursuant to the *Company Law*, transfer of shares by shareholders shall be carried out at a legally established securities exchange or in other ways stipulated by the State Council. Registered shares may be transferred after the shareholders endorse the back of the share certificates or in any other manner specified by laws or administrative regulations. Following the transfer, the company shall enter the names and addresses of the transferees into its share register. No changes of registration in the share register described above shall be effected during a period of twenty days prior to convening a shareholders' general meeting or five days prior to the record date for the purpose of determining entitlements to dividend distributions, subject to any legal provisions on the registration of changes in the share register of listed companies.

According to the *Company law*, shares issued prior to the public issuance of shares shall not be transferred within one year from the date of the joint stock limited company's listing on a stock exchange. Directors, supervisors and the senior management shall declare to the company their shareholdings in the company and any changes of such shareholdings; they shall not transfer more than 25% of all the shares they hold in the company annually during their tenure; and they shall not transfer the shares they hold within one year from the date on which the company's shares are listed and commenced trading on a stock exchange, nor within six months after their resignation from their positions with the company.

**Shareholders**

According to the *Company Law*, the rights of holders of ordinary shares of a joint stock limited company include:

- the right to attend or appoint a proxy to attend general meetings and to vote thereat;
- the right to transfer shares in accordance with laws, administrative regulations and provisions of the articles of association;
- the right to inspect the company's articles of association, share register, counterfoil of company debentures, minutes of general meetings, resolutions of meetings of the board of directors, resolutions of meetings of the board of supervisors and financial and accounting reports and to make proposals or enquiries on the company's operations;
- the right to bring an action in the people's court to rescind resolutions passed by general meetings and board of directors where the articles of association is violated by the above resolutions;

- the right to receive dividends and other types of interest distributed in proportion to the number of shares held;
- in the event of the termination or liquidation of the company, the right to participate in the distribution of residual properties of the company in proportion to the number of shares held; and
- other rights granted by laws, administrative regulations, other regulatory documents and the company's articles of association.

The obligations of a shareholder include the obligation to abide by the company's articles of association, to pay the subscription moneys in respect of the shares subscribed for and in accordance with the form of making capital contributions, to be liable for the company's debts and liabilities to the extent of the amount of his or her subscribed shares and any other shareholders' obligation specified in the company's articles of association.

### **Shareholder's General Meetings**

The general meeting is the organ of authority of the company, which exercises its powers in accordance with the *Company Law*. According to the *Company Law*, the general meeting exercises the following principal powers:

- to elect or remove the directors and supervisors (other than the representative of the employees of the company) and to decide on matters relating to the remuneration of directors and supervisors;
- to examine and approve reports of the board of directors;
- to examine and approve reports of the board of supervisors;
- to examine and approve the company's proposals for profit distribution plans and loss recovery plans;
- to decide on any increase or reduction of the company's registered capital;
- to decide on the issue of bonds by the company;
- to decide on issues such as merger, division, dissolution and liquidation of the company and other matters;
- to amend the company's articles of association; and
- other powers as provided for in the articles of association.

Annual general meeting is required to be held once every year. Extraordinary general meeting is required to be held within two months after the occurrence of any of the following:

- the number of directors is less than the number stipulated by the law or less than two thirds of the number specified in the articles of association;
- the aggregate losses of the company which are not recovered reach one-third of the company's total paid-in registered capital;
- when shareholders individually or in aggregate holding 10% or more of the company's shares request the convening of an extraordinary general meeting;
- whenever the board of directors deems necessary;
- when the board of supervisors so requests; or
- other circumstances as provided for in the articles of associations.

According to the *Company Law*, general meetings shall be convened by the board of directors, and presided over by the chairman of the board of directors. In the event that the chairman is incapable of performing or does not perform his/her duties, the meeting shall be presided over by the vice chairman. In the event that the vice chairman is incapable of performing or not performing his/her duties, a director nominated by more than half of directors shall preside over the meeting.

Where the board of directors is incapable of performing or not performing its duties of convening the general meeting, the board of supervisors shall convene and preside over such meeting in a timely manner. In case the board of supervisors fails to convene and preside over such meeting, shareholders alone or in aggregate holding more than 10% of the company's shares for 90 days consecutively may unilaterally convene and preside over such meeting.

According the *Company Law*, notice of annual general meeting shall state the time and venue of and matters to be considered at the meeting and shall be given to all shareholders 20 days before the meeting. Notice of extraordinary general meetings shall be given to all shareholders 15 days prior to the meeting.

There is no specific provision in the *Company Law* regarding the number of shareholders constituting a quorum in a general meeting.

According to the *Company Law*, shareholders present at general meeting have one vote for each share they hold, save that shares held by the company are not entitled to any voting rights.

Pursuant to the provisions of the articles of association or a resolution of the general meeting, the accumulative voting system may be adopted for the election of directors and supervisors at the general meeting. Under the accumulative voting system, each share shall be entitled to vote equivalent to the number of directors or supervisors to be elected at the general meeting and shareholders may consolidate their voting rights when casting a vote.

Pursuant to the *Company Law*, resolutions of the general meeting shall be adopted by more than half of the voting rights held by the shareholders present at the meeting. However, resolutions of the general meeting regarding the following matters shall be adopted by more than two-thirds of the voting rights held by the shareholders present at the meeting: (i) amendments to the articles of association; (ii) the increase or decrease of registered capital; (iii) the merger, division, dissolution, liquidation or change in the form of the company; and (iv) other matters considered by the general meeting, by way of an ordinary resolution, to be of a nature which may have a material impact on the company and should be adopted by a special resolution.

According to the *Company Law*, meeting minutes shall be prepared in respect of decisions on matters discussed at the general meeting. The chairman of the meeting and directors attending the meeting shall sign to endorse such minutes. The minutes shall be kept together with the shareholders' attendance register and the proxy forms.

### **Board of Directors**

According to the *Company Law*, a joint stock limited company shall have a board of directors which shall have at least three members. For a company that has three hundred or more employees, the board of directors shall include the staff representative unless the board of supervisors has been established and already included the staff representative supervisor. The term of a director shall be stipulated in the articles of association, provided that no term of office shall last for more than three years. A director may serve consecutive terms if re-elected. A director shall continue to perform his/her duties as a director in accordance with the laws, administrative regulations and articles of association until a duly re-elected director takes office, if re-election is not conducted in a timely manner upon the expiry of his/her term of office, or if the resignation of directors results in the number of directors being less than the quorum.

According to the *Company Law*, the board of directors mainly exercises the following powers:

- to convene the general meetings and report on its work to the general meetings;
- to implement the resolutions passed in general meetings;
- to decide on the company's business plans and investment proposals;

- to formulate the company's profit distribution proposals and loss recovery proposals;
- to formulate proposals for the increase or reduction of the company's registered capital and the issuance of corporate bonds;
- to prepare plans for the merger, division, dissolution and change in the form of the company;
- to decide on the setup of the company's internal management organs;
- to appoint or dismiss the company's manager and decide on his/her remuneration and, based on the manager's recommendation, to appoint or dismiss any deputy manager and financial officer of the company and to decide on their remunerations;
- to formulate the company's basic management system; and
- to exercise any other power under the articles of association.

#### **Meetings of the Board of Directors**

According to the *Company Law*, the board of directors of a joint stock limited company shall hold at least two meetings per year. The board of directors shall issue a notice of meeting to all directors and supervisors 10 days before the meeting. Shareholders representing more than 10% of the voting rights, more than one-third of the directors or the board of supervisors may propose to convene an extraordinary meeting of the board of directors. The chairman of the board of directors shall convene and preside over a meeting of the board of directors within 10 days from the receipt of the proposal. A meeting of the board of directors may only be held if half or more of the directors are present. Resolutions of the board of directors shall be approved by a majority of all directors. Resolutions approved by the board of directors shall be by one person, one vote. Directors shall attend meetings of the board of directors in person. If a director is unable to attend for any reason, he/she may appoint another director to attend the meeting on his/her behalf by a written power of attorney specifying the scope of authorization.

If a resolution of the board of directors violates any laws, administrative regulations or the articles of association, and as a result of which the company sustains serious losses, the directors participating in the resolution are liable to compensate the company. However, if it can be proved that a director expressly objected to the resolution when the resolution was voted on, and that such objection was recorded in the minutes of the meeting, such director shall be relieved from that liability.

**Chairman of the Board of Directors**

Pursuant to the *Company Law*, the board of directors shall appoint a chairman and may appoint a vice chairman. The chairman and the vice chairman shall be elected with approval of more than half of all the directors. The chairman shall convene and preside over board meetings and review the implementation of board resolutions. The vice chairman shall assist the chairman to perform his/her duties. Where the chairman is incapable of performing or is not performing his/her duties, the duties shall be performed by the vice chairman. Where the vice chairman is incapable of performing or is not performing his/her duties, a director elected by more than half of the directors shall perform his/her duties.

**Qualifications of Directors**

Under the *Company Law*, the following person may not serve as a director in a company:

- a person without capacity or restricted capacity to undertake any civil liabilities;
- a person who has been sentenced to any criminal penalty for corruption, bribery, embezzlement, misappropriation of property or destruction of the socialist economic order, or who has been deprived of his political rights due to his crimes and such sentence has expired for no more than five years, or who is granted probation, if no more than two years have passed since the expiration of the probation period;
- a person who has been a former director, factory manager or manager of a company or an enterprise that has entered into insolvent liquidation and who was personally liable for the insolvency of such company or enterprise, where no more than three years have elapsed since the date of the completion of the bankruptcy and liquidation of the company or enterprise;
- a person who has been a legal representative of a company or an enterprise that has had its business license revoked due to violations of the law or has been ordered to close down by law and the person was personally responsible, where less than three years have elapsed since the date of such revocation or the order to close down; or
- a person who is listed as a dishonest person subject to enforcement by the people's court due to failure to pay off a large amount of unliquidated mature debts.

**Board of Supervisors**

A joint stock limited company shall have a board of supervisors composed of not less than three members. The board of supervisors shall consist of representatives of the shareholders and an appropriate proportion of representatives of the company's staff, among which the proportion of representatives of the company's staff shall not be less than one-third, and the actual proportion shall be determined in the articles of association. Representatives of the company's staff at the board of supervisors shall be democratically elected by the company's staff at the staff representative assembly, general staff meeting or otherwise.

Directors and senior management shall not act concurrently as supervisors.

The board of supervisors shall appoint a chairman and may appoint a vice chairman. The chairman and the vice chairman of the board of supervisors shall be elected by more than half of the supervisors. The chairman of the board of supervisors shall convene and preside over board of supervisors meetings. Where the chairman of the board of supervisors is incapable of performing or is not performing his/her duties, the vice chairman of the board of supervisors shall convene and preside over supervisory board meetings. Where the vice chairman of the board of supervisors is incapable of performing or is not performing his/her duties, a supervisor nominated by more than half of the supervisors shall convene and preside over meetings of the board of supervisors.

Each term of office of a supervisor is three years and he/she may serve consecutive terms if re-elected. A supervisor shall continue to perform his/her duties as a supervisor in accordance with the laws, administrative regulations and the articles of association until a duly re-elected supervisor takes office, if re-election is not conducted in a timely manner upon the expiry of his/her term of office or if the resignation of supervisors results in the number of supervisors being less than the quorum. The board of supervisors meets at least once every six months. In accordance with the *Company Law*, resolutions by the board of supervisors shall be passed by a majority of all supervisors

The board of supervisors may exercise its powers:

- to review the company's financial position;
- to supervise the directors and senior management in their performance of their duties and to propose the removal of directors and senior management who have violated laws, regulations, the articles of association or shareholders' resolutions;
- when the acts of directors or senior management are detrimental to the company's interests, to require the director and senior management to correct these acts;

- to propose the convening of extraordinary shareholders' general meetings and to convene and preside over shareholders' general meetings when the board of directors fails to perform the duty of convening and presiding over shareholders' general meetings under the *PRC Company Law*;
- to submit proposals to the shareholders' general meetings;
- to bring actions against directors and senior management pursuant to the relevant provisions of the *PRC Company Law*; and
- to exercise any other authority stipulated in the articles of association.

Supervisors may be present at board meetings and make inquiries or proposals in respect of the resolutions of the board. The board of supervisors may investigate any irregularities identified in the operation of the company and, when necessary, may engage an accounting firm to assist its work at the cost of the company.

#### **Manager and Senior Management**

Pursuant to the *Company Law*, a company shall have a manager who shall be appointed or removed by the board of directors. The manager shall exercise his/her powers in accordance with the company's articles of association or the authorization of the board of directors.

Other provisions in the articles of association on the manager's powers shall also be complied with. The manager shall be present at meetings of the board of directors. However, the manager shall have no voting rights at meetings of the board of directors unless he/she concurrently serves as a director.

Pursuant to the *Company Law*, senior management refers to the manager, deputy manager, financial officer, secretary to the board of directors of a listed company and other personnel as stipulated in the articles of association.

#### **Duties of Directors, Supervisors and Senior Management**

Directors, supervisors and senior management are required under the *Company Law* to comply with the relevant laws, regulations and the articles of association, and shall be obliged to be faithful and diligent towards the company. Where the controlling shareholder or actual controller of the company who does not serve as a director but actually attends to the company's affairs, shall comply with the foregoing provisions.

Directors, supervisors and management personnel are prohibited from abusing their authority in accepting bribes or other unlawful income and from misappropriating the company's property.

Directors, supervisors and senior management are prohibited from:

- seizing the assets of the company or misappropriating company funds;
- depositing company funds into accounts under their own names or the names of other individuals;
- taking advantage of power to accept bribes or other illegal income;
- accepting commissions paid by a third party for transactions conducted with the company for their own benefit;
- unauthorized divulgence of confidential information of the company; and
- other acts in violation of their duty of loyalty to the company.

Where directors, supervisors and senior management directly or indirectly conclude any contract or engage in transactions with the company, they shall report to the board of directors or the shareholders' meeting and seek approval by resolutions of the board of directors or the shareholders' meeting in accordance with the articles of association. The requirement shall also apply to the conclusion of contracts or engagement in transactions by close relatives of the directors, supervisors and senior management or enterprises directly or indirectly controlled by close relatives of the directors, supervisors and senior management as well as persons who are otherwise related to the directors, supervisors and senior management.

Directors, supervisors and senior management shall not take advantage of duty to seek business opportunities for themselves or others that would have been directed to the company, unless such act has been reported to and approved by the board of directors or the shareholders' meeting in accordance with the articles of association or the company is unable to take the business opportunity in accordance with applicable laws, administrative regulations, and the articles of association.

Directors, supervisors and senior management shall not engage in the business similar to those of the company for themselves or others, unless such act has been reported to and approved by the board of directors or the shareholders' meeting in accordance with the articles of association.

Income generated by directors or senior management in violation of aforementioned shall be returned to the company.

A director, supervisor or senior management who contravenes any laws, regulations or the company's articles of association in the performance of his/her duties resulting in any loss to the company shall be liable to the company for compensation.

The *Guidance for Articles of Association* provides that a company's directors and senior management shall have duties of diligence towards the company, for example, the directors shall be prudent, serious and diligent in exercising the authority conferred by the company to ensure that the business activities of the company comply with state's laws, administrative regulations and various economic policy requirements and that the business activities do not go beyond the scope of business activities specified in the company's business license; the directors shall treat all shareholders equally; the shareholders shall keep abreast of the company's business management status; both the directors and the senior management shall sign written statements confirming periodic reports of the company and ensure that the information disclosed by the company is true, accurate and complete; both the directors and the senior management shall provide accurate information and materials to the board of supervisors and shall not interfere with the performance of duties by the board of supervisors or individual supervisors; both the directors and the senior management shall have other diligence duties prescribed by laws, administrative regulations, departmental rules and the company's articles of association.

### **Finance and Accounting**

Pursuant to the *Company Law*, a company shall establish its own financial and accounting systems according to the laws, administrative regulations and the regulations of the competent financial departments of the State Council. At the end of each financial year, a company shall prepare a financial report which shall be audited by an accounting firm in accordance with the laws. The financial and accounting reports shall be prepared in accordance with the laws, administrative regulations and the regulations of the financial departments of the State Council.

Pursuant to the *Company Law*, the company shall send the financial accounting report to all shareholders in accordance with the period stipulated in the articles of association, and the company's financial accounting report shall be made available for inspection by shareholders at least 20 days before the annual general meeting. A company that makes public stock offerings shall publish its financial reports.

When distributing each year's profits after taxation, the company shall set aside 10% of its profits after taxation for the company's statutory common reserve fund until the fund has reached more than 50% of the company's registered capital. When the company's statutory common reserve fund is not sufficient to make up for the company's losses for the previous years, the current year's profits shall first be used to make good the losses before any allocation is set aside for the statutory common reserve fund. After the company has made allocations to the statutory common reserve fund from its profits after taxation, it may, upon passing a resolution at a shareholders' general meeting, make further allocations from its profits after taxation to the discretionary common reserve fund. After the company has made good its losses and made allocations to the abovementioned reserve fund, the remaining profits after taxation shall be distributed in proportion to the number of shares held by the shareholders, except for those which are not distributed in a proportionate manner as provided by the articles of association.

Profits distributed to shareholders in violation of the requirements described above must be returned to the company. The company shall not be entitled to any distribution of profits in respect of shares held by it.

The premium over the nominal value of the shares of the company on issue and other income as required by relevant government authorities to be treated as the capital reserve fund shall be accounted for as the capital reserve fund. The common reserve fund of a company shall be applied to make good the company's losses, expand its business operations or increase its capital. Where any losses need to be covered with reserve fund of the company, discretionary reserve fund and statutory common reserve fund shall first be used and if still insufficient, capital reserve fund can be used in accordance with applicable provisions. Upon the transfer of the statutory common reserve fund into increasing capital, the balance of the statutory common fund shall not be less than 25% of the registered capital of the company before such transfer.

The company shall have no accounting books other than the statutory books. The company's capital shall not be deposited in any account opened under the name of an individual.

#### **Appointment and Retirement of Accounting Firm**

In accordance with the *Company Law*, the appointment or dismissal of the accounting firm responsible for the company's auditing shall be determined at a shareholders' general meeting, by the board of directors, or by the board of supervisors, as stipulated in the articles of association. The accounting firm should be allowed to make representations when the shareholders' general meeting, the board of directors, or the board of supervisors votes on its dismissal. The company should provide true and complete accounting evidence, accounting books, financial and accounting reports and other accounting information to the engaged accounting firm without any refusal, withholding or falsification of information.

The *Guidance for Articles of Association* provides that a company shall engage an accounting firm which is qualified with the *PRC Securities Law* to provide services including the audit of financial statements, the verification of net assets and other relevant consultancy services. The engagement term is one year and may be extended. The audit fee for the accounting firm shall also be determined by shareholders at a general meeting.

#### **Profit Distribution**

According to the *Company Law*, a company shall not distribute profits before losses are covered and the statutory common reserve fund is provided.

**Amendments to the Articles of Association**

Pursuant to the *Company Law*, the resolution of a shareholders' general meeting regarding any amendment to a company's articles of association requires affirmative votes by more than two-thirds of the votes held by shareholders attending the meeting.

Pursuant to the *Guidance for Articles of Association*, the company shall amend its articles of association under any of the following circumstances: (i) where, after any amendment to the *PRC Company Law* or any other applicable law or administrative regulation, the provisions of the articles of association conflict with the law and/or administrative regulations amended; (ii) where the company's circumstances change to such an extent that they are inconsistent with what is recorded in the articles of association; and (iii) where the shareholders' general meeting decides to amend the articles of association.

The *Guidance for Articles of Association* further provides that where any amendment to the articles of association adopted by a shareholders' general meeting is subject to approval by the competent authorities, such amendment shall be submitted for approval; where any amendment involves the company's registration items, the company's registration with the authority shall also be amended. In addition, an announcement shall be made in accordance with the applicable provisions provided that the amendment to the articles of association is required to be disclosed by any law or regulation.

**Dissolution and Liquidation**

Pursuant to the *Company Law*, a company shall be dissolved for any of the following reasons: (i) the term of its operation set out in the articles of association has expired or other events of dissolution specified in the articles of association have occurred; (ii) the shareholders have resolved at a shareholders' general meeting to dissolve the company; (iii) the company is dissolved by reason of its merger or division; (iv) the business license of the company is revoked or the company is ordered to close down or to be dissolved in accordance with the laws; or (v) the company is dissolved by a people's court in response to the request of shareholders holding shares that represent more than 10% of the voting rights of all shareholders of the company, on the grounds that the operation and management of the company has suffered serious difficulties that cannot be resolved through other means, rendering ongoing existence of the company a cause for significant losses to the shareholders' interests.

On the occurrence of the abovementioned events, the company shall make an announcement on the National Enterprise Credit Information Publicity System within ten days.

In the event of paragraphs (i) and (ii) above, the company may carry on its existence by amending its articles of association if no property has been distributed to any shareholder. The amendments to the articles of association in accordance with the provisions described above shall require the approval of more than two-thirds of voting rights of shareholders attending a shareholders' general meeting.

Where the company is dissolved under the circumstances set forth in paragraph (i), (ii), (iv) or (v) above, a liquidation group shall be formed to commence the liquidation procedure within fifteen days of the date on which the dissolution event occurs.

Where the company is dissolved under the circumstances set forth in paragraph (i), (ii), (iv) or (v) above, the liquidation procedure shall be conducted and directors shall be the company's liquidation obligor and it should establish a liquidation group within fifteen days of the date on which the dissolution event occurs. The liquidation group shall be composed of directors or any other persons determined by a shareholders' general meeting. If a liquidation group is not established within the prescribed period or the liquidation fails to effect after the establishment of a liquidation group, the interested party may file an application with a people's court, requesting that the court appoint relevant personnel to form a liquidation group to administer the liquidation. The people's court should accept such application and form a liquidation group to conduct liquidation in a timely manner.

The liquidation group may exercise following powers during the liquidation:

- to dispose of the company's assets and to prepare a balance sheet and an inventory of assets;
- to notify the creditors by notice or announcement;
- to deal with and settle any outstanding business related to the liquidation;
- to pay any outstanding tax together with any tax arising during the liquidation process;
- to settle the company's claims and liabilities;
- to distribute the company's remaining assets after its debts have been paid off; and
- to represent the company in any civil procedures.

The liquidation group shall notify the company's creditors within ten days from its establishment, and publish an announcement in newspapers or on the National Enterprise Credit Information Publicity System within sixty days.

A creditor shall lodge his claim with the liquidation group within thirty days of receipt of the notification or within forty-five days of the date of the announcement if he has not received any notification.

A creditor shall, in making his claim, state matters relevant to his creditor's rights and furnish relevant evidence. The liquidation group shall register such creditor's rights. The liquidation group shall not make any settlement to creditors during the period of the claim.

Upon disposal of the company's property and preparation of the required balance sheet and inventory of assets, the liquidation group shall draw up a liquidation plan and submit this plan to a shareholders' general meeting or a people's court for endorsement. The remaining assets of the company, after payment of liquidation expenses, employee wages, social insurance expenses and statutory compensation, outstanding taxes and the company's debts, shall be distributed to shareholders in proportion to shares held by them.

The company shall continue to exist during the liquidation period, although it cannot engage in operating activities that are not related to the liquidation. The company's property shall not be distributed to shareholders before repayments are made in accordance with the requirements described above.

Upon liquidation of the company's property and preparation of the required balance sheet and inventory of assets, if the liquidation group becomes aware that the company does not have sufficient assets to repay its liabilities, it must apply to a people's court for a declaration of bankruptcy in accordance with the laws. Following such declaration by the people's court, the liquidation group shall hand over the administration matters to the bankruptcy administrator designated by the people's court.

Upon completion of the liquidation, the liquidation group shall prepare a liquidation report and submit it to the shareholders' general meeting or a people's court for confirmation of its completion, and to the company registration authority to cancel the company's registration, and an announcement of its termination shall be published. Members of the liquidation group are required to discharge their duties in good faith and in compliance with relevant laws.

Members of the liquidation group shall be prohibited from abusing their authority in accepting bribes or other unlawful income and from misappropriating the company's properties. Members of the liquidation group are liable to indemnify the company and its creditors in respect of any loss arising from their willful or material default.

Liquidation of a company declared bankrupt according to laws shall be processed in accordance with the laws on corporate bankruptcy.

**Overseas Listing**

Pursuant to the Overseas Listing Trial Measures, both initial public offerings or listings in overseas markets shall be filed with the CSRC within three business days after the relevant application is submitted overseas. Subsequent securities offerings of an issuer in the same overseas market where it has previously offered and listed securities shall be filed with the CSRC within three business days after the offering is completed. Moreover, where the filing documents are complete and in compliance with stipulated requirements, the CSRC will, within twenty business days after receiving the filing documents, conclude the filing procedure and publish the filing results on the CSRC website. Where the filing documents are incomplete or do not conform to stipulated requirements, the CSRC shall request supplementation and amendment thereto within five business days after receiving the filing documents. The issuer shall then complete supplementation and amendment within thirty business days.

**Loss of Share Certificates**

A shareholder may, in accordance with the relevant provisions set out in the PRC Civil Procedure Law, apply to a people's court if his share certificate(s) in registered form is either stolen, lost or destroyed, for a declaration that such certificate(s) will no longer be valid. After a people's court declares that such certificate(s) are invalid, the shareholder may apply to the company for the issuance of a replacement certificate(s).

**Merger and Demerger**

Merger of companies may be conducted by absorption or consolidation. If companies adopt the method of absorption, the absorbed company shall be dissolved. If companies are incorporated in the form of consolidation, the parties to the merger shall be dissolved.

The parties to the merger shall enter into a merger agreement and prepare a balance sheet and a list of properties. Within ten days of the date on which the resolution on merger is made, the creditors shall be notified by the company and a public announcement shall be in the press or on the National Enterprise Credit Information Publicity System within thirty days. The creditors may require the company to repay its debts or provide guarantees for covering the debts within thirty days of receipt of the notification or within forty-five days of the date of the announcement if the creditor has not received any notification; and in case of a merger, the credits and debts of the merging parties shall be assumed by the surviving or the new company.

Where a company merges with another company in which the former holds not less than 90% of the shares, the acquired company is not required to obtain approval by resolution of its shareholders' meeting, but shall notify the other shareholders who have the right to request the company to buy its equities or shares as a reasonable price. If the price paid for a company's merger does not exceed 10% of the company's net assets, approval by resolution of its

shareholder's meeting may not be required unless otherwise provided by the company's articles of association. Where a company's merger is exempt from approval by resolution of the shareholders' meeting in the previous two cases, it shall be subject to approval by resolution of the board of directors.

In case of a division, the company's assets shall be divided and a balance sheet and an inventory of assets shall be prepared. Within ten days of the date on which the resolution on division is made, the creditors shall be notified by the company, and a public announcement shall be made in the press or on the National Enterprise Credit Information Publicity System within thirty days. The liabilities of the company which have accrued prior to the division shall be jointly borne by the separated companies, unless otherwise stipulated in the agreement in writing entered into by the company with creditors in respect of the settlement of debts prior to division.

### **Securities Laws and Regulations of PRC**

The PRC has promulgated a number of regulations related to the issue and trading of shares as well as information disclosure. In October 1992, the State Council established the Securities Committee and the China Securities Regulatory Commission (CSRC). The Securities Committee is responsible for coordinating the drafting of securities regulations, formulating securities-related policies, planning the development of securities market, guiding, coordinating and supervising all securities-related institutions in the PRC, and administering the CSRC. The CSRC is the regulatory department of the Securities Committee, responsible for drafting regulatory provisions for the securities market, supervising securities companies, regulating the public offering of securities by PRC companies at home and abroad, overseeing securities trading, compiling securities-related statistics, and conducting relevant research and analysis. In April 1998, the State Council consolidated the two departments and reformed the CSRC.

The *Interim Provisional Regulations on the Administration of Share Issuance and Trading* covers the application and approval procedures for public offerings of equity securities, trading of equity securities, acquisition of listed companies, custody, clearing and transfer of listed equity securities, information disclosure, investigation, penalties of listed companies, and dispute resolution.

On December 25, 1995, the State Council promulgated and implemented the *Regulations of the State Council Concerning Domestic Listed Foreign Shares of Joint Stock Limited Companies* (which was repealed on March 31, 2023). The provisions mainly cover the issuance, subscription, trading and dividend declaration and other distribution of domestic listed foreign-invested shares, as well as the information disclosure of joint stock limited companies holding domestic listed foreign-invested shares.

The *Securities Law of the People's Republic of China* (the “*Securities Law*”) took effect on July 1, 1999, and was revised on August 28, 2004, October 27, 2005, June 29, 2013, August 31, 2014, and December 28, 2019, respectively. The latest revision of the *Securities Law* came into effect on March 1, 2020. This is China's first national securities law, consisting of 14 chapters and 226 articles, regulating, among other things, the issuance and trading of securities, the acquisition by listed companies, and the obligations and responsibilities of stock exchanges, securities companies, and the State Council's securities regulatory authorities. The *Securities Law* comprehensively regulates the activities of securities market in PRC. Article 224 of the *Securities Law* stipulates that domestic enterprises shall comply with relevant regulations of the State Council to list their shares outside the PRC. Currently, the issuance and trading of foreign-issued shares (including H shares) are mainly governed by the rules and regulations promulgated by the State Council and the CSRC.

On November 14, 2019, the CSRC issued the *Guidance for the Application for the “Full Circulation” of Domestic Unlisted Shares of H-Share Companies*, which was partially revised on August 10, 2023 in accordance with the *Decision on Revising and Abolishing Part of Securities and Futures Policy Documents by CSRC*. The guideline aims to regulate the listing and circulation of unlisted domestic shares (including unlisted domestic shares held by domestic shareholders prior to overseas listing, unlisted domestic shares issued in China after overseas listing, and unlisted shares held by foreign shareholders) of joint-stock limited companies listed on the Hong Kong Stock Exchange (hereinafter referred to as H-Share Companies) (hereinafter referred to as “**Full Circulation**”).

Unlisted domestic joint-stock companies may submit an application for “Full Circulation” when applying for overseas initial public offering and listing.

### **Arbitration and Enforcement of Arbitral Awards**

On August 31, 1994, the SCNPC passed the *Arbitration Law of the People's Republic of China* (the “**Arbitration Law**”), which came into effect on September 1, 1995, and was amended on August 27, 2009, and September 1, 2017. According to the Arbitration Law, an arbitration committee may, before the China Arbitration Association promulgates arbitration rules, formulate interim arbitration rules in accordance with the Arbitration Law and the Civil Procedure Law. Where the parties have by agreement provided arbitration as the method for dispute resolution, the people's court will refuse to accept the case, unless the arbitration agreement is deemed invalid.

Where a dispute or claim of rights referred to in the preceding paragraph is referred to arbitration, the entire claim or dispute must be referred to arbitration, and all persons who have a cause of action based on the same facts giving rise to the dispute or claim or whose participation is necessary for the resolution of such dispute or claim, must comply with the arbitration. Disputes over the definition of shareholders and disputes over the issuer's register of shareholders need not be resolved by arbitration.

A claimant may elect for arbitration to be carried out at either the China International Economic and Trade Arbitration Commission (“**CIETAC**”) in accordance with its arbitration rules, or at the Hong Kong International Arbitration Centre (“**HKIAC**”) in accordance with its Securities Arbitration Rules (the “**Securities Arbitration Rules**”). Once a claimant refers a dispute or claim to arbitration, the other party shall submit to the arbitral body elected by the claimant. If the claimant elects for arbitration to be carried out at the HKIAC, any party to the dispute or claim may apply for a hearing to take place in Shenzhen in accordance with the Securities Arbitration Rules. According to the CIETAC Arbitration Rules which was amended on September 2, 2023 and implemented on January 1, 2024, CIETAC shall deal with economic and trading disputes over contractual or non-contractual transactions based on the agreement of the parties, including disputes involving Hong Kong based on the agreement of the parties. The CIETAC is established in Beijing and its branches and centers have been set up in Shenzhen, Shanghai, Tianjin, Chongqing, Zhejiang, Hubei, Fujian, Shanxi, Jiangsu, Sichuan, and Shandong.

Under the Arbitration Law and the Civil Procedure Law, an arbitral award is final and binding on the parties to the arbitration. If a party to the arbitration fails to comply with an arbitral award, the other party to the award may apply to the people’s court for its enforcement. A people’s court may refuse to enforce an arbitral award made by an arbitration commission if there is any irregularity on the procedures or composition of arbitrators specified by law, or if the award exceeds the scope of the arbitration agreement or is outside the jurisdiction of the arbitration commission.

A party seeking to enforce an arbitral award of a PRC arbitration tribunal against a party who, or whose property, is not within the PRC, may apply to a foreign court with jurisdiction over the case for enforcement. Similarly, an arbitral award made by a foreign arbitral body may be recognized and enforced by the PRC courts in accordance with the principle of reciprocity or any international treaty concluded or acceded to by the PRC. The PRC has acceded to the Convention on the Recognition and Enforcement of Foreign Arbitral Awards (the “**New York Convention**”) adopted on June 10, 1958, pursuant to a resolution of the SCNPC passed on December 2, 1986. The New York Convention provides that all arbitral awards made in a state which is a party to the New York Convention shall be recognized and enforced by other parties thereto, subject to their rights to refuse enforcement under certain circumstances, including where the enforcement of the arbitral award is against the public policy of that state. It was declared by the SCNPC simultaneously with the accession of the PRC that (i) the PRC will only recognize and enforce foreign arbitral awards on the principle of reciprocity and (ii) the PRC will only apply the New York Convention in disputes considered under PRC laws to arise from contractual and non-contractual mercantile legal relations.

An arrangement was reached between Hong Kong and the Supreme People’s Court for the mutual enforcement of arbitral awards. On June 18, 1999, the Supreme People’s Court adopted the *Arrangement Concerning Mutual Enforcement of Arbitral Awards between the Mainland and the Hong Kong Special Administrative Region*, which took effect on February 1, 2000. The above arrangement was amended by the *Supplemental Arrangement Concerning the Mutual*

*Enforcement of Arbitral Awards between the Mainland and the Hong Kong Special Administrative Region*, which was adopted by the Supreme People's Court and took effect on November 27, 2020. In accordance with this arrangement, awards made by mainland arbitral authorities under the Arbitration Law can be enforced in Hong Kong, and Hong Kong arbitral awards are also enforceable in the mainland.

### **Judicial Judgement and Its Enforcement**

On January 14, 2019, the Judicial Committee of the Supreme People's Court adopted the *Arrangement on Reciprocal Recognition and Enforcement of Judgments in Civil and Commercial Matters by the Courts of the Mainland and of the Hong Kong Special Administrative Region*, which came into effect on January 29, 2024 and seeks to establish a mechanism with greater clarity and certainty for recognition and enforcement of judgements in wider range of civil and commercial matters between Hong Kong and the mainland China. The arrangement discontinued the requirement for a choice of court agreement for bilateral recognition and enforcement. The arrangement further stipulates, among others, the scope and particulars of judgments, the procedures and methods of the application for recognition and enforcement, the review of the jurisdiction of the court that issued the original judgement, the circumstances where the recognition and enforcement of judgement shall be refused, and the approaches towards remedies for the reciprocal recognition and enforcement of judgements in civil and commercial matters between the courts in Mainland China and those in Hong Kong. Upon implementation of this arrangement, the *Arrangement on Reciprocal Recognition and Enforcement of Judgments in Civil and Commercial Matters by the Courts of the Mainland and of the Hong Kong Special Administrative Region Pursuant to Choice of Court Agreements between Parties Concerned*, adopted by the Judicial Committee of the Supreme People's Court on June 12, 2006 and effective from August 1, 2008, has been repealed.

This Appendix contains a summary of major provisions of the Articles of Association. This Appendix mainly provides potential investors with an overview on the Articles of Association. As it is only a summary, it does not contain all the information that may be important to potential investors.

### **SHARES AND REGISTERED SHARE CAPITAL**

The Company's shares shall be in the form of share certificates.

The issuance of the shares of the Company shall be conducted in the principle of openness, fairness and justness, and each share of the same class shall be entitled to equal rights.

For shares issued at the same time and within the same class, it shall be issued in the same conditions and price; and the price paid by any organization or individual for each share shall be the same.

### **INCREASE/DECREASE, REPURCHASE AND TRANSFER OF SHARES**

#### **Increase/Decrease of Shares**

The Company may, based on its operating and development needs and in accordance with laws and regulations and the resolution of any general meeting, increase its registered capital by the following methods:

- (i) a public offering of shares upon approval by the securities regulatory authority in the place where the shares of the Company are listed;
- (ii) a private issuance of shares;
- (iii) offering of bonus shares to existing shareholders;
- (iv) the conversion of reserve funds into share capital;
- (v) placement of new shares to existing shareholders; and
- (vi) any other methods provided in laws and administrative regulations and approved by the securities regulatory authorities in the place where the shares of the Company are listed.

The Company may reduce its registered capital. If the Company reduces its registered capital, it shall do so by the procedures set forth in the Company Law and other related requirements and the Articles of Association.

**Repurchase of Shares**

In accordance with applicable laws, administrative regulations, regulations of the authorities and the Articles of Association, the Company shall not purchase its own shares other than in any of the following circumstances:

- (i) reducing its registered capital;
- (ii) merging with another company which holds shares in the Company;
- (iii) utilizing the shares for employee stock ownership plan or equity incentive plan;
- (iv) acquiring its own shares at the request of its shareholders who vote at general meeting against a resolution regarding a merger or separation;
- (v) utilizing the shares for conversion of corporate bonds which are convertible into shares issued by a listed company;
- (vi) maintaining corporate value and shareholders' interests by the Company as and when necessary;
- (vii) such other circumstances as permitted by laws and administrative regulations.

The Company may repurchase its shares by an open centralized transaction method or other methods as permitted by laws and regulations, the CSCR and the securities regulatory authorities and the other securities exchange(s) in the place where the shares of the Company are listed, subject to compliance with the requirements prescribed by applicable laws, administrative regulations, regulations of the authorities and securities regulatory rules of the place where the shares of Company are listed.

The Company's repurchase of its own shares under the circumstance as stipulated in items (iii), (v) or (vi) of the preceding paragraph shall be conducted by an open centralized transaction method.

The Company's purchase of its own shares under the circumstance as stipulated in items (i) and (ii) of the preceding paragraph shall be subject to a resolution of the general meeting; the Company's purchase of its own shares under the circumstance as stipulated in items (iii), (v) or (vi) of the preceding paragraph may be subject to a resolution of the meeting of the Board of Directors with more than two thirds of Directors present, subject to compliance with the securities regulatory rules of the place where the shares of the Company are listed.

The shares acquired by the Company under the circumstance stipulated in item (i) hereof shall be cancelled within ten days upon the date of acquisition of shares; the shares shall be transferred or cancelled within six months if the repurchase of shares is made under the circumstances stipulated in either item (ii) or (iv); and the shares held in total by the Company after the repurchase under any of the circumstances stipulated in item (iii), (v) or (vi) shall not exceed 10% of the Company's total issued shares, and shall be transferred or cancelled within three years.

### **Transfer of Shares**

The shares of the Company held by promoters shall not be transferred within one year of the establishment of the Company. Shares issued prior to the public issuance of shares by the Company shall not be transferred within one year from the date the shares of the Company were listed and traded at the stock exchange.

Directors, Supervisors and the senior management members of the Company shall declare to the Company their shareholdings in the Company and any changes of such shareholdings; they shall not transfer more than 25% of the total shares they hold in the Company annually during their tenure; and they shall not transfer the shares they held within one year from the date on which the Company's shares are listed and traded at the stock exchange, nor within six months after their resignation from their positions with the Company.

If a Director, Supervisor or senior management member of the Company, or a shareholder holding more than 5% of the shares sells the shares of the Company or other securities with the nature of equity within six months after buying those shares, or buys the shares within six months after selling those shares, all the gains arising thereof shall belong to the Company, and such gains shall be collected by the Board of Directors of the Company. However, the following circumstances shall be excluded where a securities company underwrites unsold shares, thereby holding more than 5% of the shares or where the provisions of the CSRC are applicable. If listing rules of the stock exchange of the place(s) where the shares of the Company are listed provide otherwise on restrictions on transfers of shares, such rules shall prevail.

### **Shareholders and the General Meetings**

#### ***Shareholders***

The Company shall keep a register of shareholders according to the evidence provided by the share registrars. The register of shareholders shall be the sufficient evidence of the shareholders' shareholding in the Company. The original register of holders of H shares shall be maintained in Hong Kong and made available for shareholders' inspection, but the Company may suspend the registration of shareholders in accordance with applicable laws and regulations and the requirements of the securities regulatory rules of the place where the shares of the Company are listed. Shareholders have rights and assume obligations in proportion to the class of shares they hold; Shareholders who hold the same class of shares shall enjoy equal rights and assume the same obligations.

The shareholders of the Company shall be entitled to the following rights:

- (i) to be entitled to dividends and other forms of distribution in proportion to the number of shares held;
- (ii) the right to propose, convene and preside over, to attend or appoint a proxy to attend general meetings and to exercise the corresponding voting rights in accordance with laws, unless individual shareholders are required by the securities regulatory rules of the place where the shares are listed or applicable laws and regulations to abstain from voting on individual matters;
- (iii) to supervise and manage the business activities of the Company and to put forward proposals or raise inquiries;
- (iv) to transfer, donate, or pledge shares held by them in accordance with the laws, administrative regulations and provisions of the Articles of Association;
- (v) to review the Articles of Association, the register of shareholders, corporate bond stubs, minutes of general meeting, resolutions of the Board of Directors, resolutions of the Supervisory Committee and financial and accounting reports;
- (vi) upon termination or liquidation of the Company, to participate in the distribution of remaining assets of the Company in accordance with the number of shares held;
- (vii) with respect to shareholders who vote against any resolution adopted at the general meeting on the merger or division of the Company, to require the Company to acquire the shares held by them;
- (viii) other rights conferred by laws, administrative regulations, regulations of the authorities, the securities regulatory rules of the place where the shares of the Company are listed and the Articles of Association.

If the procedures for convening, or the method of voting at a general meeting or the Board of Directors are in breach of laws, administrative regulations and the Articles of Association, or the content of a resolution violates the Articles of Association, shareholders shall have the right to petition the People's Court to revoke the resolution within 60 days from the date of the adoption of such resolution.

The shareholders of the Company shall assume the following obligations:

- (i) to abide by laws, administrative regulations and the Articles of Association;
- (ii) to pay subscription monies according to the number of shares subscribed and the method of subscription;

- (iii) not to surrender the shares unless required by the laws and regulations;
- (iv) not to abuse the shareholder's rights so as to damage the interests of the Company or those of any other shareholders; not to abuse the independent legal person status of the Company and the limited liability owed by the shareholders so as to damage the interests of the Company's creditors;
- (v) other obligations imposed by laws, administrative regulations and the Articles of Association.

Where shareholders of the Company abuse their shareholders' rights and thereby causing loss to the Company or other shareholders, such shareholders shall be liable for indemnity in accordance with laws.

Where shareholders of the Company abuse the Company's status as an independent legal entity and the limited liability owed by the shareholders for the purposes of evading from making debt repayments, thereby materially impairing the interests of the creditors of the Company, such shareholders shall be jointly and severally liable for the debts owed by the Company.

#### **General Provisions on the General Meetings**

The general meetings shall be the organ of power of the Company and shall exercise the following duties and powers according to laws:

- (i) to decide on the operating guidelines and investment plans of the Company;
- (ii) to elect and replace the Directors and Supervisors which are not appointed as representatives of the employees, and to decide on the remuneration of the relevant Directors and Supervisors;
- (iii) to consider and approve reports of the Board of Directors;
- (iv) to consider and approve reports of the Supervisory Committee;
- (v) to consider and approve the Company's annual financial budgets and final accounts;
- (vi) to consider and approve the Company's profit distribution plans and plans for making up losses;
- (vii) to consider and approve adjustment or change to the Company's profit distribution policy;
- (viii) to decide on increases or reductions in the Company's registered capital;

- (ix) to make resolution on the issuance of corporate bonds;
- (x) to make resolutions on the merger, demerger, spin-off, liquidation or change of corporate form of the Company;
- (xi) to amend the Articles of Association;
- (xii) to make resolutions on the issue of appointment, dismissal or non-reappointment of accounting firms;
- (xiii) to examine and approve the guarantee issues as prescribed in Article 44 of the Articles of Association;
- (xiv) to consider any matters on the acquisition or disposal of a substantial assets during a year, which involves an amount exceeding 30% of the latest audited total assets of the Company for the most recent period;
- (xv) to examine and approve matters relating to the change of purpose of raised fund;
- (xvi) To examine equity incentive plan and employee stock ownership plan;
- (xvii) to examine the connected transactions between the Company and connected parties (except for the Company's provision of guarantees, donated cash assets, and debts that are simply reduced or exempted from the obligations of the listed company) exceeds RMB30 million and represents more than 5% of the absolute value of the Company's latest audited net assets, and other connected transactions subject to the general meeting for deliberation in accordance with the securities regulatory rules of the place where the shares of the Company are listed;
- (xviii) to examine the proposals of the shareholders, individually or in the aggregate, holding 3% or more of the voting shares of the Company;
- (xix) to examine other matters required by laws, administrative regulations, regulations of the authorities, securities regulatory rules of the place where the shares of the Company are listed and the Articles of Association, to be resolved by the general meeting.

The following external guarantees of the Company shall be considered and approved by the general meeting:

- (i) any single guarantee of which the amount exceeds 10% of the audited net assets for the latest financial year;
- (ii) any guarantee provided after the total amount of the external guarantees provided by the Company and its subsidiaries reaches or exceeds 50% of the audited net assets for the latest financial year;

- (iii) any guarantee provided after the total amount of the external guarantees provided by the Company and its subsidiaries exceeds 30% of the audited total assets for the latest financial year;
- (iv) any guarantee whose amount exceeds 30% of the Company's latest total audited assets according to the principle of cumulative calculation of guarantee amount for 12 consecutive months;
- (v) any guarantee provided to the guaranteed object with a debt-to-asset ratio of more than 70% as indicated by the data in the latest financial statements;
- (vi) any guarantee provided to shareholders, actual controllers and their related parties; and
- (vii) any other guarantees provided by laws, administrative regulations, rules and regulations, securities regulatory rules of the place where the shares of the Company are listed or other regulatory documents or the Articles of Association.

For guarantee matters within the scope of authorization of the Board of Directors, in addition to the approval of more than half of all Directors, the approval of over two-thirds of the Directors present at the meeting of the Board of Directors shall be required. The guarantee set out in item (iv) above shall be approved by more than two thirds of voting rights held by shareholders present at the meeting.

Shareholders' general meetings include annual general meetings and extraordinary general meetings. The annual general meeting shall be held once every year within six months after the end of the previous accounting year.

The Company shall hold an extraordinary general meeting within two months from the date of occurrence of any of the following circumstances:

- (i) the number of Directors is less than that prescribed by the Company Law or less than the two thirds of the amount required by the Articles of Association;
- (ii) the uncovered losses are in excess of one-third of the Company's total paid-in share capital;
- (iii) shareholders individually or collectively holding 10% (including 10%) of the Company's shares request in writing;
- (iv) the Board of Directors considers it necessary;
- (v) the Supervisory Committee proposes to hold such a meeting;
- (vi) more than two independent Directors propose to convene the meeting;
- (vii) such other circumstances as provided for by laws, administrative regulations, regulations of the authorities, securities regulatory rules of the place where the shares of the Company are listed and the Articles of Association.

**Convening of the General Meetings**

Independent Directors shall have the right to propose to the Board of Directors to convene extraordinary general meetings. When an independent Director proposes to convene an extraordinary general meeting, the Board of Directors shall issue written feedback on consent or non-consent to the convening of the extraordinary general meeting within 10 days from the receipt of the proposal according to the laws, administrative regulations and the Articles of Association. If the Board of Directors gives consent to convene an extraordinary general meeting, it shall, within five days from the passing of the Board of Directors resolution, issue a notice on convening the general meetings. If the Board of Directors does not give consent to convene an extraordinary general meeting, the Board of Directors shall state the reason and issue an announcement.

The Supervisory Committee shall have the right to propose the convening of extraordinary general meetings and submit such proposal in writing to the Board of Directors. In accordance with the laws, administrative regulations and the Articles of Association, the Board of Directors shall issue written feedback on consent or non-consent to the convening of the extraordinary general meetings within 10 days from the receipt of the proposal. If the Board of Directors gives consent to convene an extraordinary general meeting, it shall, within five days from the passing of the Board of Directors resolution, issue a notice on convening the general meetings. Any changes to the original proposal in the notice shall obtain the consent of the Supervisory Committee. If the Board of Directors does not give consent to convene an extraordinary general meeting or does not issue feedback within 10 days from the receipt of the proposal, the Board of Directors shall be deemed as unable to perform or failed to perform the duties of convening a general meeting. In such cases, the Supervisory Committee may proceed to convene and chair the meeting on its own.

Shareholders that, either individually or jointly, hold over 10% of shares of the Company have the right to propose to the Board of Directors for the convening of an extraordinary general meeting, and such proposal shall be made in writing to the Board of Directors and explain the topic of the meeting. The Board of Directors shall, in accordance with laws, administrative regulations, and the Articles of Association, provide a written feedback within 10 days after receiving the proposal with respect to whether it agrees with the proposal to convene an extraordinary general meeting. In event that the Board of Directors agrees to convene an extraordinary general meeting, a notice of the general meeting shall be provided within five days of such resolution by the Board of Directors. Alterations to the original proposals in the notice shall be approved by the relevant shareholders. In the event that the Board of Directors disagrees with the convening of an extraordinary general meeting, or fails to provide any feedback within 10 days after receiving the proposal, shareholders that, either individually or jointly, hold over 10% of shares of the Company have the right to propose to the Supervisory Committee for the convening of an extraordinary general meeting, and such proposal shall be made in writing to the Supervisory Committee. In event that the Supervisory Committee agrees to convene an extraordinary general meeting, a notice of the general meeting shall be issued within five days of receipt of such request. Alterations to the original proposals in the notice shall be approved by the relevant shareholders. In event that the Supervisory

Committee did not provide a notice of the general meeting within the specified timeframe, the Supervisory Committee shall be considered to be unwilling to convene and preside over the general meeting. The shareholders that, either individually or jointly, hold over 10% of shares of the Company for a period of 90 consecutive days or more may at their sole discretion convene and preside over the extraordinary general meeting.

Where the Supervisory Committee or shareholders decide to convene a general meeting on its/their own, it/they shall notify the Board of Directors in writing and file relevant evidential documents with the Shanghai Stock Exchange. The Shareholders who convene the general meeting shall hold no less than 10% shares of the Company when any resolution is made at such meeting. The Supervisory Committee or the convening shareholders shall, when the notice of general meeting or announcement of resolutions of general meeting is issued, submit relevant evidential documents to the authority appointed by CSRC in the location of the Company and the Shanghai Stock Exchange.

For the general meetings convened by the Supervisory Committee or shareholders, the Board of Directors and the secretary of the Board of Directors shall cooperate. The Board of Directors shall provide the register of shareholders as at the date of record. Where the Board of Directors fails to provide the register of shareholders, the convener(s) may apply to the securities registration and clearing institution for such a register of shareholders with the announcement relating to the notice of convening the general meeting. The register of shareholders obtained by the convener shall not be used for any purpose other than convening a general meeting.

### **Proposals and Notices of the General Meeting**

The contents of the general meeting proposals shall be within the scope of powers of the general meeting and such proposals shall have precise agenda and specific matters to be resolved, and be in compliance with the relevant provisions of laws, administrative regulations and securities regulatory rules of the place where the shares of the Company are listed and the Articles of Association.

As a general meeting is convened, the Board of Directors, Supervisory Committee and any of the shareholders individually or jointly holding more than 3% of the shares of the Company may propose any resolution to the Company. Any of the shareholders individually or jointly holding more than 3% of the shares of the Company may submit an interim proposal in writing to the convener at least 10 days prior to the convention of the general meeting. If the proposal meets the requirements of Article 54 of the Articles of Association, the convener shall issue a supplemental notice to the general meeting within two days upon receipt of such proposal and announce the contents of the extraordinary resolution. If, according to the securities regulatory rules of the place where the shares of the Company are listed, the general meeting needs to be postponed due to the publication of a supplementary notice of the general meeting, the convening of the general meeting shall be postponed in accordance with the securities regulatory rules of the place where the shares of the Company are listed.

The convener shall notify all shareholders in writing (including announcement) 21 days prior to the annual general meeting, and 15 days prior to an extraordinary general meeting. When calculating the interval between the notice of the general meeting and the date of the meeting, it should not include the day of the meeting, but include the day the notice is issued.

The notice of the general meeting shall contain the following details:

- (i) the time, venue and duration of the meeting;
- (ii) matters and proposals to be considered at the meeting;
- (iii) contain a conspicuous statement that all shareholders are entitled to attend the general meeting and may appoint a proxy in writing to attend and vote on his/her behalf at the meeting, and that a proxy need not be a shareholder of the Company;
- (iv) the date of registration of equity entitlements for shareholders entitled to attend the general meeting;
- (v) it shall contain the names and telephone numbers of permanent contact persons for the affairs of the meeting;
- (vi) the time and procedures for voting online or by other means;
- (vii) other requirements stipulated by laws, administrative regulations, departmental regulations, securities regulatory rules of the place where the shares of the Company are listed and the Articles of Association.

The notice of the general meeting and its supplementary notice shall include other matters prescribed by securities regulatory rules of the place where the shares of the Company are listed or the Articles of Association and shall fully and completely disclose the specific contents of all proposals. If any matter to be discussed requires opinions of the independent Directors, the opinions and reasons of the independent Directors shall be disclosed together with the issuance of such notice and its supplementary notice.

### **Holding of the General Meeting**

Any shareholder in the register of shareholders on the record date or his proxy shall be entitled to attend the general meeting, and have the right to vote pursuant to the laws, regulations, and the Articles of Association. Shareholders can attend the general meeting in person or appoint proxies to attend and vote on their behalf. Such proxy needs not necessarily be a shareholder of the Company.

Individual shareholders attending the meeting in person shall present their identity cards or other valid documents or certificates, or stock account cards as a proof of their identities. Proxies attending the meeting on behalf of shareholders shall present their valid identity cards and power of attorney.

A corporate shareholder shall attend the meeting by its legal representative or by proxies appointed by the legal representative. The legal representative present at the meeting shall produce his/her identity card and valid proof showing his/her status, and the proxy present at the meeting shall present his/her identity card and the power of attorney in writing issued by the legal representative in accordance with laws, except for shareholders who are recognized clearing houses and their nominees as defined by relevant regulations or securities regulatory rules of the place where the shares of the Company are listed, which may come into effect from time to time under Hong Kong laws.

The power of attorney issued by a shareholder to appoint a proxy to attend general meeting shall specify:

- (i) the name of the proxy;
- (ii) whether or not the proxy has any voting right;
- (iii) directive to vote for or against or abstain from voting on each and every issue included in the agenda of the general meeting;
- (iv) the date of issue and validity period of the power of attorney;
- (v) signature (or seal) of the principal; If the principal is a corporate shareholder, it shall be stamped with the seal of the legal person or signed by a legally authorized person.

Any form issued to a shareholder by the Board of Directors for use by him for appointing a proxy shall allow the shareholder to freely instruct the proxy to vote in favour of or against each resolution and to give instructions on the matters to be voted on in respect of each question at the meeting. Such form shall contain a statement that, in the absence of instructions by the shareholder, his proxy may vote as he thinks fit.

If the power of attorney for voting by proxy is signed by the authorized person of the principal, the power of attorney for signing or other authorization documents shall be notarized. The notarized the power of attorney or other authorization documents and the power of attorney for voting by proxy shall be placed at the domicile of the Company or other place specified in the meeting.

If the principal is a legal person, its legal representative or the person authorized by the Board of Directors or other decision-making authorities shall attend the general meeting of the Company as a representative.

If a shareholder is recognized as a clearing house (or its nominee), the shareholder is entitled to authorize one or more person(s), as it thinks fit, to act as its proxy at any general meeting or creditors' meeting. However, if more than one person is authorized, the power of attorney shall set out the number and class of shares represented by each of the persons so authorized. The power of attorney shall be signed by the authorized personnel of the recognized clearing house. A person so authorized may exercise rights (without presenting any share certificate, notarized authorization and/or other evidence indicating that he/she has been duly authorized), and must have the same legal rights as other shareholders, including the right to speak and vote, on behalf of the recognized clearing house (or its nominee), as if he/she was an individual shareholder of the Company.

When a general meeting is convened, the Directors, Supervisors and the secretary to the Board of Directors of the Company shall attend the meeting, and the President and other senior management members shall be present at the meeting. Subject to the securities regulatory rules of the place where the shares of the Company are listed, the aforementioned persons may attend or be present at the meeting via internet, video, telephone or other means with equivalent effect.

Shareholders' general meetings shall be convened by the Board of Directors in accordance with laws, and the general meeting shall be presided over by Chairman of the Board of Directors. Where the Chairman of the Board of Directors is unable or fails to perform the duty, the meeting shall be presided over by a Co-Chairman (if any) jointly elected by a simple majority of the Directors if the Company has two or more Co-Chairmen; When Co-Chairman of the Board of Directors is unable or fails to perform the duty, the meeting shall be presided over by the Deputy Chairman (if any) jointly elected by a simple majority of the Directors if the Company has two or more Deputy Chairmen. Where the Deputy Chairman of the Board of Directors is unable or fails to perform the duty, a Director jointly elected by more than half of the Directors will preside over the meeting. A general shareholders' meeting convened by the Supervisory Committee itself shall be presided over by the Chairman of the Supervisory Committee. Where the Chairman of the Supervisory Committee is unable or fails to perform the duty, the Deputy Chairman of the Supervisory Committee (if any) shall preside over the meeting, and when the Deputy Chairman of the Supervisory Committee is unable or fails to perform the duty, a Supervisor jointly elected by more than half of the Supervisors shall preside over the meeting. A general meeting convened by the shareholders themselves shall be presided over by a representative elected by the conveners. If, for any reason, the conveners are unable to elect a representative as a presider to preside over the meeting, the shareholders holding the most voting shares among the conveners (including proxies) shall act as the presider to preside over the meeting.

In the event that the general meeting cannot proceed due to violation of the rules of procedure by the presider of the meeting, the general meeting may appoint one person as the presider of the meeting upon consent of a simple majority of the voting shareholders present at the meeting and continue the meeting.

**Voting of the General Meeting**

Resolutions of the general meeting shall be divided into ordinary resolutions and special resolutions. An ordinary resolution must be passed by votes representing a simple majority of the voting rights represented by the shareholders (including proxies) present at the meeting. A special resolution must be passed by votes representing more than two-thirds of the voting rights represented by the shareholders (including proxies) present at the meeting.

The following matters shall be resolved by an ordinary resolution at a general meeting:

- (i) the work report of the Board of Directors and the Supervisory Committee;
- (ii) the profit distribution plan and plan for covering losses formulated by the Board of Directors;
- (iii) the connected transaction matters subject to the general meeting for deliberation;
- (iv) the election and removal of members of the Board of Directors and the Supervisory Committee and their remunerations and the method of payment thereof;
- (v) the Company's annual financial budgets and final accounts plans;
- (vi) make resolutions on the engagement, re-engagement or dismissal of the accounting firm or the remuneration of the accounting firm by the Company;
- (vii) the annual reports of the Company;
- (viii) other matters requiring approval by special resolutions in accordance with laws, administrative regulations, requirements of the securities regulatory rules of the place where the shares of the Company are listed or the Articles of Association.

The following matters shall be resolved by a special resolution at a general meeting:

- (i) increase or reduction in the registered capital of the Company and issue any type of shares, warrants, and other similar securities;
- (ii) issuance of corporate bonds;
- (iii) division, merger, change of the corporate form, dissolution and liquidation of the Company (including voluntary liquidation of the Company);
- (iv) amendments to the Articles of Association;

- (v) any purchase or disposal of substantial assets made or guarantee provided by the Company within one year, the amount of which exceeds 30% of the latest audited total assets of the Company;
- (vi) adjustment or amendment of profit distribution policy;
- (vii) repurchase of shares of the Company;
- (viii) equity incentive plan;
- (ix) any other matters as required by laws, administrative regulations, securities regulatory rules of the place where the shares of the Company are listed or the Articles of Association and matters which, if resolved by way of an ordinary resolution at a general meeting, will have a material impact on the Company and need be adopted by way of special resolutions.

A shareholder (including proxies) when voting at a general meeting may exercise voting rights in accordance with the number of shares carrying the right to vote. Each share shall have one voting right.

For significant matters to be decided in general meetings that would affect the interests of medium and small investors, the votes by medium and small investors shall be counted separately. The result of such separate vote counting shall be timely disclosed.

The shares of the Company held by itself have no voting rights and shall not be counted into the total number of shares carrying voting rights at the general meeting.

If a shareholder purchases the shares of the Company with voting rights in violation of the provisions of paragraphs 1 and 2 of Article 63 of the Securities Law, the voting rights of shares exceeding the prescribed proportion shall not be exercised within 36 months after the purchase, and shall not be counted into the total number of shares carrying voting rights at the general meeting.

If any shareholders should give up the voting right for certain proposal or are restricted to be only able to vote for or against certain proposal in accordance with the provisions of applicable laws and regulations and the Hong Kong Listing Rules, the votes by those shareholders or their representatives shall not be counted in case of any violation of the relevant provisions or restriction.

The Board of Directors of the Company, independent Directors, shareholders holding more than one percent of the shares with voting rights or investor protection institutions established according to laws, administrative regulations or provisions of the CSRC may publicly solicit voting rights from the shareholders. Such information as the specific vote intention shall be sufficiently disclosed to the solicited persons in respect of solicitation of the

shareholders' right to vote. It is not permitted to solicit the shareholders' right to vote in a chargeable or disguised chargeable manner. Saving for statutory conditions, the Company shall not impose restriction on minimum shareholding proportion against solicitation of voting rights.

When a connected transaction is considered at a general meeting, the connected shareholders shall not participate in casting votes and the number of shares with voting rights represented by them shall not be counted in the total number of valid votes. The announcement of the resolutions of the general meeting shall fully disclose the voting status of the non-connected shareholders. Such connected transaction shall be voted by the non-connected shareholders attending the meeting on a poll, with the consent of more than half of the valid voting rights of the non-related shareholders who voted at the meeting; if such transaction falls within the scope of a special resolution, it shall be approved by more than two-thirds of the valid voting rights held by the shareholders (including proxies of shareholders) attending the general meeting. If any shareholders should give up the voting right for certain proposal or are restricted to be only able to vote for or against certain proposal in accordance with the provisions of applicable laws and regulations and the Hong Kong Listing Rules, the votes by those shareholders or their representatives shall not be counted in case of any violation of the relevant provisions or restriction.

## **BOARD OF DIRECTORS**

### **Directors**

The Directors of the Company shall include executive Directors, non-executive Directors and independent Directors. The Directors of the Company shall be natural persons. Person falling under any of the following circumstances may not act as the Directors of the Company:

- (i) a person who is unable or has limited ability to undertake any civil liabilities;
- (ii) a person who has been convicted of an offense of bribery, corruption, embezzlement or misappropriation of property, or the destruction of socialist market economy order; or who has been deprived of his political rights due to his crimes, in each case where less than five years have elapsed since the date of completion of the sentence;
- (iii) a person who has been a former director, factory manager or manager of a company or an enterprise that has entered into insolvent liquidation and who was personally liable for the insolvency of such company or enterprise, where less than three years have elapsed since the date of the completion of the bankruptcy and liquidation of the company or enterprise;
- (iv) a person who has been a legal representative of a company or an enterprise that has had its business license revoked due to violations of the law and has been ordered to close down by law and the person was personally responsible, where less than three years have elapsed since the date of such revocation;

- (v) a person who is liable for a relatively large amount of debts that are overdue;
- (vi) a person who has been barred from the securities market by the CSRC for a certain period of time and such period has not expired yet;
- (vii) any other circumstances stipulated by applicable laws, administrative regulations, regulations of the authorities, or requirements under the listing rules of the place where the shares of the Company are listed.

Directors shall be elected or replaced by the general meeting, and may further be removed from their office prior to the conclusion of the term thereof by the general meeting. The term of office of a Director shall not be more than three years, which is renewable upon re-election.

The tenure of a Director shall be from the date of appointment to the expiry of tenure of the current Board of Directors. If a Director's tenure expires but a re-elected Director is not elected in time, then before the re-elected Director holding office, the original Director shall still perform the duties as Director, in accordance with applicable laws, administrative regulations, regulations of the authorities and the Articles of Association.

Directors may be concurrently held by the President or other senior management members, but the total number of Directors concurrently serving as the President or other senior management members shall not exceed one half of the total number of Directors of the Company.

It is unnecessary for Directors to hold shares of the Company.

A Director may propose resignation before expiry of tenure, by filing a resignation report in writing to the Board of Directors. The Board of Directors will disclose the relevant information in a timely manner in accordance with the provisions of the securities regulatory rules of the place where the shares of the Company are listed. If the resignation of a Director causes the number of Board of Directors members to be less than the quorum, and would result in the proportion of independent Directors on the Board of Directors or its special committees not in compliance with the provisions of laws and regulations or the Articles of Association, or if there is a lack of accounting professionals among the independent Directors, then the original Director shall still perform the duties as Director under the applicable laws, administrative regulations, regulations of the authorities and the Articles of Association before the re-elected Directors take office. Otherwise, a Director's resignation shall be effective from the time such resignation report is delivered to the Board of Directors.

**Board of Directors**

The Company shall establish a Board of Directors, who shall be accountable to the general meeting. The Board of Directors of the Company shall comprise nine members, and the number of independent Directors shall not be less than one-third.

The Board of Directors shall exercise the following powers and duties:

- (i) to convene the general meeting and to report on its work to the general meeting;
- (ii) to implement the resolutions adopted by the general meeting;
- (iii) to determine the Company's business plans and investment plans;
- (iv) to formulate the Company's plans for annual financial budgets and final accounts;
- (v) to formulate the Company's profit distribution plans and plans to cover losses;
- (vi) to formulate the plans for the increase or reduction of the Company's registered capital and the plans for the issuance of the Company's bonds or other securities and listing plans;
- (vii) to draft the plans for major acquisitions, repurchases of the Company's shares or merger, division, dissolution or change of the corporate form of the Company;
- (viii) to determine, within the scope authorized by the general meeting, such matters as the Company's external investments, the purchase and sale of assets, asset mortgages, external guarantees, entrusted wealth management, related-party transactions and external donations;
- (ix) to decide on the establishment of the Company's internal management organizations;
- (x) to appoint or remove the Company's President, the secretary of the Board of Directors, and, according to the nomination of the President, to appoint or remove the senior management members of the Company, such as the Vice President and chief financial officer and decide on matters relating to their remuneration and rewards;
- (xi) to formulate and amend the Company's basic management policy;
- (xii) to formulate the plans for the amendment of the Articles of Association;
- (xiii) to manage the Company's information disclosure;

- (xiv) to propose to the general meeting the appointment or replacement of an accounting firm that performs audits for the Company;
- (xv) to listen to the work report of the President of the Company and inspect the work of the President;
- (xvi) Other powers and duties conferred by laws, administrative regulations, regulations of the authorities, securities regulatory rules of the place where the shares of the Company are listed, or the Articles of Association.

The Board of Directors shall have the right to dispose of, guarantee, make external investment, finance, engage in connected transactions, and make external donations within a certain limit, subject to compliance with the securities regulatory rules of the place where the shares of Company are listed. The Board of Directors shall abide by the principles of legality, compliance, prudence, and safety when exercising the above-mentioned rights, establish strict review and decision-making procedures, and organize relevant experts and professionals to review major investment projects, and submit them to the general meeting for approval. The specific approval authority of the Board of Directors is as follows:

- (i) the disposal of assets other than those that require approval by the general meeting as stipulated in Article 43 of the Articles of Association refers to the purchase, sales, and restructuring of creditor's rights and debts;
- (ii) external investments with a total amount not exceeding 30% of the Company's latest audited total assets within a complete accounting year, including equity investments, bond investments, entrusted wealth management, entrusted loans, and other legally compliant corporate investment activities;
- (iii) financing that does not exceed 60% of the audited net assets of the previous year within a complete accounting year, which refers to the Company's bond financing to financial institutions and other enterprises (but does not include issuing bonds);
- (iv) external guarantees other than those listed in Article 44 of the Articles of Association (including but not limited to asset mortgages, pledges, guarantees, etc.);
- (v) connected transactions between the Company and its affiliated natural persons with a transaction amount of over RMB300,000 (excluding external guarantees), and related party transactions with affiliated legal persons with a transaction amount of over RMB3 million and accounting for more than 0.5% of the absolute value of the Company's latest audited net assets (excluding external guarantees) within a complete accounting year.

When exercising the above-mentioned powers and duties, the Board of Directors shall comply with relevant laws, regulations, rules, and the Rules Governing the Listing of Shares on the Shanghai Stock Exchange and Hong Kong Listing Rules. Subject to compliance with the listing rules of the place where the shares of Company are listed, the Board of Directors may authorize the Chairman, the President or the related internal institutions to make decisions and exercise the aforementioned powers and duties of the Board of Directors as stipulated in the Articles of Association during its closing period. The specific decision-making authority shall be clarified by the resolution of the Board of Directors or relevant rules and regulations of the Company.

The Board of Directors shall have one Chairman and may have Co-Chairman and Deputy Chairman according to the needs of the work. The Chairman, the Co-Chairman and the Deputy Chairman shall be elected or removed by more than half of all the Directors for a term of three years and shall be re-elected and re-appointment upon expiration.

The Chairman shall exercise the following powers and duties:

- (i) presiding over general meeting, convening and presiding over meetings of the Board of Directors;
- (ii) supervising and inspecting the implementation of resolutions of the Board of Directors;
- (iii) signing the shares, corporate bonds and other securities of the Company;
- (iv) signing important documents of the Board of Directors and other documents that should be signed by the Company's legal representative;
- (v) exercising the powers and duties of the legal representative;
- (vi) in the event of a force majeure emergency such as a catastrophic natural disaster, exercise the special right to dispose of the Company's affairs in accordance with laws, regulations, securities regulatory provisions of the place where the shares of the Company are listed and the interests of the Company, and report to the Board of Directors of the Company and general meeting afterwards;
- (vii) other powers and duties granted by the Board of Directors.

The Co-Chairman and Deputy Chairman of the Company assist the Chairman in his work. Where the Chairman is unable or fails to perform its duties, such duties shall be performed by the Co-Chairman (if the Company has two or more Co-Chairmen, such duties shall be performed by the Co-Chairman jointly elected by a simple majority of Directors); if the Co-Chairman is unable or fails to perform such duties, such duties shall be performed by Deputy Chairman (if the Company has two or more Deputy Chairmen, such duties shall be performed by the Deputy Chairman jointly elected by a simple majority of Directors); if the Deputy Chairman is unable or fails to perform such duties, such duties shall be performed by a Director jointly elected by a simple majority of Directors.

The Board of Directors shall hold at least one meeting every quarter, convened by the Chairman, and notify all Directors and Supervisors in writing 14 days before the meeting is held. Shareholders representing more than one tenth of the voting rights, or more than one-third of the Board of Directors or Supervisory Committee, may propose to convene an extraordinary general meeting of the Board of Directors. The Chairman shall convene and preside over the meeting of the Board of Directors within 10 days after receiving the proposal. The Chairman may also convene and preside over extraordinary general meetings of the Board of Directors when deemed necessary.

Notice of extraordinary general meeting of the Board of Directors may be delivered by notice in writing (include by hand, via facsimile), telephone, e-mail or SMS notification. The notification deadline is three days before the meeting is held. However, in case of emergency, where an extraordinary general meeting of the Board of Directors is required to be convened as soon as possible, the notice of such meeting may be issued by phone or other oral methods at any time. An extraordinary general meeting of the Board of Directors may be convened at any time on the premise of notifying all Directors, and an explanation of the emergency shall be made at the meeting by the convener.

Meetings of the Board of Directors shall be held only if more than half of the Directors are present. Any resolutions of the Board of Directors must be subject to adoption by a simple majority of all Directors. Each Director shall have one vote for the resolutions of the Board of Directors.

If Directors have associated relationship with enterprises involved in issues to be determined in the extraordinary general meeting of the Board of Directors, such Directors shall not exercise the voting power on the resolution or exercise the voting power on behalf of other Directors. The meeting of the Board of Directors may be held with over one-half Directors without associated relationship, and the resolutions of the meeting of the Board of Directors shall be approved by over one-half Directors without associated relationship. If the unassociated Directors attending the meeting of the Board of Directors are less than 3 people, the issues shall be submitted to the general meetings for examination. If a substantial shareholder or a Director has a conflict of interest in a matter to be considered by the Board of Directors which the Board of Directors has determined to be material, the matter shall be dealt with by convening a physical meeting of the Board of Directors rather than a written resolution. Independent non-executive Director who, and whose close associates, have no material interest in the transaction should be present at that the meeting of the Board of Directors. If there are any additional restrictions on Directors' participation in meeting of the Board of Directors and voting imposed by laws, regulations and securities regulatory rules of the place where the shares of the Company are listed, such provisions shall prevail.

Resolutions to be adopted at the meeting of the Board of Directors shall be voted by a show of hands or in writing. Unless otherwise provided by the securities regulatory rules of the place where the shares of the Company are listed and the Articles of Association, the extraordinary general meetings of the Board of Directors may, under the premise that Directors will be guaranteed to have their opinions fully and thoroughly expressed, be conducted via facsimile or other communication and resolutions may be passed thereat, to be signed by the Directors present at the meeting.

The Directors shall attend in person the meetings of the Board of Directors. Where any Director who cannot attend for reasons may entrust another Director in writing to attend and vote on his/her behalf. The power of attorney shall specify the name of the agent, the matters to be represented, the scope of authorization, and the period of validity, and shall be signed or stamped by the principal. The Directors who attend the meeting on behalf shall exercise the rights as Directors within the scope of authorization. Failure by a Director to attend a meeting of the Board of Directors or to authorize a representative to attend the meeting on his/her behalf shall be deemed waiver of the voting right at such meeting.

#### **PRESIDENT AND OTHER SENIOR MANAGEMENT MEMBERS**

The Company shall have one President, who shall be appointed or dismissed by the Board of Directors. The Company shall have several Vice Presidents, who shall be appointed or dismissed by the Board of Directors.

Article 99 of the Articles of Association on the duty of loyalty of Directors and Article 100 (iv) to (vi) on the duty of diligence are also applicable to senior management members.

The term of office of the President is three years and the President can renew his term of office through re-election.

The President of the Company shall be accountable to the Board of Directors and shall exercise the following powers:

- (i) to preside over the operation and management of the Company and report to the Board of Directors;
- (ii) to organize the implementation of the Company's annual operation plans and investment plans;
- (iii) to draft the plan for the establishment of the Company's internal management organizations;
- (iv) to draft the basic management policy of the Company;
- (v) formulate the salary, welfare, rewards and punishments of the Company's employees, and decide on the employment and dismissal of the Company's employees;
- (vi) to formulate specific rules and regulations of the Company;
- (vii) to propose to the Board of Directors on the appointment or dismissal of the Company's other senior management members including Vice President and chief financial officer;

(viii) to determine to appoint or dismiss the management personnel except for those who should be appointed or dismissed by the Board of Directors;

(ix) such other powers granted by the Articles of Association or the Board of Directors.

The President of the Company shall attend meetings of the Board of Directors.

The senior management members of the Company shall faithfully perform their duties and safeguard the best interests of the Company and all shareholders. If the senior management members of the Company fail to faithfully perform their duties or violates the duty of good faith, causing damage to the interests of the Company and the shareholders of the public shares, they shall be liable for compensation in accordance with laws.

## **SUPERVISORY COMMITTEE**

### **Supervisors**

The Directors, the President and other senior management members shall not act concurrently as Supervisors.

Supervisors shall abide by laws, administrative regulations and the Articles of Association, have a duty of loyalty and diligence to the Company, and shall be prohibited from abusing their authority in accepting bribes or other unlawful income and from misappropriating the Company's properties.

The term of office of Supervisors shall be three years renewable upon re-election and re-appointment.

Where a Supervisor fails to be re-elected in a timely manner upon the expiration of his or her term of office, or where a Supervisor resigns during his or her term of office, resulting in a lower than the quorum of the Supervisory Committee, the original Supervisor shall still perform his or her duties as a Supervisor in accordance with the provisions of laws, administrative regulations, and the Articles of Association before a re-elected Supervisor takes office.

### **Supervisory Committee**

The Company shall have a Supervisory Committee. The Supervisory Committee shall be composed of 3 Supervisors. The Supervisory Committee shall have one Chairman and shall have a Deputy Chairman according to the needs of the work. The Chairman and the Deputy Chairman of Supervisory Committee shall be elected by a simple majority of all Supervisors. The Chairman of the Supervisory Committee convenes and presides over a meeting of the Supervisory Committee, and if the Chairman of the Supervisory Committee is unable to perform his or her duties or fails to perform his or her duties, the Deputy Chairman of the Supervisory Committee shall convene and preside over the meeting of the Supervisory

Committee, and if the Deputy Chairman of the Supervisory Committee is unable to perform his duties or fails to perform his or her duties, a simple majority of Supervisors shall jointly nominate one of the Supervisors to convene and preside over the meeting of the Supervisory Committee.

The Supervisory Committee shall be composed of Supervisors who are either Shareholder representatives or an appropriate proportion of employee representatives. The employee representative Supervisors shall account for at least one-third of entire Supervisors. The employee representative Supervisors shall be democratically elected and removed at the Company's employee representative meeting, the employees' meeting or by other means. Shareholder representatives shall be elected and removed at the general meeting.

The Supervisory Committee shall be accountable to the general meeting, and shall exercise the following powers in accordance with laws:

- (i) shall audit the Company's securities issuance documents and periodic reports prepared by the Board of Directors and issue auditing opinions in writing;
- (ii) to check the Company's financial position;
- (iii) supervise the performance of duties by Directors and senior management members, and propose the removal of Directors and management members who violate laws, administrative regulations, Articles of Association or resolutions of the general meetings;
- (iv) when the behavior of Directors and senior management member harms the interests of the Company, the Directors and management members are required to make corrections;
- (v) propose to convene an extraordinary general meeting to convene and preside over a general meeting when the Board of Directors fails to perform its duties of convening and presiding over a general meeting as stipulated in the Company Law;
- (vi) submit proposals to the general meeting;
- (vii) represent the Company in negotiations with or bringing an action against Directors and management members in accordance with Article 151 of the Company Law;
- (viii) if the Company's operation is found to be abnormal, it can be investigated; When necessary, accounting firms, law firms and other professional institutions can be engaged to assist in their work, and the cost shall be borne by the Company;

- (ix) to check the financial information, such as the financial reports, reports of operations and profit distribution plans to be submitted by the Board of Directors to the general meeting, and to authorize, in the Company's name, public certified accountants and licensed auditors to assist in the re-examination of such information, should any doubt arise in respect thereof;
- (x) such other powers as provided by laws, administrative regulations and regulations of the authorities or provisions of the Articles of Association or other powers conferred by the general meeting.

The Supervisory Committee shall hold at least one meeting every six months, and shall be convened by the Chairman of the Supervisory Committee. Supervisors may propose to convene an extraordinary meeting of Supervisors. A resolution of the Supervisory Committee shall be passed by more than half of all the Supervisors.

## **FINANCIAL AND ACCOUNTING POLICY AND PROFIT DISTRIBUTION AND AUDIT**

### **Financial And Accounting Policy**

The Company shall establish its financial and accounting policies in accordance with laws, administrative regulations and provisions of competent authorities.

The Company shall submit and disclose its annual report to the CSRC and the stock exchange of the place where the shares of the Company are listed within four months from the end of each accounting year, and its announcement of interim results to the agencies of the CSRC and the stock exchange of the place where the shares of the Company are listed within two months from the end of first half of each accounting year. The above annual report and interim report shall be prepared in accordance with relevant laws, administrative regulations, regulations of the authorities and the regulations of the stock exchange of the place where the shares of the Company are listed.

Saving for the statutory accounting books, the Company does not set up separate accounting books. The Company's assets should not be deposited in any account opened under any personal name.

### **Profits Distribution**

In distributing the profits after tax for the current year, the Company shall allocate 10% of the profits to its statutory reserve. When the accumulated statutory reserve exceeds 50 percent of the Company's registered capital, the Company may cease to make such allocation. If the statutory reserve is not sufficient to cover the losses made in the previous year, the Company may make allocation to the discretionary reserve from the profits after tax. The remaining profits after tax after offsetting its losses and allocating to its reserves may be distributed to its shareholders in proportion to their shareholding percentages unless otherwise

provided in the Articles of Association. If at a general meeting, the requirements stipulated in the preceding paragraph are breached by distributing profits to the shareholders before offsetting losses of the Company and allocating to its statutory surplus reserve, the profits so distributed are required to be returned to the Company. The shares held by the Company are not entitled to any profit distribution.

The Company shall appoint one or more collection agents in Hong Kong SAR for H share shareholders. The collection agents shall collect or keep the dividends distributed by the company on H shares and other amounts payable on behalf of the relevant H share shareholders pending payment to such H share shareholders. The collection agents appointed by the Company shall meet the requirements of the laws, regulations and the securities regulatory rules of the place where the Company's shares are listed.

The common reserve funds of the Company shall be used to make up for the losses, expansion of the Company's production or operation or increase the capital of the Company. However, the capital reserve fund shall not be used to make up for losses of the Company.

After a resolution on the profit distribution plan is made at the general meeting, the Board of Directors of the Company shall complete the distribution of the dividend (or shares) within two months after the said meeting. If the specific plan cannot be implemented within two months according to the provisions of laws and regulations and the securities regulatory rules of the place where the shares of the Company are listed, the implementation date of the specific plan can be adjusted according to such provisions and the actual situation.

The Company shall distribute dividends in form of cash, shares or a combination of cash and shares, and shall prioritize profit distribution in form of cash.

#### **INTERNAL AUDIT**

The Company shall implement an internal auditing policy and appoint full time auditors to carry out internal auditing and supervision of the Company's incomes and expenses and economic activities.

The internal audit policy of the Company and the responsibilities of auditors shall be implemented upon approval by the Board of Directors. The personnel in charge of auditing is responsible to the Board of Directors and reports on relevant work.

#### **ENGAGEMENT OF ACCOUNTING FIRMS**

The Company engages an accounting firm that complies with the Securities Law, Hong Kong Listing Rules, and securities regulatory rules of the place where the shares of the Company are listed to conduct accounting statement auditing, net asset verification, and other related consulting services. The engagement period is one year and can be renewed.

The engagement of an accounting firm is decided by the General Meeting. The Board of Directors shall not engage an accounting firm prior to the decision by the General Meetings.

The Company guarantees to provide the hired accounting firm with true and complete accounting vouchers, accounting books, financial accounting reports, and other accounting data. Refusal, concealment, and false reporting are not allowed.

The audit fees of the accounting firm shall be determined by the General Meeting.

The Company shall send a 30-day prior notice to the accounting firm, in order to dismiss or not to reappoint the accounting firm, and the said accounting firm is entitled to give opinions when the General Meeting of the Company votes on the dismissal of the accounting firm.

The accounting firm, in order to resign, shall make representations whether the Company has any improper affairs to the General Meeting.

## **MERGER, DIVISION, CAPITAL INCREASE, CAPITAL REDUCTION, DISSOLUTION AND LIQUIDATION**

### **Merger, Division, Capital Increase And Capital Reduction**

The merger of the Company may take the form of either merger by absorption or merger by consolidation.

A company that absorbs other company is known as merger by absorption whereby the company being absorbed shall be dissolved. The merger of two or more companies by the establishment of a new company is known as merger by the establishment of a new company whereby the merged companies shall be dissolved.

In the event of merger of the Company, the parties to such merger shall execute a merger agreement and prepare a balance sheet and an inventory of assets. The Company shall notify its creditors within ten days of, and make announcement in the newspapers within thirty days of, the date of the Company's resolution for merger. A creditor may, within 30 days of receipt of the notice from the Company or, in the case of failure to receive such notice, within 45 days of the date of announcement, require the Company to repay its debts or to provide a corresponding guarantee for such debt.

After merger, any creditor's rights and indebtedness of the merged parties shall be assumed by the Company which survives the merger or the newly established company.

In the event of division of the Company, its assets shall be divided up accordingly.

In the event of division of the Company, the parties to division shall execute a division agreement and prepare a balance sheet and an inventory of assets. The Company shall notify its creditors within ten days of, and make announcement in the newspapers within 30 days, of the date of the Company's division resolution.

Debts owed by the Company prior to the division shall be assumed by the companies upon the division according to the agreement entered into unless provided otherwise in a written agreement on debt repayment reached between the Company and a creditor prior to the division.

The Company must prepare a balance sheet and an inventory list of its assets when it intends to reduce its registered capital.

The Company shall notify its creditors within 10 days of, and make announcement in the newspapers within 30 days, of the date of the Company's resolution for reduction of capital. A creditor may, within thirty days of receipt of the notice from the Company or, in the case of failure to receive such notice, within 45 days of the date of announcement, require the Company to repay its debts or to provide a corresponding guarantee for such debt.

The Company's registered capital must not, after the reduction in capital, be less than the minimum amount required by laws.

The Company shall, in accordance with laws, handle the procedures for change registration with the Company registration authority where a change in any registration items arises as a result of any merger or division. In the event of dissolution of the Company, the Company shall handle the procedures for registration of cancellation in accordance with the law. In the event of establishment of a new company, the Company shall handle the procedures for registration of establishment in accordance with laws.

Where the Company increases or reduces its registered capital, the Company shall handle the procedures for change registration with the Company registration authority in accordance with laws.

## **DISSOLUTION AND LIQUIDATION**

The Company may be dissolved and go into liquidation in accordance with laws in any of the following circumstances:

- (i) where the operation period provided herein expires or where any cause for dissolution provided herein occurs;
- (ii) where the general meeting has adopted a resolution for dissolution;
- (iii) where dissolution is required due to merger or division of the Company;

- (iv) where the Company is declared bankrupt in accordance with laws due to its inability to pay the debts that are due;
- (v) where the business license of the Company is revoked, or the Company is ordered to close down or cancelled in accordance with laws;
- (vi) where the Company runs deep into difficulties in operation and management, its continuous existence may cause material losses to shareholders' interests, and such difficulties cannot be dealt with in other ways, the shareholders holding 10% or more of votes of all shareholders of the Company may file an application to the People's Court to dissolve the Company.

In the circumstance as set out in the Item (i) of the preceding article, the Company may continue to exist by amending the Articles of Association; if this Articles of Association is amended subject to the aforesaid provisions, it must be approved by shareholders representing two-thirds or above of the voting rights present at the general meeting.

Where the Company is dissolved pursuant to the items (i), (ii), (v) and (vi) of the preceding article, a liquidation team shall be established within 15 days and start to carry out liquidation. The liquidation team shall be composed of persons determined by Directors or the general meeting. In case no liquidation team is established within the specified period to carry out liquidation, the creditors may file an application to the People's Court to designate relevant persons to form a liquidation team to carry out liquidation.

The liquidation team shall notify the creditors within 10 days of, and make announcements in the newspapers within 60 days, of the date of its establishment. A creditor shall, within 30 days of receipt of the notice, or in the case of failure to receive the notice, within 45 days of the date of the announcement, claim its rights to the liquidation team.

In claiming its rights, the creditor shall explain the relevant issues on the creditor's rights, and provide evidential materials in respect thereof. The liquidation team shall register the creditor's rights in accordance with the relevant laws.

In the course of claiming of creditors' rights, the liquidation team shall not make any repayment to creditors.

After it has liquidated the Company's assets and prepared the balance sheet and an inventory of assets, the liquidation team shall formulate a liquidation plan and present it to the general meeting or to the People's Court for confirmation. The assets of the Company shall be applied in the sequence below: payment of liquidation costs, salary of employees, social insurance premiums, statutory compensation, taxes payable, and debts of the Company. The remaining assets after payment is made pursuant to the foregoing provision shall be distributed to its shareholders according to the category and proportion of the shares held by shareholders.

During the liquidation period, the Company remains in existence; however, it shall not carry out any business activities unrelated to liquidation. The Company's assets shall not be distributed to its shareholders before payment is made pursuant to the foregoing provision.

In the event of liquidation due to dissolution of the Company, after liquidation of the Company's assets and preparation of a balance sheet and an inventory of assets, the liquidation team discovers that the Company's assets are insufficient to pay the Company's debts in full, the liquidation team shall file an application to the People's Court for declaration of bankruptcy in accordance with laws. After the Company is declared bankrupt pursuant to the adjudication of the People's Court, the liquidation team shall transfer all matters relating to the liquidation to the People's Court.

Upon completion of the liquidation, the liquidation team shall prepare a liquidation report and submit it to the general meeting or the People's Court for confirmation, and shall submit the same to the registration authority of the Company and apply for cancellation of registration of the Company, and make announcement relating to the termination of the Company.

Where the Company is declared bankrupt in accordance with laws, bankruptcy liquidation shall be carried out in accordance with the laws concerning bankruptcy of enterprises.

#### **AMENDMENTS TO THE ARTICLES OF ASSOCIATION**

In any of the following circumstances, the Company shall amend the Articles of Association:

- (i) the Articles of Association are contradictory to any provision of the amended version of the Company Law or other relevant laws or administrative regulations or the securities regulatory rules of the place where the shares of the Company are listed;
- (ii) there is any change to the condition of the Company, which is inconsistent with any matter recorded in the Articles of Association;
- (iii) the general meeting adopts a resolution for amendment of the Articles of Association.

If an amendment of the Articles of Association adopted by the resolution of the general meeting needs to be approved by the competent authority, it shall be submitted to the competent authority for approval; if there is any change relating to the registered particulars of the Company, the procedures for change registration shall be handled in accordance with laws.

The Board of Directors shall amend the Articles of Association according to the resolution of the general meeting for amendments hereof and the approval opinions of competent authority.

**A. FURTHER INFORMATION ABOUT OUR GROUP****1. Incorporation of our Company**

Our Company was established in the PRC as a limited liability company on June 22, 1998. On August 23, 2000, it was converted into a joint stock company with limited liability under the PRC Company Law. Since April 14, 2004, our A Shares have been listed on the Shanghai Stock Exchange with the stock code of 600988. Our registered office is located at Fumin Village, Sidaowanzi Town, Aohan, Chifeng, Inner Mongolia Autonomous Region, PRC.

We have established a principal place of business in Hong Kong at Room 1905, 19th Floor, China Resources Building, 26 Harbour Road, Wanchai, Hong Kong, and was registered as a non-Hong Kong company under Part 16 of the Companies Ordinance on October 14, 2024 under the same address. Mr. Wong Hok Bun Mario has been appointed as our agent for the acceptance of service of process and notices on our behalf in Hong Kong. The address for service of process on the Company in Hong Kong is the same as its principal place of business in Hong Kong as set out above.

As we were established in the PRC, our corporate structure and Articles of Association are subject to the relevant laws and regulations of the PRC. A summary of the relevant provisions of our Articles of Association is set out in Appendix VI to this Prospectus. A summary of certain relevant aspects of the laws and regulations of the PRC is set out in Appendix V to this Prospectus.

**2. Changes in the share capital of our Company**

For details relating to the changes in the share capital of our Company, see the section headed “History, Development and Corporate Structure — Major Changes in Shareholding and Share Capital of our Company” in this Prospectus.

Save as disclosed above, there has been no alteration in our share capital within the two years immediately preceding the date of this Prospectus.

**3. Changes in the share capital of our subsidiaries**

For details relating to the changes in the share capital of our subsidiaries, please refer to the section headed “History, Development and Corporate Structure — Our Principal Subsidiaries” in this Prospectus.

Save as disclosed in this Prospectus, there has been no alteration in the share capital of any of our subsidiaries within the two years immediately preceding the date of this Prospectus.

#### 4. Resolutions in writing of our Shareholders passed on August 23, 2024

Pursuant to the written resolutions passed by our Shareholders on August 23, 2024, it was resolved, among others:

- (a) the issue by our Company of H Shares of nominal value of RMB1.00 each and such H Shares be listed on the Hong Kong Stock Exchange;
- (b) the number of H Shares to be issued before the exercise of the Over-allotment Option for the Global Offering shall not exceed 15% of the enlarged share capital of our Company upon completion of the Global Offering and granting the Underwriters of not more than 15% of the above number of H Shares issued pursuant to the Global Offering;
- (c) authorization of the Board and its authorized persons to handle all matters relating to, among other things, the Global Offering, the issue and listing of the H Shares; and
- (d) subject to the completion of the Global Offering, the conditional adoption of the revised Articles of Association, which shall become effective on the Listing Date.

#### 5. Restrictions on Share Repurchase

For details of the restrictions on share repurchase by our Company, please refer to “Appendix VI — Summary of the Articles of Association” to this Prospectus.

### B. FURTHER INFORMATION ABOUT OUR BUSINESS

#### 1. Summary of our Material Contracts

We have entered into the following contracts (not being contracts entered into in the ordinary course of business) within the two years immediately preceding the date of this Prospectus that are or may be material:

- (a) an equity transfer agreement entered into among China Investment (Property) Limited (中國投資(置業)有限公司) (“**China Investment**”), China Investment Mining (Laos) Sole Co., Ltd, Chixia Laos and Chijin Xiawu on March 4, 2024, pursuant to which Chixia Laos agreed to acquire from China Investment 90% of the equity interest in China Investment Mining (Laos) Sole Co., Ltd at a total consideration of US\$18,963,000;
- (b) a cornerstone investment agreement dated February 26, 2025 and entered into among our Company, Gold Mountains (H.K.) International Mining Company Limited (金山(香港)國際礦業有限公司), CITIC Securities (Hong Kong) Limited (中

信證券(香港)有限公司), CLSA Limited (中信里昂證券有限公司) and Macquarie Capital Limited (麥格理資本股份有限公司) with respect to a subscription of the H Shares at the Offer Price in the amount of the Hong Kong dollar equivalent of US\$40 million;

- (c) a cornerstone investment agreement dated February 26, 2025 and entered into among our Company, Sparky International Company Limited (斯派柯國際有限公司), CITIC Securities (Hong Kong) Limited (中信證券(香港)有限公司), CLSA Limited (中信里昂證券有限公司), Macquarie Capital Limited (麥格理資本股份有限公司) and China International Capital Corporation Hong Kong Securities Limited (中國國際金融香港證券有限公司) with respect to a subscription of the H Shares at the Offer Price in the amount of the Hong Kong dollar equivalent of RMB400 million; and
- (d) the Hong Kong Underwriting Agreement.

## 2. Material intellectual property rights of our Group

Save as disclosed below, as of the Latest Practicable Date, there were no other intellectual property rights which are or may be material to our business in the opinion of our Directors.

### (a) Trademarks

#### (i) Registered Trademarks

As of the Latest Practicable Date, we have registered the following trademarks which we consider to be or may be material to our business:

No.	Name of Registered Proprietor	Trademark	Registration Number	Class	Place of Registration	Expiry Date
1 . .	Our Company	The trademark consists of the Chinese characters "赤金" in a bold, black font, with "CHI JIN" written in a smaller, black font directly below them.	12370177	37	PRC	April 6, 2025 <sup>(1)</sup>
2 . .	Our Company	The trademark features the Chinese characters "赤金" in a bold, black font, with "CHI JIN" written vertically in a smaller, black font to the left of the characters.	12370166	37	PRC	April 6, 2025 <sup>(1)</sup>
3 . .	Our Company	A 3D isometric logo of a cube with a stylized 'G' or 'C' shape inside, rendered in a grey, metallic-looking finish.	43088353	37	PRC	December 20, 2030
4 . .	Our Company	A 3D isometric logo of a cube with a stylized 'G' or 'C' shape inside, rendered in a grey, metallic-looking finish.	43097556	42	PRC	December 13, 2030

No.	Name of Registered Proprietor	Trademark	Registration Number	Class	Place of Registration	Expiry Date
5 . .	Our Company	 赤峰吉隆黄金矿业股份有限公司 CHIFENG JILONG GOLD MINING CO., LTD.	43204068	37	PRC	January 27, 2031
6 . .	Our Company	 赤峰吉隆黄金矿业股份有限公司 CHIFENG JILONG GOLD MINING CO., LTD.	43238591	42	PRC	January 27, 2031
7 . .	Hanfeng Mining	 HANFENG MINING 瀚丰矿业	7827527	36	PRC	March 13, 2031
8 . .	Hanfeng Mining	 天宝山 TIANBAOSHAN	6709701	6	PRC	March 27, 2030
9 . .	Guangyuan Technology	 广源科技	41834913	40	PRC	September 20, 2030
10 .	LXML	 ສາມັນລຽງ ມິນໂຮນເສ ສີມິເສັດ 万象矿业有限公司 CHIFENG LXML SEPON	57702	6, 17, 40, 41, 42	Lao PDR	January 17, 2033
11 .	LXML	 ສາມັນລຽງ ມິນໂຮນເສ ສີມິເສັດ 万象矿业有限公司 CHIFENG LXML SEPON	57703	6, 17, 40, 41, 42	Lao PDR	January 17, 2033
12 .	Our Company	(A)  (B) 	306629266	1, 6, 14, 37, 42	Hong Kong	August 1, 2034
13 .	Our Company	(A)  (B)  (C)  (D) 	306629257	1, 6, 14, 37, 42	Hong Kong	August 1, 2034

*Note:*

- (i) These trademarks remained to be validly registered in PRC as of the Latest Practicable Date. To the best knowledge of the Directors having made all reasonable enquiries, there are no legal impediment to the renewal of the registration of these trademarks upon the expiry date, if necessary.

*(ii) Trademarks Pending Registration*

As of the Latest Practicable Date, we have applied for the registration of the following trademarks which we consider to be or may be material to our business:

No.	Name of Applicant	Trademark	Application Number	Class	Place of Application	Application Date
1 . .	Our Company	(A) <b>赤峰黃金</b> (B) <b>赤峰黃金</b>	306630994	1, 6, 14, 37, 42	Hong Kong	August 5, 2024
2 . .	Our Company	(A) <b>CHIFENG GOLD</b> (B) <b>CHIFENG GOLD</b>	306631001	1, 6, 14, 37, 42	Hong Kong	August 5, 2024

*(b) Patents**(i) Registered Patents*

As of the Latest Practicable Date, we had registered the following patents which we consider to be or may be material to our business:

No.	Name of Patentee	Name of Patent	Registration Number	Place of Registration	Registration Date	Validity Period	Category
1 . .	Wulong Mining	Miner's lamp (礦燈)	ZL201410515583.1	PRC	September 29, 2014	20 years	Original Invention
2 . .	Wulong Mining	A kind of three-quarter mine shaft hoisting mechanism (一種三分礦豎井提升機構)	ZL202121602737.2	PRC	July 15, 2021	10 years	Utility model
3 . .	Wulong Mining	A quarter mine ventilation system (一種四分礦通風系統)	ZL202121653692.1	PRC	July 20, 2021	10 years	Utility model
4 . .	Wulong Mining	A kind of reversed continuous charging structure using upper disk columns (一種採用上盤柱狀反向連續裝藥結構)	ZL202121665369.6	PRC	July 21, 2021	10 years	Utility model

## APPENDIX VII

## STATUTORY AND GENERAL INFORMATION

No.	Name of Patentee	Name of Patent	Registration Number	Place of Registration	Registration Date	Validity Period	Category
5 . .	Wulong Mining	A kind of safety protection cage for mine (一種礦井用安全防護罐籠)	ZL202121666391.2	PRC	July 21, 2021	10 years	Utility model
6 . .	Wulong Mining	A kind of powder ore recycling mat (一種粉礦回收墊板)	ZL202121678701.2	PRC	July 22, 2021	10 years	Utility model
7 . .	Wulong Mining	A kind of motorcycle frame line powder failure protection device (一種電機車架線斷電保護裝置)	ZL202121690127.2	PRC	July 23, 2021	10 years	Utility model
8 . .	Wulong Mining	An ore chute structure arrangement structure (一種礦石溜井結構布置結構)	ZL202121690131.9	PRC	July 23, 2021	10 years	Utility model
9 . .	Wulong Mining	A kind of anti-electrocution device for overhead electric locomotive based on PLC architecture (一種基於PLC架構的架線電機車防觸電裝置)	ZL202320010120.4	PRC	January 4, 2023	10 years	Utility model
10 . .	Wulong Mining	A kind of mine shaft dewatering device (一種礦山深井排水裝置)	ZL202420431397.9	PRC	March 6, 2024	10 years	Utility model
11 . .	Wulong Mining	A kind of screen plate structure that improves the screening efficiency of the vibrating screen (一種可提高振動篩篩分效率的篩板結構)	ZL202420287697.4	PRC	February 7, 2024	10 years	Utility model
12 . .	Wulong Mining	A kind of detachable filter press feeding structure (一種可拆卸式壓濾機進料結構)	ZL202420196505.9	PRC	January 26, 2024	10 years	Utility model

## APPENDIX VII

## STATUTORY AND GENERAL INFORMATION

No.	Name of Patentee	Name of Patent	Registration Number	Place of Registration	Registration Date	Validity Period	Category
13.	Wulong Mining	A kind of highly efficient crushing structure for processing gold ore (種金礦選礦用的高效破碎機構)	ZL202420080329.2	PRC	January 12, 2024	10 years	Utility model
14.	Wulong Mining	A kind of dust suppression system for a mine shaft (一種礦井井下降塵噴霧裝置)	ZL202420313948.1	PRC	February 20, 2024	10 years	Utility model
15.	Wulong Mining	A kind of automatic recycling feeding device for a filter press (一種壓濾機自動循環進料設備)	ZL202420667903.4	PRC	April 2, 2024	10 years	Utility model
16.	Wulong Mining	A screening device for a raw material for mineral processing agents (一種選礦藥劑原料的篩分裝置)	ZL202420545915.X	PRC	March 20, 2024	10 years	Utility model
17.	Jilong Mining	A kind of zinc powder feeding device adopted for cyanide leaching in gold mine (一種黃金礦山氰化浸出採用的鋅粉給料裝置)	ZL202121744747.X	PRC	July 29, 2021	10 years	Utility model
18.	Jilong Mining	A positioning device for uncoupled charging of gun holes (一種炮孔不耦合裝藥的定位裝置)	ZL202121744748.4	PRC	July 29, 2021	10 years	Utility model
19.	Jilong Mining	A kind of belt conveyor roller frame (一種皮帶運輸機托輓架)	ZL202121742523.5	PRC	July 29, 2021	10 years	Utility model
20.	Jilong Mining	An improved mining thickening device (一種改進的礦用濃密機裝置)	ZL202121744750.1	PRC	July 29, 2021	10 years	Utility model

## APPENDIX VII

## STATUTORY AND GENERAL INFORMATION

No.	Name of Patentee	Name of Patent	Registration Number	Place of Registration	Registration Date	Validity Period	Category
21	Jilong Mining	A kind of mine drainage ditch dredging device (一種礦井排水溝清淤裝置)	ZL202321032624.2	PRC	April 28, 2023	10 years	Utility model
22	Jilong Mining	A kind of underground automatic drainage system (一種井下自動排水系統)	ZL202321012760.5	PRC	April 28, 2023	10 years	Utility model
23	Jilong Mining	A kind of belt conveyor for washing concentrate (一種洗選精礦的皮帶輸送機)	ZL202320682501.7	PRC	March 31, 2023	10 years	Utility model
24	Jilong Mining	A mine shaft preheating system (一種礦井井口預熱系統)	ZL202320586472.4	PRC	March 23, 2023	10 years	Utility model
25	Jilong Mining	An elevator gate tile wear monitoring system (一種提升機閘瓦磨損監測系統)	ZL202310026191.8	PRC	January 9, 2023	20 years	Original Invention
26	Jilong Mining	A multi-level intelligent water storage and drainage system for mines (一種壓濾機自動循環進料設備)	ZL202420795574.1	PRC	April 17, 2024	10 years	Utility model
27	Jilong Mining	An improved descaling device for the thickener (一種改進的濃密機除垢裝置)	ZL202420984997.8	PRC	May 8, 2024	10 years	Utility model

*(c) Domain Names*

As of the Latest Practicable Date, we have registered the following domain names which we consider to be or may be material to our business:

### C. FURTHER INFORMATION ABOUT OUR DIRECTORS, SUPERVISORS AND SUBSTANTIAL SHAREHOLDERS

#### 1. Disclosure of Interests

(a) *Interests and short positions of our Directors, Supervisors and the chief executive of our Company in the shares, underlying shares and debentures of our Company and our associated corporations*

Save as disclosed below, immediately following the completion of the Global Offering (assuming that the Offer Size Adjustment Option and the Over-allotment Option are not exercised), so far as our Directors are aware, none of our Directors, Supervisors or chief executive has any interests or short positions in our Shares, underlying shares and debentures of our Company or any associated corporations (within the meaning of Part XV of the SFO) which will have to be notified to our Company and the Hong Kong Stock Exchange pursuant to Divisions 7 and 8 of Part XV of the SFO (including interests or short positions which they are taken or deemed to have under such provisions of the SFO) or which will be required, pursuant to Section 352 of the SFO, to be recorded in the register referred to therein or which will be required to be notified to our Company and the Hong Kong Stock Exchange pursuant to the Model Code for Securities Transactions by Directors of Listed Issuers contained in Hong Kong Listing Rules.

Name	Position	Nature of interest	Description of Shares	Number of Shares	Approximate percentage of interest in the total issued share capital of our Company as of the Latest Practicable Date	Approximate percentage of interest in the A Shares immediately following the completion of the Global Offering (assuming the Offer Size Adjustment Option and the Over-allotment Option are not exercised)	Approximate percentage of interest in the total issued share capital of our Company immediately following the completion of the Global Offering (assuming the Offer Size Adjustment Option and the Over-allotment Option are not exercised)
Wang Jianhua . . .	Chairman of the Board and Executive Director	Beneficial owner	A Shares	74,200,071	4.46%	4.46%	3.97%
Yang Yi-fang . . .	Executive Director and Chief Executive Officer	Beneficial owner	A Shares	113,000	0.01%	0.01%	0.01%

Name	Position	Nature of interest	Description of Shares	Number of Shares	Approximate percentage of interest in the total issued share capital of our Company as of the Latest Practicable Date	Approximate percentage of interest in the A Shares immediately following the completion of the Global Offering (assuming the Offer Size Adjustment Option and the Over-allotment Option are not exercised)	Approximate percentage of interest in the total issued share capital of our Company immediately following the completion of the Global Offering (assuming the Offer Size Adjustment Option and the Over-allotment Option are not exercised)
Lyu Xiaozhao . . .	Executive Director, Vice President and Chief Engineer	Beneficial owner	A Shares	111,700	0.01%	0.01%	0.01%
Gao Bo . . . . .	Executive Director and Vice President	Beneficial owner	A Shares	153,500	0.01%	0.01%	0.01%

**(b) *Interests and short positions of the Substantial Shareholders in the Shares of our Company***

Save as disclosed in the section headed “Substantial Shareholders” in this Prospectus, our Directors are not aware of any person who will, immediately following completion of the Global Offering (assuming that the Offer Size Adjustment Option and the Over-allotment Option are not exercised), have interests or short positions in our Shares or underlying Shares which would be required to be disclosed to us and the Hong Kong Stock Exchange under the provisions of Divisions 2 and 3 of Part XV of the SFO, or who is, directly or indirectly, interested in 10% or more of the issued voting shares of our Company.

(c) *Interests of the Substantial Shareholders of any Member of Our Group (other than Our Company)*

Save as disclosed in the section headed “History, Development and Corporate Structure” in this Prospectus and the table below, so far as our Directors are aware, immediately following the completion of the Global Offering, no persons will, directly or indirectly, be interested in 10% or more of the nominal value of the share capital carrying rights to vote in all circumstances at general meetings of any member of the Group (other than our Company).

<u>Member of our Group</u>	<u>Name of substantial shareholder</u>	<u>Approximate percentage of equity interests held by the substantial shareholder</u>
Xinhenghe Mining . . . . .	Liu Xin (劉信)	30%
	Li Yuanyuan (李媛媛)	12%
	Zhu Jiande (朱建德)	7%
Golden Star Resources . . . . .	Kefei Investment (BVI) Limited <sup>(1)</sup>	38%

*Note:*

- (1) Kefei Investment (BVI) Limited was wholly owned by China-Africa Fund for Industrial Cooperation Co., Ltd. (“CAFIC”). CAFIC was held as to (i) 80% of the equity interest by Wutongshu Investment Platform Company Limited (梧桐樹投資平台有限責任公司) (“Wutongshu Investment”), which was wholly owned by the State Administration of Foreign Exchange Central Foreign Exchange Business Center (國家外匯管理局中央外匯業務中心); and (ii) 20% of the equity interest by the Export-Import Bank of China (中國進出口銀行), which in turn was owned as to 89.26% and 10.74% equity interest by Wutongshu Investment and MOF.

## 2. Particulars of Directors’ Service Contracts and Letters of Appointment

(a) *Directors and Supervisors*

We have entered into a service contract or letter of appointment with each of our Directors and Supervisors in respect of, among other things (i) compliance of relevant laws and regulations; (ii) observance of the Articles of Association; and (iii) provisions on arbitration. The principal particulars of these service contracts and letters of appointment include (i) the term of service; and (ii) are subject to termination in accordance with their respective term. The service contracts or letters of appointment may be renewed in accordance with our Articles of Association and the applicable Hong Kong Listing Rules.

Save as disclosed above, none of our Directors or Supervisors has entered into any service contracts as a director or supervisor with any member of our Group (excluding contracts expiring or determinable by the employer within one year without payment of compensation (other than statutory compensation)).

**(b) Others**

- (i) Save as disclosed above, none of our Directors and Supervisors has entered into any service contract with any member of our Group (excluding contracts expiring or determinable by the employer within one year without payment of compensation other than statutory compensation).
  - (ii) For the three years ended December 31, 2023, for the nine months ended September 30, 2024, the aggregate of the remuneration and benefits in kind payable to our Directors was approximately RMB26.89 million, RMB20.34 million, RMB20.95 million and RMB10.49 million, respectively. Details of our Directors' remuneration are also set out in Note 8 to the Accountant's Report set out in Appendix IA to this Prospectus.
  - (iii) For the three years ended December 31, 2023, for the nine months ended September 30, 2024, the aggregate of the remuneration and benefits in kind payable to our Supervisors was approximately RMB3.99 million, RMB2.24 million, RMB1.56 million and RMB0.77 million, respectively.
  - (iv) None of our Directors and Supervisors has waived or agreed to waive any emolument for each of the three financial years ended December 2023 and for the nine months ended September 30, 2024.
  - (v) Save as disclosed herein and in Note 8 to the Accountant's Report set out in Appendix IA to this Prospectus, no other emoluments have been paid or are payable, in respect of the years ended December 31, 2021, 2022 and 2023 and for the nine months ended September 30, 2024 by us to our Directors or Supervisors.
  - (vi) Save as disclosed herein, no remuneration was paid by us to, or receivable by, our Directors, Supervisors or the five highest paid individuals as an inducement to join or upon joining our Company for each of the three financial years ended December 2023 and for the nine months ended September 30, 2024. No compensation was paid by us to, or receivable by, our Directors, former Directors, Supervisors or the five highest-paid individuals for each of the three financial years ended December 2023 and for the nine months ended September 30, 2024 for the loss of any office in connection with the management of the affairs of any members of our Group.
- (c) Based on the arrangements currently in force, the aggregate of the remuneration and benefits in kind payable to our Directors for the year ending December 31, 2024 is estimated to be approximately RMB15.74 million.

Based on the arrangements currently in force, the aggregate of the remuneration and benefits in kind payable to our Supervisors for the year ending December 31, 2024 is estimated to be approximately RMB1.32 million.

- (d) None of our Directors and our Supervisors or any past Directors and any past Supervisors of any members of our Group has been paid any sum of money for the three years ended December 31, 2023 and the nine months ended September 30, 2024 (i) as an inducement to join or upon joining us or (ii) for loss of office as a Director and Supervisor of any member of our Group or of any other office in connection with the management of the affairs of any member of our Group.
- (e) There has been no arrangement under which a Director and Supervisor has waived or agreed to waive any remuneration or benefits in kind for the three years ended December 31, 2023 and nine months ended September 30, 2024.
- (f) None of our Directors and Supervisors has been or is interested in the promotion of, or in the property proposed to be acquired by, us, and no sum has been paid or agreed to be paid to any of them in cash or shares or otherwise by any person either to induce him to become, or to qualify him as, a Director or a Supervisor, or otherwise for services rendered by him in connection with the promotion or formation of our Company.

### **3. Fees or commissions received**

Save as disclosed in the section headed “History, Development and Corporate Structure” in this Prospectus, none of our Directors, Supervisors or any of the persons whose names are listed under the paragraph headed “D. Other Information — 7. Consent of Experts” in this Appendix had received any commissions, discounts, agency fee, brokerages or other special terms in connection with the issue or sale of any capital of any member of our Group within the two years immediately preceding the date of this Prospectus.

### **4. Employee Stock Ownership Plans**

Our Company adopted the Phase I ESOP, the Phase II ESOP and the Phase III ESOP on October 13, 2020 (as revised on May 26, 2021, September 30, 2022 and April 20, 2023), February 27, 2023 (as revised on March 20, 2023) and January 15, 2025, respectively.

The purpose of the ESOPs is to provide an incentive for the eligible participants (namely, the Directors, Supervisors, senior management and key members of our Company and its subsidiaries) a means through which our Group may grant incentives to attract, motivate, retain and reward them. They aim to foster shared interests between our Shareholders and our management team, thereby furthering our Company’s focus on long-term development.

As of the Latest Practicable Date, an aggregate of 15,192,600 A Shares (including 10,000 A Shares under Phase I ESOP and 15,182,600 A Shares under Phase III ESOP) were being held under the ESOPs whilst Phase II ESOP had disposed of all the A Shares held by it by September 30, 2024. The ESOPs are not subject to the provisions of Chapter 17 of the Hong Kong Listing Rules as they do not involve the grant of options by our Company to subscribe for new Shares or award of Shares upon Listing.

The key terms and implementation of the ESOPs are as follows.

**(a) *Plan limit***

The maximum number of participants under the Phase I ESOP, the Phase II ESOP and the Phase III ESOP shall not exceed 98, 120 and 210, respectively. Meanwhile, the maximum number of A Share to be held by the Phase I ESOP, the Phase II ESOP and the Phase III ESOP shall be 41,597,732 A Shares, 16,575,406 A Shares and 15,182,600 A Shares, accounting for approximately 2.50%, 0.9962% and 0.9125% of our Company's issued Share capital, respectively.

The total number of Shares held by each of the ESOPs shall not exceed 10% of the issued share capital of our Company. The maximum number of Shares corresponding to the awards held an individual participant shall not exceed 1% of the issued share capital of our Company.

**(b) *Contribution of funds to the ESOP***

The eligible participants shall use their salaries and personal funds to subscribe to the ESOP, and obtain the corresponding interest in the ESOP.

**(c) *Source of Shares***

The A Shares obtained by the ESOP shall be the A Shares repurchased by the Company through centralized price bidding process.

The Phase I ESOP has entrusted an Independent Third Party professional institution with asset management qualifications to establish a directional plan available for subscription by the eligible participants. Within six months from the approval of the ESOP by the general meeting, the directional plan would obtain and hold the A Shares repurchased by our Company through a block trade process. Such funds would not be used to purchase the shares of other companies.

The Phase II ESOP and the Phase III ESOP are maintained by our Company. The management committee of Phase II ESOP shall the asset manager and exercise all shareholders' rights in relation to the A Shares held by the plan. It would set up a securities account designated for the plan of the Company whereby the A Shares repurchased by our Company are obtained by the plan by non-transactional transfer means and other means as permitted under applicable laws and regulations.

The purchase price of such A Shares by the ESOP shall be the average price paid by our Company for the repurchase of such Shares.

As of April 30, 2021, April 28, 2023 and June 27, 2024, our Company repurchased a total of 41,597,732, 16,575,406 and 15,182,600 A Shares for the purpose of the Phase I ESOP, the Phase II ESOP and the Phase III ESOP, respectively.

Upon the expiry of the lock-up period, various A Shares had been disposed of by the Phase I ESOP and the Phase II ESOP and as of the Latest Practicable Date, the Phase I ESOP held 10,000 A Shares whilst the Phase II ESOP had disposed of all the 16,575,406 A Shares held by it and did not hold any Shares.

*(d) Term*

The term of the Phase I ESOP shall be 36 months and the term of each of the Phase II ESOP and the Phase III ESOP shall be 24 months, commencing from the date when the respective ESOP is approved by the general meeting and the Company announcing the transfer of the last batch of the subject Shares to the ESOP, respectively.

Upon expiry of the lock-up period, the ESOPs can be terminated early if all the Shares held by the ESOPs are disposed of, and all assets (if any) held by the ESOPs are in the form of cash and have been liquidated or distributed.

*(e) Lock-up period*

The lock-up period for each of the ESOPs is 12 months from the date when the ESOP (as revised) is approved by the general meeting and our Company announces the transfer of the last batch of subject Shares to the ESOP.

Upon expiry of the lock-up period and prior to the expiration of the term of the ESOP, the management committee of the ESOP (see below) may, upon authorization from the resolutions of the participants, sell or transfer the Shares held by the ESOP as it deems appropriate.

*(f) Performance target*

The entitlement to the corresponding benefits from the ESOP by the participants shall be subject to the following performance targets:

- For the Phase I ESOP, if our Company's cumulative gold production from 2022 to 2024 is not less than 43 tonnes, the plan could distribute an amount equivalent to the entire accumulated equity interest in the subject Shares after repaying the financing principal and interest of the directional plan.
- For the Phase II ESOP, if our Company realizes an increase in net profit attributable to Shareholders of the listed company by 30% or above in 2023 when compared to that of the previous year, the plan could distribute an amount equivalent to the entire accumulated equity interest in the subject Shares.
- For the Phase III ESOP, if our Company's gold production for 2025 realizes a growth of 5% or above from that for 2024, the plan could distribute an amount equivalent to the entire accumulated equity interest in the subject Shares.

**(g) Management committee**

Each of the ESOPs have established a management committee to oversee the daily management of the ESOP. The committee consists of three members who are elected through resolutions of the participants. Resolutions may only be passed by the management committee when majority members voting in favour of such resolution, and each management committee member shall have one vote.

The management committee is responsible for the daily management of the ESOP, including: (i) supervising the daily management of the ESOP on behalf of all its participants, (ii) exercising the shareholder rights in respect of the Shares held by the plan; (iii) managing the distribution of benefits from the ESOP; and (iv) making decision as to the disposal of the Shares held by the ESOP upon expiry of the lock-up period in accordance with the terms of the ESOP, any and all rights pertaining to the A Shares held by the ESOP, including the voting rights, the dividend rights and the rights to dispose of such Shares, rest solely in the management committee instead of the individual participants.

Save for (i) Mr. Zhao Qiang who is a director of Chijin Xiawu and serves as a management committee member of the Phase I ESOP; (ii) Mr. Zhou Xinbing who is a director of Chijin HK and LXML and serves as a management committee member of the Phase I ESOP; and (iii) Mr. Dong Shubao who is a director of Chijin Xiawu and serves as a management committee member of the Phase I ESOP, none of the management committee members of the ESOPs is a core connected person of our Company.

**(h) Distribution**

During the term of the ESOP, unless otherwise stipulated by laws, administrative regulations, departmental rules, or with the consent of the management committee, the corresponding interest in the plan held by the participants shall not be transferred, used as collateral, or otherwise disposed of in a similar manner.

During the term of the ESOP, participants shall not request for distribution of the equity interest in the Shares held by the ESOP.

Upon expiry of the term of the ESOP, if the assets (if any) held by the ESOP still include the Shares, the management committee shall determine the disposal method of such Shares. The management committee may also, with the authorization from the resolution of the participants, liquidate the plan within 30 working days from such expiration date, after deducting relevant taxes and fees as required by the law. The distribution of the proceeds from the aforesaid disposal shall be based on the fulfillment of the performance target and the corresponding interest in the plan held by individual participants. Given that the distribution shall only be made after the term of the ESOP when the Shares held by the ESOP Platform had been disposed of, fulfillment of the performance target will not lead to a drop in the public float of the Company.

## 5. Disclaimers

Save as disclosed in this Prospectus:

- (a) none of our Directors or Supervisors has any interests and short positions in the Shares, underlying Shares and debentures of our Company or its associated corporation (within the meaning of Part XV of the SFO) which will have to be notified to us and the Hong Kong Stock Exchange pursuant to Divisions 7 and 8 of Part XV of the SFO (including interests and short positions which he is taken or deemed to have under such provisions of SFO) or which will be required, pursuant to section 352 of the SFO, to be entered in the register referred to therein, or will be required, pursuant to the Model Code for Securities Transactions by Directors of Listed Issuers to be notified to us and the Hong Kong Stock Exchange, in each case once our Shares are listed on the Hong Kong Stock Exchange;
- (b) none of our Directors, Supervisors or any of the parties listed in the paragraph headed “D. Other Information — 7. Consent of Experts” in this Appendix is interested in our promotion, or in any assets which have, within the two years immediately preceding the issue of this Prospectus, been acquired or disposed of by or leased to us, or are proposed to be acquired or disposed of by or leased to us;
- (c) save in connection with the Underwriting Agreements, none of our Directors, Supervisors or any of the parties listed in the paragraph headed “D. Other Information — 7. Consent of Experts” of this Appendix is materially interested in any contract or arrangement subsisting at the date of this Prospectus which is significant in relation to the business of our Group;
- (d) save in connection with the Underwriting Agreements, none of the parties listed in the paragraph headed “D. Other Information — 7. Consent of Experts” in this Appendix: (i) is interested legally or beneficially in any of our Shares or any shares in any of our subsidiaries; or (ii) has any right (whether legally enforceable or not) to subscribe for or to nominate persons to subscribe for securities in any member of our Group;
- (e) taking no account of any Shares which may be taken up under the Global Offering, so far as is known to any of our Directors or Supervisors, no person has an interest or short position in the Shares and underlying Shares which would fall to be disclosed to us and the Hong Kong Stock Exchange under the provisions of Divisions 2 and 3 of Part XV of the SFO, or is, directly or indirectly, interested in 10.00% or more of the nominal value of any class of share capital carrying rights to vote in all circumstances at general meetings of any other member of the Group; and

- (f) save as disclosed in the paragraphs headed “— Sales and Customers — Customers” and “— Procurement and Suppliers — Suppliers” in this Prospectus, none of our Directors, Supervisors or their respective associates or any of our Shareholders (who to the knowledge of our Directors owns more than 5.00% of our issued share capital) has any interest in our five largest suppliers or our five largest customers.

## **D. OTHER INFORMATION**

### **1. Estate Duty**

We have been advised that no material liability for estate duty under PRC law is likely to fall upon us.

### **2. Litigation**

During the Track Record Period and up to the Latest Practicable Date, saved as disclosed in this Prospectus and so far as our Directors are aware, no litigation, arbitration proceedings or claim of material importance (to our Group’s financial condition or results of operation) is pending or threatened against any member of our Group.

### **3. Sole Sponsor**

The Sole Sponsor has made an application on our behalf to the Listing Committee for the listing of, and permission to deal in, the Shares in issue and to be issued as mentioned in this Prospectus (including any H Shares which may be issued pursuant to the exercise of the Offer Size Adjustment Option and/or the Over-allotment Option).

The Sole Sponsor satisfies the independence criteria applicable to sponsors set out in Rule 3A.07 of the Hong Kong Listing Rules. The fees to the Sole Sponsor are approximately US\$500,000 and will be borne by our Company.

### **4. Preliminary expenses**

We did not incur any material preliminary expenses in relation to the incorporation of our Company.

## 5. Promoters

Information of our promoters as of the time of our Company's conversion into a joint stock company on August 23, 2000 is as follows:

No.	Name
1.	Guangdong Jin'an Automobile Industrial Engineering Company Limited (廣東省金安汽車工業製造有限公司)
2.	Huang Yizhen (黃乙珍)
3.	Yang Wenjiang (楊文江)
4.	Yang Wenying (楊文英)
5.	Yang Jinpeng (楊金朋)

Save as disclosed in the sections headed "History, Development and Corporate Structure" and "Financial Information — Dividend" in this Prospectus, within the two years immediately preceding the date of this Prospectus, no cash, securities or other benefit has been paid, allotted or given nor are any proposed to be paid, allotted or given to any promoters in connection with the Global Offering and the related transactions described in this Prospectus.

## 6. Qualification of Experts

The following are the qualifications of the experts who have given opinion or advice which are contained in this Prospectus:

**7. Consent of Experts**

Each of the experts named in the paragraph headed “D. Other Information — 6. Qualification of Experts” in this Appendix has given and has not withdrawn its respective written consent to the issue of this Prospectus with the inclusion of its report and/or letter and/or opinion and/or the references to its name included in this Prospectus in the form and context in which it is respectively included. Each of the experts named in the paragraph headed “D. Other Information — 6. Qualification of Experts” in this Appendix has given and has not withdrawn its respective written consent to the issue of this Prospectus with the inclusion of its report and/or letter and/or opinion and/or the references to its name included in this Prospectus in the form and context in which it is respectively included.

As of the Latest Practicable Date, none of the experts named above has any shareholding interests in any member of our Group or the right (whether legally enforceable or not) to subscribe for or to nominate persons to subscribe for securities in any member of our Group.

**8. Binding Effect**

This prospectus shall have the effect, if an application is made in pursuance of this Prospectus, of rendering all persons concerned bound by all of the provisions (other than the penal provisions) of sections 44A and 44B of the Companies (Winding Up and Miscellaneous Provisions) Ordinance insofar as applicable.

**9. Taxation of holders of H Shares**

The sale, purchase and transfer of H Shares are subject to Hong Kong stamp duty if such sale, purchase and transfer are affected on the H Share register of members of our Company, including in circumstances where such transactions are effected on the Hong Kong Stock Exchange. The current rate of Hong Kong stamp duty for such sale, purchase and transfer on each of the purchaser and the seller is 0.1% of the consideration or, if higher, the fair value of the H Shares being sold or transferred.

**10. Bilingual prospectus**

The English language and Chinese language versions of this Prospectus are being published separately, in reliance upon the exemption provided by section 4 of the Companies (Exemption of Companies and Prospectuses from Compliance with Provisions) Notice (Chapter 32L of the Laws of Hong Kong).

**E. RELATED PARTY TRANSACTIONS**

Our Group entered into the related party transactions within the two years immediately preceding the date of this Prospectus as mentioned in Note 46 to the Accountants' Report set out in Appendix IA to this Prospectus.

**F. MISCELLANEOUS**

- (a) Save as disclosed in the section headed "History, Development and Corporate Structure" in this Prospectus, within the two years immediately preceding the date of this Prospectus:
  - (i) no share or loan capital of our Company or any of its subsidiaries has been issued or agreed to be issued or is proposed to be fully or partly paid either for cash or a consideration other than cash;
  - (ii) no share or loan capital of our Company or any of its subsidiaries is under option or is agreed conditionally or unconditionally to be put under option;
  - (iii) no founders or management or deferred shares of our Company or any of its subsidiaries have been issued or agreed to be issued;
  - (iv) no commissions, discounts, brokerages or other special terms have been granted (except in connection with the Underwriting Agreements) or agreed to be granted in connection with the issue or sale of any share or loan capital of our Company or any of its subsidiaries; and
  - (v) no commission has been paid or is payable for subscription, agreeing to subscribe, procuring subscription or agreeing to procure subscription of any share in our Company or any of its subsidiaries.
- (b) Our Group had not issued any debentures nor did it have any outstanding debentures or any convertible debt securities.
- (c) Our Directors confirm that:
  - (i) there has been no material adverse change in the financial or trading position or prospects of the Group since September 30, 2024 (being the date to which the latest audited consolidated financial statements of the Group were prepared);
  - (ii) there is no arrangement under which future dividends are waived or agreed to be waived; and

- (iii) there has not been any interruption in the business of the Group which may have or has had a significant effect on the financial position of the Group in the 12 months preceding the date of this Prospectus.
- (d) All necessary arrangements have been made to enable our H Shares to be admitted into CCASS for clearing and settlement.
- (e) Save for our A Shares which are listed on the Shanghai Stock Exchange and the H Shares to be issued in connection with the Global Offering, none of our equity and debt securities is listed or dealt with in any other stock exchange nor is any listing or permission to deal being or proposed to be sought.
