Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to*	• The model of the Dananhu No.2 Open-pit was constructed using Carlson SURVCAD software based on the original data in the Beijing 1954 coordinate system. The model database includes the collar coordinates and elevation of each borehole, the top and bottom depths of each lithology, and the coal quality data of each coal seam. The SURVCAD software can generate triangulated surface models for the roof and floor of each coal seam, thereby enabling the estimation of the spatial volume between them. The resource estimation is then calculated based on the apparent density of each seam. • The modeling utilized all borehole data within the mining area, and the extent of the resources was constrained by mine boundary, authorized mining elevation and topo showing the current pit-shell. The key parameters and assumptions used for the resource

Criteria	JORC Code explanation	Commentary
	the average sample spacing and the search employed. • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	estimation include: a density of 2.1 for partings, partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters. • The critical step in coal modeling data validation lies in seam correlation, which is conducted prior to database establishment. The Qualified Person (QP) first assesses the rationality of seam correlation through a comprehensive review of borehole data. Owing to the characteristics of layered deposits, upon model completion, the model itself can be integrated with geological rationality analysis to identify any anomalous data. • The resource estimation methodology for all underground mines and is detailed as follows: - Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. - Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. - Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data.

Criteria	JORC Code explanation	Commentary
		- Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. - Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). - Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. - Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. - In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent

Criteria	JORC Code explanation	Commentary
		dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: Lignite 15.7 MJ/kg. Bituminous Coal 17.0 MJ/Kg
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• The following assumptions are made specifically for open-pit mining: partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters. • The following assumptions are made specifically for underground mining: - All seams will be extracted by FM LW mining method (with/without sub-level caving capability). - In-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmen-	• *Assumptions made regarding possible waste and process residue*	• The Dananhu No.2 Open-pit Mining Right provided preliminary design

Criteria	JORC Code explanation	Commentary
tal factors or assumptions	*disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	report which covers dump site descriptions and environmental impact assessment report. The Dananhu Coalfield area is a designated major energy base, where approval process for waste dump site acquisition has been smooth for Dananhu No.2 Open-pit, and no obstacle in obtaining future sites for waste storage was identified. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.

Criteria	JORC Code explanation	Commentary
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.5 m thick at the Dananhu No.2 Open-pit and greater than 0.8 m

Criteria	JORC Code explanation	Commentary
		thick within other exploration rights. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated). - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited China Energy Guoyuan Power Co., Ltd in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for Dananhu No.2 Open-pit was provided, which is the typical mine design report for underground and open-pit coal mines in China, respectively, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated

Criteria	JORC Code explanation	Commentary
parameters		Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Preliminary Design Report for each mine was provided, which has the necessary mining design details for coal reserve estimation. Coal deposit depth is the main consideration in selecting underground or open-pit mining method. Dananhu No.2 Open-pit employs shovel-truck approach with semi-mobile crushing/bot transportation arrangement. • The coal seams of Dananhu No.2 Open-pit in the Dananhu Coalfield feature shallow occurrence with generally simple geological settings. The dry weather and weak water-bearing strata are benefit for open-pit mining. In addition, this area has only sparsely distributed population. The shovel-truck mining method is widely used in open-pit coal mines in China with abundant successful experiences. The selection of mining methods in the two mines is considered appropriate. • For Dananhu No.2 Open-pit, geotechnical parameters are designed based on the geotechnical testing of rock and coal strata. Since the mine had years of operating history, extension of mining started from the current location. Mining and geotechnical parameters are as follows: 
<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>
<table>
<tr><th>Sign</th><th>Parameter</th><th>Unit</th><th>Mining</th><th>Stripping</th></tr>
<tr><td>H</td><td>Bench Height</td><td>m</td><td>10</td><td>10</td></tr>

• The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.
• The infrastructure requirements of the selected mining methods.</td><td>• Not applicable
• For Dananhu No.2 Open-pit, OSD of 3% was considered for all the seams during mining.
• For Dananhu No.2 Open-pit, a 98% recovery factor was used
• Minimum mining working bench width used was 60 m for Dananhu No.2 Open-pit
• In Coal Reserve estimation, Inferred Coal Resources were excluded.
• Dananhu Coalfield is located in the eastern part of Xinjiang Uygur Autonomous Region, which is designated by the central and regional government to be a major energy base with numerous mines in operation and planned. Infrastructure needed for underground and open-pit mining operations are conveniently available such as power supply, transportation network, water supply, Telecommunication network, etc.</td></tr>
<tr><td>Metallurgical factors or assumptions</td><td>• The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.
• Whether the metallurgical process is well-tested technology or novel</td><td>• Dananhu No.2 Open-pit only has crusher systems to produce coal at different sizes.
The proposed coal processing arrangements are considered appropriate and can satisfy the requirement of product coal quality by the power plants.
• The crushing and screening and TDS technologies are all widely</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
	in nature.	adopted coal processing technologies and have been well tested throughout the coal industry in China.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• The two mines do not involve metallurgical testing. Instead, coal processing test work has been completed to assess the performance of crushing and screening and TDS dry separation. The test work is considered representative of the coal seams included in the Coal Reserve estimate.
	•	Product yield for Dananhu No.2 Open-pit used is 96% since only crushing and screening are involved.
	•	
	• *Any assumptions or allowances made for deleterious elements.*	• No deleterious elements
	• *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• The two subject mines have well-established coal processing history, thus no bulk sample or pilot scale test work is needed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Calorific Value and ash content parameters in coal quality are the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Each of the two subject mines provided preliminary design report which covers dump site descriptions and environmental impact assessment report. The Dananhu Coalfield area is a designated major energy base, where approval process for waste dump site acquisition has been smooth for Dananhu No.2 Open-pit, and no obstacle in obtaining future sites for waste storage was identified.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Dananhu Coalfield is located in the eastern part of Xinjiang Uygur Autonomous Region. Due to the well-developed coal industry and designated energy base status, infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, etc.

Criteria	JORC Code explanation	Commentary
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB30/t and RMB5/t of coal producing capacity were assumed for Dananhu No.2 Open-pit mines, respectively, which are typical for underground operations and large open-pit mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by each mine based on historical performance and adjusted for certain changes such as stripping ratio. The competent person extended the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.*	• No deleterious elements.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• The historical three-year average prices (VAT inclusive) were used for our economic analysis of each mine. Dananhu No.2 Open-pit: RMB138.75/t
	• *The source of exchange rates used in the study.*	• Exchange rates: not applicable
	• *Derivation of transportation charges.*	• Transportation charges are included in the operating costs and related to stripping ratio, which are adjusted accordingly in future operation projections.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting, which appears common for coal mines.
	• *The allowances made for royalties payable, both Government and private.*	• The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change.

Criteria	JORC Code explanation	Commentary
	• *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• The historical three-year average prices (VAT inclusive) were used for our economic analysis of each mine. Dananhu No.2 Open-pit: RMB138.75/t
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Most of coal products from the subject open-pit mines will supply the nearby power plants and local market. The Dananhu Coalfield is one of the major coal producing areas in Xinjiang and is a designated energy base. The coal products from the Dananhu No.2 Open-pit have consistent coal quality and are expected to continue its market share. • Coal prices have been slowly declining over the 2024-2025 period. The historical three-year average prices were used for our economic analysis of the mine.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimates the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%, as of 31 July 2025. NPV Under Various Sensitivity Cases (RMB Millions) Mine | 6.0% | 7.0% | Base Case (7.1%) | 8.0% | 9.0% | 10.0% Dananhu No.2 Open-pit | 4,540 | 4,015 | 3,958 | 3,571 | 3,195 | 2,873
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The mines recognize their social responsibility and have maintained cordial relationship with local government and society. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been

Criteria	JORC Code explanation	Commentary
	• *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the subject open-pit mine cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative	• *Where appropriate a statent of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure*	• The Ore Reserve estimate for the underground and open-pit operations may exhibit minor variance due to equipment-dependent

Criteria	JORC Code explanation	Commentary
accuracy/ confidence	*deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	minimum mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small. • The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained. • Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations. • No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-4 JORC Code, 2012 Edition – Table 1 – Dongsheng Coalfield

The Chahasu Mine controlled by Guodian Construction and Investment Inner Mongolia Energy Co., Ltd. is located in the Dongsheng Coalfield.

Section 1 Sampling Techniques and Data

The drilling activities of the Chahasu Mine has been stopped for over a decade. The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	• *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Topcon GTS-602 type GPS. The accuracy of the control points was evaluated using two sets of coordinate differences. The maximum difference between the two sets of coordinates was 0.17 meters, and the elevation difference was 0.12 meters. • The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>performance, and the measurement methods employed are correct and appropriate. A more than 10% random re-survey was conducted on 44 engineering boreholes in this area using the repeat observation method. The plane error of 98% of the drilling holes is within ±0.10 to ±0.15 meters. Elevation error: ≤ ±0.05 meters
• The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.
• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.
• Whether sample compositing has been applied.</td><td>• The drilling grids for different areas of Chahasu Mine in Dongsheng Coalfield are as follows:
<table><tr><th></th><th colspan="3">Mining Area</th><th colspan="3">Rsources %</th></tr><tr><th>Mining</th><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr><tr><td>Chahasu</td><td>500</td><td>1,000</td><td>2,000</td><td>59</td><td>26</td><td>15</td></tr></table>As shown in the table, the resources at Chahasu Mine have been well defined. The data spacing is adequate to establish geological and quality continuity.
• Sample compositing is not applicable to coal.</td></tr>
<tr><td>Orientation of data in relation to geological structure</td><td>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.
• If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</td><td>• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results.
• There is no bias for coal.</td></tr>
<tr><td>Sample security</td><td>• The measures taken to ensure sample security.</td><td>• The exploration activities date too far back in history, and the relevant information can no longer be traced.</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Chahasu Coal Mine: Type of Mining Right: Mining Right Mining Right Name: Inner Mongolia Autonomous Region Ordos City Dongsheng Coalfield Chahasu Coal Mine Mining Right Number: C1500002024071210157148 Area: 77.9515 km² Location: Dongsheng District, Ordos, Inner Mongolia Autonomous Region Ownership: Guodian Construction and Investment Inner Mongolia Energy Co., Ltd. (100% owned by China Energy) Currently no available information on material social and environmental issues. • Related coal mine in the Dongsheng Coalfield is Chahasu Mine. The mining right certificate for the mine is valid. No known impediments to maintain and renew such certificate were identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete the resources/reserves estimates for Chahasu Mine, the following exploration reports were provided for our review: =Reserves Verification Report for the Chahasu Mine, 2024 • It's the CP's opinion that the reports are reliable, and the drill hole

Criteria	JORC Code explanation	Commentary
		data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Chahasu Mine is situated in the eastern part of Dongsheng Coalfield, which is formed in the Jurassic Period. On a global basis, the geologic settings, or nature, of the Chahasu Mine is judged to vary from simple to moderate. While the strata are flat-lying, sand erosion and coal seam thinning are complicating factors in some mine areas. The Dongsheng Coalfield is an intracontinental coal-accumulating basin, which located in the northern sector of the Dongsheng–Jingbian Monocline, within the Yishan Monocline Zone of the Ordos Basin. The Ordos Basin forms a broad, gently sloping asymmetrical syncline characterized by a wide, gently dipping eastern limb and a comparatively steeper western limb. Structural complexity is largely confined to the margins of the basin, while the interior remains tectonically simple.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	explain why this is the case.	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
data	*method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The competent persons converted the data from the editable versions into the database for this resource estimate. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • The completed model was cross-checked and validated against the attached maps in the geological reports. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited Guodian Construction and Investment Inner Mongolia Energy Co., Ltd. in September 2025.

Criteria	JORC Code explanation	Commentary
		During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of the subject mine with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Competent Person converted the data from the editable versions into the database for this resource estimation. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. The completed resources/reserves figures were cross-checked and validated against the attached maps in the geological reports. If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like the Chahasu Mine is high. The competent persons for this report, through the review of borehole logs and geophysical logs for seam correlation, as well as subsequent model representation, consider the geological interpretation of the Chahasu Mine to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>regular pattern.
- Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as:
= Syndepositional structures leading to seam splitting and thinning.
= Post-depositional structures including erosion by paleochannels, and magmatic erosion.
• Factors compromising coal seam continuity encompass:
- Seam splitting and thinning.
- Erosion by paleochannels/up-lifting to surface/ igneous intrusions.
- Faulting.
- outcrop.</td></tr>
<tr><td>Dimensions</td><td>• The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</td><td>• The resources area is delineated by the authorized mine boundary, covering an area of 77.9515 km², with vertical mining elevation limits between +740 m to +1040 m. The following tables show the detailed characteristics of each seam at the subject mining right area:
<table><tr><th rowspan="2">Mine</th><th rowspan="2">Seam</th><th colspan="3">Thickness (m)</th><th rowspan="2">Distance from the Upper Seam (m)</th><th rowspan="2">Seam Depth Range (m)</th><th rowspan="2">Seam Dip (deg.)</th><th rowspan="2">Seam Occurrence</th></tr><tr><th>Coal</th><th>Parting</th><th>Seam</th></tr><tr><td>Chahasu</td><td>2-2U</td><td>2.2</td><td>0.01</td><td>2.2</td><td>-</td><td>221 - 449</td><td>2-NW</td><td>Moderate</td></tr><tr><td></td><td>3-1</td><td>4.0</td><td>0.21</td><td>4.2</td><td>39</td><td>258 - 485</td><td>2-NW</td><td>Moderate</td></tr><tr><td></td><td>4-1</td><td>1.7</td><td>0.11</td><td>1.8</td><td>20</td><td>288 - 513</td><td>2-NW</td><td>Moderate</td></tr><tr><td></td><td>5-1</td><td>1.5</td><td>0.05</td><td>1.5</td><td>28</td><td>317 - 524</td><td>2-NW</td><td>Moderate</td></tr><tr><td></td><td>5-2</td><td>1.2</td><td>0.09</td><td>1.3</td><td>8</td><td>326 - 551</td><td>2-NW</td><td>Moderate</td></tr><tr><td></td><td>6-1M</td><td>1.0</td><td>0.05</td><td>1.1</td><td>20</td><td>343 - 536</td><td>2-NW</td><td>Eratic</td></tr><tr><td></td><td>6-2U</td><td>3.7</td><td>0.15</td><td>3.9</td><td>22</td><td>361 - 592</td><td>2-NW</td><td>Eratic</td></tr><tr><td></td><td>6-2M</td><td>1.4</td><td>0.07</td><td>1.5</td><td>5</td><td>364 - 543</td><td>2-NW</td><td>Uniform</td></tr></table></td></tr>
<tr><td>Estimation and modelling</td><td>• The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance</td><td>The resource estimation methodology is detailed as follows:
• Database Establishment: Transfer data into Excel, including:</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
techniques	*of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area

Criteria	JORC Code explanation	Commentary
		boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: 17.0 MJ/kg
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be*	• The following assumptions are made specifically for underground mining: - All seams will be extracted by FM LW mining method (with/without sub-level caving capability). • in-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.

Criteria	JORC Code explanation	Commentary
	reported with an explanation of the basis of the mining assumptions made.	
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• The Chahasu Mine provided environmental impact assessment report. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the

Criteria	JORC Code explanation	Commentary
	evaluation process of the different materials.	competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Criteria	JORC Code explanation	Commentary
	• *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.8 m thick for bituminous thermal coal as presented at Dongsheng Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated) and barrier areas along main roadway development for mine plans. - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and*	• The Competent Person, Mr. Jisheng Han visited Chahasu in

Criteria	JORC Code explanation	Commentary
	the outcome of those visits. • *If no site visits have been undertaken indicate why this is the case.*	September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of Chahasu mine with technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for Chahasu Mine was provided, which is the typical mine design report for coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Preliminary Design Report for Chahasu Mine was provided, which has the necessary mining design details for coal reserve estimation. The initial mining method selected is FM LW. • Seam thickness is the major factor considered in selecting the underground mining method. FM LW method is widely used in underground coal mines in China. The selection of mining method in Chahasu Mine is considered appropriate in terms of the seam thickness and general occurrence as well as the design output capacity. • Ground control in the LW faces are provided by hydraulic shields, which are designed by evaluating various factors including the mining

Criteria	JORC Code explanation	Commentary
		depth, the roof strata structure and mining heights. Roadway support features mainly roof bolts with mesh wires and cables.
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).*	• Not applicable
	• *The mining dilution factors used.*	• OSD of 0.05-0.1 m roof rock was considered for most seams during mining.
	• *The mining recovery factors used.*	• An 85% recovery factor was used.
	• *Any minimum mining widths used.*	• LW faces are generally designed at fixed width.
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded from LW panels.
	• *The infrastructure requirements of the selected mining methods.*	• Dongsheng Coalfield is located in the Ordos area of Inner Mongolia, which is the most famous coal-producing region in China. Due to the well-developed coal industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Chahasu is designed to adopt TDS and the heavy media vessel technologies to process the ROM coal, which is widely used in the Dongsheng Coalfield mines. The proposed coal processing arrangement is considered appropriate and can satisfy the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The TDS and heavy media vessel technologies are all widely adopted coal processing technologies and have been well tested.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Chahasu Mine has well-established coal processing history. Actual amount of coal being processed is determined by customer requirements and market conditions. The coal recovery factor (or

Criteria	JORC Code explanation	Commentary
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	yield) for each seam is estimated based on the percentage of partings and OSD for each seam, and assumption on coal loss and moisture gain during processing. • No deleterious elements • Chahasu Mine has well-established coal processing history, thus no bulk sample or pilot scale test work is needed. • Calorific Value and ash content parameters in coal quality is the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmen-tal	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Chahasu Mine provided environmental impact assessment report. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Dongsheng Coalfield is located in the Ordos area of Inner Mongolia, which is major coal-producing region in China. Due to the well-developed coal industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB30/t of coal producing capacity was assumed which is typical for underground mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by Chahasu based on historical

Criteria	JORC Code explanation	Commentary
		operating performance, which appears appropriate. The competent person extended the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.* • *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• No deleterious elements. • The historical three-year average coal price at RMB597.3/t VAT inclusive was used for our economic analysis of Chahasu Mine. • Exchange rates: not applicable • Transportation charges account for only a small portion of the costs for underground mines, and are included in the operating costs. • Penalties for such failure were not considered in forecasting. • The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Geological conditions over the projection period are consistent with recent experience from nearby mines; no material coal quality change. • The historical three-year average coal price at RMB597.3/t VAT inclusive was used for our economic analysis of Chahasu Mine.
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Coal produced by Chahasu Mine will be mainly used to supply the on-site Bulian Power Plant; the remaining portion is sold by China Energy using its national sales network, which minimizes the market risk. • The historical three-year average coal price at RMB597.3/t VAT inclusive was used for our economic analysis of Chahasu Mine.

Criteria	JORC Code explanation	Commentary
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimate the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%, as of 31 July 2025. NPV Under Various Sensitivity Cases (RMB Millions) Base Case Mine | 6.00% | 7.00% | (7.1%) | 8.00% | 9.00% | 10.00% Chahasu | 7,977 | 7,331 | 7,259 | 6,762 | 6,258 | 5,808
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The mine recognizes its social responsibility and has maintained cordial relationships with local government and society. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource

Criteria	JORC Code explanation	Commentary
		areas. Under normal conditions as in the Chahasu case, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.*	• The Ore Reserve estimate for the underground operation may exhibit minor variance due to equipment-dependent mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for

Criteria	JORC Code explanation	Commentary
	remaining areas of uncertainty at the current study stage. • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	underground longwall or continuous mining operations. • No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-5 JORC Code, 2012 Edition – Table 1 – Hedong Coalfield

The Ciyaogou and Shaping mines controlled by Shanxi Jinshen Energy Co., Ltd., Shangyuquan Mine and the Data and Huangbai exploration right areas controlled by China Energy Guoyuan Power Co., Ltd, are located in the Hedong Coalfield. These properties are adjacent to each other.

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• All coal seam samples were collected in accordance with China's "Regulations on the Collection of Coal Samples for Coal Resource Exploration". All seams with a thickness greater than the minimum minable thickness (0.8 m for the coal seams in Hedong Coalfield) are sampled by core logging. The sampling thickness for each interval is typically less than 3 meters. For multi-layer coal seams, each individual coal layer is to be sampled separately, while partings and carbonaceous mudstone are also sampled independently. When the thickness of a parting exceeds 0.10 meters, only 0.10 meters is collected. The samples are described layer by layer according to specified requirements. After sorting and cleaning, the length and weight recovery rates are calculated. Finally, the samples are packaged, boxed, and sent to the testing laboratory along with the sample submission forms and coal sample summary sheets.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Core drilling was employed. Hard rock strata are drilled using PDC (Polycrystalline Diamond Compact) bits or surface-set diamond bits. Double split core barrels were used for coal. Coal Core diameter is 63.5 mm. All holes are vertical holes.

Criteria	JORC Code explanation	Commentary
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.*	• Core recovery was determined by measuring the sample length and weight, which was later compared with the geophysical logs that were run after the hole was completed. According to Chinese Standard, the minimum acceptable linear and weight recovery requirements are 75% and 60%, respectively. Seam cores with lower recoveries were not analyzed per Chinese standards. While these minimum recoveries are lower than some international standards, actual core recoveries were generally higher.
	• *Measures taken to maximise sample recovery and ensure representative nature of the samples.*	• During rock stratum drilling, a single-tube core barrel is typically employed. When the drillers determine that the coal seam has been entered based on the returning drilling mud, they switch to a double-tube coal coring tool and appropriately adjust the drilling rate and pressure to ensure coal core recovery.
	• *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• There was no obvious relationship found between coal core recovery and coal quality.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.*	• All core samples were lithologically logged and described using standardized codes for rock type, grain size, color, and Rock Quality Designation (RQD). Core photos were taken before logging. Logging was initially recorded on paper forms at the site and then entered into a spreadsheet in the office afterwards.
	• *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• All drill holes also underwent geophysical logging to verify parameters such as the thickness of lithological strata in the coal-bearing sequence, coal seam structure, hole diameter, and deviation. Logs run include natural gamma, density, resistivity, calliper, and vertical deviation.
Sub-sampling	• *If core, whether cut or sawn and whether quarter, half or all core taken.*	• Sub-sampling techniques are not applicable to coal. The entire core for all mineable coal seams was sampled and there was no

Criteria	JORC Code explanation	Commentary
techniques and sample preparation	• *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	subsampling.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Samples taken for analytical testing were delivered to a licensed laboratory where individual samples were weighed, air dried, crushed, and riffled according to Chinese standards. Subsamples of the riffled samples are taken for various analyses, with the remainder of the sample retained for future analyses. • The laboratories conduct quality control procedures, including sending duplicates to other labs and internal audits.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.*	• Due to large-scale occurrence and consistent coal quality, the verification of significant intersections is not applicable to coal projects. • Twinned holes were generally not drilled. • Data recording field work, such as core logging, sampling records were handwritten and was scanned and transferred to electronic version after the field work was completed. Laboratories use electronic data entry system at each testing station.

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td>• Discuss any adjustment to assay data.</td><td>• No adjustments were made to the assay data.</td></tr>
<tr><td>Location of data points</td><td>• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.
• Specification of the grid system used.
• Quality and adequacy of topographic control.</td><td>• Topographic surveying for the project area utilized aerial photogrammetric outputs at a scale of 1:5000. Digital mapping was based on 3 National Class II control points and 3 GPS Class D control points. The delineation of mined-out areas and topographic control employed the Xi'an 1980 Coordinate System and the National 1985 Height Datum. The overall accuracy is assessed as good.
• For boreholes drilled prior to 1965, inclination was measured using the hydrofluoric acid glass tube method, achieving an accuracy better than 3° per 100 meters. The quality of geophysical logging in historical boreholes is generally considered good.
• Considering the accuracy of the integrated topographic control, borehole surveys, and underground surveys, along with the continuous geometry of the coal seams, the quality of the existing survey data is suitable for coal Resource estimation conducted in accordance with the JORC Code (2012).</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.</td><td>• The drilling grids for different areas of each of the subject Jinshen Energy and Guoyuan Power properties in Hedong Coalfield are as follows:
<table>
<tr><th rowspan="2">Mining/Exploration Right</th><th colspan="3">Mining Area</th><th colspan="3">Rsources %</th></tr>
<tr><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr>

</table></td></tr>
<tr><td></td><td>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral</td><td>• As shown in the table, the resources at all properties, except for the Data Exploration Right, have been well defined. The data spacing at</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
	Resource and Ore Reserve estimation procedure(s) and classifications applied.	Ciyaogou, Shaping, Shangyuquan mining rights, and Huangbai Exploration right Area is adequate to establish geological and quality continuity. • The Data Exploration Right were moderately drilled and further drilling are needed for further feasibility study.
	• *Whether sample compositing has been applied.*	• Sample compositing is not applicable to coal.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results. • There is no bias for coal.
Sample security	• *The measures taken to ensure sample security.*	• All samples were packaged in double-layer heavy-duty plastic sampling bags, which were then wrapped and sealed with adhesive tape to ensure the samples remain free from damage or contamination during storage and transportation. All samples taken were temporarily stored at the field office of the exploration team and are regularly sent to the designated laboratory by a designated person.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary

		was identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected mining/exploration rights located in the Hedong Coalfield, the following exploration reports were provided for our review: - Ciyaogou Mine: = Production Geology Report for the Ciyaogou Mine, April 2023 - Shaping Mine: = Supplementary Exploration Geological Report for the Shaping Mine, August 2021 - Shangyuquan Mine: = Annual Reserves Verification Reports for Years 2021 to 2024 = Geological Classification Report for the Shangyuquan Mine, May 2022 = Geology Report for the Shangyuquan Mine, March 2022 - Data Mine: = Exploration Geology Report for the Data Mine, January 2023 - Huangbai Mine: = Exploration Geological Classification Report for the Huangbai Mine, May 2004 = Additional Exploration Geology Report for the Huangbai Mine, June 2012 • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based

Criteria	JORC Code explanation	Commentary
		on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Hedong Coalfield is situated at the northern terminus of the Baode-Linxian Block Sag within the Ordos Depression of the North China Plate. Regional structural trends predominantly align NE-NNE, with localized NW-trending structures. Key tectonic features include: 1) the Qingshui Graben, comprising two 310 degrees striking normal faults extending southeast from Shaanxi; 2) the Fanjialiang-Xinyao Syncline, a NNW-trending broad fold with Shanxi Formation at its core; 3) the Tianqiao Horst formed by three 300 degrees striking normal faults exposing Ordovician strata; and 4) the Tiejiangpu Graben with three NEE-trending normal faults (>250 m displacement) exposing purple mudstone. The structural domain is characterized by fault-block systems and broad folds, with negligible magmatic activity. • The mine field forms a gently NW-dipping monocline with dip angles typically ranging from 3 degrees to 5 degrees. The southern sector develops three broad, gentle folds consisting of one syncline and two anticlines, all trending NW-SE with limb dips of approximately 2 degrees-3 degrees. These folds exhibit simple geometry and high structural reliability. A total of 25 normal faults has been identified, with 11 exposed during mining of the No. 8 Seam and 13 in the No. 13 Seam. These faults generally display displacements of 0.3-3.6

Criteria	JORC Code explanation	Commentary
		meters, characterized by limited scale and non-conductive hydrologic properties, resulting in minimal impact on mining operations. No magmatic intrusions have been documented within the mining area. Overall, the structural framework is dominated by small-scale normal faults and broad folds, indicating low to moderate structural complexity throughout the deposit.

Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:*
	  ○ *easting and northing of the drill hole collar*
	  ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar*
	  ○ *dip and azimuth of the hole*
	  ○ *down hole length and interception depth*
	  ○ *hole length.*
	• *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*
		• Not applicable as no Exploration Results included in the report.

Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The competent persons converted the data from the editable versions into the database for this resource estimate. The database was verified using Carlson SURVCAD before modeling. • The completed model was cross-checked and validated against the attached maps in the geological reports. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited China Energy Guoyuan Power Co., Ltd. and Shanxi Jinshen Energy Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Competent Person converted the data from the editable versions into the database for this resource estimation.

Criteria	JORC Code explanation	Commentary
	• *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like the subject mining right areas and/or exploration right areas is high. The competent persons for this report, through the review of borehole logs and geophysical logs for seam correlation, as well as subsequent model representation, consider the geological interpretation of the subject mining right areas and/or exploration right areas to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - outcrop.

Criteria	JORC Code explanation	Commentary
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The resources area is delineated by the authorized mine boundary, with vertical mining elevation limits as follows: - Ciyaogou: from780 m to 1,100 m - Shaping: from 700 m to 990 m - Shangyuquan: from 680 m to 1,030 m - Data: No elevation-related constraints - Huangbai: No elevation-related constraints • The following tables show the detailed characteristics of each seam of each mine

Mine	Seam	Thickness (m)			Distance from the Upper Seam (m)	Seam Depth Range (m)	Seam Dip (deg.)	Seam Occurrence
		Coal	Parting	Seam				
Ciyaogou	10-2	5.74	0.57	6.30	-	46 - 168	4-W	Uniform
	13	11.91	1.15	13.06	18	10 - 220	4-W	Uniform
Shaping	9	3.06	0.25	3.31	-	21 - 201	4-W	Moderate
	10	1.69	0.09	1.78	5	31 - 213	4-W	Moderate
	11	1.86	0.03	1.89	7	35 - 218	4-W	Moderate

Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.*	The resource estimation methodology is detailed as follows: • Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal

Criteria	JORC Code explanation	Commentary
	• *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent

Criteria	JORC Code explanation	Commentary
		dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: 17.0 MJ/kg
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• The following assumptions are made specifically for underground mining: - All seams will be extracted by FM LW mining method (with/without sub-level caving capability). • in-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmen-	• *Assumptions made regarding possible waste and process residue*	• Each of the Shangyuquan, Ciyaogou and Shaping mines provided

Criteria	JORC Code explanation	Commentary
tal factors or assumptions	*disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	environmental impact assessment reports. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the

Criteria	JORC Code explanation	Commentary
	data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data). • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data.

Criteria	JORC Code explanation	Commentary
conversion to Ore Reserves	*additional to, or inclusive of, the Ore Reserves.*	- Review of seam correlation. - Identification of coal seam occurrence greater than 0.8 m thick for bituminous thermal coal as presented at the Hedong Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated) and barrier areas along main roadway development for mine plans. - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han visited Shaping, Ciyaogou and Shangyuquan mines located in the Hedong Coalfield during September 1-2, 2025. During the site visit, the Competent Person observed the mine operations, collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources*	• A Preliminary Design Report for each of the Shangyuquan, Shaping

Criteria	JORC Code explanation	Commentary
	to be converted to Ore Reserves. • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	and Ciyaogou mines was provided, which is the typical mine design report for coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).*	• Preliminary Design Report for each mine was provided, which has the necessary mining design details for coal reserve estimation. The mining method selected: - Shangyuquan is FM LW - Ciyaogou: FM LW SLC - Shaping: FM LW and FM LW SLC
	• *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• Seam thickness is the major factor considered in selecting the mining method. Typically, the threshold seam thickness for sublevel caving mining is approximately 4.5-6.0 m. Both FM LW and FM LW SLC methods are widely used in underground coal mines in China. The selection of mining methods in the three mines are considered appropriate in terms of the seam thickness and general occurrence as well as the design output capacity.
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Ground control in the LW faces are provided by hydraulic shields, which are designed by evaluating various factors including the mining depth, the roof strata structure and mining heights. Roadway support features mainly roof bolts with mesh wires and cables.
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).*	• Not applicable

Criteria	JORC Code explanation	Commentary
	• *The mining dilution factors used.*	• OSD of 0.1 m roof rock was considered for most seams during mining.
	• *The mining recovery factors used.*	• An 85% recovery factor was used.
	• *Any minimum mining widths used.*	• LW faces are generally designed at fixed width.
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded from LW panels.
	• *The infrastructure requirements of the selected mining methods.*	• Hedong Coalfield is located in the western part of Shanxi Province. Due to the well-developed coal industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Shangyuquan adopts jig technology to process the coarse coal and the 3-product heavy media cyclone technology to process the fine coal. Shaping uses roller crusher to break the coarse coal and then uses the heavy media vessel technology for fine coal processing. Ciyaogou does not have coal processing facilities but outsources its ROM coal to a nearby third-party processing plant. The proposed coal processing arrangement is considered appropriate and can satisfy the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The jig, 3-product heavy media cyclone and heavy media vessel technologies are all widely adopted coal processing technologies and have been well tested for decades.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Shangyuquan, Ciyaogou and Shaping mines have well-established coal processing history. Actual amount of coal being processed is determined by customer requirements and market conditions. The coal recovery factor (or yield) for each seam is estimated based on

Criteria	JORC Code explanation	Commentary
		the percentage of partings and OSD for each seam.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• No deleterious elements • Shangyuquan, Ciyaogou and Shaping mines have well-established coal processing history, thus no bulk sample or pilot scale test work is needed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Calorific Value parameter in coal quality is the main focus for thermal coal. In the Coal Reserve estimation process, such parameter has been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Each of the Shangyuquan, Ciyaogou and Shaping mines provided environmental impact assessment reports. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Hedong Coalfield is located in the western part of Shanxi Province. Due to the well-developed coal industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB30/t of coal producing capacity was assumed which is typical for underground mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by each mine based on historical

Criteria	JORC Code explanation	Commentary
		performance and adjusted for certain changes. The competent person extend the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.*	• No deleterious elements.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• The historical three-year average prices were used for our economic analysis of each mine. Shangyuquan: RMB342/t VAT inclusive Ciyaogou: RMB421.75/t VAT inclusive Shaping: RMB382.5/t VAT inclusive
	• *The source of exchange rates used in the study.*	• Exchange rates: not applicable
	• *Derivation of transportation charges.*	• Transportation charges account for only a small portion of the costs for underground mines, and are included in the operating costs.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting, which appears common for coal mines.
	• *The allowances made for royalties payable, both Government and private.*	• The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• The historical three-year average prices were used for our economic analysis of each mine. Shangyuquan: RMB342/t VAT inclusive Ciyaogou: RMB421.75/t VAT inclusive Shaping: RMB382.5/t VAT inclusive
Market	• *The demand, supply and stock situation for the particular commodity,*	• Most of coal products from Shangyuquan Mine will supply the nearby

Criteria	JORC Code explanation	Commentary
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the Shangyuquan, Ciyaogou and Shaping cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.

Criteria	JORC Code explanation	Commentary
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• The Ore Reserve estimate for the underground operation may exhibit minor variance due to equipment-dependent mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small. • The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained. • Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations. • No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-6 JORC Code, 2012 Edition – Table 1 – Helanshan Coalfield

The Huangbaici, Suhaitu and Wuhushan mines controlled by China Energy Wuhai Energy Co., Ltd. are located in the Helanshan Coalfield. These properties are adjacent to each other. Suhaitu is recovering the remaining coal pillars and no JORC Coal Resources are estimated.

Section 1 Sampling Techniques and Data

All the three mines have similar long history of operation, with the drilling activities of the three mines started in 1950s. The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. The latest drilling activity applicable for coal quality verification and seam correlation at Helanshan Coalfield were conducted decades ago. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	sample preparation technique. • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Historical geological surveying in this area commenced in the 1950s. Recent underground surveys have been conducted using theodolites and total stations, with accuracy complying with underground surveying specifications. The mined-out areas surveyed in 2019 were measured by a Grade B qualified unit and reviewed by the competent

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>authority, utilizing the Xi'an 1980 Coordinate System and the National 1985 Height Datum. The control network was properly established with no systematic errors observed. Topographic maps were produced through aerial photogrammetry at scales of 1:2,000 and 1:5,000, with complete control and benchmark points. Both horizontal and vertical accuracy meet the requirements for resource estimation.
• The boreholes utilized in this study are predominantly from the 1950s-1960s. Historical borehole inclination surveys were conducted using glass tube or electronic inclinometers, generally showing deviations of <2-3°/100m, with individual exceeding holes corrected. Classified under current standards, most are rated as Grade B or C. Overall quality is considered acceptable given the technological context of the period and suitable for coal seam interpretation.
• Considering the integrated accuracy of topographic control, borehole surveys, and the continuous geometry of the coal seams, the quality of the existing survey data is suitable for Coal Resource estimation conducted in accordance with the JORC Code (2012).</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.
• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.
• Whether sample compositing has been applied.</td><td>• The drilling grids for different areas of each of the subject mining rights in Helanshan Coalfield are as follows:
<table><tr><th></th><th colspan="3">Mining Area</th><th colspan="3">Rsources %</th></tr><tr><th>Mining/Exploration Right</th><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr><tr><td>Huangbaici</td><td>500</td><td>500</td><td>500</td><td>76</td><td>9</td><td>15</td></tr><tr><td>Wuhushan</td><td>500</td><td>1,000</td><td>1,000</td><td>59</td><td>38</td><td>3</td></tr></table>• As shown in the table, the resources at both properties have been well defined. The data spacing is adequate to establish geological and quality continuity.
• Sample compositing is not applicable to coal.</td></tr>
<tr><td>Orientation of</td><td>• Whether the orientation of sampling achieves unbiased sampling of</td><td>• For coal seams, as long as full seam interval sampling is achieved,</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
data in relation to geological structure	*possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	the sampling orientation has virtually no impact on the results. • There is no bias for coal.
Sample security	• *The measures taken to ensure sample security.*	• All samples were packaged in double-layer heavy-duty plastic sampling bags, which were then wrapped and sealed with adhesive tape to ensure the samples remain free from damage or contamination during storage and transportation. All samples taken were temporarily stored at the field office of the exploration team and are regularly sent to the designated laboratory by a designated person.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Huangbaici Coal Mine: Type of Mining Right: Mining Right Mining Right Name: China Energy Wuhai Energy Co., Ltd. Huangbaici Coal Mine Mining Right Number: C100000201201114012241O Area: 5.7933 km² Location: Wuda District, Wuhai City, Inner Mongolia Autonomous Region Ownership: China Energy Wuhai Energy Co., Ltd. (100% owned by China Energy directly and/or via subsidiaries)

Criteria	JORC Code explanation	Commentary
		According to the EIA and/or exploration report of the project, the mine does not involve environmentally sensitive areas such as nature reserves or cultural relics. All residents within the mine area were relocated by China Energy Wuhai Energy Co., Ltd. in 2010, and the project site is far from urban areas. • Wuhushan Coal Mine: Type of Mining Right: Mining Right Mining Right Name: China Energy Wuhai Energy Co., Ltd. Wuhushan Coal Mine Mining Right Number: C100000201201114012241 2 Area: 8.0834 km² Location: Wuda District, Wuhai City, Inner Mongolia Autonomous Region Ownership: China Energy Wuhai Energy Co., Ltd. (100% owned by China Energy directly and/or via subsidiaries) According to the EIA and/or exploration report of the project, there are no sensitive protection targets such as national nature reserves, scenic spots, or cultural relics protection units within the mine area. • Suhaitu Coal Mine: Type of Mining Right: Mining Right Mining Right Name: China Energy Wuhai Energy Co., Ltd. Suhaitu Coal Mine Mining Right Number: C100000201201114012237 8

Criteria	JORC Code explanation	Commentary
		Area: 11.0057 km² Location: Wuda District, Wuhai City, Inner Mongolia Autonomous Region Ownership: China Energy Wuhai Energy Co., Ltd. (100% owned by China Energy directly and/or via subsidiaries) Currently no available information on material social and environmental issues. • Related coal mines in the Helanshan Coalfield include Huangbaici, Suhaitu and Wuhushan mines. The mining right certificates and exploration right certificates for these are all valid. Suhaitu will be closed once the coal pillars recovery operation is completed. No known impediments to maintain and renew the mining right certificates for Huangbaici and Wuhushan was identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected mining/exploration rights located in the Helanshan Coalfield, the following exploration reports were provided for our review: - Huangbaici Mine: = Reserves Verification Report for the Huangbaici Mine，2019 = Annual Reserves Verification Reports for the Huangbaici Mine for Years 2020 to 2025 - Wuhushan Mine: = Detailed Exploration Report for the Wuhushan No.1 Mine, Wuda Mining Area, Northern Helan Mountain Coalfield, October 1964

Criteria	JORC Code explanation	Commentary
		= Supplementary Hydrogeological Exploration Report for the Wuda Mining Area, April 2011 = Reserves Verification Report for the Wuhushan Mine, Wuda Mining Area, Helan Mountain Coalfield, February 2019 = Production Geology Report for the Wuhushan Mining Company, China Energy Wuhai Energy Co., Ltd., November 2024 = Annual Reserves Verification Reports for the Wuhushan Mine for Years 2020 to 2024 • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The three subject mines are situated within the Wuda Mining Area, which was developed near NS-trending structures by the late Mesozoic Yanshanian movement. The subsequent Cenozoic Himalayan orogeny superimposed roughly EW-trending structures, which cut the earlier systems, forming multiple isolated coal-bearing synclines, including the Wuda syncline. Thrust by the Wuda reverse fault, the syncline's western limb forms an east-dipping monocline.

Criteria	JORC Code explanation	Commentary
		Central strata strike NS and dip east, bending eastward and closing at the ends. • The three subject mines are located in the central western limb of the Wuda Syncline. Due to truncation by the Wuda thrust fault on the eastern side, the field forms a broadly east-dipping monoclinal structure, striking approximately north-south with dips of 3–13°, increasing to 12–17° near the fault. • The structure of the subject mines is dominated by faults, with folds mainly developed in the eastern area near the Wuda thrust fault. These folds have roughly north-south trending axes and are generally normal and slightly asymmetric, with local overturning. Major folds include the Liangjiagou (striking over1000 m, symmetrical), Bei 111 (striking over 400 m, locally tight and overturned), and Chenjiagou (striking over 600 m, tight in the north, gentle in the south). • Suhaitu is recovering the remaining coal pillars and no JORC Coal Resources are estimated.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other	• *Other exploration data, if meaningful and material, should be reported*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
substantive exploration data	*including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The competent persons converted the data from the editable versions into the database for this resource estimate. The database was verified using Carlson SURVCAD before modeling. • The completed model was cross-checked and validated against the attached maps in the geological reports. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited China Energy Wuhai Energy

Criteria	JORC Code explanation	Commentary
	• *If no site visits have been undertaken indicate why this is the case.*	Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource estimation. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like Wuhai Energy mines in Zhuozishan Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, considers the geological interpretation of the Wuhai Energy mines in Zhuozishan Coalfield to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>paleochannels, and magmatic erosion.
• Factors compromising coal seam continuity encompass:
- Seam splitting and thinning.
- Erosion by paleochannels/up-lifting to surface/ igneous intrusions.
- Faulting.
- outcrop.</td></tr>
<tr><td>Dimensions</td><td>• The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</td><td>• The resources area is delineated by the authorized mine boundary, with vertical mining elevation limits as follows:

• Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
	• *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation

Criteria	JORC Code explanation	Commentary
		limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: 17.0 MJ/kg
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions*	• The following assumptions are made specifically for underground mining: - All seams will be extracted by FM LW mining method (with/without sub-level caving capability). • in-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.

Criteria	JORC Code explanation	Commentary
	made.	
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Each of the Huangbaici and Wuhushan mines provided environmental impact assessment report. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk

Criteria	JORC Code explanation	Commentary
		density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.7 m thick for coking coal as presented at the Helanshan Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated) and barrier areas along main roadway development for mine plans. - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han, and Senior Geologist, Mr. Yongliang Xing, visited Wuhai Energy in September 2025. During the site visit, the Competent Person observed the mine operations, collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future

Criteria	JORC Code explanation	Commentary
		plans of each subject mine with corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Coal Resources Development and Utilization Plan for each of the Huangbaici and Wuhushan mines was provided, which is the typical mine feasibility study document for coal mines in China, generally considered comparable to the Pre-Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).*	• Coal Resources Development and Utilization Plan for each mine was provided, which has the necessary mining design details for coal reserve estimation. The mining method selected for both mines is FM LW.
	• *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• Seam thickness is the major factor considered in selecting the mining method. Typically, the coal seam thickness at Huangbaici Mine ranges from 0.9 m to 3.8 m, and the coal seam thickness at Wuhushan Mine ranges from 0.9 m to 4.0 m, which makes the FM LW method the best choice for coal excavation. The FM LW methods are widely used in underground coal mines in China. The selection of mining methods in the two mines is considered appropriate in terms of the seam thickness and general occurrence as well as the design output capacity.
	• *The assumptions made regarding geotechnical parameters (eg pit*	• Ground control in the LW faces are provided by hydraulic shields,

Criteria	JORC Code explanation	Commentary
	slopes, stope sizes, etc), grade control and pre-production drilling.	which are designed by evaluating various factors including the mining depth, the roof strata structure and mining heights. Roadway support features mainly roof bolts with mesh wires and cables.
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).*	• Not applicable
	• *The mining dilution factors used.*	• OSD of 0.05 - 0.1 m roof rock for Huangbaici, 0.05 – 0.2 m roof rock for Wuhushan rock were considered for most seams during mining.
	• *The mining recovery factors used.*	• An 85% recovery factor was used.
	• *Any minimum mining widths used.*	• LW faces are generally designed at fixed width.
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded from LW panels.
	• *The infrastructure requirements of the selected mining methods.*	• Helanshan Coalfield is located in the western part of Inner Mongolia. Due to the well-developed coal industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Huangbaici adopts jig and crush-screening technologies to process the coarse coal and the 3-product heavy media cyclone technology to process the fine coal. Wuhushan uses TDS technology for coarse coal processing, and uses the 3-product heavy media cyclone technology to process the fine coal. The proposed coal processing arrangement is considered appropriate and can satisfy the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The jig and 3-product heavy media cyclone technologies are all widely adopted coal processing technologies and have been well tested for decades.

Criteria	JORC Code explanation	Commentary
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Huangbaici and Wuhushan mines have well-established coal processing history. Actual amount of coal being processed is determined by customer requirements and market conditions. The coal recovery factor (or yield) for each seam is estimated based on the percentage of partings and OSD for each seam.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• No deleterious elements • Huangbaici and Wuhushan mines have well-established coal processing history, thus no bulk sample or pilot scale test work is needed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• The coal type at Helanshan Coal field is mainly coking coal or fat coal which are used in the coking industry. The inherent caking index of the clean coal satisfies the coking requirements (>90%) while the processing is mainly for ash and sulphur content control. Clean coal for coking purpose generally requires the ash content below 10.5%, and sulphur content below 1.8% for medium-sulphur coking coal and below 3.2% for high-sulphur coking coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmen-tal	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Each of the Huangbaici and Wuhushan mines provided environmental impact assessment report. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk*	• Helanshan Coalfield is located in the western part of Inner Mongolia near Wuhai City. Due to the well-developed coal industry,

Criteria	JORC Code explanation	Commentary
	commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.	infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB30/t of coal producing capacity was assumed which is typical for underground mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by each mine based on historical performance and adjusted for certain changes. The competent person extended the projection period to the year when the Coal Reserves are depleted.
	• *Allowances made for the content of deleterious elements.* • *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• No deleterious elements. • The historical three-year average prices were used for our economic analysis of each mine. Huangbaici: RMB775/t VAT inclusive Wuhushan: RMB703/t VAT inclusive
	• *The source of exchange rates used in the study.* • *Derivation of transportation charges.*	• Exchange rates: not applicable • Transportation charges account for only a small portion of the costs for underground mines, and are included in the operating costs.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting, which appears common for coal mines.
	• *The allowances made for royalties payable, both Government and*	• The mines already paid the mining right fees in obtaining the mining

Criteria	JORC Code explanation	Commentary
	private.	rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change. • The historical three-year average prices were used for our economic analysis of each mine. Huangbaici: RMB775/t VAT inclusive Wuhushan: RMB703/t VAT inclusive
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• The clean coal products from Huangbaici and Wuhushan mines are used as coking coal to supply the coking and steel industry. Helanshan Coalfield is a well-developed coalfield with a mature coal market. The coal products from the mines have consistent coal quality and are expected to continue their market share. • Coal prices have been slowly declining over the 2024-2025 period. The historical three-year average prices were used for our economic analysis of each mine. Huangbaici: RMB775/t VAT inclusive Wuhushan: RMB703/t VAT inclusive
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimate the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%,

Criteria	JORC Code explanation	Commentary
	• *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	as of 31 July 2025. NPV Under Various Sensitivity Cases (RMB Millions) Base Case Mine | 6.00% | 7.00% | (7.1%) | 8.00% | 9.00% | 10.00% Huangbaici | 159 | 49 | 37 | -47 | -131 | -204 Wuhushan | 152 | 67 | 57 | -6 | -68 | -120
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The mines recognize their social responsibility and have maintained cordial relationship with local government and society. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the Huangbaici and Wuhushan cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated

Criteria	JORC Code explanation	Commentary
		Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.*	• The Ore Reserve estimate for the underground operation may exhibit minor variance due to equipment-dependent mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations.
	• *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence*	• No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological

Criteria	JORC Code explanation	Commentary
	of the estimate should be compared with production data, where available.	interpretation, and modifying factor assumptions.

APPENDIX B-7 JORC Code, 2012 Edition – Table 1 – Hesigewula Coalfield

The Hesigewula South Open-pit Mine controlled by Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. Is located in the Hesigewula Coalfield.

Section 1 Sampling Techniques and Data

The drilling activities of the Hesigewula Coalfield dates back to the 2000s. The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. The latest drilling activity at Hesigewula Coalfield was completed in 2006. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	maximise representivity of samples. • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.*	• The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Topcon GTS-602 type GPS. The accuracy of the control points was evaluated using two sets of coordinate differences. The maximum difference between the two sets of coordinates was 0.17 meters, and the

Criteria	JORC Code explanation	Commentary
		elevation difference was 0.12 meters.
	• *Specification of the grid system used.*	• The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. A more than 10% random re-survey was conducted on 44 engineering boreholes in this area using the repeat observation method. The plane error of 98% of the drilling holes is within ±0.10 to ±0.15 meters. Elevation error: ≤ ±0.05 meters
	• *Quality and adequacy of topographic control.*	• The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.*	• The drilling grid coverage over all areas of the Hesigewula mining license. Approximately 90% of the area is covered by a **250 m × 250 m** drilling grid, while a 500×500 meter grid is adopted in the remaining majority of the region. This drilling spacing is sufficient to classify the majority of the resources in the Hesigewula South mining area as the Measured category. The data spacing is adequate to establish geological and quality continuity
	• *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.*	• The data spacing is adequate to establish geological and quality continuity
	• *Whether sample compositing has been applied.*	• Sample compositing is not applicable to coal.
Orientation of data in relation to	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.*	• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results.

Criteria	JORC Code explanation	Commentary
geological structure	• *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• There is no bias for coal.
Sample security	• *The measures taken to ensure sample security.*	• All samples were packaged in double-layer heavy-duty plastic sampling bags, which were then wrapped and sealed with adhesive tape to ensure the samples remain free from damage or contamination during storage and transportation. All samples taken were temporarily stored at the field office of the exploration team and are regularly sent to the designated laboratory by a designated person.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Hesigewula South Open-pit Coal Mine: Type of Mining Right: Mining Right Mining Right Name: Inner Mongolia Xilinhe Coal Chemical Co., Ltd. Hesigewula South Open-pit Coal Mine Mining Right Number: C1000002020011110149419 Area: 27.2313 km² Location: Xilinguole League, Inner Mongolia Autonomous Region Ownership: Inner Mongolia Xilinhe Coal Chemical Co., Ltd. (51% owned by China Energy directly and/or via subsidiaries) According to the EIA and/or exploration report of the project, the Hesigewula South Open-pit Coal Mine does not involve

Criteria	JORC Code explanation	Commentary
		environmentally sensitive points requiring special protection, such as nature reserves, scenic spots, water source protection zones, or cultural relics and historic sites. • Related coal mine in the Hesigewula Coalfield is Hesigewula South Open-pit Mine. The mining right certificate for the mine is within the valid period. No known impediments to maintaining and renewing such mining certificate were identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete the resources/reserves estimates for Hesigewula South Open-pit, the following exploration reports were provided for our review: - Exploration Report for the Hesigewula South Open-pit Mine, 2006 • The report include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. • It's the CP's opinion that the report is reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The geologic settings of the Hesigewula South Open-pit is judged to be moderate. While the strata are flat-lying, complex structure containing multiple partings of the coal seams is a complicating factor for the seam in most of the mine areas. • The Hesigewula Coalfield is situated within the Hesigewula Pasture

Criteria	JORC Code explanation	Commentary
		Coal Basin, a fault-depression basin with a distinct NE-trending, S-shaped elongated planform. The basin is tectonically affiliated with the Siberian Plate, specifically the Southeast Siberian Continental Margin Accretionary Belt and the Dong Ujimqin–Zhalantun Volcanic Passive Continental Margin. The basin is primarily controlled by NNE-trending structures. Its western, northern, and southern margins are defined by erosional boundaries, while the eastern margin is bounded by the F1 Fault. • The Hesigewula South Open-pit Mining Area is located in the southern part of the Hesigewula Coalfield. The area is characterized by a broad, gentle syncline with an axial orientation of NE and a slightly eastern-offset axis. Both limbs of the syncline generally dip at approximately 10°. Fault development within the mining area is limited. Only two oblique-slip normal faults, designated F5 and F6, have been identified. No intrusive igneous rocks have been observed in the area.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly*	• Not applicable as no Exploration Results included in the report

Criteria	JORC Code explanation	Commentary
	explain why this is the case.	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report
Other substantive exploration	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and*	• Not applicable as no Exploration Results included in the report

Criteria	JORC Code explanation	Commentary
data	*method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The competent persons converted the data from the editable versions into the database for this resource estimate. The database was verified using Carlson SURVCAD before modeling. • The completed model was cross-checked and validated against the attached maps in the geological reports. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current

Criteria	JORC Code explanation	Commentary
		status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource estimation. The database was verified using Carlson SURVCAD before modeling. The completed model was cross-checked and validated against the attached maps in the geological reports. If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like the Hesigewula South Open-pit Mine is high. The competent persons for this report, through the review of borehole logs and geophysical logs for seam correlation, as well as subsequent model representation, consider the geological interpretation of the Hesigewula South Open-pit Mine to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities,

Criteria	JORC Code explanation	Commentary
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	• The model of the Hesigewula South Open-pit Coal Mine was constructed using Carlson SURVCAD software based on the original data. The model database includes the collar coordinates and elevation of each borehole, the top and bottom depths of each lithology, and the coal quality data of each coal seam. The SURVCAD software can generate triangulated surface models for the roof and floor of each coal seam, thereby enabling the estimation of the spatial volume between them. The resource estimation is then calculated based on the apparent density of each seam. • The modeling utilized all borehole data within the mining area, and the extent of the resources was constrained by mine boundary, authorized mining elevation and topo showing the current pit-shell. The key parameters and assumptions used for the resource estimation include: a density of 2.1 for partings, partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters. • The critical step in coal modeling data validation lies in seam correlation, which is conducted *prior to* database establishment. The Qualified Person (QP) first assesses the rationality of seam correlation through a comprehensive review of borehole data. Owing to the characteristics of layered deposits, upon model completion, the model itself can be integrated with geological rationality analysis to identify any anomalous data

Criteria	JORC Code explanation	Commentary
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% • Calorific Value Qnet,d: 15.7 MJ/kg.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• The following assumptions are made specifically for open-pit mining: partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of*	• The Hesigewula South Open-pit provided preliminary design report which covers dump site descriptions and environmental impact assessment report. The Hegegula South Open-pit Mine has completed land acquisition for all required waste dumps, ensuring unimpeded waste disposal operations. Full internal dumping is

Criteria	JORC Code explanation	Commentary
	potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.	anticipated to be achievable by 2028. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons'view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.

Criteria	JORC Code explanation	Commentary
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.5m thick for lignite coal as presented at the Hesigewula Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major

Criteria	JORC Code explanation	Commentary
		streams, and populated areas that are not planned to be relocated). - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. in September 2025. Mr. Xing made another site visit in October 2025 to further observe mining and operation details. During the site visits, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for Hesigewula South Open-pit was provided, which is the typical mine design report for open-pit coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.

Criteria	JORC Code explanation	Commentary
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).*	• Preliminary Design Report for the mine was provided, which has the necessary mining design details for coal reserve estimation. The mining method selected for the open-pit mine was shovel-truck approach with semi-mobile crushing/bot transportation arrangement.
	• *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• The coal seams in the Hesigewula Coalfield feature shallow occurrences with generally simple geological settings. In addition, this area has only sparsely distributed population. The shovel-truck mining method is widely used in open-pit coal mines in China with abundant successful experiences. The selection of mining method in the mine is considered appropriate.
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Geotechnical parameters are designed based on the geotechnical testing of rock and coal strata. Hesigewula South Open-pit Min has years of operating history. Major mining and geotechnical parameters are as follows: 
Criteria	JORC Code explanation	Commentary
		<table><tr><th>Parameter</th><th>Unit</th><th>Soil w/o blasting</th><th>Coal/Rock w/ blasting</th></tr><tr><td>Bench Height</td><td>m</td><td>12</td><td>12</td></tr><tr><td>Working Width</td><td>m</td><td>20</td><td>20</td></tr><tr><td>Bench Face Angle</td><td>°</td><td>55</td><td>65</td></tr><tr><td>Safety Offset</td><td>m</td><td>4</td><td>4</td></tr><tr><td>Blast Pile Projection Distance</td><td>m</td><td>0</td><td>6</td></tr><tr><td>Road Width</td><td>m</td><td>23</td><td>23</td></tr><tr><td>Safety Clearance</td><td>m</td><td>3</td><td>3</td></tr><tr><td>Minimum Working Bench Width</td><td>m</td><td>60</td><td>60</td></tr></table>
	•	
	•	
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).*	• Not applicable
	• *The mining dilution factors used.*	• OSD of 3% was considered for all the seams during mining.
	• *The mining recovery factors used.*	• A 98% recovery factor was used for the open-pit mine.
	• *Any minimum mining widths used.*	• Minimum mining working bench width used was 60 m for Hesigewula South Open-pit.
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded.
	• *The infrastructure requirements of the selected mining methods.*	• Hesigewula Coalfield is located in the eastern part of Inner Mongolia Autonomous Region, which is major coal-producing area with numerous mines in operation and planned. Infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, Telecommunication network, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Hesigewula South Open-pit has crusher systems to produce coal at different sizes. No further processing is needed. The proposed coal processing arrangements are considered appropriate and can satisfy the requirement of product coal quality by their customers.

Criteria	JORC Code explanation	Commentary
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The crushing and screening technologies are all widely adopted coal processing technologies and have been well tested throughout the coal industry in China.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Test work undertaken for the Hesigewula South Open-pit does not involve metallurgical testing. Instead, coal processing test work has been completed to assess the performance of crushing and screening separation. The test work is considered representative of the coal seams included in the Coal Reserve estimate. Yield (recovery) factors applied to the Coal Reserve estimate are derived from the test work and available operational data.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• No deleterious elements • The subject open-pit mine has well-established coal processing history, thus no bulk sample or pilot scale test work is needed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Calorific Value parameter and ash content in coal quality are the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• The subject open-pit mine provided preliminary design report which covers dump site descriptions and environmental impact assessment report. The Hesigewula Coalfield area is a regional coal-producing center, where approval process for waste dump site acquisition has been smooth, and no obstacle in obtaining future sites for waste storage was identified.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk*	• Hesigewula Coalfield is located in the eastern part of Inner Mongolia Autonomous Region. Due to the well-developed coal industry and

Criteria	JORC Code explanation	Commentary
	commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.	designated energy base status, infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided covering civil constructions, equipment purchases, etc. Sustaining capital at RMB5/t of coal producing capacity was assumed which is typical for large open-pit mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by the mine based on historical performance and adjusted for certain changes such as stripping ratio. The competent person extended the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.*	• No deleterious elements.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• The historical three-year average price (VAT inclusive) was used for our economic analysis of the mine. Hesigewula South Open-pit: RMB250.75/t
	• *The source of exchange rates used in the study.*	• Exchange rates: not applicable
	• *Derivation of transportation charges.*	• Transportation charges are included in the operating costs and related to stripping ratio, which are adjusted accordingly in future operation projections.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting.
	• *The allowances made for royalties payable, both Government and private.*	• The mine already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue	• *The derivation of, or assumptions made regarding revenue factors*	• Geological conditions over the projection period are consistent with

Criteria	JORC Code explanation	Commentary
factors	*including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	recent experience; no material coal quality change. • The historical three-year average price (VAT inclusive) was used for our economic analysis of the mine. Hesigewula South Open-pit: RMB250.75/t
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Most of coal products from the subject open-pit mine will supply the nearby power plants and local market. The Hesigewula Coalfield is one of the major coal producing areas in Inner Mongolia. The coal products from the mine have consistent coal quality and are expected to continue their market share. • Coal prices have been slowly declining over the 2024-2025 period. The historical three-year average price was used for our economic analysis of the mine.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimates the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%, as of 31 July 2025. NPV Under Various Sensitivity Cases (RMB Millions) Base Case Mine | 6.0% | 7.0% | (7.1%) | 8.0% | 9.0% | 10.0% Hesigewula South Open-pit | 13,630 | 12,231 | 12,077 | 11,039 | 10,017 | 9,136
Social	• *The status of agreements with key stakeholders and matters leading*	• The mine recognizes its social responsibility and has maintained

Criteria	JORC Code explanation	Commentary
	to social licence to operate.	cordial relationship with local government and society. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the subject open-pit mine cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent

Criteria	JORC Code explanation	Commentary
reviews		Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.*	• The Ore Reserve estimate for the open-pit operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for surface mining operations.
	• *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-8 JORC Code, 2012 Edition – Table 1 – Houxia Coalfield

The Heishan Open-pit controlled by China Energy Xinjiang Energy and Chemical Co., Ltd. is located in the Houxia Coalfield.

Section 1 Sampling Techniques and Data

The coal drilling activities of the Houxia Coalfield dates back to the 2007and ends in 2009. There are some drilling activities during 2012 and 2015, but they are not for coal core drilling. The coal drilling techniques employed in 2007 and 2009 are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	duplicate/second-half sampling. • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Leica GS15 GPS. • A total of 27 GPS control points (D- and E-class) were established across the area, providing full and uniform coverage for all subsequent survey and engineering activities. All engineering surveys were carried out with calibration against higher-order control points, achieving planimetric accuracy of approximately ±1 cm + 1 ppm and

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>elevation accuracy of approximately ±2 cm + 1 ppm. The density, coverage and achieved accuracy of the control network are considered adequate for Mineral Resource estimation.
• The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.
• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.
• Whether sample compositing has been applied.</td><td>• The drilling grids for different areas of Heishan Open-pit are as follows:
<table><tr><th></th><th colspan="3">Mining Area</th><th colspan="3">Rsources %</th></tr><tr><th>Mining/Exploration Right</th><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr><tr><td>Heishan Open-pit</td><td>250</td><td>500</td><td>1,000</td><td>12</td><td>32</td><td>56</td></tr></table>• As shown in the table, the resources at Heishan Open-pit have been moderately defined. The data spacing is adequate to establish reasonable geological and quality continuity.
Sample compositing is not applicable to coal.</td></tr>
<tr><td>Orientation of data in relation to geological structure</td><td>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.
• If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</td><td>• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results.
• There is no bias for coal.</td></tr>
<tr><td>Sample security</td><td>• The measures taken to ensure sample security.</td><td>• The exploration activities date too far back in history, and the relevant information can no longer be traced.</td></tr>
<tr><td>Audits or reviews</td><td>• The results of any audits or reviews of sampling techniques and data.</td><td>• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.</td></tr>
</table>

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Heishan Open-pit Coal Mine: Type of Mining Right: Mining Right Mining Right Name: China Energy Xinjiang Energy and Chemical Co., Ltd. Tuokexun County Heishan Open-pit Coal Mine Mining Right Number: C6500020171111110145786 Area: 48.3671 km² Location: Tuokexun County, Tulufan City, Xinjiang Autonomous Region Ownership: China Energy Xinjiang Energy and Chemical Co., Ltd. (100% owned by China Energy directly and/or via subsidiaries) According to the EIA and/or exploration report of the project, the Heishan Open-pit Mine does not involve environmentally sensitive points requiring special protection, such as nature reserves, scenic spots, water source protection zones, or cultural relics and historic sites.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for Heishan Open-pit, the following exploration reports were provided for our review: ○ Detailed Exploration Report for the Xiao'erbulake (Heishan)-Tixiong Gou Area, March 2007 ○ Exploration Report for the Xiao'erbulake-Tixiong Gou Open-pit Mine, Heishan Mining Area, April 2009 ○ Geohazard Risk Assessment Report for the Heishan Open-pit Mine Construction Project, Ltd., December 2012

Criteria	JORC Code explanation	Commentary
		○ Slope Engineering Geological Exploration Report for the Initial Mining Area of the Tuokexun Heishan Open-pit Mine, October 2014 ○ Special Hydrogeological Exploration Report for the Heishan Open-pit Mine, March 2015 ○ 2016 Reserves Verification Report for the Heishan Mine • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Houxia Coalfield is situated at the junction of the North Tianshan Orogenic Belt and the southern margin of the Junggar Basin, belonging to an intermontane depression-type coalfield. Its formation and evolution were primarily controlled by the Yanshanian and Himalayan tectonic movements. The regional structural trend is nearly east-west, consistent with the tectonic grain of the North Tianshan. • Based on sedimentary basin and structural characteristics, the coalfield can be subdivided into several mining areas, including the Heishan Mining Area. The Heishan Open-pit Mine is located within this Heishan Mining Area. The Houxia Coalfield features a simple geological structure, primarily

Criteria	JORC Code explanation	Commentary
		a south-dipping monocline (dipping at 13 to 25 degrees). Several reliably identified faults are present. A combustion metamorphic rock (burned rock) belt, formed from ancient coal seam ignition, trends east-west. It reaches a maximum depth of 240 m, as confirmed by drilling and geophysical surveys. No magmatic rocks are found within the coal measures. Overall, the geological structure of the mining area is classified as simple.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Not applicable as no Exploration Results included in the report.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	should be clearly stated.	
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The competent persons converted the data from the editable versions into the database for this resource estimate. The database was verified using Carlson SURVCAD before modeling. • The completed model was cross-checked and validated against the attached maps in the geological reports. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited China Energy Xinjiang Energy and Chemical Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource estimation. The database was verified using Carlson SURVCAD before modeling. The completed model was cross-checked and validated against the attached maps in the geological reports. If any

Criteria	JORC Code explanation	Commentary
	• *The factors affecting continuity both of grade and geology.*	errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like the Heishan Open-pit Mine is high. The competent persons for this report, through the review of borehole logs and geophysical logs for seam correlation, as well as subsequent model representation, consider the geological interpretation of the Heishan Open-pit Mine to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting.

<tr><td>Estimation and modelling techniques</td><td>• The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.
• The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.
• The assumptions made regarding recovery of by-products.
• Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).
• In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</td><td>• The model of the Heishan Open-pit Coal Mine was constructed using Carlson SURVCAD software based on the original data in the Beijing 1954 coordinate system. The model database includes the collar coordinates and elevation of each borehole, the top and bottom depths of each lithology, and the coal quality data of each coal seam. The SURVCAD software can generate triangulated surface models for the roof and floor of each coal seam, thereby enabling the estimation of the spatial volume between them. The resource estimation is then calculated based on the apparent density of each seam.
• The modeling utilized all borehole data within the mining area, and the extent of the resources was constrained by mine boundary, authorized mining elevation and topo showing the current pit-shell.</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
	• *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	The key parameters and assumptions used for the resource estimation include: a density of 2.1 for partings, partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters. The critical step in coal modeling data validation lies in seam correlation, which is conducted *prior to* database establishment. The Qualified Person (QP) first assesses the rationality of seam correlation through a comprehensive review of borehole data. Owing to the characteristics of layered deposits, upon model completion, the model itself can be integrated with geological rationality analysis to identify any anomalous data.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and reported on natural moisture basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: 17.0 MJ/kg
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be*	• The following assumptions are made specifically for open-pit mining: partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters.

Criteria	JORC Code explanation	Commentary
	reported with an explanation of the basis of the mining assumptions made.	
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• The Heishan Open-pit Mine has implemented partial internal dumping of overburden. Both the internal and external waste dumps currently possess sufficient capacity to meet all mine production requirements. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk

Criteria	JORC Code explanation	Commentary
	evaluation process of the different materials.	density values and the assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.5 m thick for bituminous thermal coal as presented at the Houxia Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated). - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and Senior Geologist, Mr. Yongliang Xing visited China Energy Xinjiang Energy and Chemical Co., Ltd in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plan of the subject mine with technical staff and management personnel.

Criteria	JORC Code explanation	Commentary
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for Heishan Open-pit was provided, which is the typical mine design report for open-pit coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas. Minimum mineable seam thickness: 1.0 m Ash content Ad: 40% Sulphur content St.d: 3% Calorific Value Qnet.d: 17 MJ/kg
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).*	• Preliminary Design Report for the mine was provided, which has the necessary mining design details for coal reserve estimation. The mining method selected for Heishan open-pit was shovel-truck approach with semi-mobile crushing/belt transportation arrangement.
	• *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• The coal seams in Houxia Coalfield feature shallow occurrence with generally simple geological settings. The dry weather and weak water-bearing strata are benefit for open-pit mining. In addition, this area has only sparsely distributed population. The shovel-truck mining method is widely used in open-pit coal mines in China with abundant successful experiences. The selection of mining method in the mine is considered appropriate.
	• *The assumptions made regarding geotechnical parameters (eg pit*	• Geotechnical parameters are designed based on the geotechnical

Criteria	JORC Code explanation	Commentary
	slopes, stope sizes, etc), grade control and pre-production drilling.	testing of rock and coal strata. Mining and geotechnical parameters are as follows:  Sign | Parameter | Unit | Mining | Stripping H | Bench Height | m | 15 | 15 b | Working Width | m | 20 | 20 a | Bench Face Angle | ° | 70 | Soil:65 Rock:70 F | Safety Offset | m | 1 | 1 C | Blast Pile Projection Distance | m | 14 | 14 D | Road Width | m | 19 | 19 G | Safety Clearance | m | 2 | 2 B_{min} | Minimum Working Bench Width | m | 60 | 60
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• Not applicable • OSD of 3% was considered for all the seams during mining. • A 98% recovery factor was used for the open-pit mine. • Minimum mining working bench width used was 60 m. • In Coal Reserve estimation, Inferred Coal Resources were excluded. • Houxia Coalfield is located in the eastern part of Xinjiang Uygur Autonomous Region, which is a major coal-producing area with numerous mines in operation and planned. Infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, Telecommunication network, etc.

Criteria	JORC Code explanation	Commentary
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Heishan Open-pit adopts crushing and screening for ROM coal, then the 300-50 mm size coal is processed using TDS technology. The proposed coal processing arrangements are considered appropriate and can satisfy the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The crushing and screening and TDS technologies are all widely adopted coal processing technologies and have been well tested throughout the coal industry in China.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Test work undertaken for Heishan Open-pit does not involve metallurgical testing. Instead, coal processing test work has been completed to assess the performance of crushing and screening and TDS dry separation methods. The test work is considered representative of the coal seams included in the Coal Reserve estimate. Yield (recovery) factors applied to the Coal Reserve estimate are derived from the test work and available operational data for TDS systems, resulting a 95% yield for Heishan Open-pit.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• No deleterious elements • The Heishan open-pit mine has well-established coal processing history, thus no bulk sample or pilot scale test work is needed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Calorific Value and ash content parameters in coal quality are the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.

Criteria	JORC Code explanation	Commentary
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Heishan Open-pit provided preliminary design report which covers dump site descriptions and environmental impact assessment report. The Houxia Coalfield area is a known coal-producing area, where approval process for waste dump site acquisition has been smooth, and no obstacle in obtaining future sites for waste storage was identified.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Houxia Coalfield is located in Tuokexun County of Xinjiang Uygur Autonomous Region. Due to the well-developed coal industry, infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB5/t of coal producing capacity was assumed which is typical for large open-pit mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by the mine based on historical performance and adjusted for certain changes such as stripping ratio. The competent person extended the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.* • *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• No deleterious elements. • The historical three-year average prices were used for our economic analysis of the mine. Heishan Open-pit: RMB385.5/t VAT inclusive

Criteria	JORC Code explanation	Commentary
	• *The source of exchange rates used in the study.* • *Derivation of transportation charges.*	• Exchange rates: not applicable • Transportation charges are included in the operating costs and related to stripping ratio, which are adjusted accordingly in future operation projections.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting, which appears common for coal mines.
	• *The allowances made for royalties payable, both Government and private.*	• The mine already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change. • The historical three-year average prices were used for our economic analysis of the mine. • Heishan Open-pit: RMB385.5/t VAT inclusive
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Most of coal products from the subject open-pit mine will supply the nearby power plants and local chemical market. The coal products from the mines have consistent coal quality and are expected to continue their market share. • Coal prices have been slowly declining over the 2024-2025 period. The historical three-year average prices were used for our economic analysis of each mine.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted

Criteria	JORC Code explanation	Commentary
	inputs including estimated inflation, discount rate, etc.	average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimate the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%, as of 31 July 2025.
	• *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	NPV Under Various Sensitivity Cases (RMB Millions) Base Case Mine | 6.0% | 7.0% | (7.1%) | 8.0% | 9.0% | 10.0% Heishan Open-pit | 9,871 | 8,180 | 7,998 | 6,780 | 5,612 | 4,632
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The mine recognizes its social responsibility and has maintained cordial relationship with local government and society. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the subject open-pit mine cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal

Criteria	JORC Code explanation	Commentary
		Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.*	• The Ore Reserve estimate for the open-pit operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations. • No reconciliation against long-term production is available.

Criteria	JORC Code explanation	Commentary
	• *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-9 JORC Code, 2012 Edition – Table 1 – Nileke Coalfield

The three exploration rights (Jinsanjiao East, Jirentai Youyan West, and Jirentai West) controlled by Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. are located in the Nileke Coalfield. The three mines are adjacent to each other.

Section 1 Sampling Techniques and Data

The drilling activities of the Jinsanjiao East, Jirentai Youyan West, and Jirentai West exploration rights were conducted in 2010, 2013 and 2009. The drilling techniques employed in those drilling programs are difficult to trace with precision. The geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each drilling program. All the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	duplicate/second-half sampling. • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The geological reports of the subject exploration rights discussed the accuracy of the survey as follows: - The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Huace X20 GPS. The maximum elevation fitting standard error of the control-grade GPS network is 0.022 m.

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>- The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. Four Class-E GPS control points and eleven traverse-grade GPS survey points were established.The E-class GPS control network was anchored by two national Class-IV geodetic points.Control points are evenly distributed across the survey area, and the achieved accuracy meets the requirements of the relevant surveying standards.
- The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.</td><td>• The drilling grids for different areas of each of the subject exploration rights in Nileke Coalfield are as follows:
<table><tr><th></th><th colspan="3">Mining Area</th><th colspan="3">Rsources %</th></tr><tr><th>Mining/Exploration Right</th><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr><tr><td>Jinsanjiao East</td><td>500</td><td>1,000</td><td>1,000</td><td>73</td><td>25</td><td>2</td></tr><tr><td>Jirentai Youyan West</td><td>500</td><td>1,000</td><td>1,000</td><td>73</td><td>25</td><td>2</td></tr><tr><td>Jirentai West</td><td>250- 500</td><td>1,000</td><td>1,000</td><td>44</td><td>47</td><td>9</td></tr></table></td></tr>
<tr><td></td><td>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</td><td>• As shown in the table, the resources at each of the subject exploration rights have been well defined. The data spacing is adequate to establish geological and quality continuity at the three subject properties.</td></tr>
<tr><td></td><td>• Whether sample compositing has been applied.</td><td>• Sample compositing is not applicable to coal.</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results. • There is no bias for coal.
Sample security	• *The measures taken to ensure sample security.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Jinsanjiao East: Mineral Right Type: Exploration Right Mineral Right Name: Jinsanjiao Coal Mine Eastern Exploration, Nileke County, Xinjiang Mineral Right Number: T6500002009031010026502 Area: 4.18 km² Location: Nileke County, Ili Prefecture, Xinjiang Ownership: Guodian Pingmei Nileke Energy Chemical Co., Ltd. (National Energy 100%) Shareholding Structure: Inner Mongolia Pingzhuang Coal Industry (Group) Co., Ltd. holds 100% of Guodian Pingmei Nileke Energy Chemical Co., Ltd.

Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected exploration rights located in Nileke Coalfield, the following exploration reports were provided for our review: - Jinsanjiao East: = Exploration Report for the Eastern Part of the Jinsanjiao West Mine, August 2010 - Jirentai Youyan West: = Exploration Report for the Jirentai Western Exploration Area, June 2013 - Jirentai West: = Exploration Report for the Jirentai West Mine, May 2009 • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and

Criteria	JORC Code explanation	Commentary
		presentation. • It's the CP's opinion that the reports are reliable, and the dill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Nileke Coalfield is situated within the Nileke Intermontane Depression, located in the eastern segment of the Tianshan Latitudinal Tectonic Belt and represents the eastern extension of the Yili Depression. The Nileke Intermontane Depression is bounded to the north and south by the F5 and F6 reverse faults, forming a rift graben basin. • The tectonic deformation of the Nileke Intermontane Depression is characterized by broadly E–W trending, gentle folds, such as the Hujiertai Syncline (W1). Associated with intense thrust-nappe activity, Paleozoic strata have been overthrust onto the Jurassic succession. This deformation has generated numerous folds and faults within the coal-bearing sequence, which collectively controls the occurrence and distribution of the coal seams. • The three exploration areas covered by the project are adjacent to each other and situated on the northern limb of the Hujirtai Syncline (W1). The overall structure is characterized by a monocline. The strata generally strike approximately E–W and dip southward. Dip angles vary between 7° and 59°, typically ranging from 7° to 30°, exhibiting a pattern of steeper dips at shallow depths that become gentler with increasing depth. In the western part of the exploration area, the strata trend shifts toward the southwest, gradually transitioning into the western limb of the syncline. Fault structures are poorly developed within the exploration areas. The dominant structural features are broad, gentle folds.

Criteria	JORC Code explanation	Commentary
		• The exploration area exhibits a complete stratigraphic sequence, with the following units exposed in ascending order: - Lower Carboniferous Dahalajunshan Formation - Lower Jurassic Badaowan and Sangonghe Formations - Middle Jurassic Xishanyao Formation - Paleogene System - Quaternary System • Coal deposition is recorded in the Lower Jurassic Badaowan Formations and Middle Jurassic Xishanyao Formations, with the Xishanyao Formation representing the principal coal-bearing unit.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Not applicable as no Exploration Results included in the report.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions,*	• There is currently no further exploration planned.

Criteria	JORC Code explanation	Commentary
	including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The CP converted the data from the editable versions into the database for this resource estimate. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited Pingzhuang Coal. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource

Criteria	JORC Code explanation	Commentary
	estimation. • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	estimation. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like Baotou mining holding exploration rights in Nileke Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, considers the geological interpretation of the subject exploration rights in Nileke Coalfield to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - Outcrop.
Dimensions	• *The extent and variability of the Mineral Resource expressed as*	• The resources areas of exploration rights are delineated by the

Criteria	JORC Code explanation	Commentary
	length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.	authorized mine boundary of each property. • The following tables show the detailed characteristics of each seam of each exploration right:
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.*	• Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is

Criteria	JORC Code explanation	Commentary
	• *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource

Criteria	JORC Code explanation	Commentary
		block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: **Lignite** 15.7 MJ/kg. **Bituminous Coal** 17.0 MJ/Kg.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• The following assumptions are made specifically for undergoud mining: - All seams will be extracted by SC mining method (with/without sub-level caving capability). - In-seam parting thinner than the minimum mining thickness of coal for SC mining will have to be mined together with coal.

Criteria	JORC Code explanation	Commentary
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• The three target tenements are currently held under exploration licenses and represent contingent resources in early-stage development. All remain in an undeveloped state. • It is assumed that environmental factors will not present material constraints to future mine development and construction activities.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the assumption are appropriate.

Criteria	JORC Code explanation	Commentary
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate for the underground operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves — No Coal Reserves; No Pre-feasibility Study was performed

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.* • *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *he derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
	acceptance requirements prior to a supply contract.	
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
Discussion of relative accuracy/ confidence	• *Where appropriate a statent of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Not applicable, as the exploration rights status does not support a reserve estimate.

APPENDIX B-10 JORC Code, 2012 Edition – Table 1 – Ningdong Coalfield

The Renjiazhuang Mine controlled by China Energy Guoyuan Power Co., Ltd. is located in the Ningdong Coalfield.

Section 1 Sampling Techniques and Data

The drilling activities of the Ningdong Coalfield dates back to the 1980s. The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. The latest drilling activity applicable for coal quality verification and seam correlation at Renjiazhuang Mine was completed in 2006. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required,*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	• *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Topcon GTS-602 type GPS. The accuracy of the control points was evaluated using two sets of coordinate differences. The maximum difference between the two sets of coordinates was 0.17 meters, and the elevation difference was 0.12 meters.

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>• The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. A more than 10% random re-survey was conducted on 44 engineering boreholes in this area using the repeat observation method. The plane error of 98% of the drilling holes is within ±0.10 to ±0.15 meters. Elevation error: ≤ ±0.05 meters
• The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.</td><td>• The drilling grids for different areas of Renjiazhuang Mine are as follows:
<table><tr><th></th><th colspan="3">Mining Area (m)</th><th colspan="3">Rsources %</th></tr><tr><th>Mining/Exploration Right</th><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr><tr><td>Renjiazhuang</td><td>200 - 350</td><td>700</td><td>700</td><td>81</td><td>16</td><td>3</td></tr></table></td></tr>
<tr><td></td><td>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</td><td>• As shown in the table, the resources at Renjiazhuang Mine have been well defined. The data spacing is adequate to establish geological and quality continuity.</td></tr>
<tr><td></td><td>• Whether sample compositing has been applied.</td><td>• Sample compositing is not applicable to coal.</td></tr>
<tr><td>Orientation of data in relation to geological structure</td><td>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</td><td>• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results.</td></tr>
<tr><td></td><td>• If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</td><td>• There is no bias for coal.</td></tr>
<tr><td>Sample</td><td>• The measures taken to ensure sample security.</td><td>• All samples were packaged in double-layer heavy-duty plastic</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
security		sampling bags, which were then wrapped and sealed with adhesive tape to ensure the samples remain free from damage or contamination during storage and transportation. All samples taken were temporarily stored at the field office of the exploration team and are regularly sent to the designated laboratory by a designated person.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Renjiazhuang Mine Type of Mining Right: Mining Right Mining Right Name: China Energy Ningxia Coal Mining Co., Ltd. Ningxia Ninglu Coal and Power Co., Ltd. Renjiazhuang Mine Mining Right Number: C1000020080711200000425 Area: 17.4581 km² Location: Linhe County, Lingwu City, Ningxia Uygur Autonomous Region. Ownership: China Energy Ningxia Coal Mining Co., Ltd. (75.5% owned by China Energy directly and/or via subsidiaries) • According to the EIA and/or exploration report of the project, the Chaoyang Open-pit Mine does not involve environmentally sensitive points requiring special protection, such as scenic sites, cultural relics or historic sites. • Related coal mine in the Ningdong Coalfield include Renjiazhuang

Criteria	JORC Code explanation	Commentary
		Mine. The mining and right certificate for the mine is valid. No known impediments to maintain and renew such certificate were identified.

Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the Renjiazhuang Mine, the following exploration reports were provided for our review:
		  • Annual Reserves Verification Reports for Years 2013 to 2024
		  • Detailed Exploration Report for the Renzhuang Hongshiwan Mine, Hengcheng Exploration Area, July 2006
		• The 2006 exploration programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation.
		• It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.

Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Renjiazhuang Mine is the only one of the subject mines located in the Ningdong Coalfield, which is located in the Shanxi and Taiyuan Formation of the Carboniferous and Permian Age. On a global basis, the geological setting of the Renjiazhuang Mine is considered moderately complex. While the strata are moderately dipping, complex structure containing multiple partings of the coal seams is a complicating factor for the seam in most of the mine areas. • The Ningdong Coalfield's structural system originated from Late

Criteria	JORC Code explanation	Commentary
		Jurassic E-W compression, forming a predominantly S-N trending tectonic framework characterized by one major anticline, two synclines, and associated submeridional faults. The region-scale anticline traverses the entire area, preserving complete coal-bearing sequences in its southern segment. Faults align with the fold axes, with the S-N trending F3 thrust fault (displacement >300 m) defining the primary structural geometry. Secondary NE- and NW-trending normal and reverse faults (displacement 30-128 m) locally displace seams, causing thickness variations and pinch-outs. This S-N structural system fundamentally controls coal seam distribution, thickness, and stability.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Not applicable as no Exploration Results included in the report.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).*	• There is currently no further exploration planned.

Criteria	JORC Code explanation	Commentary
	• *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The CP converted the data from the editable versions into the database for this resource estimate. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited I China Energy Guoyuan Power Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the

Criteria	JORC Code explanation	Commentary
	• *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	data from the editable versions into the database for this resource estimation. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like Renjiazhuang MIne in Ningdong Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, considers the geological interpretation of the subject mine in Ningdong Coalfield to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - Outcrop.

Criteria	JORC Code explanation	Commentary
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The resources area is delineated by the authorized mine boundary, covering an area of 7.4581 km², with vertical mining elevation limits between +500 m to +1,100 m. The following tables show the detailed characteristics of each seam at Renjiazhuang Mine •
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control*	• Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality

Mine	Seam	Thickness (m) Coal	Parting	Seam	Distance from the Upper Seam (m)	Seam Depth Range (m)	Seam Dip (deg.)	Seam Occurrence
Renjiazhuang	3	2.9	0.05	2.9	-	203 - 651	17-E	Moderate
	5	4.6	0.21	4.8	39	204 - 1,345	17-E	Moderate
	9	4.8	0.68	5.4	71	234 - 1,270	17-E	Moderate

Criteria	JORC Code explanation	Commentary
	the resource estimates. • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: 17.0 MJ/Kg

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• All seams will be extracted by FM LW mining method (with/without sub-level caving capability). • in-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Renjiazhuang Mine provided environmental impact assessment report and annual environmental protection reports. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The

Criteria	JORC Code explanation	Commentary
	frequency of the measurements, the nature, size and representativeness of the samples. • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate for the underground operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and

Criteria	JORC Code explanation	Commentary
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.8 m thick for bituminous thermal coal as presented at the Ningdong Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated) and barrier areas along main roadway development for mine plans. - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those

Criteria	JORC Code explanation	Commentary
		portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and Senior Geologist, Mr. Yongliang Xing visited Guoyuan Power in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of the mine with technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for Renjiazhuang Mine was provided, which is the typical mine design report for coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• Preliminary Design Report for Renjiazhuang Mine was provided, which has the necessary mining design details for coal reserve estimation. The mining method selected is FM LW technology. • Seam thickness is the major factor considered in selecting the mining method. Typically, the threshold seam thickness for sublevel caving mining is approximately 4.5-6.0 m. FM LW method is widely used in underground coal mines in China. The selection of mining method in

Criteria	JORC Code explanation	Commentary
		Renjiazhuang Mine is considered appropriate in terms of the seam thickness and general occurrence as well as the design output capacity.
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Ground control in the LW faces are provided by hydraulic shields, which are designed by evaluating various factors including the mining depth, the roof strata structure and mining heights. Roadway support features mainly roof bolts with mesh wires and cables.
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).*	• Not applicable
	• *The mining dilution factors used.*	• OSD of 0.2 m roof rock was considered for most seams during mining.
	• *The mining recovery factors used.*	• An 85% recovery factor was used.
	• *Any minimum mining widths used.*	• LW faces are generally designed at fixed width.
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded from LW panels.
	• *The infrastructure requirements of the selected mining methods.*	• Ningdong Coalfield is located in eastern Ningxia Province, which is one of the major coal and chemical base in China. Due to the well-developed coal and chemical industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Renjiazhuang is designed to adopt the 3-product heavy media cyclone technology to process the fine coal, which is widely used in the Ningdong Coalfield mines. The proposed coal processing arrangement is considered appropriate and can satisfy the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel*	• The 3-product heavy media cyclone technology is widely adopted in

Criteria	JORC Code explanation	Commentary
	in nature.	the coal industry in China with mature application experiences.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Renjiazhuang Mine has well-established coal processing history. Actual amount of coal being processed is determined by customer requirements and market conditions. The coal recovery factor (or yield) for each seam is estimated based on the percentage of partings and OSD for each seam.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• No deleterious elements • Renjiazhuang Mine has well-established coal processing history, thus no bulk sample or pilot scale test work is needed. • Calorific Value parameter in coal quality is the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Renjiazhuang Mine provided environmental impact assessment report and annual environmental protection reports. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Ningdong Coalfield is located in the eastern portion of Ningxia Province, which is a major coal-producing and chemical industry area in China. Infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.

Criteria	JORC Code explanation	Commentary
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by the mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB30/t of coal producing capacity was assumed which is typical for underground mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by the mine based on historical performance and adjusted for certain changes. The competent person extended the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.* • *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.*	• No deleterious elements. • The historical three-year average prices were used for the economic analysis of Renjiazhuang Mine. • Exchange rates: not applicable • Transportation charges account for only a small portion of the costs for underground mines, and are included in the operating costs.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.* • *The allowances made for royalties payable, both Government and private.*	• No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting. • The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• The historical three-year average price at RMB415.5/t was used for our economic analysis of the mine.

Criteria	JORC Code explanation	Commentary
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Clean coal produced by Renjiazhuang Mine can be used as coking coal and the middlings can be used for power generation. The mine is located in a major coal and chemical base with a mature coal market. The coal product from the mine has consistent coal quality and is expected to continue its market share. • The historical three-year average price at RMB415.5/t was used for our economic analysis of the mine.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimate the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%, as of 31 July 2025. NPV Under Various Sensitivity Cases (RMB Millions) Base Case Mine | 6.0% | 7.0% | (7.1%) | 8.0% | 9.0% | 10.0% Renjiazhuang | 2,832 | 2,628 | 2,605 | 2,446 | 2,284 | 2,140
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The mine recognizes its social responsibility and has maintained cordial relationship with local government and society. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to

Criteria	JORC Code explanation	Commentary
	• *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the Renjiazhuang case, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence*	• The Ore Reserve estimate for the underground operation may exhibit minor variance due to equipment-dependent mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.

Criteria	JORC Code explanation	Commentary
	limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.	
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations.
	• *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-11 JORC Code, 2012 Edition – Table 1 – Shaanbei Coalfield

The Sandaogou Mine controlled by China Energy Guoyuan Power Co., Ltd. And Xiwan Open-pit controlled by China Energy Shaanxi Shenyan Coal Co., Ltd. are located in the Shaanbei Coalfield.

Section 1 Sampling Techniques and Data

The drilling activities of the Shaanbei Coalfield dates back to the 2000s. The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. The latest drilling activity at Shaanbei Coalfield was completed in 2011. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	• *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate system is the 2000 National Coordinate system, and the elevation system adopts the 1985 National elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the RTK GPS, drone with 3D laser scanners. The accuracy is suitable for conducting resource estimation.

<table>

Shenmu City Xiwan Open-pit Coal Mine Mining Right Number: C6100002014111110138223 Area: 76.5606 km² Location: Shenmu City and Yulin City, Shaanxi Province. Ownership: China Energy Shaanxi Shenyan Coal Co., Ltd. (41% owned by China Energy directly and/or via subsidiaries) According to the EIA and/or exploration report of the project, the cultural relics involved in this project are the Xinhua Site, Da'abaohao Temple Group, and the Qin Great Wall. The Xinhua Site and the Qin Great Wall will be protected in situ, while the Da'abaohao Temple Group will be relocated prior to mining operation. • Related coal mines in the Shaanbei Coalfield include Sandaogou and Xiwan Open-pit mines. The mining right certificates are all valid. No known impediments to maintaining and renewing such mining right certificates were identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected mining/exploration rights located in the Shaanbei Coalfield, the following exploration reports were provided for our review: - Sandaogou: = Detailed Exploration Report for the Sandaogou Mining Area, Shaanbei Coalfield, November 2002

Criteria	JORC Code explanation	Commentary
		= Reserve Verification Report for the Sandaogou Coal Mine, August 2011 = Geology Exploration Report for Mine Construction for the Sandaogou Coal Mine, October 2017 - Xiwan Open-pit Coal Mine: = Detailed Exploration Report for the Xiwan Open-pit Mining Area, Shaanbei Coalfield, September 2007 = Exploration Report for Production for the Xiwan Open-pit Coal Mine, November 2024 = Mine Geology Classification Report for the Xiwan Open-pit Coal Mine, December 2024 • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The structure of Shaanbei Coalfield - The structure of Shaanbei Coalfield is characterized by broad, gentle undulations and a series of post-depositional disconformities formed by large-scale crustal uplift. No major

Criteria	JORC Code explanation	Commentary
		faults or magmatic activity have been discovered. The strata generally form a monocline gently dipping to the northwest at about 1 degree. Along the Yaozhen area following the Tuwei River, the contour lines of the coal seam floor are relatively dense, suggesting the possible presence of minor faults in this zone. • The Sandaogou Mine - The Sandaogou Mine is the only one of the subject Guoyuan Power mines located in the Shaanbei Coalfield. The Jurassic Shaanbei Coalfield is situated on the Northern Shaanxi Slope, which forms the eastern flank of the Ordos Syncline. Regional data indicate that the basement is influenced by several major structural trends: the Wubao–Jingbian EW-trending zone, the Baode–Wuqi NE-trending zone, and the Yulin West–Shenmu West NE-trending zone. These basement structures exerted a certain degree of control on the formation and distribution of the coalfield. • The Xiwan Open-pit - The Xiwan Open-pit area exhibits gently inclined strata, forming a monocline with a general north-northeast strike and northwest dip direction, and dip angles of approximately 1 degree. This monocline is superimposed by broad, gentle undulations. The area lacks significant fault development and shows no evidence of magmatic activity.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The CP converted the data from the editable versions into the database for this resource estimate. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • For Open-pit mine, the database was verified using Carlson SURVCAD before modeling. The completed model was cross-checked and validated against the attached maps in the geological

Criteria	JORC Code explanation	Commentary
		reports. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited China Energy Guoyuan Power Co., Ltd. and China Energy Shaanxi Shenyan Coal Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Competent Person converted the data from the editable versions into the database for this resource estimation. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like Sandaogou Mine and Xiwan Open-pit in Shaanbei Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, considers the geological interpretation of the Shaanbei Coalfield to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a

Criteria	JORC Code explanation	Commentary
		regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - outcrop.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The resources area of Sandaogou Mine is delineated by the authorized mine boundary, covering an area of 17.1364km², with vertical mining elevation limits between +1033 m to +1,258 m. The following tables show the detailed characteristics of each seam at Sandaogou Mine: • The resources area at Xiwan Open-pit is delineated by the authorized

Mine	Seam	Thickness (m) Coal	Parting	Seam	Distance from the Upper Seam (m)	Seam Depth Range (m)	Seam Dip (deg.)	Seam Occurrence
Sandaogou	4-3	1.3	-	1.3	-	11 - 1,290	2-W	Eratic
	4-4	1.1	-	1.1	14	12 - 1,306	2-W	Eratic
	5-2U	2.2	0.07	2.2	14	2 - 1,307	2-W	Uniform
	5-2	4.4	0.21	4.6	19	19 - 1,305	2-W	Uniform

Criteria	JORC Code explanation	Commentary
		mine boundary, covering an area of 76.5606km², with vertical mining elevation limits between +873 m to +1,099 m. The following tables show the detailed characteristics of each seam at Xiwan Open-pit Mine:

Mine	Seam	Thickness (m) Coal	Parting	Seam	Distance from the Upper Seam (m)	Seam Depth Range (m)	Seam Dip (deg.)	Seam Occurrence
China Energy Shaanxi Shenyan Coal Co., Ltd.								
Xiwan Open-pit	2-2	10.80	0.21	11.01		20 - 280	1-NW	Uniform
	3-1	2.18	2.78	4.96	45	80 - 320	1-NW	Uniform
	4-3	1.75	0.14	1.89	50	150 - 380	1-NW	Uniform
	5-3U	2.07	0.32	2.39	40	220 - 450	1-NW	Uniform
	5-3L	1.63	0.25	1.88	5	230 - 450	1-NW	Eratic
	5-4	0.83	0.38	1.21	15	240 - 460	1-NW	Eratic

Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.*	Xiwan Open-pit Coal Mine • The model of the Xiwan Open-pit Coal Mine was constructed using Carlson SURVCAD software based on the original data in the 2000 National coordinate system. The model database includes the collar coordinates and elevation of each borehole, the top and bottom depths of each lithology, and the coal quality data of each coal seam. The SURVCAD software can generate triangulated surface models for the roof and floor of each coal seam, thereby enabling the estimation of the spatial volume between them. The resource estimation is then calculated based on the apparent density of each seam. • The modeling utilized all borehole data within the mining area, and the extent of the resources was constrained by mine boundary, authorized mining elevation and topo showing the current pit-shell. The key parameters and assumptions used for the resource

Criteria	JORC Code explanation	Commentary
	• *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	estimation include: a density of 2.1 for partings, partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters. • The critical step in coal modeling data validation lies in seam correlation, which is conducted *prior to* database establishment. The Competent Person (CP) first assesses the rationality of seam correlation through a comprehensive review of borehole data. Owing to the characteristics of layered deposits, upon model completion, the model itself can be integrated with geological rationality analysis to identify any anomalous data. Sandaogou Coal Mine • Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal

Criteria	JORC Code explanation	Commentary
		seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent

Criteria	JORC Code explanation	Commentary
		dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% • Calorific Value Qnet,d: 17.0 MJ/kg.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• The following assumptions are made specifically for open-pit mining: partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters. • The following assumptions are made specifically for underground mining: - All seams will be extracted by FM LW mining method (with/without sub-level caving capability). - in-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.

Criteria	JORC Code explanation	Commentary
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Each of the two subject mines provided preliminary design report which covers dump site descriptions and environmental impact assessment report. Approval process for waste dump site acquisition has been smooth for Xiwan Open-pit, and no obstacle in obtaining future sites for waste storage was identified. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.

Criteria	JORC Code explanation	Commentary
	view of the deposit.	
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.8 m

Criteria	JORC Code explanation	Commentary
Reserves		thick for bituminous thermal coal as presented at the Shaanbei Coalfield for underground Sandaogou mine. For Xiwan Open-pit, the minimum recoverable seam thickness is 0.5 m. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated). - Preparation of coal isopach maps within the identified resource areas. Geological modeling approach was used for Xiwan Open-pit. - Review of seam quality.
	• *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited China Energy Guoyuan Power Co., Ltd and Shaanxi Shenyan (Xiwan Open-pit) in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine area with corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources*	• A Preliminary Design Report for each of the Sandaogou and Xiwan

Criteria	JORC Code explanation	Commentary
	to be converted to Ore Reserves. • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	Open-pit was provided, which is the typical mine design report for underground and open-pit coal mines in China, respectively, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).*	• Preliminary Design Report for each mine was provided, which has the necessary mining design details for coal reserve estimation. Sandaogou uses FM LW method and Xiwan Open-pit employs shovel-truck approach with semi-mobile crushing/belt transportation arrangement.
	• *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• Coal seams of Sandaogou are relatively deeper and thick, which makes FM LW the appropriate underground mining method for the mine and is widely used in underground mines in China. The coal seams of Xiwan Open-pit in the Shaanbei Coalfield feature shallow occurrence with generally simple geological settings. In addition, this area has only sparsely distributed population. The shovel-truck mining method is widely used in open-pit coal mines in China with abundant successful experiences. The selection of mining methods in the two mines is considered appropriate.
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• For Sandaogou, ground control in the LW faces is provided by hydraulic shields, which are designed by evaluating various factors including the mining depth, the roof strata structure and mining heights. Roadway support features mainly roof bolts with mesh wires and cables.

Criteria	JORC Code explanation	Commentary
		For Xiwan Open-pit, geotechnical parameters are designed based on the geotechnical testing of rock and coal strata. Since the mine had years of operating history, extension of mining started from the current location. Mining and geotechnical parameters are as follows:  Parameter / Unit / Mining / Stripping Bench Height: m / 11 / 15 Working Width: m / 24 / 24 Bench Face Angle: ° / 75 / 75 Safety Offset: m / 1 / 1 Blast Pile Projection Distance: m / 9 / 9 Road Width: m / 29 / 29 Safety Clearance: m / 7 / 7 Minimum Working Bench Width: m / 72 / 72
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).*	• Not applicable
	• *The mining dilution factors used.*	• For Sandaogou, an OSD of 0.10-0.20 m of roof rock is considered For Xiwan Open-pit, an OSD of 3% was considered for all the seams during mining.
	• *The mining recovery factors used.*	• For Sandaogou, an 85% recovery factor was used For Xiwan Open-pit, a 98% recovery factor was used

Criteria	JORC Code explanation	Commentary
	• *Any minimum mining widths used.*	• For Sandaogou, LW faces are generally designed at fixed width based on the mine boundary configuration. Minimum mining working bench width used was 72 m for Xiwan Open-pit
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded.
	• *The infrastructure requirements of the selected mining methods.*	• Shaanbei Coalfield is located in the northern part of Shaanxi Province, which is a major coal-producing area in Shaanxi with numerous mines in operation and planned. Infrastructure needed for underground and open-pit mining operations are conveniently available such as power supply, transportation network, water supply, Telecommunication network, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Sandaogou and Xiwan Open-pit only have crusher-screen systems to produce coal at different sizes. The proposed coal processing arrangements are considered appropriate and can satisfy the requirement of product coal quality by the power plants.
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The crushing and screening technologies are all widely adopted coal processing technologies and have been well tested throughout the coal industry in China.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• The two mines do not involve metallurgical testing. Instead, coal processing test work has been completed to assess the performance of crushing and screening separation. The test work is considered representative of the coal seams included in the Coal Reserve estimate.

Criteria	JORC Code explanation	Commentary
		Yield (recovery) factors applied to the Coal Reserve estimate are derived from the test work and technology used. Product yield for Sandaogou and Xiwan Open-pit is 96-97% since only crushing and screening are involved.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• No deleterious elements • The two subject mines have well-established coal processing history, thus no bulk sample or pilot scale test work is needed. • Calorific Value and ash content parameters in coal quality are the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Each of the two subject mines provided preliminary design report which covers dump site descriptions and environmental impact assessment report. Approval process for waste dump site acquisition has been smooth for Xiwan Open-pit, and no obstacle in obtaining future sites for waste storage was identified.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Shaanbei Coalfield is located in the northern part of Shaanxi Province. Due to the well-developed coal industry, infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB30/t and RMB5/t of coal producing capacity were assumed for Sandaogou and Xiwan Open-pit mines, respectively, which are typical for underground operations and large open-pit mines in China.

Criteria	JORC Code explanation	Commentary
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by each mine based on historical performance and adjusted for certain changes such as stripping ratio. The competent person extended the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.*	• No deleterious elements.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• The historical three-year average prices (VAT inclusive) were used for our economic analysis of each mine. Sandaogou: RMB482.25/t Xiwan Open-pit: RMB495/t
	• *The source of exchange rates used in the study.*	• Exchange rates: not applicable
	• *Derivation of transportation charges.*	• Transportation charges are included in the operating costs and related to stripping ratio, which are adjusted accordingly in future operation projections.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting, which appears common for coal mines.
	• *The allowances made for royalties payable, both Government and private.*	• The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• The historical three-year average prices (VAT inclusive) were used for our economic analysis of each mine. Sandaogou: RMB482.25/t Xiwan Open-pit: RMB495/t
Market	• *The demand, supply and stock situation for the particular commodity,*	• Most of coal products from the subject open-pit mines will supply the

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td>assessment</td><td>consumption trends and factors likely to affect supply and demand into the future.
• A customer and competitor analysis along with the identification of likely market windows for the product.

It has been rare that under normal situations, operating coal mines in China would not receive government approvals to</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
	• *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the subject open-pit mine cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to*	• The Ore Reserve estimate for the underground and open-pit operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors

Criteria	JORC Code explanation	Commentary
	quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.	may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations. • No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-12 JORC Code, 2012 Edition – Table 1 – Yimin Coalfield

The three exploration rights (Yiminhe East Backup, Yiminhe East No.2, and Yiminhe East Peripheral) held by China Energy Baotou Mining Co., Ltd. are located in the Yimin Coalfield. The three mines are adjacent to each other.

Section 1 Sampling Techniques and Data

The drilling activities of the Yimin Coalfield dates back to the 2000s. The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. The latest drilling activity at Yimin Coalfield was completed in 2010. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	• *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Topcon GTS-602 type GPS. The accuracy of the control points was evaluated using two sets of coordinate differences. The maximum difference

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>between the two sets of coordinates was 0.17 meters, and the elevation difference was 0.12 meters.
• The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. A more than 10% random re-survey was conducted on 44 engineering boreholes in this area using the repeat observation method. The plane error of 98% of the drilling holes is within ±0.10 to ±0.15 meters. Elevation error: ≤ ±0.05 meters
• The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.</td><td>• The drilling grids for different areas of each of the subject Baotou Mining properties in Yimin Coalfield are as follows:
<table><tr><th></th><th colspan="3">Mining Area</th><th colspan="3">Rsources %</th></tr><tr><th>Mining/Exploration Right</th><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr><tr><td>Yinminhe East Backup</td><td>1,000</td><td>2,000</td><td>2,000</td><td>16</td><td>9</td><td>75</td></tr><tr><td>Yinminhe East No.2</td><td>500</td><td>1,000</td><td>2,000</td><td>44</td><td>25</td><td>31</td></tr><tr><td>Yinminhe East Peripheral</td><td>500</td><td>1,000</td><td>2,000</td><td>28</td><td>38</td><td>34</td></tr></table></td></tr>
<tr><td></td><td>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</td><td>• As shown in the table, the resources at Yiminhe East No.2 and Yiminhe East Peripheral exploration rights have been properly defined. The data spacing is adequate to establish geological and quality continuity at these two properties.
• The Yiminhe East Backup Exploration Right are not well drilled and further drilling are needed for further feasibility study.</td></tr>
<tr><td></td><td>• Whether sample compositing has been applied.</td><td>• Sample compositing is not applicable to coal.</td></tr>
<tr><td>Orientation of</td><td>• Whether the orientation of sampling achieves unbiased sampling of</td><td>• For coal seams, as long as full seam interval sampling is achieved,</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
data in relation to geological structure	*possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	the sampling orientation has virtually no impact on the results. • No sampling bias is expected for coal seams.
Sample security	• *The measures taken to ensure sample security.*	• All samples were packaged in double-layer heavy-duty plastic sampling bags, which were then wrapped and sealed with adhesive tape to ensure the samples remain free from damage or contamination during storage and transportation. All samples taken were temporarily stored at the field office of the exploration team and are regularly sent to the designated laboratory by a designated person.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Yiminhe East Backup Exploration Type of Mining Right: Exploration Right Mining Right Name: Inner Mongolia Autonomous Region Ewenke Banner Yiminhe East Backup Exploration Mining Right Number: T150000200811101001910 5 Area: 29.9396 km² Location: Ewenke Autonomous Banner, Hulun Buir City, Inner Mongolia Autonomous Region. Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected exploration rights located in the Yimin Coalfield, the following exploration reports were provided for our review: = Y Exploration Report for the Yiminhe East Backup, July 2010 = Exploration Report for the Yiminhe East Peripheral, May 2008 = Exploration Report for the Yiminhe East No.2 Mine, July 2009 • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right

Criteria	JORC Code explanation	Commentary
		certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Yimin Basin is located in the eastern part of the Hailar Depression within the Neocathaysian Third Subsidence Zone. It is a fault-depression coal basin controlled by the Ajitu Yihongde Fault (F26) and the Yiminhe Fault (F19), trending northeast. The basin's primary basement consists of the Xing'anling Group, overlain by the coal-bearing Jalawur Group.The Yimin basin's internal structure comprises three secondary tectonic units, arranged from south to north: the Yimin Syncline, Wumuchang Anticline, and Menggenchulu Syncline. These subunits are separated by major faults, forming relatively independent coal-bearing basins. The Yimin Coalfield is situated within the Menggenchulu Syncline. • The Yimin Coalfield is located in the northeastern part of the Yimin Basin. The area features a broad, gentle syncline with an axial trend of northeast. Strata dips are generally around 5 degrees, increasing locally to 25 degrees near faults. Dips gradually steepen from the axial zone towards the limbs, with the southeastern limb being slightly steeper than the northwestern limb. The structure exhibits gentle undulations both along its strike and down its dip.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	metres) of the drill hole collar ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The CP converted the data from the editable versions into the database for this resource estimate. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification.

Criteria	JORC Code explanation	Commentary
		No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited I Baotou Mining. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource estimation. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like Baotou mining holding exploration rights in Yimin Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, considers the geological interpretation of the subject exploration rights in Yimin Coalfield to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities,

Criteria	JORC Code explanation	Commentary
		such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - Outcrop.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The resources areas of exploration rights are delineated by the authorized mine boundary of each property. • The following tables show the detailed characteristics of each seam of each mine

Criteria	JORC Code explanation	Commentary

Mine	Seam	Thickness (m) Coal	Parting	Seam	Distance from the Upper Seam (m)	Seam Depth Range (m)	Seam Dip (deg.)	Seam Occurrence

Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage*	• Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer

Criteria	JORC Code explanation	Commentary
	characterisation). • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis

Criteria	JORC Code explanation	Commentary
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: 15.7 MJ/kg.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• The following assumptions are made specifically for underground mining: - All seams will be extracted by SC mining method (with/without sub-level caving capability). - in-seam parting thinner than the minimum mining thickness of coal for SC mining will have to be mined together with coal.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of*	• The three target tenements are currently held under exploration licenses and represent contingent resources in early-stage development. All remain in an undeveloped state. • Based on operational experience from surrounding mines, it is assumed that environmental factors will not present material constraints to future mine development and construction activities.

Criteria	JORC Code explanation	Commentary
	these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.	
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of	• *Where appropriate a statement of the relative accuracy and*	• Data protocols and estimation techniques used in the Mineral

Criteria	JORC Code explanation	Commentary
relative accuracy/ confidence	*confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate for the undergournd operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves – No Coal Reserves; No Pre-feasibility Study was performed

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
	• *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.* • *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.* • *Whether the metallurgical process is well-tested technology or novel in nature.*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.* • *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.* • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.* • *The methodology used to estimate operating costs.* • *Allowances made for the content of deleterious elements.* • *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.* • *The source of exchange rates used in the study.* • *Derivation of transportation charges.* • *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
	• *The allowances made for royalties payable, both Government and private.*	
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *he derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
	viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.	
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.* • *Whether the result appropriately reflects the Competent Person's view of the deposit.* • *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Not applicable, as the exploration rights status does not support a reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific*	• Not applicable, as the exploration rights status does not support a reserve estimate.

Criteria	JORC Code explanation	Commentary
	discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage. • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	

APPENDIX B-13 JORC Code, 2012 Edition – Table 1 – Yuanbaoshan Coalfield

The Yuanbaoshan Open-pit Mine controlled by Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. Is located in the Yuanbaoshan Coalfield.

Section 1 Sampling Techniques and Data

The drilling activities of the Yuanbaoshan Coalfield dates back to the 1980s. The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. The latest drilling activity at Yuanbaoshan Coalfield was completed in 1997. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required,*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	• *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Topcon GTS-602 type GPS. The accuracy of the control points was evaluated using two sets of coordinate differences. The maximum difference

Criteria	JORC Code explanation	Commentary
		between the two sets of coordinates was 0.17 meters, and the elevation difference was 0.12 meters. • The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. A more than 10% random re-survey was conducted on 44 engineering boreholes in this area using the repeat observation method. The plane error of 98% of the drilling holes is within ±0.10 to ±0.15 meters. Elevation error: ≤ ±0.05 meters • The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• The drilling grid in the eastern part of the mining area, covering approximately one-third of the total area, is 250×250 meters, while a 500×500 meter grid is adopted in the remaining majority of the region. This drilling spacing is sufficient to classify the majority of the resources in the Yuanbaoshan mining area as the Measured category. The data spacing is adequate to establish geological and quality continuity. • Sample compositing is not applicable to coal.
Orientation of data in relation to geological	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation*	• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results.

Criteria	JORC Code explanation	Commentary
structure	*of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• No sampling bias is expected for coal seams, as full-seam interval sampling was achieved.
Sample security	• *The measures taken to ensure sample security.*	• All samples were packaged in double-layer heavy-duty plastic sampling bags, which were then wrapped and sealed with adhesive tape to ensure the samples remain free from damage or contamination during storage and transportation. All samples taken were temporarily stored at the field office of the exploration team and are regularly sent to the designated laboratory by a designated person.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Yuanbaoshan Open-pit Coal Mine: Type of Mining Right: Mining Right Mining Right Name: Inner Mongolia Pingzhuang Coal Industry (Group) Co., Ltd. Yuanbaoshan Open-pit Coal Mine Mining Right Number: C100000201112114012185 8 Area: 12.8574 km² Location: Yuanbaoshan District, Chifeng City, Inner Mongolia Autonomous Region Ownership: Inner Mongolia Pingzhuang Coal Industry (Group) Co., Ltd. (100% owned by China Energy Investment Corporation directly and/or via subsidiaries)

Criteria	JORC Code explanation	Commentary
		According to the EIA and/or exploration report of the project, the Chaoyang Open-pit Mine does not involve environmentally sensitive points requiring special protection, such as cultural relics or historic sites. • Related coal mine in the Yuanbaoshan Coalfield is Yuanbaoshan Open-pit Mine. The mining right certificate for the mine is within the valid period. No known impediments to maintaining and renewing such mining certificate were identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• The Yuanbaoshan Open-pit Coal Mine underwent two exploration campaigns which were conducted by Liaoning Province Coal Geology Survey Bureau in 1980, and by Pingzhuang Mining Industry Bureau (predecessor of Inner Mongolia Pingzhuang Coal Industry (Group) Co., Ltd.) in 1997, respectively. The resulting geological reports were reviewed and approved by the competent authorities at various levels. • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole

Criteria	JORC Code explanation	Commentary
		data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The geologic settings of the Yuanbaoshan Open-pit is judged to be moderate. While the strata are flat-lying, complex structure containing multiple partings of the coal seams is a complicating factor for the seam in most of the mine areas. • Regional Geology: The Yuanbaoshan Coalfield is situated at the intersection of the Tianshan–Yinshan Latitudinal Tectonic Belt and the NNE-trending Neocathaysian Second Subsidence Zone. The regional structural framework comprises a series of NE–SW trending, echelon-arranged fault-depressed coal-bearing basins. • Structure: The Yuanbaoshan Coalfield exhibits a gently undulating fold structure with an overall NE–SW tectonic trend. The strata predominantly dip SE, with dip angles ranging from 4° to 47° and generally between 8° and 18°.The coalfield is composed of three synclines and two anticlines, which collectively form its gently undulating folded structure.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	explain why this is the case.	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
data	*method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The competent persons converted the data from the editable versions into the database for this resource estimate. The database was verified using Carlson SURVCAD before modeling. • The completed model was cross-checked and validated against the attached maps in the geological reports. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration

Criteria	JORC Code explanation	Commentary
		history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource estimation. The database was verified using Carlson SURVCAD before modeling. The completed model was cross-checked and validated against the attached maps in the geological reports. If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like the Yuanbaoshan Open-pit Mine is high. The competent persons for this report, through the review of borehole logs and geophysical logs for seam correlation, as well as subsequent model representation, consider the geological interpretation of the Yuanbaoshan Open-pit Mine to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities,

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>such as:
= Syndepositional structures leading to seam splitting and thinning.
= Post-depositional structures including erosion by paleochannels, and magmatic erosion.

<table><tr><th rowspan="2">Mine</th><th rowspan="2">Seam</th><th colspan="3">Thickness (m)</th><th rowspan="2">Distance from the Upper Seam (m)</th><th rowspan="2">Seam Depth Range (m)</th><th rowspan="2">Seam Dip (deg.)</th><th rowspan="2">Seam Occurrence</th></tr><tr><th>Coal</th><th>Parting</th><th>Seam</th></tr><tr><td>Yuanbaoshan Open-pit</td><td>4</td><td>9.9</td><td>1.85</td><td>11.8</td><td>-</td><td>61 - 226</td><td>15-SE</td><td>Moderate</td></tr><tr><td></td><td>5</td><td>17.1</td><td>2.46</td><td>19.6</td><td>70</td><td>19 - 323</td><td>15-SE</td><td>Moderate</td></tr><tr><td></td><td>6</td><td>24.1</td><td>2.65</td><td>26.8</td><td>80</td><td>24 - 468</td><td>15-SE</td><td>Moderate</td></tr><tr><td></td><td>7</td><td>6.1</td><td>1.60</td><td>7.7</td><td>15</td><td>44 - 506</td><td>15-SE</td><td>Moderate</td></tr></table></td></tr>
<tr><td>Estimation and modelling techniques</td><td>• The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</td><td>• The model of the Yuanbaoshan Open-pit Coal Mine was constructed using Carlson SURVCAD software based on the original data in the Beijing 1954 coordinate system. The model database includes the collar coordinates and elevation of each borehole, the top and bottom depths of each lithology, and the coal quality data of each coal seam. The SURVCAD software can generate triangulated surface models</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
	• *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	for the roof and floor of each coal seam, thereby enabling the estimation of the spatial volume between them. The resource estimation is then calculated based on the apparent density of each seam. • The modeling utilized all borehole data within the mining area, and the extent of the resources was constrained by mine boundary, authorized mining elevation and topo showing the current pit-shell. The key parameters and assumptions used for the resource estimation include: a density of 2.1 for partings, partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters. • The critical step in coal modelling data validation lies in seam correlation, which is conducted *prior to* database establishment. The Competent Person (CP) first assesses the rationality of seam correlation through a comprehensive review of borehole data. Owing to the characteristics of layered deposits, upon model completion, the model itself can be integrated with geological rationality analysis to identify any anomalous data.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis.
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: 15.7 MJ/kg
Mining	• *Assumptions made regarding possible mining methods, minimum*	• The following assumptions are made specifically for open-pit mining:

Criteria	JORC Code explanation	Commentary
factors or assumptions	*mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• The subject open-pit mine provided preliminary design report which covers dump site descriptions and environmental impact assessment report. The Yuanbaoshan Coalfield area is a regional coal-producing center, where approval process for waste dump site acquisition has been smooth, and no obstacle in obtaining future sites for waste storage was identified. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental

Criteria	JORC Code explanation	Commentary
	representativeness of the samples. • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Criteria	JORC Code explanation	Commentary
	estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.5 m thick for bituminous thermal coal as presented at the Yuanbaoshan Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated). - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable

Criteria	JORC Code explanation	Commentary
		Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for Yuanbaoshan Open-pit was provided, which is the typical mine design report for open-pit coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas. The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: 2,700kcal/kg
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining*	• Preliminary Design Report for the mine was provided, which has the necessary mining design details for coal reserve estimation. The mining method selected for the open-pit mine was shovel-truck approach with semi-mobile crushing/belt transportation arrangement. • The coal seams in the Yuanbaoshan Coalfield feature shallow

Criteria	JORC Code explanation	Commentary
	method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.	occurrences with generally simple geological settings. The mine area has only sparsely distributed population. The shovel-truck mining method is widely used in open-pit coal mines in China with abundant successful experiences. The selection of mining method in the mine is considered appropriate.
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Geotechnical parameters are designed based on the geotechnical testing of rock and coal strata. Yuanbaoshan Open-pit Min has years of operating history. Major mining and geotechnical parameters are as follows: Parameter / Unit / Mining / Stripping Bench Height / m / 15 / 24/8 Working Width / m / 30 / 30 Bench Face Angle / ° / 70 / Soil:50 Rock:70 Safety Offset / m / 6 / 6 Road Width / m / 26 / 26 Safety Clearance / m / 8 / 8 Minimum Working Bench Width / m / 70 / 70
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).* • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.*	• Not applicable • OSD of 3% was considered for all the seams during mining. • A 98% recovery factor was used for the open-pit mine. • Minimum mining working bench width used was 70 m for Yuanbaoshan Open-pit.

Criteria	JORC Code explanation	Commentary
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded. • Yuanbaoshan Coalfield is located in the eastern part of Inner Mongolia Autonomous Region, which is major coal-producing area with numerous mines in operation and planned. Infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, Telecommunication network, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Yuanbaoshan Open-pit has crusher systems to produce coal at different sizes. The proposed coal processing arrangements are considered appropriate and can satisfy the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The crushing and screening technologies are all widely adopted coal processing technologies and have been well tested throughout the coal industry in China.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Test work undertaken for the Yuanbaoshan Open-pit does not involve metallurgical testing. Instead, coal processing test work has been completed to assess the performance of crushing and screening separation. The test work is considered representative of the coal seams included in the Coal Reserve estimate. Yield (recovery) factors applied to the Coal Reserve estimate are derived from the test work and available operational data.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the*	• No deleterious elements • The subject open-pit mine has well-established coal processing history, thus no bulk sample or pilot scale test work is needed.

Criteria	JORC Code explanation	Commentary
	degree to which such samples are considered representative of the orebody as a whole. • *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Calorific Value parameter and ash content in coal quality are the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• The subject open-pit mine provided preliminary design report which covers dump site descriptions and environmental impact assessment report. The Yuanbaoshan Coalfield area is a regional coal-producing center, where approval process for waste dump site acquisition has been smooth, and no obstacle in obtaining future sites for waste storage was identified.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Yuanbaoshan Coalfield is located in the eastern part of Inner Mongolia Autonomous Region. Due to the well-developed coal industry and designated energy base status, infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided covering civil constructions, equipment purchases, etc. Sustaining capital at RMB5/t of coal producing capacity was assumed which is typical for large open-pit mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by the mine based on historical performance and adjusted for certain changes such as stripping ratio.

Criteria	JORC Code explanation	Commentary
		The competent person extended the projection period to the year when the Coal Reserves are depleted.
	• *Allowances made for the content of deleterious elements.*	• No deleterious elements.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• The historical three-year average price (VAT inclusive) was used for our economic analysis of the mine. Yuanbaoshan Open-pit: RMB266.5/t
	• *The source of exchange rates used in the study.*	• Exchange rates: not applicable
	• *Derivation of transportation charges.*	• Transportation charges are included in the operating costs and related to stripping ratio, which are adjusted accordingly in future operation projections.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting.
	• *The allowances made for royalties payable, both Government and private.*	• The mine already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• The historical three-year average price (VAT inclusive) was used for our economic analysis of the mine. Yuanbaoshan Open-pit: RMB266.5/t
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.*	• Most of coal products from the subject open-pit mine will supply the nearby power plants and local market. The Yuanbaoshan Coalfield is one of the major coal producing areas in Inner Mongolia. The coal products from the mine have consistent coal quality and are expected to continue their market share.
	• *A customer and competitor analysis along with the identification of likely market windows for the product.*	

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td>• Price and volume forecasts and the basis for these forecasts.

Criteria	JORC Code explanation	Commentary
	Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.	
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the subject open-pit mine cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.*	• The Ore Reserve estimate for the open-pit operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam

Criteria	JORC Code explanation	Commentary
	estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.	thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for surface mining operations.
	• *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-14 JORC Code, 2012 Edition – Table 1 – Zhundong Coalfield

The three open-pit mines (Hongshaquan No.1 Open-pit, Hongshaquan No.2 Open-pit and Zhundong Open-pit) and four exploration right areas (Jiangjunmiao, Wucaiwan No.2, Wucaiwan No.3 and Wucaiwan No.5) held by China Energy Xinjiang Energy and Chemical Co., Ltd. are located in the Zhundong Coalfield.

Section 1 Sampling Techniques and Data

Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. For the three open-pit mines (Zhundong Open-pit Mine, Hongshaquan No.1 Open-pit Mine and Hongshaquan No.2 Open-pit Mine) are relatively new and were commissioned in recent years, the drilling and sampling relevant information for these three mines are available, as shown in below Section 1 information in regards to drilling, sampling, logging and lab testing. For the four exploration right areas, the latest drilling activity at Jiangjunmiao, Wucaiwan No.2, Wucaiwan No.3 and Wucaiwan No.5 was completed in 2013, 2012, 2012 and 2011 respectively, and relevant information can not be traced. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge*	• All coal seam samples were collected in accordance with China's "Regulations on the Collection of Coal Samples for Coal Resource Exploration". All seams with a thickness greater than the minimum minable thickness (0.8 m for the coal seams in Zhundong Coalfield) are sampled by core logging. The sampling thickness for each interval is typically less than 6 meters. For multi-layer coal seams, each individual coal layer is to be sampled separately, while partings and carbonaceous mudstone are also sampled independently. When the thickness of a parting exceeds 0.10 meters, only 0.10 meters is collected. The samples are described layer by layer according to specified requirements. After sorting and cleaning, the length and weight recovery rates are calculated. Finally, the samples are packaged, boxed, and sent to the testing laboratory along with the

Criteria	JORC Code explanation	Commentary
	for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	sample submission forms and coal sample summary sheets.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Core drilling was employed. Hard rock strata are drilled using PDC (Polycrystalline Diamond Compact) bits or surface-set diamond bits. Double split core barrels were used for coal. Coal Core diameter is 63.5 mm. All holes are vertical holes.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.*	• Core recovery was determined by measuring the sample length and weight, which was later compared with the geophysical logs that were run after the hole was completed. According to Chinese Standard, the minimum acceptable linear and weight recovery requirements are 75% and 60%, respectively. Seam cores with lower recoveries were not analyzed per Chinese standards. While these minimum recoveries are lower than some international standards, actual core recoveries were generally higher.
	• *Measures taken to maximise sample recovery and ensure representative nature of the samples.*	• During rock stratum drilling, a single-tube core barrel is typically employed. When the drillers determine that the coal seam has been entered based on the returning drilling mud, they switch to a double-tube coal coring tool and appropriately adjust the drilling rate and pressure to ensure coal core recovery.
	• *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• There was no obvious relationship found between coal core recovery and coal quality.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate*	• All core samples were lithologically logged and described using standardized codes for rock type, grain size, color, and Rock Quality

Criteria	JORC Code explanation	Commentary
	Mineral Resource estimation, mining studies and metallurgical studies. • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	Designation (RQD). Core photos were taken before logging. Logging was initially recorded on paper forms at the site and then entered into a spreadsheet in the office afterwards. • All drill holes also underwent geophysical logging to verify parameters such as the thickness of lithological strata in the coal-bearing sequence, coal seam structure, hole diameter, and deviation. Logs run include natural gamma, density, resistivity, calliper, and vertical deviation.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Sub-sampling techniques are not applicable to coal. The entire core for all mineable coal seams was sampled and there was no subsampling.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.*	• Samples taken for analytical testing were delivered to a licensed laboratory where individual samples were weighed, air dried, crushed, and riffled according to Chinese standards. Subsamples of the riffled samples are taken for various analyses, with the remainder of the sample retained for future analyses. • The laboratories conduct quality control procedures, including sending duplicates to other labs and internal audits.

Criteria	JORC Code explanation	Commentary
	• *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.*	• Due to large-scale occurrence and consistent coal quality, the verification of significant intersections is not applicable to coal projects.
	• *The use of twinned holes.*	• Twinned holes were generally not drilled.
	• *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.*	• Data recording field work, such as core logging, sampling records were handwritten and was scanned and transferred to electronic version after the field work was completed. Laboratories use electronic data entry system at each testing station.
	• *Discuss any adjustment to assay data.*	• No adjustments were made to the assay data.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.*	• The coordinate system is the 2000 National Coordinate system, and the elevation system adopts the 1985 National elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the RTK GPS. The maximum error in the plane is 9 millimeters, and the maximum error in elevation is 7 millimeters.
	• *Specification of the grid system used.*	• The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. A 10% random re-survey was conducted in this area using the repeat observation method. After adjustment, the mean error of the weakest point position is ±0.009 meters, and the mean error of the maximum elevation is ±0.134 meters.
	• *Quality and adequacy of topographic control.*	• The re-survey results confirm that the engineering survey outcomes

Criteria	JORC Code explanation	Commentary
		Currently no available information on material social and environmental issues. Xinjiang Energy provided a series of documents related to the exploration permit applications and government replies regarding the Wucaiwan No. 5 Open-pit Mine Exploration project. Among them, the "Reply Letter on Soliciting Opinions on the Exploration Change and Continuation of the Xinjiang Zhundong Coalfield Jimusaer County Wucaiwan No. 5 Open-pit Mine Exploration project" issued by the Natural Resources Bureau of Changji Prefecture in June 2025 states that the Bureau has approved the procedures for the change and continuation of the exploration right, the new exploration right certificate will be based on the previous exploration right certificate (No. T65120090801033442) of "Xinjiang Zhundong Coalfield Jimusaer County Lucaogou Coal Mine No.1 Exploration Area". China Energy Xinjiang Energy and Chemical Co., Ltd. is actively applying for the relevant process, and the applicant is Xinjiang Shenxing Energy Co., Ltd. Based on the document Xinjiang Energy provided and the Competent Person's knowledge and experiences with Chinese mining industry, there is reasonable expectation that Xinjiang Energy will be granted of the exploration right certificate. • Related coal mines in the Zhundong Coalfield include Zhundong Open-pit, Hongshaquan No.1 and Hongshaquan No.2 mines; exploration right areas include Jiangjunmiao, Wucaiwan No.2, Wucaiwan No.3 and Wucaiwan No.5. The mining right certificates and exploration right certificates for these are all valid. No known impediments to maintaining and renewing such mining and

Criteria	JORC Code explanation	Commentary
		exploration certificates were identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected mining/exploration rights located in the Zhundong Coalfield, the following exploration reports were provided for our review: - Zhundong Open-pit: = Detailed Exploration Report for the Xinjiang Jimusaer County (Shenhua) Zhundong Open-pit Mine Exploration, January 2008 = Reserve Verification Report for the Xinjiang Jimusaer County Wucaiwan Mine Area No.3 Open-pit Mine Field, October 2014 = Geology Report for Mine Production for Zhundong Open-pit Mine, June 2023 = Feasibility Study Report for Zhundong Open-pit Mine, May 2024 - Hongshaquan No.1 Open-pit: = Supplementary Exploration Report for the Hongshaquan No.1 Open-pit Mine, Xiheishan Mining Area, May 2025 - Hongshaquan No.2 Open-pit: = Exploration for the Hongshaquan No.2 Open-pit Mine, August 2010 = Supplementary Exploration Report for the Hongshaquan No.2 Open-pit Mine, September 2022 = 2024 Annual Reserves Verification Report for the Hongshaquan No.2 Open-pit Mine

Criteria	JORC Code explanation	Commentary
		= Monitoring Statement for the Hongshaquan No.2 Open-pit Mine, Xiheishan Mining Area, First Half of 2025 - Jiangjunmiao Exploration Right: = Exploration Report for the Jiangjunmiao Open-pit Mine, September 2013 - Wucaiwan No.2 Exploration Right: = Exploration Report for the Lucaogou Exploration Area (Underground Mining Section), December 2012 - Wucaiwan No.3 Exploration Right: = Exploration Report for the Lucaogou Exploration Area (Underground Mining Section), December 2012 - Wucaiwan No.5 Exploration Right: = Exploration Report for the Wucaiwan No.5 Open-pit Mine, November 2011 = Feasibility Study Report for the Wucaiwan No.5 Open-pit Mine, April 2025 • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.

Criteria	JORC Code explanation	Commentary
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Coal deposit. • The geologic settings of the Zhundong Coalfield is judged to be moderate. While the strata are moderately dipping and the major seams are favorably thick, the complex structure containing folds and faults is a complicating factor for the seams in each of the mine areas. • Regional Geology: Located in the Kalamaili foredeep belt on the eastern margin of the Junggar Basin, the Zhundong Coalfield constitutes an independent tectonic-sedimentary unit. Its structural framework was shaped by multiple tectonic cycles, with the Yanshanian movement playing a decisive role in reforming the Jurassic coal measures and forming the present structural and coal accumulation framework. The region features a Variscan folded basement and sedimentary cover from Carboniferous to Quaternary, with primary coal-bearing strata in the Jurassic Xishanyao and Badaowan Formations. Multi-phase tectonic events ultimately created the current structural pattern of interwoven uplifts and depressions. • Structure: The Zhundong Coalfield exhibits a complex internal structure, where folds and faults of varying scales govern the spatial distribution of coal seams. Three typical coal-controlling structural types have developed: compound synclinal folds, imbricate thrust structures, and nappe structures, forming a unique structural control pattern. Overall, coal seam distribution follows a "three-zone" differentiation trend: thicker in the west and thinner in the east, deeper in the north and shallower in the south. - Western Thick-Seam Zone (Wucaiwan-Jiangjunmiao):

Criteria	JORC Code explanation	Commentary
		Dominated by the Xishanyao Formation's B1 coal seam, with single-layer thickness generally exceeding 50m. Simple structure, primarily monoclinal, suitable for large-scale open-pit mining. All the subject properties of Xinjiang Energy are located in this zone. - Eastern Thin-Seam Zone (Laojunmiao-Xiheishan): Seam thickness reduces to 20 to 40m, split into 2 to 3 layers, with dip angles increasing to 8 to 13 degrees. - Northern Deep Zone (Dajing-Zhangpenggou): Burial depth increases to 500 to 700m, requiring underground mining methods.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Not applicable as no Exploration Results included in the report.
Data aggregation	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
methods	*grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The CP converted the data from the editable versions into the database for this resource estimate. The database was verified using Carlson SURVCAD before modelling for all open-pit mining/exploration rights (i.e. Hongshaquan No.1 Open-pit, Hongshaquan No.2 Open-pit, Zhundong Open-pit, Jiangjunmiao and Wucaiwan No.5). The database of Wucaiwan No.2 and No.3 exploration rights was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • The completed model was cross-checked and validated against the attached maps in the geological reports. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited China Energy Xinjiang Energy and Chemical Co., Ltd. in September 2025. During the site visit, the

Criteria	JORC Code explanation	Commentary
		Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource estimation. The database was verified using Carlson SURVCAD before modeling for the open-pit mines, and using excel tools for underground mining/exploration rights. The completed model or seam figure was cross-checked and validated against the attached maps in the geological reports. If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like the Zhundong Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, as well as subsequent model representation, considers the geological interpretation of the subject mining rights (i.e. Hongshaquan No.1 Open-pit, Hongshaquan No.2 Open-pit and Zhundong Open-pit) and exploration right areas (i.e. Jiangjunmiao, Wucaiwan No.2, Wucaiwan No.3 and Wucaiwan No.5)

Criteria	JORC Code explanation	Commentary
		to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - outcrop.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The resources areas of the mining rights are delineated by the authorized mine boundary, with vertical mining elevation limits as follows: - Hongshaquan No.1 Open-pit: +760 m to -51 m - Hongshaquan No.2 Open-pit: +727 m to -47 m - Zhundong Open-pit: +636 m to -60 m • The resources areas of the exploration rights (i.e. Jiangjunmiao, Wucaiwan No.2, Wucaiwan No.3 and Wucaiwan No.5) are only

Criteria	JORC Code explanation	Commentary
		delineated by the authorized mine boundary •

Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation*	• The models of the open-pit mining/exploration rights (i.e. Hongshaquan No.1 Open-pit, Hongshaquan No.2 Open-pit and Zhundong Open-pit, Jiangjunmiao and Wucaiwan No.5)were constructed using Carlson SURVCAD software based on the original

Criteria	JORC Code explanation	Commentary
	method was chosen include a description of computer software and parameters used. • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	data in the 2000 National coordinate system. The model database includes the collar coordinates and elevation of each borehole, the top and bottom depths of each lithology, and the coal quality data of each coal seam. The SURVCAD software can generate triangulated surface models for the roof and floor of each coal seam, thereby enabling the estimation of the spatial volume between them. The resource estimation is then calculated based on the apparent density of each seam. • The modeling utilized all borehole data within the mining area, and the extent of the resources was constrained by mine boundary, authorized mining elevation and topo showing the current pit-shell. The key parameters and assumptions used for the resource estimation include: a density of 2.1 for partings, partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters. • The critical step in coal modeling data validation lies in seam correlation, which is conducted prior to database establishment. The Qualified Person (QP) first assesses the rationality of seam correlation through a comprehensive review of borehole data. Owing to the characteristics of layered deposits, upon model completion, the model itself can be integrated with geological rationality analysis to identify any anomalous data. • The resource estimation methodology for all underground mines and is detailed as follows: - Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam,

Criteria	JORC Code explanation	Commentary
		coal seam roof and floor depths/elevations, and coal quality data. - Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. - Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data. - Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. - Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent

Criteria	JORC Code explanation	Commentary
		sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). - Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. - Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. - In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: Lignite 15.7 MJ/kg. Bituminous Coal 17.0 MJ/Kg.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider*	• The following assumptions are made specifically for open-pit mining: partings thicker than 0.5 m can be separately stripped in open-pit production, and a minimum minable coal seam thickness of 0.5 meters.

Criteria	JORC Code explanation	Commentary
	potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.	• The following assumptions are made specifically for underground mining: - All seams will be extracted by FM LW mining method (with/without sub-level caving capability). - In-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Each of the three subject open-pit mines provided preliminary design report which covers dump site descriptions and environmental impact assessment report. The Zhundong Coalfield area is a designated major energy base, where approval process for waste dump site acquisition has been smooth, and no obstacle in obtaining future sites for waste storage was identified. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental

Criteria	JORC Code explanation	Commentary
	representativeness of the samples. • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall

Criteria	JORC Code explanation	Commentary
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.5 m thick at each open-pit mining/exploration rights (i.e. Hongshaquan No.1, Hongshaquan No.2 and Zhundong mining rights, and Jiangjunmiao and Wucaiwan No.5 exploration rights) and greater than 0.8 m thick within other exploration rights(i.e. Wucaiwan No.2 and Wucaiwan No.3 exploration rights) . - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated). - Preparation of coal isopach maps within the identified

Criteria	JORC Code explanation	Commentary
		resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited China Energy Xinjiang Energy and Chemical Co., Ltd in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for each of the Zhundong Open-pit, Hongshaquan No.1 Open-pit and Hongshaquan No.2 mines was provided, which is the typical mine design report for open-pit coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore*	• Preliminary Design Report for each mine was provided, which has the necessary mining design details for coal reserve estimation. The

Criteria	JORC Code explanation	Commentary
assumptions	*Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).*	mining method selected for the three open-pit mines was shovel-truck approach with semi-mobile crushing/belt transportation arrangement.
	• *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• The coal seams in the Zhundong Coalfield feature shallow occurrence with generally simple geological settings. The dry weather and weak water-bearing strata are benefit for open-pit mining. In addition, this area has only sparsely distributed population. The shovel-truck mining method is widely used in open-pit coal mines in China with abundant successful experiences. The selection of mining method in the three mines is considered appropriate.
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Geotechnical parameters are designed based on the geotechnical testing of rock and coal strata. Zhundong Open-pit Mine: since the mine had years of operating history, extension of mining started from the current location along the western portion of the pit. Mining and geotechnical parameters are as follows:

- *The major assumptions made and Mineral Resource model used for*
- Not applicable

Criteria	JORC Code explanation	Commentary
	pit and stope optimisation (if appropriate). • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• OSD of 3% was considered for all the seams during mining. • A 95% of recovery factor was used for all the open-pit mines. • Minimum mining working bench width used was 50 m, 70 m and 65 m for Zhundong Open-pit, Hongshaquan No.1 Open-pit and Hongshaquan No.2 Open-pit mines, respectively. • In Coal Reserve estimation, Inferred Coal Resources were excluded. • Zhundong Coalfield is located in the eastern part of Xinjiang Uygur Autonomous Region, which is designated by the central and regional government to be a major energy base with numerous mines in operation and planned. Infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, Telecommunication network, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Zhundong Open-pit only has crusher systems to produce coal at different sizes. Hongshaquan No.1 has three processing units. Unit one adopts roller crusher to crush the coal first, then the 150-30 mm coal is washed using heavy media vessel technology while the -30 mm coal is not processed. Unit 2 process the 350-50 mm coal using TDS technology. Unit 3 only adopts crushing and screening technology. Hongshaquan No.2 adopts crushing and screening for ROM coal, then the 300-50 mm size coal is processed using TDS technology. The proposed coal processing arrangements are considered appropriate and can satisfy the requirement of product coal quality by their customers.

Criteria	JORC Code explanation	Commentary
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The crushing and screening, heavy media vessel and TDS technologies are all widely adopted coal processing technologies and have been well tested throughout the coal industry in China.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Test work undertaken for the Zhundong Open-pit, Hongshaquan No.1 Open-pit and Hongshaquan No.2 Open-pit does not involve metallurgical testing. Instead, coal processing test work has been completed to assess the performance of crushing and screening, TDS dry separation, and heavy medium shallow vessel separation methods. The test work is considered representative of the coal seams included in the Coal Reserve estimate. Yield (recovery) factors applied to the Coal Reserve estimate are derived from the test work and available operational data for TDS heavy media shallow vessel systems.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• No deleterious elements • The three subject open-pit mines have well-established coal processing history, thus no bulk sample or pilot scale test work is needed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Calorific Value parameter in coal quality is the main focus for thermal coal. In the Coal Reserve estimation process, such parameter has been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process*	• Each of the three subject open-pit mines provided preliminary design report which covers dump site descriptions and environmental impact assessment report. The Zhundong Coalfield area is a designated major energy base, where approval process for waste dump site

Criteria	JORC Code explanation	Commentary
	residue storage and waste dumps should be reported.	acquisition has been smooth, and no obstacle in obtaining future sites for waste storage was identified.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Zhundong Coalfield is located in the eastern part of Xinjiang Uygur Autonomous Region. Due to the well-developed coal industry and designated energy base status, infrastructure needed for open-pit mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB5/t of coal producing capacity was assumed which is typical for large open-pit mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by each mine based on historical performance and adjusted for certain changes such as stripping ratio. The competent person extend the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.* • *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• No deleterious elements. • The historical three-year average prices were used for our economic analysis of each mine. Zhundong Open-pit: RMB127/t VAT inclusive Hongshaquan No.1: RMB159/t VAT inclusive Hongshaquan No.2: RMB159/t VAT inclusive
	• *The source of exchange rates used in the study.* • *Derivation of transportation charges.*	• Exchange rates: not applicable • Transportation charges are included in the operating costs and related to stripping ratio, which are adjusted accordingly in future operation projections.
	• *The basis for forecasting or source of treatment and refining charges,*	• Processing cost projections are based on historical performance and

Criteria	JORC Code explanation	Commentary
	penalties for failure to meet specification, etc.	included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting, which appears common for coal mines.
	• *The allowances made for royalties payable, both Government and private.*	• The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change. • The historical three-year average prices were used for our economic analysis of each mine. Zhundong Open-pit: RMB127/t VAT inclusive Hongshaquan No.1: RMB159/t VAT inclusive Hongshaquan No.2: RMB159/t VAT inclusive
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Most of coal products from the subject open-pit mines will supply the nearby power plants and local market. Zhundong Coalfield is one of the major coal producing area in Xinjiang and is a designated energy base. The coal products from the three mines have consistent coal quality and are expected to continue their market share. • Coal prices have been slowly declining over the 2024-2025 period. The historical three-year average prices were used for our economic analysis of each mine.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted

<table>

</table>

Criteria	JORC Code explanation	Commentary
		confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.*	• The Ore Reserve estimate for the open-pit operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations.

Criteria	JORC Code explanation	Commentary
	• *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-15 JORC Code, 2012 Edition – Table 1 – Zhunge'er Coalfield

The Boligou Mine and Heidaigou exploration right area controlled by Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. are located in the Zhunge'er Coalfield.

Section 1 Sampling Techniques and Data

The coal drilling activities of the Zhunge'er Coalfield dates back to the 2008. There is no drilling activity for the Heidaigou Exploration Right in the past ten years and related coal drilling techniques employed are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

A Supplementary Geology Exploration was completed for Boligou in 2024. The comments in this section is based on the CP's interview with Shaanxi 185 Coalfield Geology Co., Ltd., who conducted the 35 hole drilling program for Boligou in 2024.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required,*	• All coal seam samples were collected in accordance with China's "Regulations on the Collection of Coal Samples for Coal Resource Exploration". All seams with a thickness greater than the minimum minable thickness (0.8 m for the coal seams in Zhunge'er Coalfield) are sampled by core logging. The sampling thickness for each interval is typically less than 3 meters. For multi-layer coal seams, each individual coal layer is to be sampled separately, while partings and carbonaceous mudstone are also sampled independently. When the thickness of a parting exceeds 0.10 meters, only 0.10 meters is collected. The samples are described layer by layer according to specified requirements. After sorting and cleaning, the length and weight recovery rates are calculated. Finally, the samples are packaged, boxed, and sent to the testing laboratory along with the

Criteria	JORC Code explanation	Commentary
	such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	sample submission forms and coal sample summary sheets.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Core drilling was employed. Hard rock strata are drilled using PDC (Polycrystalline Diamond Compact) bits or surface-set diamond bits. Double split core barrels were used for coal. Coal Core diameter is 63.5 mm. All holes are vertical holes.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.*	• Core recovery was determined by measuring the sample length and weight, which was later compared with the geophysical logs that were run after the hole was completed. According to Chinese Standard, the minimum acceptable linear and weight recovery requirements are 75% and 60%, respectively. Seam cores with lower recoveries were not analyzed per Chinese standards. While these minimum recoveries are lower than some international standards, actual core recoveries were generally higher.
	• *Measures taken to maximise sample recovery and ensure representative nature of the samples.*	• During rock stratum drilling, a single-tube core barrel is typically employed. When the drillers determine that the coal seam has been entered based on the returning drilling mud, they switch to a double-tube coal coring tool and appropriately adjust the drilling rate and pressure to ensure coal core recovery.
	• *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• There was no obvious relationship found between coal core recovery and coal quality.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical*	• All core samples were lithologically logged and described using standardized codes for rock type, grain size, color, and Rock Quality Designation (RQD). Core photos were taken before logging. Logging

Criteria	JORC Code explanation	Commentary
	studies. • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	was initially recorded on paper forms at the site and then entered into a spreadsheet in the office afterwards. • All drill holes also underwent geophysical logging to verify parameters such as the thickness of lithological strata in the coal-bearing sequence, coal seam structure, hole diameter, and deviation. Logs run include natural gamma, density, resistivity, calliper, and vertical deviation.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Sub-sampling techniques are not applicable to coal. The entire core for all mineable coal seams was sampled and there was no subsampling.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks,*	• Samples taken for analytical testing were delivered to a licensed laboratory where individual samples were weighed, air dried, crushed, and riffled according to Chinese standards. Subsamples of the riffled samples are taken for various analyses, with the remainder of the sample retained for future analyses. • The laboratories conduct quality control procedures, including

Criteria	JORC Code explanation	Commentary
	duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	sending duplicates to other labs and internal audits.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Due to large-scale occurrence and consistent coal quality, the verification of significant intersections is not applicable to coal projects. • Twinned holes were generally not drilled. • Laboratories use electronic data entry system at each testing station. • No adjustments were made to the assay data.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Topcon GTS-602 type GPS. The accuracy of the control points was evaluated using two sets of coordinate differences. The maximum difference between the two sets of coordinates was 0.17 meters, and the elevation difference was 0.12 meters. • The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. A more than 10% random re-survey was conducted on 44 engineering boreholes in this area using the repeat observation method. The plane error of 98% of the drilling holes is within ±0.10 to ±0.15 meters. Elevation error: ≤ ±0.05 meters

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>• The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.</td><td>• The drilling grids for different areas of each of the subject Pingzhuang Coal properties in Zhunge'er Coalfield are as follows:
<table><tr><th></th><th colspan="3">Mining Area</th><th colspan="3">Rsources %</th></tr><tr><th>Mining/Exploration Right</th><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr><tr><td>Boligou</td><td>400</td><td>800</td><td>1,600</td><td>67</td><td>23</td><td>10</td></tr><tr><td>Heidaigou</td><td>500</td><td>1,000</td><td>1,000</td><td>25</td><td>71</td><td>4</td></tr></table></td></tr>

Criteria	JORC Code explanation	Commentary
reviews		data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Boligou Coal Mine: Type of Mining Right: Mining Right Mining Right Name: Inner Mongolia Autonomous Region Zhunge'er Coalfield Boligou Coal Mine Mining Right Number: C1500002021041110151849 Area: 18.1463 km² Location: Xuejiawan Town, Zhunge'er Banner, Ordos City, Inner Mongolia Autonomous Region Ownership: Inner Mongolia Pingzhuang Coal Industry (Group) Co., Ltd. (100% owned by China Energy) According to the EIA and/or exploration report of the project, the Boligou Coal Mine does not involve environmentally sensitive points requiring special protection, such as nature reserves, cultural relics or historic sites. • Heidaigou Exploration Type of Mining Right: Exploration Right Mining Right Name: Inner Mongolia Autonomous Region Zhunge'er Coalfield Heidaigou Mine Area Coal Exploration Mining Right Number: T150000200811105001991 Area: 21.422 km²

Criteria	JORC Code explanation	Commentary
		Location: Xuejiawan Town, Zhunge'er Banner, Ordos City, Inner Mongolia Autonomous Region Ownership: Inner Mongolia Pingzhuang Coal Industry (Group) Co., Ltd. (100% owned by China Energy) Currently no available information on material social and environmental issues. • Related coal properties in the Zhunge'er Coalfield include Boligou Mine and Heidaigou exploration right area. The mining and exploration right certificates for these are valid. No known impediments to maintain and renew such certificates were identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected mining/exploration rights located in the Zhunge'er Coalfield, the following exploration reports were provided for our review: - Boligou Coal Mine: = General Exploration Report for the Boligou Mine Field, Zhunge'er Coalfield, June 2008 = Detailed Exploration Report for the Boligou Mine Field, Zhunge'er Coalfield, March 2009 = Supplementary Geology Exploration Report for the Boligou Coal Mine, Zhunge'er Coalfield, April 2024 - Heidaigou Exploration Right: = Detailed Exploration Report for the Heidaigou Mine Field, Zhunge'er Coalfield, April 2008 = Reserve Verification Report for the Heidaigou Mine Field, Zhunge'er Coalfield, April 2021

Criteria	JORC Code explanation	Commentary
		• All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Zhunge'er Coalfield is situated on the northeastern margin of the Ordos Basin, in the western part of the Sino-Korean Paraplatform. Its tectonic evolution has been primarily controlled by the Yinshan Giant Latitudinal Tectonic Belt and the Neocathaysian Structural System. • During the Himalayan Orogeny, the uplift of the Tibetan Plateau induced peripheral rifting around the Ordos Basin, while the basin interior experienced regional uplift, collectively forming the present-day structural geomorphology. • The Boli Gou mining area is situated in the northern Zhunge'er Coalfield, on the western flank of the Yaogou Anticline. The area is characterized by a monocline striking NNE–SSW and dipping NW, with generally gentle strata attitudes and dips averaging approximately 5 degrees. Superimposed on the monocline are local, very broad and gentle undulations. Faulting is relatively well-developed, dominated by normal faults with vertical displacements generally under 10 meters. No magmatic intrusions have been

Criteria	JORC Code explanation	Commentary
		identified within the mining area. • The Heidaigou exploration area is situated in the central Zhunge'er Coalfield, on the western flank of the Changtan Flexure. The area is characterized by a monocline structure striking NNE and dipping NWW, with strata generally inclined at approximately 5 degrees. No faults or magmatic intrusions have been identified within the area.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Not applicable as no Exploration Results included in the report.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
	should be clearly stated.	
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The CP converted the data from the editable versions into the database for this resource estimate. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited Inner Mongolia Pingzhuang Coal (Group) Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Competent Person converted the data from the editable versions into the database for this resource estimation. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like Pingzhuang Coal's mines in Zhunge'er

Criteria	JORC Code explanation	Commentary
	• *The factors affecting continuity both of grade and geology.*	Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, considers the geological interpretation of the Zhunge'er Coalfield to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - outcrop.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The resources area is delineated by the authorized mine boundary, with vertical mining elevation limits as follows: - Boligou: from740 m to 960m - Heidaigou: No elevation-related constraints for exploration right

Criteria	JORC Code explanation	Commentary
		Thickness (m) / Distance from the / Seam Depth / Seam / Seam Mine / Seam / Coal / Parting / Seam / Upper Seam (m) / Range (m) / Dip (deg.) / Occurrence Boligou / 4 / 1.4 / 0.05 / 1.5 / - / 262 - 480 / 5-NW / Eratic 5 / 2.3 / 0.47 / 2.8 / 16 / 272 - 503 / 5-NW / Eratic 6U / 2.4 / 0.47 / 2.9 / 19 / 288 - 487 / 5-NW / Eratic 6 / 11.2 / 2.23 / 13.4 / 27 / 296 - 525 / 5-NW / Moderate 8 / 1.9 / 0.50 / 2.4 / 14 / 325 - 546 / 5-NW / Eratic 9 / 1.5 / 0.17 / 1.7 / 9 / 341 - 554 / 5-NW / Eratic Heidaigou / 4 / 2.6 / 0.8 / 3.5 / - / 442-608 / 5-SW / Moderate 5 / 1.4 / 0.3 / 1.7 / 7 / 448-608 / 5-SW / Eratic 6U / 3.5 / 0.4 / 3.9 / 19 / 470-640 / 5-SW / Moderate 6 / 11.8 / 1.3 / 13.1 / 7 / 481-652 / 5-SW / Eratic 6L / 3.1 / 0.8 / 3.8 / 17 / 498-661 / 5-SW / Eratic to Modera 9 / 3.9 / 0.9 / 4.7 / 10 / 507-673 / 5-SW / Moderate
Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.*	• Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the

Criteria	JORC Code explanation	Commentary
	• *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% • Calorific Value Qnet,d: 17.0 MJ/kg.
Mining factors or	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining*	• The following assumptions are made specifically for underground mining:

Criteria	JORC Code explanation	Commentary
assumptions	*dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	- All seams will be extracted by FM LW mining method (with/without sub-level caving capability). - in-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Boligou Mine provided environmental impact assessment reports. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages. Our estimation is based on the assumption that future production is highly unlikely to be impacted by environmental issues. • There is no design report prepared for the Heidaigou Exploration as of the cut-off date of this Report.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources.

Criteria	JORC Code explanation	Commentary
	• *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall

Criteria	JORC Code explanation	Commentary
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.8 m thick for bituminous thermal coal as presented at the Zhunge'er Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated) and barrier areas along main roadway development for mine plans. - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those

Criteria	JORC Code explanation	Commentary
		portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han visited Inner Mongolia Pingzhuang Coal (Group) Co., Ltd in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of Boligou mine with technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for Boligou Mine was provided, which is the typical mine design report for coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• Preliminary Design Report for Boligou Mine was provided, which has the necessary mining design details for coal reserve estimation. The initial mining method selected is FM LW in the No.5 Seam. When the thicker No.6 Seam is mined, FM LW SLC method will be used. • Seam thickness is the major factor considered in selecting the mining method. Typically, the threshold seam thickness for sublevel caving mining is approximately 4.5-6.0 m. Both FM LW and FM LW SLC

Criteria	JORC Code explanation	Commentary
		methods are widely used in underground coal mines in China. The selection of mining methods in Boligou Mine is considered appropriate in terms of the seam thickness and general occurrence as well as the design output capacity.
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Ground control in the LW faces are provided by hydraulic shields, which are designed by evaluating various factors including the mining depth, the roof strata structure and mining heights. Roadway support features mainly roof bolts with mesh wires and cables.
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).*	• Not applicable
	• *The mining dilution factors used.*	• OSD of 0.1 m roof rock was considered for most seams during mining.
	• *The mining recovery factors used.*	• An 85% recovery factor was used.
	• *Any minimum mining widths used.*	• LW faces are generally designed at fixed width.
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded from LW panels.
	• *The infrastructure requirements of the selected mining methods.*	• Zhunge'er Coalfield is located in the Ordos area of Inner Mongolia, which is the most famous coal-producing region in China. Due to the well-developed coal industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Boligou is designed to adopt TDS and the heavy media vessel technologies to process the ROM coal, which is widely used in the Zhunge'er Coalfield mines. The proposed coal processing arrangement is considered appropriate and can satisfy the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel*	• The TDS and heavy media vessel technologies are all widely adopted

Criteria	JORC Code explanation	Commentary
	in nature.	coal processing technologies and have been well tested.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Although Boligou Mine is under construction, there are numerous operating coal mines in the Zhunge'er Coalfield. Bulk coal samples from the nearby Tangjiahui Mine were used to test the washability parameters, which is the common practice in the coal industry and deemed appropriate. The coal recovery factor (or yield) for each seam is estimated based on the percentage of partings and OSD for each seam, falling in the 70-80% range.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• No deleterious elements • Bulk coal samples from the nearby Tangjiahui Mine were used for processing analysis. Tangjiahui is next to Boligou and the general geology conditions and similar, and such samples are considered representative. This is also the commonly adopted approach before a new mine is constructed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Calorific Value parameter in coal quality is the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Boligou Mine provided environmental impact assessment reports. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk*	• Zhunge'er Coalfield is located in the Ordos area of Inner Mongolia, which is major coal-producing region in China. Due to the well-

Criteria	JORC Code explanation	Commentary
	commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.	developed coal industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB30/t of coal producing capacity was assumed which is typical for underground mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by Pingzhuang Coal based on regional operating experiences, which appears appropriate. The competent person extended the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.*	• No deleterious elements.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• The historical coal prices from the neighboring mines with similar coal quality at RMB328/t VAT inclusive were used for our economic analysis of Boligou Mine.
	• *The source of exchange rates used in the study.*	• Exchange rates: not applicable
	• *Derivation of transportation charges.*	• Transportation charges account for only a small portion of the costs for underground mines, and are included in the operating costs.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Penalties for such failure were not considered in forecasting.
	• *The allowances made for royalties payable, both Government and private.*	• The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns,*	• Geological conditions over the projection period are consistent with recent experience from nearby mines; no material coal quality

Criteria	JORC Code explanation	Commentary
	etc. • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	change. • The historical coal prices from the neighboring mines with similar coal quality at RMB328/t VAT inclusive were used for our economic analysis of Boligou Mine.
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Coal produced by Boligou Mine will be sold by China Energy using its national sales network, which minimizes the market risk. • The historical coal prices from the neighboring mines with similar coal quality at RMB328/t VAT inclusive were used for our economic analysis of Boligou Mine.
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.* • *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimate the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%, as of 31 July 2025. NPV Under Various Sensitivity Cases (RMB Millions) Base Case Mine | 6.00% | 7.00% | (7.1%) | 8.00% | 9.00% | 10.00% Boligou | 3,724 | 3,378 | 3,340 | 3,077 | 2,812 | 2,579
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The mine is under construction. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been

Criteria	JORC Code explanation	Commentary
	• *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the Boligou case, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For*	• The Ore Reserve estimate for the underground operation may exhibit minor variance due to equipment-dependent mining height, coal-seam thickness undulation, and assumptions regarding OSD and

Criteria	JORC Code explanation	Commentary
confidence	*example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.* • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small. • The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained. • Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations. • No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-16 JORC Code, 2012 Edition – Table 1 – Zhunnan Coalfield

The Tunbao, Wudong underground mines and the Liuhuanggou No.4 exploration right area, all controlled by China Energy Xinjiang Energy and Chemical Co., Ltd., are located in the Zhunnan Coalfield. These properties are adjacent to each other.

Section 1 Sampling Techniques and Data

The drilling activities of the Zhunnan Coalfield date back to the 1990s (even 1960s for Wudong Mine). The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. The latest drilling activity at Tunbao Mine, Wudong Mine and Liuhuanggou No.4 Exploration Right area was completed in 2009, 2007 and 2009 respectively. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	maximise representivity of samples. • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• "The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Topcon GTS-602 type GPS. The accuracy of the control points was evaluated using two sets of coordinate differences. The maximum difference

<table>
<tr><th>Criteria</th><th>JORC Code explanation</th><th>Commentary</th></tr>
<tr><td></td><td></td><td>between the two sets of coordinates was 0.17 meters, and the elevation difference was 0.12 meters.
• The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. A more than 10% random re-survey was conducted on 44 engineering boreholes in this area using the repeat observation method. The plane error of 98% of the drilling holes is within ±0.10 to ±0.15 meters. Elevation error: ≤ ±0.05 meters
• The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications."</td></tr>
<tr><td>Data spacing and distribution</td><td>• Data spacing for reporting of Exploration Results.</td><td>• The drilling grids for different areas of each of the subject Xinjiang Energy properties in Zhunnan Coalfield are as follows:
<table>
<tr><th></th><th colspan="3">Mining Area</th><th colspan="3">Rsources %</th></tr>
<tr><th>Mining/Exploration Right</th><th>Initial</th><th>Successive</th><th>Backup</th><th>Measured</th><th>Indicated</th><th>Inferred</th></tr>
<tr><td>Tunbao</td><td>350 - 500</td><td>350 - 500</td><td>350 - 500</td><td>66</td><td>34</td><td>-</td></tr>
<tr><td>Wudong</td><td>100 - 200</td><td>100 - 200</td><td>100 - 200</td><td>-</td><td>73</td><td>27</td></tr>
<tr><td>Liuihuanggou No.4</td><td>350 - 500</td><td>1,000</td><td>1,000</td><td>10</td><td>58</td><td>32</td></tr>
</table></td></tr>
<tr><td></td><td>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</td><td>• As shown in the table, the resources at all properties have been well defined. The data spacing is adequate to establish geological and quality continuity.</td></tr>
<tr><td></td><td>• Whether sample compositing has been applied.</td><td>• Sample compositing is not applicable to coal.</td></tr>
<tr><td>Orientation of data in relation to</td><td>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</td><td>• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results.</td></tr>
</table>

Criteria	JORC Code explanation	Commentary
geological structure	• *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• No material sampling bias is expected for coal.
Sample security	• *The measures taken to ensure sample security.*	• All samples were packaged in double-layer heavy-duty plastic sampling bags, which were then wrapped and sealed with adhesive tape to ensure the samples remain free from damage or contamination during storage and transportation. All samples taken were temporarily stored at the field office of the exploration team and are regularly sent to the designated laboratory by a designated person.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Tunbao Coal Mine: Type of Mining Right: Mining Right Mining Right Name: China Energy Xinjiang Energy Co., Ltd. Tunbao Coal Mine Mining Right Number: C6500002009121120054802 Area: 6.143 km² Location: Changji City, Changji Prefecture, Xinjiang Autonomous Region Ownership: China Energy Xinjiang Energy Co., Ltd. (100% owned by China Energy directly and/or via subsidiaries, predecessor of China Energy Xinjiang Energy and Chemical Co., Ltd.)

Criteria	JORC Code explanation	Commentary
		According to the EIA and/or exploration report of the project, there are no highway, first-class road, railway, water conservation facilities, hydropower facilities, natural reserves zone, or scenic sites within the impacting area of the mine. • Wudong Coal Mine: Type of Mining Right: Mining Right Mining Right Name: Shenhua Xinjiang Energy Co., Ltd. Criteria	JORC Code explanation	Commentary
		Ownership: China Energy Xinjiang Energy Co., Ltd. (100% owned by China Energy directly and/or via subsidiaries, predecessor of China Energy Xinjiang Energy and Chemical Co., Ltd.) Currently no available information on material social and environmental issues. • Related coal properties in the Zhunnan Coalfield include Tunbao and Wudong mines and Liuhuanggou No.4 exploration right area. The mining right certificates and exploration right certificate for these are all valid. No known impediments to maintaining and renewing such mining and exploration certificates was identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected mining/exploration rights located in the Zhunnan Coalfield, the following exploration reports were provided for our review: - The Tunbao Mine underwent four exploration campaigns commissioned from the Xinjiang Coalfield Geology Bureau No.161 Team, in 1985-1990, 2003, 2006 and 2008-2009, successively. The resulting geological reports were reviewed and approved by the competent authorities at various levels. - The Wudong Mine underwent exploration work in 1957. The earliest applicable exploration work that can be traced back to is from 1978 to 1980, which was carried out by the 161 and 156 teams of Xinjiang Coalfield Geological Exploration Company. And subsequently, in 1983, from 1985 to 1989, and in 2005, multiple exploration works were carried out by these two geological teams. In 2007, the No.9 Geological Team of the Xinjiang Geological Bureau completed a small amount of exploration work.

Criteria	JORC Code explanation	Commentary
		The above resulting geological reports were reviewed and approved by the competent authorities at various levels. - The Liuhuanggou No.4 Mine underwent four exploration campaigns commissioned by Shenhua Xinjiang Energy Co., Ltd from the same geological team, the 161 Coalfield Geological Exploration Team of the Xinjiang Coalfield Geological Bureau, from 1985 to 1990, in 2003, in 2006, in 2009, respectively. The resulting geological reports were reviewed and approved by the competent authorities at various levels. • All programs include the collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Zhunnan Coalfield is tectonically located on the southern margin of the Junggar Block, within the mid-eastern part of the North Tianshan Foreland Depression. It is bounded to the north by the Central Uplift of the Junggar Basin and to the south by the North Tianshan Orogenic Belt, forming a typical foreland basin coal-accumulating unit. The basin initiated from the Permian to Triassic, entered a major coal-forming period during the Jurassic, and experienced intense tectonic compression and modification from the

Criteria	JORC Code explanation	Commentary
		Cretaceous to the Cenozoic. During the Himalayan Orogeny, the collision between the Indian and Eurasian plates caused the North Tianshan to thrust strongly over the Junggar Basin. This formed the present structural pattern -steep in the south and gentle in the north - and led to deep burial and complex deformation of the coal measures. • Structure The formation of the Zhunnan Coalfield is primarily controlled by the North Tianshan Fault Zone and its associated foreland thrust-nappe system. The coalfield's structure is dominated by thrust faults, accompanied by associated strike-slip and normal faults. Folds are commonly linked to the thrusts, forming a thrust-fold belt. Fold axial traces generally trend NWW, consistent with the regional structural grain. • Based on structural complexity, the Zhunnan coalfield can be divided into three zones: • Southern Foreland Strong Deformation Zone: adjacent to the North Tianshan, this zone is extremely complex, featuring dense faulting, steep dips (often >60 degrees), and intensely crumpled coal seams or tectonic coal. • Central Thrust-Fold Zone: moderately complex, characterized by broad anticlines/synclines and thrust faults. This is the main area for current coal mining. • Northern Monocline Zone: structurally simple, with gentle strata dips and stable coal seams. • The Tunbao Mining Right and the Liuhuanggou Exploration Right are adjacent to each other, featuring a northwest-dipping monocline with a dip angle of approximately 18 degrees. The Wudong Mine is divided into northern and southern sections by the NE-SW trending

Criteria	JORC Code explanation	Commentary
		Badaowan Syncline, with the southern limb dipping at 83 to 89 degrees and the northern limb dipping at 43 to 51 degrees.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Not applicable as no Exploration Results included in the report.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report.
Relationship between mineralisation widths and	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
intercept lengths	• *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The CP

Criteria	JORC Code explanation	Commentary
	and its use for Mineral Resource estimation purposes. • *Data validation procedures used.*	converted the data from the editable versions into the database for this resource estimate. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited I China Energy Xinjiang Energy Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource estimation. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like Xinjiang Energy mines in Zhunnan Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, considers the geological interpretation of the Xinjiang Energy mines in Zhunnan

Criteria	JORC Code explanation	Commentary
		Coalfield to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - outcrop.
Dimensions	• *The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	• The resources area is delineated by the authorized mine boundary, with vertical mining elevation limits as follows: - Liuhuanggou No.4: No elevation-related constraints for exploration right - Tunbao: from 0m to 1,500m - Wudong: from 200 m to 800 m • The following tables show the detailed characteristics of each seam of each mine

Criteria	JORC Code explanation	Commentary

Mine	Seam	Thickness (m)			Distance from the Upper Seam (m)	Seam Depth Range (m)	Seam Dip (deg.)	Seam Occurrence
		Coal	Parting	Seam				
Tunbao	5	6.9	1.4	8.3	-	117 - 1213	18-NW	Moderate

Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.*	All mining and exploration rights within the Zhunnan Coalfield are underground coal mines. The resource estimation methodology is consistent for all underground mines and is detailed as follows: • Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining

Criteria	JORC Code explanation	Commentary
	• *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.* • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface

Criteria	JORC Code explanation	Commentary
		infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and reported on natural moisture basis
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% Calorific Value Qnet,d: Lignite 15.7 MJ/kg. Bituminous Coal 17.0 MJ/Kg.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be*	• The following assumptions are made specifically for underground mining: - All seams will be extracted by FM LW mining method (with/without sub-level caving capability). • in-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.

Criteria	JORC Code explanation	Commentary
	reported with an explanation of the basis of the mining assumptions made.	
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	• No metallurgical factors or assumptions used for coal resources estimates.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Each of the Tunbao and Wudong mines provided environmental impact assessment reports. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk

Criteria	JORC Code explanation	Commentary
	evaluation process of the different materials.	density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The resources were classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data. • The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• nternal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate for the undergournd operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore Reserves	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.8 m thick for bituminous thermal coal as presented at the Zhunnan Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated) and barrier areas along main roadway development for mine plans. - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han visited Xinjiang Energy in September 2025. During the site visit, the Competent Person observed collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with

Criteria	JORC Code explanation	Commentary
		corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.*	• A Preliminary Design Report for each of the Tunbao and Wudong mines was provided, which is the typical mine design report for coal mines in China, generally considered comparable to or higher than the Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).* • *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.* • *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Preliminary Design Report for each mine was provided, which has the necessary mining design details for coal reserve estimation. The mining method selected: - Tunbao: FM LW SLC - Wudong: FM LW SLC • Seam thickness is the major factor considered in selecting the mining method. Typically, the threshold seam thickness for sublevel caving mining is approximately 4.5-6.0 m. Both FM LW and FM LW SLC methods are widely used in underground coal mines in China. The selection of mining method (FM LW SLC) in the two mines are considered appropriate in terms of the seam thickness and general occurrence as well as the design output capacity. • Ground control in the LW faces are provided by hydraulic shields, which are designed by evaluating various factors including the mining depth, the roof strata structure and mining heights. Roadway support

Criteria	JORC Code explanation	Commentary
		features mainly roof bolts with mesh wires and cables.
	• *The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).*	• Not applicable
	• *The mining dilution factors used.*	• Tunbao: OSD of 0.05-0.20 m roof rock was considered for various coal seams during mining. Wudong: OSD of 0.20 m roof rock was considered for the seams.
	• *The mining recovery factors used.*	• An 85% recovery factor was used for both mines.
	• *Any minimum mining widths used.*	• LW faces are generally designed according to the mine configurations and coal seam occurrence. Tunbao LW face width is 230 m. Zhunnan's LW face width is determined by the thick and steep seam conditions, ranging from 25-95 m.
	• *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.*	• In Coal Reserve estimation, Inferred Coal Resources were excluded from LW panels.
	• *The infrastructure requirements of the selected mining methods.*	• Zhunnan Coalfield is located approximately 30 km southwest of Urumqi City of Xinjiang Uygur Autonomous Region, where infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• Tunbao uses roller crusher to break the coarse coal and then uses the heavy media vessel technology for further coal processing. Wudong uses TDS dry separation technology for coal processing. The proposed coal processing arrangement is considered appropriate and can satisfy the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The heavy media vessel and TDS technologies are all widely adopted coal processing technologies and have been well tested for decades.

Criteria	JORC Code explanation	Commentary
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Tunbao and Wudong mines have well-established coal processing history. Actual amount of coal being processed is determined by customer requirements and market conditions. The coal recovery factor (or yield) for each seam is estimated based on the percentage of partings and OSD for each seam, and the processing technology adopted. Product yield for various seams ranges from 80% to 94%, for Tunbao, and from 81% to 89% for Wudong
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• No deleterious elements • Tunbao and Wudong mines have well-established coal processing history, thus no bulk sample or pilot scale test work is needed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• Calorific Value and ash content parameters in coal quality are the main focus for thermal coal. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmen-tal	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Each of the Tunbao and Wudong mines provided environmental impact assessment reports. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Zhunnan Coalfield is located close to Urumqi City, Xinjiang. Infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.

Criteria	JORC Code explanation	Commentary
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil constructions, equipment purchases, etc. Sustaining capital at RMB30/t of coal producing capacity was assumed which is typical for underground mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by each mine based on historical performance and adjusted for certain changes. The competent person extended the projection period to thirty years.
	• *Allowances made for the content of deleterious elements.* • *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• No deleterious elements. • The historical three-year average prices were used for our economic analysis of each mine. Tunbao: RMB309/t VAT inclusive Wudong: RMB352/t VAT inclusive
	• *The source of exchange rates used in the study.* • *Derivation of transportation charges.*	• Exchange rates: not applicable • Transportation charges account for only a small portion of the costs for underground mines, and are included in the operating costs.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting.
	• *The allowances made for royalties payable, both Government and private.*	• The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates,*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change.

Criteria	JORC Code explanation	Commentary
	transportation and treatment charges, penalties, net smelter returns, etc. • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• The historical three-year average prices were used for our economic analysis of each mine. Tunbao: RMB309/t VAT inclusive Wudong: RMB352/t VAT inclusive
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.*	• Most of coal products from Tunbao and Wudong mines will supply the nearby Power Plants and other factories as thermal coal. Zhunnan Coalfield is one of the major Xinjiang coal producing areas with a mature coal market. The coal products from the two mines have consistent coal quality and are expected to continue their market share.
	• *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• Coal prices have been slowly declining over the 2024-2025 period. The historical three-year average prices were used for our economic analysis of each mine. Tunbao: RMB309/t VAT inclusive Wudong: RMB352/t VAT inclusive
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount rate was derived from the study of peer group analysis, weighted average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimate the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%, as of 31 July 2025.
	• *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	

Criteria	JORC Code explanation	Commentary
		NPV Under Various Sensitivity Cases (RMB Millions) Base Case Mine / 6.0% / 7.0% / (7.1%) / 8.0% / 9.0% / 10.0% Tunbao 180 25 8 (101) (202) (284) Wudong 307 108 86 (55) (188) (298)
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The mines recognize their social responsibility and have maintained cordial relationship with local government and society. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying confidence categories.*	• Once Coal Resources of various categories were estimated, Coal Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the Shangyuquan, Ciyaogou and Shaping cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.

Criteria	JORC Code explanation	Commentary
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.*	• The Ore Reserve estimate for the underground operation may exhibit minor variance due to equipment-dependent mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations.
	• *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

APPENDIX B-17 JORC Code, 2012 Edition – Table 1 – Zhuozishan Coalfield

Subject coal mines located in the Zhuozishan Coalfield include Gongwusu, Laoshidan, Limin, Luotuoshan, Lutian and Pinggou. In addition, the Hongliushu West and Kabuqi Deep Exploration areas are also located in Zhuozishan Coalfield. These properties are controlled by China Energy Wuhai Energy Co., Ltd and adjacent to each other.

Section 1 Sampling Techniques and Data

The drilling activities of the Zhuozishan Coalfield dates back to the 1960s. The drilling techniques employed in historical exploration across various mines are difficult to trace with precision. The phased coal mine geological reports compiled according to Chinese standards also lack detailed descriptions of the sampling/drilling techniques used in each phase. Through interviews with technical personnel from mines and exploration teams previously responsible for these projects, we learned that the exploration work in the target coalfield was exclusively conducted by state-owned, specialized coal exploration teams. Their exploration results were required to undergo review and approval by management authorities at various levels. Consequently, the drilling technologies adopted by these different teams uniformly complied with relevant nationally issued specifications. With the exception of the exploration work for the Hongliushu exploration right, which was completed in 2006, all other coal mine exploration in the area was finished before 2000. Geological reports for all the mines over the past 20 years have involved no substantial new drilling activities, focusing instead on the verification of resource and reserves. Although the specific historical drilling techniques are difficult to retrace, based on our review of the borehole data from each mine and its comparison with production data, we confirm that this data is generally consistent with the information exposed during mining operations.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
	relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Sub-sampling techniques and sample	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.

Criteria	JORC Code explanation	Commentary
preparation	*sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate system is the 1954 Beijing Coordinate system, and the elevation system adopts the 1956 Yellow Sea elevation reference. Total stations are set up using nearby control points, and the position of the survey point in the plane is determined using the Topcon GTS-602 type GPS. The accuracy of the control

Criteria	JORC Code explanation	Commentary
		points was evaluated using two sets of coordinate differences. The maximum difference between the two sets of coordinates was 0.17 meters, and the elevation difference was 0.12 meters. • The surveying instruments used for borehole positioning hold valid annual inspection certificates issued by the quality control department. These instruments demonstrate stable and reliable performance, and the measurement methods employed are correct and appropriate. A more than 10% random re-survey was conducted on 44 engineering boreholes in this area using the repeat observation method. The plane error of 98% of the drilling holes is within ±0.10 to ±0.15 meters. Elevation error: ≤ ±0.05 meters • The re-survey results confirm that the engineering survey outcomes in this area are accurate, and their precision meets the requirements of relevant regulations and specifications.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• The drilling grid in most mines in Zhuozishan Coalfield is 500×500 m, with the exception of Lutian mine, which is about 200x200 m since historically open-pit mining method was used. This drilling spacing is sufficient to classify the majority of the resources in the each mining area as the indicated category. The data spacing is adequate to establish geological and quality continuity • Sample compositing is not applicable to coal.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a*	• For coal seams, as long as full seam interval sampling is achieved, the sampling orientation has virtually no impact on the results. • No material sampling bias is expected for coal seams where full-interval sampling was conducted.

Criteria	JORC Code explanation	Commentary
	sampling bias, this should be assessed and reported if material.	
Sample security	• *The measures taken to ensure sample security.*	• The exploration activities date too far back in history, and the relevant information can no longer be traced.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• There are no known audits or reviews of sampling techniques and data. This is not routine practice in the Chinese coal industry.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Gonwusu Coal Mine: Type of Mining Right: Mining Right Mining Right Name: Shenhua Group Haibowan Mining Co., Ltd. Gongwusu No.3 Coal Mine Mining Right Number: C1000002012011140122379 Area: 14.7566 km² Location: Gongwusu Town, Hainan District, Wuhai City, Inner Mongolia Autonomous Region Ownership: Inner Shenhua Group Haibowan Mining Co., Ltd. (100% owned by China Energy directly and/or via subsidiaries) According to the "Implementation Opinions on the Main Functional Zoning Plan" issued by the Inner Mongolia Autonomous Region Government (NZF [2015] No. 18), the main functional zones include key development areas, development restricted areas, and development prohibited areas. According to the document, Hainan District is listed in the Appendix 3 (of above document) - Key

Criteria	JORC Code explanation	Commentary
		Development Area Catalog of Inner Mongolia Autonomous Region, however per the Appendix 8 – Development Prohibited Area Catalog for Natural Protection Area, part of the eastern boundary of Gongwusu No.3 Coal Mine falls under the jurisdiction of Etuoke Banner of Ordos City, and partially overlap with the Western Ordos National Natural Protection Zone, which fall within the category of Development Prohibited Area. As a result of the above, the Gongwusu No. 3 Coal Mine has been adjusted so as to avoid overlapping with the Natural Protection Zone, with a 9.28 million-ton protective coal pillar being designed. The mine maintains a minimum distance of 10m from the nearest experimental zone, 120m from the nearest buffer zone, and 325m from the nearest core zone to meet ecological access requirements of Inner Mongolia Autonomous Region. • Laoshidan Coal Mine: Type of Mining Right: Mining Right Mining Right Name: China Energy Wuhai Energy Co., Ltd. Criteria	JORC Code explanation	Commentary
		• Kabuqi Deep Area Exploration: Type of Mining Right: Not Available (Exploration Right pending) Mining Right Name: Not Available Mining Right Number: Not Available Area: Not Available Location: Haibowan District, Wuhai City, Inner Mongolia Autonomous Region Ownership: Shenhua Group Haibowan Mining Co., Ltd. (100% owned by China Energy directly and/or via subsidiaries) Currently no available information on material social and environmental issues. Wuhai Energy initially applied for the Exploration Right in 2005, however as of the data cut-off date of this Report, the Exploration Right has never been granted. Wuhai Energy provided a series of documents provided by Natural Resource authorities showing that the Exploration Right has been reserved for Wuhai Energy in the past decade and latest document was issued in 2018 without an expiration date of their valid reservation period of the Exploration Right, which requested Wuhai Energy to re-apply for the Exploration Right after removing an area of 4.5 km^2 from the right which overlap with the Western Ordos Natural Protection Zone. According to Wuhai, this Exploration Right is still reserved for Wuhai Energy, based on the document Wuhai Energy provided and the Competent Person's knowledge and experiences with Chinese mining industry, Wuhai Energy's claim appears reliable. • Related coal mines in the Zhuozishan Coalfield include Gongwusu, Laoshidan, Limin, Luotuoshan, Lutian and Pinggou mines, exploration right areas include Hongliushu West and Kabuqi Deep Exploration

Criteria	JORC Code explanation	Commentary
		areas. The mining right certificates and exploration right certificates for these are all valid. No known impediments to maintaining and renewing such mining and exploration certificates were identified.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• In order to complete a resources/reserves estimates for the subjected mining/exploration rights located in the Zhuozishan Coalfield, the following exploration reports were provided for our review: - Gongwusu Mine: = Detailed Exploration Report for the Gongwusu Mining Area, Zhuozishan Coalfield, November 1965 = Supplementary Production Geology Exploration Report for the Gongwusu Open-pit Mine, November 1989 - Laoshidan Mine: = Detailed Exploration Report for the Luotuoshan Mining Area, Zhuozishan Coalfield, December 1972 = Detailed Exploration Report for the Luotuoshan Mine, November 1984 - Pinggou Mine = Detailed Geological Report for Pinggou and Jiudonggou Mine, February 1964 - Hongliushu Mine: = Coal Exploration Report for Hongliushu Mine, June 2006 • All programs include collection of data on coal occurrence and quality, hydrology, and geotechnical characteristics of strata, spontaneous combustion and explosiveness of coal, coalbed methane, etc. Based on the Chinese mining regulation, the results of exploration are presented in the form of an Exploration Report that must be approved

Criteria	JORC Code explanation	Commentary
		by the government in order to apply for exploration and mining right certificates. Due to these detailed regulated procedures, drilling data, exploration reports, and mine design reports prepared in PRC are very consistent in content and presentation. • It's the CP's opinion that the reports are reliable, and the drill hole data in the report was used for resources/reserves estimates.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Coal deposit. • The geologic settings of the Zhuozishan Coalfield is judged to be moderate. While the strata are mostly gently dipping, seam splitting and complex faulting are the complicating factors for the seams in Zhuozishan Coalfield. • Regional Geology: The region is located on the eastern limb of the Gongwusu Anticline, characterized by an east-dipping monoclinal structure. Strata strike SN–NNE with dips of 10–30°, generally steeper at shallow depths and gentler in deeper sections. Folding is weakly developed, featuring only three minor structures: the Gongwusu Anticline (NNE-trending, about 7 km long, shallow seams at the axis suitable for open-pit mining), the A1 Anticline (approximately 2.5 km long, disrupted by the F10 thrust fault), and the S1 Syncline. • Structure: Faults are the dominant structural feature, with 62 identified (31 confirmed, 22 basically confirmed, 1 preliminarily controlled). These include 19 thrust and 43 normal faults, mostly with throws <30 m. Early NS-trending thrust faults strongly control structure, while later EW-trending normal faults often cut them. Major thrusts include Xilaifeng (throw 100 to 500 m, significantly influencing coal seams and Ordovician groundwater), Hongliushu

Criteria	JORC Code explanation	Commentary
		and its branches (35 to 220 m), and F10 (0 to 110 m). Key normal faults (e.g., F11, F12, XF1, DF10) mostly dip east with throws of 10–40 m. No magmatic activity is observed. Overall, the structure is dominated by monocline, with minor folds and numerous but controllable faults, moderately impacting mining layout. The structural complexity is rated as moderate.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Not applicable as no Exploration Results included in the report.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Not applicable as no Exploration Results included in the report.

Criteria	JORC Code explanation	Commentary
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Not applicable as no Exploration Results included in the report.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Not applicable as no Exploration Results included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Not applicable as no Exploration Results included in the report.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Not applicable as no Exploration Results included in the report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• There is currently no further exploration planned.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.* • *Data validation procedures used.*	• Collected coal mine geological reports, including drilling data, are available in both PDF and editable Word/Excel formats. The CP converted the data from the editable versions into the database for this resource estimate. The database was verified in the spreadsheet by checking the maximum, minimum, average, and duplicates, seam sequence checking. • If any errors preventing further progress were identified during the process, the cause was investigated based on error prompts, and comparisons were made with the PDF version data for verification. No data anomalies were detected during this estimate process.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han and BOYD Senior Geologist, Mr. Yongliang Xing visited I CHN Energy Wuhai Energy Co., Ltd. in September 2025. During the site visit, the Competent Person collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Geological interpretation	• *Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* • *Nature of the data used and of any assumptions made.* • *The effect, if any, of alternative interpretations on Mineral Resource estimation.* • *The use of geology in guiding and controlling Mineral Resource estimation.* • *The factors affecting continuity both of grade and geology.*	• Collected coal mine geological reports are available in both PDF and editable Word/Excel formats. The Qualified Person converted the data from the editable versions into the database for this resource estimation. • Due to the layered continuity and large-scale occurrence of coal seams, the geological interpretation reliability for coal seams in mature mining areas like Wuhai Energy mines in Zhuozishan

Criteria	JORC Code explanation	Commentary
		Coalfield is high. The CP for this report, through the review of coal quality, borehole logs and geophysical logs for seam correlation, considers the geological interpretation of the Wuhai Energy mines in Zhuozishan Coalfield to be highly reliable. • The geological interpretation utilizes the following assumptions: - Variations in coal seam thickness are linear and follow a regular pattern. - Sudden and significant changes in coal seam thickness over short distances typically indicate structural abnormalities, such as: = Syndepositional structures leading to seam splitting and thinning. = Post-depositional structures including erosion by paleochannels, and magmatic erosion. • Factors compromising coal seam continuity encompass: - Seam splitting and thinning. - Erosion by paleochannels/up-lifting to surface/ igneous intrusions. - Faulting. - outcrop.
Dimensions	• The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.	• The resources area is delineated by the authorized mine boundary, with vertical mining elevation limits as follows: - Gongwusu: from 1,300 m to 400 m - Laoshidan: from 1,250 m to 775 m - Limin: from 1,377 m to 855 m

Criteria	JORC Code explanation	Commentary
		- Luotuoshan: from 1,230 m to 360 m - Lutian: from 1,235 m to 1,024 m - Pinggou: from 1,310 m to 750 m • The resources area of Hongliushu Exploration Area is only delineated by the authorized certificate boundary. • Kabuqi Deep Exploration Area：Kabuqi Deep Exploration Area is the deeper area located under the Pinggou Mine, while the exploration right for this area has not been approved by the time our report is prepared, according to the source data provided by Wuhai Energy, the authorized mining elevation of Pinggou Mine overlaps with the upper part of Kabuqi Deep Exploration Area, therefore the coal resources occurred in the 16-1 seam and 16-2 seam which are situated within the overlapped elevation range have been included in our resources and reserve estimation for Pinggou Mine, however the lower 17 seam and 18 seam are not included, as the drilling data of these two seams are too limited to support a resource estimation according to JORC Code.

Criteria	JORC Code explanation	Commentary
		•

Estimation and modelling techniques	• *The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.* • *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* • *The assumptions made regarding recovery of by-products.* • *Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).* • *In the case of block model interpolation, the block size in relation to*	All mining and exploration rights within the Zhuozishan Coalfield are underground coal mines. The resource estimation methodology is consistent for all underground mines and is detailed as follows: • Database Establishment: Transfer data into Excel, including: mining right boundary coordinates and authorized mining elevations, borehole collar coordinates and elevations, coal seam structure data for each seam, coal seam roof and floor depths/elevations, and coal quality data. • Data Validation: Use various Excel tools and formulas to screen for anomalous data, verifying them against original source documents. The correctness of the seam sequence is validated by calculating inter-seam spacing. Check for duplicates and

Criteria	JORC Code explanation	Commentary
	the average sample spacing and the search employed. • *Any assumptions behind modelling of selective mining units.* • *Any assumptions about correlation between variables.* • *Description of how the geological interpretation was used to control the resource estimates.* • *Discussion of basis for using or not using grade cutting or capping.* • *The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.*	correct them post-verification. • Data Completeness Review: Batch import the preliminarily validated data layer by layer into AutoCAD. Compare each coal seam layer against the original maps to ensure the dataset incorporates all the latest data. • Seam Correlation: Review the provided original borehole logs, geophysical logs, exploration line cross-sections, and resource/reserve estimation maps. Compare these with the newly created and preliminarily validated database to confirm the rationality of the seam correlation. Update the database iteratively based on the correlation conclusions until all seams are satisfactorily correlated. Preserve the database to prevent accidental modifications. • Resource Map Generation in CAD: Using the final database, generate resource maps for each coal seam in CAD. These primarily include: coal seam isopachs, floor elevation contours, resource classification boundaries, and various resource area boundaries (e.g., permanent sterilized areas, surface infrastructure protection zones, authorized mining elevation limits, structural protection zones, minimum thickness lines). • Coal Quality Review: Confirm whether any areas need to be excluded based on coal quality criteria. • Resource Calculation: Calculate the area of each resource block by resource classification and thickness range. Then, calculate the total in-situ resources for each classification using

Criteria	JORC Code explanation	Commentary
		parameters like coal apparent density and formation dip angle. • In-seam parting Calculation: For seams containing non-excludable partings, calculate the tonnage of this inherent dilution using the same methodology.
Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• All resource tonnages are estimated and report on natural moisture basis
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• The cut-off grades used: Ash content Ad: 40% Sulphur content St,d: 3% • Calorific Value Qnet,d: 17.0 MJ/kg.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• The following assumptions are made specifically for underground mining: - All seams will be extracted by FM LW mining method (with/without sub-level caving capability). - in-seam parting thinner than the minimum mining thickness of coal for LW-FM mining will have to be mined together with coal.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of*	• No metallurgical factors or assumptions used for coal resources estimates.

Criteria	JORC Code explanation	Commentary
	the basis of the metallurgical assumptions made.	
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• Each of the subject Wuhai Energy mines (except for Pinggou which is undergoing mine upgrade construction preparation) provided environmental impact assessment report. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.* • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	• The competent persons have reviewed the bulk density data corresponding to each sample in the received borehole data. The arithmetic mean for each coal seam was adopted as the fundamental parameter for calculating the seam's resources. • In accordance with standard Chinese exploration practice, bulk density data for partings within coal seams is typically not prioritized, resulting in a limited dataset. Based on industry experience, the competent persons have assumed a value of 2.1 for this parameter. • The competent persons confirm that the adoption of these bulk density values and the aforementioned assumption are appropriate.
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).*	• The resource was classified as Measured, Indicated, and inferred in accordance with the JORC Code (2012 Edition) and Australasia Institute of Mining and Metallurgy (AusIMM) guidelines. • Resource classification considered geological factors (structural and sedimentary) and continuity of coal quality, sample spacing and the quality of the data.

Criteria	JORC Code explanation	Commentary
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The results reflect the competent persons' view.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the coal resources estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.* • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	• Data protocols and estimation techniques used in the Mineral Resource adhere to the guidelines outlined in the JORC Code (2012 Edition). • The coal resources estimate for the undergournd operations may exhibit minor variance due to equipment-dependent minimum mining height, coal-seam thickness undulation, and assumptions regarding the maximum thickness of parting that is to be mined together with coal. While these factors may introduce limited systematic and unavoidable deviation, their overall impact on resource accuracy is negligible.

Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral Resource estimate for conversion to Ore	• *Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.* • *Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.*	• In estimating coal resources, the following steps were used: - Independent review and interpretation of the source exploration data. - Review of seam correlation. - Identification of coal seam occurrence greater than 0.7 m

Criteria	JORC Code explanation	Commentary
Reserves		thick for coking coal as presented at the Zhuozishan Coalfield. - Exclusion of barrier areas underlying protected surface structures (e.g., mine facilities, major highways, major streams, and populated areas that are not planned to be relocated) and barrier areas along main roadway development for mine plans. - Preparation of coal isopach maps within the identified resource areas. - Review of seam quality. • The Coal Resources reported are inclusive of the Coal Reserves. Coal Reserve estimation has only been undertaken for those portions of the Measured and Indicated Resources that satisfy the applicable Modifying Factors.
Site visits	• *Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* • *If no site visits have been undertaken indicate why this is the case.*	• The Competent Person, Mr. Jisheng Han visited Wuhai Energy in September 2025. During the site visit, the Competent Person observed the mine operations, collected source data, reviewed exploration history and records, discussed historic performance and current status as well as future plans of each subject mine and exploration area with corresponding technical staff and management personnel.
Study status	• *The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.* • *The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves.*	• A Preliminary Design Report for the Gongwusu, Laoshidan, Limin, Luotuoshan and Pinggou mines, and a Coal Resource Development and Utilization Plan for Lutian were provided, which are the typical feasibilitystudy or mine design reports for coal mines in China,

Criteria	JORC Code explanation	Commentary
	Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.	generally considered comparable to or higher than the Pre-Feasibility Study level. The mine plan and economics were carefully reviewed in detail and concluded as viable to support Coal Reserves estimate.
Cut-off parameters	• *The basis of the cut-off grade(s) or quality parameters applied.*	• Coal reserves estimation was limited to the Measured and Indicated Resource areas and no cut-off grades were used.
Mining factors or assumptions	• *The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).*	• Preliminary Design Report or Coal Resource Development and Utilization Plan for each mine was provided, which has the necessary mining design details for coal reserve estimation. The mining method selected: - Gongwusu: FM LW SLC - Laoshidan: FM LW SLC - Limin: FM LW - Luotuoshan: FM LW - Lutian: FM LW SLC - Pinggou: FM LW
	• *The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.*	• Seam thickness is the major factor considered in selecting the mining method. Typically, the threshold seam thickness for sublevel caving mining is approximately 4.5-6.0 m. Both FM LW and FM LW SLC methods are widely used in underground coal mines in China. The selection of mining methods in the six mines is considered appropriate in terms of the seam thickness and general occurrence as well as the design output capacity.
	• *The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.*	• Ground control in the LW faces are provided by hydraulic shields, which are designed by evaluating various factors including the mining depth, the roof strata structure and mining heights. Roadway support features mainly roof bolts with mesh wires and cables.
	• *The major assumptions made and Mineral Resource model used for*	• Not applicable

Criteria	JORC Code explanation	Commentary
	pit and stope optimisation (if appropriate). • *The mining dilution factors used.* • *The mining recovery factors used.* • *Any minimum mining widths used.* • *The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.* • *The infrastructure requirements of the selected mining methods.*	• OSD of 0.05 – 0.2 m roof rock was considered for most seams during mining depending on the roof rock type and mining methods selected. • An 85% recovery factor was used. • LW faces are generally designed at fixed width. • In Coal Reserve estimation, Inferred Coal Resources were excluded from LW panels. • Zhuozishan Coalfield is located in the western part of Inner Mongolia Autonomous Region. Due to the well-developed coal industry, infrastructure needed for underground mining operations in the Wuhai area are conveniently available such as power supply, transportation network, water supply, etc.
Metallurgical factors or assumptions	• *The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.*	• The subject Wuhai Energy mines adopt crusher and screen technology to process the coarse coal and the 3-product heavy media cyclone technology to process the fine coal. The proposed coal processing arrangement is considered appropriate for the coking coal in this coalfield, and appeared capable of satisfying the requirement of product coal quality by their customers.
	• *Whether the metallurgical process is well-tested technology or novel in nature.*	• The crusher and screen process and 3-product heavy media cyclone technology are all widely adopted coal processing technologies and have been well tested for decades in various regions in China.
	• *The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.*	• Most of the subject Wuhai Energy mines have well-established coal processing history. Actual amount of coal being processed is determined by customer requirements and market conditions. The coal recovery factor (or yield) for each seam is estimated based on

Criteria	JORC Code explanation	Commentary
		the percentage of partings and OSD for each seam.
	• *Any assumptions or allowances made for deleterious elements.* • *The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole.*	• No deleterious elements • Most of the subject Wuhai Energy mines have well-established coal processing history, thus no bulk sample or pilot scale test work is needed.
	• *For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?*	• The coal type at Zhuozishan Coalfield is mainly coking coal or 1/3 coking coal which are used in the coking industry. The inherent caking index of the clean coal satisfies the coking requirements (>90%) while the processing is mainly for ash content control. The clean coal for coking purpose generally requires ash content below 10.5%. In the Coal Reserve estimation process, such parameters have been reviewed and demonstrated in the product coal quality.
Environmental	• *The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.*	• Each of the subject Wuhai Energy mines (except for Pinggou which is undergoing mine upgrade construction preparation) provided environmental impact assessment report. The mines do not need residue storage since the waste rocks are either used by the mines for backfilling or transported away for various usages.
Infrastructure	• *The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.*	• Zhuozishan Coalfield is located in the western part of Inner Mongolia Autonomous Region near Wuhai City. Due to the well-developed coal industry, infrastructure needed for underground mining operations are conveniently available such as power supply, transportation network, water supply, etc.
Costs	• *The derivation of, or assumptions made, regarding projected capital costs in the study.*	• Capital expenditure projections for the period from August 2025 to December 2029 were provided by each mine covering civil

Criteria	JORC Code explanation	Commentary
		constructions, equipment purchases, etc. Sustaining capital at RMB30/t of coal producing capacity was assumed which is typical for underground mines in China.
	• *The methodology used to estimate operating costs.*	• Operating cost projections for the period from August 2025 to December 2029 were provided by each mine based on historical performance and adjusted for certain changes. The competent person extended the projection period to the year when the Coal Reserves are depleted.
	• *Allowances made for the content of deleterious elements.*	• No deleterious elements.
	• *The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products.*	• The historical three-year average prices (VAT inclusive) were used for our economic analysis of each mine. Gongwusu: RMB754/t Laoshidan: RMB814.75/t Limin: RMB858.5/t Luotuoshan: RMB697.6/t Lupian: RMB443.75/t Pinggou: RMB650/t
	• *The source of exchange rates used in the study.*	• Exchange rates: not applicable
	• *Derivation of transportation charges.*	• Transportation charges account for only a small portion of the costs for underground mines, and are included in the operating costs.
	• *The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.*	• Processing cost projections are based on historical performance and included in overall mining operation costs. No case of failure to meet quality specifications was reported and penalties for such failure were not considered in forecasting, which appears common for coal mines.
	• *The allowances made for royalties payable, both Government and private.*	• The mines already paid the mining right fees in obtaining the mining rights. Such fees were amortized over operating years.

Criteria	JORC Code explanation	Commentary
Revenue factors	• *The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc.* • *The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.*	• Geological conditions over the projection period are consistent with recent experience; no material coal quality change. • The historical three-year average prices (VAT inclusive) were used for our economic analysis of each mine. Gongwusu: RMB754/t Laoshidan: RMB814.75/t Limin: RMB858.5/t Luotuoshan: RMB697.6/t Lupian: RMB443.75/t Pinggou: RMB650/t
Market assessment	• *The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.* • *A customer and competitor analysis along with the identification of likely market windows for the product.* • *Price and volume forecasts and the basis for these forecasts.* • *For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.*	• The clean coal products from the subject Wuhai Energy mines are used as coking coal to supply the coking and steel industry. Zhuozishan Coalfield is a well-developed coalfield with a mature coking coal market. The coal products from the mines have consistent coal quality and are expected to continue their market share. • Coal prices have been slowly declining over the 2024-2025 period. The historical three-year average prices (VAT inclusive) were used for our economic analysis of each mine. Gongwusu: RMB754/t Laoshidan: RMB814.75/t Limin: RMB858.5/t Luotuoshan: RMB697.6/t Lupian: RMB443.75/t Pinggou: RMB650/t
Economic	• *The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic*	• The projection on output, operating costs, capital expenditures, tax rates, working capital, etc. are used to produce the NPV. The discount

Criteria	JORC Code explanation	Commentary
	inputs including estimated inflation, discount rate, etc.	rate was derived from the study of peer group analysis, weighted average cost of capital, equity cost of capital and debt cost of capital. Based on the results of the above analysis, we estimates the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%, as of 31 July 2025.
	• *NPV ranges and sensitivity to variations in the significant assumptions and inputs.*	NPV Under Various Sensitivity Cases (RMB Millions) Base Case Mine / 6.0% / 7.0% / (7.1%) / 8.0% / 9.0% / 10.0% Gongwusu 303 49 21 (167) (351) (508) Laoshidan 53 20 16 (10) (37) (61) Limin 203 56 40 (68) (173) (261) Luotuoshan 97 38 31 (16) (65) (109) Lutian 5 5 5 5 5 5 Pinggou 148 61 51 (7) (59) (98)
Social	• *The status of agreements with key stakeholders and matters leading to social licence to operate.*	• The mines recognize their social responsibility and have maintained cordial relationship with local government and society. No social issues affecting or disrupting mine operations were reported.
Other	• *To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:* • *Any identified material naturally occurring risks.* • *The status of material legal agreements and marketing arrangements.* • *The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.*	• No such factors that will have impact on the project and/or on the estimation and classification of the Coal Reserves have been identified. It has been rare that under normal situations, operating coal mines in China would not receive government approvals to continue mine operations.
Classification	• *The basis for the classification of the Ore Reserves into varying*	• Once Coal Resources of various categories were estimated, Coal

Criteria	JORC Code explanation	Commentary
	confidence categories.	Reserves were estimated after applying the mine plan to the resource areas. Under normal conditions as in the subject Wuhai Energy mines cases, the basis for the classification of the Coal Reserves into varying confidence categories is derived from the categories of Coal Resources, i.e., the Proven Reserves are from the Measured Resources, and the Probable Reserves are from the Indicated Resources.
	• *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• They do.
	• *The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).*	• None.
Audits or reviews	• *The results of any audits or reviews of Ore Reserve estimates.*	• Internal technical reviews were undertaken by peer Competent Persons as part of its routine governance process. These reviews did not identify material issues affecting the Ore Reserve estimate.
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.*	• The Ore Reserve estimate for the underground operation may exhibit minor variance due to equipment-dependent mining height, coal-seam thickness undulation, and assumptions regarding OSD and extraction losses. These factors may introduce limited deviation, but the overall impact on reserve accuracy is expected to be small.
	• *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.*	• The accuracy statement relates primarily to the global Coal Reserve estimate. Local accuracy may vary slightly in zones where seam thickness fluctuates or equipment recovery is constrained.
	• *Accuracy and confidence discussions should extend to specific*	• Uncertainty is mainly associated with modifying factors such as mining equipment mining height, operational OSD assumptions, and

Criteria	JORC Code explanation	Commentary
	discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage. • *It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*	recovery/loss parameters. These factors influence extraction thickness and mined tonnage but remain within normal ranges for underground longwall or continuous mining operations. • No reconciliation against long-term production is available. Confidence is therefore based on equipment capability, geological interpretation, and modifying factor assumptions.

STATEMENT

I, Ronald L. Lewis, confirm that I am the Competent Person for the Report and:

- I have read and understood the requirements of the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code, 2012 Edition).
- I am a Competent Person as defined by the JORC Code, 2012 Edition, having five years experience that is relevant to the style of mineralisation and type of deposit described in the Report, and to the activity for which I am accepting responsibility.
- I am a registered members of the Society of Mining, Metallurgy, and Exploration, Inc..
- I have reviewed the Report to which this Consent Statement applies.

I am a full time employee of John T. Boyd Company and have been engaged by China Shenhua Energy Company Limited to prepare the documentation for forty-seven coal mines and exploration right areas on which the Report is based, for the period ended 31 July 2025.

I have disclosed to the reporting company the full nature of the relationship between myself and the company, including any issue that could be perceived by investors as a conflict of interest.

I verify that the Report is based on and fairly and accurately reflects in the form and context in which it appears, the information in my supporting documentation relating to Coal Resources and Coal Reserves.

Ronald L. Lewis, CP
Managing Director and COO

CONSENT

I consent to the release of the Report and this Consent Statement by the directors of:

China Shenhua Energy Company Limited

Signature of Competent Person Date:

Professional Membership Membership Number

Signature of Witness Print Witness Name and Residence

Additional deposits covered by the Report for which the Competent Person signing this form is accepting responsibility:

None.

Additional Reports related to the deposit for which the Competent Person signing this form is accepting responsibility:

STATEMENT OF JORC COMPLIANCE

The estimates of Coal Resources and Reserves for forty-seven (47) coal mines and coal exploration right areas under subsidiaries of China Energy presented in this report have been carried out in accordance with the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" prepared by the Joint Ore Reserves Committee of The Australasian Institute of Mining and Metallurgy, Australasian Institute of Geoscientists and Mineral Council of Australia, 2012.

The information in this report to which this statement is attached that relates to the Coal Resources is based on information reviewed by Mr. Ronald L. Lewis, who is registered members of the Society of Mining, Metallurgy, and Exploration, Inc., and full-time employees of John T. Boyd Company.

Mr. Lewis has sufficient experience, which is relevant to the style of mineralization and type of deposit under consideration and to the activity which they are undertaking, to qualify as Competent Persons as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves."

(Signed)

Ronald L. Lewis, CP
Managing Director and COO

STATEMENT ON MATERIAL CHANGES SINCE THE EFFECTIVE DATE

I, Ronald L. Lewis, the Lead Competent Person responsible for this Competent Person's Report, hereby state that, to the best of my knowledge and belief, there have been no material changes to the Coal Resource and Coal Reserve estimates contained in this Report, nor to the key assumptions, parameters, and methods supporting these estimates, between the effective date of this Report (31 July 2025) and the date of this statement.

DRAFT
Date: 24 December 2025
File: 3123.040

China Shenhua Energy Company Limited
Shenhua Tower, 22 Andingmen Xibinhe Road
Dongcheng District, Beijing
People's Republic of China

Attention: Mr. Zhang Changyan
Executive Director

Subject: Valuation Report
Forty-Seven Coal Mines and Exploration Right Areas Under Subsidiaries of China Energy Investment Corporation Limited
Heilongjiang, Shanxi, Shaanxi Provinces And Inner Mongolia, Ningxia, Xinjiang Autonomous Regions
People's Republic of China

Dear Ladies and Gentlemen:

John T. Boyd Company (BOYD) was engaged in September 2025 by China Shenhua Energy Company Limited (China Shenhua) to complete an independent valuation of forty-seven (47) coal mines and coal exploration right areas, which are currently held by multiple subsidiaries of China Energy Investment Corporation Limited (China Energy). The subject properties are located in various coal-producing provinces (regions) of the People's Republic of China (PRC) including Heilongjiang, Inner Mongolia, Ningxia, Shaanxi, Shanxi and Xinjiang. We understand China Shenhua intends to acquire the subsidiaries of China Energy which control the subject properties, and this Valuation Report is prepared in accordance with the VALMIN Code.

The reader is referred to a companion Competent Person's Report (CPR) prepared by BOYD in December 2025, which provides the basis of the estimated coal resources and reserves, mine plans, and related economics used as the primary source of information in preparing this Valuation Report.

Respectfully submitted,

JOHN T. BOYD COMPANY

GLOSSARY AND DEFINITIONS

Additional Coal Reserve	Coal reserve that remains unmined in each mine beyond 2054 until when DCF analysis is completed by BOYD (from August 2025 through 2054). It is also called Tail Reserve in the report.
Apt.....	Arbitrage pricing theory.
BOYD.....	John T. Boyd Company.
CAPEX.....	Capital expenditure.
CAPM.....	Capital asset pricing model.
Competent Evaluator.....	A Competent Person undertaking mineral valuations that satisfy HKEx RULE 18.23.
Competent Person.....	A person that satisfies HKEx rules 18.21&.22.
CPR	Competent Person' Report.
CPP.....	Coal processing plant.
DCF.....	Discounted cash flow.
ERP.....	Equity risk premium.
Expert (VALMIN)	May be either: (a) an "Independent individual" who prepares and accepts responsibility for a Report, or (b) a "Representative Expert" who is the nominated representative of a legally constituted body. He or she supervises the preparation of a Report and accepts responsibility for it on behalf of that body. Independent Individual Expert: (a) must be Competent in and have had at least ten years of relevant and recent general mining experience in the mining industry, as may be appropriate; (b) have had at least five years of relevant and recent experience in the assessment and/or valuation of mineral assets or securities, as may be appropriate; (c) hold appropriate licenses; (d) be a member of an appropriate professional

	association having an enforceable code of ethics. Representative Expert: should preferably have the same length of experience and degree of competence as is required of an Independent Individual Expert. If this is not the case, he or she must engage a "Senior Specialist" who: (a) is competent and has had at least ten years of relevant and recent experience in the mining industry, as may be appropriate; (b) has had at least five years of relevant and recent experience in the assessment and/or valuation of mineral assets and securities, as may be appropriate; (c) holds the appropriate licenses; (d) is a member of an appropriate professional association having an enforceable code of ethics.
Feasibility Study	A comprehensive design and costing study of the selected option for the development of a mineral project in which appropriate assessments have been made of realistically assumed geological, mining, metallurgical, economic, marketing, legal, environmental, social, governmental, engineering, operational, and all other relevant factors, which are considered in enough detail to demonstrate at the time of reporting that extraction is reasonably justified and the factors reasonably serve as the basis for a final decision by a financial institution to finance the development of the project.
GAAP	Generally accepted accounting principles.
HKEx	Stock Exchange of Hong Kong.
Indicated Resource.....	That part of a mineral Resource for which tonnage, densities, shape, physical characteristics, grade, and mineral content can be estimated with a reasonable level of confidence.
Inferred Resource.....	That part of a mineral Resource for which tonnage, grade, and mineral content can be estimated with a low level of confidence. It is inferred from geological evidence, sampling, and assumed but not verified geological and/or grade continuity.

JORC Code	The Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (2012 edition), as published by the Joint Ore Reserves Committee, as amended from time to time.
Life-of-Mine (LOM) Plan	A design and costing study of an existing or proposed mining operation where all Modifying Factors have been considered in sufficient detail to demonstrate at the time of reporting that extraction is reasonably justified. Such a study should be inclusive of all development and mining activities proposed through to the effective closure of the existing or proposed mining operation.
LOM	Life-of-Mine.
Market Value	The estimated amount of money (or the cash equivalent of some other consideration) for which the Mineral Asset should exchange on the date of Valuation between a willing buyer and a willing seller in an arm's length transaction after appropriate marketing wherein the parties each acted knowledgeably, prudently, and without compulsion.
Measured Resource	That part of a mineral Resource for which tonnage, densities, shape, physical characteristics, grade, and mineral content can be estimated with a high level of confidence.
Mine Planning	Includes production planning, scheduling and economic studies within the Mine Design taking into account geological structures and mineralization, associated infrastructure and constraints, and other relevant aspects that span commissioning, operation and closure.
Mineral	Any naturally occurring material found in or on the earth's crust that is useful to and/or has a value placed on it by humankind, excluding crude oil, natural gas, coal-based methane, tar sands, and oil-shale, which are classified as Petroleum as defined in D35 of VALMIN Code.
Mineral Asset	All property, including but not limited to real property, intellectual property, mining, and exploration tenements held or acquired in connection with the exploration of, the development of, and the production from those tenements together with all plant, equipment, and infrastructure owned or acquired for the development, extraction, and processing of minerals in connection with those tenements. Most Mineral Assets can be classified as either:

Exploration Areas — properties where mineralization may or may not have been identified, but where a Mineral or Petroleum Resource has not been identified.

Advanced Exploration Areas — properties where considerable exploration has been undertaken and specific targets have been identified that warrant further detailed evaluation, usually by drill testing, trenching or some other form of detailed geological sampling. A resource estimate may or may not have been made but sufficient work will have been undertaken on at least one prospect to provide both a good understanding of the type of mineralization present and encouragement that further work will elevate one or more of the prospects to the resource category.

Pre-Development Projects — properties where Mineral Resources have been identified and their extent estimated (possibly incompletely) but where a decision to proceed with development has not been made. Properties at the early assessment stage, properties for which a decision has been made not to proceed with development, properties on care and maintenance, and properties held on retention titles are included in this category if Mineral Resources have been identified, even if no further Valuation, Technical Assessment, delineation, or advanced exploration is being undertaken.

Development Projects — properties for which a decision has been made to proceed with construction and/or production, but which are not yet commissioned or are not yet operating at design levels.

Operating Mines — mineral properties, particularly mines and processing plants, that have been commissioned and are in production.

Mt	Million tonnes.
MV	Market Value.
NPVs	Net present values.
PRC	The People's Republic of China.
Prefeasibility Study	A comprehensive study of the viability of a mineral project that has advanced to a stage where the mining method, for underground mining, or the pit configuration, for an open pit,

	has been established and an effective method of mineral processing has been determined. It includes a financial analysis based on realistically assumed or reasonable assumptions of technical, engineering, legal, operating, economic, social, and environmental factors and the evaluation of other relevant factors which are enough for a Competent Person, acting reasonably, to determine if all or part of the mineral Resource may be classified as a mineral Reserve.
Probable Reserve.....	With regard to minerals, the economically mineable part of an Indicated, and in some circumstances a Measured, Resource.
Professional Association	A self-regulating body such as one of engineers or geoscientists or both that: (a) has been given authority or recognition by statute; (b) admits members primarily on the basis of their academic qualifications and professional experience; (c) requires compliance with professional standards of expertise and behavior according to a code of ethics established by the association; and (d) has enforceable disciplinary powers, including that of suspension or expulsion of a member, should its code of ethics be breached.
Proved Reserve.....	With regard to minerals, the economically mineable part of a Measured Resource.
Reasonableness	Implies that an assessment which is impartial, rational, realistic and logical in its treatment of the inputs to a Valuation or Technical Assessment has been used, to the extent that another Practitioner with the same information would make a similar Technical Assessment or Valuation.
Recognized Professional Organization.....	A self-regulatory organization of professional individuals in the mining or petroleum industry which admits individuals on the basis of their academic qualifications and experience, requires compliance with professional standards of competence and ethics established by the organization, and has disciplinary powers, including the power to suspend or expel a member.

Reserve	With regard to minerals, the economically mineable part of a Measured, and/or Indicated Resource, taking into account diluting materials and allowances for losses, which may occur when the material is mined. Appropriate assessments to a minimum of a Prefeasibility Study must have been carried out. Mineral Reserves are subdivided in order of increasing confidence into Probable Reserves and Proved Reserves. Note: although the term Mineral Reserve is used throughout this Chapter, it is recognized that the term Ore Reserve is used in the JORC Code.
Resources	With regard to minerals, a concentration or occurrence of material of intrinsic economic interest in or on the earth's crust in such form, quality, and quantity that there are reasonable prospects for their eventual economic extraction. The location, quantity, grade, geological characteristics, and continuity of a mineral Resource are known, estimated, or interpreted from specific geological evidence and knowledge. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated, and Measured Resources, as defined in the JORC Code.
Risk	The chance of an event occurring that will have an impact on objectives. A risk may be quantifiable in terms of the likelihood of loss, less than expected returns, or an undesirable outcome.
RMB	Renminbi, the Chinese currency.
Specialist	A person whose profession, reputation or relevant industry experience in a technical discipline (such as geology, mine engineering, or metallurgy) provides them with the authority to assess or value Mineral Assets.
Technical Assessment	An evaluation prepared by a Specialist of the technical aspects of a Mineral Asset. Depending on the development status of the Mineral Asset, a Technical Assessment may include the review of geology, mining methods, metallurgical processes and recoveries, provision of infrastructure and environmental aspects.
Technical Assessment Report	(a.k.a. CPR) Involves the Technical Assessment of elements that may affect the economic benefit of a Mineral Asset.
Technical Value	An assessment of a Mineral Asset's future net economic benefit at the Valuation Date under a set

	of assumptions deemed most appropriate by an Expert or Specialist, excluding any premium or discount to account for such factors as market or strategic considerations.
VALMIN Code	The Code for the Technical Assessment and Valuation of Mineral and Petroleum Assets and Securities for Independent Expert Reports (2005 edition), as prepared by the VALMIN Committee, a joint committee of the Australasian Institute of Mining and Metallurgy, the Australian Institute of Geoscientists, and the Mineral Industry Consultants Association as amended from time to time.
Valuation	The process of determining the monetary Value of a Mineral Asset at a set Valuation Date.
Valuation Date.....	The reference date on which the monetary amount of a Valuation in "dollars of that day" terms is current. This date could be different from the dates of completion or signing of the Report or the cut-off date of available data.
Valuation Methods	A subset of Valuation Approaches and may represent variations on a common rationale or basis.
Valuation Report.....	The public valuation report prepared by a Competent Evaluator on Mineral or Petroleum Assets in compliance with SEHK rule 18.34 and the applicable Reporting Standard, as modified by this Chapter. It may form part of a Competent Person's Report.
VAT	Value-Added Tax.
VR	Valuation Report.
WACC	Weighted Average Cost of Capital.
YTM	Yield to maturity.

1.0 INTRODUCTION

1.1 Scope of Work/Purpose

This independent valuation of the forty-seven (47) coal mines and coal exploration right areas was prepared by BOYD under the direction of Ronald L. Lewis, Representative Expert, for China Shenhua Energy Company Limited (China Shenhua) for use in a public filing on the Stock Exchange of Hong Kong (HKEx). In preparing this report, we have relied on a companion report: Competent Person's Report (CPR), prepared by BOYD in December 2025. The Valuation Date for this study is 31 July 2025. This report is prepared in accordance with HKEx Listing Rules Chapter 18 and the Australasian Code for Public Reporting of Technical Assessments and Valuations of Mineral Assets, 2015 Edition (VALMIN Code 2015).

1.2 Assets Summary

As of the date of valuation, the subject mine operations and related assets and the exploration rights are fully or partially controlled by multiple subsidiaries of China Energy Investment Corporation Limited (China Energy). Most of the mines and related facilities are fully developed, with several individual mines in other status including under technical renovation, under construction and to be constructed. The operations employ underground or open-pit mining method with various design

capacity and coal handling arrangements. Coal mines and exploration right areas included in the scope of work are summarized in Table 1-1.

Table 1-1 Summary of Subject Coal Mines and Exploration Areas

Mine/Exploration Right Area	Share of China Energy*	Mining Method**	Status	Location	
				Area	Province/Region
China Energy Baotou Mining Co., Ltd.					
Exploration Rights					
Yinminhe East Backup	100%	UG	Greenfield	Hulunbuir	Inner Mongolia

Note: *China Energy's share of the title owner of the mining/exploration rights.
**UG = Underground, OP = Open-pit.

1.3 Source Data

The reader is referred to the BOYD CPR for a listing of source data used to prepare this document. For purposes of this Valuation Report (VR), BOYD requested and received the following additional source data:

- Details for forward August 2025-2029 mining and business plans (projections):
  - Projected product type.
  - General and administrative cost.
  - Selling costs and taxes.
  - Financial costs.
  - Fully Mechanized longwall (FM LW) and development equipment replacement plan.

- Coal sales:
  - Existing coal sales commitments (or contracts) for forward sales.
  - Summary of historical coal sales contracts, showing the name of customer, name of mine, coal quality requirement, FOB price, tonnage, and other additional pricing agreement.
  - FOB mine coal sales prices for the mine on the close of the first day of each month for the past 12 months and past 5 years.

- Existing assets:
  - Fixed asset summary listing for the mines and facilities, as of 31 July 2025, showing original and net asset values.
  - Annual depreciation rates by asset classes.
  - Depreciation schedule for all the assets from 1 August 2025 until the end of the year when the estimated reserves are depleted.

- Mineral and land costs:
  - Mineral resource compensation fees.
  - Outstanding mining right fees to be paid as of 1 August 2025.
  - Mining right fees paid in and future payment schedules as of 1 August 2025.
  - Land usage fees and future payment schedules as of 1 August 2025.

- Other forward planning considerations:
  - Production fee projections by year with detailed breakdowns for the period from August 2025 to 2029 and beyond.
  - Expected coal processing requirements for CPPs.
  - Rate and calculation method for all the fees/taxes levied by the tax department or administrative organizations
  - Expected VAT obligation as percent of selling price and expected deductions to VAT for purchase of goods and services.

1.4 BOYD Background and Qualifications

BOYD is one of the largest independent consulting firms exclusively serving the mining, financial, utility, power, and mineral related industries. Consultancy services have been provided on a continuous basis since 1943 in over 100 countries. Our full-time staff includes specialists in the analysis of geology, reserves, mine planning and costs, material handling and processing, markets, business planning, transport, environmental assessments, and mineral valuation. Our full range of professional services includes:

- Independent technical reports (ITR, QPR, CPR)
- Geologic, reserve and mine plan modeling
- Exploration design and supervision
- Reserve and geotechnical studies
- Economic feasibility studies and valuations
- Due diligence of mining operations
- Assessment of existing operations
- Permitting and environmental analysis
- Market and transport analyses
- Material handling and processing
- Strategic business planning
- Financial analysis
- Asset appraisals
- Monitoring of operating companies
- Minerals industry restructuring
- Privatization studies

BOYD possesses extensive computer and software systems to estimate reserves, and complete mine plans including Mincom Minescape, MAPTEK Vulcan, Carlson SurvCADD, Runge XPAC, Mintec Mine Sight, and GEMCOM Whittle.

The company is privately owned, with James W. Boyd serving as Chairman, John T. Boyd II serving as President and Carlos F. Barrera serving as CEO. Currently, a full-time staff of more than 65 is maintained in five offices (Canonsburg, Pennsylvania, USA; Denver, Colorado, USA; Brisbane, Australia; Beijing, China; and Bogota, Colombia). Our staff is supplemented by associates and executive consultants in various areas of specialized expertise in the mining industry.

We have extensive experience with international mining operations and in preparing Competent Person's Reports (CPR), Qualified Person's Reports (QPR), and Independent Technical Reports (ITR) for international financing purposes and for stock exchange filings. We are fully knowledgeable of the listing requirements of the Hong Kong Stock Exchange (HKEx), London Stock Exchange (and AIM), Australian Stock Exchange (ASX), Toronto Stock Exchange (TSX), and Singapore Stock Exchange (SGX). These exchanges generally require technical reports to comply with internationally recognized reporting guidelines such as NI 43-101 (Canadian Requirements), JORC Code, and US Securities and Exchange Commission (SEC) S-K 1300, etc., with regard to mining operations.

Shenhua Group Corporation, a key state-owned enterprise in China and the largest coal company in the world, retained BOYD as their technical advisor for their successful 2005 IPO on the HKEx. Our work included an analysis of reserves (JORC

Standards), coal quality, mine operations, processing, material handling and rail and ocean transport facilities, and economics. Our report was accepted by the HKEx. Subsequently, we completed the resource and reserve reviews for China Shenhua Energy Company Limited's (1088.HK) asset acquisitions filed with the HKEx in 2007, 2010, 2011, and 2012, and prepared coal resource and reserve updates for HKEx annual auditing in 2009, 2014, 2016, 2020, 2022 and 2024.

Inner Mongolia Yitai Coal Company, the largest private coal company in China, successfully listed their IPO on the HKEx in July 2012. BOYD completed the CPR and VR according to international (JORC and VALMIN Codes) standards and Chapter 18 rules.

Yankuang Energy Group Company Limited (Yankuang Energy, formerly Yanzhou Coal Mining Company Limited), a wholly-owned subsidiary of Yankuang Group, is a company listed on four stock markets including HKEx, NYSE, SSE, and ASX. BOYD was engaged by Yankuang Energy to complete the CPR according to International (JORC 2012) standards for its 12 coal mine assets in 2017 as well as the annual update of CPR for annual reporting during 2018 and 2024. In September 2020 BOYD completed a CPR and a VR for Yankuang Energy according to international (JORC and VALMIN Codes) standards and Chapter 18 rules to support the acquisition of the Jinjitan Mine.

BOYD is a recognized consultancy having worldwide stature. Her Majesty's Government, Department of Trade and Industry retained us regarding the privatization of British Coal Corporation, and we were actively involved with N M Rothschild, the lead financial advisor, during the course of this project. Our work assisted in the successful restructuring of the UK coal industry.

Over 2,000 reserve audits have been completed, and many of the largest US and international mineral producers have entrusted BOYD to review their reserve holdings. BOYD's reserve statements have been used by client companies for stock exchange filings. Staff representatives of BOYD have appeared before stock exchange technical staff to support our estimates. As an example, Peabody Energy, one of the largest international coal-producing companies, has utilized BOYD to develop information for SEC filing purposes.

BOYD has worked with and/or for virtually all of the major international banks. Numerous financial agencies have used our services to opine on major property/mine operations and prepare bankable documents accepted and used with confidence by major financial institutions and other investors around the world.

Our commitment to the China/Asia mining industry is exemplified by the presence of our office in Beijing, China. Our clients receive the services of an international company with expertise in the People's Republic of China (PRC) and knowledge of international financial community requirements.

1.5 Competent Evaluator and Specialists

Competent Evaluator for this Valuation Report is Mr. Ronald L. Lewis, who is serving as Representative Expert as defined by VALMIN Code. Mr. Lewis clearly meets all HKEx Rule 18.23 requirements:

- Employed by BOYD for approximately 54 years, currently serving as Chief Operating Officer (COO) and overall Managing Director (MD).
- Relevant experience includes: oversight of all BOYD consulting activities and senior management approval of BOYD work products, direct participation in mining and mineral resource/reserve and valuation assignments.
- Independently recognized expert in mineral valuation serving as an expert witness in over 50 legal proceedings.
- Registered Member of the Society for Mining, Metallurgy, and Exploration, Inc. (SME, a Recognized Professional Organization under the JORC Code), a registered Professional Engineer in the United States, and a Certified Member of the International Institute of Minerals Appraisers.

Mr. Lewis has directed and participated in the preparation of this Report, and accepts responsibility for the Report on behalf of BOYD. Key Senior Specialists who assisted Mr. Lewis are:

Mr. Jisheng (Jason) Han – Vice President, MS (Mining Engineering)
Mr. Han has 29 years of mining engineering experience focused on ground control, geomechanics, general mining engineering, and assessment of mining operations. Experienced in roof bolting and other support design, underground structure stability analysis, remedy reinforcement design, ground control problems associated with multi-seam coal mining and ground subsidence study, feasibility study of mine projects, evaluation of underground mine plans, mining operations, operating costs, mine staffing, capital requirements, mining technique upgrade, and productivity. Expertise has been developed in mine feasibility, economic analysis of mining operations and operational assessments. Additional mine engineering expertise in ventilation analysis, evaluation of coal quality, geological impacts on mine operations and valuation of mining operations. Mr. Han is a Registered Member of the Society for Mining, Metallurgy, and Exploration, Inc., and is qualified as a Competent Person

as defined in the JORC Code and HKEx Chapter 18 requirements. Mr. Han has independent status as required by Rule 18.22.

Mr. Rongjie (Jeff) Li – Managing Director - China, MS (Geochemistry), BE (Geology)
Mr. Li has 19 years of consulting geological based experience in mineral deposits on design and management of exploration programs, and interpretation of exploration data, evaluation of depositional features impacting mineability and utilization, preparation of resource/reserve estimates, technical and economic assessment of mining operations, and valuations of mineral assets. Mr. Li is a Registered Member of the Society for Mining, Metallurgy, and Exploration, Inc., and is qualified as a Competent Person as defined in the JORC Code and HKEx Chapter 18 requirements. Mr. Li has independent status as required by Rule 18.22.

1.6 Certification of Competent Evaluator

As evidenced by Mr. Lewis's signature to this report, he certifies that, to the best of his knowledge and belief:

- The statements of fact contained in this Report are true and correct.
- The reported analyses, opinions, and conclusions are limited only by the reported assumptions and limiting conditions, and are my personal, and BOYD's impartial, and unbiased professional analyses, opinions, conclusions, and recommendations.
- I (Mr. Lewis), nor BOYD, have no present or prospective interest in the China Energy assets that are the subject of this Report, and I, nor BOYD, have no personal interest with respect to the parties involved.
- I, or BOYD, have no bias with respect to any property that is the subject of this report or to the parties involved with this assignment.
- BOYD's engagement in this assignment was not contingent upon developing or reporting predetermined results.
- BOYD's compensation for completing this assignment is not contingent upon the development or reporting of a predetermined value or direction in value that favors the cause of the client, the amount of the value opinion, the attainment of a stipulated result, or the occurrence of a subsequent event directly related to the intended use of this appraisal.
- Our analyses, opinions, and conclusions were developed and this report has been prepared in conformity with the VALMIN Code.

- Mr. Lewis has not made a personal inspection of the properties that is the subject of the report, but representatives of BOYD have visited the subsidiaries of China Energy in conjunction with the preparation of the companion Competent Person's Report.

1.7 Reporting Considerations

BOYD is a privately owned consultancy firm with headquarters in the United States. Our company was selected for this assignment on the basis of our internationally recognized expertise in exploration, resource/ reserve studies, mine development, and valuation.

Estimates of resources and reserves, as well as projections of mine and processing plant output, and financial results, are inherently forward-looking statements. Actual performance may differ from projections of future performance due to various reasons beyond the control of BOYD, including, but not limited to: inherent uncertainties in geologic data interpretation, occurrence of unforeseen geological conditions, change or lack of development in key domestic and international markets, material changes in market prices, variances in the execution of construction and mine plans, and significant changes in projected materials, supplies, parts and equipment, operating costs, and expenditures. Imposition of different central, regional, and/or local government policies could affect future coal production. For example, increased environmental compliance and changes in regulatory oversight for health and safety could result in reduced output and increased costs. Possible variations of future performance from the projections presented in this report are addressed in more detail in specific sections of this report.

We believe the China Energy mining operations are appropriately equipped and operated, and except for normal geologic, operational, and other risks associated with underground coal mining in the PRC, BOYD has not identified any material concerns and/or risks that we consider extraordinary. Management of the mines is a critical element in achieving both production plans and a high degree of safety. China Energy's output plans are based on operating the mine and production facilities consistent with the operation's production capacity. In the event that any unforeseeable events result in temporary decreased production, BOYD is of the opinion that the subject operations have additional capacity potential to make up for minor loss of production volumes.

The primary source of information (written and verbal) relied upon by BOYD in preparing this VR was provided by the subsidiaries of China Energy controlling the

subject mine operations and exploration rights areas. We have exercised reasonable care in reviewing the information provided and received written confirmation from China Energy that all historical data have been accurately reported and all forward projections are prepared and/or approved by competent professionals and China Energy management. Information regarding historical coal sales were provided in summary form and used by BOYD as provided. We have no reason to believe that any material facts have been withheld. We are not responsible for any material errors or omissions in the information provided.

The valuation opinion presented in this report represents the independent professional opinion of the Competent Evaluator and BOYD based on our review of available project information. Our expertise is in technical and valuation issues, and BOYD is not qualified to offer, nor do we represent that any of our findings include, matters of a legal or accounting nature. We have not independently researched land and/or coal certificate rights, nor have we reviewed or verified the ownership or structure of the various entities with interests in the subject mine operations, exploration rights, subsidiary companies of China Energy and China Energy. BOYD is not qualified and does not purport to offer a legal opinion on the status of ownership/control and/or the right to mines.

Although we believe all findings and conclusions to be reasonable, we rely on information developed by others and reflect mining and marketing conditions, and our interpretation of regulations, as of the date of the VR.

2.0 VALUATION OPINION

2.1 Valuation and Sensitivity

The assignment of this report is to opine on the Market Value (MV) of the subject mines and exploration rights holdings, as of 31 July 2025. Based on the production sales, cost, and other data provided to BOYD for the purposes of this assignment and our LOM plan and DCF analysis for the mines and market approach for the exploration rights holdings, we developed an independent opinion of the Technical Value of the existing and projected mine operations and exploration right areas.

According to our discounted cash flow analysis and market approach studies, the Base MV of the subject mine operations is RMB 76,337 million, with an additional indicative MV of RMB 1,716 million. Whilst the Base MV of the exploration rights areas are RMB 13,892 million.

To provide guidance on the probable range in values, we have completed a series of sensitivity DCF-NPV analyses. The probable range in Technical Value using the

variables below applied to the specified Base Case DCF-NPV parameters are as follows:

Table 2-1 China Energy DCF-NPV Sensitivity Analyses

		NPV in Different Sensitivity Cases (RMB Millions)								
	Sensitivity					Base Case				
Mine	Case	-20%	-15%	-10%	-5%	(7.1% Discount Rate)	5%	10%	15%	20%

Although BOYD has used a 7.1 discount factor to arrive at our Base MV for the subject operations and exploration rights, for sensitivity purposes, we also included DCF analyses using discount rate ranging from 6% to 10%. While we believe the 7.1 discount factor is appropriate and reasonable, an alternate factor of 6% is included to reflect highest technical value to a synergistic buyer. The 8% to 10% discount rates are typical for MV (any willing buyer) valuations.

We developed life-of-mine (LOM) plan for the subject mines that provides the foundation of the cash flow projections. Level of study of the LOM plans is

considered to be Prefeasibility. The plan is limited to defined JORC Code qualified Proven and Probable Reserves (as developed by BOYD in the Competent Person's Report (CPR). The mines valued in this report have varying LOM. For mines with an LOM of less than 30 years, our DCF valuation extends to the year of reserve depletion. For mines with an LOM of 30 years or more, our DCF valuation only covers the first 30 years (up to 2054). The remaining reserves not extracted by 2054 (within the 30-year period) were valued using a Hybrid Approach.

In cases where the coal reserves are depleted before 2054, we have shown the value of the estimated mine closure costs in the final year of mine operation. We recognize that the mine operator may elect to continue to operate marginal performing mines for other commercial reasons or to delay the cost of closure.

The valuation of the exploration tenements was conducted using two approaches: the Market Approach for these with available comparable market transactions, and a Hybrid Approach for these without such transaction information.

In the Market Approach, a set of comparable market transactions was collected, including available information on location, resource quantity, and transaction prices. Each target exploration tenement was analyzed against these comparable cases, and adjustments were applied to account for differences in geology, resource quality, infrastructure, and project maturity.

The Hybrid Approach is adopted when sufficient comparable transaction cases are not available due to confidentiality restrictions, incomplete public disclosure, and heterogeneous transaction structures. Consequently, the Market Approach is not practical. Alternatively, an indicative value was derived using a correlation to the average per-tonne profitability of comparable operating coal mines within the same geological region, for which the detailed operational information is available and assessed in the CPR. Adjustments were made to account for resource conversion, exploration uncertainty, and development risk. The resulting value is considered an indicative estimate of potential market value rather than a formal market-based valuation.

2.2 DCF-NPV Analysis Parameters and Assumptions

The major valuation parameters and assumptions used to develop our base case DCF-NPV analysis are as follows:

1. Annual Coal production, operating cost and capital expenditures are derived from the LOM plan (supplied by the subsidiary companies of China Energy and developed by BOYD if certain information is incomplete) for the subject mines.
2. Product coal FOB sales prices are expressed in constant RMB including VAT.
3. Annual cash flow projections are calculated on an after-tax basis, with capital expenditures deducted in the year incurred.
4. Mid-year discounting is utilized with the 7.1 discount rate.
5. Mine level general and administrative costs are included; corporate general and administrative charges are not included.
6. The mining right Fee, Construction Tax, and Education Supplementary Tax are included in our cost estimate.
7. Working capital/parts/inventory in July 2025 at each mine was reviewed; additional capital injection is considered if deemed inadequate for the LOM Plan . It is assumed that the mines will recover the working capital during the last operation year.
8. Detailed capital expenditure projections were provided by China Energy only for some mines in the next five years. Based on the information from the site discussions with mine technical and management personnel, BOYD developed a capital expenditures (CAPEX) projection for the mines until the year when the identified remaining LOM reserves exhausts, by assigning an unit CAPEX of RMB 15-30 per tonne for underground mines and RMB 5-15 per tonne for open-pit mines.
9. Depreciation and amortization are standard pro-forma non-cash charges. Production maintenance fee ("keep simple production"), safety fund fee, and financial expense charges are unique to Chinese coal industry accounting. These charges are generally considered to be non-cash deductions to determine taxable income. Production maintenance fee and safety fund fee projections are based on actual local financial policies.
10. Operating costs for CPPs were included in the overall operating costs.
11. LOM terminal values of fixed assets and intangible assets of the mine/CPP/railway spur line were estimated by straight-line depreciation method.

2.3 Market Approach Assumptions

The market value of the exploration right areas has been estimated by reference to recent comparable transactions of coal exploration tenements with same coal type, similar geological setting, mining method within the same geological region.

A unit value expressed in RMB per tonne of in-situ resource has been adopted, adjusted by a Price Factor, which is determined by deducting the risk factors of price and market volatility risks, policy and regulation risks and other risks from 100% as shown below:

Assumption	Market Approach Deducting Factors %
Uncertainty of geological occurrenc	10.0
Price and market volatility risks	20.0
Policy and regulation risks	10.0
Other risks	5.0
Price Factor	55.0

All assumptions are considered reasonable and consistent with VALMIN Code (2015) requirements for Market-Based Valuation.

2.4 Hybrid Approach Assumptions

Owing to the absence of directly comparable exploration-tenement transactions in the region, this valuation applies an alternative correlation method based on the profitability performance of nearby operating mines. The approach uses observed operating data and reasonable adjustment assumptions to infer the potential economic worth of the resources when market evidence is limited. It is reasonable to assume that the subject exploration right areas share comparable general coal deposit geology and future mine development conditions, thus the potential profitability from the coal resources is comparable to the mines in operation in the same region, although adjustments are necessary to account for the uncertainties of the exploration rights. The Hybrid Approach was also applied to value the Tail (Residual) Reserves that remain unmined beyond 2054.

The core concept of the hybrid approach is to replace the market unit price in the market approach with the discounted cash flow (DCF) profit unit value (RMB/t) of coal mines similar to the subject mine/exploration right, in order to value the target's additional reserves or resources.

The parameters and assumptions used in the Hybrid Approach for valuing Tail Reserves and Resources under exploration rights are as follows:

	%	
Assumption	Tail Reserves	Resources
Unit Price Parameter	**5.0**	**15.0**
Exploration and development uncertainty	-	30.0
Construction-period and financing delay risks	-	20.0
Post-2054 Economic and Technological Obsolescence Risk	60.0	-
Price, and market volatility risks	20.0	20.0
Policy and regulation risks	10.0	10.0
Other risks	5.0	5.0
Recoverable Factor	**100.0**	**50.0**

As shown in the table above, the unit price factor for Tail Reserves 5% is derived by subtracting the following parameters/risk factors from 100%:

- Post-2054 Economic and Technological Obsolescence Risk
- Price and market volatility risks
- Policy and regulation risks
- Other risks

Whilst the unit price factor for the exploration rights resource/reserves is derived by subtracting the following parameters/risk factors from 100%:

- Exploration and development uncertainty
- Construction-period and financing delay risks
- Price and market volatility risks
- Policy and regulation risks
- Other risks

In addition, 100% of the Tail Reserves are included in the valuation, and we reasonably assume that half of the Exploration Right resources will be extracted and ultimately salable, therefor a 50% recovery factor is applied to the resources.

The resulting figure represents an Indicative Market Value, subject to uncertainties relating to resource conversion, coal-price evolution, and development conditions, and should not be interpreted as a realizable or transaction price.

2.5 Conclusion

Based on our DCF-NPV analysis and the methodology BOYD used to assess China Energy mines' existing and projected operation Technical Value, which were supplemented by interactions with China Energy personnel, we have a high degree

of confidence that the MV shown in this report are a reasonable representation of the subject assets as of 31 July 2025.

3.0 SUMMARY OF ASSETS

3.1 Introduction

A detailed description of the subject mining operations and exploration rights areas is contained in the companion report: Competent Person's Report, Forty-Seven Coal Mines And Exploration Right Areas Under Subsidiaries of China Energy Investment Corporation Limited, December 2025, as prepared by BOYD. This Chapter provides a summary of the subject assets included in this independent Valuation Report.

Mining and exploration rights for the subject mines and areas are all controlled by China Energy. Table 3-1 shows the mining/exploration rights information, as provided by the subsidiary companies of China Energy.

Table 3-1 Mining/Exploration Right Certificates

Mining/Exploration Right Area	Mining/Exploration Right Certificate Number	Authorized Output Capacity (Mtpa) Certificate	Authorized Output Capacity (Mtpa) New Approva	Authorized Mining Elevation (m)	Area (km^2)	Current Term Grant Date (month/yr)	Current Term Expiration (month/yr)

Xinjiang Energy holds 48.42% of Xinjiang Shenxing Energy Company Limited (Shenxing Energy). Shenxing Energy is currently applying to the government authorities through for the modification of the Wucaiwan No. 5 Open-pit Exploration License to larger area of 55.10 km^2. In June 2025, the Natural Resources Bureau of Changji Prefecture, Xinjiang, issued an "Official Reply on Soliciting Opinions

Regarding the Exploration Change and Renewal of the Wucaiwan No. 5 Open-pit Mining Field in Zhundong Coalfield, Jimsar County, Xinjiang Autonomous Region" stating that the bureau has consented to process the change and renewal procedures for the exploration license. After reviewing the provided documentation, we have reasonably assumed that the exploration license will be successfully modified.

BOYD has reviewed the mining and exploration rights documentation presented by China Energy with regard to the individual assets. To the extent supported by the documentation and from BOYD's standing as a technical expert, we have accepted that China Energy holds the mining/exploration right certificates for the areas evaluated in this report. We assume the current term of the mining rights will be extended through depletion of remaining reserves during the normal course of business, and the exploration rights will be extended upon application.

3.2 Geology Resources

3.2.1 Geologic Setting

On a global basis, the geologic setting, or nature, of the mining/exploration rights areas included in this report is judged to vary from simple to complex. At most of the mines, the coal seam has a moderate dip between 5 and 20 degrees. However, in some areas of the Zhundong and Zhunnan coalfields in Xinjiang Autonomous Region, the coal seam dip has increased to 30 degrees due to folding. The Wudong Coal Mine is an isolated case. The coal seams within its area form a large syncline between the northern and southern regions. The coal seam in the northern region has a seam dip 40 and 50 degrees, whereas in the southern region it reaches 85 degrees. Typically, the mines in Heilongjiang, Shanxi, Shaanxi and Erdos area of the Inner Mongolia Autonomous Region have favorable geologic settings, with gentle seam dip and less faulting and folds. The mines in other areas typically moderate to complex geologic settings due to faulting, seam splitting and thinning and sand channel erosion. The presence of burnt areas in coal seams near outcrops is common in Xinjiang coal mines. It is also one of the factors that complicate the occurrence of coal seams.

3.2.2 Resources and Reserves

Using Source data provided, BOYD has independently assessed this information and prepared resource and reserve estimates in accordance with JORC Code 2012. Our

resource and reserve tonnage estimates for the mines as of 31 July 2025, are as follows:

Table 3-2 Coal Resources Estimates – All Mines

Note:Figures may not add due to rounding.

We have estimated coal resources for all the subject mining and exploration rights, except Suhaitu Mine and Kabuqi Deep Exploration Area. Suhaitu Mine had depleted its coal resources years ago, and is currently recovering the remaining coal pillars left by previous mining activities using open-pit method in the name of environmental protection (prevent future spontaneous combustion and prepare the mined-out area for reclamation), as approved by the local government. Kabuqi Deep Exploration Area is the deeper area located under the Pinggou Mine, while the exploration right for this area has not been approved by the time our report is prepared, according to the source data provided by Wuhai Energy, the authorized mining elevation of Pinggou Mine overlaps with the upper part of Kabuqi Deep Exploration Area, therefore the coal resources occurred in the 16-1 seam and 16-2 seam which are situated within the overlapped elevation range have been included in our resources and reserve estimation for Pinggou Mine, however the lower 17 seam and 18 seam are not included, as the drilling data of these two seams are too limited to support a resource estimation according to JORC Code.

Total Marketable Reserves are 11,549.01 Mt. Approximately 48% of the marketable reserves are in the proved classification.

3.2.3 Coal Quality

The age of the coal-bearing strata within the mining/exploration rights areas ranges from the Late Carboniferous-Early Permian to the Jurassic and the Cretaceous, as well as the Paleogene and Neogene. Typical coal quality characteristics at each geological period are summarized in the following table:

Table 3-4 Coal Quality by Geological Period

Geological Period	Typical Coal Rank & Type	Key Quality Characteristics	Depositional Environment & Notes
Late Carboniferous to Early Permian	Bituminous coal (Coking coal in Wuhai Area)	Variable sulfur content in the Carboniferouos seams	Coastal/Paralic, seawater influence led to higher sulfur & pyrite content
Jurassic	Low-rank bituminous coal, occasional anthracite	Low to medium ash, generally low sulfur, high calorific value	Inland/Lacustrine, oxidizing conditions led to high inertinite and low sulfur. Excellent for power generation and gasification
Cretaceous	Primarily lignite, followed by low-rank bituminous coal	Highly variable, can range from low ash & sulfur to high volatile matter characteristic of low-rank coal.	Inland/Basin, quality is highly dependent on the specific local basin conditions
Paleogene and Neogene	Lignite	High moisture, high volatile matter, variable ash & sulfur, low heat value	Wet, forested swamps, low thermal maturity

As the summarized coal quality data is too voluminous to include in this report, readers are referred to the Chapter 3 "Coal Quality" Section in the companion report: Competent Person's Report, Forty-Seven Coal Mines And Exploration Right Areas Under Subsidiaries of China Energy Investment Corporation Co., Ltd., December 2025, as prepared by BOYD.

3.3 Mine Operations

3.3.1 Mine Introduction

The subject mining operations include twenty-eight (28) mines under the seven (7) subsidiary companies of China Energy. Among these mines, eleven (11) are open-pit

operations and seventeen (17) are underground operations. The subject mines are summarized as shown in Table 3-15:

Table 3-5 Summary of Subject Mines

Ciyaogou	UG	5.0	-	RH, CM	FM LW SLC
Shaping	UG	8.0	-	RH, BM, CM	FM LW, FM LW SLC

Note: OP=Open-pit; UG=Underground; FM LW=Fully-Mechanized Longwall; SLC=Sublevel Caving; RH=Roadheader; BM=Bolter Miner; CM=Continuous Miner

The mines are mostly located in well-known coal-producing regions in Heilongjiang, Inner Mongolia, Ningxia, Shaanxi, Shanxi, Xinjiang provinces/autonomous regions, and are administered by China Energy through its subsidiary entities. Among them, Guoyuan Power holds the most extensive distribution of mines, a result of its role as one of the nation-wide power supply companies. Wuhai Energy operates locally at Wuhai area, and most of its mines are relatively smaller and older underground operations with long operating history. Except for Tunbao and Wudong underground mines, the other Xinjiang Energy's mines are large and relatively new open-pit

operations, which is a result of the central and Xinjiang regional coal development strategy in recent years. Pingzhuang Coal is a company with long operating history. The subject mines in eastern Inner Mongolia are all large open-pit operations mining lignite. Shenyan Coal and Jinshen Energy are two joint-ventures cooperated between China Energy and local companies.

Based on our experience and review, we are of the opinion that the subject mines represent typical open-pit and underground operations in China. The mining technologies employed at each mine have decades of demonstrated successful history in China, and are widely used throughout the international coal industry.

3.3.2 Historical Output

Coal output for the subject China Energy mines for the period 2022 to July 2025 is summarized as follows:

Table 3-6 Historical Production

	Historical Production (Mt)			
Company / Mine	2022	2023	2024	Jan.-Jul. 2025
China Energy Guoyuan Power Co., Ltd.				
Chaoyang Open-pit	6.51	6.55	6.78	4.33

Subtotal - Pingzhuang Coal	35.25	34.80	37.62	21.57
Shanxi Jinshen Energy Co., Ltd.				
Ciyaogou	5.52	5.70	4.21	2.52
Shaping	5.34	4.65	2.11	0.80
Subtotal - Jinshen Enrgy	10.86	10.35	6.32	3.32
Total	190.56	198.10	197.82	108.86

As shown, the overall historical product coal outputs are generally stable over the past three years, although there have been some fluctuations among individual mines for various reasons.

The underground mines employ modern FM LW mining techniques. Physical mining conditions vary considerably among different subsidiary companies of China Energy, although mine design and equipment selection at each mine are generally

considered appropriate as observed by BOYD in the PRC coal mining industry. Luotuoshan and Hongshaquan No.2 Open-pit mines started their operation in the past three years. Pinggou just completed a new mine design but construction of the mine has not commenced. Suhaitu depleted its coal reserves and is recovering remaining barrier pillars and no JORC reserves are reported in the CPR. Boligou is under construction, and initial mine operation is projected to start in 2028.

The open-pit operations employ shovel-truck approach. Stripping of waste materials is commonly outsourced to third-party companies at most of the open-pit mines. The mining equipment fleets satisfy the designated output level at each mine.

3.3.3 Staffing

Historical staffing for the subject China Energy mines is summarized by mine as follows:

Table 3-7 Historical Staffing

	Year			
Company / Mine	2022	2023	2024	Jan.-Jul. 2025
China Energy Guoyuan Power Co., Ltd.	Historical No. of Personnel			
Chaoyang Open-pit	91	113	188	194
Dananhu No.2 Open-pit	97	102	237	230
Renjiazhuang	1,258	1,307	1,334	1,316
Sandaogou	1,001	881	886	879
Shangyuquan	869	869	851	843

Baiyinhua No.1 Open-pit	1,248	1,328	1,180	1,250
Boligou	-	-	-	-
Hesigewula South Open-pit	693	700	715	704
Yuanbaoshan Open-pit	1,500	1,498	1,450	1,413
Shanxi Jinshen Energy Co., Ltd.				
Ciyaogou	613	615	628	619
Shaping	854	861	1,010	903
Subtotal - Open-pit	5,303	5,648	5,857	6,340
Subtotal - Underground	11,456	11,522	11,348	11,566
Total	16,759	17,170	17,205	17,906

For open-pit mines, it is a common practice to contract stripping work to third-party contractors. The personnel shown in the table does not include the staff from

contractors. The overall staffing of the subject China Energy mines remains generally stable, with slight fluctuations less than 3%.

The historical labor productivity, in terms of open-pit and underground operations, is summarized as follows (the labor productivity numbers for 2025 are annualized):

Table 3-8 Historical Labor Productivity

	Year			
	2022	2023	2024	Jan. - Jul. 2025
Operations	Product Tonnes, Mt			
Open-Pit	138.19	151.09	157.49	84.02
Underground	52.37	47.01	40.33	24.84
Total	190.56	198.10	197.82	108.86
	Historical No. of Personnel			
Open-Pit	5,303	5,648	5,857	6,340
Underground	11,456	11,522	11,348	11,566
Total	16,759	17,170	17,205	17,906
	Labor Productivity, Product Tonnes / Employee-Year			
Open-Pit	26,060	26,750	26,890	22,720
Underground	4,570	4,080	3,550	3,680
Overall	11,370	11,540	11,500	10,420

The labor productivity for the open-pit operations averages 25,520 tonnes/employee-year, which is comparable to that of other large open-pit coal mines in China.

The labor productivity for the underground operations averages approximately 3,970 tonnes/employee-year, which appears slightly lower than the average level of underground FM LW coal mines in China. It is BOYD's opinion that this lower productivity mainly results from the relatively small-scale and lower output of the underground operations of Wuhai Energy. The overall average labor productivity for the subject China Energy operations during the period from 2022 to July 2025 is approximately 11,200 tonnes/employee-year.

3.3.4 Capital Expenditures

Historical capital expenditures for the subject China Energy mines in the period from 2022 to July 2025, by mine are summarized as follows:

Table 3-9 Historical Capital Expenditures

	Historical Capital Expenditures, RMB millions			
Company / Mine	2022	2023	2024	Jan. - Jul. 2025
China Energy Guoyuan Power Co., Ltd.

Shaping	32.5	169.6	320.8	27.5
Subtotal - Jinshen Energy	72.7	301.8	483.0	96.9
Total	3,126.4	2,598.9	4,371.2	1,566.6

The largest capital spending is attributed to new mine construction including surface facilities, major mine expansion, major production equipment replacement, safety-related facilities upgrading, coal preparation facilities upgrading, etc. The overall sustaining capital for the open-pit mines averages approximately RMB7.1/tonne of output capacity, which appears moderate for the large size open-pit operations. The average sustaining capital spending for the underground mines is approximately RMB29.6/tonne of output capacity, which in our opinion appears slightly higher and reasonable compared with the average of underground FM LW mines in China, mainly due to the recent commencement of mine technical upgrading and new mine.

3.3.5 Operating Costs

Historical operating costs for the period 2022 to July 2025, by mine are summarized as follows:

Table 3-10 Historical Operating Costs

				Jul.				Jan.-Jul.
	2022	2023	2024	2025	2022	2023	2024	2025

Shaping	130	142	201	300	174	189	273	508

Operating costs of the subject open-pit mines during the period from 2022 to July 2025 averaged approximately RMB150 per product tonne, which appears comparable to other open-pit coal mines with similar output (mostly in northern China). Average operating costs for the Wuhai Energy underground mines exceed RMB500 per product tonne, which is higher than the industrial average, resulting from the longer operating years and lower output level than the actual capacities. Operating costs for the underground mines of the subject companies other than Wuhai Energy generally appear normal. The operating costs for all the subject underground mines averages RMB294 per product tonne. The operating costs of all the subject China Energy mines are approximately RMB191 per product tonne.

3.4 Life-of-Mine Planning

In order to have a reliable basis to project future revenue, operating and capital costs, and cash flow for the subject mines, BOYD has extended the available five-year projections to a life-of-mine (LOM) plan for the mines (here LOM is for the period during which the current Reserves defined in the CPR are exhausted). This is a necessary step in the valuation of mining operations using the income method (of valuation). We have restricted all future mine plans to defined Marketable Reserve areas in accordance with VALMIN, JORC, and HKEx Chapter 18 requirements. The level of mine planning is considered Prefeasibility.

BOYD's LOM projections and operating performance include annual ROM output and generalized product coal output. The LOM period for each mine extends from August 2025 to the year the reserves defined in the CPR are depleted.

The ROM output levels are all within the authorized output limit for each mine, and are consistent with recent operating history and our experience with similar Chinese coal mines.

LW face retreat rate may vary in certain years due to fluctuation of coal seam thickness, and open-pit advancing rates may vary too. We assume that the mines will maintain sufficient mining equipment redundancy to support the projected output tonnages. We have assumed that LW development for underground mines is adequate to avoid LW face relocation delays. Similarly, we also have assumed that land acquisition for open-pit mining is well scheduled to avoid mine advancing delays. Detailed development timing for underground mines as well as land acquisition for surface operations have not been performed, but recognizing the mines' historical performance, we are confident that the subject mines have the resources and management experiences to avoid such delays due to insufficient gate development and land acquisition.

3.5 Future Operations

3.5.1 Coal Output

Except for Suhaitu, which had depleted its coal reserves and mines ramping up output from initial operation, most of the subject mines planned to produce coal generally at the authorized ROM output level. Mining operations are projected to

continue using the mining technologies employed. The five-year projections for ROM and product tonnages are shown in the table follows:

Table 3-11 Output Projections

	Production Projections (Mt)				
Company / Mine	Aug.-Dec. 2025	2026	2027	2028	2029
China Energy Guoyuan Power Co., Ltd.

Shanxi Jinshen Energy Co., Ltd.					
Ciyaogou	619	619	619	619	622
Shaping	918	933	947	962	977
Subtotal - Open-pit	6,375	6,307	6,285	6,269	6,222
Subtotal - Underground	11,790	11,899	12,243	12,289	12,250
Total	18,165	18,206	18,528	18,558	18,472

The open-pit mines plan to continue the practice to contract stripping work to third-party contractors. The personnel shown in the table does not include the staff from contractors. The overall staffing level of the subject China Energy mines remains generally stable with only slight fluctuations.

The projected labor productivity, in terms of open-pit and underground operations, is summarized as follows:

Table 3-13 Projected Labor Productivity

Operations	Aug.-Dec. 2025	2026	2027	2028	2029
	Projected Product Tonnes, Mt				
Open-Pit	60.28	162.00	174.90	187.40	188.40
Underground	20.39	48.64	50.07	52.47	57.78
Total	80.67	210.64	224.97	239.87	246.18
	Projected No. of Personnel				
Open-Pit	6,375	6,307	6,285	6,269	6,222
Underground	11,790	11,899	12,243	12,289	12,250
Total	18,165	18,206	18,528	18,558	18,472
	Labor Productivity, Product Tonnes / Employee-Year				
Open-Pit	22,690	25,690	27,830	29,890	30,280
Underground	4,150	4,090	4,090	4,270	4,720
Overall	10,660	11,570	12,140	12,930	13,330

The labor productivity for the open-pit operations averages 27,250 tonnes/employee-year, which is approximately 7% higher than the historical performance due to the output increase from the open-pit mines. The labor productivity for the underground operations averages approximately 4,260 tonnes/employee-year, which appears comparable to the historical performance. It is BOYD's opinion that the overall projection of the subject mines appears achievable.

3.5.3 Capital Expenditures

BOYD was not provided with detailed capital expenditure projections for all the mines in the future years. Based on BOYD's site visit discussions with technical and

management personnel, a capital expenditures (CAPEX) projection for the subject mines for the period August 2025 to 2029 was developed as follows:

Table 3-14 Capital Expenditures Projection

	Projected Capital Expenditures, RMB millions				
Company / Mine	Aug.-Dec. 2025	2026	2027	2028	2029
China Energy Guoyuan Power Co., Ltd.

Total	3,254.2	3,451.2	6,055.9	3,055.0	1,657.3

Capital expenditure projections data provided were not complete, with the missing data mainly for the normal operating mines. Based on our experience in China, the sustaining capital for underground and open-pit mines generally falls in the range approximately RMB15-30/ROM tonne capacity and RMB5-15/ROM tonne capacity, respectively. The capital spending projections for the mines under expansion, technical upgrading and new mine construction were provided. Upon our review, the

projected capital expenditure generally appears reasonable to achieve the target output capacity within the projected timeframe for these mines.

3.5.4 Operating Costs

Projected operating costs for the period 2025 to 2029 by mine, on per tonne basis and total RMB, are summarized as follows:

Table 3-15 Unit Operating Cost Projection

	Aug.-Dec. 2025	2026	2027	2028	2029	Aug.-Dec. 2025	2026	2027	2028	2029

BOYD reviewed the projections of detailed operating costs by category. Our comments regarding China Energy mines' internal operating cost projections are as follows:

- The Salaries and Welfare costs reflect the projected level of employee numbers.
- Material, Power and Repairs costs appear reasonable as compared with historical performance.
- Subsidence Compensation is paid to local government and villagers for the relocation of residents and management of subsided surface. The subject mines have accumulated experience in planning and managing subsidence related

issues and the projections for Subsidence Compensation costs appear reasonable.

- Depreciation costs are calculated using the straight-line method for fixed assets according to established asset depreciation lives and salvage value estimations.
- The Amortization is composed mainly of the amortization of Mining Rights fees paid by the company. In acquiring the mining rights, the mines had to pay off the resource charges upfront or in the earlier years of operation. This cost is amortized throughout the life of the mine operation.
- Safety Production and Production Maintenance ("Keep Simple Production") fees are considered as non-cash cost accruals (according to GAAP) for income tax calculations, although the monies may be utilized for mine-related projects.

It is BOYD's opinion that the projected operating costs are generally comparable to China Energy mines' historical performance and appear reasonable.

3.6 Environmental Overview

BOYD has completed an overview of the subject mines' environmental practices and policies and opines that environmental protection plans of these operations are in compliance with relevant PRC and provincial laws and regulations. Management at the mines has made diligent efforts to incorporate responsible environmental protection policies and practices into the mine designs.

4.0 VALUATION

4.1 Introduction

The assignment of this report is to opine on the MV of the subjective China Energy mine operations and exploration right areas, as of 31 July 2025.

Given the unique nature of coal (mineral) resources, and the mining and processing operations used to recover the in situ mineral in order to produce the saleable product, coal (mineral) valuation requires the services of an evaluator knowledgeable or specialized in coal (mineral) resource assessment, mining, processing, marketing, and related disciplines. Following are the three generally accepted methods for valuing mineral and mineral-producing assets.

Replacement Cost determines the value of the mineral asset by first calculating the new cost to replicate the asset to its condition on the Valuation Date, then adjusting plant and equipment to a depreciated replacement value basis. In the case of undeveloped mineral holdings, the new cost would include exploration and mining right fees, exploration, technical studies, and other site development work. Although the replacement Cost method has application in some situations (i.e., normally when valuing fixed assets and/or undeveloped mineral holdings), it seldom is appropriate when valuing developed or operating mineral properties.

Market Transaction/Comparable Sales method involves a comparison of the coal or mineral lands under study with transactions involving similar property interests that were sold in the open market. The known comparable sale(s) are, ideally, contemporaneous and include reserves having similar geologic and quality characteristics and are located in the general vicinity of the property being valued. The comparable sales approach, where comparisons are reasonably direct, is an acceptable method of appraisal. If direct comparable sales are not available, data from other mineral property sales can still be valuable to the appraiser. A general review, even though direct comparisons may not be possible, still provides insight into market activity, the number and nature of potential buyers and sellers, the level of market activity, range of prices paid, etc. this information is important in considering how a potential buyer would evaluate a property. The ability to use the Market Transaction method relies on both the availability of recent comparable transactions and an in-depth knowledge of the details of each transaction (e.g., assets conveyed, associated debt and liabilities, structure of payment, etc.).

Income method uses a discounted cash flow (DCF) operational analysis to estimate the net present value (NPV) of projected cash flow of the existing or planned mining operation. It is important to identify what asset is being valued. In the case of an

operating mining business, the annual revenues and expenses (capital and operating costs) are estimated for the mine over its remaining operating life. It is critical that realistic assumptions regarding mining plans, markets, etc. are used. For a fully developed mining operation, the calculated NPV represents the enterprise value (Technical Value) of the business, including reserves, equipment and facilities, sales agreements, and other assets incorporated into the cash flow model.

In addition, according to Clause 8.2(a) of the VALMIN Code:

> *Market-based, which is based primarily on the notion of substitution. In this Valuation Approach the Mineral Asset being valued is compared with the transaction value of similar Mineral Assets under similar time and circumstance on an open market.*
>
> *Valuation Methods include but are not limited to comparable sales transactions and joint venture terms.*

In the process of BOYD attempting to collect comparable market transactions in the same regions of the subject exploration right areas, two issues were encountered: a) only limited number of comparable transaction cases are available due to confidentiality restrictions, incomplete public disclosure, and heterogeneous transaction structures, and b) The deal prices for the transaction cases collected are deemed heavily deviated from the actual profitability of the mine operations in the same region which are reviewed in the CPR, implying that significant value overestimate may be resulted if such transactions are used as comparable cases. Alternatively, an indicative value for a particular exploration right area was derived using a correlation to the average per-tonne profitability of comparable operating coal mines within the same geological region. This approach is referred to as the Hybrid Approach in this report.

4.2 Risk Assessment

4.2.1 Introduction

Coal mining operations are unlike other industrial facilities in that mines can be engineered or planned to a precise design capacity or cost structure, but there are inherent uncontrollable natural and external factors that can prevent the attainment of precise production, cost and revenue targets. Mining operations are conducted in the earth's strata rather than within a homogeneous and controlled work environment.

There is inherent geologic risk, and mine operators must therefore contend with periodic adverse or variable geological conditions that cannot be fully anticipated in advance of actual mining activity. While the occurrences of these physical conditions

are beyond the control of site management, it should not be interpreted that coal mining is inherently risky. On the contrary, there are established measures that mine operators utilize to minimize the operational and financial impacts associated with such encounters. Coal mining operations in the region have a demonstrated track record in sustaining consistent and predictable levels of performance.

Assessment of risk associated with any enterprise is largely subjective in nature and relies on the relevant experience of the professional completing the study in the specific industry and operating venue applicable to the subject enterprise. There are three general categories of business risk inherent in a mining operation, namely: geological, operational, and market. For purposes of this study and in accordance with SEHK guidelines, we define risk in three broad categories of severity, as follows:

- Major Risk: A factor that would have a materially adverse effect (15% to 20% or higher) on project cash flow for the risk assessment period, possibly leading to project failure, if the specific risk occurred and was not corrected.
- Moderate Risk: A factor that would have significant adverse effect (10% to 15%) on project cash flow for the risk assessment period, if the specific risk occurred and was not corrected.
- Minor Risk: A factor that would have minimal or no adverse effect (less than 10%) on project cash flow for the risk assessment period, if the specific risk occurred and was not corrected.

However, equally, or perhaps more, important, is the probability or likelihood that the specific risk will occur. For this study, a risk assessment period is considered with the following probability of occurrence ratings:

- Likely: Event is likely to occur.
- Possible: Event may occur.
- Unlikely: Event is unlikely to occur.

The overall risk assessment combines these two components, severity and probability, to determine the final overall risk assessment, as shown below:

Probability of Risk Occurring	Severity (Consequence) of Risk		
	Minor	Moderate	Major
	Overall Risk Assessment		
Likely	Medium	High	High
Possible	Low	Medium	High
Unlikely	Low	Low	Medium

The risk assessment period for this study is August 2025 to 2029 and our risk assessment is based on PRC coal industry conditions as of the end of July 2025 and does not reflect subsequent industry developments.

As discussed in detail in the companion CPR, BOYD completed an independent risk assessment and concluded the subject China Energy mining operations and exploration rights was Medium in overall risk.

4.2.2 Market Risk

We judge market volatility and uncertainty as the primary risk for the PRC coal industry. A substantial reduction in market prices would have a material adverse impact on financial performance of the subject China Energy mines. Such an event would occur if there were surplus alternative coals from other suppliers, or a reduction in demand from the subject mines' customer base.

In the period 2013 to 2016, PRC coal demand on a composite industry basis appeared to have ceased growing supporting a basis for considering that Chinese coal demand had peaked. The demand for coal for industrial uses declined during the period, which offset increases in demand for coal for power generation. Coal prices reacting to lower overall demand decreased in the period. The central government imposed the 276- working day rule in March 2016 in part to support coal prices. The rule was abated in November 2016 as coal prices began to recover. Coal prices rebounded sharply in 2017 from the low-price coal market environment experienced in 2013 to 2016 period and leveled off in early 2018. After some decline of thermal coal prices in later 2018, the prices reached another high point in the first quarter of 2019 and followed a moderate declining trend for the rest of the year. The early 2020 COVID-19 outbreak brought down the market significantly, which however recovered to the mid-2019 level as of mid-2020. From mid-2020, following the initial pandemic disruption, China's coal prices recovered steadily as industrial activity resumed. In 2021, demand growth, tight supply, and policy constraints pushed coal prices to record highs before government intervention stabilized the market late in the year. During 2022, international energy shocks and strong domestic demand kept prices elevated, though volatility increased. In 2023, production and imports expanded rapidly, outpacing consumption growth and leading to a gradual decline in prices. The downward trend continued through 2024 amid abundant supply and moderate demand. By the first half of 2025, coal inventories were high, imports weakened, and thermal coal prices fell to their lowest levels in four years. As of July 2025, prices had stabilized at a lower plateau, well below the peaks of 2021–2022.

During the 2013 to 2016 period of declining coal demand and continuing to date, the central government continued its campaign to close small mines in favor of strengthening support for larger mining operations. The small mine closure campaign with other market factors (such as the 276-working day rule) may have been the impetus for the rebound in coal prices experienced in 2017. The ongoing economic recovery from the Covid 19 pandemic has supported the recent coal market recovery.

It is unclear if overall PRC coal demand will experience growth during the five-year risk assessment period. Despite the rationalization of small coal mines, new mine development in recent years has resulted in the prospect of potentially excessive coal supplies especially for thermal quality coals used in the industrial and coal-fired generation markets, as well as in coal chemical industries, which are the major markets served by the subject mines. On the other hand, the central government appears to have improved strategic planning for domestic and regional coal and downstream industries development in recent years. This will have a positive effect in stabilizing the coal market.

Owing to the recent significant declining PRC and world economies (which may potentially continue in the near future), it is possible that domestic markets for the subject China Energy mines could decline. Factors such as barriers to new mine development, expansion and addition of power plants would tend to support market conditions. It is BOYD's opinion that new competitors are unlikely to generate surplus production capacity. There are high barriers to entry, as new mine development requires significant capital investment and government approval.

Market Risk Assessment

Severity:	Moderate to Major
Probability:	Possible
Overall:	Medium

4.3 Valuation Method Selected

Based on the established (fully developed) and active producing, technical upgrading construction status of the subject mining operations, BOYD selected the Income Method of mineral valuation as the preferred and appropriate method for the mines with mining rights, the Market Approach (Market Transaction/Comparable Sales) for the exploration right areas where comparable transaction cases are available, and the Hybrid Approach for the exploration areas where limited comparable transaction data are accessible, but detailed information for mine operations in the same area are available.

It is BOYD's understanding that China Energy has entered into an Assets Transfer Agreement with China Shenhua under which China Energy agrees to transfer the subject mineral assets to China Shenhua.

We opine that the pending transaction will provide synergistic (added) value to the assets being acquired by China Shenhua (as reflected in our Base Case). This VR provides our independent opinion of the MV of the subject mining operations and exploration areas on a debt-free basis. We initially assessed the likely financial performance of the existing mine (and identified reserves) using the DCF-NPV

analysis of the life-of-mine (LOM) plan In completing the forward mining projections used as the foundation of the cash flow, BOYD reviewed all primary components for reasonableness and adjusted projected output, capital costs, operating costs and coal prices were warranted in our expert opinion. The resulting cash flow projection is intended to be reasonable and achievable, and further adjustments (i.e., changes to the Technical Value for "market strategic or other considerations" (VALMIN Code D43) are therefore not considered appropriate in the judgment of the Competent Evaluator for determining the market value of the enterprise (business) incorporated into the LOM plan. The Market Approach for the exploration right areas without mining development studies is the mostly adopted approach and thus considered appropriate. The Hybrid Approach stablishes a correlation between the economic performance of regional operating coal mines and the potential value of the exploration rights, representing an alternative valuation method applied where direct market evidence is limited.

As required by HKEx Chapter 18 rules, all reported reserves are sufficiently explored to be classified as either Proved Reserve or Probable Reserve. In addition, most of the subject mines have an established production record. Reliability of forward mine plans (production and economics) is considered low risk.

4.4 30-Year Period LOM Plan Reserves Valuation - Income Method

4.4.1 Discount Rate

The discount rate is a critical input in any discounted cash flow (DCF) valuation analysis. The following section discusses the methodology and assumptions utilized by BOYD to estimate a reasonable discount rate for the subject China Energy mines.

4.4.1.1 Peer Group Analysis

For the development of a discount rate, BOYD reviewed the financial structure of twelve companies that primarily operate coal mining and preparation businesses and supply coal-related products into the domestic and international markets. The peer

group analyzed and recent information regarding their current financial position are shown in the following table:

		(CNY 000's)				Percentage:	
Stock No.	Stock Name	Market Capitalization	Total Debt	Total Equity	Total Capitalization	Total Debt	Total Equity
601898	China Coal Energy Co. Ltd.	137,474,700	99,639	155,714	255,353	39.0%	61.0%
600188	Yankuang Energy	112,677,600	124,342	84,443	208,785	59.6%	40.4%
601001	Jinneng Holding Shanxi Coal Ind.	21,289,460	2,335	18,321	20,656	11.3%	88.7%
900948	Inner Mongolia Yitai Coal Co. Ltd.	5,820,860	27,153	47,650	74,802	36.3%	63.7%
601225	Shaanxi Coal Industry Co. Ltd.	195,742,000	25,406	88,963	114,369	22.2%	77.8%
600546	Shanxi Coal International Energy Co.	19,289,300	10,818	15,942	26,760	40.4%	59.6%
600348	Shan Xi Hua Yang	25,180,350	27,099	33,250	60,349	44.9%	55.1%
600403	Henan Dayou Energy	8,726,470	6,436	4,845	11,281	57.0%	43.0%
601666	Pingdingshan Tianan Coal Mining Co.	19,532,610	28,184	26,997	55,181	51.1%	48.9%
600121	Zhengzhou Coal Industry	19,532,610	4,006	1,679	5,685	70.5%	29.5%
601101	Beijing Haohua Energy Res. Co.	10,411,180	6,843	11,914	18,756	36.5%	63.5%
600508	Shanghai Datun Energy Res. Co. Ltd.	8,759,340	2,221	12,854	15,075	14.7%	85.3%
Weighted Average:						37.9%	62.1%

Source: Reuters September 11, 2025

The China-based peer group companies are listed on the Shanghai Stock Exchange.

4.4.1.2 Weighted Average Cost of Capital

The weighted average cost of capital (WACC) is a required component of a DCF valuation. Simplistically, a company has two primary sources of capital: debt and equity. The WACC is the weighted average of the expected returns required by the providers of these two capital sources. Mathematically, the required return of each source of funding is multiplied by its respective weight in the company's capital structure. The sum of the weighted components equals the WACC. The basic formula for computing the after-tax WACC is as follows:

$$WACC = (k_e \, x \, W_e) + [k_d \, x \, W_d]$$

Where:

k_e = Cost of equity
k_d = After-tax cost of debt (i.e., pretax cost of debt * (1 – effective tax rate))
W_e = Percentage of equity capital in the capital structure
W_d = Percentage of debt capital in the capital structure

The peer group's financial statements and their associated public trading data points were reviewed to determine debt levels, market capitalizations, beta values (both levered and unlevered) and effective tax rates to compute the WACC for the Shenhua mining operations. As shown above, the peer group's capital structure includes both equity and long-term debt. Consequently, it is reasonable to assume

that the capital structure of China Energy will also encompass both equity and debt. As such, a discount rate using the WACC approach is appropriate for discounting the target company's projected cash flow. Derivation of the components of WACC for China Energy mines is discussed below.

4.4.1.3 Equity Cost of Capital

The cost of equity is the return required by equity investors, which adequately compensates them for the risk assumed by investing in a given company's equity. There are several models that can be used to estimate the cost of equity, including the capital asset pricing model (CAPM), the buildup method, Fama-French three-factor model, and the arbitrage pricing theory (APT). For purposes of this analysis, BOYD utilized the "build-up" approach.

The equity cost of capital is generally defined as the sum of a risk-free rate and a risk premium. The build-up model divides the risk premium into three main subcomponents: (1) an equity risk premium, (2) a size premium, and (3) a country and/or company-specific risk premium. The formula for the equity cost of capital using the build-up method is shown below:

$$k_e = R_f + ERP * \beta_L + R_{CP} + R_{SP} + R_{CS}$$

Where:

- The risk-free rate (R_f) is the theoretical return associated with an investment where the expected return equals the actual return. For the valuation of a Chinese company, the nominal risk-free rate is the yield on 10-year People's Republic of China (PRC) government bonds. As of July 1, 2025, the yield on the PRC 10-year government bond was 1.70%.

- The equity risk premium (ERP) is defined as the expected return on a fully diversified portfolio of equity securities less the expected rate of return on a risk-free security (i.e., ERP is the level of risk-reward that equity investors in the stock market would require as compensation for the level of risk undertaken versus a risk-free investment). For purposes of this analysis, BOYD utilized ERP data for Chinese publicly traded companies published by the Stern School of Business at New York University[1] as of July 1, 2025. The ERP value (5.25%) is adjusted for the target company's levered beta (1.27).

- Country risk premium (R_{CP}) published by the Stern School of Business at New York University as of July 1, 2025, was 1.04%.

[1] Damodaran Online, https://pages.stern.nyu.edu/~adamodar/New_Home_Page/datacurrent.html#discrate. Updated values as of January 9, 2025, and July 1, 2025.

- The size risk premium (R_{SP}) is a factor added to the cost of equity and refers to the excess return that an investor would require as compensation for the risk associated with investing in a small or start-up company. Size premium is based on research from the Center for Research in Security Prices that groups companies into deciles based upon market capitalization. Due to Shenhua's expected large-company status, BOYD elected not to apply a company-size risk premium.

- Company-specific risk premiums (R_{CS}) are intended to account for any unsystematic risk not already captured by other risk factors.
  Some reasons utilized for the inclusion of company-specific risk premiums in a cost of equity estimate include projection risk, customer concentration risk, inferior management team, key employee risk, and limited liquidity. For this project, there are no additional company-specific risks present that would require inclusion of an additional risk premium.

Based on these factors, the cost of equity for the target company is estimated to be 9.38%.

4.4.1.4 Debt Cost of Capital

The cost of debt is the interest rate that a company pays on its debt, which is typically based on the anticipated return on a bond if the bond is held until maturity (i.e., the yield to maturity (YTM) on its long-term debt). For companies that do not have publicly traded debt from which to derive YTM, the cost of debt can be viewed as the rate a prudent debt investor would require on comparable long-term interest-bearing debt. As such, BOYD built an estimated after-tax cost of debt using the following equation:

$$k_d = [R_f + Country\ Borrowing\ Spread + R_{CP}\,]\ x\ (1 - t)$$

Where:

- The risk-free rate (R_f) is again the yield on the 10-year PRC government bonds.
- Country Borrowing Spread is based on China's three-month interbank offered rate, which is the interest rate at which banks lend funds to one another in the international interbank rate. As of July 31, 2025, the three-month interbank offered rate published by China's Central Bank was 1.57%.
- Country risk premium (R_{CP}) is again 1.04%.
- According to the Stern School of Business at New York University, as of January 9, 2025, the effective tax rate for coal and related energy companies was 20.76%.

Based on these factors, the cost of debt for Shenhua is estimated to be 3.41%.

4.4.1.5 Discount Rate Utilized

The following table summarizes the steps utilized to derive the nominal after-tax WACC:

Cost of Capital Build Up		Comment
$Weighted\ Average\ Cost\ of\ Capital = [(ke * We) + (k_d * W_d)]$		
% Equity Weighting (We)	62.1	From peer group analysis.
Cost of Equity (ke)	9.4	From above.
% Debt Weighting (Wd)	37.9	From peer group analysis.
After-Tax Cost of Debt*	3.4	From above.
Nominal after-tax WACC %	7.1	With the impact of inflation
PRC Inflation Rate %	-	FocusEconomics.com
Real after-tax WACC %	7.1	Without the impact of inflation.

* Based on an effective tax rate of 20.76%

Based on the results of the above analysis, as of 31 July 2025, BOYD estimates the nominal after-tax WACC rate (and the real after-tax WACC rate) to be 7.1%. Given BOYD's experience related to coal industry valuations, it is our opinion that a 6.0 to 10.0 percent after-tax discount rate is appropriate for an established operating mining company such as China Energy. The 6.0 percent discount rate reflects the maximum synergistic value attributable to China Shenhua, and the 8.0 to 10.0 percent scenarios are typical discount rates used in determining MV (assuming any willing buyer).

4.4.2 Major Assumptions

BOYD's DCF-NPV analysis is based upon the following major assumptions:

- Material changes in government policies and regulation do not occur during the LOM mine projection period.
- The subject mines will receive necessary approvals to renew and continue their mining rights in the future seams after paying the mining right fees for the rest of the resources. The estimation of the amount of the mining right fees follows the same approach as that used when the mines acquired the current mining rights.
- Geological conditions over the mine projection period are consistent with recent experience.
- Mining operations do not experience any major interruptions, such as major roof falls mine accidents that result in extended idle mine periods.
- Operating costs do not experience material fluctuations other than because of variations in output and seam conditions.
- Imposition of government taxes, fees, and other charges does not materially increase over the mine projection periods.

- Company management are competent, responsible and capable to execute work plans as demonstrated by their recent performance.
- Force majeure events such as war, natural disasters, etc. do not occur during the mine projection period.

4.4.3 Valuation Procedure

As shown in Chapter 3 of this report (and detailed in the separate Competent Person's Report also prepared by BOYD), we have developed a LOM plan for the subjective mines that provide the foundation of the cash flow projections. Level of study of the LOM plans is considered to be Prefeasibility. The plans are limited to defined JORC Code qualified Proved and Probable Reserves (as developed by BOYD in the Competent Person's Report).

The following Valuation parameters and assumptions are used to develop our base Technical Value:

12. Annual Coal production, operating cost and capital expenditures are derived from the LOM plan (developed by BOYD) for the subject mines.
13. FOB sales prices are expressed in constant RMB including VAT. The VAT is calculated using 13% of revenue with a credit adjustment of 35% of raw materials + power + repairs/maintenance + capital.
14. Annual cash flow projections are calculated on an after-tax basis, with capital expenditures deducted in the year incurred. A PRC income tax rate of 25% is utilized for most of the mines, and tax rate of 15% is utilized for mines satisfying the Western Development policies.
15. Mid-year discounting is utilized with the 7.1% discount rate.
16. Mine level general and administrative costs are included; corporate general and administrative charges are not included.
17. Percentages of VAT for Construction Tax and Education Supplementary Tax are selected based on the local policies of the area where the individual mine is located.
18. Working capital in July 2025 is derived from the balance sheet provided by the subsidiaries of China Energy. If deemed insufficient, additional working capital is considered to support operations throughout the LOM plan. It is assumed that each mine will recover the working capital during the last operation year.
19. Detailed capital expenditure projections for the future years were not provided by China Energy. Based on the information from site discussions with mine technical and management personnel, BOYD developed a capital expenditures (CAPEX) projection for each mine until the year when the remaining LOM reserves are exhaust. The major CAPEX projections include:
    - RMB5-15/t of sustaining capital is assumed for the open-pit mines; RMB15-25/t of sustaining capital is assumed for the underground mines.

- During the last year of the LOM operation, capital for mine decommissioning is assumed at different level based on the mine sizes and locations.

20. Depreciation and amortization are standard pro-forma non-cash charges. Production maintenance fee ("keep simple production"), safety fund fee, and financial expense charges are unique to Chinese coal industry accounting. These charges are generally considered to be non-cash deductions to determine taxable income. Production maintenance fee and safety fund fee projections are selected according to the actual required levels for each mine.
21. Operating costs for the CPPs were included in the overall operating costs.
22. The terminal value of fixed assets and intangible assets of the mine and affiliated facilities at the end of the LOM were estimated by using straight-line depreciation method.

4.4.4 Pricing

Except the mines of Wuhai Energy which produces coking coal, the rest subject mines produce low to medium grade steam coal utilized primarily for fuel power generation and as feedstock to the chemical industry. Many of the subject mines

supply coal to the nearby power plants which are also mainly controlled by China Energy. Typical commercial product coal quality at the subject mines is as follows:

	Typical Product Coal Quality			
	%			kcal/kg
Mine / CPP	Ash (Ad)	Moisture (Mt)	Sulfur (St,d)	CV (Qnet.ar)
China Energy Guoyuan Power Co., Ltd.				
Chaoyang Open-pit	25.2	49.2	0.24	2,110
Dananhu No.2 Open-pit	26.1	25.8	0.62	3,370
Renjiazhuang	33.9	4.5	2.36	4,710
Sandaogou	13.8	13.3	0.20	5,570
Shangyuquan	32.1	10.3	0.86	4,270
China Energy Shaanxi Shenyan Coal Co., Ltd.				
Xiwan Open-pit	8.3	11.4	0.67	6,160
China Energy Wuhai Energy Co., Ltd.				
Hainan CPC Gongwusu Plant	10.5	9.8	2.50	5,860
Hainan CPC Laoshidan Plant	11.0	10.8	1.80	5,880
Limin	11.7	9.4	0.89	6,010
Luotuoshan	12.9	10.0	0.71	5,890
Wuda	9.0	10.5	2.00	6,600
China Energy Xinjiang Energy and Chemical Co., Ltd.				
Heishan Open-pit	9.8	7.3	0.62	6,290
Hongshaquan No.1 Open-pit	7.5	23.6	0.41	4,950
Hongshaquan No.2 Open-pit	9.5	23.0	0.85	4,730
Tunbao	23.5	11.6	0.01	4,940
Wudong	26.5	7.8	0.74	5,160
Zhundong Open-pit	7.2	28.5	0.63	4,270
Guodian Jiantou Inner Mongolia Energy Co., Ltd.				
Chahasu	7.1	15.2	0.39	5,830
Inner Mongolia Pingzhuang Coal (Group) Co., Ltd.				
Baiyinhua No.1 Open-pit	25.8	30.4	0.67	3,260
Hesigewula South Open-pit	12.0	39.1	0.51	3,300
Yuanbaoshan Open-pit	30.2	25.6	1.47	3,480
Shanxi Jinshen Energy Co., Ltd.				
Ciyaogou	27.3	9.3	1.41	4,730
Shaping	41.8	9.1	1.05	3,520

China Energy provided historical coal pricing for commercial products for the 12-month period and past five years. VAT is included for each of the products sales

realization in accordance with HKEx 18.33(4). The following shows a summary of the composite historical coal prices for the subject mines:

	Historical Price (RMB/tonne)					
Mine	2020	2021	2022	2023	2024	Jan.-Jul. 2025
China Energy Guoyuan Power Co., Ltd.						
Chaoyang Open-pit	-	-	189	194	183	185
Dananhu No.2 Open-pit	123	139	168	132	134	121

The historical coal prices across the subject mines showed significant fluctuations between 2020 and 2025. Overall, prices for most mines increased substantially from 2020 to a peak in 2022, followed by a general declining trend from 2023 onwards into 2025. Some mines, particularly those under Wuhai Energy Co., Ltd., experienced extreme volatility, with prices at mines like Gongwusu and Wuhushan more than doubling from 2020 to 2022 before falling sharply by 2025. The historical prices indicates a notable market correction or price decrease for the year 2025 across nearly all operations.

To adopt reasonable prices for economic analysis, we assume the current market conditions will persist until 2026, followed by a gradual increase. Accordingly, in our economic analysis, the prices for 2026 are based on the average prices of each mine from January to July 2025. The prices for 2027 are based on the average prices of

the preceding two years, for 2028 on the average prices of the preceding three years, and for 2029 and beyond on the average prices of the preceding four years.

4.4.5 Base Case DCF-NPV Analysis

As shown in Table 4-3, following this text, the Base MV of the subject Mining Right operations, as of 31 July 2025, is RMB 76, 337 million.

To provide guidance on the probable range in value and sensitivity to various analysis inputs and discount rates, we completed the following series of DCF-NPV analyses:

Table 4-1 China Energy DCF-NPV Sensitivity Analyses

Although BOYD has used a 7.1% discount factor to arrive at our Base FMV for the subjective operations, the sensitivity of 8% to 10**%** encompasses the typical range of discount rates applied to this type of asset. While we believe the 7.1% discount factor is supportable and reasonable, an alternate factor in the range of 8% to 10**%** would also be appropriate, particularly if the FMV (i.e. any willing buyer) is the objective. As shown in the preceding table, at the higher nominal discount rates, the NPV for numerous mining operations are negative.

4.5 Additional Coal Reserves Valuation - Hybrid Approach

Excluding the identified coal reserves which are valued in the LOM plan cash flow analysis through the year 2054, some mines also control substantial additional coal reserves in the remaining underlying coal seams.

BOYD opines that these additional coal reserves add supplemental Indicative MV to each mine. To reflect the more speculative nature of these coal reserves, we have adopted the Hybrid Approach to value the additional reserves that remain unmined beyond 2054.

4.5.1 Hybrid Approach Procedures

The following procedures are used in the Hybrid Approach to value the additional coal reserves at each mine:

- Derivation of Per-tonne Economic Contribution Indicator

  Using the valuation outcomes of each subject mine estimated in Section 4.4, the net present value (NPV) derived from each mine's DCF model was divided by its corresponding 30-year LOM plan recoverable tonnage to determine the "per-tonne profitability" (RMB per tonne). The result represents the benchmark for the subject operating-mine's profitability per tonne of recoverable coal in 30-year LOM plan.

- Risk Adjustment and Profitability Discounting

  Given that the mine plan for the Additional Reserves has been scheduled for 30 years later (after 2054), the per-tonne profitability indicator is adjusted downward to account for multiple layers of uncertainty. Key adjustment factors include, but are not limited to:

  – Post-2054 Economic and Technological Obsolescence Risk (typically 50%–70%);
  – Price and market volatility risks (20%–30%);
  – Policy and regulation risks (5%–15%);
  – Other risks (1%–10%).

  The adjusted figure, termed "risk-adjusted per-tonne profitability," represents the indicative economic efficiency achievable under normal market conditions after allowance for development risks.

- Computation of Valuation

  The risk-adjusted per-tonne profitability is multiplied by the estimated saleable reserves (converted from the in-situ resource base) to derive the indicative value of the additional reserves. The value, expressed in RMB, represents the

potential additional economic worth of the mining rights under the assumption of future operation after the year 2054:

Indicative Market Value = (Risk-adjusted Profit per tonne) × (Expected Recoverable Tonnage)

This approach establishes a correlation between the economic performance of operating coal mines and the potential value of their additional reserves. It represents an alternative valuation method that is applied when the income method covers a valuation period that is too long (over 30 years), as this may introduce a systematic bias. The methodology aligns with Sections 8.2 and 8.3 of the VALMIN Code (2015 Edition), which permit the use of logical and transparent alternative methods when available information is constrained.

The result constitutes an Indicative Market Value, intended as a quantitative reference to potential economic worth rather than a directly realizable or transaction value. The outcome remains subject to uncertainties relating to future resource conversion, market conditions, regulatory environment, and project execution.

4.5.2 Major Assumptions

The following parameters and assumptions are used to value the Additional Reserves:

Table 4-4 Major Assumptions for Additional Coal Reserves Valuation

Assumption	Deducting Ratio %
Unit Price Parameter	**5.0**
Post-2054 Economic and Technological Obsolescence Risk	60.0
Price, and market volatility risks	20.0
Policy and regulation risks	10.0
Other risks	5.0

As shown in the table above, the unit price factor for the additional reserves 5% is derived by subtracting the following parameters/risk factors from 100%:

- Post-2054 Economic and Technological Obsolescence Risk
- Price and market volatility risks
- Policy and regulation risks
- Other risks

4.5.3 Additional Reserve Value

The additional Indicative MV at each mine was valued by using the discounted cash flow (DCF) profit unit value (RMB/t) of its 30-year LOM reserves, and the above mentioned unit price parameter, as shown bellow:

Table 4-5 Indicative MV for Additional Reserves

Mining Right	Additional Reserves (Mt)	Unit DCF Profit (RMB/t)	Unit Price Parameter (%)	Additional Indicative Market Value (RMB Million) Base Case	Probable Range
China Energy Guoyuan Power Co., Ltd.					
Chaoyang Open-pit	172	4.92	5	42	20 - 50
Dananhu No.2 Open-pit	1,041	10.43	5	543	270 - 650
Shangyuquan	227	9.11	5	103	50 - 120
China Energy Shaanxi Shenyan Coal Co., Ltd.					
Xiwan Open-pit	84	62.29	5	263	130 - 320
China Energy Xinjiang Energy and Chemical Co., Ltd.					
Heishan Open-pit	137	17.02	5	117	60 - 140
Hongshaquan No.1 Open-pit	1,655	0.01	5	1	0 - 1
Hongshaquan No.2 Open-pit	1,553	0.03	5	2	1 - 2
Tunbao	15	0.10	5	0.1	-
Wudong	119	0.88	5	5	3 - 6
Zhundong Open-pit	144	0.02	5	0.1	-
Guodian Jiantou Inner Mongolia Energy Co., Ltd.					
Chahasu	395	30.91	5	610	310 - 730
Inner Mongolia Pingzhuang Coal (Group) Co., Ltd.					
Boligou	19	31.51	5	30	15 - 36
Total	**5,562**			**1,716**	**900 - 2,100**

Note: Figures may not add due to rounding

Although BOYD has used a 5% unit price factor to arrive at our base case Indicative MV for the subjective operations, we consider a range of a 50% decrease and a 20% increase from this parameter would also be appropriate.

4.6 Exploration Right Resources Valuation

The valuation of the exploration tenements was conducted using two approaches: the Market Approach for these with available comparable market transactions, and the Hybrid Approach for these without such transaction information.

4.6.1 Valuation Procedures

Market Approach Procedures

The following procedures are used in the Market Approach:

- Collection and Compilation of Comparable Transaction Cases
  We have collected coal mine transaction cases in China since 2023 from public channels and summarized them as follows:

Table 4-6 Comparable Transaction Cases

	Location		Deal		Resource	Price	Unit Price
Exploration Right Area	Area	Province	Year	Area (km^2)	(Mt)	(million RMB)	(RMB/t)
Bayanchaidamu	Wushen, Ordos	Inner Mongolia	2023	115.43	2,131	30,150	14
Guanzigou No.1 North	Zhunge'er, Ordos	Inner Mongolia	2024	3.10	78	722	9
Hadatu	Ordos	Inner Mongolia	2024	59.40	200	13,862	69
Heilonggou Block	Shenmu, Yulin	Shaanxi	2023	N/A	221	12,529	57
Huashuta Block	Baode, Xinzhou	Shanxi	2024	45.69	560	16,000	29
Huolinhe No.1	Huolinguole, Tongliao	Inner Mongolia	2023	N/A	1,041	3,717	4
Huolinhe No.4	Huolinguole, Tongliao	Inner Mongolia	2025	N/A	972	2,855	3
Niudinghao Block	Shenmu, Yulin	Shaanxi	2023	N/A	376	23,382	62
Santanghu No.7	Balikun, Hami	Xinjiang	2024	109.28	209	3,523	17
Shangma Block	Xianghuan, Changzhi	Shanxi	2024	72.42	820	12,126	15
Sitou Block	Yangcheng, Jincheng	Shanxi	2025	15.49	217	6,949	32
Xing Country Block	Xing County, Luliang	Shanxi	2024	52.18	953	24,705	26
Yujiazhuang Block	Shouyang, Jinzhong	Shanxi	2024	73.22	630	6,800	11

- Comparison between the Transaction and the Subject Exploration Rights

  Through comparison with the subject exploration right areas estimated in this report, we found that only two transaction cases (Huolinhe No. 1 and Huolinhe No. 4) are potentially comparable with the Yinminhe East Backup Area, Yinminhe East No.2 Area, and Yinminhe East Peripheral Area. Additionally, the Guanzigou No. 1 North case is potentially comparable with the subject Heidaigou Exploration Right. Thus, we applied the market approach valuation for the Yinminhe East Backup Area, Yinminhe East No.2 Area, Yinminhe East Peripheral Area, and Heidaigou Area using the corresponding comparable cases.

- Risk Adjustment and Profitability Discounting

  Due to the lack of detailed technical information, we can only confirm that the selected transaction cases are potentially comparable to the aforementioned six subject exploration rights in terms of coal type, potential mining method, and geographic location. Other relevant factors affecting the economic viability of coal mine development (such as geological occurrence and structural complexity) are not available for comparation. Given this, we have applied a pricing factor to the transaction unit prices to reflect the aforementioned uncertainties. Key adjustment factors include, but are not limited to:
  - Uncertainty of geological occurrence differences (5%-15%)

- Price and market volatility risks (10%-30%)
- Policy and regulation risks (5%-15%)
- Other risks (1%-10%)

- Computation of Valuation

  The risk-adjusted per-tonne profitability is multiplied by the estimated saleable reserves (converted from the in-situ resource base) to derive the indicative value of the exploration rights. The value, expressed in RMB, represents the potential economic worth of the exploration rights under the assumption of future development:

  Indicative Market Value = (Risk-adjusted Profit per tonne) × (Expected Recoverable Tonnage)

Hybrid Approach Procedures

For the other exploration rights that have no suitable transactions to compare, we used the Hybrid method for their valuation. The following procedures are used in the Hybrid Approach:

- Collection and Compilation of Comparable Operating Data

  In the absence of directly comparable exploration right transactions, data from a representative set of operating coal mines located within or adjacent to the subject exploration right areas are assembled.

- Derivation of Per-tonne Economic Contribution Indicator

  Using the available data on recoverable reserves and valuation outcomes, the net present value (NPV) derived from each mine's DCF model was divided by its corresponding recoverable tonnage to determine the "per-tonne profitability" (RMB per tonne). The resulting weighted mean represents the regional benchmark for operating-mine profitability per tonne of recoverable coal.

- Resource-to-Reserve Conversion Assumption

  Considering the exploration maturity, geological confidence, seam continuity, and analog performance of neighboring producing mines, it is assumed that a certain portion of the in-situ resources within the exploration right area may ultimately convert to economically recoverable reserves at a conversion ratio of approximately 50%.

- Risk Adjustment and Profitability Discounting

  Given that an exploration tenement has yet to enter production, the per-tonne profitability indicator is adjusted downward to account for multiple layers of uncertainty. Key adjustment factors include, but are not limited to:
  - Exploration and development uncertainty (typically 20%–30%);
  - Construction-period and financing delay risks (10%–20%);
  - Policy, price, and market volatility risks (5%–10%).

  The adjusted figure, termed "risk-adjusted per-tonne profitability," represents the indicative economic efficiency achievable under normal market conditions after allowance for exploration and development risks.
- Computation of Valuation

  The risk-adjusted per-tonne profitability is multiplied by the estimated saleable reserves (converted from the in-situ resource base) to derive the indicative value of the exploration rights. The value, expressed in RMB, represents the potential economic worth of the exploration rights under the assumption of future development:

  Indicative Market Value = (Risk-adjusted Profit per tonne) × (Expected Recoverable Tonnage)

4.6.2 Major Assumptions

A unit value expressed in RMB per tonne of in-situ resource has been adopted, adjusted by the pricing factor, which is determined by deducting various risk factors from 100% as shown below:

	Deducting Factors (%)	
Assumption	Market Approach	Hybrid Approach
Uncertainty of geological occurrence differences	10.0	-
Exploration and development uncertainty	-	30.0
Construction-period and financing delay risks	-	20.0
Price and market volatility risks	20.0	20.0
Policy and regulation risks	10.0	10.0
Other risks	5.0	5.0
Pricing Factor	55.0	15.0

Since the unit value used by the Hybrid Method is in Reserve basis, additional recovery assumption was made for the hybrid Method. Considering the exploration maturity, geological confidence, seam continuity, and analog performance of neighboring producing mines, it is assumed that a certain portion of the in-situ resources within the exploration right area may ultimately convert to economically recoverable reserves at a conversion ratio of approximately 50%.

4.6.3 Exploration Rights Resources Value

The Indicative MV of the subject exploration right area are as bellow:

Table 4-7 Indicative MV for Exploration Rights Resources

Exploration Right	Resources (Mt)	Unit Value (RMB/t)	Pricing Factor (%)	Mining Recovery (%)	Indicative Market Value (RMB Million) Base Case	Indicative Market Value (RMB Million) Probable Range	Value Method

Total	**26,255**				**13,892**	**6,900 - 16,700**	

Note: Figures may not add due to rounding

Although BOYD has used 25% and 15% pricing factors for the Market Approach and Hybrid Approach, respectively, to arrive at our Base Case Indicative MV for the subjective Exploration Rights, we consider a range of a 50% decrease and a 20% increase from this parameter would also be appropriate.

4.7 Conclusion

Based on the fully developed status of the subjective mines and related operations, and rating of the operation as among the best in terms of productivity and operating cost, in China, BOYD concludes the derived Technical Value of the existing operation is the same as Market Value (i.e., no further adjustments are warranted). In addition to the value assigned to the existing operations, we opine it is appropriate to recognize and assign Indicative Market Value to the large tonnage of additional resources and reserves which are not considered in the DCF-NPV analysis

(Technical Value). We have a high degree of confidence that the MV shown in this report is a reasonable representation of the subject assets, as of 31 July 2025.

RESPONSIBILITY STATEMENT

This circular, for which the Directors collectively and individually accept full responsibility, includes particulars given in compliance with the Listing Rules for the purpose of giving information with regard to the Company. The Directors, having made all reasonable enquiries, confirm that to the best of their knowledge and belief the information contained in this circular is accurate and complete in all material respects and not misleading or deceptive, and there are no other matters the omission of which would make any statement herein or this circular misleading.

DISCLOSURE OF INTERESTS

Directors, Chief Executives of the Company in the Shares of the Company

As at the Latest Practicable Date, none of the directors or chief executive of the Company held any shares of the Company, nor did they have any interest or short position in the shares or underlying shares of the Company or any of its associated corporations (within the meaning of Part XV of the Securities and Futures Ordinance (Chapter 571 of the Laws of Hong Kong)) which were required, pursuant to section 352 of the Securities and Futures Ordinance, to be recorded in the register referred therein, or to be notified to the Company and the HKEx pursuant to the Model Code for Securities Transactions by Directors of Listed Issuers (the "**Model Code**") as set out in Appendix C3 to the Hong Kong Listing Rules.

Substantial Shareholders' Interests and Short Positions in the Shares of the Company

As at the Latest Practicable Date, persons set out in the table below had an interest and/or short position in the shares or underlying shares of the Company which is required to be recorded in the register of equity interests and/or short positions pursuant to section 336 of Part XV of the Securities and Futures Ordinance (Chapter 571 of the Laws of Hong Kong):

Name of Shareholder	Capacity	H Shares/A Shares	Nature of Interest	Number of H shares/ A Share held *(share)*	Percentage of H shares/ A shares held over the issued H shares/ A shares of the Company, respectively *(%)*	Percentage of total issued shares of the Company *(%)*
China Energy	Beneficial owner	A Shares	Long position	13,812,709,196	83.76	69.52
	Interest of corporation controlled by the substantial shareholder	A Shares	Long position	11,593,528	0.07	0.06

Name of Shareholder	Capacity	H Shares/A Shares	Nature of Interest	Number of H shares/ A Share held *(share)*	Percentage of H shares/ A shares held over the issued H shares/ A shares of the Company, respectively *(%)*	Percentage of total issued shares of the Company *(%)*
BlackRock, Inc.	Interest of corporation controlled by the substantial shareholder	H Shares	Long position	179,400,364	5.31	0.90
	Interest of corporation controlled by the substantial shareholder	H Shares	Short position	85,000	0.00	0.00
Rui Life Insurance Co., Ltd. (瑞眾人壽保險有限責任公司)	Beneficial owner	H Shares	Long position	168,874,500	5.00	0.85

Director's Employment with Substantial Shareholders

As at the Latest Practicable Date, the following Director is also an employee of a company which has an interest or short position in the Shares and underlying Shares of the Company which would fall to be disclosed to the Company under the provisions of Divisions 2 and 3 of Part XV of the SFO:

Name of Director	Name of Substantial Shareholder of the Company	Position in the Substantial Shareholder of the Company
Kang Fengwei	China Energy	Assistant to the chief executive officer and chief engineer
Li Xinhua	China Energy	Director of the coal and transportation industry management department

MATERIAL ADVERSE CHANGE

As at the Latest Practicable Date, the Directors are not aware of any material adverse changes in the financial or trading position of the Group since 31 December 2024, being the date to which the latest published audited accounts of the Group were made up.

CONSENTS AND QUALIFICATIONS OF EXPERTS

The following is the qualification of the expert who has been named in this circular or has provided its opinion, letter or advice, which are contained in this circular:

Name	Qualification
Beijing China Enterprise Appraisals Co. Ltd.	certified independent assets valuer in the PRC
China United Assets Appraisal Group Co., Ltd.	certified independent assets valuer in the PRC
Ernst & Young	Certified Public Accountants Registered Public Interest Entity Auditor
John T. Boyd Company	Competent Person
Somerley Capital Limited	a corporation licensed to carry out Type 1 (dealing in securities) and Type 6 (advising on corporate finance) regulated activities under the SFO

Each of the experts mentioned above has given and has not withdrawn its written consent to the issue of this circular, with the inclusion therein of its letter and/or report or the references to its name in the form and context in which they appear respectively.

As at the Latest Practicable Date, each of the experts mentioned above did not have any shareholding in any member of the Group or any right (whether legally enforceable or not) to subscribe for or to nominate persons to subscribe for any securities in any member of the Group.

As at the Latest Practicable Date, each of the experts mentioned above did not have, nor had, any direct or indirect interest in any assets which had been since 31 December 2024, being the date to which the latest published audited financial statements of the Company were made up, acquired or disposed of by or leased to any member of the Group, or are proposed to be acquired or disposed of by or leased to any member of the Group.

FURTHER INFORMATION CONCERNING DIRECTORS

1. Service Contracts

As at the Latest Practicable Date, none of the Directors of the Company had any existing or proposed service contract that the Group can terminate without compensation within one year (other than statutory compensation).

2. Interest in Competing Business

As at the Latest Practicable Date, Mr. Kang Fengwei, non-executive Director of the Company, is assistant to the chief executive officer and chief engineer of China Energy. Mr. Li Xinhua, non-executive Director of the Company is the director of the coal and transportation industry management department of China Energy.

Although these roles sit within China Energy, the Company believes that such positions do not involve the relevant Directors any management responsibility over the operations of the Group. The Board further notes that their positions at China Energy may, in certain circumstances, give rise to an indirect influence in transactions between the Company and China Energy and its subsidiaries (excluding the Group). However, the Company believes that both Mr. Kang Fengwei nor Mr. Li Xinhua will, at all times, act in the best interests of the Group and exercise independent judgment in making decisions at the Board meetings. The Company will, in accordance with applicable laws, regulations and the listing rules of its place of listing, ensure that the relevant Directors abstain from voting on any resolutions relating to such transactions where a conflict of interest may arise.

Saved as disclosed above, as at the Latest Practicable Date, none of the Directors or their respective associates (as defined under the Hong Kong Listing Rules) had any interests in the businesses, other than being a Director, which compete or are likely to compete, either directly or indirectly, with the businesses of the Group (as would be required to be disclosed under Rule 8.10 of the Hong Kong Listing Rules if they were controlling shareholders of the Company).

3. Interest in the Group's assets or contracts or arrangements significant to the Group

As at the Latest Practicable Date, none of the Directors had any direct or indirect interest in any assets which had been acquired or disposed of by or leased to any member of the Group or were proposed to be acquired or disposed of by or leased to any member of the Group since 31 December 2024, being the date to which the latest published audited consolidated financial statements of the Company were made up.

As at the Latest Practicable Date, none of the Directors of the Company had materially interest in any existing contract or arrangement at the Latest Practicable Date which is significant in relation to the business of the Group.

LITIGATION

As at the Latest Practicable Date, so far as the Directors are aware, there was no litigation or claim of material importance pending or threatened against any member of the Enlarged Group.

MATERIAL CONTRACTS

As at the Latest Practicable Date, the following contracts (not entered into in the ordinary course of business) have been entered into by members of the Group within the two years preceding the date of this circular which are or may be material:

(i) Asset Purchase Agreement;

(ii) Supplemental Asset Purchase Agreement;

(iii) Performance Compensation Agreement;

(iv) On 24 January 2025, the Company and China Energy entered into the equity transfer agreement in relation to the acquisition of 100% equity interest of China Energy Hangjin Energy Co., Ltd. (國家能源集團杭錦能源有限責任公司) held by China Energy at a consideration of RMB852.6495 million.

Save as disclosed above, no material contract (not a contract entered into in the ordinary course of business) has been entered into by any member of the Enlarged Group within two years immediately preceding the issue of this circular.

MISCELLANEOUS

1. The registered address of the Company is 22 Andingmen Xibinhe Road, Dongcheng District, Beijing, the PRC.

2. The joint company secretaries of the Company are Mr. Song Jinggang (a Fellow of The Hong Kong Chartered Governance Institute) and Mr. Zhuang Yuan (an Associate of The Hong Kong Chartered Governance Institute).

3. The H Share Registrar of the Company is Computershare Hong Kong Investor Services Limited, which is located at 17M Floor, Hopewell Centre, 183 Queen's Road East, Wanchai, Hong Kong.

4. In the event of inconsistency, the English text of this circular shall prevail over the Chinese text.

DOCUMENTS ON DISPLAY

The following documents will be posted on the website of the Stock Exchange (http://www.hkexnews.hk) and the website of the Company (www.csec.com) for at least 14 days from the date of this circular:

(i) a copy of the Asset Purchase Agreement;

(ii) a copy of the Supplemental Asset Purchase Agreement;

(iii) Performance Compensation Agreement;

(iv) Impairment Compensation Undertaking Letter;

(v) letter from the Independent Board Committee, the full text of which is set out in this circular;

(vi) letter from the Independent Financial Adviser, the full text of which is set out in this circular;

(vii) the accountants' reports on financial information of the Target Companies and Target Assets, the text of which is set out in Appendix II to this circular;

(viii) the report on unaudited pro forma financial information of the Enlarged Group, full text of which is set out in Appendix III to this circular;

(ix) summary of the asset valuation report on each of the Target Companies and Target Assets, full text of which is set out in Appendix V;

(x) the Competent Person's Report and Competent Person's valuation report, full text of which are set out in Part A and Part B of Appendix VI, respectively; and

(xi) the letters of consent set out in the section "Consents and Qualifications of Experts" of this Appendix.

NOTICE OF EXTRAORDINARY GENERAL MEETING

NOTICE IS HEREBY GIVEN that the first extraordinary general meeting for 2026 (the "**Extraordinary General Meeting**") of China Shenhua Energy Company Limited (the "**Company**") will be held at He Meeting Room, 2F, Gehua New Century Hotel Beijing, 19 Gulouwai Avenue, Chaoyang District, Beijing, the People's Republic of China at 2:30 p.m. on Friday, 23 January 2026 for the purpose of considering and, if thought fit, passing the following resolutions:

AS SPECIAL RESOLUTIONS:

1. To consider and, if thought fit, approve the resolution on the Transaction and the Proposed Issuance of A Shares complying with the relevant laws and regulations

2. To consider and, if thought fit, approve the resolution on the proposal in respect of the Transaction and the Proposed Issuance of A Shares

   2.1 the overall proposal of the Transaction and the Proposed Issuance of A Shares

   2.2 the Transaction – Target Assets

   2.3 the Transaction – Counterparties

   2.4 the Transaction – transaction price and payment method

2.5 the Transaction – type, par value and listing venue of shares to be issued

2.6 the Transaction – issue method

2.7 the Transaction – target subscriber and subscription method

2.8 the Transaction – issuance price and pricing basis

2.9 the Transaction – number of shares to be issued

2.10 the Transaction – lock-up period

2.11 the Transaction – attribution of profits and losses for the transition period

2.12 the Transaction – arrangements for accumulated undistributed profits

2.13 the Proposed Issuance of A Shares – type, par value and listing venue of shares to be issued

2.14 the Proposed Issuance of A Shares – issue method, target subscribers and subscription method

2.15 the Proposed Issuance of A Shares – pricing basis, Pricing Benchmark Date and issuance price for shares to be issued

2.16 the Proposed Issuance of A Shares – number of shares to be issued

2.17 the Proposed Issuance of A Shares – lock-up period

2.18 the Proposed Issuance of A Shares – use of proceeds to be raised

2.19 the Proposed Issuance of A Shares – arrangements for accumulated undistributed profits

2.20 performance commitment and compensation arrangements

2.21 validity period of the resolutions

3. To consider and, if thought fit, approve the resolution on the "Report (Draft) of China Shenhua on the Purchase of Assets through the Issuance of Shares and Cash Payment, the Raising of Supporting Funds, and the Related Transaction" and its summary

4. To consider and, if thought fit, approve the resolution on the adjustments to the proposal in respect of the Transaction and the Proposed Issuance of A Shares not constituting material adjustments

5. To consider and, if thought fit, approve the resolution on the Transaction and the Proposed Issuance of A Shares constituting related transaction

6. To consider and, if thought fit, approve the resolution on the Transaction and the Proposed Issuance of A Shares not constituting major asset restructuring

7. To consider and, if thought fit, approve the resolution on the Transaction and the Proposed Issuance of A Shares not constituting reorganisation and listing

8. To consider and, if thought fit, approve the resolution on the execution of conditional agreements with the Counterparties to the Transaction

9. To consider and, if thought fit, approve the resolution on the independence of the valuation institutions, the reasonableness of the valuation assumptions, the relevance of the valuation methodologies to the valuation purposes, and the fairness of the valuation pricing

10. To consider and, if thought fit, approve the resolution on the review reports, audit reports and asset valuation reports relating to the Transaction and the Proposed Issuance of A Shares

11. To consider and, if thought fit, approve the resolution on the circumstances regarding the dilution of immediate return arising from the Transaction and the remedial measures

12. To consider and, if thought fit, approve the resolution on the Transaction and the Proposed Issuance of A Shares complying with Articles 11, 43 and 44 of the Administrative Measures for the Major Asset Restructuring of Listed Companies

13. To consider and, if thought fit, approve the resolution on the Transaction and the Proposed Issuance of A Shares complying with Article 4 of the Regulatory Guidelines for Listed Companies No. 9 – Regulatory Requirements for the Planning and Implementation of Major Assets Restructurings by Listed Companies

14. To consider and, if thought fit, approve the resolution on the confirmation that none of the relevant parties to the Transaction and the Proposed Issuance of A Shares falls within the circumstances under Article 12 of the Regulatory Guidelines for Listed Companies No. 7 that would prohibit participation in major asset restructuring of a listed company

15. To consider and, if thought fit, approve the resolution on the confirmation that the Company does not fall within the circumstance under Article 11 of the Administrative Measures for the Registration of Securities Offerings of Listed Companies that would prohibit the issuance of shares to specific targets

16. To consider and, if thought fit, approve the resolution on the price movement of the Company's Shares prior to the information disclosure in relation to the Transaction and the Proposed Issuance of A Shares

17. To consider and, if thought fit, approve the resolution on the confidentiality measures and confidentiality procedures adopted in connection with the Transaction and the Proposed Issuance of A Shares

18. To consider and, if thought fit, approve the resolution on the circumstances of the Company's purchase and sale of assets within 12 months prior to the Transaction and the Proposed Issuance of A Shares

19. To consider and, if thought fit, approve the resolution on the explanation regarding the completeness and compliance of the statutory procedures performed for the Transaction and the Proposed Issuance of A Shares and the validity of the legal documents submitted

20. To consider and, if thought fit, approve the resolution on proposing to the general meeting of the Company to authorise the Board and its authorised persons to handle, with full discretion, all matters relating to the Transaction and the Proposed Issuance of A Shares

By order of the Board
China Shenhua Energy Company Limited
Chief Financial Officer and Secretary to the Board of Directors
Song Jinggang

Beijing, 24 December 2025

Notes:

1. Reference is made to the circular of the Extraordinary General Meeting of the Company dated 24 December 2025 (the "**Circular**"). Unless the context otherwise requires, capitalized terms used in this notice shall have the same meanings as those defined in the Circular.

2. ELIGIBILITY FOR ATTENDING THE EXTRAORDINARY GENERAL MEETING

Holders of H shares of the Company whose names appear on the register of members of the Company kept by the share registrar of the Company, Computershare Hong Kong Investor Services Limited on 23 January 2026 (Friday) are entitled to attend the Extraordinary General Meeting.

The register of members will be closed from 20 January 2026 (Tuesday) to 23 January 2026 (Friday) (both days inclusive) to determine the identity of the shareholders of H shares who are entitled to attend and vote at the Extraordinary General Meeting. In order to be eligible for attending and voting at the Extraordinary General Meeting, transferees of H shares must lodge their duly stamped instruments of transfer, accompanied by the relevant share certificates, to Computershare Hong Kong Investor Services Limited, the Company's share registrar for H shares at Shops 1712–1716, 17th Floor, Hopewell Centre, 183 Queen's Road East, Wanchai, Hong Kong no later than 4:30 p.m. on 19 January 2026 (Monday) to effect the transfer of shares.

3. PROXY

(1) Each shareholder entitled to attend and vote at the Extraordinary General Meeting may appoint one or more proxies in writing to attend and vote on his/her behalf. A proxy need not be a shareholder of the Company.

(2) The proxies shall be appointed in writing by shareholders. The instrument appointing a proxy must be signed by the appointor or his attorney duly authorised in writing. If that instrument is signed by an attorney of the appointor, the power of attorney authorising that attorney to sign or other documents of authorisation must be notarised.

(3) To be valid, the notarially certified power of attorney or other documents of authorisation, and the form of proxy must be delivered to the Office of the Board of Directors of the Company (at Room 1003, Block A, Shenhua Tower, 22 Andingmen Xibinhe Road, Dongcheng District, Beijing, the People's Republic of China, Postal Code: 100011) for holders of domestic shares and to the H share registrar of the Company for holders of H shares not less than 24 hours before the time fixed for convening the Extraordinary General Meeting or any adjournment thereof (as the case may be). Completion and return of a form of proxy will not preclude a shareholder from attending and voting in person at the meeting if he/she so wishes. The H share registrar of the Company is Computershare Hong Kong Investor Services Limited at 17M Floor, Hopewell Centre, 183 Queen's Road East, Wanchai, Hong Kong.

(4) A proxy may exercise the right to vote by showing his/her hand or by poll. However, if a shareholder appoints more than one proxy, such proxies shall only exercise the right to vote by poll.

4. REGISTRATION PROCEDURES FOR ATTENDING THE EXTRAORDINARY GENERAL MEETING

(1) A shareholder or his/her proxy should produce proof of identity when attending the Extraordinary General Meeting. If a corporate shareholder appoints its legal representative or other person authorized by the board of directors or other governing body to attend the meeting, such legal representative or the authorized person shall produce a copy of the resolution of the board of directors or other governing body of such shareholder appointing such person to attend the meeting.

(2) Shareholders who intend to attend the Extraordinary General Meeting should return the reply slip of such meeting to the Company on or before 20 January 2026 (Tuesday).

(3) Shareholders of the Company may return the reply slip personally or by post, email or facsimile to the Company.

(4) Non-registered H shareholders who hold shares of the Company through Hong Kong Securities Clearing Company Limited, banks, brokers or other custodians are advised to consult them directly for assistance in appointment of proxy.

5. CLOSURE OF REGISTER OF MEMBERS

The register of members will be closed from 20 January 2026 (Tuesday) to 23 January 2026 (Friday) (both days inclusive) to determine the identity of the shareholders of H shares who are entitled to attend and vote at the Extraordinary General Meeting. In order to be eligible for attending and voting at the Extraordinary General Meeting, transferees of H shares must lodge their duly stamped instruments of transfer, accompanied by the relevant share certificates, to Computershare Hong Kong Investor Services Limited, the Company's share registrar for H shares at Shops 1712–1716, 17th Floor, Hopewell Centre, 183 Queen's Road East, Wanchai, Hong Kong no later than 4:30 p.m. on 19 January 2026 (Monday) to effect the transfer of shares.

6. PROCEDURES ON DEMANDING A POLL

Subject to the listing rules of the stock exchanges on which the shares of the Company have been listed, a poll may be demanded in respect of any resolution by the following persons before or after a vote is carried out by a show of hands:

(1) the chairman of the meeting; and

(2) at least two shareholders or their proxies entitled to vote thereat; or

(3) one or more shareholders (including their authorised proxies) separately or jointly representing 10% or more of all shares carrying the right to vote at the meeting.

Unless a poll is demanded, the chairman of the meeting shall declare the result of a proposal put to vote on a show of hands. A demand for a poll may be withdrawn by the person who made the demand.

7. In accordance with the Company Law of the People's Republic of China and the articles of association of the Company, shareholder(s) individually or jointly holding 1% or more of the shares of the Company may put forward provisional proposals at a general meeting. The contents of the provisional proposals shall meet the requirements of the articles of association of the Company and regulatory rules in the place where the shares are listed (including review on qualifications of serving as independent non-executive directors, etc.).

8. MISCELLANEOUS

(1) The Extraordinary General Meeting is expected to be held for less than half a day. Shareholders who attend the meeting, personally or by proxy, shall bear their own travelling and accommodation expenses.

(2) The share registrar of the Company for H shares is Computershare Hong Kong Investor Services Limited at 17M Floor, Hopewell Centre, 183 Queen's Road East, Wanchai, Hong Kong.
